Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for ETSI members and non-members, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs): Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This ETSI Standard (ES) has been produced by ETSI Technical Committee Telecommunications and Internet converged Services and Protocols for Advanced Networking (TISPAN).
1 Scope

The present document describes the IP Multimedia Subsystem (IMS) core component of the TISPAN NGN functional architecture and its relationships to other subsystems and components.

2 References

References are either specific (identified by date of publication and/or edition number or version number) or non-specific.

- For a specific reference, subsequent revisions do not apply.
- Non-specific reference may be made only to a complete document or a part thereof and only in the following cases:
  - if it is accepted that it will be possible to use all future changes of the referenced document for the purposes of the referring document;
  - for informative references.

Referenced documents which are not found to be publicly available in the expected location might be found at http://docbox.etsi.org/Reference.

For online referenced documents, information sufficient to identify and locate the source shall be provided. Preferably, the primary source of the referenced document should be cited, in order to ensure traceability. Furthermore, the reference should, as far as possible, remain valid for the expected life of the document. The reference shall include the method of access to the referenced document and the full network address, with the same punctuation and use of upper case and lower case letters.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

2.1 Normative references

The following referenced documents are indispensable for the application of the present document. For dated references, only the edition cited applies. For non-specific references, the latest edition of the referenced document (including any amendments) applies.

[2] ETSI TS 182 006: "Telecommunications and Internet converged Services and Protocols for Advanced Networking (TISPAN); IP Multimedia Subsystem (IMS); Stage 2 description (3GPP TS 23.228 v7.2.0, modified)".

[3] ETSI TS 123 218: "Digital cellular telecommunications system (Phase 2+); Universal Mobile Telecommunications System (UMTS); IP Multimedia (IM) session handling; IM call model; Stage 2 (3GPP TS 23.218)".

[5] ETSI ES 283 024: "Telecommunications and Internet converged Services and Protocols for Advanced Networking (TISPAN); PSTN/ISDN Emulation: H.248 Profile for controlling Trunking Media Gateways in the PSTN/ISDN Emulation Subsystem (PES); Protocol specification".
2.2 Informative references

The following referenced documents are not essential to the use of the present document but they assist the user with regard to a particular subject area. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Not applicable.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

**IP Multimedia Subsystem**: As defined in TS 123 002 [10].

**NGN IP Multimedia Subsystem**: IMS that supports the provision of SIP-based multimedia services and PSTN/ISDN simulation services to NGN terminals

**User Equipment (UE)**: one or more devices allowing a user to access services delivered by TISPAN NGN networks
3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

- **AF**  Application Function
- **AS**  Application Server
- **ASF** Application Server Function
- **BCSM** Basic Call State Model
- **BGF** Border Gateway Function
- **CAMEL** Customized Application for Mobile Enhanced Logic
- **CCBS** Call Control on Busy Subscriber
- **CSCF** Call Session Control Function
- **E-CSCF** Emergency-Call Session Control Function
- **IBC** Intermediate Breakout Control Function
- **I-BGF** Interconnection-Border Gateway Function
- **I-CSF** Interrogating-Call Session Control Function
- **IM-MGW** IP Multimedia - Media GateWay
- **IMS**  IP Multimedia Subsystem
- **IN**  Intelligent Network
- **IN-SCF** Intelligent Network Switching Control Function
- **IP-CAN** IP-Connectivity Access Network
- **ISDN** Integrated Services Digital Network
- **MGCF** Media Gateway Control Function
- **MGF** Media Gateway Function
- **MM**  MultiMedia
- **MRFC** Multimedia Resource Function Controller
- **MRFP** Multimedia Resource Function Processor
- **NAPT** Network Address and Port Translation
- **NASS** Network Attachment SubSystem
- **NGN** Next Generation Network
- **OSA** Open Service Access
- **P-CSCF** Proxy-Call Session Control Function
- **PDF** Policy Decision Function
- **PES** PSTN/ISDN Emulation Subsystem
- **PSTN** Public Switched Telephony Network
- **RACS** Resource and Admission Control Subsystem
- **SCF**  Switching Control Function
- **SCIM** Service Capability Interaction Manager
- **S-CSCF** Serving-Call Session Control Function
- **SGF**  Signalling Gateway Function
- **SIP**  Session Initiation Protocol
- **SLF**  Subscription Locator Function
- **SPIRITS** Service in the PSTN/IN Requesting InTernet Services
- **SSF** Service Switching Function
- **TCAP** Transaction Capabilities Application Part
- **T-MGF** Trunking-Media Gateway Function
- **UE** User Equipment
- **UPSF** User Profile Server Function

