## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for ETSI members and non-members, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://webapp.etsi.org/IPR/home.asp).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

## Foreword

This Technical Specification (TS) has been produced by ETSI 3rd Generation Partnership Project (3GPP).
The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under http://webapp.etsi.org/key/queryform.asp.

## Foreword

This Technical Specification has been produced by the $3^{\text {rd }}$ Generation Partnership Project (3GPP).
The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z
where:
$x$ the first digit:
1 presented to TSG for information;
2 presented to TSG for approval;
3 or greater indicates TSG approved document under change control.
Y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
z the third digit is incremented when editorial only changes have been incorporated in the document.

## 1 Scope

The present document specifies the coding, multiplexing and mapping to physical channels for E-UTRA.

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document in the same Release as the present document.

## 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in [1] and the following apply. A term defined in the present document takes precedence over the definition of the same term, if any, in [1].

Definition format
<defined term>: <definition>.

### 3.2 Symbols

For the purposes of the present document, the following symbols apply:

| $N_{\mathrm{RB}}^{\mathrm{DL}}$ | Downlink bandwidth configuration, expressed in number of resource blocks [2] |
| :--- | :--- |
| $N_{\mathrm{RB}}^{\mathrm{UL}}$ | Uplink bandwidth configuration, expressed in number of resource blocks [2] |
| $N_{\text {symb }}^{\text {PUSCH }}$ | Number of SC-FDMA symbols carrying PUSCH in a subframe |

| $N_{\text {symb }}^{\text {PUSCH-initial }}$ | Number of SC-FDMA symbols carrying PUSCH in the initial PUSCH transmission subframe |
| :--- | :--- |
| $N_{\text {symb }}^{\text {UL }}$ | Number of SC-FDMA symbols in an uplink slot |
| $N_{S R S}$ | Number of SC-FDMA symbols used for SRS transmission in a subframe (0 or 1). |

### 3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

| BCH | Broadcast channel |
| :--- | :--- |
| CFI | Control Format Indicator |
| CP | Cyclic Prefix |
| DCI | Downlink Control Information |
| DL-SCH | Downlink Shared channel |
| FDD | Frequency Division Duplexing |
| HI | HARQ indicator |
| MCH | Multicast channel |
| PBCH | Physical Broadcast channel |
| PCFICH | Physical Control Format Indicator channel |
| PCH | Paging channel |
| PDCCH | Physical Downlink Control channel |
| PDSCH | Physical Downlink Shared channel |
| PHICH | Physical HARQ indicator channel |
| PMCH | Physical Multicast channel |
| PMI | Precoding Matrix Indicator |
| PRACH | Physical Random Access channel |
| PUCCH | Physical Uplink Control channel |
| PUSCH | Physical Uplink Shared channel |
| RACH | Random Access channel |
| RI | Rank Indication |
| SRS | Sounding Reference Signal |
| TDD | Time Division Duplexing |
| TPMI | Transmitted Precoding Matrix Indicator |
| UCI | Uplink Control Information |
| UL-SCH | Uplink Shared channel |

## 4 Mapping to physical channels

### 4.1 Uplink

Table 4.1-1 specifies the mapping of the uplink transport channels to their corresponding physical channels. Table 4.1-2 specifies the mapping of the uplink control channel information to its corresponding physical channel.

Table 4.1-1

| TrCH | Physical Channel |

## $5 \quad$ Channel coding, multiplexing and interleaving

Data and control streams from/to MAC layer are encoded /decoded to offer transport and control services over the radio transmission link. Channel coding scheme is a combination of error detection, error correcting, rate matching, interleaving and transport channel or control information mapping onto/splitting from physical channels.

### 5.1 Generic procedures

This section contains coding procedures which are used for more than one transport channel or control information type.

### 5.1.1 CRC calculation

Denote the input bits to the CRC computation by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1} . A$ is the size of the input sequence and $L$ is the number of parity bits. The parity bits are generated by one of the following cyclic generator polynomials:
$-\mathrm{g}_{\text {CRC } 24 \mathrm{~A}}(D)=\left[D^{24}+D^{23}+D^{18}+D^{17}+D^{14}+D^{11}+D^{10}+D^{7}+D^{6}+D^{5}+D^{4}+D^{3}+D+1\right]$ and;

- $\quad \mathrm{g}_{\text {CRC24B }}(D)=\left[D^{24}+D^{23}+D^{6}+D^{5}+D+1\right]$ for a CRC length $L=24$ and;
- $\quad g_{\text {CRC16 }}(D)=\left[D^{16}+D^{12}+D^{5}+1\right]$ for a CRC length $L=16$.
- $\quad g_{\text {CRC } 8}(D)=\left[D^{8}+D^{7}+D^{4}+D^{3}+D+1\right]$ for a CRC length of $L=8$.

The encoding is performed in a systematic form, which means that in $\mathrm{GF}(2)$, the polynomial:
$a_{0} D^{A+23}+a_{1} D^{A+22}+\ldots+a_{A-1} D^{24}+p_{0} D^{23}+p_{1} D^{22}+\ldots+p_{22} D^{1}+p_{23}$
yields a remainder equal to 0 when divided by the corresponding length- 24 CRC generator polynomial, $g_{\text {CRC24A }}(D)$ or $g_{\text {CRC24B }}(D)$, the polynomial:
$a_{0} D^{A+15}+a_{1} D^{A+14}+\ldots+a_{A-1} D^{16}+p_{0} D^{15}+p_{1} D^{14}+\ldots+p_{14} D^{1}+p_{15}$
yields a remainder equal to 0 when divided by $g_{C R C 16}(D)$, and the polynomial:
$a_{0} D^{A+7}+a_{1} D^{A+6}+\ldots+a_{A-1} D^{8}+p_{0} D^{7}+p_{1} D^{6}+\ldots+p_{6} D^{1}+p_{7}$
yields a remainder equal to 0 when divided by $g_{\text {CRC } 8}(D)$.
The bits after CRC attachment are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where $B=A+L$. The relation between $a_{k}$ and $b_{k}$ is:

$$
\begin{array}{ll}
b_{k}=a_{k} & \text { for } k=0,1,2, \ldots, A-1 \\
b_{k}=p_{k-A} & \text { for } k=A, A+1, A+2, \ldots, A+L-1 .
\end{array}
$$

### 5.1.2 Code block segmentation and code block CRC attachment

The input bit sequence to the code block segmentation is denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where $B>0$. If $B$ is larger than the maximum code block size $Z$, segmentation of the input bit sequence is performed and an additional CRC sequence of $L=24$ bits is attached to each code block. The maximum code block size is:

- $Z=6144$.

If the number of filler bits $F$ calculated below is not 0 , filler bits are added to the beginning of the first block.
Note that if $B<40$, filler bits are added to the beginning of the code block.
The filler bits shall be set to $\langle N U L L\rangle$ at the input to the encoder.
Total number of code blocks $C$ is determined by:
if $B \leq Z$
$L=0$
Number of code blocks: $C=1$

$$
B^{\prime}=B
$$

else

$$
L=24
$$

Number of code blocks: $C=\lceil B /(Z-L)\rceil$.

$$
B^{\prime}=B+C \cdot L
$$

end if
The bits output from code block segmentation, for $C \neq 0$, are denoted by $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-1\right)}$, where $r$ is the code block number, and $K_{r}$ is the number of bits for the code block number $r$.

Number of bits in each code block (applicable for $C \neq 0$ only):
First segmentation size: $K_{+}=$minimum $K$ in table 5.1.3-3 such that $C \cdot K \geq B^{\prime}$
if $C=1$
the number of code blocks with length $K_{+}$is $C_{+}=1, K_{-}=0, C_{-}=0$
else if $C>1$
Second segmentation size: $K_{-}=$maximum $K$ in table 5.1.3-3 such that $K<K_{+}$

$$
\Delta_{K}=K_{+}-K_{-}
$$

Number of segments of size $K_{-}: C_{-}=\left\lfloor\frac{C \cdot K_{+}-B^{\prime}}{\Delta_{K}}\right\rfloor$.
Number of segments of size $K_{+}: C_{+}=C-C_{-}$.
end if
Number of filler bits: $F=C_{+} \cdot K_{+}+C_{-} \cdot K_{-}-B^{\prime}$
for $k=0$ to $F-1 \quad$-- Insertion of filler bits
$c_{0 k}=<N U L L>$
end for
$k=F$
$s=0$
for $r=0$ to $C-1$
if $r<C_{-}$

$$
K_{r}=K_{-}
$$

else

$$
K_{r}=K_{+}
$$

end if
while $k<K_{r}-L$

$$
\begin{gathered}
c_{r k}=b_{s} \\
k=k+1 \\
s=s+1
\end{gathered}
$$

end while
if $C>1$
The sequence $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-L-1\right)}$ is used to calculate the CRC parity bits $p_{r 0}, p_{r 1}, p_{r 2}, \ldots, p_{r(L-1)}$ according to section 5.1.1 with the generator polynomial $\mathrm{g}_{\mathrm{CRC} 24 \mathrm{~B}}(D)$. For CRC calculation it is assumed that filler bits, if present, have the value 0 .
while $k<K_{r}$
$c_{r k}=p_{r\left(k+L-K_{r}\right)}$
$k=k+1$
end while
end if
$k=0$
end for

### 5.1.3 Channel coding

The bit sequence input for a given code block to channel coding is denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits to encode. After encoding the bits are denoted by $d_{0}^{(i)}, d_{1}^{(i)}, d_{2}^{(i)}, d_{3}^{(i)}, \ldots, d_{D-1}^{(i)}$, where $D$ is the number of
encoded bits per output stream and $i$ indexes the encoder output stream. The relation between $c_{k}$ and $d_{k}^{(i)}$ and between $K$ and $D$ is dependent on the channel coding scheme.

The following channel coding schemes can be applied to TrCHs :

- tail biting convolutional coding;
- turbo coding.

Usage of coding scheme and coding rate for the different types of TrCH is shown in table 5.1.3-1. Usage of coding scheme and coding rate for the different control information types is shown in table 5.1.3-2.

The values of $D$ in connection with each coding scheme:

- tail biting convolutional coding with rate $1 / 3: D=K$;
- turbo coding with rate $1 / 3: D=K+4$.

The range for the output stream index $i$ is 0,1 and 2 for both coding schemes.
Table 5.1.3-1: Usage of channel coding scheme and coding rate for TrCHs.

| TrCH | Coding scheme | Coding rate |
| :---: | :---: | :---: |
| UL-SCH | Turbo coding | $1 / 3$ |
| DL-SCH |  |  |
| PCH |  | $1 / 3$ |
| MCH |  |  |
| BCH |  |  |

Table 5.1.3-2: Usage of channel coding scheme and coding rate for control information.

| Control Information | Coding scheme | Coding rate |
| :---: | :---: | :---: |
| DCI | Tail biting <br> convolutional <br> coding | $1 / 3$ |
| CFI | Block code | $1 / 16$ |
| HI | Repetition code | $1 / 3$ |
| UCI | Block code | variable |
|  | Tail biting <br> convolutional <br> coding | $1 / 3$ |

### 5.1.3.1 Tail biting convolutional coding

A tail biting convolutional code with constraint length 7 and coding rate $1 / 3$ is defined.
The configuration of the convolutional encoder is presented in figure 5.1.3-1.
The initial value of the shift register of the encoder shall be set to the values corresponding to the last 6 information bits in the input stream so that the initial and final states of the shift register are the same. Therefore, denoting the shift register of the encoder by $s_{0}, s_{1}, s_{2}, \ldots, s_{5}$, then the initial value of the shift register shall be set to

$$
s_{i}=c_{(K-1-i)}
$$

Figure 5.1.3-1: Rate $1 / 3$ tail biting convolutional encoder.
The encoder output streams $d_{k}^{(0)}, d_{k}^{(1)}$ and $d_{k}^{(2)}$ correspond to the first, second and third parity streams, respectively as shown in Figure 5.1.3-1.

### 5.1.3.2 Turbo coding

### 5.1.3.2.1 Turbo encoder

The scheme of turbo encoder is a Parallel Concatenated Convolutional Code (PCCC) with two 8 -state constituent encoders and one turbo code internal interleaver. The coding rate of turbo encoder is $1 / 3$. The structure of turbo encoder is illustrated in figure 5.1.3-2.

The transfer function of the 8 -state constituent code for the PCCC is:

$$
G(D)=\left[1, \frac{g_{1}(D)}{g_{0}(D)}\right]
$$

where

$$
\begin{aligned}
& g_{0}(D)=1+D^{2}+D^{3} \\
& g_{1}(D)=1+D+D^{3}
\end{aligned}
$$

The initial value of the shift registers of the 8 -state constituent encoders shall be all zeros when starting to encode the input bits.

The output from the turbo encoder is

$$
\begin{aligned}
& d_{k}^{(0)}=x_{k} \\
& d_{k}^{(1)}=z_{k} \\
& d_{k}^{(2)}=z_{k}^{\prime}
\end{aligned}
$$

for $k=0,1,2, \ldots, K-1$.
If the code block to be encoded is the 0 -th code block and the number of filler bits is greater than zero, i.e., $F>0$, then the encoder shall set $c_{k},=0, k=0, \ldots,(F-1)$ at its input and shall set $d_{k}^{(0)}=<N U L L>, k=0, \ldots,(F-1)$ and $d_{k}^{(1)}=\langle N U L L>, k=0, \ldots,(F-1)$ at its output.

The bits input to the turbo encoder are denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, and the bits output from the first and second 8state constituent encoders are denoted by $z_{0}, z_{1}, z_{2}, z_{3}, \ldots, z_{K-1}$ and $z_{0}^{\prime}, z_{1}^{\prime}, z_{2}^{\prime}, z_{3}^{\prime}, \ldots, z_{K-1}^{\prime}$, respectively. The bits output from the turbo code internal interleaver are denoted by $c_{0}^{\prime}, c_{1}^{\prime}, \ldots, c_{K-1}^{\prime}$, and these bits are to be the input to the second 8 state constituent encoder.

Figure 5.1.3-2: Structure of rate $1 / 3$ turbo encoder (dotted lines apply for trellis termination only).

### 5.1.3.2.2 Trellis termination for turbo encoder

Trellis termination is performed by taking the tail bits from the shift register feedback after all information bits are encoded. Tail bits are padded after the encoding of information bits.

The first three tail bits shall be used to terminate the first constituent encoder (upper switch of figure 5.1.3-2 in lower position) while the second constituent encoder is disabled. The last three tail bits shall be used to terminate the second constituent encoder (lower switch of figure 5.1.3-2 in lower position) while the first constituent encoder is disabled.

The transmitted bits for trellis termination shall then be:

$$
\begin{aligned}
& d_{K}^{(0)}=x_{K}, d_{K+1}^{(0)}=z_{K+1}, d_{K+2}^{(0)}=x_{K}^{\prime}, d_{K+3}^{(0)}=z_{K+1}^{\prime} \\
& d_{K}^{(1)}=z_{K}, d_{K+1}^{(1)}=x_{K+2}, d_{K+2}^{(1)}=z_{K}^{\prime}, d_{K+3}^{(1)}=x_{K+2}^{\prime} \\
& d_{K}^{(2)}=x_{K+1}, d_{K+1}^{(2)}=z_{K+2}, d_{K+2}^{(2)}=x_{K+1}^{\prime}, d_{K+3}^{(2)}=z_{K+2}^{\prime}
\end{aligned}
$$

### 5.1.3.2.3 Turbo code internal interleaver

The bits input to the turbo code internal interleaver are denoted by $c_{0}, c_{1}, \ldots, c_{K-1}$, where $K$ is the number of input bits. The bits output from the turbo code internal interleaver are denoted by $c_{0}^{\prime}, c_{1}^{\prime}, \ldots, c_{K-1}^{\prime}$.

The relationship between the input and output bits is as follows:

$$
c_{i}^{\prime}=c_{\Pi(i)}, i=0,1, \ldots,(K-1)
$$

where the relationship between the output index $i$ and the input index $\Pi(i)$ satisfies the following quadratic form:

$$
\Pi(i)=\left(f_{1} \cdot i+f_{2} \cdot i^{2}\right) \bmod K
$$

The parameters $f_{1}$ and $f_{2}$ depend on the block size $K$ and are summarized in Table 5.1.3-3.
Table 5.1.3-3: Turbo code internal interleaver parameters.

| i | $K$ | $f_{1}$ | $f_{2}$ | i | $K$ | $f_{1}$ | $f_{2}$ | i | $K$ | $f_{1}$ | $f_{2}$ | i | $K$ | $f_{1}$ | $f_{2}$ |

### 5.1.4 Rate matching

### 5.1.4.1 Rate matching for turbo coded transport channels

The rate matching for turbo coded transport channels is defined per coded block and consists of interleaving the three information bit streams $d_{k}^{(0)}, d_{k}^{(1)}$ and $d_{k}^{(2)}$, followed by the collection of bits and the generation of a circular buffer as depicted in Figure 5.1.4-1. The output bits for each code block are transmitted as described in section 5.1.4.1.2.

Figure 5.1.4-1. Rate matching for turbo coded transport channels.
The bit stream $d_{k}^{(0)}$ is interleaved according to the sub-block interleaver defined in section 5.1.4.1.1 with an output sequence defined as $v_{0}^{(0)}, v_{1}^{(0)}, v_{2}^{(0)}, \ldots, v_{K_{\Pi}-1}^{(0)}$ and where $K_{\Pi}$ is defined in section 5.1.4.1.1.

