

TS 100 616 V5.0.1 (1998-08)

Technical Specification

Digital cellular telecommunications system (Phase 2+); Event and call data (GSM 12.05 version 5.0.1 Release 1996)

The GSM logo consists of the letters 'GSM' in a bold, blue, sans-serif font. A small red square is positioned at the top right corner of the 'M'. A registered trademark symbol (®) is located to the right of the 'M'.

Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available **free of charge** from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://www.etsi.fr/ipr> or <http://www.etsi.org/ipr>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by the Special Mobile Group (SMG) of the European Telecommunications Standards Institute (ETSI).

This specification is concerned with the administration of subscriber related event and call data within the digital cellular telecommunications system.

The contents of this TS is subject to continuing work within SMG and may change following formal SMG approval. Should SMG modify the contents of this TS, it will be re-released by SMG with an identifying change of release date and an increase in version number as follows:

Version 5.x.y

where:

- 5 indicates GSM Phase 2+ Release 1996;
- x the second digit is incremented for all other types of changes, i.e. technical enhancements, corrections, updates, etc.;
- y the third digit is incremented when editorial only changes have been incorporated in the specification.

1 Scope

The present document is concerned with the administration of subscriber related event and call data. This includes both the collection of call data from, and the distribution of tariff data to, the network elements.

The subscriber (IMSI) and mobile equipment (IMEI) related call and event data collected is employed by a number of management activities including billing & accounting, statistical analysis and customer care.

The tariff data in the network elements is required to support the supplementary service "Advice of Charge".

The aim of the present document is to describe both the network management functions required and the data involved.

2 Normative references

References may be made to:

- a) specific versions of publications (identified by date of publication, edition number, version number, etc.), in which case, subsequent revisions to the referenced document do not apply; or
- b) all versions up to and including the identified version (identified by "up to and including" before the version identity); or
- c) all versions subsequent to and including the identified version (identified by "onwards" following the version identity); or
- d) publications without mention of a specific version, in which case the latest version applies.

A non-specific reference to an ETS shall also be taken to refer to later versions published as an EN with the same

3 Definitions

For the purposes of the present document, the following definitions apply:

accounting meter record: A record containing one or more counters employed to register the usage of resources en masse. Includes simple event counters and/or cumulative call second counters.

advice of charge: The real-time display of the network utilisation charges incurred by the Mobile Station. The charges are displayed in the form of charging units. If a unit price is stored by the MS then the display may also include the equivalent charge in the home currency.

aoc service: A combination of one or more services, both basic and supplementary, together with a number of other charging relevant parameters to define a customised service for the purpose of advice of charge.

call data: One or more call records.

call record: A set of parameters related to one call attempt.

CAMEL: A network feature that provides the mechanisms to support operator specific services even when roaming outside HPLMN.

CAMEL subscription information: Identifies a subscriber as having CAMEL services.

charging calendar: One or more date definitions each of which assigns a day class to a particular day.

charging destination: Also referred to as a destination for charging, this is a nominal reference defining the point of termination of a connection for charging purposes.

charging origin: A nominal reference defining the point of origin of a connection for charging purposes.

charging zone: A distance class (e.g. "local" and "long distance") defined by one or more combinations of charging origins and charging destinations.

day class: A group of days for which the same tariff switch-over pattern applies e.g. public holidays

event data: One or more event records.

event record: A set of parameters related to a single telecommunications event.

observed IMEI ticket: A record used to describe an EIR relevant event e.g. a blacklisted IMEI

service distance dependency: The relationship between an AoC service, a charging zone and the relevant tariff class.

successful call: A connection that reaches the communication or data transfer phase e.g. the "answered" state for speech connections. All other connection attempts are regarded as unsuccessful.

tariff: A set of parameters defining the network utilisation charges for the use of a particular service.

tariff class: A grouping of one or more service distance dependencies for the purpose of defining the corresponding tariff switching patterns.

tariff period: A part of one (calendar) day during which a particular tariff is applied. Defined by the time at which the period commences (the switch-over time) and the tariff to be applied after switch-over.

tariff switch-over pattern: A set of tariff periods defining the tariffs to be applied over one complete 24 hour period (calendar day).

4 Abbreviations

For the purposes of the present document, the following abbreviations apply:

| | |
|--------|---|
| ADC | Administration Centre |
| AoC | Advice of Charge |
| BSS | Base Station System |
| CAI | Charge Advice Information |
| CAMEL | Customised Applications for Mobile network Enhanced Logic |
| CMIP | Common Management Information Protocol |
| CMIS | Common Management Information Service |
| CUG | Closed User Group |

5 General

Call and event data from the Mobile Services Switching Centres (MSCs), Base Station Systems (BSSs) and location registers (HLR/VLR) is required for a number of network management activities including, but not limited to, the following:

- the billing of home subscribers, either directly or via service providers, for network utilisation charges;
- the settlement of accounts for traffic carried or services performed by fixed network and other operators;
- the settlement of accounts with other PLMNs for roaming traffic via the transferred account procedure;
- statistical analysis of service usage;
- as historical evidence in dealing with customer service and billing complaints;

In addition to the information collected from these network elements, network management functions are required for the administration of on-line charging data stored in the MSCs. This data is employed to drive the charge display in the Mobile Station (MS) as required by the advice of charge (AoC) service and defined by GSM 02.86 [13] and GSM 02.24 [12].

The present document describes the network management interfaces and functions required in terms of the Telecommunications Management Network (TMN) information model defined by the CCITT (see CCITT M.3010 [3] and GSM 12.00 [18]).

For the purpose of the present document, the call and event data is considered to be collected, in real-time, by network element function (NEF) blocks located within the MSCs, BSSs and location registers.

The data collected by the NEFs is sent to, or collected by, the appropriate Operations System Function (OSF) blocks for storage and further processing.

Similarly, the tariff data required by the NEFs to provide on-line charging information is distributed by the appropriate OSF.

The location of the OSF is implementation specific and may, for example, be provided either by an Administration Centre (ADC) or integrated within the network elements themselves.

6 TMN management services

6.1 Tariff and charging administration

The TMN Management Service "Tariff and Charging Administration", as defined in CCITT M.3200 [4], covers those management activities related to the charging of service usage including both the data collection process and the

administration of charging data within the network elements. The relationship between this and other management services and activities is illustrated in figure 1 and described in the following subclauses.

Figure 1: Tariff and charging administration

6.1.1 Subscriber billing

The call and event data collected from the network elements is employed to determine the network utilisation charges for the basic and supplementary services utilised by the home subscribers of the PLMN. The charges calculated are then combined with the network access (subscription) charges and billed to those customers directly serviced by the PLMN.

For those subscribers handled by Service Providers, the billing information is employed for both wholesale (Network Operator to Service Provider) and retail (Service Provider to Subscriber) billing. Consequently, having been processed by the PLMN Billing Centre, the call and event data collected from the network elements may also be sent to the Service Provider for further processing.

6.1.2 Accounting

6.1.2.1 Inter-PLMN accounting

Inter-PLMN accounts for roaming traffic are determined in accordance with CCITT principles (see CCITT D.93 [1]) and are settled by means of the Transferred Account Procedure (TAP).

6.1.2.1.1 'Visitors' from other PLMNs

The call and event data collected from the network also includes details of the services employed by visiting (roaming) subscribers. The charges for mobile originated calls (MOCs) and for supplementary services used are calculated as for home subscribers, converted to an agreed accounting currency (e.g. SDRs) and included in the call detail records for the TAP. Even if mobile terminated calls (MTCs) are zero-priced in the visited network (VPLMN), in the absence of 'optimised routing' the MTC TAP records are still required by the home network (HPLMN) in order to determine the re-routing charges from the HPLMN to the VPLMN.

The TAP records generated are exchanged with each HPLMN on a regular basis. These TAP records form the basis of the invoice submitted by the VPLMN for the traffic carried.

6.1.2.1.2 'Home' subscribers roaming in other PLMNs

The HPLMN receives TAP records from each VPLMN for services employed by home subscribers whilst roaming. These records are employed to verify the invoices from the VPLMN and to bill the home subscribers for the services used. The charges contained in the TAP records are converted from the accounting currency to the local currency and a handling surcharge (mark-up) is added if required. The TAP records are subsequently passed to the subscriber billing process described in subclause 6.1.1.

6.1.2.2 Fixed network operators and other service providers

The settlement of accounts with the operators of fixed networks for traffic carried, is generally performed on a bulk basis according to the principles outlined in the CCITT D-series of recommendations.

The traffic accounted for in this manner may include:

- outgoing (Mobile to Land) traffic;
- incoming (Land to Mobile) traffic;
- transit traffic, carried by intermediate networks;
- signalling (MAP/SCCP) traffic e.g. location updates.

Accounting information may also be required for the use of services provided by other operators such as short message service centres and other value added service (VAS) providers.

The charges for the various traffic shares may be determined on the basis of the call records generated by the network elements or on the basis of bulk counters (accounting meter records) in the gateway MSCs (GMSCs). For the purpose of the present document, the management information required is assumed to be derived from call and event records. The management of accounting meters is outside the scope of the present document.

6.1.3 Service provision

The call and event data collected from the network elements may be used to provide statistical information concerning the use of services, by both home and visiting subscribers, within the network. In addition, the introduction of new services and/ or modifications to the tariffs of existing services may also require the distribution of the appropriate tariff information to the network elements for Advice of Charge purposes.

6.1.4 Customer administration

The call data collected from the NEs provides a historic record of subscriber activity and may be used for the handling of customer care enquiries and, in particular, billing complaints. For further details of customer administration services see GSM 12.02 [20].

6.2 Management of mobile equipment

The TMN Management Service "Management of Mobile Equipment" covers those management activities related to the International Mobile Station Equipment Identity (IMEI) of the mobile station (MS). The main objective of this management service is to administer the data of the Equipment Identity Register (EIR) thereby preventing the access by unauthorised or faulty equipment to the network.

Figure 2 illustrates the exchange of information between the OSF and the appropriate NEFs. The EIR Management Data exchanged takes the form of a number of lists (white, grey and black) which determine whether or not access to the network is permitted for a particular range of IMEIs. For further details concerning the content and use of the white, grey and black lists see GSM 02.16. For full details of the management of these lists see GSM 12.02 [20].

The Observed IMEI Ticket Data collected from the network elements may be used to identify unknown IMEIs, to gather statistics concerning the use of the network by unauthorised mobile stations and to detect the presence of cloned equipment. The present document is concerned with the control of the generation of IMEI tickets together with the collection of those tickets from the NEFs.

Figure 2: Management of mobile equipment

7 TMN management service components

7.1 Tariff and charging administration

The following TMN Management Service Components (TMN-MSCs) are relevant for mobile applications:

- Tariff Administration (real-time tariffing i.e. advice of charge);
- Data Collection Management (detailed billing, statistics etc.).

These components are illustrated in figure 3 (see also CCITT M.3400 for comparison).

7.1.1 Tariff administration

This service component is concerned with the administration of tariff information in the network elements (NEFs). This information is required by the MSC for the on-line transmission of tariff information to the mobile station in order to support the Advice of Charge (AoC) service as described in GSM 02.86 [13] and GSM 02.24 [12].

The tariff to be applied to a particular service may depend on a number of factors including:

- the service itself;
- the origin and destination of the connection (charging zone);
- the date of the year, day of the week and the time of day;
- the type of resource being used e.g. full/ half rate radio traffic channel;
- the mode of operation of the basic service employed (transparent/ non-transparent);
- the call/ connection type e.g. MOC/ MTC;
- additional network-specific criteria.

The tariff administration service component provides the OS with the management functions required to administer both the tariffs themselves and the parameters required for the application of those tariffs.

7.1.2 Data collection

This service component is concerned with the collection of data from the NEs. It includes the specification of the data to be collected as well as the mechanisms required for the transfer of that data to the OS.

7.1.2.1 Data generation control

The generation, intermediate storage and transmission of call and event data consume considerable amounts of network and TMN resources. This service component permits the OS to configure and optimise both the generation of records within the NEs and the contents of those records according to the needs of the network operator.

7.1.2.2 Data transfer control

The call and event records produced by the NEF of the appropriate NEs shall be transmitted to, or collected by, the appropriate OSF for subsequent (off-line) processing.

This service component provides mechanisms for the transfer of call and event records, both individually (real-time event reporting) and in bulk (file transfer), between the NEFs and OSFs.

Figure 3: Management Service Components

7.2 Management of mobile equipment

The present document is concerned solely with the management of the EIR data collection process. This service component permits the OS to enable and disable the generation of observed IMEI tickets within the NEs. It also controls the transfer of the IMEI tickets from the NEs to the OS.

8 TMN management functions

This clause describes the individual TMN management functions (TMN-MFs) required. As described in CCITT M.3400, each of these TMN-MFs shall be mapped onto one or more OSI System Management Functions (SMFs) defined in the following recommendations:

- Object Management Function (CCITT X.730 [7]);
- State Management Function (CCITT X.731 [8]);
- Alarm Reporting Function (CCITT X.733 [9]);
- Event Reporting Management Function (CCITT X.734 [10]);
- Log Control Function (CCITT X.735 [11]).

In the following subclauses, each group of TMN functions is described in terms of the SMFs required. The terms create/ set/ get/ delete/ action/ and notification each refer to the appropriate pass-through service defined in CCITT X.730 [7]. The object classes on which these operations are performed are described in detail in annex A.

It should be noted that each of the network management operations described may be performed on a particular network element (NEF) or "broadcast" to all relevant network elements. Both the handling of such "broadcast" operations and

the mechanisms required to ensure the consistency of the information distributed are considered to be outside the scope of the present document.

8.1 Tariff administration

The following management functions are provided:

- Tariff class management;
- Tariff period management;
- Day class management;
- Tariff management;
- Tariff system management (change control).

8.1.1 Tariff class management

The purpose of the tariff class management functions is to permit the OS to assign a tariff class to a set of service and distance dependent charging parameters. Distance dependencies are defined in terms of charging origins, charging destinations and charging zones. Service dependencies are defined in terms of customised AoC services. For further details see subclause A.1.1. The table 1 includes some examples of possible tariff classes.

Table 1: Tariff class examples

| Tariff class description | Service and distance dependencies |
|--|--|
| Telephony, class 2 mobiles, calls made within a particular metropolitan area | Service, origin, destination, MS classmark |
| Telephony, half rate codec, international calls | Service, destination, radio channel used |
| Short message service, mobile originated | Service only |

8.1.1.1 Charging origin functions

This group of functions shall be used to create, set, get, and delete one or more charging origins. A charging origin represents a nominal reference point for the origination of a connection or transaction. Charging origins may be derived from a number of network configuration parameters including originating cell-id., incoming trunk group, MSC id. etc. The derivation of charging origins is a network specific matter and outside the scope of the present document. For the purpose of the present document it is sufficient to know the names and identities of the origins available.

The following system management functions are required:

Create/Set/Get/Delete chargingOrigin

8.1.1.2 Charging destination functions

This group of functions shall be used to create, set, get, and delete one or more charging destinations. A charging destination represents a nominal reference point for the termination of a connection or transaction. Charging destinations may be derived from a number of parameters including the called number, roaming number etc. The derivation of charging destinations is a network specific matter and outside the scope of the present document. For the purpose of the present document, it is sufficient to know the names and identities of the destinations available.

The following system management functions are required:

Create/Set/Get/Delete chargingDestination

8.1.1.3 Charging zone functions

This group of functions shall be used to create, set, get, and delete one or more charging zones. A charging zone provides a nominal measurement of the distance between the point of origination and termination of a connection.

Each charging zone shall consist of one or more origin and destination combinations. Each origin and destination combination shall contain a charging origin and/ or a charging destination. Only those origins and destinations previously created by means of the TMN-MFs functions described above may be referenced by a charging zone.

The following system management functions are required:

Create/Set/Get/Delete chargingZone

8.1.1.4 AoC service functions

This group of functions shall be used to create, set, get, and delete one or more AoC service definitions. An AoC service definition is a grouping of services together with additional charging parameters to provide a customised definition of a service for the purpose of Advice of Charge.

An AoC service definition shall consist of a combination of the following:

- one or more basic services; and/or
- one or more supplementary services; and/or
- one or more network specific services; and/or
- one or more power capability classes (MS classmark); and/or
- the type of radio traffic channel used/ requested;
- the transparency mode of the basic service employed (transparent/non-transparent);
- the type of call or connection (e.g. MOC/ MTC).

This list may also be extended to include additional network specific parameters.