4 Overall architecture

The TISPAN NGN functional architecture ES 282 001 [1] is structured according to a service layer and an IP-based transport layer (see figure 1).

The service layer comprises the following components:

- The IP Multimedia Subsystem core component (IMS).
- The PSTN/ISDN Emulation Subsystem (PES).
The NGN IP Multimedia Subsystem (IMS) supports the provision of SIP-based multimedia services to NGN terminals. It also supports the provision of PSTN/ISDN simulation services.

Functional entities of an IMS may be used by an operator in support of transit network scenarios. The routing may be performed, depending on the entity performing the routing, and depending on the traffic case, on signalling information, configuration data, and/or data base lookup.

The NGN IMS, also known as "Core IMS" is a subset of the 3GPP IMS defined in TS 123 002 [10] which is restricted to the session control functionalities. Application Servers (AS) and transport/media related functions such as the Multimedia Resource Function Processor function (MRFP) and the IP Multimedia Gateway Functions (IM-MGW) are considered to be outside the "core IMS".

Although essentially identical to the 3GPP IMS entities, NGN IMS functional entities might exhibit minor variations in behaviour, due to differences in access networks and user equipment. However, the NGN IMS architecture defined in the present document remains compatible with 3GPP-defined IP-connectivity access networks (IP-CAN) and as such can provide services to user equipment connected to both fixed broadband access and 3GPP IP-CANs (see annex A).
Figure 2 illustrates the position of the IMS in the overall NGN architecture. The IMS interfaces the following components:

- User Equipment.
- The Resource and Admission Control Subsystem.
- The Network Attachment Subsystem.
- The PSTN/ISDN.
- The PSTN/ISDN Emulation Subsystem.
- Other multimedia subsystems.
- Charging Functions.
- Network Management Functions.
- Applications and other common architectural elements.

![Figure 2: TISPAN IMS and its environment](image)

6 Functional entities

Figure 3 provides an overview of the functional entities that compose the NGN IMS, the reference points between them and with components outside the IMS.

---

Unless stated explicitly, the functional entities identified in this clause are identical to those defined in TS 123 002 [10]. Except when highlighting explicitly a difference, the descriptions provided in the present document are intended to provide tutorial information only and in case of discrepancy with the definitions in TS 123 002 [10], the definitions in TS 123 002 [10] shall take precedence.
6.1 Call Session Control Function (CSCF)

The Call Session Control Function (CSCF) establishes, monitors, supports and releases multimedia sessions and manages the user's service interactions. For more details see clause 4a.7.1 in TS 123 002 [10].

NOTE: The CSCF can act as Proxy CSCF (P-CSCF), Serving CSCF (S-CSCF) or Interrogating CSCF (I-CSCF). The P-CSCF is the first contact point for the UE within the IM subsystem (IMS); the S-CSCF actually handles the session states in the network; the I-CSCF is mainly the contact point within an operator's network for all IMS connections destined to a subscriber of that network operator, or a roaming subscriber currently located within that network operator's service area.

This functional entity is identical to the CSCF defined in TS 123 002 [10], except for when acting as a P-CSCF. The P-CSCF behaviour differs from the behaviour in TS 123 002 [10] by the following main points:

- The e2 reference point is supported to enable the P-CSCF to retrieve information (e.g. physical location of the user equipment) from the Network Attachment Subsystem (see clause 11).