The bit stream $d_{k}^{(1)}$ is interleaved according to the sub-block interleaver defined in section 5.1.4.1.1 with an output sequence defined as $v_{0}^{(1)}, v_{1}^{(1)}, v_{2}^{(1)}, \ldots, v_{K_{\Pi}-1}^{(1)}$.

The bit stream $d_{k}^{(2)}$ is interleaved according to the sub-block interleaver defined in section 5.1.4.1.1 with an output sequence defined as $v_{0}^{(2)}, v_{1}^{(2)}, v_{2}^{(2)}, \ldots, v_{K_{\Pi}-1}^{(2)}$.

The sequence of bits $e_{k}$ for transmission is generated according to section 5.1.4.1.2.

### 5.1.4.1.1 Sub-block interleaver

The bits input to the block interleaver are denoted by $d_{0}^{(i)}, d_{1}^{(i)}, d_{2}^{(i)}, \ldots, d_{D-1}^{(i)}$, where $D$ is the number of bits. The output bit sequence from the block interleaver is derived as follows:
(1) Assign $C_{\text {subblock }}^{T C}=32$ to be the number of columns of the matrix. The columns of the matrix are numbered 0,1 , $2, \ldots, C_{\text {subblock }}^{T C}-1$ from left to right.
(2) Determine the number of rows of the matrix $R_{\text {subblock }}^{T C}$, by finding minimum integer $R_{\text {subblock }}^{T C}$ such that:

$$
D \leq\left(R_{\text {subblock }}^{T C} \times C_{\text {subblock }}^{T C}\right)
$$

The rows of rectangular matrix are numbered $0,1,2, \ldots, R_{\text {subblock }}^{T C}-1$ from top to bottom.
(3) If $\left(R_{\text {subblock }}^{T C} \times C_{\text {subblock }}^{T C}\right)>D$, then $N_{D}=\left(R_{\text {subblock }}^{T C} \times C_{\text {subblock }}^{T C}-D\right)$ dummy bits are padded such that $y_{k}=\langle N U L L\rangle$ for $k=0,1, \ldots, N_{D}-1$. Then, $y_{N_{D}+k}=d_{k}^{(i)}, k=0,1, \ldots, D-1$, and the bit sequence $y_{k}$ is written into the $\left(R_{\text {subblock }}^{T C} \times C_{\text {subblock }}^{T C}\right)$ matrix row by row starting with bit $y_{0}$ in column 0 of row 0 :

$$
\left[\begin{array}{ccccc}
y_{0} & y_{1} & y_{2} & \cdots & y_{C_{\text {subblock }}^{T C}-1} \\
y_{C_{\text {subblock }}^{T C}} & y_{C_{\text {subblock }}^{T C}} & y_{C_{\text {subblock }}^{T C}+2} & \cdots & y_{2 C_{\text {subblock }}^{T C}-1} \\
y_{\left(R_{\text {subblock }}^{T C}-1\right) \times C_{\text {subblock }}^{T C}} & y_{\left(R_{\text {subblock }}^{T C}-1\right) \times C_{\text {subblock }}^{T C}} & y_{\left(R_{\text {subblock }}^{T C}-1\right) \times C_{\text {subblock }}^{T C}+2} & \cdots & y_{\left(R_{\text {subblock }}^{T C} \times C_{\text {subblock }}^{T C}-1\right)}
\end{array}\right]
$$

For $d_{k}^{(0)}$ and $d_{k}^{(1)}$ :
(4) Perform the inter-column permutation for the matrix based on the pattern $\langle P(j)\rangle_{j \in\left\{0,1, \ldots, C_{\text {subblock }}^{T C}-1\right\}}$ that is shown in table 5.1.4-1, where $\mathrm{P}(j)$ is the original column position of the $j$-th permuted column. After permutation of the columns, the inter-column permuted $\left(R_{\text {subblock }}^{T C} \times C_{\text {subblock }}^{T C}\right)$ matrix is equal to

$$
\left[\begin{array}{ccccc}
y_{P(0)} & y_{P(1)} & y_{P(2)} & \cdots & y_{P\left(C_{\text {subblock }}^{T C}-1\right)} \\
y_{P(0)+C_{\text {subblock }}^{T C}} & y_{P(1)+C_{\text {subblock }}^{T C}} & y_{P(2)+C_{\text {sublock }}^{T C}} & \cdots & y_{P\left(C_{\text {subblock }}^{T C}-1\right)+C_{\text {subblock }}^{T C}} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
y_{P(0)+\left(R_{\text {subblock }}^{T C}-1\right) \times C_{\text {subblock }}^{T C}} & y_{P(1)+\left(R_{\text {subblock }}^{T C}-1\right) \times C_{\text {subblock }}^{T C}} & y_{P(2)+\left(R_{\text {subblock }}^{T C}-1\right) \times C_{\text {subblock }}^{T C}} & \cdots & y_{P\left(C_{\text {subblock }}^{T C}-1\right)+\left(R_{\text {subblock }}^{T C}-1\right) \times C_{\text {subblock }}^{T C}}
\end{array}\right]
$$

(5) The output of the block interleaver is the bit sequence read out column by column from the inter-column permuted $\left(R_{\text {subblock }}^{T C} \times C_{\text {subblock }}^{T C}\right)$ matrix. The bits after sub-block interleaving are denoted by $v_{0}^{(i)}, v_{1}^{(i)}, v_{2}^{(i)}, \ldots, v_{K_{\Pi}-1}^{(i)}$, where $v_{0}^{(i)}$ corresponds to $y_{P(0)}, v_{1}^{(i)}$ to $y_{P(0)+C_{\text {subblock }}^{T C}} \ldots$ and $K_{\Pi}=\left(R_{\text {subblock }}^{T C} \times C_{\text {subblock }}^{T C}\right)$.

For $d_{k}^{(2)}$ :
(4) The output of the sub-block interleaver is denoted by $v_{0}^{(2)}, v_{1}^{(2)}, v_{2}^{(2)}, \ldots, v_{K_{\Pi}-1}^{(2)}$, where $v_{k}^{(2)}=y_{\pi(k)}$ and where

$$
\pi(k)=\left(P\left(\left\lfloor\frac{k}{R_{\text {subblock }}^{T C}}\right\rfloor\right)+C_{\text {subblock }}^{T C} \times\left(k \bmod R_{\text {subblock }}^{T C}\right)+1\right) \bmod K_{\Pi}
$$

The permutation function $P$ is defined in Table 5.1.4-1.
Table 5.1.4-1 Inter-column permutation pattern for sub-block interleaver.

| Number of columns <br> $C_{\text {subblock }}^{\text {TC }}$ | Inter-column permutation pattern <br>  <br>  <br>  |
| :---: | :---: |
|  | $<0,16,8,24,4,20,12, \ldots, 28,2,18,10,26,6,22,14,30$, |
| sCubblock -1$)\rangle$ |  |$|$

### 5.1.4.1.2 Bit collection, selection and transmission

The circular buffer of length $K_{w}=3 K_{\Pi}$ for the $r$-th coded block is generated as follows:

$$
\begin{array}{ll}
w_{k}=v_{k}^{(0)} & \text { for } k=0, \ldots, K_{\Pi}-1 \\
w_{K_{\Pi}+2 k}=v_{k}^{(1)} & \text { for } k=0, \ldots, K_{\Pi}-1
\end{array}
$$

$$
w_{K_{\Pi}+2 k+1}=v_{k}^{(2)} \text { for } k=0, \ldots, K_{\Pi}-1
$$

Denote the soft buffer size for the transport block by $N_{\mathrm{IR}}$ bits and the soft buffer size for the $r$-th code block by $N_{c b}$ bits. The size $N_{c b}$ is obtained as follows, where $C$ is the number of code blocks computed in section 5.1.2:

$$
\begin{array}{ll}
-N_{c b}=\min \left(\left\lfloor\frac{N_{I R}}{C}\right\rfloor, K_{w}\right) & \text { for downlink turbo coded transport channels } \\
-N_{c b}=K_{w} & \text { for uplink turbo coded transport channels }
\end{array}
$$

where $N_{\text {IR }}$ is equal to:

$$
N_{I R}=\left\lfloor\frac{N_{\text {soft }}}{K_{\mathrm{MIMO}} \cdot \min \left(M_{\text {DL_HARQ }}, M_{\text {limit }}\right)}\right\rfloor
$$

where:
$N_{\text {soft }}$ is the total number of soft channel bits [4].
$K_{\text {MIмо }}$ is equal to 2 if the UE is configured to receive PDSCH transmissions based on transmission modes 3,4 or 8 as defined in section 7.1 of [3], 1 otherwise.
$M_{\text {DL_HARQ }}$ is the maximum number of DL HARQ processes as defined in section 7 of [3].
$M_{\text {limit }}$ is a constant equal to 8 .
Denoting by $E$ the rate matching output sequence length for the $r$-th coded block, and $r v_{i d x}$ the redundancy version number for this transmission $\left(r v_{i d x}=0,1,2\right.$ or 3$)$, the rate matching output bit sequence is $e_{k}, k=0,1, \ldots, E-1$.

Define by $G$ the total number of bits available for the transmission of one transport block.
Set $G^{\prime}=G /\left(N_{L} \cdot Q_{m}\right)$ where $Q_{m}$ is equal to 2 for QPSK, 4 for 16QAM and 6 for 64QAM, and where

- $\quad N_{L}$ is equal to 1 for transport blocks mapped onto one transmission layer, and
- $\quad N_{L}$ is equal to 2 for transport blocks mapped onto two or four transmission layers.

Set $\gamma=G^{\prime} \bmod C$, where $C$ is the number of code blocks computed in section 5.1.2.
if $r \leq C-\gamma-1$

$$
\operatorname{set} E=N_{L} \cdot Q_{m} \cdot\left\lfloor G^{\prime} / C\right\rfloor
$$

else

$$
\operatorname{set} E=N_{L} \cdot Q_{m} \cdot\left\lceil G^{\prime} / C\right\rceil
$$

end if
Set $k_{0}=R_{\text {subblock }}^{T C} \cdot\left(2 \cdot\left[\frac{N_{c b}}{8 R_{\text {subblock }}^{T C}}\right] \cdot r v_{i d x}+2\right)$, where $R_{\text {subblock }}^{T C}$ is the number of rows defined in section 5.1.4.1.1.
Set $k=0$ and $j=0$
while $\{k<E\}$

$$
\text { if } \begin{gathered}
w_{\left(k_{0}+j\right) \bmod N_{c b}} \neq<\text { NULL> } \\
e_{k}=w_{\left(k_{0}+j\right) \bmod N_{c b}} \\
k=k+1
\end{gathered}
$$

end if
$j=j+1$
end while

### 5.1.4.2 Rate matching for convolutionally coded transport channels and control information

The rate matching for convolutionally coded transport channels and control information consists of interleaving the three bit streams, $d_{k}^{(0)}, d_{k}^{(1)}$ and $d_{k}^{(2)}$, followed by the collection of bits and the generation of a circular buffer as depicted in Figure 5.1.4-2. The output bits are transmitted as described in section 5.1.4.2.2.

Figure 5.1.4-2. Rate matching for convolutionally coded transport channels and control information.
The bit stream $d_{k}^{(0)}$ is interleaved according to the sub-block interleaver defined in section 5.1.4.2.1 with an output sequence defined as $v_{0}^{(0)}, v_{1}^{(0)}, v_{2}^{(0)}, \ldots, v_{K_{\Pi}-1}^{(0)}$ and where $K_{\Pi}$ is defined in section 5.1.4.2.1.

The bit stream $d_{k}^{(1)}$ is interleaved according to the sub-block interleaver defined in section 5.1.4.2.1 with an output sequence defined as $v_{0}^{(1)}, v_{1}^{(1)}, v_{2}^{(1)}, \ldots, v_{K_{\Pi}-1}^{(1)}$.

The bit stream $d_{k}^{(2)}$ is interleaved according to the sub-block interleaver defined in section 5.1.4.2.1 with an output sequence defined as $v_{0}^{(2)}, v_{1}^{(2)}, v_{2}^{(2)}, \ldots, v_{K_{\Pi}-1}^{(2)}$.

The sequence of bits $e_{k}$ for transmission is generated according to section 5.1.4.2.2.

### 5.1.4.2.1 Sub-block interleaver

The bits input to the block interleaver are denoted by $d_{0}^{(i)}, d_{1}^{(i)}, d_{2}^{(i)}, \ldots, d_{D-1}^{(i)}$, where $D$ is the number of bits. The output bit sequence from the block interleaver is derived as follows:
(1) Assign $C_{\text {subblock }}^{C C}=32$ to be the number of columns of the matrix. The columns of the matrix are numbered 0,1 , $2, \ldots, C_{\text {subblock }}^{C C}-1$ from left to right.
(2) Determine the number of rows of the matrix $R_{\text {subblock }}^{C C}$, by finding minimum integer $R_{\text {subblock }}^{C C}$ such that:

$$
D \leq\left(R_{\text {subblock }}^{C C} \times C_{\text {subblock }}^{C C}\right)
$$

The rows of rectangular matrix are numbered $0,1,2, \ldots, R_{\text {subblock }}^{C C}-1$ from top to bottom.
(3) If $\left(R_{\text {subblock }}^{C C} \times C_{\text {subblock }}^{C C}\right)>D$, then $N_{D}=\left(R_{\text {subblock }}^{C C} \times C_{\text {subblock }}^{C C}-D\right)$ dummy bits are padded such that $y_{k}=\langle N U L L>$ for $k=0,1, \ldots, N_{D}-1$. Then, $y_{N_{D}+k}=d_{k}^{(i)}, k=0,1, \ldots, D-1$, and the bit sequence $y_{k}$ is written into the $\left(R_{\text {subblock }}^{C C} \times C_{\text {subblock }}^{C C}\right)$ matrix row by row starting with bit $y_{0}$ in column 0 of row 0 :

$$
\left[\begin{array}{ccccc}
y_{0} & y_{1} & y_{2} & \cdots & y_{C_{\text {sublock }}^{C C}}-1 \\
y_{C_{\text {subblock }}^{C C}} & y_{C_{\text {subblock }}^{C C}}+1 & y_{C_{\text {subblock }}^{C C}}+2 & \cdots & y_{2 C_{\text {sublock }}^{C C}-1} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
\left.y_{\left(R_{\text {subblock }}^{C C}\right.}-1\right) \times C_{\text {subblock }}^{C C} & \left.y_{\left(R_{\text {subblock }}^{C C}\right.}-1\right) \times C_{\text {subblock }}^{C C}+1 & \left.y_{\left(R_{\text {subblock }}^{C C}\right.}-1\right) \times C_{\text {subblock }}^{C C}+2 & \cdots & \left.y_{\left(R_{\text {sublock }}^{C C}\right.} \times C_{\text {subblock }}^{C C}-1\right)
\end{array}\right]
$$

(4) Perform the inter-column permutation for the matrix based on the pattern $\left.\langle P(j)\rangle_{j \in\left\{0,1, \ldots, C_{\text {subblock }}-1\right\}}^{C C}\right\}$ that is shown in table 5.1.4-2, where $\mathrm{P}(j)$ is the original column position of the $j$-th permuted column. After permutation of the columns, the inter-column permuted $\left(R_{\text {subblock }}^{C C} \times C_{\text {subblock }}^{C C}\right)$ matrix is equal to

$$
\left[\begin{array}{ccccc}
y_{P(0)} & y_{P(1)} & y_{P(2)} & \cdots & y_{P\left(C_{\text {Sublock }}^{C C}-1\right)} \\
y_{P(0)+C_{\text {subblock }}^{C C}} & y_{P(1)+C_{\text {subblock }}^{C C}} & y_{P(2)+C_{\text {subblock }}^{C C}} & \cdots & y_{P\left(C_{\text {Sublock }}^{C C}-1\right)+C_{\text {subblock }}^{C C}} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
y_{P(0)+\left(R_{\text {subblock }}^{C C}-1\right) \times C_{\text {subblock }}^{C C}} & y_{P(1)+\left(R_{\text {subblock }}^{C C}-1\right) \times C_{\text {subblock }}^{C C}} & y_{P(2)+\left(R_{\text {subblock }}^{C C}-1\right) \times C_{\text {subblock }}^{C C}} & \cdots & y_{P\left(C_{\text {subllock }}^{C C}-1\right)+\left(R_{\text {subblock }}^{C C}-1\right) \times C_{\text {subblock }}^{C C}}^{C C}
\end{array}\right]
$$

(5) The output of the block interleaver is the bit sequence read out column by column from the inter-column permuted $\left(R_{\text {subblock }}^{C C} \times C_{\text {subblock }}^{C C}\right)$ matrix. The bits after sub-block interleaving are denoted by $v_{0}^{(i)}, v_{1}^{(i)}, v_{2}^{(i)}, \ldots, v_{K_{\Pi}-1}^{(i)}$, where $v_{0}^{(i)}$ corresponds to $y_{P(0)}, v_{1}^{(i)}$ to $y_{P(0)+C_{\text {subblock }}^{C C}} \ldots$ and $K_{\Pi}=\left(R_{\text {subblock }}^{C C} \times C_{\text {subblock }}^{C C}\right)$

Table 5.1.4-2 Inter-column permutation pattern for sub-block interleaver.

| Number of columns <br> $C_{\text {subblock }}^{C C}$ | Inter-column permutation pattern <br> $\left.<P(0), P(1), \ldots, P\left(C_{\text {subblock }}^{C C}-1\right)\right\rangle$ |
| :---: | :---: |
| 32 | $<1,17,9,25,5,21,13,29,3,19,11,27,7,23,15,31$, |
|  | $0,16,8,24,4,20,12,28,2,18,10,26,6,22,14,30\rangle$ |

This block interleaver is also used in interleaving PDCCH modulation symbols. In that case, the input bit sequence consists of PDCCH symbol quadruplets [2].