The following system management functions are required:

Create/Set/Get/Delete aocService

8.1.1.5 Tariff class functions

This group of functions shall be used to create, set, get, and delete one or more tariff classes. A tariff class is a grouping of service and distance dependent charging parameters for the purpose of defining the corresponding tariff switching patterns.

Each tariff class shall contain one or more service distance dependencies. Each service distance dependency shall contain a reference to an AoC service definition and may include a reference to a charging zone.

The following system management functions are required:

Create/Set/Get/Delete tariffClass

8.1.2 Tariff period management

These functions permit the OS to create, set, get, and delete the tariff switching patterns and tariff periods defined in the NEs i.e. to manage the time-based tariff dependencies.

Each tariff class shall contain one or more tariff switching patterns, each of which assigns a tariff switching pattern to a particular day class. Each tariff switching pattern in turn shall contain one or more tariff periods.

A tariff period is a period of the day during which a particular tariff is applied e.g. a "peak rate" tariff period from 08:00 to 20:00. A tariff period shall contain a tariff switch-over time and a reference to the tariff to be applied after the switch-over. If the tariff to be applied does not change during the day then a single tariff period shall be defined with a default switching time of "00:00" i.e. Midnight. For further details see subclause A.1.2. The following table includes an example switching pattern for a particular tariff class.

Table 2: Tariff switching patterns for one tariff class

| Day Class | Tariff | Switching | Pattern |
|-------------|------------------|-----------------|------------------|
| | Tariff Period 1 | Tariff Period 2 | Tariff Period 3 |
| Working day | 00:00 "off-peak" | 08:00 "peak" | 18:00 "off-peak" |
| Holiday | 00:00 "off-peak" | - | - |

The following system management functions are required:

Create/Set/Get/Delete tariffSwitchPattern

8.1.3 Day class management

These functions permit the OS to create, set, get, and delete the day classes employed by the charging calendar table in the NEs. A day class groups together a number of days of the year for which the same tariff switch-over pattern applies e.g. Work days, Weekends and Holidays etc.

Each day of the week (Monday, Tuesday, etc.) shall be assigned by the charging calendar to a particular day class. Each day of the year (date) may also be assigned to a day class. The day class defined for a particular date takes priority over the class defined for the day of the week i.e. each day of the year belongs to one and only one day class.

A day class shall first be explicitly created before it can be referenced by a charging calendar. A separate charging calendar shall be created for each year.

The following system management functions are required:

Create/Set/Get/Delete chargingCalendar
Create/Set/Get/Delete dayClass

8.1.4 Tariff management

These functions permit the OS to create, set, get, and delete the tariffs defined in the NEs. In a GSM environment the tariff information takes the form of charge advice information (CAI) parameters as defined in GSM 02.24 [12].

In addition to the tariffs of the home PLMN, an invariant tariff set shall also be held for each foreign PLMN in order to provide AoC for MTCs to roaming subscribers as defined in GSM 02.24 [12]. This set also includes the e3 scaling factor required to convert the VPLMN units incurred into the units of the roaming subscribers home PLMN as displayed by the MS.

The following system management functions are required:

Create/Set/Get/Delete tariff
Create/Set/Get/Delete roamerTariff

8.1.5 Tariff system management (change control)

This group of functions controls the changes made to a tariff system as a whole rather than to individual entities. A tariff system is defined as a complete and consistent set of the following: tariffs (including roamer tariffs), tariff periods, tariff switching patterns and tariff classes.

Only one tariff system may be "active" at any given time and the entities contained within the active tariff system shall not be modified.

In addition to the active tariff system, there may be a number of additional tariff systems under development. On creation a tariff system shall assume the "available" state and may be extended or modified by employing any of the tariff class, tariff period or tariff administration functions as required.

In order to minimise the amount of effort required to modify an existing tariff system the "tsCopyTariffSystem" action may be used to create a complete copy of the current tariff system. The new (copied) system may then be modified or extended as required.

On completion of the modifications to a tariff system a check may be performed within the NEF in order to ensure that the set of tariffing parameters is consistent. If required, the check shall be invoked by means of the "tsCheck" action. If the check is successful then the tariff system shall assume the "checked" state.

The activation of a tariff system may either be immediate, or scheduled to take place at some future date and time e.g. Midnight on the 1 January. The activation of a tariff system involves a changeover between the current and the new tariff system. A changeover between tariff systems shall be invoked by means of the "tsChangeover" action. On changeover, the old tariff system shall assume the "standby" state. If, for any reason, the new tariff system causes problems then a second changeover may be performed swapping the current and standby tariff systems and thereby restoring the old configuration.

The change-over function may also include authentication parameters to ensure that the OS user is permitted to carry out the desired changes to the tariff system.

If, for any reason, a scheduled changeover is to be prevented, then the "tsCancelChangeover" action shall be employed to remove the scheduled changeover request. Both the currently active tariff system and the next scheduled changeover may be retrieved at any time by means of a "get" on the appropriate attributes.

Modifications and extensions to a tariff system (or the entities contained in it) are only permitted in the "available" state. If, for any reason, a tariff system in the "checked" or "standby" state requires modification then it shall first be explicitly released via the "tsUnfreeze" action.

Any modification in the state of a tariff system shall be reported to the OS by means of the "stateChange" notification.

The following system management functions are required:

| | |
|-----------------------|--|
| Get | tariffAdmin |
| Action | tsChangeover, tsCancelChangeover, tsCopyTariffSystem |
| Notification | stateChange |
| Create/Set/Get/Delete | tariffSystem |
| Action | tsCheck, tsUnfreeze |
| Notification | stateChange |

8.2 Data collection

The data collection management service component employs both the event report function (CCITT X.734 [10]) and log control function (CCITT X.735 [11]). The conceptual model is illustrated in figure 4. The call recording function collects internal telecommunication events within the NEF and formats them into potential call and event records. The record generation control functions determine which of these potential records are actually stored in the local NEF record filestore. The records within the filestore are collected by the OSF via file transfer (FTAM). The record classes of the record generation control function also determine which of the records produced are transmitted to the OSF in the form of event reports.

Similarly, the log control function determines which of the potential records are stored locally as log records. Once stored the log records may be individually accessed by the OSF via the appropriate object management functions. Care should be taken in the selection of filter criteria for the call and event record logs to avoid unnecessary overheads.

Finally, the potential call and event records are also passed to the event forwarding discriminators of the event reporting function. The EFDs determine which of the potential records are transmitted to the OSF in the form of event reports. Whereas the record classes are intended to produce event reports on a semi-permanent basis for day to day operation, the EFDs are intended for short term event reporting and with more complex filter constructs.

Figure 4: Data collection model

8.2.1 Data generation control

The following groups of TMN management functions are provided:

- Record generation control;
- Emergency call notification control;
- Observed IMEI ticket control;
- Log control.

8.2.1.1 Record generation control

These TMN management functions control the generation of call and event records within the record filestore of the NEF. The following groups of functions are provided:

- Record type generation control;
- Supplementary service recording control;
- Partial record generation control.

8.2.1.1.1 Record type generation control

This group of functions permit the network operator to enable/disable the generation of each call/event record type and to specify the conditions under which such records will be generated.

Each type of record to be stored locally within the record filestore shall be contained within one or more record classes. The record class shall define the destination(s) to which the records are to be sent. Each destination may be either a particular type of file within the filestore, or another management application to which the record shall be sent in the form of an event report.

Each record class shall contain one or more record type controls. Each record type control shall include the conditions under which the records of this type are to be generated. The records may be created for home subscriber and/ or visiting subscribers. The records may also be created for unsuccessful and/ or successful transactions.

The following system management functions are required:

Create/Set/Get/Delete recordClass
Create/Set/Get/Delete recordTypeControl

See also supplementary service recording control.

8.2.1.1.2 Partial record generation control

This function controls the generation of partial records. Partial records may be generated for any one of the following reasons:

- expiry of the partial record timer;
- change of basic service during a connection;
- change of location (LAC or Cell Id.) during a connection;
- change of MS classmark during a connection;
- change of AoC parameters during a call;
- change of radio channel (full/ half rate) during a call.
- change of HSCSD parameters during call.

This functions permits both the selection of the above options and the specification of the partial record interval timer for long hold calls. The timer may take any value within the range 0 to 24 hours, where 0 means no partial records will be generated.

The following system management functions are required:

Set/Get callRecordingFunction

8.2.1.1.3 Supplementary service recording control

These functions control the recording of supplementary service actions. There are two basic kinds of supplementary service action, call-related and non-call related.

Non-call related SS-actions may be recorded in SS-action records as defined in Annex B. Call-related SS-actions (usually "invocation") may either be included in the appropriate call record (MOC/ MTC) or recorded in separate SS-action records.

Functions are provided to enable the OS to define the supplementary services to be recorded via the creation of "supplServiceControl" objects. These objects may be defined for both individual services and for groups of services. A separate set of these objects may be contained within each record class object.

Each "supplServiceControl" object shall contain one or more "ssActionControl" objects which define the supplementary service action (registration, erasure, etc.) to be recorded; how the action is to be recorded (in MOC/ MTC records or in SS-action records); and for which class of subscribers the actions are to be recorded (own/ visiting/ all subscribers).

The following system management functions are required:

Create/Set/Get/Delete supplServiceControl
Create/Set/Get/Delete ssActionControl

8.2.1.2 Emergency call notification control

This function permits the OS to enable/ disable the generation of the emergency call notification. It also permits the OS to define the destinations (management application entities) to which the notification is to be sent.

The following system management functions are required:

Set/Get callRecordingFunction

8.2.1.3 Observed IMEI ticket control

This function permits the OS to enable/ disable the generation of observed IMEI tickets. If the generation of these tickets is enabled then they shall be stored in the appropriate file type ("observed IMEI ticket") within the local record filestore.

This function also permits the definition of one or more destinations (management application entities) to which the tickets may be sent in the form of event reports.

The following system management functions are required:

Set/Get callRecordingFunction

8.2.1.4 Log control

This function permits the record notifications described above to be stored and retrieved from logs within the NEF. The logging of these records is performed in accordance with the log control function specified in CCITT X.735 [11] and no additional management functions are required.

8.2.2 Data transfer control

This service component contains the following groups of TMN management functions:

- Event reporting;
- Bulk record transfer;
- Log access.

8.2.2.1 Event reporting

These TMN functions control the generation and transmission of notifications from the NEF to the OSF.

8.2.2.1.1 Event forwarding discriminators

In addition to the notification control functions outlined in subclause 8.2.1, for short-term recording of specific events and for more complicated filter conditions the event forwarding discriminator construct defined in CCITT X.734 [10] and CCITT X.721 [5] shall be employed.

The event forwarding discriminator construct is extremely flexible permitting the combination of a number of fields and logical operations with a wide variety of scheduling options. The EFD also controls the destinations to which the event reports are sent. Several such filters may be defined and scheduled for operation at different times and for different time periods.

The following system management functions are required:

Create/Set/Get/Delete eventForwardingDiscriminator

8.2.2.1.2 Call event record reporting

This function permits the NEF to transmit a call or event record for a particular call attempt or event to the OSF. In general the record shall be sent on completion of the call or event. This function is controlled by means of the management functions described in subclause 8.2.1.1.

The following system management functions are required:

Notification callEventRecordReport

8.2.2.1.3 Emergency call reporting

This function permits the NEF to send a notification to an application entity within the OS whenever an emergency call is made within the network. The notification includes the IMEI (if available), the IMSI (if available) and the identity of

the cell from which the call is made. This notification shall be sent during the emergency call set-up. The generation of this notification is controlled by means of the functions described in subclause 8.2.1.2.

The following system management functions are required:

Notification emergencyCallIndication

8.2.2.1.4 Observed IMEI ticket reporting

This function permits the NEF to send a notification to an application entity within the OS whenever an observed IMEI ticket is generated. The generation of this notification is controlled by means of the functions described in subclause 8.2.1.3.

The following system management functions are required:

Notification observedIMEITicketReport

8.2.2.2 Bulk record transfer

This group of TMN functions is concerned with the bulk transfer of call and event records from the NEF record filestore to the NEF.

The call and event records shall be transferred from the NEF to the OSF by the use of FTAM services. For further details of the use of FTAM see GSM 12.01 [19].

In addition to the simple file transfer services provided by FTAM, peer-to-peer application process communication may be also be supported. The use of CMIS services for the uploading of files from the NEF to the OSF is specified in GSM 12.00 [18].

8.2.2.3 Log access

This TMN function control the access to the log described in subclause 8.2.1.4. Each log defined may contain one or more log entries. Each log entry contains a single call/ event record, emergency call indication report or observed IMEI ticket report.

NOTE: The term log entry has been used instead of the term log record to avoid confusion between the records contained within the local filestore and the records stored within logs.

For further details concerning the use of logs see CCITT X.735 [11].

The following system management functions are required:

Get/Delete callEventLogEntry
 Get/Delete emergencyCallIndicationLogRecord
 Get/Delete observedIEMITicketReportLogEntry

Annex A (Normative): Information model

A.1 Overview

This annex contains the formal description of the information model for the present document. It consists of a simplified Entity-Relationship (ER) model by way of introduction, together with an object model specified in terms of the templates defined in CCITT X.722 [6] "Guidelines for the Definition of Managed Objects".

The ER model consists of the following diagrams:

- tariff administration, the service and distance view;
- tariff administration, the date and time view;
- the call recording view.

These diagrams are intended to be an aid to understanding and, as a result, only the most important entities and relationships are shown. Some of the entities are present to resolve "many-to-many" relationships and are modelled via attributes rather than object classes. Such entities are explicitly marked.

A.1.1 Tariff administration, the service and distance view

Figure A.1 illustrates the most important service and distance relationships.

The "AoC Service" entity represents one or more services combined with a number of additional charging relevant parameters to form a customised service definition for the purpose of advice of charge. If a number of services are charged in the same way then they may be combined into a single "AoC Service" definition.

Each network contains a finite number of charging origins, nominal reference points defining the point of origin of a connection. The allocation of charging origins to cell identities, MSC areas, incoming trunk groups etc. is a network-specific matter and outside the scope of the present document. For the purpose of tariff administration it is sufficient to know the identities of the origins available.

Similarly, the derivation of charging destinations from, for example, the called address or number dialled is outside the scope of the present document. For the purpose of tariff administration it is sufficient to have a definitive list of the destinations available.

The combination of a charging origin with a charging destination provides a nominal measure of the distance factor involved in a connection. It should be noted that both the origin and destination within the "origin/ destination combination" are optional and that either of them may be omitted e.g. international connections may be purely destination dependent.

The combination of one or more such origin/ destination pairs defines a charging zone. The charging zone groups together those pairs belonging to the same distance class, typical examples include "local" and "long distance" zones.

The "Service Distance Dependency" combines an AoC service with a charging zone in order to apply a particular tariff class. Again, the charging zone is optional, if the charging of the service is not distance dependent then the zone is omitted.

Finally, a tariff class groups together those service distance dependencies to which the same tariff switching pattern is applied. The tariff switching pattern (see subclause A.1.2) determines the tariff to be applied at any particular point in time.

Figure A.1: Tariff administration, the service and distance view

A.1.2 Tariff administration, the date and time view

In general, the tariffs to be applied are dependent on a number of time-based factors including day, date and time of day. Figure A.2 illustrates the major entities involved and the relationships between them.

Each tariff class contains a number of tariff switching patterns defining the tariff to be applied over a complete 24 hour period (calendar day). The tariff switching pattern to be applied on a particular day depends on the day class of the day in question. Typical day classes include "weekday", "weekend" and "holiday". Each tariff class contains one, and only one, tariff switching pattern for each day class defined. However, the tariff switching pattern applied to a number of day classes may be the same.

A charging calendar contains a number of both "day" and "date" definitions assigning a day class to days of the week and days of the year respectively. Whereas a day class shall be defined for each day of the week, only those dates explicitly requiring a day class (e.g. holidays) are included in the charging calendar. It should be noted that the "date"

definitions take precedence over the "day" definitions. For the avoidance of doubt, each day of the year belongs to one, and only one, day class.

Each tariff switching pattern contains one or more tariff periods. A tariff period is a continuous period of time during which the same tariff is applied. A tariff period is characterised by a tariff switch-over time and a reference to the tariff to be applied after that time. If the tariff does not vary over the 24 hour period covered by the switching pattern then a single tariff period shall be created with a switch-over time of midnight (00:00).