- The Gq and Iq reference points are not supported but replaced with the Gq’ reference point (see clause 12).

Based on local configuration, the I-CSCF may perform transit routing functions (see TS 182 006 [2]).

Further specifications of the P-, S- and I-CSCF are provided in TS 182 006 [2].

Support of emergency communications require the use of an E-CSCF as described in TS 182 009 [16]. For the sake of simplicity this type of CSCF is not represented on figure 3.

6.2 Media Gateway Control Function (MGCF)

The Media Gateway Controller Function (MGCF) provides the ability to control a trunking media gateway function (T-MGF) through a standardized interface. Such control includes allocation and deallocation of resources of the media gateway, as well as modification of the usage of these resources. The MGCF communicates with the CSCF, the BGCF and circuit-switched networks. The MGCF performs protocol conversion between ISUP and SIP. It also supports interworking between SIP and non-call related SS7 signalling (i.e. TCAP-based signalling for supplementary services such as CCBS).
In case of incoming calls from legacy networks, the MGCF determines the next hop in IP routing depending on received signalling information.

Based on local configuration, the MGCF may perform transit routing functions (see TS 182 006 [2]).

This functional entity is identical to the MGCF defined in TS 123 002 [10], except that in addition it supports TCAP interworking. A node implementing this functional entity in an NGN network and a node implementing it in a 3GPP network may differ in terms of supported resources (e.g. codecs) and configuration.

6.3 Multimedia Resource Function Controller (MRFC)

The Multimedia Resource Function Controller (MRFC), in conjunction with an MRFP located in the transport layer (see ES 282 001 [1]), provides a set of resources within the core network for supporting services. The MRFC interprets information coming from an AS via an S-CSCF and control MRFP accordingly. The MRFC, in conjunction with the MRFP, provides e.g. multi-way conference bridges, announcement playback, media transcoding, etc.

This functional entity is identical to the MRFC defined in TS 123 002 [10], although a node implementing this functional entity in an NGN network and a node implementing it in a 3GPP network may differ in terms of supported resources and configuration.

6.4 Breakout Gateway Control Function (BGCF)

The Breakout Gateway Control Function (BGCF) determines the next hop in SIP routing. This determination may be based on information received in the protocol, administrative information, and/or database access. For PSTN terminations, the BGCF selects the network in which PSTN breakout is to occur and - within the network where the breakout is to occur - selects the MGCF. This functional entity is identical to the BGCF defined in TS 123 002 [10], although a node implementing this functional entity in an NGN network and a node implementing it in a 3GPP network may differ in terms of configuration (e.g. breakout criteria).

In case of transit the BGCF may have extra functionality for routing transit traffic (see TS 182 006 [2]).

6.5 Interconnection Border Control Function (IBCF)

An IBCF provides application specific functions at the SIP/SDP protocol layer in order to perform interconnection between two operator domains. It enables communication between IPv6 and IPv4 SIP applications, network topology hiding, controlling transport plane functions, screening of SIP signalling information, selecting the appropriate signalling interconnect and generation of charging data records.

Based on local configuration, the IBCF may perform transit routing functions (see TS 182 006 [2]).

This functional entity is identical to the IBCF defined in TS 123 002 [10].

Details are described in TS 182 006 [2].

7 Internal reference points

Unless stated explicitly, the reference points identified in this clause are identical to those defined in TS 123 002 [10]. Except when highlighting explicitly a difference, the descriptions provided in the present document are intended to provide tutorial information only and in case of discrepancy with the definitions in TS 123 002 [10], the definitions in TS 123 002 [10] shall take precedence.
7.1 Reference point MGCF - CSCF (Mg reference point)

This reference point is identical to the reference point MGCF - CSCF (Mg) defined in TS 123 002 [10].

The Mg reference point allows the MGCF to forward incoming session signalling (from the PSTN) to the CSCF for the purpose of interworking with PSTN networks.