### 5.1.4.2.2 Bit collection, selection and transmission

The circular buffer of length $K_{w}=3 K_{\Pi}$ is generated as follows:

$$
\begin{array}{ll}
w_{k}=v_{k}^{(0)} & \text { for } k=0, \ldots, K_{\Pi}-1 \\
w_{K_{\Pi}+k}=v_{k}^{(1)} & \text { for } k=0, \ldots, K_{\Pi}-1 \\
w_{2 K_{\Pi}+k}=v_{k}^{(2)} & \text { for } k=0, \ldots, K_{\Pi}-1
\end{array}
$$

Denoting by $E$ the rate matching output sequence length, the rate matching output bit sequence is $e_{k}, k=0,1, \ldots, E-1$.
Set $k=0$ and $j=0$
while $\{k<E\}$

$$
\begin{gathered}
\text { if } w_{j \bmod K_{w}} \neq \ll N U L L> \\
e_{k}=w_{j \bmod K_{w}}
\end{gathered}
$$

$$
\begin{aligned}
& \quad k=k+1 \\
& \text { end if } \\
& j=j+1
\end{aligned}
$$

end while

### 5.1.5 Code block concatenation

The input bit sequence for the code block concatenation block are the sequences $e_{r k}$, for $r=0, \ldots, C-1$ and $k=0, \ldots, E_{r}-1$. The output bit sequence from the code block concatenation block is the sequence $f_{k}$ for $k=0, \ldots, G-1$.

The code block concatenation consists of sequentially concatenating the rate matching outputs for the different code blocks. Therefore,

Set $k=0$ and $r=0$
while $r<C$

$$
\text { Set } j=0
$$

while $j<E_{r}$

$$
\begin{aligned}
& f_{k}=e_{r j} \\
& k=k+1 \\
& j=j+1
\end{aligned}
$$

end while

$$
r=r+1
$$

end while

### 5.2 Uplink transport channels and control information

### 5.2.1 Random access channel

The sequence index for the random access channel is received from higher layers and is processed according to [2].

### 5.2.2 Uplink shared channel

Figure 5.2.2-1 shows the processing structure for the UL-SCH transport channel. Data arrives to the coding unit in the form of a maximum of one transport block every transmission time interval (TTI). The following coding steps can be identified:

- Add CRC to the transport block
- Code block segmentation and code block CRC attachment
- Channel coding of data and control information
- Rate matching
- Code block concatenation
- Multiplexing of data and control information
- Channel interleaver

The coding steps for UL-SCH transport channel are shown in the figure below.

Figure 5.2.2-1: Transport channel processing for UL-SCH.

### 5.2.2.1 Transport block CRC attachment

Error detection is provided on UL-SCH transport blocks through a Cyclic Redundancy Check (CRC).
The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1} . A$ is the size of the transport block and $L$ is the number of parity bits. The lowest order information bit $a_{0}$ is mapped to the most significant bit of the transport block as defined in section 6.1.1 of [5].

The parity bits are computed and attached to the UL-SCH transport block according to section 5.1 .1 setting $L$ to 24 bits and using the generator polynomial $g_{\text {CRC24A }}(D)$.

### 5.2.2.2 Code block segmentation and code block CRC attachment

The bits input to the code block segmentation are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$ where $B$ is the number of bits in the transport block (including CRC).

Code block segmentation and code block CRC attachment are performed according to section 5.1.2.
The bits after code block segmentation are denoted by $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-1\right)}$, where $r$ is the code block number and $K_{r}$ is the number of bits for code block number $r$.

### 5.2.2.3 Channel coding of UL-SCH

Code blocks are delivered to the channel coding block. The bits in a code block are denoted by $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-1\right)}$, where $r$ is the code block number, and $K_{r}$ is the number of bits in code block number $r$. The total number of code blocks is denoted by $C$ and each code block is individually turbo encoded according to section 5.1.3.2.

After encoding the bits are denoted by $d_{r 0}^{(i)}, d_{r 1}^{(i)}, d_{r 2}^{(i)}, d_{r 3}^{(i)}, \ldots, d_{r\left(D_{r}-1\right)}^{(i)}$, with $i=0,1$, and 2 and where $D_{r}$ is the number of bits on the $i$-th coded stream for code block number $r$, i.e. $D_{r}=K_{r}+4$.

### 5.2.2.4 Rate matching

Turbo coded blocks are delivered to the rate matching block. They are denoted by $d_{r 0}^{(i)}, d_{r 1}^{(i)}, d_{r 2}^{(i)}, d_{r 3}^{(i)}, \ldots, d_{r\left(D_{r}-1\right)}^{(i)}$, with $i=0,1$, and 2 , and where $r$ is the code block number, $i$ is the coded stream index, and $D_{r}$ is the number of bits in each coded stream of code block number $r$. The total number of code blocks is denoted by $C$ and each coded block is individually rate matched according to section 5.1.4.1.

After rate matching, the bits are denoted by $e_{r 0}, e_{r 1}, e_{r 2}, e_{r 3}, \ldots, e_{r\left(E_{r}-1\right)}$, where $r$ is the coded block number, and where $E_{r}$ is the number of rate matched bits for code block number $r$.

### 5.2.2.5 Code block concatenation

The bits input to the code block concatenation block are denoted by $e_{r 0}, e_{r 1}, e_{r 2}, e_{r 3}, \ldots, e_{r\left(E_{r}-1\right)}$ for $r=0, \ldots, C-1$ and where $E_{r}$ is the number of rate matched bits for the $r$-th code block.

Code block concatenation is performed according to section 5.1.5.
The bits after code block concatenation are denoted by $f_{0}, f_{1}, f_{2}, f_{3}, \ldots, f_{G-1}$, where $G$ is the total number of coded bits for transmission excluding the bits used for control transmission, when control information is multiplexed with the ULSCH transmission.

### 5.2.2.6 Channel coding of control information

Control data arrives at the coding unit in the form of channel quality information (CQI and/or PMI), HARQ-ACK and rank indication. Different coding rates for the control information are achieved by allocating different number of coded symbols for its transmission. When control data are transmitted in the PUSCH, the channel coding for HARQ-ACK, rank indication and channel quality information $o_{0}, o_{1}, o_{2}, \ldots, o_{O-1}$ is done independently.

For TDD, two HARQ-ACK feedback modes are supported by higher layer configuration.

- HARQ-ACK bundling, and
- HARQ-ACK multiplexing

For TDD HARQ-ACK bundling, HARQ-ACK consists of one or two bits information. For TDD HARQ-ACK multiplexing, HARQ-ACK consists of between one and four bits of information and the number of bits is determined as described in section 7.3 of [3].

When the UE transmits HARQ-ACK bits or rank indicator bits, it shall determine the number of coded symbols $Q^{\prime}$ for HARQ-ACK or rank indicator as
$Q^{\prime}=\min \left(\left[\frac{O \cdot M_{s c}^{\text {PUSCH-initial }} \cdot N_{\text {symb }}^{\text {PUSCH-initial }} \cdot \beta_{o f f s e t}^{\text {PUSCH }}}{\sum_{r=0}^{C-1} K_{r}}\right], 4 \cdot M_{s c}^{\text {PUSCH }}\right)$
where $O$ is the number of HARQ-ACK bits or rank indicator bits, $M_{\mathrm{sc}}^{\mathrm{PUSCH}}$ is the scheduled bandwidth for PUSCH transmission in the current sub-frame for the transport block, expressed as a number of subcarriers in [2], and $N_{\text {symb }}^{\text {PUSCH-initial }}$ is the number of SC-FDMA symbols per subframe for initial PUSCH transmission for the same transport block given by $N_{\text {symb }}^{\text {PUSCH-initial }}=\left(2 \cdot\left(N_{\text {symb }}^{\mathrm{UL}}-1\right)-N_{\text {SRS }}\right)$, where $N_{S R S}$ is equal to 1 if UE is configured to send PUSCH and SRS in the same subframe for initial transmission or if the PUSCH resource allocation for initial transmission even partially overlaps with the cell-specific SRS subframe and bandwidth configuration defined in section 5.5 .3 of [2]. Otherwise $N_{S R S}$ is equal to $0 . M_{s c}^{P U S C H-i n i t i a l}, C$, and $K_{r}$ are obtained from the initial PDCCH for the same transport block. If there is no initial PDCCH with DCI format 0 for the same transport block, $M_{s c}^{\text {PUSCH-initial }}, C$, and $K_{r}$ shall be determined from:

- the most recent semi-persistent scheduling assignment PDCCH, when the initial PUSCH for the same transport block is semi-persistently scheduled, or,
- the random access response grant for the same transport block, when the PUSCH is initiated by the random access response grant.

For HARQ-ACK, $Q_{A C K}=Q_{m} \cdot Q^{\prime}$ and $\left[\beta_{\text {offset }}^{P U S C H}=\beta_{\text {offset }}^{\text {HARQ-ACK }}\right]$, where $\beta_{\text {offset }}^{\text {HARQ-ACK }}$ shall be determined according to [3].

For rank indication, $Q_{R I}=Q_{m} \cdot Q^{\prime}$ and $\left[\beta_{\text {offset }}^{P U S C H}=\beta_{\text {offset }}^{R I}\right.$ ], where $\beta_{\text {offset }}^{R I}$ shall be determined according to [3].

## For HARQ-ACK

- Each positive acknowledgement (ACK) is encoded as a binary ' 1 ' and each negative acknowledgement (NACK) is encoded as a binary ' 0 '
- If HARQ-ACK consists of 1-bit of information, i.e., $\left[o_{0}^{A C K}\right]$, it is first encoded according to Table 5.2.2.6-1.
- If HARQ-ACK consists of 2-bits of information, i.e., $\left[o_{0}^{A C K} o_{1}^{A C K}\right.$ ] with $o_{0}^{A C K}$ corresponding to HARQACK bit for codeword 0 and $o_{1}^{A C K}$ corresponding to that for codeword 1, it is first encoded according to Table 5.2.2.6-2 where $o_{2}^{A C K}=\left(o_{0}^{A C K}+o_{1}^{A C K}\right) \bmod 2$.

Table 5.2.2.6-1: Encoding of 1-bit HARQ-ACK.

| $\boldsymbol{Q}_{\boldsymbol{m}}$ | Encoded HARQ-ACK |
| :---: | :---: |
| 2 | $\left[o_{0}^{A C K} \mathrm{y}\right]$ |
| 4 | $\left[o_{0}^{A C K} \mathrm{y} \mathrm{x} \mathrm{x}\right]$ |
| 6 | $\left[o_{0}^{A C K} \mathrm{y} \mathrm{x} \mathrm{x} \mathrm{x} \mathrm{x}\right]$ |

Table 5.2.2.6-2: Encoding of 2-bit HARQ-ACK.

| $Q_{m}$ | Encoded HARQ-ACK |
| :---: | :---: |
| 2 | $\left[o_{0}^{A C K} o_{1}^{A C K} o_{2}^{A C K} o_{0}^{A C K} o_{1}^{A C K} o_{2}^{A C K}\right]$ |
| 4 | $\left[o_{0}^{A C K} o_{1}^{A C K} \times \mathrm{x} \mathrm{x} o_{2}^{A C K} o_{0}^{A C K} \times \mathrm{x} o_{1}^{A C K} o_{2}^{A C K} \mathrm{x} \mathrm{x}\right]$ |
| 6 | $\left[o_{0}^{A C K} o_{1}^{A C K} \mathrm{xxxx} o_{2}^{A C K} o_{0}^{A C K} \mathrm{xxxx} o_{1}^{A C K} o_{2}^{A C K} \mathrm{x} \mathrm{x} \mathrm{x} \mathrm{x]}\right.$ |

The " $x$ " and " $y$ " in Table 5.2.2.6-1 and 5.2.2.6-2 are placeholders for [2] to scramble the HARQ-ACK bits in a way that maximizes the Euclidean distance of the modulation symbols carrying HARQ-ACK information.

For the cases with FDD or TDD HARQ-ACK multiplexing when HARQ-ACK consists of one or two bits of information, the bit sequence $q_{0}^{A C K}, q_{1}^{A C K}, q_{2}^{A C K}, \ldots, q_{Q_{A C K}-1}^{A C K}$ is obtained by concatenation of multiple encoded HARQACK blocks where $Q_{A C K}$ is the total number of coded bits for all the encoded HARQ-ACK blocks. The last concatenation of the encoded HARQ-ACK block may be partial so that the total bit sequence length is equal to $Q_{A C K}$.

For the case with TDD HARQ-ACK bundling, a bit sequence $\tilde{q}_{0}^{A C K}, \tilde{q}_{1}^{A C K}, \tilde{q}_{2}^{A C K}, \ldots, \tilde{q}_{Q_{A C K}-1}^{A C K}$ is obtained by concatenation of multiple encoded HARQ-ACK blocks where $Q_{A C K}$ is the total number of coded bits for all the encoded HARQ-ACK blocks. The last concatenation of the encoded HARQ-ACK block may be partial so that the total bit sequence length is equal to $Q_{A C K}$. A scrambling sequence $\left[w_{0}^{A C K} w_{1}^{A C K} w_{2}^{A C K} w_{3}^{A C K}\right]$ is then selected from Table 5.2.2.6-A with index $i=\left(N_{\text {bundled }}-1\right) \bmod 4$, where $N_{\text {bundled }}$ is determined as described in section 7.3 of [3]. The bit sequence $q_{0}^{A C K}, q_{1}^{A C K}, q_{2}^{A C K}{ }_{,}, \ldots, q_{Q_{A C K}-1}^{A C K}$ is then generated by setting $m=1$ if HARQ-ACK consists of 1-bit and $m=3$ if HARQ-ACK consists of 2-bits and then scrambling $\tilde{q}_{0}^{A C K}, \tilde{q}_{1}^{A C K}, \tilde{q}_{2}^{A C K}, \ldots, \widetilde{q}_{Q_{A C K}-1}^{A C K}$ as follows

Set $i, k$ to 0
while $i<Q_{A C K}$

$$
\begin{aligned}
& \text { if } \tilde{q}_{i}^{A C K}=y \quad \text { // place-holder repetition bit } \\
& q_{i}^{A C K}=\left(\tilde{q}_{i-1}^{A C K}+w_{\lfloor k / m\rfloor}^{A C K}\right) \bmod 2 \\
& k=(k+1) \bmod 4 m
\end{aligned}
$$

else

$$
\text { if } \tilde{q}_{i}^{A C K}=x \quad / / \text { a place-holder bit }
$$

$$
q_{i}^{A C K}=\tilde{q}_{i}^{A C K}
$$

else
// coded bit

$$
\begin{aligned}
& q_{i}^{A C K}=\left(\tilde{q}_{i}^{A C K}+w_{\lfloor k / m\rfloor}^{A C K}\right) \bmod 2 \\
& k=(k+1) \bmod 4 m
\end{aligned}
$$

end if

$$
i=i+1
$$

end while

Table 5.2.2.6-A: Scrambling sequence selection for TDD HARQ-ACK bundling.
$\left.\left.\begin{array}{|c|c|}\hline i & w_{0}^{A C K} w_{1}^{A C K} w_{2}^{A C K} w_{3}^{A C K}\end{array}\right] \left\lvert\, \begin{array}{llll}1 & 1 & 1 & 1\end{array}\right.\right]$

For the case that HARQ-ACK consists of more than two bits information, i.e. [ $o_{0}^{A C K} o_{1}^{A C K} \cdots o_{O^{A C K}{ }_{-1}}^{A C K}$ ] with $O^{A C K}>2$, the bit sequence $q_{0}^{A C K}, q_{1}^{A C K}, q_{2}^{A C K}, \ldots, q_{Q_{A C K}-1}^{A C K}$ is obtained as
$q_{i}^{A C K}=\sum_{n=0}^{O_{n}^{A C K}}\left(o_{n}^{A C K} \cdot M_{(i \bmod 32), n}\right) \bmod 2$
where $i=0,1,2, \ldots, Q_{A C K^{-1}}$ and the basis sequences $\mathrm{M}_{\mathrm{i}, \mathrm{n}}$ are defined in Table 5.2.2.6.4-1.
The vector sequence output of the channel coding for HARQ-ACK information is denoted by $\underline{q}_{0}^{A C K}, \underline{q}_{1}^{A C K}, \ldots, \underline{q}_{Q_{A C K}-1}^{A C K}$, where $Q_{A C K}^{\prime}=Q_{A C K} / Q_{m}$, and is obtained as follows:

Set $i, k$ to 0
while $i<Q_{A C K}$

$$
\begin{aligned}
& \underline{q}_{k}^{A C K}=\left[q_{i}^{A C K} \ldots q_{i+Q_{m}-1}^{A C K}\right]^{T} \\
& i=i+Q_{m} \\
& k=k+1
\end{aligned}
$$

end while
For rank indication (RI)

- The corresponding bit widths for RI feedback for PDSCH transmissions are given by Tables 5.2.2.6.1-2, 5.2.2.6.2-3, 5.2.2.6.3-3, 5.2.3.3.1-3 and 5.2.3.3.2-4, which are determined assuming the maximum number of layers according to the corresponding eNodeB antenna configuration and UE category.
- If RI consists of 1 -bit of information, i.e., $\left[o_{0}^{R I}\right]$, it is first encoded according to Table 5.2.2.6-3. The $\left[o_{0}^{R I}\right]$ to RI mapping is given by Table 5.2.2.6-5.
- If RI consists of 2-bits of information, i.e., $\left[o_{0}^{R I} o_{1}^{R I}\right]$ with $o_{0}^{R I}$ corresponding to MSB of 2-bit input and $o_{1}^{R I}$ corresponding to LSB, it is first encoded according to Table 5.2.2.6-4 where $o_{2}^{R I}=\left(o_{0}^{R I}+o_{1}^{R I}\right) \bmod 2$. The $\left[\begin{array}{ll}o_{0}^{R I} & o_{1}^{R I}\end{array}\right]$ to RI mapping is given by Table 5.2.2.6-6.