A tariff system (not shown) is defined as a complete and consistent set of tariff classes, tariff switching patterns and tariffs. There can be only one "active" tariff system at any one point in time and this system may not be altered. Alterations to tariff classes, tariff switch-over patterns and tariffs are prepared in advance by either copying the active tariff system or creating a new one. When the modifications are complete, a changeover between tariff systems may occur.

Figure A.2: Tariff administration, the date and time view

A.1.3 The call recording View

The call recording entities illustrated in figure A.3 control the generation and transfer of call and event records within a particular NE. The network element itself is represented by the managed element object. Each managed element may contain a call recording function. The call recording function represents the management view of the record generation process within the NE.

The generation of call records is controlled by the record class object. A record class defines the records to be produced for a particular purpose and the conditions under which those records are produced. A record class contains one or more record type control objects each of which controls the generation of records of a particular record type.

The record class also contains a number of supplementary service control objects. These objects determine which supplementary services (or groups thereof) are recorded. Each supplementary service control object contains one or more supplementary service action control objects each of which in turn determines whether or not a particular action (registration, invocation, etc.) is recorded.

The record class objects, together with the objects contained within them, define the call record generation control algorithm for normal usage. This includes both the records to be stored in the local NE filestore as well as those that are sent to the OS in the form of event reports. Additional call and event record event report filters may also be defined by employing the standard event forwarding discriminator object class. These filters are more suitable for temporary recording requirements as well as those containing more complicated filter constructs.

The notifications generated by the call recording function and presented to both the record classes and EFDs, may also be logged locally within the NE. Each managed element may contain one or more instances of the log managed object class.

Each log may contain one or more log entries each of which in turn contains a call and event record notification, an emergency call indication report or an observed IMEI ticket report.

Figure A.3: The call recording view

A.2 Naming hierarchy

The naming (containment) tree for the objects defined within the present document is illustrated in Figure A.4 below. It should be noted that all of the GSM 12.05 (the present document) object classes are shown relative to the "managedElement". For further details of the upper layers of the containment tree, including the object classes "managedElement" and "mscFunction" see GSM 12.00 [18]. For further details concerning the log class see CCITT X.721 [5].

Figure A.4: The Naming Tree

A.3 Inheritance

The inheritance tree for the present document is illustrated in Figure A.5 below. Details of the object classes "mscFunction", and "managedElement" are included in GSM 12.00 [18] and therefore not included here.

Similarly, the object classes "log", "logRecord", "eventLogRecord", and "eventForwardingDiscriminator" (not shown here) are defined in CCITT X.721 [5].

Figure A.5: The Inheritance Tree

A.4 Managed object classes

A.4.1 AoC service

This managed object class enables a number of services and additional charging parameters to be grouped together to define a "customised" network service for the purpose of AoC.

The presence of a conditional package within an instance of this object class shall be interpreted as a logical "AND" relationship i.e. if both basic and supplementary services are specified then the service definition only applies if both basic and supplementary services are used.

The SET of values within the attributes of the various packages shall be interpreted as a logical "OR" relationship i.e. the service definition applies if any one of the listed members is used.

Example: If, for the purpose of AoC, the same tariff switching pattern is to be applied to the use of call forwarding in conjunction with all teleservices except for Short Message Services then a single "aocService" object instance may be created with both the "basicServices" and "supplServices" packages instantiated. The list of basic services including all teleservice group codes except for SMS and the list of supplementary services including a single group code for "all call forwarding".

Network specific charging parameters, if required, may be included by defining a sub-class of the "aocService" object and specifying additional conditional packages.

A.4.3 Log (CCITT X.721)

This managed object class is described in CCITT X.735 [11] and defined in CCITT X.721 [5].

A.4.4 Call recording function

This managed object class is employed to control the generation of call and event records within a particular Network Element. Only one instance of this object may be created within any one NE. This class contains notifications that permit the NE to transmit call and event records; emergency call indications; and observed IMEI tickets to the OS. It also controls the generation of partial records.

```

```

A.4.5 Charging calendar

This managed object represents a charging calendar for a particular year. The calendar contains a set of day definitions each of which allocates a day class to a particular day of the week together with a set of date definitions which allocate a day class to a particular day of the year. The date definitions take precedence over the day definitions.

```
chargingCalendar MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;
  CHARACTERIZED BY
    chargingCalendarPackage PACKAGE

  REGISTERED AS {gsm1205ManagedObjectClass 5 };
```

A.4.6 Charging destination

This managed object class defines a logical destination for distance sensitive charging purposes. A charging destination may be associated with one or more address strings (e.g. country codes) but may also be derived from other quantities such as routes, trunk groups etc. As a result, this object may be allocated to/ referenced by a number of configuration management objects. It should however be noted that the administration of such configuration management objects is outside the scope of the present document.

```
chargingDestination MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;

    originDestCombinations GET-REPLACE ADD-REMOVE;;;
REGISTERED AS {gsm1205ManagedObjectClass 8 };
```

A.4.9 Day class

This managed object class defines a day class to be used in the charging calendar. A day class is used to group together days on which the same tariff switch pattern is applied.

```
dayClass MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;
  CHARACTERIZED BY
    dayClassPackage PACKAGE
  ATTRIBUTES
    dayClassId            GET,
    dayClassName          GET-REPLACE;;;
REGISTERED AS {gsm1205ManagedObjectClass 9 };
```

A.4.10 Event forwarding discriminator

The use of event forwarding discriminators (EFDs) is described in detail in CCITT X.734 [10]. The object class itself is a subclass of the "discriminator" object class. Both discriminator and event forwarding discriminator classes are defined in CCITT X.721 [5].

A.4.11 Roamer tariff

The "roamerTariff" object class is a subclass of "tariff" and therefore inherits all of its properties. This object class also contains additional information required for tariffs applied to roaming subscribers e.g. the scaling factor (e3) required to convert VPLMN units to HPLMN units.

NOTE: At present there is only one such tariff per HPLMN. This tariff, depending solely on the HPLMN, is independent of time, service etc. This invariant tariff is defined by the HPLMN but stored in the VPLMN in order to drive the AOC display for MTCs to roaming subscribers. This tariff covers the charges for the re-routing of the call from the HPLMN to the VPLMN. For further details see GSM 02.24 [12].

```
roamerTariff MANAGED OBJECT CLASS
  DERIVED FROM tariff;
  CHARACTERIZED BY

  ATTRIBUTES
    hplmnId GET,
    e3-Scaling-Factor GET-REPLACE;;;
REGISTERED AS {gsm1205ManagedObjectClass 10 };
```

A.4.12 Record class

This managed object class defines a record class. A record class groups together a number of record types recorded for a particular purpose. Examples of possible record classes might include:

- the billing relevant records both stored locally and sent to the OS in the form of event reports;
- customised record classes defined by the network operator.

The managed object instance includes the name of the record class and a list of destinations to which the records are sent and contains one or more objects of the classes "recordTypeControl", "supplServiceControl", and "ssActionControl".

```
recordClass MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;
  CHARACTERIZED BY
    recordClassPackage PACKAGE
  ATTRIBUTES
    recordClassId GET,
    recordClassName GET-REPLACE,
    recordClassDestination GET-REPLACE ADD-REMOVE;;;
REGISTERED AS {gsm1205ManagedObjectClass 11 };
```

A.4.13 Record type control

This managed object class controls the type of call and event records generated. A managed object instance of this class is created for each type of record to be produced. The object instance defines both the type of transaction recorded (successful, unsuccessful, all) and the type of subscribers for whom the records are to be created e.g. home / visiting / all subscribers.

```
recordTypeControl MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;
  CHARACTERIZED BY
    recordTypeControlPackage PACKAGE
  ATTRIBUTES
```

```

        recordType                GET,

    typeOfSubscribers            GET-REPLACE;;;
REGISTERED AS {gsm1205ManagedObjectClass 13 };

```

A.4.15 Supplementary service control

This managed object class controls the recording of the use of supplementary services. A managed object instance of this class shall be created for each supplementary service, or group of supplementary services, to be recorded. Each instance of this object class shall contain one or more objects of the class "ssActionControl" defining which of the possible supplementary service actions are to be recorded.

```

supplServiceControl MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;
  CHARACTERIZED BY
    supplServiceControlPackage PACKAGE
  ATTRIBUTES
    supplServiceCode              GET;;;
REGISTERED AS {gsm1205ManagedObjectClass 14 };

```

A.4.16 Tarif (AoC)

This object represents an on-line GSM (AoC) tariff and contains the so-called "e-parameters" defined in GSM 02.24 [12]. The parameters e1, e2, and e7 determine the time (duration) based charges to be applied; the parameters e5 and e6 determine the data volume based charges and the parameter e4 represents a simple unit increment.

```

tariff MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;

    tariffPackage PACKAGE
  ATTRIBUTES
    tariffId                    GET,
    tariffName                   GET-REPLACE,
    e1-Units-per-Time-Interval   GET-REPLACE,
    e2-Secs-per-Time-Interval    GET-REPLACE,
    e4-Unit-Increment            GET-REPLACE,
    e5-Units-per-Data-Interval   GET-REPLACE,
    e6-Segments-per-Data-Interval GET-REPLACE,
    e7-Initial-Secs-per-Time-Interval GET-REPLACE;;;
REGISTERED AS {gsm1205ManagedObjectClass 15 };

```

A.4.17 Tariff administration

This managed object class contains all of the managed objects required by the tariff administration function. There shall be one, and only one managed object instance of this class in any network element. The "tsActive" attribute points to the currently active "tariffSystem" and the attribute "tsStandby" points to a back-up "tariffSystem" to permit a roll-back to a previous state. Both "tsActive" and "tsStandby" are read-only and may only be changed via the action "tsChangeover".

The action "tsChangeover" updates the attribute "tsActive" with a new tariff system Id. and replaces the value of "tsStandby" with the currently active tariff system Id. The state of the tariff system objects involved is also updated accordingly. This action may be performed immediately or scheduled for later execution.

Once scheduled, the attribute "tsNextChange" contains details of both the change-over time and the change that will take place. A scheduled change-over may be cancelled at any time by means of the action "tsCancelChangeover".

Any change to the contents of the attributes "tsActive"/"tsStandby" shall result in the generation of a "stateChange" notification.

No changes are permitted to the currently active tariff system or the objects contained within it. The action "tsCopyTariffSystem" may be employed to copy the entire contents of the active tariff system, including all of the contained objects, to a new tariff system. The new system may then be modified as required.

```
tariffAdministration MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;
  CHARACTERIZED BY
  tariffAdminPackage PACKAGE
  ATTRIBUTES

    tsNextChange           GET;
  ACTIONS
    tsChangeover,
    tsCancelChangeover,
    tsCopyTariffSystem;
  NOTIFICATIONS
    "Recommendation X.721:1992":stateChange;;
REGISTERED AS {gsm1205ManagedObjectClass 16 };
```

A.4.18 Tariff class

This managed object class represents a tariff class. The tariff class defines a set of service and distance dependencies for which the same tariff switch-over patterns apply.

Each instance of a tariff class shall contain one or more tariff switching pattern objects.

```
tariffClass MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;
  CHARACTERIZED BY
  tariffClassPackage PACKAGE
  ATTRIBUTES
    tariffClassId          GET,
    serviceDistanceDependencies GET-REPLACE ADD-REMOVE;;
REGISTERED AS {gsm1205ManagedObjectClass 17 };
```

A.4.19 Tariff switch pattern

This managed object class defines the tariff switching pattern for a 24 hour period i.e. one calendar day. This pattern is applied to all of the days belonging to particular day classes. The day classes attribute contains the list of day classes to which the tariff pattern is applied.

The tariff periods attribute contains one or more tariff periods defined by their switch-over times and a reference to the tariff to be applied after the switch-over. Each tariff switching pattern contains a minimum of one tariff period with a switch-over time of midnight ("00:00:00"). If the tariff does not change within the 24 hour period covered by the tariff switching pattern then no other tariff period is required.

```
tariffSwitchPattern MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":top;
  CHARACTERIZED BY
    tariffSwitchPatternPackage PACKAGE
      ATTRIBUTES
        tariffSwitchPatternId          GET,
        dayClasses                      GET-REPLACE ADD-REMOVE,
        tariffPeriods                   GET-REPLACE ADD-REMOVE;;;
REGISTERED AS {gsm1205ManagedObjectClass 18 };
```

A.4.20 Tariff System

This managed object class defines a consistent set of tariff entities (tariff classes, tariffs etc.). It also provides the mechanisms required to control the modification of such entities in order to guarantee that the set remains consistent after modification.

The tariff system object class contains a complete set of tariffs, roamer tariffs, and tariff classes. The tariff classes in turn contain the switch-over patterns.

The state of the tariff system is contained within the attribute "tariffSystemStatus". A simplified state transition diagram is illustrated in figure A.6. There shall be one, and only one, "active" tariff system at any one point in time and the objects contained within this tariff system may not be modified whilst it is in the "active" state. There may be a number of tariff systems currently in preparation.

Figure A.6: Tariff system state transition diagram

If supported by the network element, a completed tariff system and its contained objects may be checked for consistency. On receipt of the "tsCheck" action the NEF shall perform a set of standard checks to ensure that the tariff system is both complete and consistent.

Once complete, a tariff system may be activated by means of the "tsChangeover" action (see managed object class "tariffAdmin"). Depending on the activation date and time specified in the action, the tariff system may become active immediately or be placed in the standby state and scheduled for later activation. The "tsChangeover" action may also include a signature (passwords, encryption keys etc.) to authorise the changes to be made. The definition of such security features is outside the scope of the present document.

On activation, a changeover takes place between the currently active tariff system and the new tariff system specified in the "tsChangeover" action. The new tariff system becomes active and the old is placed into the "standby" state. This action also results in the updating of the "tariffAdmin" attributes as described in subclause A.2.3.16. In the event of any problems with the new tariff system a second "tsChangeover" may be issued causing a roll-back to the standby system.

If, for any reason, a "tariffSystem" that has been checked or is awaiting activation requires further modification, then it may be returned to the "available" state by means of the "tsUnfreeze" action.

Any change to the "tariffSystemStatus" shall result in the generation of a "stateChange" notification.

A.4.22 Observed IMEI ticket report log entry

This managed object class is used to store the observed IMEI ticket report notifications as log records. It is a subclass of the "eventLogRecord" class described in CCITT X.735 [11] and defined in CCITT X.721 [5] and therefore inherits all of the properties of both the "logRecord" and "eventLogRecord" classes. This includes the name binding "logRecord-log" defined in X.721.

```
observedIMEITicketReportLogEntry MANAGED OBJECT CLASS
  DERIVED FROM "Recommendation X.721 : 1992":eventLogRecord;
  CHARACTERIZED BY

A.5 Attributes

A.5.1 AoC Service Identity

```
aocServiceId ATTRIBUTE
  WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.SimpleIntegerName;
  MATCHES FOR EQUALITY;
  BEHAVIOUR
    aocServiceIdBehaviour BEHAVIOUR
  DEFINED AS
    "This attribute uniquely identifies an AoC service definition";
REGISTERED AS {gsm1205Attribute 1 };
```

A.5.2 AoC Service Name

```
aocServiceName ATTRIBUTE
  WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.SimpleStringName;
  MATCHES FOR EQUALITY;
  BEHAVIOUR
    aocServiceNameBehaviour BEHAVIOUR
  DEFINED AS
    "This attribute contains the descriptive name of an AoC service
    definition.";
REGISTERED AS {gsm1205Attribute 2 };
```

A.5.3 Basic service

This attribute may be used to define the filter of an event forwarding discriminator.

```
basicService ATTRIBUTE
  WITH ATTRIBUTE SYNTAX MAP-CommonDataTypes.BasicServiceCode;
  MATCHES FOR EQUALITY;
REGISTERED AS {gsm1205Attribute 3 };
```

A.5.4 Basic Services

```
basicServices ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.BasicServices;
    MATCHES FOR EQUALITY, SET-COMPARISON, SET-INTERSECTION;
    BEHAVIOUR
    basicServicesBehaviour BEHAVIOUR
    DEFINED AS
    "This attribute contains a list of GSM basic services.>";
REGISTERED AS {gsm1205Attribute 4 };
```

A.5.5 Calendar year

```
calendarYear ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.SimpleIntegerName;
    MATCHES FOR EQUALITY, ORDERING;
    BEHAVIOUR
    calendarYearBehaviour BEHAVIOUR
    DEFINED AS
    "This attribute contains a calendar year expressed as a four figure
    decimal integer e.g. 1993. This value uniquely identifies a charging
    calendar";
REGISTERED AS {gsm1205Attribute 5 };
```

A.5.6 Call duration

This attribute may be used to define the filter of an event forwarding discriminator.