NOTE: The protocol used for the Mg reference point is SIP.

Details are described in TS 182 006 [2].

7.2 Reference point CSCF - MRFC (Mr reference point)

This reference point is identical to the reference point CSCF - MRFC (Mr) defined in TS 123 002 [10].

The Mr reference point allows the S-CSCF to relay signalling messages between an application server function and an MRFC.

NOTE: The protocol used for the Mr reference point is SIP.

Details are described in TS 182 006 [2].

7.3 Reference point CSCF - CSCF (Mw reference point)

This reference point is identical to the reference point CSCF - CSCF (Mw) defined in TS 123 002 [10].

The Mw reference point allows the communication and forwarding of signalling messaging between CSCFs, e.g. during registration and session control.

NOTE: The protocol used for the Mr reference point is SIP.

Details are described in TS 182 006 [2].

7.4 Reference point CSCF - BGCF (Mi reference point)

This reference point is identical to the reference point CSCF-BGCF (Mi) defined in TS 123 002 [10].

This reference point allows the Serving CSCF to forward the session signalling to the Breakout Gateway Control Function for the purpose of interworking to the PSTN networks.

NOTE: The protocol used for the Mi reference point is SIP.

Details are described in TS 182 006 [2].

7.5 Reference point BGCF - MGCF (Mj reference point)

This reference point is identical to the reference point BGCF - MGCF (Mj) defined in TS 123 002 [10].

This reference point allows the Breakout Gateway Control Function to forward the session signalling to the Media Gateway Control Function for the purpose of interworking to the PSTN networks.

This reference point may also be used by an MGCF to forward session signalling to the BGCF in case of transit scenarios, if the MGCF supports transit routing.

NOTE: The protocol used for the Mj reference point is SIP.

Details are described in TS 182 006 [2].
7.6 Reference point BGCF - BGCF (Mk reference point)

This reference point is identical to the reference point BGCF - BGCF (Mk) defined in TS 123 002 [10].

This reference point allows the Breakout Gateway Control Function to forward the session signalling to another Breakout Gateway Control Function.

NOTE: The protocol used for the Mk reference point is SIP.

Details are described in TS 182 006 [2].

7.7 Reference point CSCF or BGCF - IBCF (Mx Reference Point)

This reference point is identical to the reference point CSCF or BGCF - IBCF (Mx) defined in TS 123 002 [10].

The Mx reference point allows the communication and forwarding of signalling messages between a CSCF or a BGCF and an IBCF.

NOTE: The protocol used for the Mx reference point is SIP.

Details are described in TS 182 006 [2].

8 Value added services architecture

Unless stated explicitly, the reference points identified in this clause are identical to those defined in TS 123 002 [10]. Except when highlighting explicitly a difference, the descriptions provided in the present document are intended to provide tutorial information only and in case of discrepancy with the definitions in TS 123 002 [10], the definitions in TS 123 002 [10] shall take precedence.

8.1 Overview

Three types of Application Server Functions (ASF) can be accessed by the IMS through the ISC or Ma reference point (see figure 4).

- SIP Application Servers (SIP AS);
- the IM-SSF Application Server;
- the OSA SCS Application Server.

A SIP Application Server may contain "Service Capability Interaction Manager" (SCIM) functionality and other application servers. The SCIM functionality is an application which performs the role of interaction management. The internal structure of the application server is outside the standards.

The purpose of the IM SSF is to enable access to IN service logic programs hosted in legacy SCPs. The IM-SSF functionality encompasses the emulation of the IN Call Model (BCSM) on top of SIP signalling, IN triggering and feature management mechanisms, emulation of the IN Service Switching Finite State Machine and interworking with INAP.

