# 1 Scope

The present document describes the subset of Radio Access Network Application Part (RANAP) messages and procedures, defined in 3GPP TS 25.413 [4], which is used on the E-interface. A general description can be found in 3GPP TS 23.002 [7] and 3GPP TS 23.009 [2].

For the initiation and execution of relocation of SRNS (relocation for short, throughout the whole document) between MSCs a subset of RANAP procedures are used. For the subsequent control of resources allocated to the User Equipment (UE) RANAP procedures are used. The Direct Transfer Elementary Procedure (EP) of RANAP, is used for the transfer of connection management and mobility management messages between the UE and the controlling 3G\_MSC.

## 4 Principles for the use of RANAP on the E-interface

### 4.1 General

The mechanism for the transfer of the RANAP messages on the E-interface is defined in TS 29.002 [5]. The operation of the relocation procedures between 3G\_MSCs and the use of the RANAP messages for those procedures is described in TS 23.009 [2] and TS 29.010 [6].

RANAP is defined to connect the RNS to both, the cs and ps domain of an UMTS CN. Procedures, messages and IEs, only defined for communication between the RNS and the ps domain of an UMTS CN will, of course, never appear on the E-interface.

In the same way as a the connection oriented service of SCCP is used for the messages relating to one UE on the 3G\_MSC-RNS interface a TCAP dialogue is used on the E-interface for messages relating to one UE. As no correspondence to the connectionless service on the 3G\_MSC-RNS interface is used on the E-interface none of the global procedures are applicable.

The management of the terrestrial circuits between the 3G\_MSCs is outside the scope of the E-interface (see TS 23.009 [2]), therefore all procedures, messages and information elements relating to terrestrial circuits are also excluded from the RANAP procedures and messages used on the E-interface.

### 4.2 Transfer of RANAP layer 3 messages on the E-interface

The RANAP data which on the 3G\_MSC-RNS interface is contained in the user data field of the exchanged SCCP frames is on the E-interface transferred as the contents of the access network signalling info in the AN-APDU parameter as described in TS 29.002 [5], indicating the access network protocol identification "ts3G-25413".

### 4.3 Roles of 3G\_MSC-A, 3G\_MSC-I and 3G\_MSC-T

For the description in the present document, the 3G\_MSC's functionality related to the relocation between 3G\_MSCs has been split into three logical parts, 3G\_MSC-A, 3G\_MSC-T and 3G\_MSC-I. The different roles need not necessarily be performed by different 3G\_MSCs.

3G\_MSC-A is the call/connection controlling part of the 3G\_MSC where the call/connection was originally established and the switching point for relocation between 3G\_MSCs. (This corresponds to 3G\_MSC-A as defined in TS 23.009 [2] and TS 29.002 [5]). The 3G\_MSC that is the 3G\_MSC-A will not be changed during the duration of a call/connection.

3G\_MSC-T is the part relating to the transitory state during the relocation for the 3G\_MSC controlling the RNS the serving RNS functionality is relocated to, when basic relocation or subsequent relocation (see TS 23.009) take place. (This corresponds, depending on the type of relocation to 3G\_MSC-A, 3G\_MSC-B or 3G\_MSC-B' in TS 23.009 [2] and TS 29.002 [5]).

3G\_MSC-I is the part of a 3G\_MSC through which the 3G\_MSC-A, via an E-interface (or an internal interface) is in contact with the UE. (This corresponds, depending on the type of relocation to 3G\_MSC-A, 3G\_MSC-B or 3G\_MSC-B' in TS 23.009 [2] and TS 29.002 [5]).

The 3G\_MSC that is the 3G\_MSC-A can also have the role of either the 3G\_MSC-I or the 3G\_MSC-T during a period of the call/connection.

The following is applicable for the involved 3G\_MSCs concerning the exchange of RANAP data on an E-interface before and after a successful inter 3G\_MSC relocation:

- 1) At basic relocation, two 3G\_MSCs are involved, one 3G\_MSC being 3G\_MSC-A and one being 3G\_MSC-T. When this relocation has been performed, the two 3G\_MSCs interworking on the E-interface have the roles of 3G\_MSC-A and 3G\_MSC-I respectively, i.e. the 3G\_MSC that is the 3G\_MSC-T during the relocation is now the 3G\_MSC-I.
- 2) At subsequent relocation back to 3G\_MSC-A, two 3G\_MSCs are involved. The 3G\_MSC having the role of 3G\_MSC-A has also the role of 3G\_MSC-T. The other 3G\_MSC involved has the role of 3G\_MSC-I. When this

relocation has been completed, there is no exchange of RANAP data on the E-interface, i.e. the 3G\_MSC being the 3G\_MSC-I before and during the relocation is now no longer taking part.

- 3) At subsequent relocation of SRNS to an 3G\_MSC not being 3G\_MSC-A, three 3G\_MSCs are involved. The roles of these 3G\_MSCs are 3G\_MSC-A, 3G\_MSC-I, and 3G\_MSC-T respectively. When this relocation has been performed, the two 3G\_MSCs interworking on an E-interface have the roles of 3G\_MSC-A and 3G\_MSC-I respectively, i.e. the 3G\_MSC that is the 3G\_MSC-T during the relocation is now the 3G\_MSC-I and the 3G\_MSC being 3G\_MSC-I during the relocation is now no longer taking part.