```
callDuration ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.CallDuration;
    MATCHES FOR EQUALITY, ORDERING;
REGISTERED AS {gsm1205Attribute 6 };
```

A.5.7 Caller ID

This attribute may be used to define the filter of an event forwarding discriminator.

```
callerId ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.IMSIorIMEI;
    MATCHES FOR EQUALITY, ORDERING;
REGISTERED AS {gsm1205Attribute 7 };
```

A.5.8 Call event record content

```
callEventRecordContent ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.CallEventRecord;
    MATCHES FOR EQUALITY, ORDERING;
    BEHAVIOUR
    callEventRecordContentBehaviour BEHAVIOUR
    DEFINED AS
    "This attribute contains the contents of a call or event record.>";
REGISTERED AS {gsm1205Attribute 8 };
```

A.5.9 Call event record type

```
callEventRecordType ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.CallEventRecordType;
    MATCHES FOR EQUALITY, ORDERING;
    BEHAVIOUR
        callEventRecordTypeBehaviour BEHAVIOUR
    DEFINED AS
        "This attribute contains the type of a call or event record.>";
REGISTERED AS {gsm1205Attribute 9 };
```

A.5.10 Call recording function Identity

```
callRecordingFunctionId ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.SimpleIntegerName;
    MATCHES FOR EQUALITY;
    BEHAVIOUR
        callRecordingFunctionIdBehaviour BEHAVIOUR
    DEFINED AS
        "This attribute uniquely identifies the call recording function.>";
REGISTERED AS {gsm1205Attribute 10 };
```

A.5.11 Call reference

This attribute may be used to define the filter of an event forwarding discriminator.

```
callReference ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.CallReference;
    MATCHES FOR EQUALITY, ORDERING;
REGISTERED AS {gsm1205Attribute 11 };
```

A.5.12 Call types

```
callTypes ATTRIBUTE
    WITH ATTRIBUTE SYNTAX GSM1205-DataTypes.CallTypes;
    MATCHES FOR EQUALITY, ORDERING;
    BEHAVIOUR
        callTypesBehaviour BEHAVIOUR
    DEFINED AS

A.10 Application context

The application context name to be used in connection with the management functions described in this document shall take the following object identifier value:

```
{gsm-OM-DomainId gsm-12-05 (5) protocolSupport(1) applicationContext (0) gsm-Management (0)}
```

and the following object description value:

```
"gsm 12.05 management application context".
```

Annex B (Normative): Call and event records

B.1 General

In order to provide the data required for the management activities outlined in the previous chapters (billing, accounting, statistics etc.), the NEF of the MSC and/or Location Registers shall be able to produce an event or call record for each of the following:

- Mobile originated call attempt;
- Mobile originated emergency call attempt;
- Mobile originated, call forwarding attempt;
- Mobile terminated call attempt;
- Roaming call attempt in a gateway MSC;
- Incoming call attempt in a gateway MSC;
- Outgoing call attempt from a gateway MSC;
- Transit call attempt;
- Supplementary service actions;
- HLR interrogation;
- Location updating (HLR & VLR);
- Short message service (point-to-point), mobile originated;
- Short message service (point-to-point), mobile terminated;
- Short message service (point-to-point), mobile originated interworking MSC;
- Short message service (point-to-point), mobile terminated gateway MSC;
- Common equipment usage.

The contents and purpose of each of these records are described in the following subclauses. A detailed formal description of the data defined in the present document is to be found in Annex A.

As not all of these records may be required for any given network, each record type shall be enabled/ disabled by means of the network management functions outlined in 8.2.1.1.

B.1.1 Use of supplementary services

The recording of supplementary service usage is controlled via the procedures outlined in subclause 8.2.1.1.3. These procedures permit the OS to specify the supplementary service actions (invocation, registration etc.) to be recorded.

In addition to specifying the actions to be recorded, the OS may also determine how these events are to be recorded. Non-call related events, such as the administration of supplementary services by the subscriber via the MMI of the MS, shall result in the production of supplementary service action records. Call related events (e.g. invocation of supplementary services) shall be recorded "in-line" in the appropriate call record and/ or in a separate SS-action record depending on the configuration specified by the OS.

Where the use of a supplementary service results in the production of further connections (e.g. call forwarding, multi-party service etc.) additional call records shall be produced to describe the relevant connections. The use of such services is described in more detail both in this subclause and in the example scenarios.

B.1.1.1 Use of call forwarding

When one of the call forwarding services is used, the NEF of the MSC that forwards the call, shall produce the call record for the forwarded part of the call. The call record produced is an MOC record as described in subclause B.2.3.

For further information concerning the recording of call forwarding services see the example scenarios in subclause B.4.6 and B.4.7.

B.1.1.2 Use of call hold and multi-party services

The use of the call hold service shall be recorded either in-line in the appropriate call record or in a separate supplementary service "invocation" record as described above. For the avoidance of doubt, the duration for which the call is held, i.e. is inactive, is not recorded.

The use of the multi-party service requires a minimum of 3 subscribers and the use of a conference circuit. For the purpose of the following description the subscriber invoking the service is referred to as the conference originator ("A") and the conference call is regarded as consisting of a number of individual "legs" between the organiser and the other parties ("B", "C", etc.) in the call.

Normal MOC and MTC call records shall be generated for each party and each leg of the call. In addition, if common equipment records are enabled, a common equipment record shall be produced for the conference originator in order to record the use of a conference bridge and to record the total duration of the conference connection.

Example: Subscriber "C" calls subscriber "A". Subscriber "A" places the call from "C" on hold and makes a second call to subscriber "B". Subscriber "A" then invokes the multi-party service in order to set-up a conference call with "B" and "C".

Assuming that the appropriate types of record are enabled, the following call records shall be produced:

- An MOC record for subscriber "C" and the "C"->"A" leg of the call;
- An MTC record for subscriber "A" and the "C"->"A" leg of the call;
- An MOC record for subscriber "A" and the "A"->"B" leg of the call;
- An SS-Action record for the invocation of the call hold service by subscriber "A";
- An MTC record for subscriber "B" and the "A"->"B" leg of the call;
- An SS-Action record for the invocation of the multi-party service by subscriber "A";
- A common equipment record for the use of the conference bridge by subscriber "A";

Each of the MOC/MTC records for the conference originator ("A") shall include the supplementary service code for the multi-party service.

Any subsequent action affecting only one leg of the connection shall be recorded either in a separate supplementary service action record or in-line in the appropriate call record. Any action affecting the conference as a whole e.g. the originator holding the conference shall be recorded either in a separate supplementary service action record or in the common equipment usage record.

For further information concerning the recording of multi-party services see the example scenario in subclause B.4.9.

B.1.2 Partial records

In order to increase the security of the recording process and to simplify post-processing, it may be desirable to generate a sequence of call records to describe a single connection or transaction.

In case of connections of extended duration, the loss of a single call record may result in an unacceptable loss of revenue. If the connection is, for example, recorded in a number of consecutive partial records generated at say hourly intervals, then the maximum loss of revenue is the equivalent of a one hour continuous connection.

Most modern billing systems employ some form of cumulative credit-limit checking based on the stream of input call records. If however, a call record is only produced at the end of the connection then a subscriber may avoid such credit checking by employing a connection for days, weeks or even months without a single call record being produced.

All of the records defined in the present document are of variable length and some at least are potentially unlimited in size (SET OF, SEQUENCE OF etc.). However, the storage capacity of the internal records within the NEF is normally subject to strict size limitations. Under such conditions a partial record may be required in order to circumvent internal resource limitations. For example, if an internal MOC record can only support the use of four supplementary service invocations then the use of a fifth may result in the generation of a partial record.

Alternatively, for those manufacturers whose systems are based on fixed length records, partial records may be employed instead of the various lists contained within the GSM 12.05 (the present document) definitions. In such cases a partial record will be produced each time one of the key fields alters during the connection.

Finally, in case of radio link failure and subsequent call re-establishment partial records shall be generated to record the duration of the call prior to the radio link failure and the subsequent duration of the call once the call has been re-established. For further details see subclause B.1.5.

To summarise, the following events may result in the generation of a partial record:

- expiry of the partial record timer;
- change of basic service during a connection;
- change of location (LAC or Cell Id.) during a connection;
- change of MS classmark during a connection;
- change of AoC Parameters during a call;
- change of Radio Channel Type (full/half rate) during a call;
- radio link failure and subsequent call re-establishment;
- change of HSCSD Parameters during a call.

All partial records for the same connection shall contain the same call reference and shall be ordered via a running sequence number. The time stamps involved shall apply to the individual partial records rather than the connection as a whole i.e. the "end" time stamp (duration) of one record shall, in general, coincide with the "start" time stamp (answer time) of the next. Each time a new partial record is created the cause for termination of the previous field shall contain the value "partial record ". The cause for termination of the final partial record shall contain the true cause for termination of the connection.

It should be noted that the records produced in case of call re-establishment are not contiguous and that the value of the cause for term field in the record that is closed on radio link failure contains the value "partial record call re-establishment". For further details of these records see subclause B.2.18.

The partial records generated may repeat each of the non-varying fields contained in the original record. Alternatively, a form of reduced partial record may be generated which includes only those fields required to identify the original record together with the field(s) that actually change. An example of a reduced partial record for MOCs is provided in subclause B.2.18.

B.1.3 Use of packet data services

If packet data services are employed in conjunction with a Packet Switched Public Data Network (PSPDN) then an MOC/MTC call record may be produced in the originating/terminating MSC and a gateway record in the gateway/interworking MSC. If the packet volume is not available within the PLMN then this information may also be provided in the form of a call record from the PSPDN. In such cases the OS is responsible for the correlation of the various records describing the connection. The definition of such PSPDN call records is outside the scope of the present document.

B.1.4 Inter-msc handover

In the case of an inter-MSC handover the controlling MSC, as defined by GSM 03.09, remains in control of the connection and shall therefore, produce the call record. For the avoidance of doubt, it is not necessary to produce call or event records in the subsequent MSC(s).

B.1.5 Call re-establishment

In case of radio link failure as described in GSM 04.08 [16], the MS may attempt to re-establish the call using the procedures described in GSM 04.08 [16].

For the time period between the detection of the radio link failure by the mobile station and the successful re-establishment of the call, the advice of charge function in the MS is suspended as described in GSM 04.86. In order to minimise the difference in charges between the on-line calculations performed by the MS and the off-line processing on the basis of the call records, it is necessary to exclude the time taken for the re-establishment phase from the chargeable duration stored in the call records.

If the re-establishment attempt fails then an ordinary call record (MOC/MTC) shall be produced with the cause for termination value "stable call abnormal termination". The chargeable duration stored in this record covers the time period from "Answer" to the detection of the radio link failure by the MSC.

If, the attempt to re-establish the call succeeds then the current call record shall be closed with the cause for termination value "partial record call re-establishment" and a new partial record shall be opened for the re-established call. The chargeable duration stored in the original record is once again the time period from "answer" to detection of the radio link failure by the MSC. Both the "seizure" and "answer" times of the subsequent partial record correspond to the time at which the new traffic channel is allocated for the re-established call (see subclause B.3.12 for further details).

Further radio link failures during the re-established call may result in the generation of additional partial records as described above. All of the partial records belonging to the same connection are identified by the same call reference and a running sequence number as described in subclause

NOTE: As the MS and MSC may detect the radio link failure at different points in time, it is not possible to guarantee that the duration used for the AOC display corresponds to that recorded in the call records. The purpose of the above procedure is merely to minimise any discrepancies that may occur.

B.1.6 Restricted directory numbers

In addition to the information pertaining to the served mobile subscriber (IMSI, MSISDN, etc.), the call records defined in the present document also contain the directory numbers of other parties involved in the recorded connections or transactions. In order to comply with data protection legislation, it is necessary to distinguish between those numbers that may be passed on to third parties and those that needs to be handled confidentially. As a result, each of the number fields (e.g. calling/connected number) contains the presentation and screening information defined in both GSM 04.08 [16] and ISUP signalling. If this information is supported by the network, then even restricted numbers may be included in the appropriate records and suppressed off-line by the administration or billing centre. If this information is not supported then the entire directory number shall be suppressed by the MSC/VLR.

B.2 Record contents

The following tables describe the contents of each of the call and event records defined in the present document. Each table contains the name of the field, a key indicating whether or not the field is mandatory, and a description of the contents.

The key field has the following meaning:

M This field is mandatory and always present. Any exceptions to this rule are explicitly described.

C This field is only available under certain conditions. If available the field is present.

The conditions under which the field is available are individually described.

- This field is optional and configurable either via additional TMN management functions or manufacturer specific means. For the avoidance of doubt, optional does not mean that the parameter is not supported by the network element. Equipment manufacturers shall be capable of providing all of these fields in order to claim conformance with the present document.

B.2.1 Mobile originated call attempt

If the generation of these records is enabled then an MOC record shall be created for each outgoing call attempt made by a mobile station. These MOC records shall be produced in the originating MSC.

Table B.1: MOC record

| Field | | Description |
|---|-------------|---|
| Record Type | M | Mobile originated. |
| Served IMSI | M | IMSI of the calling party. |
| Served IMEI | C | IMEI of the calling ME, if available. |
| Served MSISDN | O | The primary MSISDN of the calling party. |
| Called Number | M | The address of the called party e.g. the number dialled by the calling sub. |
| Translated Number | O | The called number after digit translation within the MSC (if applicable) |
| Connected Number | O | The number of the connected party if different to the Called Number |
| Roaming Number | O | The Mobile Station Roaming Number employed to route this connection, if applicable. |
| Recording Entity | M | The E.164 number of the visited MSC producing the record. |
| Incoming TKGP | O | The MSC trunk group on which the call originated , usually from the BSS |
| Outgoing TKGP | O | The trunk group on which the call left the MSC |
| Location | M | The identity of the cell in which the call originated including the location area code. |
| Change of Location | O | A list of changes in Location Area Code / Cell Id. each time-stamped. |
| Basic service | M | Bearer or teleservice employed. |
| Transparency Indicator | C | Only provided for those teleservices which may be employed in both transparent and non-transparent mode. |
| ChangeOfService | O | A list of changes of basic service during a connection each time-stamped. |
| Supp. Services | C | Supplementary services invoked as a result of this connection. |
| AOC Parameters | O | The charge advice parameters sent to the MS on call set-up |
| Change of AOC Parm | O | New AOC parameters sent to the MS e.g. as a result of a tariff switch over, including the time at which the new set was applied. |
| MS Classmark | M | The mobile station classmark employed on call set-up. |
| Change of Classmark | O | A list of changes to the classmark during the connection each time-stamped |
| Event time stamps: | C C O | Seizure of incoming traffic channel (for unsuccessful call attempts) Answer (for successful calls) Release of traffic channel |
| Call duration | M | The chargeable duration of the connection for successful calls, the holding time for call attempts. |
| Radio Chan. Requested | O | The type of radio traffic channel (full / half etc.) requested by the MS. |
| Radio Chan. Used | M | The type of radio channel actually used (full or half rate). |
| Change of Rad. Chan. | O | A list of changes each time stamped |
| Cause for termination | M | The reason for the release of the connection. |
| Diagnostics | O | A more detailed reason for the release of the connection. |
| Data volume | C | The number of data segments transmitted if available at the MSC |
| Sequence no. | C | Partial record sequence number, only present in case of partial records. |
| Call reference | M | A local identifier distinguishing between transactions on the same MS |
| Additional Chg. Info | O | Charge/no charge indicator and additional charging parameters |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |
| gsmSCF address | C | Identifies the CAMEL server serving the subscriber. |
| Service key | C | The CAMEL service logic to be applied. |
| Network call reference | C | An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied. |
| MSC Address | C | This field contains the E.164 number assigned to the MSC that generated the network call reference. |
| Default call handling | O | Indicates whether or not a CAMEL call encountered default call handling. |
| <u>Number of HSCSD Channels Requested</u> | <u>O</u> | <u>The maximum number of HSCSD channels requested as received from the MS at call set-up</u> |
| <u>Number of HSCSD Channels Allocated</u> | <u>O</u> | <u>The number of HSCSD channels allocated to the MS at call set-up</u> |
| <u>Change of HSCSD Parameters</u> | <u>O</u> | <u>A list of network or user initiated changes of number of HSCSD channels during a connection each timestamped</u> |

B.2.2 Mobile originated emergency call attempt

If the generation of MOC records is enabled then an MOC emergency record shall be created for each outgoing emergency call attempt made by a mobile station. These records shall be produced in the originating MSC.