NOTE 1: The IM SSF identified in the present document differs from the IM SSF identified in TS 123 002 [10]. The latter implements the CAMEL call model and protocols, as defined in TS 123 278 [11] and TS 129 278 [12], while the former implements either the CAMEL call model and protocols or the ETSI Core INAP capabilities as defined in EN 301 931 [8], or both. The Si reference point is used for CAMEL services only.
NOTE 2: The IM SSF is intended to enable access from the IMS to IN service logic programs hosted in legacy SCPs. Access to IMS services (i.e. hosted in SIP-based Application Servers) from legacy SSPs in the PSTN/ISDN is outside the scope of the present document. Appropriate gateway functions (e.g. SPIRITS gateway as defined in RFC 3136 [13]) have to be implemented in the PSTN/ISDN network for supporting such scenarios.

The purpose of the OSA Service Capability Server is to provide access to OSA applications, according to the OSA/Parlay framework ES 201 915-1 [9].

Further details can be found in TS 123 218 [3].

![Value Added Services architecture](image)

**Figure 4: Value Added Services architecture**

The Service-CSCF to AS reference point is used to forward SIP requests, based on filter criteria associated with the originating or destination user.

The Interrogating-CSCF to AS reference point is used to forward SIP requests destined to a Public Service Identity hosted by the AS directly to that AS.

### 8.2 Reference points

#### 8.2.1 Reference point S-CSCF - ASF (ISC reference point)

This reference point is identical to the reference point S-CSCF - AS (ISC Reference Point) defined in TS 123 002 [10].

This reference point between S-CSCF and the Application Server Functions (i.e. SIP Application Server, OSA Service Capability Server, or IM-SSF) is used to provide services for the IMS.

Details are described in TS 182 006 [2].

#### 8.2.2 Reference point UPSF - SIP AS or OSA SCS (Sh reference point)

This reference point is identical to the reference point HSS - SIP AS or OSA SCS (Sh Reference Point) defined in TS 123 002 [10].

The Application Server (SIP Application Server and/or the OSA Service Capability Server) may communicate to the UPSF. The Sh reference point is used for this purpose. Details are described in TS 182 006 [2].
8.2.3 Reference point UPSF - IM SSF (Si reference point)

This reference point is identical to the reference point HSS - CAMEL IM-SSF (Si Reference Point) defined in TS 123 002 [10].

The IM-SSF may communicate with the UPSF, via the Si reference point. Details are described in TS 182 006 [2].

8.2.4 Reference point ASF - SLF (Dh reference point)

This reference point is identical to the reference point AS - SLF (Dh Reference Point) defined in TS 123 002 [10].

This reference point between Application Server Functions and SLF is used to retrieve the address of the UPSF which holds the subscription for a given user. This reference point is not required in a single UPSF environment.

Details are described in TS 182 006 [2].

8.2.5 Reference point UE - ASF (Ut reference point)

This reference point is identical to the reference point UE - AS (Ut Reference Point) defined in TS 123 002 [10].

This reference point enables the user to manage information related to his services, such as creation and assignment of Public Service Identities, management of authorization policies that are used e.g. by Presence service, conference policy management, etc.

The signalling flows across this reference point may be routed directly between the UE and the ASF hosting the application to be managed or may be routed via an aggregation node acting as a front-end for a number of applications.

Details are described in TS 182 006 [2].

NOTE: The type of ASF connected to this reference point is restricted to a SIP Application Server.

8.2.6 Reference point I-CSCF - AS (Ma reference point)

This reference point is identical to the reference point I-CSCF - AS (Ma Reference Point) defined in TS 123 002 [10].

This reference point between Interrogating-CSCF and the Application Servers (i.e. SIP Application Server, OSA Service Capability Server, or CAMEL IM-SSF) is used to forward SIP requests destined to a Public Service Identity hosted by an Application Server directly to the Application Server.

Details are described in TS 182 006 [2].

9 External reference points

Unless stated explicitly, the reference points identified in this clause are identical to those defined in TS 123 002 [10]. Except when highlighting explicitly a difference, the descriptions provided in the present document are intended to provide tutorial information only and in case of discrepancy with the definitions in TS 123 002 [10], the definitions in TS 123 002 [10] shall take precedence.