Table 5.2.2.6-3: Encoding of 1-bit RI.

| $\boldsymbol{Q}_{\boldsymbol{m}}$ | Encoded RI |
| :---: | :---: |
| 2 | $\left[o_{0}^{R I} \mathrm{y}\right]$ |
| 4 | $\left[o_{0}^{R I} \mathrm{y} \mathrm{x} \mathrm{x}\right]$ |
| 6 | $\left[o_{0}^{R I} \mathrm{y} \mathrm{x} \mathrm{x} \mathrm{x} \mathrm{x}\right]$ |

Table 5.2.2.6-4: Encoding of 2-bit RI.

| $\boldsymbol{Q}_{m}$ | Encoded RI |
| :---: | :---: |
| 2 | $\left[o_{0}^{R I} o_{1}^{R I} o_{2}^{R I} o_{0}^{R I} o_{1}^{R I} o_{2}^{R I}\right]$ |
| 4 | $\left[o_{0}^{R I} o_{1}^{R I} \times \times o_{2}^{R I} o_{0}^{R I} \times \times o_{1}^{R I} o_{2}^{R I} \times \mathrm{x}\right]$ |
| 6 | $\left[o_{0}^{R I} o_{1}^{R I} \times \times \times \times o_{2}^{R I} o_{0}^{R I} \times \times \times \times o_{1}^{R I} o_{2}^{R I} \times \mathrm{xx} \mathrm{\times x}\right]$ |

Table 5.2.2.6-5: $o_{0}^{R I}$ to RI mapping.

| $o_{0}^{R I}$ | $\mathbf{R I}$ |
| :---: | :---: |
| 0 | 1 |
| 1 | 2 |

Table 5.2.2.6-6: $o_{0}^{R I}$, $o_{1}^{R I}$ to RI mapping.

| $o_{0}^{R I}, o_{1}^{R I}$ | $\mathbf{R I}$ |
| :---: | :---: |
| 0,0 | 1 |
| 0,1 | 2 |
| 1,0 | 3 |
| 1,1 | 4 |

The " $x$ " and " $y$ " in Table 5.2.2.6-3 and 5.2.2.6-4 are placeholders for [2] to scramble the RI bits in a way that maximizes the Euclidean distance of the modulation symbols carrying rank information.

The bit sequence $q_{0}^{R I}, q_{1}^{R I}, q_{2}^{R I}, \ldots, q_{Q_{R I}-1}^{R I}$ is obtained by concatenation of multiple encoded RI blocks where $Q_{R I}$ is the total number of coded bits for all the encoded RI blocks. The last concatenation of the encoded RI block may be partial so that the total bit sequence length is equal to $Q_{R I}$. The vector sequence output of the channel coding for rank information is denoted by $\underline{q}_{0}^{R I}, \underline{q}_{1}^{R I}, \ldots, \underline{q}_{Q_{R I}^{\prime}-1}^{R I}$, where $Q_{R I}^{\prime}=Q_{R I} / Q_{m}$, and is obtained as follows:

Set $i, k$ to 0
while $i<Q_{R I}$

$$
\begin{aligned}
& \underline{q}_{k}^{R I}=\left[\begin{array}{ll}
q_{i}^{R I} & \ldots q_{i+Q_{m}-1}^{R I}
\end{array}\right]^{T} \\
& i=i+Q_{m} \\
& k=k+1
\end{aligned}
$$

end while

For channel quality control information (CQI and/or PMI denoted as CQI/PMI)

When the UE transmits channel quality control information bits, it shall determine the number of coded symbols $Q^{\prime}$ for channel quality information as
$Q^{\prime}=\min \left(\left[\frac{(O+L) \cdot M_{s c}^{\text {PUSCH-initial }} \cdot N_{s y m b}^{\text {PUCH-initial }} \cdot \beta_{o f f s e t}^{\text {PUSCH }}}{\sum_{r=0}^{C-1} K_{r}}\right), M_{s c}^{\text {PUSCH }} \cdot N_{s y m b}^{\text {PUSCH }}-\frac{Q_{R I}}{Q_{m}}\right)$ where $O$ is the number of CQI/PMI bits, $L$ is the number of CRC bits given by $L=\left\{\begin{array}{cc}0 & O \leq 11 \\ 8 & \text { otherwise }\end{array}, ~ Q_{C Q I}=Q_{m} \cdot Q^{\prime}\right.$ and $\left[\beta_{\text {offset }}^{\text {PUSCH }}=\beta_{\text {offset }}^{C Q I}\right.$ ], where $\beta_{\text {offset }}^{C Q I}$ shall be determined according to [3]. If RI is not transmitted then $Q_{R I}=0$.
$M_{s c}^{\text {PUSCH-initial }}, C$, and $K_{r}$ are obtained from the initial PDCCH for the same transport block. If there is no initial PDCCH with DCI format 0 for the same transport block, $M_{s c}^{\text {PUSCH-initial }}, C$, and $K_{r}$ shall be determined from:

- the most recent semi-persistent scheduling assignment PDCCH, when the initial PUSCH for the same transport block is semi-persistently scheduled, or,
- the random access response grant for the same transport block, when the PUSCH is initiated by the random access response grant.
$N_{\text {symb }}^{\text {PUSCH-initial }}$ is the number of SC-FDMA symbols per subframe for initial PUSCH transmission for the same transport block.

For UL-SCH data information $G=N_{\mathrm{symb}}^{\mathrm{PUSH}} \cdot M_{\mathrm{sc}}^{\text {PUSCH }} \cdot Q_{m}-Q_{C Q I}-Q_{R I}$, where $M_{\mathrm{sc}}^{\text {PUSCH }}$ is the scheduled bandwidth for PUSCH transmission in the current sub-frame for the transport block, and $N_{\text {symb }}^{\text {PUSCH }}$ is the number of SC-FDMA symbols in the current PUSCH transmission sub-frame given by $N_{\text {symb }}^{\text {PUCH }}=\left(2 \cdot\left(N_{\text {symb }}^{\mathrm{UL}}-1\right)-N_{\text {SRS }}\right)$, where $N_{\text {SRS }}$ is equal to 1 if UE is configured to send PUSCH and SRS in the same subframe for the current subframe or if the PUSCH resource allocation for the current subframe even partially overlaps with the cell-specific SRS subframe and bandwidth configuration defined in section 5.5 .3 of [2]. Otherwise $N_{S R S}$ is equal to 0 .

- If the payload size is less than or equal to 11 bits, the channel coding of the channel quality information is performed according to section 5.2.2.6.4 with input sequence $o_{0}, o_{1}, o_{2}, \ldots, o_{O-1}$.
- For payload sizes greater than 11 bits, the CRC attachment, channel coding and rate matching of the channel quality information is performed according to sections 5.1.1, 5.1.3.1 and 5.1.4.2, respectively. The input bit sequence to the CRC attachment is $o_{0}, o_{1}, o_{2}, \ldots, o_{O-1}$. The output bit sequence of the CRC attachment operation is the input bit sequence to the channel coding operation. The output bit sequence of the channel coding operation is the input bit sequence to the rate matching operation.

The output sequence for the channel coding of channel quality information is denoted by $q_{0}, q_{1}, q_{2}, q_{3}, \ldots, q_{Q_{\text {cel }}-1}$.

### 5.2.2.6.1 Channel quality information formats for wideband CQI reports

Table 5.2.2.6.1-1 shows the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with transmission mode 4, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting. $N$ in Table 5.2.2.6.1-1 is defined in section 7.2 of [3].

Table 5.2.2.6.1-1: Fields for channel quality information feedback for wideband CQI reports (transmission mode 4, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 2 antenna ports |  | 4 antenna ports |  |
|  | Rank = 1 | Rank = 2 | Rank = 1 | Rank > 1 |
| Wideband CQI codeword 0 | 4 | 4 | 4 | 4 |
| Wideband CQI codeword 1 | 0 | 4 | 0 | 4 |
| Precoding matrix indicator | $2 N$ | $N$ | $4 N$ | $4 N$ |

Table 5.2.2.6.1-2 shows the fields and the corresponding bit width for the rank indication feedback for wideband CQI reports for PDSCH transmissions associated with transmission mode 4 and transmission mode 8 configured with PMI/RI reporting.

Table 5.2.2.6.1-2: Fields for rank indication feedback for wideband CQI reports (transmission mode 4 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |
| :---: | :---: | :---: | :---: |
|  | 2 antenna ports | 4 antenna ports |  |
|  |  | Max 2 layers | Max 4 layers |
| Rank indication | 1 | 1 | 2 |

The channel quality bits in Table 5.2.2.6.1-1 form the bit sequence $o_{0}, o_{1}, o_{2}, \ldots, o_{O-1}$ with $o_{0}$ corresponding to the first bit of the first field in the table, $o_{1}$ corresponding to the second bit of the first field in the table, and $o_{O-1}$ corresponding to the last bit in the last field in the table. The field of PMI shall be in the increasing order of the subband index [3]. The first bit of each field corresponds to MSB and the last bit LSB. The RI bits sequence in Table 5.2.2.6.1-2 is encoded according to section 5.2.2.6.

### 5.2.2.6.2 Channel quality information formats for higher layer configured subband CQI reports

Table 5.2.2.6.2-1 shows the fields and the corresponding bit width for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7 and transmission mode 8 configured without PMI/RI reporting. $N$ in Table 5.2.2.6.2-1 is defined in section 7.2 of [3].

Table 5.2.2.6.2-1: Fields for channel quality information feedback for higher layer configured subband CQI reports
(transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7 and transmission mode 8 configured without $\mathrm{PMI} / \mathrm{RI}$ reporting).

| Field | Bit width |
| :---: | :---: |
| Wide-band CQI codeword | 4 |
| Subband differential CQI | $2 N$ |

Table 5.2.2.6.2-2 show the fields and the corresponding bit widths for the channel quality information feedback for higher layer configured report for PDSCH transmissions associated with transmission mode 4, transmission mode 5, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting. $N$ in Table 5.2.2.6.2-2 is defined in section 7.2 of [3].

Table 5.2.2.6.2-2: Fields for channel quality information feedback for higher layer configured subband CQI reports
(transmission mode 4, transmission mode 5, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{2}$ antenna ports |  | 4 antenna ports |  |
|  | Rank = 1 | Rank = 2 | Rank = 1 | Rank > 1 |
| Wide-band CQI codeword 0 | 4 | 4 | 4 | 4 |
| Subband differential CQI codeword 0 | $2 N$ | $2 N$ | $2 N$ | $2 N$ |
| Wide-band CQI codeword 1 | 0 | 4 | 0 | 4 |
| Subband differential CQI codeword 1 | 0 | $2 N$ | 0 | $2 N$ |
| Precoding matrix indicator | 2 | 1 | 4 | 4 |

Table 5.2.2.6.2-3 shows the fields and the corresponding bit width for the rank indication feedback for higher layer configured subband CQI reports for PDSCH transmissions associated with transmission mode 3, transmission mode 4 and transmission mode 8 configured with PMI/RI reporting.

Table 5.2.2.6.2-3: Fields for rank indication feedback for higher layer configured subband CQI reports (transmission mode 3, transmission mode 4 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |
| :---: | :---: | :---: | :---: |
|  | 2 antenna ports | 4 antenna ports |  |
|  |  | Max 2 layers | Max 4 layers |
| Rank indication | 1 | 1 | 2 |

The channel quality bits in Table 5.2.2.6.2-1 through Table 5.2.2.6.2-2 form the bit sequence $o_{0}, o_{1}, o_{2}, \ldots, o_{O-1}$ with $o_{0}$ corresponding to the first bit of the first field in each of the tables, $o_{1}$ corresponding to the second bit of the first field in each of the tables, and $o_{O-1}$ corresponding to the last bit in the last field in each of the tables. The field of the PMI and subband differential CQI shall be in the increasing order of the subband index [3]. The first bit of each field corresponds to MSB and the last bit LSB. The RI bits sequence in Table 5.2.2.6.2-3 is encoded according to section 5.2.2.6.

### 5.2.2.6.3 Channel quality information formats for UE selected subband CQI reports

Table 5.2.2.6.3-1 shows the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 1, transmission mode 2, transmission mode 3 , transmission mode 7 and transmission mode 8 configured without PMI/RI reporting. $L$ in Table 5.2.2.6.3-1 is defined in section 7.2 of [3].

Table 5.2.2.6.3-1: Fields for channel quality information feedback for UE selected subband CQI reports
(transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7 and transmission mode 8 configured without PMI/RI reporting).

| Field | Bit width |
| :---: | :---: |
| Wide-band CQI codeword | 4 |
| Subband differential CQI | 2 |
| Position of the M selected subbands | $L$ |

Table 5.2.2.6.3-2 shows the fields and the corresponding bit widths for the channel quality information feedback for UE selected subband CQI for PDSCH transmissions associated with transmission mode 4, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting. $L$ in Table 5.2.2.6.3-2 is defined in section 7.2 of [3].

Table 5.2.2.6.3-2: Fields for channel quality information feedback for UE selected subband CQI reports
(transmission mode 4, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{2}$ antenna ports |  | $\mathbf{4}$ antenna ports |  |
|  | Rank = 1 | Rank = 2 | Rank = 1 | Rank > 1 |
| Wide-band CQI codeword 0 | 4 | 4 | 4 | 4 |
| Subband differential CQI codeword 0 | 2 | 2 | 2 | 2 |
| Wide-band CQI codeword 1 | 0 | 4 | 0 | 4 |
| Subband differential CQI codeword 1 | 0 | 2 | 0 | 2 |
| Position of the M selected subbands | $L$ | $L$ | $L$ | $L$ |
| Precoding matrix indicator | 4 | 2 | 8 | 8 |

Table 5.2.2.6.3-3 shows the fields and the corresponding bit widths for the rank indication feedback for UE selected subband CQI reports for PDSCH transmissions associated with transmission mode 3, transmission mode 4 and transmission mode 8 configured with PMI/RI reporting.

Table 5.2.2.6.3-3: Fields for rank indication feedback for UE selected subband CQI reports (transmission mode 3, transmission mode 4 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |
| :---: | :---: | :---: | :---: |
|  | 2 antenna ports | 4 antenna ports |  |
|  |  | Max 2 layers | Max 4 layers |
| Rank indication | 1 | 1 | 2 |

The channel quality bits in Table 5.2.2.6.3-1 through Table 5.2.2.6.3-2 form the bit sequence $o_{0}, o_{1}, o_{2}, \ldots, o_{O-1}$ with $o_{0}$ corresponding to the first bit of the first field in each of the tables, $o_{1}$ corresponding to the second bit of the first field in each of the tables, and $o_{O-1}$ corresponding to the last bit in the last field in each of the tables. The field of PMI shall start with the wideband PMI followed by the PMI for the M selected subbands. The first bit of each field corresponds to MSB and the last bit LSB. The RI bits sequence in Table 5.2.2.6.3-3 is encoded according to section 5.2.2.6.

### 5.2.2.6.4 Channel coding for CQI/PMI information in PUSCH

The channel quality bits input to the channel coding block are denoted by $o_{0}, o_{1}, o_{2}, o_{3}, \ldots, o_{O-1}$ where $O$ is the number of bits. The number of channel quality bits depends on the transmission format. When PUCCH-based reporting format is used, the number of CQI/PMI bits is defined in section 5.2.3.3.1 for wideband reports and in section 5.2.3.3.2 for UE selected subbands reports. When PUSCH-based reporting format is used, the number of CQI/PMI bits is defined in section 5.2.2.6.1 for wideband reports, in section 5.2.2.6.2 for higher layer configured subbands reports and in section 5.2.2.6.3 for UE selected subbands reports.

The channel quality information is first coded using a $(32, O)$ block code. The code words of the $(32, O)$ block code are a linear combination of the 11 basis sequences denoted $\mathrm{M}_{\mathrm{i}, \mathrm{n}}$ and defined in Table 5.2.2.6.4-1.

Table 5.2.2.6.4-1: Basis sequences for (32, $O$ ) code.

| $\mathbf{i}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{0}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{1}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{2}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{3}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{4}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{5}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{6}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{7}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{8}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{9}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{1}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 2 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 1 |
| 3 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| 4 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 |
| 5 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 1 |
| 6 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 |
| 7 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 |
| 8 | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 |
| 9 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 1 | 1 |
| 10 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 1 |
| 11 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1 |
| 12 | 1 | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 1 |
| 13 | 1 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 |
| 14 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 0 | 1 |
| 15 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 1 | 1 |
| 16 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |
| 17 | 1 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 |
| 18 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 |
| 19 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 |
| 20 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 1 |
| 21 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 22 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 1 |
| 23 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 1 | 1 | 1 |
| 24 | 1 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 0 |
| 25 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 1 |
| 26 | 1 | 0 | 1 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 0 |
| 27 | 1 | 1 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 0 |
| 28 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 0 |
| 29 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 0 | 0 |
| 30 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| 31 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

The encoded CQI/PMI block is denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$ where $B=32$ and

$$
b_{i}=\sum_{n=0}^{O-1}\left(o_{n} \cdot M_{i, n}\right) \bmod 2 \text { where } i=0,1,2, \ldots, B-1
$$

The output bit sequence $q_{0}, q_{1}, q_{2}, q_{3}, \ldots, q_{Q_{C I^{\prime}-1}}$ is obtained by circular repetition of the encoded CQI/PMI block as follows

$$
q_{i}=b_{(i \bmod B)} \text { where } i=0,1,2, \ldots, Q_{C Q I-} 1 .
$$

### 5.2.2.7 Data and control multiplexing

The control and data multiplexing is performed such that HARQ-ACK information is present on both slots and is mapped to resources around the demodulation reference signals. In addition, the multiplexing ensures that control and data information are mapped to different modulation symbols.

