Package VB5\_1

1(37)

/\* The block types  
AN & SN. \*/

/\* Process types that are  
used both in AN and SN. \*/

/\* Procedures that are used  
both in AN and SN. \*/

## Package VB5\_1

2(37)

/\*Procedures, data and comments for  
enabling/facilitating  
tool supported simulation\*/

```
/* For handling of protocol syntax errors, three types of errors are distinguished (see subclauses 13.3.1.5. and 14.1.7.2 on  
general error handling procedures)  
type 1: errors in the common message part, e.g. protocol discriminator, transaction id, message type  
type 2: unexpected messages or message sequence errors  
type 3: errors within message parameters (IE errors)  
The checking for and handling of errors is shown in the SDLs in a different way.  
For type 1 errors it is assumed that the common message part of RTMC messages is checked prior to processing in the  
SDL processes. These errors are represented in the SDLs by pseudo events.  
Type 2 errors are shown explicitly in the SDLs  
For type 3 errors the SDLs show the possible results of IE syntax checking (procedure IE_CHECK) only and the subsequent  
error handling (procedure IE_ERROR_HANDLING)  
*/
```

Procedure ERR\_CONTAINED is used to control the error handling during simulation runs. It allows switching on and off of the error handling via an external synonym C\_ErrContained. If C\_ErrContained is set to FALSE, no error handling is activated. If C\_ErrContained is set to TRUE, then you have to indicate the type of error during simulation in the procedures IE\_CHECK, IE\_ERROR\_HANDLING and MSG\_ERROR\_HANDLING

Procedure IE\_CHECK is used to check the syntax of the IEs of a VB5-message. The common octects of each message (first 9 octets) are not considered for error handling. The syntax check is described in an informal manner and shall be used for simulation purposes only. Subclause 13.3.1.5 'General error handling' contains the normative part of the error handling procedures which shall be applied for real implementations.

Procedure IE\_ERROR\_HANDLING is used for handling of an IE syntax error (see table 36)

Procedure MSG\_ERROR\_HANDLING is used for handling of syntax errors in the common octects of each message (first 9 octets, see table 35)

Procedure CONV\_RSCID is used by the AN\_STATUS\_MGT and SN\_STATUS\_MGT for converting a resource identifier (given either by the environment or by the peer side) into an index. With this index a PID table is accessed in order to retrieve the PID of the affected VPCSTAT process.

## Package VB5\_1

3(37)

/\*Procedures, data and comments for enabling/facilitating tool supported simulation\*/

Procedure IE\_CONTAINED shall be used for analysis of Rsclsds within a VB5 message (procedure ANA\_RSC).  
For simulation purposes this procedure evaluates the number of present Rsclsds.  
The Rsclsds are stored within an unlimited array A\_RTMCRsclList. The default value of each entry is (. 0,0,0,0 .) which is the initial value within the SDT tool. This value is represented by C\_EmptyRsclId, i.e. C\_EmptyRsclId has to be set to (. 0,0,0,0 .)  
To check whether a resource ID is present or not, this synonym C\_EmptyRsclId is used.

/\*Resource identifier IE not present\*/  
SYNONYM C\_EmptyRsclId ST\_RsclId = (. 0, 0, 0, 0 .);

/\* Declaration of primitives for establishing the communication between the protocol management processes at the AN and SN side. \*/

signal  
SIM\_SN\_started; /\* primitive to announce the PId of the SN\_MGR\_CPROT process to the AN\_MGR\_CPROT process \*/  
SIM\_AN\_started; /\* primitive to announce the PId of the AN\_MGR\_CPROT process to the SN\_MGR\_CPROT process \*/

/\* Provisioning of resource identifiers to VPCSTAT processes\*/  
/\*  
AN\_VPCSTAT and SN\_VPCSTAT processes are instantiated dynamically by the AN/SN\_STATUS\_MGT process when a meeVPCCreateReq primitive is received. The RsclId of each VPC is given by a parameter of the primitive to the corresponding STATUS\_MGT process, see signal definition.  
The RsclId is only known by the STATUS\_MGT process. This process maps the RsclId to the corresponding PID. I.e. the VPCSTAT process needs not to know its own RsclId.  
For the indication of Rsclsds within primitives, see definition of type ST\_RsclId. The following components are used:  
- Resource Indicator  
    0 complete LSP  
    1 connections at LSP  
    2 connections at LUP  
- Unknown Resource Indicator, this value is only relevant in \_conf primitives  
    0 LSP Id or LUP Id unknown  
    1 VPCI unknown  
- value of LUP Identifier/LSP Identifier  
- value of VPCI  
Note:  
For simulation only a single VPCI and not a range of VPCIs per RsclId is considered  
Example: For creating three VPCI status FSMs for VPCI=1..3 at LUPId=4 you may specify the following primitives at AN and SN side:  
meeVPCCreateReq (. 2, 0, 4, 1 .)  
meeVPCCreateReq (. 2, 0, 4, 2 .)  
meeVPCCreateReq (. 2, 0, 4, 3 .)  
It is assumed that - the VPCI value of a VPC resource is unique in the VB5.1 system  
                  - the VPCI values start with 1  
                  - there are no gaps in the provisioned VPCI values  
\*/

/\*Procedures, data and comments for  
enabling/facilitating  
tool supported simulation\*/

/\* Example for command file for the startup of the AN and SN VB5 SDL system. After  
system startup further commands may be directed to the simulator  
depending on the specific use case you want to perform.

```
----- begin of file
go
output-via meeVPCCreateReq (. 2, 0, 10, 1.) CH_ANVB5_ENV
go
output-via meeVPCCreateReq (. 2, 0, 20, 2.) CH_ANVB5_ENV
go
output-via meeVPCCreateReq (. 2, 0, 30, 3.) CH_ANVB5_ENV
go
output-via meeVPCCreateReq (. 2, 0, 10, 1.) CH_SNVB5_ENV
go
output-via meeVPCCreateReq (. 2, 0, 20, 2.) CH_SNVB5_ENV
go
output-via meeVPCCreateReq (. 2, 0, 30, 3.) CH_SNVB5_ENV
go
output-via meeStartupReq CH_SNVB5_ENV
proceed-until 1
output-via AAL_establish_conf CH_SNMGT_SAAL
output-via AAL_establish_ind CH_ANMGT_SAAL
go
----- end of file
*/

```

/\* Assignment of values to the external synonyms \*/

/\*Local LSPID\*/
SYNONYM C\_LocalLSPId INTEGER = EXTERNAL; /\*Own LSPID\*/

/\*Activation or Deactivation of error handling\*/
SYNONYM C\_ErrContained BOOLEAN = EXTERNAL;

/\*
Before you can start simulation, the values for the external synonyms C\_ErrContained and C\_LocalLSPId  
must be set. To avoid direct input during simulation start, you should use an input-file instead.

Example of an input file:  
----- begin of input file
C\_ErrContained FALSE;
C\_LocalLSPId 8;
----- end of input-file
\*/