9.1 Interfaces with entities in the transfer plane

Transfer plane entities are defined in ES 282 001 [1].

9.1.1 Reference Point MGCF - T-MGF (Mn Reference Point)

This reference point is identical to the reference point MGCF - IMS-MGW (Mn Reference Point) defined in TS 123 002 [10].
The Mn reference point describes the interfaces between the MGCF and a T-MGF. It has the following properties:

- Open architecture where extensions/Packages definition work on the interface may be carried out.
- Dynamic sharing of T-MGF physical node resources. A physical T-MGF can be partitioned into logically separate virtual media gateways/domains consisting of a set of statically allocated Terminations.
- Dynamic sharing of transmission resources between the domains as the MGF controls bearers and manage resources according to the H.248 protocols and functions for IMS.

Details are described in ES 283 024 [5].

### 9.1.2 Reference point MGCF - SGF (Ie reference point)

The Ie reference point enables the MGCF to exchange SS7 signalling information over IP with the SGF, according to the SIGTRAN architecture.

### 9.1.3 Reference point MRFC - MRFP (Mp reference point)

This reference point is identical to the reference point MRFC - MRFP (Mp reference point) defined in TS 123 002 [10].

The Mp reference point allows an MRFC to control media stream resources provided by an MRFP.

The Mp reference point has the following properties:

- Open architecture where extensions (packages) definition work on the interface may be carried out.

Details are described in TS 182 006 [2].

### 9.2 Interface with the UE

The reference point CSCF - UE (Gm reference point) is identical to the reference point CSCF - UE (Gm reference point) defined in TS 123 002 [10].

The Gm reference point supports the communication between UE and the IMS, e.g. related to registration and session control.

**NOTE:** The protocol used for the Gm reference point is SIP.

Details are described in TS 182 006 [2].

### 9.3 Interfaces with the user profile

The SLF and UPSF entities are defined in ES 282 001 [1].

#### 9.3.1 Reference point CSCF - SLF (Dx reference point)

The interface at this reference point is identical to the one at reference point CSCF - SLF (Dx Reference Point) defined in TS 123 002 [10].

Interface between CSCF and SLF is used to retrieve the address of the UPSF which holds the subscription for a given user.

This reference point is not required in a single UPSF environment. An example for a single UPSF environment is a server farm architecture.

Details are described in TS 182 006 [2].
9.3.2 Reference point CSCF - UPSF (Cx reference point)

This reference point is identical to the reference point HSS - CSCF (Cx Reference Point) defined in TS 123 002 [10].

The Cx reference point supports information transfer between CSCF and UPSF.

The main procedures that require information transfer between CSCF and UPSF are:

1) Procedures related to Serving CSCF assignment.
2) Procedures related to routing information retrieval from UPSF to CSCF.
3) Procedures related to authorization (e.g., checking of roaming agreement).
4) Procedures related to authentication: transfer of security parameters of the subscriber between UPSF and CSCF.
5) Procedures related to filter control: transfer of filter parameters of the subscriber from UPSF to CSCF.

Further information on the Cx reference point is provided in TS 182 006 [2].

9.4 Interfaces with Charging Functions

The following functional entities in the Core IMS may act as charging trigger points:

- AS;
- BGCF;
- (I-/P-/S-/E-) CSCF;
- MGCF;
- MRFC;
- IBCF.

For off-line charging the Rf reference point is used. For on-line charging the Ro reference point is used. Details are described in ES 282 010 [4].

10 Interconnection with other networks

10.1 Interfaces with the PSTN/ISDN

Interconnection at the signalling level is provided via the SGF (transport) and MGCF (call/service control).

Interconnection at the media level is provided by the trunk interfaces at the T-MGF.

Further details can be found in ES 283 027 [6].

10.2 Interfaces with other IP-based service subsystems

Interconnection with other IP-based service subsystems (including PSTN/ISDN Emulation subsystems and other IMS subsystems) is performed via the IBCF at the signalling level and the I-BGF at the media level.