The inputs to the data and control multiplexing are the coded bits of the control information denoted by $q_{0}, q_{1}, q_{2}, q_{3}, \ldots, q_{Q_{C I^{-}-1}}$ and the coded bits of the UL-SCH denoted by $f_{0}, f_{1}, f_{2}, f_{3}, \ldots, f_{G-1}$. The output of the data and control multiplexing operation is denoted by $\underline{g}_{0}, \underline{g}_{1}, \underline{g}_{2}, \underline{g}_{3}, \ldots, \underline{g}_{H^{\prime}-1}$, where $H=\left(G+Q_{C Q I}\right)$ and $H^{\prime}=H / Q_{m}$,
and where $\underline{g}_{i}, i=0, \ldots, H^{\prime}-1$ are column vectors of length $Q_{m} . H$ is the total number of coded bits allocated for ULSCH data and CQI/PMI information.

The control information and the data shall be multiplexed as follows:
Set $i, j, k$ to 0
while $j<Q_{C Q I}$-- first place the control information

$$
\begin{aligned}
& \underline{g}_{k}=\left[q_{j} \ldots q_{j+Q_{m}-1}\right]^{T} \\
& j=j+Q_{m} \\
& k=k+1
\end{aligned}
$$

end while
while $i<G$-- then place the data

$$
\begin{aligned}
& \underline{g}_{k}=\left[f_{i} \ldots f_{i+Q_{m}-1}\right]^{T} \\
& i=i+Q_{m} \\
& k=k+1
\end{aligned}
$$

end while

### 5.2.2.8 Channel interleaver

The channel interleaver described in this section in conjunction with the resource element mapping for PUSCH in [2] implements a time-first mapping of modulation symbols onto the transmit waveform while ensuring that the HARQACK information is present on both slots in the subframe and is mapped to resources around the uplink demodulation reference signals.

The input to the channel interleaver are denoted by $\underline{g}_{0}, \underline{g}_{1}, \underline{g}_{2}, \ldots, \underline{g}_{H^{\prime}-1}, \underline{q}_{0}^{R I}, \underline{q}_{1}^{R I}, \underline{q}_{2}^{R I}, \ldots, \underline{q}_{Q_{R I}^{\prime-1}}^{R I}$ and $\underline{q}_{0}^{A C K}, \underline{q}_{1}^{A C K}, \underline{q}_{2}^{A C K}, \ldots, \underline{q}_{Q_{A C K}-1}^{A C K}$. The number of modulation symbols in the subframe is given by $H^{\prime \prime}=H^{\prime}+Q_{R I}^{\prime}$. The output bit sequence from the channel interleaver is derived as follows:
(1) Assign $C_{m u x}=N_{\text {symb }}^{\text {PUSCH }}$ to be the number of columns of the matrix. The columns of the matrix are numbered 0 , $1,2, \ldots, C_{m u x}-1$ from left to right. $N_{\text {symb }}^{\text {PUSCH }}$ is determined according to section 5.2.2.6.
(2) The number of rows of the matrix is $R_{m u x}=\left(H^{\prime \prime} \cdot Q_{m}\right) / C_{m u x}$ and we define $R_{m u x}^{\prime}=R_{m u x} / Q_{m}$. The rows of the rectangular matrix are numbered $0,1,2, \ldots, R_{m u x}-1$ from top to bottom.
(3) If rank information is transmitted in this subframe, the vector sequence $\underline{q}_{0}^{R I}, \underline{q}_{1}^{R I}, \underline{q}_{2}^{R I}, \ldots, \underline{q}_{Q_{R I}^{\prime-1}}^{R I}$ is written onto the columns indicated by Table 5.2.2.8-1, and by sets of $Q_{m}$ rows starting from the last row and moving upwards according to the following pseudocode.

Set $i, j$ to 0 .
Set $r$ to $R_{m u x}^{\prime}-1$
while $i<Q_{R I}^{\prime}$

$$
c_{R I}=\operatorname{Column} \operatorname{Set}(j)
$$

$$
\begin{aligned}
& \underline{y}_{r \times C_{m u x}+c_{R I}}=\underline{q}_{i}^{R I} \\
& i=i+1 \\
& r=R_{m u x}^{\prime}-1-\lfloor i / 4\rfloor \\
& j=(j+3) \bmod 4
\end{aligned}
$$

end while
Where ColumnSet is given in Table 5.2.2.8-1 and indexed left to right from 0 to 3 .
(4) Write the input vector sequence, for $k=0,1, \ldots, H^{\prime}-1$, into the $\left(R_{m u x} \times C_{m u x}\right)$ matrix by sets of $Q_{m}$ rows starting with the vector $\underline{y}_{0}$ in column 0 and rows 0 to $\left(Q_{m}-1\right)$ and skipping the matrix entries that are already occupied:

$$
\left[\begin{array}{ccccc}
\underline{y}_{0} & \underline{y}_{1} & \underline{y}_{2} & \cdots & \underline{y}_{C_{m u x}-1} \\
\underline{y}_{C_{m u x}} & \underline{y}_{C_{\text {mux }}+1} & \underline{y}_{C_{\operatorname{mux}}+2} & \cdots & \underline{y}_{2 C_{\text {mux }}-1} \\
\vdots & \vdots & \vdots & \ddots & \vdots \\
\underline{y}_{\left(R_{\text {mux }}^{\prime}-1\right) \times C_{m u x}} & \underline{y}_{\left(R_{\text {mux }}^{\prime}-1\right) \times C_{m u x}+1} & \underline{y}_{\left(R_{\operatorname{mux}}^{\prime}-1\right) \times C_{\text {mux }}+2} & \cdots & \underline{y}_{\left(R_{\text {mux }}^{\prime} \times C_{m u x}-1\right)}
\end{array}\right]
$$

The pseudocode is as follows:
Set $\mathrm{i}, \mathrm{k}$ to 0 .
While $\mathrm{k}<H^{\prime}$,

$$
\text { if } \underline{y}_{i} \text { is not assigned to RI symbols }
$$

$$
\begin{aligned}
& \underline{y}_{i}=\underline{g}_{k} \\
& \mathrm{k}=\mathrm{k}+1
\end{aligned}
$$

end if

$$
\mathrm{i}=\mathrm{i}+1
$$

end While
(5) If HARQ-ACK information is transmitted in this subframe, the vector sequence $\underline{q}_{0}^{A C K}, \underline{q}_{1}^{A C K}, \underline{q}_{2}^{A C K}, \ldots, \underline{q}_{Q_{A C K}^{\prime}-1}^{A C K}$ is written onto the columns indicated by Table 5.2.2.8-2, and by sets of $Q_{m}$ rows starting from the last row and moving upwards according to the following pseudocode. Note that this operation overwrites some of the channel interleaver entries obtained in step (4).

Set $i, j$ to 0 .
Set $r$ to $R_{\text {mux }}^{\prime}-1$
while $i<Q_{A C K}^{\prime}$

$$
\begin{aligned}
& c_{A C K}=\operatorname{ColumnSet}(j) \\
& \underline{y}_{r \times C_{\operatorname{mux}}+c_{A C K}}=\underline{q}_{i}^{A C K} \\
& i=i+1 \\
& r=R_{\operatorname{mux}}^{\prime}-1-\lfloor i / 4\rfloor
\end{aligned}
$$

$$
j=(j+3) \bmod 4
$$

end while
Where ColumnSet is given in Table 5.2.2.8-2 and indexed left to right from 0 to 3 .
(6) The output of the block interleaver is the bit sequence read out column by column from the $\left(R_{m u x} \times C_{m u x}\right)$ matrix. The bits after channel interleaving are denoted by $h_{0}, h_{1}, h_{2}, \ldots, h_{H+Q_{R I}-1}$.

## Table 5.2.2.8-1: Column set for Insertion of rank information.

| CP configuration | Column Set |
| :--- | :---: |
| Normal | $\{1,4,7,10\}$ |
| Extended | $\{0,3,5,8\}$ |

Table 5.2.2.8-2: Column set for Insertion of HARQ-ACK information.

| CP configuration | Column Set |
| :--- | :---: |
| Normal | $\{2,3,8,9\}$ |
| Extended | $\{1,2,6,7\}$ |

### 5.2.3 Uplink control information on PUCCH

Data arrives to the coding unit in the form of indicators for measurement indication, scheduling request and HARQ acknowledgement.

Three forms of channel coding are used, one for the channel quality information CQI/PMI, another for HARQ-ACK (acknowledgement) and scheduling request and another for combination of CQI/PMI and HARQ-ACK.

Figure 5.2.3-1: Processing for UCI.

### 5.2.3.1 Channel coding for UCI HARQ-ACK

The HARQ-ACK bits are received from higher layers. HARQ-ACK consists of 1-bit of information, i.e., $b_{0}$ or 2-bits of information, i.e., $b_{0}, b_{1}$ with $b_{0}$ corresponding to HARQ-ACK bit for codeword 0 and $b_{1}$ corresponding to that for codeword 1. Each positive acknowledgement (ACK) is encoded as a binary ' 1 ' and each negative acknowledgement (NACK) is encoded as a binary ' 0 '. The HARQ-ACK bits are processed according to [2].

### 5.2.3.2 Channel coding for UCI scheduling request

The scheduling request indication is received from higher layers and is processed according to [2].

### 5.2.3.3 Channel coding for UCI channel quality information

The channel quality bits input to the channel coding block are denoted by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ where $A$ is the number of bits. The number of channel quality bits depends on the transmission format as indicated in section 5.2.3.3.1 for wideband reports and in section 5.2.3.3.2 for UE-selected subbands reports.

The channel quality information is coded using a $(20, A)$ code. The code words of the $(20, A)$ code are a linear combination of the 13 basis sequences denoted $\mathrm{M}_{\mathrm{i}, \mathrm{n}}$ and defined in Table 5.2.3.3-1.

Table 5.2.3.3-1: Basis sequences for ( $20, A$ ) code.

| $\mathbf{i}$ | $\mathbf{M}_{\mathbf{i} \mathbf{0} \mathbf{0}}$ | $\mathbf{M}_{\mathbf{i} \mathbf{1} \mathbf{1}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{2}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{3}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{4}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{5}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{6}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{7}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{8}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{9}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{1 0}}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{1} 1}$ | $\mathbf{M}_{\mathbf{i}, \mathbf{1 2}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 0 |
| 2 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 1 |
| 3 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 1 |
| 4 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 1 |
| 5 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 |
| 6 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 1 |
| 7 | 1 | 0 | 0 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 1 | 1 |
| 8 | 1 | 1 | 0 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 | 1 | 1 |
| 9 | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 1 |
| 10 | 1 | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 1 |
| 11 | 1 | 1 | 1 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 1 | 1 |
| 12 | 1 | 0 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| 13 | 1 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 | 1 | 1 |
| 14 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 | 0 | 1 | 0 | 1 |
| 15 | 1 | 1 | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 1 | 1 | 0 | 1 |
| 16 | 1 | 1 | 1 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 1 | 1 |
| 17 | 1 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 1 |
| 18 | 1 | 1 | 0 | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| 19 | 1 | 0 | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |

After encoding the bits are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$ where $B=20$ and with

$$
b_{i}=\sum_{n=0}^{A-1}\left(a_{n} \cdot M_{i, n}\right) \bmod 2 \text { where } i=0,1,2, \ldots, B-1
$$

### 5.2.3.3.1 Channel quality information formats for wideband reports

Table 5.2.3.3.1-1 shows the fields and the corresponding bit widths for the channel quality information feedback for wideband reports for PDSCH transmissions associated with a transmission mode 1, transmission mode 2, transmission mode 3 , transmission mode 7 and transmission mode 8 configured without PMI/RI reporting.

Table 5.2.3.3.1-1: UCI fields for channel quality information feedback for wideband CQI reports (transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7 and transmission mode 8 configured without PMI/RI reporting).

| Field | Bit width |
| :---: | :---: |
| Wide-band CQI | 4 |

Table 5.2.3.3.1-2 shows the fields and the corresponding bit widths for the channel quality and precoding matrix information feedback for wideband reports for PDSCH transmissions associated with transmission mode 4, transmission mode 5, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting.

Table 5.2.3.3.1-2: UCI fields for channel quality information feedback for wideband CQI reports (transmission mode 4, transmission mode 5, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 2 antenna ports |  | 4 antenna ports |  |
|  | Rank = 1 | Rank = 2 | Rank = 1 | Rank > 1 |
| Wide-band CQI | 4 | 4 | 4 | 4 |
| Spatial differential CQI | 0 | 3 | 0 | 3 |
| Precoding matrix indicator | 2 | 1 | 4 | 4 |

Table 5.2.3.3.1-3 shows the fields and the corresponding bit widths for the rank indication feedback for wideband reports for PDSCH transmissions associated with transmission mode 3 , transmission mode 4 and transmission mode 8 configured with PMI/RI reporting.

Table 5.2.3.3.1-3: UCI fields for rank indication feedback for wideband reports (transmission mode 3, transmission mode 4 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |
| :---: | :---: | :---: | :---: |
|  | 2 antenna ports | 4 antenna ports |  |
|  |  | Max 2 layers | Max 4 layers |
| Rank indication | 1 | 1 | 2 |

The channel quality bits in Table 5.2.3.3.1-1 through Table 5.2.3.3.1-3 form the bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ with $a_{0}$ corresponding to the first bit of the first field in each of the tables, $a_{1}$ corresponding to the second bit of the first field in each of the tables, and $a_{A-1}$ corresponding to the last bit in the last field in each of the tables. The first bit of each field corresponds to MSB and the last bit LSB. The RI feedback for one bit is mapped according to Table 5.2.2.6-5 with $o_{0}^{R I}$ replaced by $a_{0}$. The RI feedback for two bits is mapped according to Table 5.2.2.6-6 with $o_{0}^{R I}, o_{1}^{R I}$ replaced by $a_{0}, a_{1}$.

### 5.2.3.3.2 Channel quality information formats for UE-selected sub-band reports

Table 5.2.3.3.2-1 shows the fields and the corresponding bit widths for the sub-band channel quality information feedback for UE-selected sub-band reports for PDSCH transmissions associated with transmission mode 1, transmission mode 2 , transmission mode 3 , transmission mode 7 and transmission mode 8 configured without PMI/RI reporting.

Table 5.2.3.3.2-1: UCI fields for channel quality information feedback for UE-selected sub-band CQI reports (transmission mode 1, transmission mode 2, transmission mode 3, transmission mode 7 and transmission mode 8 configured without PMI/RI reporting).

| Field | Bit width |
| :---: | :---: |
| Sub-band CQI | 4 |
| Sub-band label | 1 or 2 |

Table 5.2.3.3.2-2 shows the fields and the corresponding bit widths for the sub-band channel quality information feedback for UE-selected sub-band reports for PDSCH transmissions associated with transmission mode 4, transmission mode 5, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting.

Table 5.2.3.3.2-2: UCI fields for channel quality information feedback for UE-selected sub-band reports (transmission mode 4, transmission mode 5, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $\mathbf{2}$ antenna ports |  | $\mathbf{4}$ antenna ports |  |
|  | Rank =1 | Rank = 2 | Rank = 1 | Rank > 1 |
| Sub-band CQI | 4 | 4 | 4 | 4 |
| Spatial differential CQI | 0 | 3 | 0 | 3 |
| Sub-band label | 1 or 2 | 1 or 2 | 1 or 2 | 1 or 2 |

Table 5.2.3.3.2-3 shows the fields and the corresponding bit widths for the wide-band channel quality and precoding
matrix information feedback for UE-selected sub-band reports for PDSCH transmissions associated with transmission mode 4 , transmission mode 5 , transmission mode 6 and transmission mode 8 configured with PMI/RI reporting.

Table 5.2.3.3.2-3: UCI fields for channel quality information feedback for UE-selected sub-band CQI reports (transmission mode 4, transmission mode 5, transmission mode 6 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  | 2 antenna ports | $\mathbf{4}$ antenna ports |  |  |
|  | Rank = 1 | Rank = 2 | Rank = 1 | Rank > 1 |
| Wide-band CQI | 4 | 4 | 4 | 4 |
| Spatial differential CQI | 0 | 3 | 0 | 3 |
| Precoding matrix indicator | 2 | 1 | 4 | 4 |

Table 5.2.3.3.2-4 shows the fields and the corresponding bit width for the rank indication feedback for UE-selected subband reports for PDSCH transmissions associated with transmission mode 3, transmission mode 4 and transmission mode 8 configured with $\mathrm{PMI} /$ RI reporting.