Table B.2: MOC emergency record

| Field | | Description |
|-----------------------|-------------|---|
| Record Type | M | Mobile originated. |
| Served IMSI | C | IMSI of the calling party in case of an emergency call with a SIM card. |
| Served IMEI | C | IMEI of the calling mobile equipment if available. |
| Served MSISDN | O | The primary MSISDN of the calling party. |
| Translated Number | O | The called number after digit translation within the MSC (if applicable) |
| Recording Entity | M | The E.164 number of the visited MSC producing the record. |
| Incoming TKGP | O | The MSC trunk group on which the call originated, usually from the BSS |
| Outgoing TKGP | O | The trunk group on which the call left the MSC |
| Location | M | The identity of the cell in which the call originated including the location area code. |
| Change of Location | O | A list of changes in Location Area Code / Cell Id. each time-stamped. |
| Basic service | M | Teleservice 'emergency call'. |
| AOC Parameters | O | The charge advice parameters sent to the MS on call set-up |
| Change of AOC Parms | O | New AOC parameters sent to the MS e.g. as a result of a tariff switch over, including the time at which the new set was applied. |
| MS Classmark | M | The mobile station classmark employed on call set-up. |
| Change of classmark | O | A list of changes to the classmark during the connection each time-stamped |
| Event time stamps: | C C O | Seizure of incoming traffic channel (for unsuccessful call attempts) Answer (for successful calls) Release of traffic channel |
| Call duration | M | The chargeable duration of the connection for successful calls, the holding time for call attempts. |
| Radio Chan. Requested | O | The type of radio traffic channel (full / half etc.) requested by the MS. |
| Radio Chan. Used | M | The type of radio channel used (full or half rate). |
| Change of Rad. Chan. | O | A list of changes each time stamped |
| Cause for termination | M | The reason for the release of the connection. |
| Diagnostics | O | A more detailed reason for the release of the connection. |
| Sequence no. | C | Partial record sequence number, only present in case of partial records. |
| Call reference | M | A local identifier distinguishing between transactions on the same MS |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.3 Mobile originated call forwarding attempt

If the generation of MOC records is enabled then, In case of call forwarding, the forwarded-leg of the call shall also result in the production of an MOC record in the MSC that forwards the call (see the example scenarios in subclause B.4.6 and B.4.7).

Table B.3: MOC, call forwarding record

| Field | | Description |
|------------------------------|---|---|
| Record Type | M | Mobile originated. |
| Served IMSI | M | IMSI of the calling party. |
| Served MSISDN | O | The MSISDN of the forwarding party. |
| Calling Number | O | The address of the calling party. |
| Called Number | M | The address of the "forwarded-to" party. |
| Translated Number | O | The called number after digit translation within the MSC (if applicable) |
| Connected Number | O | The number of the connected party if different to the Called Number |
| Roaming Number | O | The Mobile Station Roaming Number employed to route this connection, if applicable. |
| Recording Entity | M | The E.164 number of the forwarding MSC |
| Incoming TKGP | O | The MSC trunk group on which the call originated at the forwarding MSC. |
| Outgoing TKGP | O | The trunk group on which the call left the forwarding MSC |
| Basic service | C | Bearer or teleservice employed, not always available e.g. in case of call forwarding unconditional. |
| Transparency Indicator | C | Only provided for those teleservices which may be employed in both transparent and non-transparent mode. |
| ChangeOfService | O | A list of changes of basic service during a connection each time-stamped. |
| Supp. Services | C | Supplementary services invoked as a result of this connection. |
| Event time stamps: | C | Seizure of incoming traffic channel (for unsuccessful call attempts) |
| | C | Answer (for successful calls) |
| | O | Release of traffic channel |
| Call duration | M | The chargeable duration of the connection for successful calls, the holding time of call attempts. |
| Cause for termination | M | The reason for the release of the connection. |
| Diagnostics | O | A more detailed reason for the release of the connection. |
| Data volume | C | The number of data segments transmitted if available at the MSC |
| Sequence no. | C | Partial record sequence number, only present in case of partial records. |
| Call reference | M | A local identifier distinguishing between transactions on the same MS |
| Additional Chg. Info | O | Charge/no charge indicator and additional charging parameters |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |
| gsmSCF address | C | Identifies the CAMEL server serving the subscriber. |
| Service key | C | The CAMEL service logic to be applied. |
| Network call reference | C | An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied. |
| MSC Address | C | This field contains the E.164 number assigned to the MSC that generated the network call reference. |
| CAMEL initiated CF indicator | C | Indicates that the CAMEL server initiated call forwarding. |
| Default call handling | C | Indicates whether or not a CAMEL call encountered default call handling. |

B.2.4 Mobile terminated call attempt

If the generation of these records is enabled, then an MTC record shall be created for each incoming call attempt made for a mobile station. The MTC records shall be produced in the terminating MSC.

Table B.4: MTC record

| Field | | Description |
|---|-------------|---|
| Record Type | M | Mobile Terminated. |
| Served IMSI | M | IMSI of the called party. |
| Served IMEI | O | IMEI of the called ME. |
| Served MSISDN | O | The MSISDN of the called party. |
| Calling Number | C | The number of the calling party if available. |
| Connected Number | O | Only relevant in case of call forwarding where the "forwarded-to" number is recorded. |
| Recording Entity | M | The E.164 number of the visited (terminating) MSC |
| Incoming TKGP | O | The MSC trunk group on which the call originated. |
| Outgoing TKGP | O | The trunk group on which the call left the MSC, usually to the BSS |
| Location | C | The identity of the cell occupied by the called party when the call was set up including the location area code. |
| Change of Location | O | A list of changes in Location Area Code / Cell Id. each time-stamped. |
| Basic Service | M | Bearer or teleservice employed |
| Transparency Indicator | C | Only provided for those teleservices which may be employed in both transparent and non-transparent mode. |
| Change of Service | O | A list of changes of basic service during a connection each time-stamped. |
| Supp. services | C | Supplementary services invoked as a result of this connection. |
| AOC Parameters | O | The charge advice parameters sent to the MS on call set-up |
| Change of AOC Parms. | O | New AOC parameters sent to the MS e.g. as a result of a tariff switch-over, including the time at which the new set was applied. |
| MS Classmark | M | The mobile station class mark |
| Change of Classmark | O | A list of changes to the classmark during the connection each time-stamped |
| Event time stamps: | C C O | Seizure of traffic channel for unsuccessful call attempts Answer time for successful calls Release of traffic channel |
| Call duration | M | The chargeable duration of the connection if successful, the holding time of the call if unsuccessful. |
| Radio Chan. Requested | O | The type of radio traffic channel (full / half etc.) requested by the MS. |
| Radio Chan. Used | M | The type of radio channel used (full or half rate). |
| Change of Rad. Chan | O | A list of changes each time stamped |
| Cause for term. | M | The reason for the release of the call. |
| Diagnostics | O | A more detailed reason for the release of the connection. |
| Data volume | C | The number of data segments transmitted, if available at the MSC |
| Sequence no. | C | Partial record sequence number, only present in case of partial records. |
| Call reference | M | A local identifier distinguishing between transactions at the same MS |
| Additional Chg. Info | O | Charge/no charge indicator and additional charging parameters |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |
| Network call reference | C | An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied. |
| MSC Address | C | This field contains the E.164 number assigned to the MSC that generated the network call reference. |
| <u>Number of HSCSD Channels Requested</u> | <u>O</u> | <u>The maximum number of HSCSD channels requested as received from the MS at call set-up</u> |
| <u>Number of HSCSD Channels Allocated</u> | <u>O</u> | <u>The number of HSCSD channels allocated to the MS at call set-up</u> |
| <u>Change of HSCSD Parameters</u> | <u>O</u> | <u>A list of network or user initiated changes of number of HSCSD channels during a connection each timestamped</u> |

B.2.5 Roaming call attempt

If the generation of these records is enabled then, a roaming record shall be created for each call redirected to a mobile subscriber roaming outside the HPLMN. These roaming records shall be produced in the GMSC.

Table B.5: Roaming record

| Field | | Description |
|------------------------|-------------|---|
| Record Type | M | Roaming record. |
| Served IMSI | M | IMSI of the called (roaming) party. |
| Served MSISDN | O | The MSISDN of the called (roaming) party. |
| Calling Number | C | The address of the calling party, if available. |
| Roaming Number | M | The Mobile Station Roaming Number employed to route this connection. |
| Recording Entity | M | The E.164 number of the GMSC |
| Incoming TKGP | O | The GMSC trunk group on which the call originated. |
| Outgoing TKGP | O | The trunk group on which the call left the GMSC |
| Basic service | M | Bearer or teleservice employed. |
| Transparency Indicator | C | Only provided for those teleservices which may be employed in both transparent and non-transparent mode. |
| ChangeOfService | O | A list of changes of basic service during a connection each time-stamped. |
| Supp. Services | C | Supplementary services invoked as a result of this connection. |
| Event time stamps: | C C O | Seizure of incoming traffic channel (for unsuccessful call attempts) Answer (for successful calls) Release of traffic channel |
| Call duration | M | The chargeable duration of the connection for successful calls, the holding time of call attempts. |
| Cause for termination | M | The reason for the release of the connection. |
| Diagnostics | O | A more detailed reason for the release of the connection. |
| Data volume | C | The number of data segments transmitted if available at the GMSC |
| Sequence no. | C | Partial record sequence number, only present in case of partial records. |
| Call reference | M | A local identifier distinguishing between transactions on the same MS |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |
| Network call reference | C | An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied. |
| MSC Address | C | This field contains the E.164 number assigned to the MSC that generated the network call reference. |

B.2.6 Incoming gateway call attempt

If generation of these records is enabled, an incoming gateway record shall be created for each incoming call attempt received by a gateway MSC from another network. These records, produced in the gateway MSC, may be used to settle accounts with other networks. The generation of gateway records shall not be influenced by the production of MTC records i.e. even if the GMSC and terminating MSC are co-located a gateway record shall still be produced.

Table B.6: Incoming gateway record

| Field | | Description |
|--------------------|-------------|--|
| Record Type | M | Incoming gateway record |
| Calling Number | C | The number of the calling party if available at this node. |
| Called Number | M | The address of the called party as seen by the GMSC. This is the number employed by the GMSC for routing. |
| Recording Entity | M | The E.164 number of the GMSC |
| Incoming TKGP | M | The incoming GMSC trunk group on which the call originated. |
| Outgoing TKGP | O | The trunk group on which the call left the GMSC. |
| Event time stamps: | M C O | Seizure of incoming trunk Answer (successful calls only) Release of incoming trunk |
| Call duration | M | The accountable duration (answer -> release of incoming trunk) of the connection if successful, the call holding time of the incoming trunk for call attempts. |
| Data Volume | C | If applicable and known at the GMSC |
| Cause for term. | M | The reason for the release of the connection. |
| Diagnostics | O | A more detailed reason for the release of the connection. |
| Sequence no. | C | Partial record sequence number, if applicable. |
| Call Reference | M | A local identifier distinguishing between transactions. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.7 Outgoing gateway call attempt

If generation of these records is enabled, an outgoing gateway record shall be created for each outgoing call attempt from a gateway MSC to another network. These records, produced in the gateway MSC, may be used to settle accounts with other networks. The generation of gateway records shall not be influenced by the production of MOC records i.e. even if the GMSC and originating MSC are co-located a gateway record shall still be produced.

Table B.7: Outgoing gateway record

| Field | | Description |
|--------------------|-------------|--|
| Record Type | M | Outgoing gateway record |
| Calling Number | C | The number of the calling party if available at this node. |
| Called Number | M | The address of the called party as seen by the GMSC. This is the number employed by the GMSC for routing. |
| Recording Entity | M | The E.164 number of the GMSC |
| Incoming TKGP | O | The incoming GMSC trunk group on which the call originated. |
| Outgoing TKGP | M | The trunk group on which the call left the GMSC. |
| Event time stamps: | M C O | Seizure of outgoing trunk Answer (successful calls only) Release of outgoing trunk |
| Call duration | M | The accountable duration (answer -> release of outgoing trunk) of the connection if successful, the call holding time of the outgoing trunk for call attempts. |
| Data Volume | C | If applicable and known at the GMSC |
| Cause for term. | M | The reason for the release of the connection. |
| Diagnostics | O | A more detailed reason for the release of the connection. |
| Sequence no. | C | Partial record sequence number, if applicable. |
| Call Reference | M | A local identifier distinguishing between transactions. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.8 Transit call attempt

If generation of these records is enabled then a transit record may be generated for each incoming call attempt received by a Transit MSC i.e. neither originating nor terminating. For the avoidance of doubt, a transit record shall only be produced if no MOC or MTC record is produced for this call attempt. The transit records, produced in the TMSC, may be used to record traffic from particular origins or to particular destinations (see also the example scenario in subclause B.4.5).

Table B.8: Transit record

| Field | | Description |
|--------------------|-------------|--|
| Record Type | M | Transit. |
| Calling Number | C | The number of the calling party if available at this node. |
| Called Number | M | The address of the called party as seen by the TMSC. |
| ISDN Basic Service | O | The ISDN basic service employed |
| Recording Entity | M | The E.164 number of the transit MSC |
| Incoming TKGP | M | The TMSC trunk group on which the call originated. |
| Outgoing TKGP | M | The trunk group on which the call left the TMSC. |
| Event time stamps: | C C O | Seizure of incoming trunk for unsuccessful call attempts Answer (successful calls only) Release of traffic channel |
| Call duration | M | The chargeable duration of the connection if successful, the call holding time for call attempts. |
| Data Volume | C | If applicable and known at the transit MSC |
| Cause for term. | M | The reason for the release of the connection. |
| Diagnostics | O | A more detailed reason for the release of the connection. |
| Sequence no. | C | Partial record sequence number, if applicable. |
| Call Reference | M | A local identifier distinguishing between transactions. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.9 Supplementary service actions

A supplementary service record may be produced in the NEF of the appropriate MSC or HLR for each supplementary service action (activation, deactivation, invocation etc.) performed or initiated by the subscriber.

There are two basic types of SS-actions:

- Call related i.e. as a result of a connection e.g. Invocation of CLIP / CLIR / AOC etc.
- Non-call related i.e. as a result of subscriber controlled input (SCI) e.g. Registration of call forwarding

Each supplementary service action shall be performed on one or more basic service groups. If the action applies to all tele and all bearer services (i.e. to all basic services) then the basic services field shall be omitted.

SCI actions may be recorded in individual SS-action records. Call related actions may be recorded in either the appropriate call record (MOC/MTC) or in separate SS-action records. For further details concerning the generation of supplementary service records see subclause 8.2.1.1.3.

Additional non-standard supplementary service actions may be made available within some networks in the form of Unstructured Supplementary Service Data (USSD). These actions may also be recorded in SS-action records. However, as these actions are non-standard they may not include an appropriate action type, supplementary service code or basic service code.

Table B.9: SS-action record

| Field | | Description |
|----------------------|---|--|
| Record Type | M | Supplementary service action. |
| Served IMSI | M | The IMSI of the MS performing the action. |
| Served IMEI | O | The IMEI of the ME performing the action. |
| Served MSISDN | O | The primary MSISDN of the party performing the action. |
| MS Classmark | M | The mobile station classmark. |
| Recording Entity | M | The E.164 number of the visited MSC / HLR. |
| Location | O | The Location Area Code and Cell Identity from which the request originated. |
| Supp. Service | C | The supplementary service or group of supplementary services for which the request was made. May not be available in case of USSD. |
| Basic Services | C | The basic service group(s) to which the supplementary service applies. This field is not provided if the action applies to all basic services. |
| SS Action | C | Activation, deactivation, interrogation etc. May not be available in case of USSD. |
| SS Action time stamp | M | The time at which the action was requested. |
| SS Parameters | C | Service dependent parameters or unstructured suppl. service data. |
| SS Action Result | C | Result of the requested transaction if unsuccessful. |
| Call Reference | M | A local identifier distinguishing between transactions at the same MS. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.10 HLR interrogation

If enabled, a HLR interrogation record shall be created for each interrogation performed for a mobile subscriber. These records may be produced in either the HLR itself or the interrogating MSC.