In case of transit the IBCF may have extra functionality for routing transit traffic.

Annex B illustrates various interconnection scenarios.

Interconnection between IMS subsystems occurs either between two home domains (e.g. session originating and terminating domain) or between a visited domain and a home domain (i.e. support of roaming capabilities).
Based on signalling information received from the Core IMS and local policy rules, the IBCF decides on a per session basis whether the RACS should be involved in the interconnection.

**NOTE:** Depending on the operator policies, the decision as to whether or nor media level interconnection is required (i.e. an I-BGF has to be inserted in the media path) for a particular session may be taken by the RACS, based on information received from the IBCF. The RACS will also choose the appropriate interconnect link for media traffic based on the information received from the IBCF.

Further details can be found in TS 183 021 [7].

Figure 5 illustrates the case where no I-BGF is inserted. Figure 6 illustrates the case where an I-BGF is inserted by the visited network. The Ici reference point is a specialization of the generic Ic reference point identified in ES 282 001 [1] and is further described in TS 182 006 [2].

### 11 Interface with the Network Attachment Subsystem (NASS)

The e2 reference point supports information transfer between the P-CSCF and the Network Attachment Subsystem. This reference point is not required when the user equipment is connected to a 3GPP IP-CAN.
12 Interface with the Resource and Admission Control Subsystem (RACS)

The NGN IMS interacts with the Resource and Admission Control Subsystem (RACS) at the Gq' reference point for the following purposes:

- authorization of QoS resources;
- resource reservation;
- gate control (including NAPT binding information relay).

With regard to the RACS architecture; the P-CSCF plays the role of an Application Function (AF).

Details are described in TS 182 006 [2].

This reference point is not required when the user equipment is connected to a 3GPP IP-CAN. In such configurations, the P-CSCF interacts the 3GPP Policy Decision Function as described in TS 123 002 [10].

In case of network interconnection, interactions with the resource control subsystem may also take place at the edge of the IMS, at the IBCF level for the following purposes:

- gate control (including NAPT binding information relay).

With regard to the RACS architecture; the IBCF plays the role of an Application Function (AF).

Details are described in TS 183 021 [7].
Annex A (informative):
IMS Access scenarios

The IMS subsystem described in the present document provides services to user equipment connected via a plurality of IP connectivity access networks. Figure A.1 illustrates the case where an IMS subsystem provides services to user equipment connected to a fixed broadband access network and to other user equipment connected via a GPRS-based IP-CAN.

Figure A.1: Access to IMS services from multiple access technologies
Annex B (informative):
IMS interconnection scenarios

This annex describes a number of example interconnection scenarios at the SIP signalling level, based on the use of an IBCF at the boundary between two TISPAN networks or between a TISPAN network and an external network.

Figure B.1 illustrates an interconnection scenario where a registration procedure is performed between a visited network and a home network.

![Figure B.1: IMS registration between visited and home network](image)

Figure B.2 illustrates an interconnection scenario where the originating and destination party of an IMS session belong to different home networks.

![Figure B.2: IMS session between two networks](image)

Figure B.3 illustrates an interconnection scenario where the originating party is in a visited network and the destination party of an IMS session belong to different home networks.

![Figure B.3: IMS session between two networks, with roaming originating party](image)
Figure B.4 illustrates an interconnection scenario where a session is established between an IMS User Equipment and the PSTN, the PSTN breakout being performed in another IMS than the originating party's home network.

**Figure B.4: IMS session with PSTN interworking**

Figure B.5 illustrates an interconnection scenario where a session is established between an IMS User Equipment and an H.323 network or a non IMS-based SIP network, see RFC 3261 [14].

**Figure B.5: Interworking with non IMS multimedia networks**

Figure B.6 illustrates an interconnection scenario where a session is established between an IMS User Equipment and a PES.

**Figure B.6: Interconnection between an IMS and a PES**
Figure B.7 illustrates a configuration where an IMS provides transit services between a PSTN or an IMS and another PSTN or IMS.