Table 5.2.3.3.2-4: UCI fields for rank indication feedback for UE-selected sub-band reports (transmission mode 3, transmission mode 4 and transmission mode 8 configured with PMI/RI reporting).

| Field | Bit width |  |  |
| :---: | :---: | :---: | :---: |
|  | 2 antenna ports | 4 antenna ports |  |
|  |  | Max 4 layers |  |
| Rank indication | 1 | 1 | 2 |

The channel quality bits in Table 5.2.3.3.2-1 through Table 5.2.3.3.2-4 form the bit sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ with $a_{0}$ corresponding to the first bit of the first field in each of the tables, $a_{1}$ corresponding to the second bit of the first field in each of the tables, and $a_{A-1}$ corresponding to the last bit in the last field in each of the tables. The first bit of each field corresponds to MSB and the last bit LSB. The RI feedback for one bit is mapped according to Table 5.2.2.6-5 with $o_{0}^{R I}$ replaced by $a_{0}$. The RI feedback for two bits is mapped according to Table 5.2.2.6-6 with $o_{0}^{R I}, o_{1}^{R I}$ replaced by $a_{0}, a_{1}$.

### 5.2.3.4 Channel coding for UCI channel quality information and HARQ-ACK

This section defines the channel coding scheme for the simultaneous transmission of channel quality information and HARQ-ACK information in a subframe.

When normal CP is used for uplink transmission, the channel quality information is coded according to section 5.2.3.3 with input bit sequence $a_{0}^{\prime}, a_{1}^{\prime}, a_{2}^{\prime}, a_{3}^{\prime}, \ldots, a_{A^{\prime}-1}^{\prime}$ and output bit sequence $b_{0}^{\prime}, b_{1}^{\prime}, b_{2}^{\prime}, b_{3}^{\prime}, \ldots, b_{B^{\prime}-1}^{\prime}$, where $B^{\prime}=20$. The HARQ-ACK bits are denoted by $a_{0}^{\prime \prime}$ in case one HARQ-ACK bit or $a_{0}^{\prime \prime}, a_{1}^{\prime \prime}$ in case two HARQ-ACK bits are reported per subframe. Each positive acknowledgement (NACK) is encoded as a binary ' 1 ' and each negative acknowledgement (NAK) is encoded as a binary ' 0 '.

The output of this channel coding block for normal CP is denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where

$$
b_{i}=b_{i}^{\prime}, i=0, \ldots, B^{\prime}-1
$$

In case one HARQ-ACK bit is reported per subframe:

$$
b_{B^{\prime}}=a_{0}^{\prime \prime} \text { and } B=\left(B^{\prime}+1\right)
$$

In case two HARQ-ACK bits are reported per subframe:

$$
b_{B^{\prime}}=a_{0}^{\prime \prime}, b_{B^{\prime}+1}=a_{1}^{\prime \prime} \text { and } B=\left(B^{\prime}+2\right)
$$

When extended CP is used for uplink transmission, the channel quality information and the HARQ-ACK bits are jointly coded. The HARQ-ACK bits are denoted by $a_{0}^{\prime \prime}$ in case one HARQ-ACK bit or $\left[a_{0}^{\prime \prime}, a_{1}^{\prime \prime}\right]$ in case two HARQ-ACK bits are reported per subframe.

The channel quality information denoted by $a_{0}^{\prime}, a_{1}^{\prime}, a_{2}^{\prime}, a_{3}^{\prime}, \ldots, a_{A^{\prime}-1}^{\prime}$ is multiplexed with the HARQ-ACK bits to yield the sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ as follows

$$
a_{i}=a_{i}^{\prime}, i=0, \ldots, A^{\prime}-1
$$

and
$a_{A^{\prime}}=a_{0}^{\prime \prime}$ and $A=\left(A^{\prime}+1\right)$ in case one HARQ-ACK bit is reported per subframe, or
$a_{A^{\prime}}=a_{0}^{\prime \prime}, a_{\left(A^{\prime}+1\right)}=a_{1}^{\prime \prime}$ and $A=\left(A^{\prime}+2\right)$ in case two HARQ-ACK bits are reported per subframe.
The sequence $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$ is encoded according to section 5.2.3.3 to yield the output bit sequence $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$ where $B=20$.

### 5.2.4 Uplink control information on PUSCH without UL-SCH data

When control data are sent via PUSCH without UL-SCH data, the following coding steps can be identified:

- Channel coding of control information
- Control information mapping
- Channel interleaver

### 5.2.4. $\quad$ Channel coding of control information

Control data arrives at the coding unit in the form of channel quality information (CQI and/or PMI), HARQ-ACK and rank indication. Different coding rates for the control information are achieved by allocating different number of coded symbols for its transmission. When the UE transmits HARQ-ACK bits or rank indicator bits, it shall determine the number of coded symbols $Q^{\prime}$ for HARQ-ACK or rank indicator as
$Q^{\prime}=\min \left(\left[\frac{O \cdot M_{s c}^{\text {PUSCH }} \cdot N_{s y m b}^{\text {PUSCH }} \cdot \beta_{o f f s e t}^{\text {PUSCH }}}{O_{C Q I-M I N}}\right\rceil, 4 \cdot M_{s c}^{\text {PUSCH }}\right)$
where $O$ is the number of HARQ-ACK bits, see also section 5.2.2.6 for the two HARQ-ACK feedback modes for TDD as configured by higher layers, or rank indicator bits, $O_{C Q I-M I N}$ is the number of CQI bits including CRC bits assuming rank equals to $1, M_{\text {sc }}^{\text {PUSCH }}$ is the scheduled bandwidth for PUSCH transmission in the current subframe expressed as a number of subcarriers in [2], and $N_{\text {symb }}^{\text {PUSCH }}$ is the number of SC-FDMA symbols in the current PUSCH transmission sub-frame given by $N_{\text {symb }}^{\text {PUSCH }}=\left(2 \cdot\left(N_{\text {symb }}^{\mathrm{UL}}-1\right)-N_{S R S}\right)$, where $N_{S R S}$ is equal to 1 if UE is configured to send PUSCH and SRS in the same subframe for the current subframe or if the PUSCH resource allocation for the current subframe even partially overlaps with the cell-specific SRS subframe and bandwidth configuration defined in section 5.5.3 of [2]. Otherwise $N_{S R S}$ is equal to 0 .

For HARQ-ACK information $Q_{A C K}=Q_{m} \cdot Q^{\prime}$ and $\left[\beta_{\text {offset }}^{\text {PUSCH }}=\beta_{\text {offset }}^{\text {HARQ-ACK }} / \beta_{\text {offset }}^{C O I}\right]$, where $\beta_{\text {offset }}^{\text {HARQ-ACK }}$ shall be determined according to [3].

For rank indication $Q_{R I}=Q_{m} \cdot Q^{\prime}$ and $\left[\beta_{\text {offset }}^{P U S C H}=\beta_{\text {offset }}^{R I} / \beta_{\text {offset }}^{C Q I}\right]$, where $\beta_{o f f s e t}^{R I}$ shall be determined according to [3].

For CQI and/or PMI information $Q_{C Q I}=N_{s y m b}^{\text {PUSCH }} \cdot M_{s c}^{\text {PUSCH }} \cdot Q_{m}-Q_{R I}$.

The channel coding and rate matching of the control data is performed according to section 5.2.2.6. The coded output sequence for channel quality information is denoted by $q_{0}, q_{1}, q_{2}, q_{3}, \ldots, q_{Q_{C Q^{\prime}-1}}$, the coded vector sequence output for HARQ-ACK is denoted by $\underline{q}_{0}^{A C K}, \underline{q}_{1}^{A C K}, \underline{q}_{2}^{A C K}, \ldots, \underline{q}_{Q_{A C K}^{\prime}-1}^{A C K}$ and the coded vector sequence output for rank indication is denoted by $\underline{q}_{0}^{R I}, \underline{q}_{1}^{R I}, \underline{q}_{2}^{R I}, \ldots, \underline{q}_{Q_{R l}-1}^{R I}$.

### 5.2.4.2 Control information mapping

The input are the coded bits of the channel quality information denoted by $q_{0}, q_{1}, q_{2}, q_{3}, \ldots, q_{Q_{C Q I}-1}$. The output is denoted by $\underline{g}_{0}, \underline{g}_{1}, \underline{g}_{2}, \underline{g}_{3}, \ldots, \underline{g}_{H^{\prime}-1}$, where $H=Q_{C Q I}$ and $H^{\prime}=H / Q_{m}$, and where $\underline{g}_{i}, i=0, \ldots, H^{\prime}-1$ are column vectors of length $Q_{m}$. $H$ is the total number of coded bits allocated for CQI/PMI information.

The control information shall be mapped as follows:
Set $j, k$ to 0
while $j<Q_{C Q I}$

$$
\begin{aligned}
& \underline{g}_{k}=\left[q_{j} \ldots q_{j+Q_{m}-1}\right]^{T} \\
& j=j+Q_{m} \\
& k=k+1
\end{aligned}
$$

end while

### 5.2.4.3 Channel interleaver

The vector sequences $\underline{g}_{0}, \underline{g}_{1}, \underline{g}_{2}, \ldots, \underline{g}_{H^{\prime}-1}, \underline{q}_{0}^{R I}, \underline{q}_{1}^{R I}, \underline{q}_{2}^{R I}, \ldots, \underline{q}_{Q_{R I}^{\prime-1}}^{R I}$ and $\underline{q}_{0}^{A C K}, \underline{q}_{1}^{A C K}, \underline{q}_{2}^{A C K}, \ldots, \underline{q}_{Q_{A C K}-1}^{A C K}$ are channel interleaved according section 5.2.2.8. The bits after channel interleaving are denoted by $h_{0}, h_{1}, h_{2}, \ldots, h_{H+Q_{R 1}-1}$.

### 5.3 Downlink transport channels and control information

### 5.3.1 Broadcast channel

Figure 5.3.1-1 shows the processing structure for the BCH transport channel. Data arrives to the coding unit in the form of a maximum of one transport block every transmission time interval (TTI) of 40 ms . The following coding steps can be identified:

- Add CRC to the transport block
- Channel coding
- Rate matching

The coding steps for BCH transport channel are shown in the figure below.

Figure 5.3.1-1: Transport channel processing for BCH.

### 5.3.1.1 Transport block CRC attachment

Error detection is provided on BCH transport blocks through a Cyclic Redundancy Check (CRC).
The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1} . A$ is the size of the transport block and set to 24 bits and $L$ is the number of parity bits. The lowest order information bit $a_{0}$ is mapped to the most significant bit of the transport block as defined in section 6.1.1 of [5].

The parity bits are computed and attached to the BCH transport block according to section 5.1 .1 setting $L$ to 16 bits. After the attachment, the CRC bits are scrambled according to the eNodeB transmit antenna configuration with the sequence $x_{a n t, 0}, x_{a n t, 1}, \ldots, x_{a n t, 15}$ as indicated in Table 5.3.1.1-1 to form the sequence of bits $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$ where

$$
\begin{array}{ll}
c_{k}=a_{k} & \text { for } k=0,1,2, \ldots, A-1 \\
c_{k}=\left(p_{k-A}+x_{a n t, k-A}\right) \bmod 2 & \text { for } k=A, A+1, A+2, \ldots, A+15
\end{array}
$$

Table 5.3.1.1-1: CRC mask for PBCH.

| Number of transmit antenna ports at eNodeB | PBCH CRC mask <br> $<x_{a n t, 0}, x_{a n t, 1}, \ldots, x_{a n t, 15}>$ |
| :---: | :---: |
| 1 | $<0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0>$ |
| 2 | $<1,1,1,1,1,1,1,1,1,1,1,1,1,1,1,1>$ |
| 4 | $<0,1,0,1,0,1,0,1,0,1,0,1,0,1,0,1>$ |

### 5.3.1.2 Channel coding

Information bits are delivered to the channel coding block. They are denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits, and they are tail biting convolutionally encoded according to section 5.1.3.1.

After encoding the bits are denoted by $d_{0}^{(i)}, d_{1}^{(i)}, d_{2}^{(i)}, d_{3}^{(i)}, \ldots, d_{D-1}^{(i)}$, with $i=0,1$, and 2 , and where $D$ is the number of bits on the $i$-th coded stream, i.e., $D=K$.

### 5.3.1.3 Rate matching

A tail biting convolutionally coded block is delivered to the rate matching block. This block of coded bits is denoted by $d_{0}^{(i)}, d_{1}^{(i)}, d_{2}^{(i)}, d_{3}^{(i)}, \ldots, d_{D-1}^{(i)}$, with $i=0,1$, and 2 , and where $i$ is the coded stream index and $D$ is the number of bits in each coded stream. This coded block is rate matched according to section 5.1.4.2.

After rate matching, the bits are denoted by $e_{0}, e_{1}, e_{2}, e_{3}, \ldots, e_{E-1}$, where $E$ is the number of rate matched bits as defined in section 6.6.1 of [2].

### 5.3.2 Downlink shared channel, Paging channel and Multicast channel

Figure 5.3.2-1 shows the processing structure for each transport block for the DL-SCH, PCH and MCH transport channels. Data arrives to the coding unit in the form of a maximum of two transport blocks every transmission time interval (TTI). The following coding steps can be identified for each transport block:

- Add CRC to the transport block
- Code block segmentation and code block CRC attachment
- Channel coding
- Rate matching
- Code block concatenation

The coding steps for DL-SCH, PCH and MCH transport channels are shown in the figure below.

Figure 5.3.2-1: Transport channel processing for DL-SCH, PCH and MCH.

### 5.3.2.1 Transport block CRC attachment

Error detection is provided on transport blocks through a Cyclic Redundancy Check (CRC).
The entire transport block is used to calculate the CRC parity bits. Denote the bits in a transport block delivered to layer 1 by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1} . A$ is the size of the transport block and $L$ is the number of parity bits. The lowest order information bit $a_{0}$ is mapped to the most significant bit of the transport block as defined in section 6.1.1 of [5].

The parity bits are computed and attached to the transport block according to section 5.1.1 setting $L$ to 24 bits and using the generator polynomial $g_{\text {CRC24A }}(D)$.

### 5.3.2.2 Code block segmentation and code block CRC attachment

The bits input to the code block segmentation are denoted by $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$ where $B$ is the number of bits in the transport block (including CRC).

Code block segmentation and code block CRC attachment are performed according to section 5.1.2.
The bits after code block segmentation are denoted by $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-1\right)}$, where $r$ is the code block number and $K_{r}$ is the number of bits for code block number $r$.

### 5.3.2.3 Channel coding

Code blocks are delivered to the channel coding block. They are denoted by $c_{r 0}, c_{r 1}, c_{r 2}, c_{r 3}, \ldots, c_{r\left(K_{r}-1\right)}$, where $r$ is the code block number, and $K_{r}$ is the number of bits in code block number $r$. The total number of code blocks is denoted by $C$ and each code block is individually turbo encoded according to section 5.1.3.2.

After encoding the bits are denoted by $d_{r 0}^{(i)}, d_{r 1}^{(i)}, d_{r 2}^{(i)}, d_{r 3}^{(i)}, \ldots, d_{r\left(D_{r}-1\right)}^{(i)}$, with $i=0,1$, and 2 , and where $D_{r}$ is the number of bits on the $i$-th coded stream for code block number $r$, i.e. $D_{r}=K_{r}+4$.

### 5.3.2.4 Rate matching

Turbo coded blocks are delivered to the rate matching block. They are denoted by $d_{r 0}^{(i)}, d_{r 1}^{(i)}, d_{r 2}^{(i)}, d_{r 3}^{(i)}, \ldots, d_{r\left(D_{r}-1\right)}^{(i)}$, with $i=0,1$, and 2 , and where $r$ is the code block number, $i$ is the coded stream index, and $D_{r}$ is the number of bits in each coded stream of code block number $r$. The total number of code blocks is denoted by $C$ and each coded block is individually rate matched according to section 5.1.4.1.

After rate matching, the bits are denoted by $e_{r 0}, e_{r 1}, e_{r 2}, e_{r 3}, \ldots, e_{r\left(E_{r}-1\right)}$, where $r$ is the coded block number, and where $E_{r}$ is the number of rate matched bits for code block number $r$.

### 5.3.2.5 Code block concatenation

The bits input to the code block concatenation block are denoted by $e_{r 0}, e_{r 1}, e_{r 2}, e_{r 3}, \ldots, e_{r\left(E_{r}-1\right)}$ for $r=0, \ldots, C-1$ and where $E_{r}$ is the number of rate matched bits for the $r$-th code block.

Code block concatenation is performed according to section 5.1.5.
The bits after code block concatenation are denoted by $f_{0}, f_{1}, f_{2}, f_{3}, \ldots, f_{G-1}$, where $G$ is the total number of coded bits for transmission. This sequence of coded bits corresponding to one transport block after code block concatenation is referred to as one codeword in section 6.3 .1 of [2]. In case of multiple transport blocks per TTI, the transport block to codeword mapping is specified according to section 5.3.3.1.5, 5.3.3.1.5A or 5.3.3.1.5B, depending on the DCI Format.

### 5.3.3 Downlink control information

A DCI transports downlink or uplink scheduling information, requests for aperiodic CQI reports, notifications of MCCH change [6] or uplink power control commands for one RNTI. The RNTI is implicitly encoded in the CRC.

Figure 5.3.3-1 shows the processing structure for the DCI. The following coding steps can be identified:

- Information element multiplexing
- CRC attachment
- Channel coding
- Rate matching

The coding steps for DCI are shown in the figure below.

Figure 5.3.3-1: Processing for DCI.

### 5.3.3.1 DCI formats

The fields defined in the DCI formats below are mapped to the information bits $a_{0}$ to $a_{A-1}$ as follows.
Each field is mapped in the order in which it appears in the description, including the zero-padding bit(s), if any, with the first field mapped to the lowest order information bit $a_{0}$ and each successive field mapped to higher order information bits. The most significant bit of each field is mapped to the lowest order information bit for that field, e.g. the most significant bit of the first field is mapped to $a_{0}$.