Table B.10: HLR-int. record

| Field | | Description |
|----------------------|---|--|
| Record Type | M | HLR interrogation. |
| Served IMSI | C | The IMSI of the party being interrogated, if successful |
| Served MSISDN | M | The MSISDN of the subscriber being interrogated. |
| Recording Entity | M | The E.164 Number of the HLR / MSC. |
| Routing Number | C | Routing number (MSRN, forwarding no.) provided by the HLR if the interrogation was successful. |
| Basic Service | O | Only for teleservice 21 (SMS-MT). |
| Int. time stamp | M | Time at which the interrogation was invoked. |
| Number of Forwarding | C | The number of times the call has been forwarded if provided by ISUP. |
| Interrogation Result | C | The result of the interrogation request if unsuccessful. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.11 Location update (VLR)

If enabled, a VLR location update record shall be produced in the (new) VLR for each location registration or location update received by the VLR for a mobile subscriber.

Table B.11: Loc.-upd. (VLR) record

| Field | | Description |
|-------------------|-------------|--|
| Record Type | M | Location update. |
| Served IMSI | M | IMSI of the served MS. |
| Served MSISDN | O | The primary MSISDN of the party performing the location update |
| Recording Entity | M | The E.164 number of the entity (VLR or MSC/VLR) generating the record. |
| Old location | C C | Not present for registration: VMSC Number Location Area Code |
| New location | M M O | VMSC Number Location Area Code Cell Identification |
| MS Classmark | M | The mobile station classmark |
| Update time stamp | M | Time at which the update was invoked. |
| Update Result | C | The result of the location update if unsuccessful. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.12 Location update (HLR)

If enabled, an HLR location update record shall be produced in the HLR for each location registration or location update received by the HLR for a mobile subscriber including location updates received from subscribers roaming in foreign PLMNs.

Table B.12: Loc.-Upd. (HLR) record

| Field | | Description |
|-------------------|---|---|
| Record Type | M | Location update. |
| Served IMSI | M | IMSI of the served MS. |
| Recording Entity | M | The E.164 Number of the HLR. |
| Old location | O | VMSC Number VLR Number |
| New location | M | VMSC Number VLR Number |
| Update time stamp | M | Time at which the update was invoked. |
| Update Result | C | The result of the location update if unsuccessful. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.13 Short message service, mobile originated

If enabled, an SMS-MO record shall be produced, within the originating MSC, for each short message sent by a mobile subscriber.

Table B.13: SMS-MO record

| Field | | Description |
|-------------------|---|---|
| Record Type | M | SMS-Mobile originated. |
| Served IMSI | M | The IMSI of the subscriber sending the short message. |
| Served IMEI | O | The IMEI of the ME sending the message, if available. |
| Served MSISDN | O | The primary MSISDN of the subscriber sending the message. |
| MS Classmark | M | The mobile station classmark. |
| Service Centre | M | The address (E.164) of the SMS-service centre. |
| Recording Entity | M | The E.164 number of the visited MSC |
| Location | O | The Location Area Code and Cell Identity from which the message originated. |
| Event Time stamp | M | The time at which the message was received by the MSC from the subscriber. |
| Message Reference | M | A reference, provided by the MS uniquely identifying this message. |
| SMS Result | C | The result of the attempted delivery if unsuccessful. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.14 Short message service, mobile terminated

If enabled, an SMS-MT record shall be produced, within the terminating MSC, for each short message received by a mobile subscriber.

Table B.14: SMS-MT record

| Field | | Description |
|-------------------|---|--|
| Record Type | M | SMS-Mobile Terminated. |
| Service Centre | M | The E.164 address of the SMS service centre. |
| Served IMSI | M | The IMSI of the receiving party. |
| Served IMEI | O | The IMEI of the receiving party, if available. |
| Served MSISDN | O | The MSISDN of the receiving party. |
| MS Classmark | M | The mobile station classmark. |
| Recording Entity | M | The E.164 number of the visited MSC. |
| Location | O | The Location Area Code and Cell Identity to which the message was delivered. |
| Event time stamp | M | Delivery time stamp, time at which message was sent to the MS by the MSC. |
| SMS Result | C | The result of the attempted delivery if unsuccessful. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.15 SMS-MO interworking record

If enabled, an SMS-MO interworking record shall be produced, within the interworking MSC, for each short message generated by a mobile subscriber. These records may be used to settle accounts between PLMNs and SMS service centres.

Table B.15: SMS-MO interworking record

| Field | | Description |
|-------------------|---|--|
| Record Type | M | SMS-MO interworking record. |
| Service Centre | M | The E.164 address of the SMS service centre. |
| Served IMSI | M | The IMSI of the sending party. |
| Recording Entity | M | The E.164 number of the visited MSC. |
| Time stamp | M | The time at which the message was received by the interworking function. |
| SMS Result | C | The result of the attempted delivery if unsuccessful. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.16 SMS-MT gateway record

If enabled, an SMS-MT gateway record shall be produced, within the gateway MSC, for each short message sent to a mobile subscriber.

Table B.16: SMS-MT gateway record

| Field | | Description |
|-------------------|---|---|
| Record Type | M | SMS-MT gateway record. |
| Service Centre | M | The E.164 address of the SMS service centre. |
| Served IMSI | M | The IMSI of the receiving party. |
| Served MSISDN | O | The MSISDN of the receiving party. |
| Recording Entity | M | The E.164 number of the visited MSC. |
| Time stamp | M | The time at which the message was received by the gateway. |
| SMS Result | C | The result of the attempted delivery if unsuccessful. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.17 Common equipment usage record

If enabled, a common equipment usage record shall be created in the VMSC to record the usage (duration) of common equipment, e.g. conference circuits, employed by a mobile subscriber. For further details see the example scenario in subclause B.4.9.

Table B.17: Common equipment usage record

| Field | | Description |
|-------------------|--------|--|
| Record Type | M | Common equipment usage record. |
| Equipment type | M | e.g. Conference circuit. |
| Equipment Id. | C | The local id. of the equipment employed. |
| Served IMSI | M | The IMSI of the party responsible for the seizure of the equipment.. |
| Served MSISDN | O | The primary MSISDN of the served party.. |
| Recording Entity | M | The E.164 number of the MSC in which the equipment is located. |
| Basic service | C | Bearer or teleservice employed, if appropriate. |
| ChangeOfService | O | A list of changes of basic service during a connection each time-stamped. |
| Supp. Services | C | Supplementary services invoked in connection with this equipment. |
| Event Time Stamp | M O | Seizure time: the time at which the equipment was seized. Release time: the time at which the equipment was released. |
| Call Duration | M | The total duration of the usage of the equipment. |
| Call Reference | M | A local identifier distinguishing between transactions. |
| Sequence no. | C | Partial record sequence number if applicable. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.18 Reduced partial records

In order to minimise the amount of data transferred, the contents of partial record may be reduced to those fields required to uniquely identify the connection and those fields that actually change. Table B.18 contains an example of such a record for a mobile originated call attempt. Reduced partial records may be generated for any of the relevant call records.

Table B.18: Reduced partial (MOC) record

| Field | | Description |
|-----------------------|---|--|
| Record Type | M | Mobile originated. |
| Served IMSI | C | IMSI of the calling party, if available |
| Called Number | C | If available. |
| Recording Entity | M | The E.164 number of the visited MSC producing the record. |
| Change of Location | C | A list of changes in Location Area Code / Cell Id. each time-stamped. |
| ChangeOfService | C | A list of changes of basic service during a connection each time-stamped. |
| Change of AOC Params | C | New AOC parameters sent to the MS e.g. as a result of a tariff switch over, including the time at which the new set was applied. |
| Change of Classmark | C | A list of changes to the classmark during the connection each time-stamped |
| Event time stamps: | M | Answer time, start of this partial record. |
| Call duration | M | The chargeable duration of this partial record. |
| Change of Rad. Chan. | C | A list of changes each time stamped |
| Cause for termination | M | The reason for the release of the connection. |
| Diagnostics | O | Only relevant for the last record in the sequence. |
| Data volume | C | The number of data segments transmitted during this partial output |
| Sequence no. | M | Partial record sequence number, only present in case of partial records. |
| Call reference | M | A local identifier distinguishing between transactions on the same MS |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.2.19 Terminating CAMEL interrogation record

If enabled, a terminating CAMEL interrogation record shall be generated for each gsmSCF invocation with an active T-CSI. This record may be produced in the GMSC.

Table B.19: Terminating CAMEL interrogation record

| | | |
|--------------------------|---|---|
| Record Type | M | Terminating CAMEL interrogation. |
| Served IMSI | M | IMSI of the called party |
| Served MSISDN | O | The MSISDN of the called party. |
| Recording Entity | M | The E.164 number of the GMSC. |
| Int. time stamp | M | Time at which the interrogation was invoked. |
| CAMEL Destination Number | M | The number available for routing after the CAMEL server enquiry. |
| gsmSCF Address | M | The CAMEL server serving the subscriber. |
| Service key | M | The CAMEL service logic to be applied. |
| Network call reference | C | An identifier to correlate transactions on the same call taking place in different network nodes, shall be present if CAMEL is applied. |
| MSC Address | C | This field contains the E.164 number assigned to the MSC that generated the network call reference. |
| Default call handling | M | Indicates whether or not a CAMEL call encountered default call handling. |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

B.3 Description of record fields

This subclause contains a brief description of each field of the call and event records described in the previous subclause.

B.3.1 Additional Charging Information

This field consists of two parts, a charge indicator and additional charging parameters. The charge indicator is derived from the information contained within the ISUP "backward call indicator" and may be used to store a charge indicator (charge/no charge) received from another network node. The additional charging parameters are non-standard and intended to permit the inclusion of further charging information received from Intelligent Network and/or Value Added Service nodes.

B.3.2 AoC parameters / change of AoC parameters

The AoC parameter field contains the set of charge advice (AoC) parameters sent to the MS on call set-up. If further sets of parameters are sent during the call, as a result of a tariff switch-over for example, then this may be recorded in the Change of AoC Parameter field including the time at which the change occurred.

It should be noted that the Change of AoC Params. field is optional and not required if partial records are generated on tariff switch-over.

The AoC parameters are defined in GSM 02.24 [12].

B.3.3 Basic Service / change of service / ISDN Basic Service

The basic service field contains the code of the basic service employed on call set-up. Any alteration to the basic service during the connection may be recorded in the change of service field including the time at which the change took place.

The change of service field is optional and may be omitted if partial records are created whenever the basic service is changed.

The coding of basic services is defined in detail in GSM 09.02 [17].

In the case of the transit record the GSM basic service employed is generally not available. However, if the device on which the call originates/terminates is connected via ISDN digital subscriber signalling then the appropriate ISDN basic service code may be recorded in the record. One possible example includes the direct connection of an ISDN PABX to an MSC/VLR.

B.3.4 Call duration

This field contains the relevant call duration in seconds. For incomplete calls (call attempts) the relevant duration is the call holding time from the seizure to the release of the traffic channel. For complete (answered) calls this is the chargeable duration from answer to release of the traffic channel. For partial records this is the duration of the individual partial record and not the cumulative duration of the call.

It should be noted that the time stamps may be expressed in terms of tenths of seconds or even milliseconds and, as a result, the calculation of the call duration may result in the rounding or truncation of the measured duration to a whole number of seconds.

Whether or not rounding or truncation is to be used is considered to be outside the scope of the present document subject to the following restrictions:

- 1) A call duration of zero seconds shall not be accepted.
- 2) The same method of truncation/rounding shall be applied to both single and partial records.

B.3.5 Call reference

This field uniquely identifies a call or transaction on one side of the interface (i.e. 'A' or 'B' side) and is derived from the transaction identifier of GSM 04.08 [16]. It is also used to identify all partial records and transactions belonging to the same connection.

For the avoidance of doubt, there is **no** global call reference defined within GSM and the call reference field **cannot** be used to combine, for example, the MOC and MTC records of a mobile-to-mobile connection.

B.3.5.1 Network call reference

Whenever CAMEL is applied, this field is used for correlation of call records outputted from the originating MSC (when applicable), the GMSC and the terminating MSC, and a network optional call record from the gsmSCF.

B.3.6 Calling / called / connected / translated number

In general a CCITT E.164 [2] number but may also include other numbering plans e.g. X.121. Each of these fields includes the type of number and number plan as specified in detail in GSM 04.08 [16]. Where appropriate, these fields may also contain the presentation and screening information also specified in GSM 04.08 [16].

The called number is the number received from the mobile station on mobile originated call set-up as defined in GSM 04.08 [16]. Similarly, the calling number is the number received from the network on mobile terminated call set-up. In case of CAMEL initiated CF, the called (forwarded-to) number is returned by CAMEL.

The translated number is the result of any digit translation performed by the MSC on the called number received from the mobile station on mobile originated call set-up.

The connected number is the number of the actual party reached as defined in GSM 04.08 [16]. Although this is normally identical to the called number it may differ.

The following examples are intended to explain the use of these fields:

- Example 1: Called Number = Connected Number
 Normal call from a mobile subscriber to a mobile subscriber or to a PSTN subscriber.
- Example 2: Called Number != Connected Number

In case of routing to a PABX with Automatic Call Distribution or to an ISDN Basic Access with several devices attached. The connected number is that of the party actually reached. N.B. The recording of the actual number connected may be limited by the capability of intermediate signalling connections.

Example 3: MTC record for Call Forwarding ("A" -> "B" -> "C")
In case of call forwarding, the connected number recorded in the MTC record of the "B" subscriber is that of the forwarded-to party or "C" subscriber. The calling party field contains the number of the "A" subscriber.

Example 4: Translated Number
This field is only present if digit translation is applied by the MSC to the called number received from the mobile station. Examples include abbreviated dialling codes and service numbers.

B.3.7 Cause for termination

This field contains a generalised reason for the release of the connection including the following:

- normal release;
- CAMEL initiated call release;
- partial record generation;
- partial record call re-establishment;
- unsuccessful call attempt;
- abnormal termination during the stable phase.

A more detailed reason may be found in the diagnostics field.

B.3.8 Data volume

This field includes the number of 64 octet segments transmitted during the use of data services if known (see B.1.3 Packet Data Services).

B.3.9 Diagnostics

This field includes a more detailed technical reason for the release of the connection and may contain one of the following:

- a MAP error from GSM 09.02 [17];
- a Cause from GSM 04.08 [16];
- a Cause from ISUP Q.767.

The diagnostics may also be extended to include manufacturer and network specific information.

B.3.10 Equipment id.

This field contains a local identifier used to distinguish between equipment of the same equipment type e.g. the number of the conference circuit employed if more than one is available.

B.3.11 Equipment type

This field contains the type of common equipment employed e.g. conference circuit for multi-party service.

B.3.12 Event time stamps

These fields contain the event time stamps relevant for each of the individual record types.

The call records may contain three significant call handling time stamps:

- The time at which the resource in question was seized (Seizure time)
- The time at which the call was answered or at which charging commences. (Answer time)
- The time at which the resource was released (Release time)

For both Mobile Originated and Mobile Terminated calls, the Seizure time is the time at which the traffic channel is allocated i.e. the time at which the ASSIGN COMMAND message is sent to the MS.

For Mobile Originated calls the Answer time is the time at which the CONNECT message is sent to the calling party. For Mobile Terminated calls the time at which the CONNECT message is received from the called party. However, if the subscriber has subscribed to the advice of charge charging level service, then the answer time shall be derived from the time at which the FACILITY message is received from the MS containing the acknowledgement of receipt of the AOC parameters. Similarly, if the AOC parameters are changed during the call then the change time recorded for a subscriber with AOC charging level is the receipt of the FACILITY message from the MS. For a subscriber with AOC information level the change time recorded is the time at which the FACILITY is sent to the MS. Finally, in case of call re-establishment (see subclause B.1.5) the answer time is the time at which the new traffic channel is allocated by the MSC i.e. when the ASSIGN COMMAND is sent to the MS.

The Release time is the time at which the connection is released by either party i.e. a DISCONNECT or RELEASE is sent by the network or a DISCONNECT is received from the MS. In the case of a radio link failure, the release time is the time at which the failure was detected by the MSC.

For unsuccessful call attempts the Seizure time is mandatory. The Release time is optional and the call duration recorded is the call holding time i.e. the difference between the two.

For successful calls the Answer time is mandatory and both the Seizure and Release times are optional. The call duration recorded is the chargeable duration i.e. the difference between the Answer and Release time stamps.