Note: DCI formats $0,1 \mathrm{~A}, 3$, and 3A shall have the same payload size.

### 5.3.3.1.1 Format 0

DCI format 0 is used for the scheduling of PUSCH.
The following information is transmitted by means of the DCI format 0 :

- Flag for format $0 /$ format 1 A differentiation - 1 bit, where value 0 indicates format 0 and value 1 indicates format 1 A
- Frequency hopping flag - 1 bit as defined in section 8.4 of [3]
- Resource block assignment and hopping resource allocation $-\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}}\left(N_{\mathrm{RB}}^{\mathrm{UL}}+1\right) / 2\right)\right\rceil$ bits
- For PUSCH hopping:
- $N_{U L \_ \text {_hop }}$ MSB bits are used to obtain the value of $\tilde{n}_{P R B}(i)$ as indicated in section 8.4 of [3]
- $\left(\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}}\left(N_{\mathrm{RB}}^{\mathrm{UL}}+1\right) / 2\right)\right\rceil-N_{\mathrm{UL} \_ \text {hop }}\right)$ bits provide the resource allocation of the first slot in the UL subframe
- For non-hopping PUSCH:

$$
-\left(\left[\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{UL}}\left(N_{\mathrm{RB}}^{\mathrm{UL}}+1\right) / 2\right)\right\rceil\right) \text { bits provide the resource allocation in the UL subframe as defined in section }
$$ 8.1 of [3]

- Modulation and coding scheme and redundancy version - 5 bits as defined in section 8.6 of [3]
- New data indicator - 1 bit
- TPC command for scheduled PUSCH - 2 bits as defined in section 5.1.1.1 of [3]
- Cyclic shift for DM RS - 3 bits as defined in section 5.5.2.1.1 of [2]
- UL index - 2 bits as defined in sections 5.1.1.1, 7.2.1, 8 and 8.4 of [3] (this field is present only for TDD operation with uplink-downlink configuration 0 )
- Downlink Assignment Index (DAI) - 2 bits as defined in section 7.3 of [3] (this field is present only for TDD operation with uplink-downlink configurations 1-6)
- CQI request - 1 bit as defined in section 7.2.1 of [3]

If the number of information bits in format 0 is less than the payload size of for format 1 A (including any padding bits appended to format 1 A ), zeros shall be appended to format 0 until the payload size equals that of format 1 A .

### 5.3.3.1.2 Format 1

DCI format 1 is used for the scheduling of one PDSCH codeword.
The following information is transmitted by means of the DCI format 1 :

- Resource allocation header (resource allocation type 0 / type 1) - 1 bit as defined in section 7.1.6 of [3]

If downlink bandwidth is less than or equal to 10 PRBs , there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:
- For resource allocation type 0 as defined in section 7.1.6.1 of [3]:

$$
-\left\lceil N_{\mathrm{RB}}^{\mathrm{DL}} / P\right\rceil \text { bits provide the resource allocation }
$$

- For resource allocation type 1 as defined in section 7.1.6.2 of [3]:
- $\left\lceil\log _{2}(P)\right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset
- 1 bit indicates a shift of the resource allocation span
- $\left.\left(N_{\mathrm{RB}}^{\mathrm{DL}} / P\right\rceil-\left\lceil\log _{2}(P)\right\rceil-1\right)$ bits provide the resource allocation
where the value of P depends on the number of DL resource blocks as indicated in section 7.1. 6 of [3]
- Modulation and coding scheme - 5 bits as defined in section 7.1.7 of [3]
- HARQ process number - 3 bits (FDD), 4 bits (TDD)
- New data indicator - 1 bit
- Redundancy version - 2 bits
- TPC command for PUCCH - 2 bits as defined in section 5.1.2.1 of [3]
- Downlink Assignment Index (this field is present in TDD for all the uplink -downlink configurations and only applies to TDD operation with uplink -downlink configuration 1-6. This field is not present in FDD) - 2 bits

If the number of information bits in format 1 is equal to that for format $0 / 1 \mathrm{~A}$, one bit of value zero shall be appended to format 1 .

If the number of information bits in format 1 belongs to one of the sizes in Table 5.3.3.1.2-1, one or more zero bit(s) shall be appended to format 1 until the payload size of format 1 does not belong to one of the sizes in Table 5.3.3.1.2-1 and is not equal to that of format $0 / 1 \mathrm{~A}$.

## Table 5.3.3.1.2-1: Ambiguous Sizes of Information Bits.

\{12, 14, 16,20, 24, 26, 32, 40, 44, 56\}

### 5.3.3.1.3 Format 1A

DCI format 1A is used for the compact scheduling of one PDSCH codeword and random access procedure initiated by a PDCCH order.

The following information is transmitted by means of the DCI format 1 A :

- Flag for format $0 /$ format 1 A differentiation - 1 bit, where value 0 indicates format 0 and value 1 indicates format 1 A

Format 1 A is used for random access procedure initiated by a PDCCH order only if format 1 A CRC is scrambled with C-RNTI and all the remaining fields are set as follows:

- Localized/Distributed VRB assignment flag - 1 bit is set to ' 0 '
- Resource block assignment $-\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil$ bits, where all bits shall be set to 1
- Preamble Index - 6 bits
- PRACH Mask Index - 4 bits, [5]
- All the remaining bits in format 1 A for compact scheduling assignment of one PDSCH codeword are set to zero

Otherwise,

- Localized/Distributed VRB assignment flag - 1 bit as defined in 7.1.6.3 of [3]
- Resource block assignment $-\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right]$ bits as defined in section 7.1.6.3 of [3]:
- For localized VRB:
$\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil$ bits provide the resource allocation
- For distributed VRB:
- If $N_{\mathrm{RB}}^{\mathrm{DL}}<50$ or if the format 1 A CRC is scrambled by RA-RNTI, P-RNTI, or SI-RNTI

$$
-\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil \text { bits provide the resource allocation }
$$

- Else
- 1 bit, the MSB indicates the gap value, where value 0 indicates $N_{\text {gap }}=N_{\text {gap, } 1}$ and value 1 indicates $N_{\text {gap }}=N_{\text {gap }, 2}$

$$
\left.-\left(\mid \log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil-1\right) \text { bits provide the resource allocation, }
$$

where $N_{\text {gap }}$ is defined in [2].

- Modulation and coding scheme - 5bits as defined in section 7.1.7 of [3]
- HARQ process number - 3 bits (FDD), 4 bits (TDD)
- New data indicator - 1 bit
- If the format 1A CRC is scrambled by RA-RNTI, P-RNTI, or SI-RNTI:
- If $N_{\mathrm{RB}}^{\mathrm{DL}} \geq 50$ and Localized/Distributed VRB assignment flag is set to 1
- the new data indicator bit indicates the gap value, where value 0 indicates $N_{\text {gap }}=N_{\text {gap, } 1}$ and value 1 indicates $N_{\text {gap }}=N_{\text {gap }, 2}$.
- Else the new data indicator bit is reserved.
- Else
- The new data indicator bit as defined in [5]
- Redundancy version - 2 bits
- TPC command for PUCCH - 2 bits as defined in section 5.1.2.1 of [3]
- If the format 1A CRC is scrambled by RA-RNTI, P-RNTI, or SI-RNTI:
- The most significant bit of the TPC command is reserved.
- The least significant bit of the TPC command indicates column $N_{\text {PRB }}^{1 \mathrm{~A}}$ of the TBS table defined of [3].
- If least significant bit is 0 then $N_{\text {PRB }}^{1 \mathrm{~A}}=2$ else $N_{\text {PRB }}^{1 \mathrm{~A}}=3$.
- Else
- The two bits including the most significant bit indicates the TPC command
- Downlink Assignment Index (this field is present in TDD for all the uplink -downlink configurations and only applies to TDD operation with uplink -downlink configuration 1-6. This field is not present in FDD) - 2 bits

If the number of information bits in format 1 A is less than that of format 0 , zeros shall be appended to format 1 A until the payload size equals that of format 0 .

If the number of information bits in format 1 A belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 1 A .

When the format 1A CRC is scrambled with a RA-RNTI, P-RNTI, or SI-RNTI then the following fields among the fields above are reserved:

- HARQ process number
- Downlink Assignment Index (used for TDD only and is not present in FDD)

### 5.3.3.1.3A Format 1B

DCI format 1B is used for the compact scheduling of one PDSCH codeword with precoding information.
The following information is transmitted by means of the DCI format 1 B :

- Localized/Distributed VRB assignment flag - 1 bit as defined in section 7.1.6.3 of [3]
- Resource block assignment $-\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil$ bits as defined in section 7.1.6.3 of [3]
- For localized VRB:

$$
\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil \text { bits provide the resource allocation }
$$

- For distributed VRB:

$$
\text { - For } N_{\mathrm{RB}}^{\mathrm{DL}}<50
$$

$-\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil$ bits provide the resource allocation

- For $N_{\mathrm{RB}}^{\mathrm{DL}} \geq 50$
- 1 bit, the MSB indicates the gap value, where value 0 indicates $N_{\text {gap }}=N_{\text {gap, } 1}$ and value 1 indicates

$$
N_{\text {gap }}=N_{\text {gap }, 2}
$$

$-\left(\left[\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil-1\right)$ bits provide the resource allocation

- Modulation and coding scheme - 5bits as defined in section 7.1.7 of [3]
- HARQ process number - 3 bits (FDD) , 4 bits (TDD)
- New data indicator - 1 bit
- Redundancy version - 2 bits
- TPC command for PUCCH - 2 bits as defined in section 5.1.2.1 of [3]
- Downlink Assignment Index (this field is present in TDD for all the uplink -downlink configurations and only applies to TDD operation with uplink -downlink configuration 1-6. This field is not present in FDD) - 2 bits
- TPMI information for precoding - number of bits as specified in Table 5.3.3.1.3A-1

TPMI information indicates which codebook index is used in Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 of [2] corresponding to the single-layer transmission.

- PMI confirmation for precoding - 1 bit as specified in Table 5.3.3.1.3A-2

Table 5.3.3.1.3A-1: Number of bits for TPMI information.

| Number of antenna ports <br> at eNodeB | Number <br> of bits |
| :---: | :---: |
| 2 | 2 |
| 4 | 4 |

Table 5.3.3.1.3A-2: Content of PMI confirmation.

| Bit field mapped <br> to index | Message |
| :---: | :---: |
| 0 | Precoding according to the indicated TPMI in <br> the TPMI information field |
| 1 | Precoding according to the latest PMI report on <br> PUSCH using the precoder(s) indicated by the <br> reported PMI(s) |

If the number of information bits in format 1 B belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 1B.

### 5.3.3.1.4 Format 1C

DCI format 1C is used for very compact scheduling of one PDSCH codeword and notifying MCCH change [6].
The following information is transmitted by means of the DCI format 1 C :
If the format 1 C is used for very compact scheduling of one PDSCH codeword

- 1 bit indicates the gap value, where value 0 indicates $N_{\text {gap }}=N_{\text {gap }, 1}$ and value 1 indicates $N_{\text {gap }}=N_{\text {gap }, 2}$
- For $N_{\mathrm{RB}}^{\mathrm{DL}}<50$, there is no bit for gap indication
- Resource block assignment $-\left\lceil\log _{2}\left(\left\lfloor N_{\mathrm{VRB}, \text { gap1 }}^{\mathrm{DL}} / N_{\mathrm{RB}}^{\text {step }}\right\rfloor \cdot\left(\left\lfloor N_{\mathrm{VRB}, \mathrm{gap} 1}^{\mathrm{DL}} / N_{\mathrm{RB}}^{\text {step }}\right\rfloor+1\right) / 2\right)\right\rceil$ bits as defined in 7.1.6.3 of [3] where $N_{\mathrm{VRB}, \text { gap } 1}^{\mathrm{DL}}$ is defined in [2] and $N_{\mathrm{RB}}^{\text {step }}$ is defined in [3]
- Transport block size index - 5 bits as defined in section 7.1.7 of [3]

Else

- Information for MCCH change notification - 8 bits as defined in section 5.8.1.3 of [6]
- Reserved information bits are added until the size is equal to that of format 1C used for very compact scheduling of one PDSCH codeword

### 5.3.3.1.4A Format 1D

DCI format 1D is used for the compact scheduling of one PDSCH codeword with precoding and power offset information.

The following information is transmitted by means of the DCI format 1D:

- Localized/Distributed VRB assignment flag - 1 bit as defined in section 7.1.6.3 of [3]
- Resource block assignment $-\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil$ bits as defined in section 7.1.6.3 of [3]:
- For localized VRB:

$$
\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil \text { bits provide the resource allocation }
$$

- For distributed VRB:

$$
\text { - For } N_{\mathrm{RB}}^{\mathrm{DL}}<50
$$

$$
-\left\lceil\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil \text { bits provide the resource allocation }
$$

- For $N_{\mathrm{RB}}^{\mathrm{DL}} \geq 50$
- 1 bit, the MSB indicates the gap value, where value 0 indicates $N_{\text {gap }}=N_{\text {gap, } 1}$ and value 1 indicates

$$
\begin{aligned}
N_{\text {gap }} & =N_{\text {gap }, 2} \\
& -\left(\left[\log _{2}\left(N_{\mathrm{RB}}^{\mathrm{DL}}\left(N_{\mathrm{RB}}^{\mathrm{DL}}+1\right) / 2\right)\right\rceil-1\right) \text { bits provide the resource allocation }
\end{aligned}
$$

- Modulation and coding scheme - 5bits as defined in section 7.1.7 of [3]
- HARQ process number - 3 bits (FDD), 4 bits (TDD)
- New data indicator - 1 bit
- Redundancy version - 2 bits
- TPC command for PUCCH - 2 bits as defined in section 5.1.2.1 of [3]
- Downlink Assignment Index (this field is present in TDD for all the uplink -downlink configurations and only applies to TDD operation with uplink -downlink configuration 1-6. This field is not present in FDD) - 2 bits
- TPMI information for precoding - number of bits as specified in Table 5.3.3.1.4A-1

TPMI information indicates which codebook index is used in Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 of [2] corresponding to the single-layer transmission.

- Downlink power offset - 1 bit as defined in section 7.1.5 of [3]

Table 5.3.3.1.4A-1: Number of bits for TPMI information.

| Number of antenna ports <br> at eNodeB | Number <br> of bits |
| :---: | :---: |
| 2 | 2 |
| 4 | 4 |

If the number of information bits in format 1D belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 1D.

### 5.3.3.1.5 Format 2

The following information is transmitted by means of the DCI format 2 :

- Resource allocation header (resource allocation type 0 / type 1) - 1 bit as defined in section 7.1.6 of [3]

If downlink bandwidth is less than or equal to 10 PRBs , there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:
- For resource allocation type 0 defined in section 7.1.6.1 of [3]:
$-\left\lceil N_{\mathrm{RB}}^{\mathrm{DL}} / P\right\rceil$ bits provide the resource allocation
- For resource allocation type 1 as defined in section 7.1.6.2 of [3]:
- $\left\lceil\log _{2}(P)\right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset
- 1 bit indicates a shift of the resource allocation span
- $\left.\left(N_{\mathrm{RB}}^{\mathrm{DL}} / P\right\rceil-\left\lceil\log _{2}(P)\right\rceil-1\right)$ bits provide the resource allocation
where the value of P depends on the number of DL resource blocks as indicated in section 7.1.6.1 of [3]
- TPC command for PUCCH - 2 bits as defined in section 5.1.2.1 of [3]
- Downlink Assignment Index (this field is present in TDD for all the uplink -downlink configurations and only applies to TDD operation with uplink -downlink configuration 1-6. This field is not present in FDD) - 2 bits
- HARQ process number - 3 bits (FDD), 4 bits (TDD)
- Transport block to codeword swap flag - 1 bit

In addition, for transport block 1:

- Modulation and coding scheme - 5 bits as defined in section 7.1.7 of [3]
- New data indicator - 1 bit
- Redundancy version - 2 bits

In addition, for transport block 2:

- Modulation and coding scheme - 5 bits as defined in section 7.1.7 of [3]
- New data indicator - 1 bit
- Redundancy version - 2 bits

Precoding information - number of bits as specified in Table 5.3.3.1.5-3
If both transport blocks are enabled, the transport block to codeword mapping is specified according to Table 5.3.3.1.5-1.

In case one of the transport blocks is disabled as specified in section 7.1.7.2 of [3], the transport block to codeword swap flag is reserved and the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2.

Table 5.3.3.1.5-1: Transport block to codeword mapping (two transport blocks enabled).

| transport block <br> to codeword <br> swap flag value | codeword 0 <br> (enabled) | codeword 1 <br> (enabled) |
| :---: | :---: | :---: |
| 0 | transport block 1 | transport block 2 |
| 1 | transport block 2 | transport block 1 |

Table 5.3.3.1.5-2: Transport block to codeword mapping (one transport block enabled).

| transport | transport | codeword | codew |
| :---: | :---: | :---: | :---: |
| block 1 | block 2 | 0 | ord 1 |
| (enabled) | (disabled) |  |  |
| enabled | disabled | transport <br> block 1 | - |
| disabled | enabled | transport <br> block 2 |  |

The interpretation of the precoding information field depends on the number of enabled codewords according to Table 5.3.3.1.5-4 and Table 5.3.3.1.5-5. Note that TPMI indicates which codebook index is used in Table 6.3.4.2.3-1 or Table 6.3.4.2.3-2 of [2]. For a single enabled codeword, indices 18 to 34 inclusive in Table 5.3.3.1.5-5 are only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two layers with closed-loop spatial multiplexing.