The event records include the following time stamps:

- HLR-int time: The receipt of a MAP_SEND_ROUTING_INFO request by the HLR.
- Loc.Upd. time: The receipt of a MAP_UPDATE_LOCATION_AREA request by the VLR or the receipt of a MAP_UPDATE_LOCATION request by the HLR.
- SS-Action: The receipt of a supplementary service request by the VLR
e.g. MAP_REGISTER_SS, MAP_INVOKE_SS
- SMS-MO: The receipt of an RP_DATA message from the MS containing an SMS_SUBMIT PDU
- SMS-MT The transmission of an RP_DATA message to the MS containing an SMS_DELIVER PDU

It should be noted that the events listed above are only examples in order to demonstrate the principles and that the list is by no means exhaustive.

All time-stamps include a minimum of date, hour, minute and second.

B.3.13 HSCSD channels requested / HSCSD channels allocated / Change of HSCSD parameters

The HSCSD channel requested field contains the maximum number of HSCSD channels that can be assigned to a HSCSD call, as received from the MS at call set-up. HSCSD channels allocated contains the actual number of HSCSD channels assigned to the MS by the network at call set-up. Any change in the number of HSCSD channels allocated, as a result of user initiated or network initiated change of number of HSCSD channels, then this may be recorded in the Change of HSCSD parameters field including the time at which the change occurred and which entity requested the change.

It should be noted that the Change of HSCSD Parameters field is optional and not required if partial records are generated when change of number of traffic channels takes place.

B.3.14 Incoming/ outgoing trunk group

The incoming trunk group describes the trunk on which the call originates as seen from the MSC. For mobile originated calls this will generally be a BSS trunk. Similarly, the outgoing trunk group describes the trunk on which the call leaves the MSC.

B.3.15 Interrogation result

This field contains the result of the HLR interrogation attempt as defined in the MAP (GSM 09.02 [17]).

NOTE: This field is only provided if the attempted interrogation was unsuccessful.

B.3.16 Location / change of location

The location field contains a combination of the location area code (LAC) and cell identity (CI) of the cell in which the served party is currently located. Any change of location may be recorded in the change of location field including the time at which the change took place.

The change of location field is optional and not required if partial records are generated when the location changes.

The LAC and CI are both 2 octet quantities and coded according to GSM 04.08 [16].

B.3.17 Message reference

This field contains a unique message reference number allocated by the mobile station when transmitting a short message to the service centre. This field corresponds to the TP-Message-Reference element of the SMS_SUBMIT PDU defined in GSM 03.40 [15].

B.3.18 Mobile station classmark / change of classmark

This MS classmark field contains the mobile station classmark employed by the served MS on call set-up as defined in GSM 04.08 [16] (see mobile station classmark 2). Any alteration in the classmark during the connection may be recorded in the change of classmark field and will include the time at which the change took place.

It should be noted that the change of classmark field is optional and not required if partial records are created when the classmark is altered.

B.3.19 Entity number

This field contains the CCITT E.164 [2] number assigned to the entity (MSC, VLR, HLR etc.) that produced the record. For further details concerning the structure of MSC and location register numbers see GSM 03.03 [14].

B.3.20 Number of forwarding

This field, if provided via ISUP signalling, contains the number of times a call has been forwarded prior to the interrogation of the HLR and is defined in GSM 09.02 [17].

B.3.21 Old /new location

These fields contain the location of a mobile subscriber before and after a location update. In case of VLR location update the location information consists of a VMSC number and location area code. In case of HLR location update the field contains the VMSC number and the VLR number.

B.3.22 Radio channel requested / rad. channel used / change of rad. channel

The radio channel requested field contains the type of channel requested by the user. The following values are permitted:

- full rate;
- half rate;
- dual mode half rate preferred;
- dual mode full rate preferred.

The radio channel used field indicates the type of traffic channel actually employed for the connection i.e. either full rate (Bm) or half rate (Lm) as described in GSM 05.01. Any change in the type of channel used may be recorded in the change of radio channel used field including the time at which the change occurred.

It should be noted that the change of radio channel field is optional and not required if partial records are generated.

B.3.23 Record extensions

The field enables network operators and/ or manufacturers to add their own extensions to the standard record definitions. This field contains a set of "management extensions" as defined in CCITT X.721 [5].

B.3.24 Record type

The field identifies the type of the record e.g. mobile originated, mobile terminated etc.

B.3.25 Routing number / roaming number

The routing number field of the HLR interrogation record contains either a mobile station roaming number or, in case of call forwarding, a forwarded-to number.

The roaming number field of the MOC record contains the mobile subscriber roaming number as defined in GSM 03.03 [14] and coded according to GSM 09.02 [17].

B.3.26 Sequence number

This field contains a running sequence number employed to link the partial records generated for a particular connection (see A.1.2 Partial records).

B.3.27 Served IMEI

This fields contains the international mobile equipment identity (IMEI) of the equipment served. The term "served" equipment is used to describe the ME involved in the transaction recorded e.g. the called ME in case of an MTC record.

The structure of the IMEI is defined in GSM 03.03 [14].

B.3.28 Served IMSI

This fields contains the international mobile subscriber identity (IMSI) of the served party. The term "served" party is used to describe the mobile subscriber involved in the transaction recorded e.g. the calling subscriber in case of an MOC record.

The structure of the IMSI is defined in GSM 03.03 [14].

B.3.29 Served MSISDN

This field contains the mobile station ISDN number (MSISDN) of the served party. The term "served" party is used to describe the mobile subscriber involved in the transaction recorded e.g. the called subscriber in case of an MTC record. In case of multi-numbering the MSISDN stored in a MOC record will be the primary MSISDN of the calling party.

The structure of the MSISDN is defined in GSM 03.03 [14].

B.3.30 Service centre address

This field contains a CCITT E.164 [2] number identifying a particular service centre e.g. short message service centre (see GSM 03.40 [15]).

B.3.31 Short message service result

This field contains the result of an attempt to deliver a short message either to a service centre or to a mobile subscriber (see GSM 09.02 [17]). Note that this field is only provided if the attempted delivery was unsuccessful.

B.3.32 Supplementary service(s)

The supplementary service field in the Supplementary Service record type contains the code of the supplementary service on which the action was performed.

The supplementary services field in the MOC / MTC records contains the codes of the supplementary services invoked as a result of, or during, a connection.

The coding of supplementary service is described in detail in GSM 09.02 [17].

B.3.33 Supplementary service action

This field contains the type of supplementary service action requested by the subscriber or performed by the network. Possible values include:

- registration;
- erasure;
- activation;
- deactivation;
- interrogation;
- invocation.

For further details see GSM 02.04.

B.3.34 Supplementary service action result

This field contains the result of an attempted supplementary service action (see GSM 09.02 [17]). Note that this field is only provided if the SS-action was at least partially unsuccessful.

B.3.35 Supplementary service parameters

This field contains the parameters associated with a supplementary service action requested by the subscriber. For further details of the parameters involved see the GSM 02.8n series of documents.

B.3.36 Transparency indicator

This field indicates whether the basic service was employed in transparent or non-transparent mode. It should also be noted that this field is only relevant for those services which may be operated in both transparent and non-transparent modes.

B.3.37 Update result

This field contains the result of the location update request as defined in the MAP (GSM 09.02 [17]). Note that this field is only provided if the attempted update was unsuccessful.

B.4 Example scenarios

This clause contains a number of example scenarios illustrating the purpose and practical usage of the various types of records defined in the previous subclauses. These examples are by no means exhaustive.

For the purpose of these examples the following assumptions have been made:

- that the MSC and VLR are co-located;
- that the records are sent to an OS "Administration/ Billing Center (ADC/BC)" for post-processing;
- that the generation of all of the record types described in this annex has been enabled;
- that the HLR interrogation records are produced in the HLR and not the interrogating MSC;
- that supplementary service actions are recorded in separate event records.

The following conventions have been used for the figures contained within this subclause:

- 1) Network connections and signalling transactions are illustrated by means of solid lines and referenced by number e.g. (1).
- 2) Operation & Maintenance actions, such as the transfer of call records, are represented by means of dotted lines and referenced by letter e.g. (A).
- 3) The ADC/BC has been included in some, but not all, of the examples. The only reason for this decision is to simplify the resulting figures. For the avoidance of doubt, the presence of an ADC/BC is assumed even if not explicitly included.

The following examples are included:-

- 1) Mobile to Land (outgoing) call;
- 2) Land to Mobile (incoming) call;
- 3) Mobile to Mobile call within the same network;
- 4) Incoming call to a roaming subscriber;
- 5) Incoming call to a PLMN Service Centre;
- 6) Call Forwarding Unconditional;
- 7) Call Forwarding conditional (on Busy);
- 8) Delivery of a Mobile Terminated Short Message;
- 9) Call Hold and Multi-party services;
- 10) Outgoing call handled by CAMEL;
- 11) Incoming call handled by CAMEL without redirection;
- 12) Incoming call to a roaming subscriber handled by CAMEL;
- 13) Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL;
- 14) Incoming call handled by CAMEL without redirection and forwarded early using GSM SS but controlled by CAMEL;
- 15) Incoming call handled by CAMEL without redirection and forwarded late using GSM SS but controlled by CAMEL;
- 16) Early forwarded call controlled by CAMEL;
- 17) Late forwarded call controlled by CAMEL.

B.4.1 Mobile to land (outgoing) call

Figure B.1 illustrates a simple outgoing call from a PLMN subscriber "A" to a fixed network subscriber "B" (1).

The originating MSC (MSC-A) shall generate an MOC record for subscriber "A".

The GMSC shall create an outgoing gateway record for accounting with the fixed network including details of the point at which the call left the PLMN i.e. the GMSC id. and outgoing trunk group. This record also includes time stamps to determine both the holding time of the outgoing trunk and the duration of the conversation.

For the avoidance of doubt, even if the MSC and GMSC are co-located both records shall be produced.

The records generated are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

Figure B.1: Mobile to land (outgoing) call

B.4.2 Land to mobile (incoming) call

Figure B.2 illustrates a simple incoming call from a fixed network subscriber "A" to a PLMN subscriber "B".

The incoming call is first routed to a GMSC (1). The GMSC shall create an incoming gateway record for fixed network accounting purposes to record the point at which the call entered the network together with the time stamps required to calculate the holding time of the incoming trunk and the conversation duration. This gateway record shall contain the IMSI of the called subscriber.

The GMSC interrogates the HLR of the called subscriber in order to determine his current location (2). The HLR shall create an HLR interrogation event record.

The GMSC routes the call to the MSC at which the subscriber is currently registered (3). This terminating MSC (MSC-B) shall create an MTC record for subscriber "B".

For the avoidance of doubt, even if the MSC and GMSC are co-located both the MTC and gateway records shall be produced.

The records generated are subsequently transferred to the OS either on release of the connection or when collected by the OS (A).

Figure B.2: Land to mobile (incoming) call

B.4.3 Mobile to mobile call within the same network

Figure B.3 illustrates a simple mobile to mobile call from subscriber "A" to subscriber "B" both within the same PLMN.

The originating MSC (MSC-A) shall produce an MOC record for the call to subscriber "B".

Having received a setup request from subscriber "A" (1), MSC-A interrogates the HLR of the called subscriber in order to determine his current location (2). The HLR shall create an HLR interrogation event record.

MSC-A routes the call to the MSC at which subscriber is currently registered (3). This terminating MSC (MSC-B) shall create an MTC record for subscriber "B". If MSC-A and MSC-B are co-located then two records, one MOC and one MTC, shall be produced for this call.

The records generated are subsequently transferred to the OS either immediately following the release of the connection or when collected by the OS.

Figure B.3: Mobile to mobile call

B.4.4 Incoming call to a roaming subscriber

Figure B.4 illustrates an incoming call from a fixed network subscriber "A" to a PLMN subscriber "B" who is currently roaming in another PLMN.

The call is first routed to a GMSC (1) and the GMSC shall create an incoming gateway record for accounting purposes as described in subclause B.4.2. The GMSC interrogates the HLR of the called subscriber in order to determine his current location (2). The HLR shall create an Interrogation event record.

The GMSC routes the call to the VPLMN in which subscriber "B" is currently located (3). The GMSC shall create an outgoing gateway record for accounting purposes. The GMSC shall also create a roaming record. This record includes the IMSI of the "B" subscriber and may be used as a cross-check for the TAP information received from the VPLMN.

The call is then routed by the VPLMN to the MSC at which the subscriber is currently located (4). The GMSC of the VPLMN shall produce an incoming gateway record and the terminating MSC shall create an MTC record for the call to "B".

The records generated are subsequently transferred to the OS of the appropriate PLMN (A). The MTC record generated by the terminating MSC shall be employed to create the appropriate MTC TAP record. The TAP records shall be included in a TAP file and transmitted to the HPLMN (B).

Figure B.4: Incoming call to a roaming subscriber

B.4.5 Incoming call to a PLMN service centre

Figure B.5 illustrates an incoming call from a fixed network subscriber "A" to a Service Centre directly connected to an MSC within a PLMN network. Examples for services provided by such a Service Centre include Voice Mail services, Operator services etc.

The call is routed to a GMSC within the PLMN (1). The GMSC analyses the dialled digits and routes the call directly to the MSC to which the Service Centre is connected (2).

As HLR interrogation is not required, there will be no HLR Interrogation record. The GMSC shall however, create an incoming gateway record based on the point at which the call entered the network and the destination (Service Centre) of the call.

The MSC then connects the calling subscriber to the service centre. As no mobile subscriber is involved, the MSC will not create an MTC record, however, the MSC shall create a transit Record describing the destination of the call.

The records generated are subsequently transferred to the OS of the PLMN (A).

It should be noted that without the transit record, the MSC would not generate a record for this connection.

Figure B.5: Incoming call to a PLMN service centre

B.4.6 Call forwarding unconditional

Figure B.6 illustrates an incoming call from a fixed network subscriber "A" to a mobile subscriber "B" who has registered and activated Call Forwarding Unconditional (CFU) for the appropriate service. The call is subsequently forwarded to a second fixed network subscriber "C".

For simplicity the registration and activation of CFU have not been included in the diagram. These actions shall of course be recorded in the appropriate supplementary service records.

The incoming call is routed to a GMSC (1). This part of the connection is identical to the scenario outlined in subclause B.4.2.

The GMSC interrogates the HLR of the called subscriber in order to determine his current location (2). The HLR shall create an HLR interrogation event record. The HLR informs the GMSC that "B" has activated CFU to subscriber "C".

The GMSC forwards the call to the fixed network subscriber "C" (3). The GMSC shall create an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". Both records shall contain the supplementary service employed (CFU). The GMSC shall also produce an outgoing gateway record as described in subclause B.4.1.

The records generated are subsequently transferred to the OS of the HPLMN (A).

Figure B.6: Call forwarding unconditional

B.4.7 Call forwarding conditional (on busy)

Figure B.7 illustrates a mobile originated call from subscriber "A" to a second mobile subscriber "B" who has registered and activated Call Forwarding on Busy (CFB) for the appropriate service. The call is subsequently forwarded to a third mobile subscriber "C". In this example, all three subscribers are currently located within the same (the home) network.

For simplicity the registration and activation of CFB have not been included in the diagram.

Having received a setup request from subscriber "A" (1), the originating MSC (MSC-A) interrogates the HLR of subscriber "B" in order to determine his current location (1a). The call is then routed to MSC-B (2).

MSC-A shall create an MOC record for subscriber "A" containing details of the call to "B". The HLR shall produce an HLR interrogation record.

On determining that subscriber "B" is busy and that CFB is active, the forwarding MSC/VLR (MSC-B) interrogates the HLR of subscriber "C" to determine his current location (2a) and forwards the call accordingly (3).

MSC-B shall produce an MTC record for the "B" subscriber for the call from "A" and an MOC record for the "B" subscriber for the call to "C". Both records shall include the supplementary service employed (CFB). The HLR shall produce an Interrogation record.

The terminating MSC (MSC-C) shall create a normal MTC record for subscriber "C".

The records generated are subsequently transferred to the OS of the PLMN.

Figure B.7: Call forwarding conditional (busy)

B.4.8 Delivery of a mobile terminated short message

Figure B.8 illustrates the delivery of a short message to a mobile subscriber.

The short message service center delivers the message to a GMSC or gateway function (1). The GMSC shall create an SMS gateway MT record.

The GMSC then interrogates the HLR of the subscriber to determine his current location (2). The HLR shall create an HLR interrogation record.

The message is subsequently transmitted to the MSC serving the mobile subscriber and finally to the mobile station of that subscriber (3). The MSC shall create an SMS MT record.

The records generated are subsequently transferred to the OS of the HPLMN (A).

Figure B.8: Delivery of a short message to a mobile subscriber

B.4.9 Call hold and multi-party service

Figure B.9 illustrates the use of the call hold and multi-party services.

A mobile subscriber ("A") sets up an outgoing call (1) to an ISDN subscriber ("B"). This call is recorded as outlined in subclause B.4.1.

Subscriber "A" then invokes the call hold service. MSC-A shall produce a supplementary service action record for the invocation.

Subscriber "A" then sets up a side-call (2) to a second mobile subscriber ("C") within the same network. This call is recorded as outlined in subclause B.4.3.

Subscriber "A" subsequently invokes the multi-party service in order to set up a three-party conference with "B" and "C". MSC-A shall produce a common equipment record for the use of a conference circuit by subscriber "A". This record shall record the duration of the whole conference irrespective of the number of parties subsequently added to, or removed from the conference connection.

Note that the MOC records produced by MSC-A for both the A -> B and A -> C legs of the conference shall contain the supplementary service code for multi-party.

Figure B.9: Call hold and multi-party service

B.4.10 Outgoing call handled by CAMEL

Figure B.10 illustrates an outgoing CAMEL call from a mobile CAMEL subscriber "A" to a fixed network subscriber "B" (1).

The "A" subscriber has an active O-CSI (stored in the VLR). Therefore MSC-A requests instructions from the gsmSSF which passes the CAMEL service key to the gsmSCF to indicate which service logic it should apply (2).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to MSC-A.

MSC-A generates an MOC record for the "A" subscriber. This record may be linked to an optional SCF-record. The record includes O-CSI data.

The GMSC routes the call to the "B" subscriber (3). The GMSC shall create an outgoing gateway record as described in subclause B.4.1.

The generated records are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

The following records are generated in HPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------|------------|-----|
| Outgoing gateway record | MOC record | - |

Figure B.10: Outgoing call handled by CAMEL

B.4.11 Incoming call handled by CAMEL without redirection

Figure B.11 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B".

The incoming call is first routed to the GMSC (1). The GMSC shall create an incoming gateway record for fixed network accounting purposes.

The GMSC interrogates the HLR of the called subscriber in order to fetch the T-CSI (2). The HLR shall create an HLR interrogation record.

The "B" subscriber has an active T-CSI. Therefore the GMSC requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC. The GMSC shall generate a terminating CAMEL interrogation record which contains T-CSI data.

The GMSC interrogates the HLR in order to determine his current location (4). The HLR shall create an HLR interrogation record.

The call is routed to MSC-B (5). An MTC record shall be generated.

For avoidance of doubt, even if the MSC and GMSC are co-located both the MTC and gateway records shall be produced.

The generated records are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

The following records are generated in HPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------------|------------|--------------------------|
| Incoming gateway record | MTC record | HLR interrogation record |
| Terminating CAMEL int. record | | |

Figure B.11: Incoming call handled by CAMEL without redirection

B.4.12 Incoming call to a roaming subscriber handled by CAMEL

Figure B.12 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B" who is currently roaming in another PLMN.

The call is first routed to a GMSC (1) and the GMSC shall create an incoming gateway record for fixed network accounting purposes.

The GMSC interrogates the HLR of the called subscriber in order to fetch the T-CSI (2). The HLR shall create an HLR interrogation record.

The "B" subscriber has an active T-CSI. Therefore the GMSC requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC. The GMSC shall generate a terminating CAMEL interrogation record which contains T-CSI data.

The GMSC interrogates the HLR in order to determine his current location (4). The HLR shall create an HLR interrogation record.

The GMSC routes the call to the VPLMN in which subscriber "B" is currently located (5). The GMSC shall create an outgoing gateway record for accounting purposes. The GMSC shall also create a roaming record. This record includes the IMSI of the "B" subscriber and may be used as a cross-check for the TAP information received from the VPLMN.

The call is then routed by the VPLMN to the MSC at which the subscriber is currently located (6). The GMSC of the VPLMN shall produce an incoming gateway record and the terminating MSC shall create an MTC record for the call to "B".

The records generated are subsequently transferred to the OS of the appropriate PLMN (A). The MTC record generated by the terminating MSC shall be employed to create the appropriate MTC TAP record. The TAP records shall be included in a TAP file and transmitted to the HPLMN (B).

The following records are generated in HPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------------|-----|--------------------------|
| Incoming gateway record | - | HLR interrogation record |
| Terminating CAMEL int. record | | |
| Roaming record | | |
| Outgoing gateway record | | |

The following records are generated in VPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------|------------|-----|
| Incoming gateway record | MTC record | - |

Figure B.12: Incoming call to a roaming subscriber handled by CAMEL

B.4.13 Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL

Figure B.13 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B". The call is subsequently forwarded to a second fixed network subscriber "C" by CAMEL initiated Call Forwarding.

The incoming call is routed to the GMSC (1). The GMSC shall create an incoming gateway record for fixed network accounting purposes.

The GMSC interrogates the HLR of the called subscriber in order to fetch the T-CSI and O-CSI (2).

The "B" subscriber has an active T-CSI. Therefore the GMSC requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

The gsmSCF modifies the Called Party number and sets the CAP parameter 'Apply O-CSI'. When gsmSCF processing is complete the call control is returned to the GMSC. The GMSC shall generate a terminating CAMEL interrogation record which contains T-CSI data.

The "B" subscriber has an active O-CSI. Therefore the GMSC requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (4).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC

The GMSC redirects the call to the fixed network subscriber "C" (5). The GMSC shall generate an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". The MOC record includes O-CSI data. The GMSC shall also produce an outgoing gateway record as described in subclause B.4.1.

If the B-subscriber do not have an active O-CSI the call is forwarded to the "C" subscriber after the first gsmSCF invocation and an MOC (call forwarding) record containing the parameter 'CAMEL initiated CF indicator' for the "B" subscriber for the call to "C" is generated.

The generated records are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

The following records are generated in HPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------------|-----|--------------------------|
| Incoming gateway record | - | HLR interrogation record |
| Terminating CAMEL int. record | | |
| MTC record | | |
| MOC (CF) record | | |
| Outgoing gateway record | | |

Figure B.13: Incoming call handled by CAMEL with redirection decided and forwarding leg handled by CAMEL

B.4.14 Incoming call handled by CAMEL without redirection and forwarded early using GSM SS but controlled by CAMEL

Figure B.14 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B". The call is subsequently forwarded to a second fixed network subscriber "C" by GSM SS Call Forwarding Unconditional (CFU) but controlled by CAMEL.

For simplicity the activation and registration of CFU have not been included in the diagram. These actions shall of course be registered in the appropriate supplementary service records.

The incoming call is routed to the GMSC (1). The GMSC shall create an incoming gateway record for fixed network accounting purposes.

The GMSC interrogates the HLR of the called subscriber in order to fetch the T-CSI and O-CSI (2). The HLR shall create an HLR interrogation record. The HLR informs the GMSC that "B" has activated CFU.

The "B" subscriber has an active T-CSI. Therefore the GMSC requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC. The GMSC shall generate a terminating CAMEL interrogation record which contains T-CSI data.

The "B" subscriber has an active O-CSI. Because the "B" subscriber has activated CFU he acts as the originating party for the forwarded leg. Therefore the GMSC requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (5).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC

The GMSC redirects the call to the fixed network subscriber "C" (6). The GMSC shall generate an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". The MOC record includes O-CSI data. The GMSC shall also produce an outgoing gateway record as described in subclause B.4.1.

If the B-subscriber do not have an active O-CSI the call is forwarded to the "C" subscriber after the first gsmSCF invocation.

The generated records are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

The following records are generated in HPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------------|-----|--------------------------|
| Incoming gateway record | - | HLR interrogation record |
| Terminating CAMEL int. record | | |
| MTC record | | |
| MOC (CF) record | | |
| Outgoing gateway record | | |

Figure B.14: Incoming call handled by CAMEL without redirection and forwarded early using GSM SS but controlled by CAMEL

B.4.15 Incoming call handled by CAMEL without redirection and forwarded late using GSM SS but controlled by CAMEL

Figure B.15 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B" who has registered and activated Call Forwarding on No Reply (CFNRY) for the appropriate service. The call is subsequently forwarded to a second fixed network subscriber "C".

For simplicity the registration and activation of CFNRY have not been included in this diagram. These actions shall be recorded in the appropriate supplementary service records.

The incoming call is routed to the GMSC (1). The GMSC shall create an incoming gateway record for fixed network accounting purposes.

The GMSC interrogates the HLR of the called subscriber in order to fetch the T-CSI and O-CSI (2). The HLR shall create an HLR interrogation record.

The "B" subscriber has an active T-CSI. Therefore the GMSC requests instructions from the gsmSSF which passes the CAMEL service key to the gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC. The GMSC shall generate a terminating CAMEL interrogation record which contains T-CSI data.

The GMSC interrogates the HLR in order to determine his current location (4). The HLR shall create an HLR interrogation record.

The call is routed to MSC-B (5). The "B" subscriber do not answer the call. MSC-B shall produce an MTC record for the "B" subscriber for the call from "A".

The "B" subscriber has an active O-CSI. Because the "B" subscriber has activated CFNRY he acts as the originating party for the forwarded leg. Therefore MSC-B requests instructions from the gsmSSF which passes the CAMEL service key to the gsmSCF to indicate which service logic it should apply (6).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to MSC-B.

MSC-B forwards the call via the GMSC to the "C" subscriber (7). MSC-B shall produce an MOC (call forwarding) for the "B" subscriber for the call to "C". The record includes O-CSI data. The GMSC shall also produce an outgoing gateway record as described in subclause B.4.1.

If the B-subscriber do not have an active O-CSI the call is forwarded to the "C" subscriber after detecting the call forwarding condition.

The generated records are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

The following records are generated in HPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------------|-----------------|-----|
| Incoming gateway record | MTC record | - |
| Terminating CAMEL int. record | MOC (CF) record | |
| Outgoing gateway record | | |

Figure B.15: Incoming call handled by CAMEL without redirection and forwarded late using GSM SS but controlled by CAMEL

B.4.16 Early forwarded call controlled by CAMEL

Figure B.16 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B". The call is subsequently forwarded to a second fixed network subscriber "C" by GSM SS Call Forwarding Unconditional (CFU) but controlled by CAMEL.

For simplicity the activation and registration of CFU have not been included in the diagram. These actions shall of course be registered in the appropriate supplementary service records.

The incoming call is routed to the GMSC (1). The GMSC shall create an incoming gateway record for fixed network accounting purposes.

The GMSC interrogates the HLR of the called subscriber in order to fetch the O-CSI (2). The HLR shall create an HLR interrogation record. The HLR informs the GMSC that "B" has activated CFU.

The "B" subscriber has an active O-CSI. Because the "B" subscriber has activated CFU he acts as the originating party for the forwarded leg. Therefore the GMSC requests instructions from the gsmSSF which passes the CAMEL service key to a gsmSCF to indicate which service logic it should apply (3).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to the GMSC

The GMSC redirects the call to the fixed network subscriber "C" (5). The GMSC shall generate an MTC record for the "B" subscriber for the call from "A" and an MOC (call forwarding) record for the "B" subscriber for the call to "C". The MOC record includes O-CSI data. The GMSC shall also produce an outgoing gateway record as described in subclause B.4.1.

The generated records are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

The following records are generated in HPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------------|-----|--------------------------|
| Incoming gateway record | - | HLR interrogation record |
| Terminating CAMEL int. record | | |
| MTC record | | |
| MOC (CF) record | | |
| Outgoing gateway record | | |

Figure B.16: Early forwarded call controlled by CAMEL

B.4.17 Late forwarded call controlled by CAMEL

Figure B.17 illustrates an incoming call from a fixed network subscriber "A" to a mobile CAMEL subscriber "B" who has registered and activated Call Forwarding on No Reply (CFNRY) for the appropriate service. The call is subsequently forwarded to a second fixed network subscriber "C".

For simplicity the registration and activation of CFNRY have not been included in this diagram. These actions shall be recorded in the appropriate supplementary service records.

The incoming call is routed to the GMSC (1). The GMSC shall create an incoming gateway record for fixed network accounting purposes.

The GMSC interrogates the HLR of the called subscriber in order to determine the current location (2). The HLR shall create an HLR interrogation record.

The call is routed to MSC-B (3). The "B" subscriber do not answer the call. MSC-B shall produce an MTC record for the "B" subscriber for the call from "A".

The "B" subscriber has an active O-CSI. Because the "B" subscriber has activated CFNRY he acts as the originating party for the forwarded leg. Therefore MSC-B requests instructions from the gsmSSF which passes the CAMEL service key to gsmSCF-B to indicate which service logic it should apply (4).

The gsmSCF may interrogate the HLR for subscriber information. As a network option, the operator may refuse to provide the requested information.

When gsmSCF processing is complete the call control is returned to MSC-B.

MSC-B forwards the call via the GMSC to the "C" subscriber (5). MSC-B shall produce an MOC (call forwarding) for the "B" subscriber for the call to "C". The record includes O-CSI data. The GMSC shall also produce an outgoing gateway record as described in subclause B.4.1.

The generated records are subsequently transferred to the OS (A) either as event reports following the release of the connection or when collected by the OS.

The following records are generated in HPLMN in this call scenario:

| GMSC | MSC | HLR |
|-------------------------|-----------------|--------------------------|
| Incoming gateway record | MTC record | HLR interrogation record |
| Outgoing gateway record | MOC (CF) record | |

Annex C (Normative): Observed IMEI tickets

C.1 General

In order to provide the data required by the mobile equipment management activities outlined in the previous chapters, the NEF of the MSC shall be capable of producing IMEI tickets for each of the following events:

- usage of a blacklisted IMEI;
- usage of a greylisted IMEI;
- usage of an IMEI not found on the white list.

The production of these records shall be enabled/disabled under network management control by the use of the procedure outlined in subclause 8.2.1.3.

C.2 Observed IMEI tickets

An observed IMEI ticket is generated whenever greylisted, blacklisted or non-whitelisted mobile equipment is detected during an IMEI check. The purpose of the ticket is to link the mobile equipment under observation with its current user (IMSI). The ticket also includes information describing when and where the equipment was used to enable the tracking of such equipment. Finally, if the ticket was triggered by a call attempt, a call reference is provided in order to locate the corresponding call record.

The IMEI tickets are generated by the NEF of the MSC performing the IMEI check.

Table C.1: IMEI ticket

| Field | | Description |
|-------------------|---|---|
| Served IMEI | M | IMEI of the observed mobile equipment |
| IMEI Status | M | The result of the IMEI check e.g. blacklisted, greylisted, unknown. |
| Served IMSI | M | The IMSI of the subscriber currently using the mobile equipment. |
| Served MSISDN | C | The MSISDN of the subscriber currently using the observed mobile equipment, only available if the event that triggered the IMEI check was an MOC, MTC, SMS-MO or SMS-MT |
| Recording Entity | M | The E.164 number of the recording MSC. |
| Event Time Stamp | M | The time at which the IMEI check was performed. |
| Location | M | The location area code and cell identity of the cell from which the mobile equipment was used. |
| IMEI Check Event | O | The event that caused IMEI checking to take place |
| Call Reference | O | Only available if the IMEI check was related to an MOC or MTC |
| Record extensions | O | A set of network/ manufacturer specific extensions to the record. |

C.3 Description of record fields

For the definition of Served IMEI, Served MSISDN, Recording Entity, Event Time Stamp, Location and Call Reference see clause B.2.

C.3.1 IMEI Check Event

This field identifies the type of event that caused the IMEI check to take place:

- Mobile originating call attempt;
- Mobile terminating call attempt;
- Mobile originating SMS;
- Mobile terminating SMS;
- Supplementary service actions performed by the subscriber;
- Location update.

C.3.2 IMEI Status

This field contains the result of the IMEI checking procedure:

- Greylisted;
- Blacklisted;
- Non-whitelisted.

Annex D (Informative): Change History

This annex lists all phase 2+ change requests approved for the present document by ETSI SMG.

| SMG# | SMG tdoc | SMG6 tdoc | VERS | CR | RV | PH | CAT | SUBJECT | Resulting Version |
|------|----------|-----------|-------|------|----|-----|-----|---|-------------------|
| s23 | 686/97 | 97/61 | 4.3.0 | A021 | | R96 | B | Incorporation of CAMEL phase 1 | 5.0.0 |