If the number of information bits in format 2 belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 2.

Some entries in Table 5.3.3.1.5-4 and Table 5.3.3.1.5-5 are used for indicating that the eNodeB has applied precoding according to $\mathrm{PMI}(\mathrm{s})$ reported by the UE. In these cases the precoding for the corresponding $\mathrm{RB}(\mathrm{s})$ in subframe $n$ is according to the latest PMI(s) reported by the UE on PUSCH, not coming from PUCCH, on or before subframe n-4.

Table 5.3.3.1.5-3: Number of bits for precoding information.

| Number of antenna ports at eNodeB | Number of bits for precoding information |
| :---: | :---: |
| 2 | 3 |
| 4 | 6 |

Table 5.3.3.1.5-4: Content of precoding information field for 2 antenna ports.

| One codeword: Codeword 0 enabled, Codeword 1 disabled |  | Two codewords: Codeword 0 enabled, Codeword 1 enabled |  |
| :---: | :---: | :---: | :---: |
| Bit field mapped to index | Message | Bit field mapped to index | Message |
| 0 | 2 layers: Transmit diversity | 0 | 2 layers: Precoding corresponding to precoder matrix $\frac{1}{2}\left[\begin{array}{cc} 1 & 1 \\ 1 & -1 \end{array}\right]$ |
| 1 | 1 layer: Precoding corresponding to precoding vector $\left[\begin{array}{ll} 1 & 1 \end{array}\right]^{T} / \sqrt{2}$ | 1 | 2 layers: Precoding corresponding to precoder matrix $\frac{1}{2}\left[\begin{array}{cc} 1 & 1 \\ j & -j \end{array}\right]$ |
| 2 | 1 layer: Precoding corresponding to precoder vector $\left[\begin{array}{cc} 1 & -1 \end{array}\right]^{T} / \sqrt{2}$ | 2 | 2 layers: Precoding according to the latest PMI report on PUSCH, using the precoder(s) indicated by the reported PMI(s) |
| 3 | 1 layer: Precoding corresponding to precoder vector $\left[\begin{array}{ll} 1 & j \end{array}\right]^{T} / \sqrt{2}$ | 3 | reserved |
| 4 | 1 layer: Precoding corresponding to precoder vector $\left[\begin{array}{ll} 1 & -j \end{array}\right]^{T} / \sqrt{2}$ | 4 | reserved |
| 5 | 1 layer: <br> Precoding according to the latest PMI report on <br> PUSCH, using the precoder(s) indicated by the reported $\mathrm{PMI}(\mathrm{s})$, if $\mathrm{RI}=2$ was reported, using $1^{\text {st }}$ column multiplied by $\sqrt{2}$ of all precoders implied by the reported $\mathrm{PMI}(\mathrm{s})$ | 5 | reserved |
| 6 | 1 layer: <br> Precoding according to the latest PMI report on PUSCH, using the precoder(s) indicated by the reported $\mathrm{PMI}(\mathrm{s})$, if RI=2 was reported, using $2^{\text {nd }}$ column multiplied by $\sqrt{2}$ of all precoders implied by the reported PMI(s) | 6 | reserved |
| 7 | reserved | 7 | reserved |

Table 5.3.3.1.5-5: Content of precoding information field for 4 antenna ports.

| One codeword: Codeword 0 enabled, Codeword 1 disabled |  | Two codewords: Codeword 0 enabled, Codeword 1 enabled |  |
| :---: | :---: | :---: | :---: |
| Bit field mapped to index | Message | Bit field mapped to index | Message |
| 0 | 4 layers: Transmit diversity | 0 | 2 layers: TPMI=0 |

| 34 | 2 layers: Precoding according to the latest PMI report on PUSCH using the precoder(s) indicated by the reported $\mathrm{PMI}(\mathrm{s})$ | 34 | 4 layers: TPMI=0 |
| 35-63 | reserved | 35 | 4 layers: TPMI=1 |
|  |  | : | : |
|  |  | 49 | 4 layers: TPMI=15 |
|  |  | 50 | 4 layers: Precoding according to the latest PMI report on PUSCH using the precoder(s) indicated by the reported PMI(s) |
|  |  | 51-63 | Reserved |

### 5.3.3.1.5A Format 2A

The following information is transmitted by means of the DCI format 2 A :

- Resource allocation header (resource allocation type 0 / type 1) - 1 bit as defined in section 7.1.6 of [3]

If downlink bandwidth is less than or equal to 10 PRBs, there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:
- For resource allocation type 0 as defined in section 7.1.6.1 of [3]
$-\left\lceil N_{\mathrm{RB}}^{\mathrm{DL}} / P\right\rceil$ bits provide the resource allocation
- For resource allocation type 1 as defined in section 7.1.6.2 of [3]
- $\left\lceil\log _{2}(P)\right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset
- 1 bit indicates a shift of the resource allocation span
$\left.-\left\lceil N_{\mathrm{RB}}^{\mathrm{DL}} / P\right\rceil-\left\lceil\log _{2}(P)\right\rceil-1\right)$ bits provide the resource allocation
where the value of P depends on the number of DL resource blocks as indicated in section 7.1.6.1 of [3]
- TPC command for PUCCH - 2 bits as defined in section 5.1.2.1 of [3]
- Downlink Assignment Index (this field is present in TDD for all the uplink -downlink configurations and only applies to TDD operation with uplink -downlink configuration 1-6. This field is not present in FDD) - 2 bits
- HARQ process number - 3 bits (FDD), 4 bits (TDD)
- Transport block to codeword swap flag - 1 bit

In addition, for transport block 1:

- Modulation and coding scheme - 5 bits as defined in section 7.1.7 of [3]
- New data indicator - 1 bit
- Redundancy version - 2 bits

In addition, for transport block 2:

- Modulation and coding scheme -5 bits as defined in section 7.1.7 of [3]
- New data indicator - 1 bit
- Redundancy version - 2 bits

Precoding information - number of bits as specified in Table 5.3.3.1.5A-1

If both transport blocks are enabled, the transport block to codeword mapping is specified according to Table 5.3.3.1.5-1.

In case one of the transport blocks is disabled, the transport block to codeword swap flag is reserved and the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2.

The precoding information field is defined according to Table 5.3.3.1.5A-2. For a single enabled codeword, index 1 in Table 5.3.3.1.5A-2 is only supported for retransmission of the corresponding transport block if that transport block has previously been transmitted using two layers with large delay CDD.

For transmission with 2 antenna ports, the precoding information field is not present. The number of transmission layers is equal to 2 if both codewords are enabled; transmit diversity is used if codeword 0 is enabled while codeword 1 is disabled.

If the number of information bits in format 2A belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 2 A .

Table 5.3.3.1.5A-1: Number of bits for precoding information.

| Number of antenna ports at eNodeB | Number of bits for precoding information |
| :---: | :---: |
| 2 | 0 |
| 4 | 2 |

Table 5.3.3.1.5A-2: Content of precoding information field for 4 antenna ports.

| One codeword: Codeword 0 enabled, Codeword 1 disabled |  | Two codewords: Codeword 0 enabled, Codeword 1 enabled |  |
| :---: | :---: | :---: | :---: |
| Bit field mapped to index | Message | Bit field mapped to index | Message |
| 0 | 4 layers: Transmit diversity | 0 | 2 layers: precoder cycling with large delay CDD |
| 1 | 2 layers: precoder cycling with large delay CDD | 1 | 3 layers: precoder cycling with large delay CDD |
| 2 | reserved | 2 | 4 layers: precoder cycling with large delay CDD |
| 3 | reserved | 3 | reserved |

### 5.3.3.1.5B Format 2B

The following information is transmitted by means of the DCI format 2B:

- Resource allocation header (resource allocation type 0 / type 1) - 1 bit as defined in section 7.1.6 of [3]

If downlink bandwidth is less than or equal to 10 PRBs , there is no resource allocation header and resource allocation type 0 is assumed.

- Resource block assignment:
- For resource allocation type 0 as defined in section 7.1.6.1 of [3]
$-\left\lceil N_{\mathrm{RB}}^{\mathrm{DL}} / P\right\rceil$ bits provide the resource allocation
- For resource allocation type 1 as defined in section 7.1.6.2 of [3]
- $\left\lceil\log _{2}(P)\right\rceil$ bits of this field are used as a header specific to this resource allocation type to indicate the selected resource blocks subset
- 1 bit indicates a shift of the resource allocation span
- $\left.\left\lceil N_{\mathrm{RB}}^{\mathrm{DL}} / P\right\rceil-\left\lceil\log _{2}(P)\right\rceil-1\right)$ bits provide the resource allocation
where the value of P depends on the number of DL resource blocks as indicated in section [7.1.6.1] of [3]
- TPC command for PUCCH - 2 bits as defined in section 5.1.2.1 of [3]
- Downlink Assignment Index (this field is present in TDD for all the uplink -downlink configurations and only applies to TDD operation with uplink -downlink configuration 1-6. This field is not present in FDD) - 2 bits
- HARQ process number - 3 bits (FDD), 4 bits (TDD)
- Scrambling identity- 1 bit as defined in section 6.10.3.1 of [2]

In addition, for transport block 1:

- Modulation and coding scheme - 5 bits as defined in section 7.1.7 of [3]
- New data indicator - 1 bit
- Redundancy version - 2 bits

In addition, for transport block 2:

- Modulation and coding scheme - 5 bits as defined in section 7.1.7 of [3]
- New data indicator - 1 bit
- Redundancy version - 2 bits

If both transport blocks are enabled, the number of layers equals two; transport block 1 is mapped to codeword 0 ; and transport block 2 is mapped to codeword 1 . Antenna ports 7 and 8 are used for spatial multiplexing.

In case one of the transport blocks is disabled, the number of layers equals one; the transport block to codeword mapping is specified according to Table 5.3.3.1.5-2; and the antenna port for single-antenna port transmission is according to Table 5.3.3.1.5B-1.

Table 5.3.3.1.5B-1: Antenna port for single-antenna port transmission (one transport block disabled).

| New data indicator of the disabled transport block | Antenna port |
| :---: | :---: |
| 0 | 7 |
| 1 | 8 |

If the number of information bits in format 2B belongs to one of the sizes in Table 5.3.3.1.2-1, one zero bit shall be appended to format 2B.

### 5.3.3.1.6 Format 3

DCI format 3 is used for the transmission of TPC commands for PUCCH and PUSCH with 2-bit power adjustments.
The following information is transmitted by means of the DCI format 3:

- TPC command number 1, TPC command number $2, \ldots$, TPC command number $N$
where $N=\left\lfloor\frac{L_{\text {format } 0}}{2}\right\rfloor$, and where $L_{\text {format } 0}$ is equal to the payload size of format 0 before CRC attachment,
including any padding bits appended to format 0 . The parameter tpc-Index provided by higher layers determines the index to the TPC command for a given UE.

If $\left\lfloor\frac{L_{\text {format } 0}}{2}\right\rfloor<\frac{L_{\text {format } 0}}{2}$, a bit of value zero shall be appended to format 3 .

### 5.3.3.1.7 Format 3A

DCI format 3A is used for the transmission of TPC commands for PUCCH and PUSCH with single bit power adjustments.

The following information is transmitted by means of the DCI format 3A:

- TPC command number 1, TPC command number $2, \ldots$, TPC command number M
where $M=L_{\text {format } 0}$, and where $L_{\text {format } 0}$ is equal to the payload size of format 0 before CRC attachment, including any padding bits appended to format 0 . The parameter tpc-Index provided by higher layers determines the index to the TPC command for a given UE.

### 5.3.3.2 CRC attachment

Error detection is provided on DCI transmissions through a Cyclic Redundancy Check (CRC).
The entire PDCCH payload is used to calculate the CRC parity bits. Denote the bits of the PDCCH payload by $a_{0}, a_{1}, a_{2}, a_{3}, \ldots, a_{A-1}$, and the parity bits by $p_{0}, p_{1}, p_{2}, p_{3}, \ldots, p_{L-1} . A$ is the PDCCH payload size and $L$ is the number of parity bits.

The parity bits are computed and attached according to section 5.1.1 setting $L$ to 16 bits, resulting in the sequence $b_{0}, b_{1}, b_{2}, b_{3}, \ldots, b_{B-1}$, where $B=A+L$.

In the case where UE transmit antenna selection is not configured or applicable, after attachment, the CRC parity bits are scrambled with the corresponding RNTI $x_{r n t i, 0}, x_{r n t i, 1}, \ldots, x_{r n t i, 15}$, where $x_{r n t i, 0}$ corresponds to the MSB of the RNTI, to form the sequence of bits $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{B-1}$. The relation between $c_{k}$ and $b_{k}$ is:

$$
\begin{array}{ll}
c_{k}=b_{k} & \text { for } k=0,1,2, \ldots, A-1 \\
c_{k}=\left(b_{k}+x_{r n t i, k-A}\right) \bmod 2 & \text { for } k=A, A+1, A+2, \ldots, A+15
\end{array}
$$

In the case where UE transmit antenna selection is configured and applicable, after attachment, the CRC parity bits of PDCCH with DCI format 0 are scrambled with the antenna selection mask $x_{A S, 0}, x_{A S, 1}, \ldots, x_{A S, 15}$ as indicated in Table 5.3.3.2-1 and the corresponding RNTI $x_{\text {rnti, } 0}, x_{\text {rnti, } 1}, \ldots, x_{r n t i, 15}$ to form the sequence of bits $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{B-1}$. The relation between $c_{k}$ and $b_{k}$ is:

$$
\begin{array}{ll}
c_{k}=b_{k} & \text { for } k=0,1,2, \ldots, A-1 \\
c_{k}=\left(b_{k}+x_{r n t i, k-A}+x_{A S, k-A}\right) \bmod 2 & \text { for } k=A, A+1, A+2, \ldots, A+15 .
\end{array}
$$

Table 5.3.3.2-1: UE transmit antenna selection mask.

| UE transmit antenna selection | Antenna selection mask <br> $<x_{A S, 0}, x_{A S, 1}, \ldots, x_{A S, 15}>$ |
| :---: | :---: |
| UE port 0 | $<0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0\rangle$ |
| UE port 1 | $<0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,1>$ |

### 5.3.3.3 Channel coding

Information bits are delivered to the channel coding block. They are denoted by $c_{0}, c_{1}, c_{2}, c_{3}, \ldots, c_{K-1}$, where $K$ is the number of bits, and they are tail biting convolutionally encoded according to section 5.1.3.1.

After encoding the bits are denoted by $d_{0}^{(i)}, d_{1}^{(i)}, d_{2}^{(i)}, d_{3}^{(i)}, \ldots, d_{D-1}^{(i)}$, with $i=0,1$, and 2 , and where $D$ is the number of bits on the $i$-th coded stream, i.e., $D=K$.

### 5.3.3.4 Rate matching

A tail biting convolutionally coded block is delivered to the rate matching block. This block of coded bits is denoted by $d_{0}^{(i)}, d_{1}^{(i)}, d_{2}^{(i)}, d_{3}^{(i)}, \ldots, d_{D-1}^{(i)}$, with $i=0,1$, and 2 , and where $i$ is the coded stream index and $D$ is the number of bits in each coded stream. This coded block is rate matched according to section 5.1.4.2.

After rate matching, the bits are denoted by $e_{0}, e_{1}, e_{2}, e_{3}, \ldots, e_{E-1}$, where $E$ is the number of rate matched bits.

### 5.3.4 Control format indicator

Data arrives each subframe to the coding unit in the form of an indicator for the time span, in units of OFDM symbols, of the DCI in that subframe. The CFI takes values CFI $=1,2$ or 3 . For system bandwidths $N_{\mathrm{RB}}^{\mathrm{DL}}>10$, the span of the DCI in units of OFDM symbols, 1,2 or 3 , is given by the CFI. For system bandwidths $N_{\mathrm{RB}}^{\mathrm{DL}} \leq 10$, the span of the DCI in units of OFDM symbols, 2,3 or 4 , is given by CFI+1.

The coding flow is shown in Figure 5.3.4-1.

Figure 5.3.4-1 Coding for CFI.

### 5.3.4.1 Channel coding

The control format indicator is coded according to Table 5.3.4-1.
Table 5.3.4-1: CFI code words.

| CFI | CFI code word <br> $\left\langle\mathbf{b}_{\mathbf{0}}, \mathbf{b}_{\mathbf{1}}, \ldots, \mathbf{b}_{\mathbf{3 1}}\right\rangle$ |
| :---: | :---: |
| 1 | $\langle 0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1\rangle$ |
| 2 | $\langle 1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0\rangle$ |
| 3 | $<1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1,0,1,1\rangle$ |
| 4 <br> (Reserved $)$ | $<0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0,0\rangle$ |

### 5.3.5 HARQ indicator (HI)

Data arrives to the coding unit in the form of indicators for HARQ acknowledgement.
The coding flow is shown in Figure 5.3.5-1.

Figure 5.3.5-1 Coding for HI .

### 5.3.5.1 Channel coding

The HI is coded according to Table 5.3.5-1, where for a positive acknowledgement $\mathrm{HI}=1$ and for a negative acknowledgement $\mathrm{HI}=0$.

Table 5.3.5-1: HI code words.

| $\mathbf{H I}$ | HI code word <br> $\left\langle\mathbf{b}_{\mathbf{0}}, \mathbf{b}_{\mathbf{1}}, \mathbf{b}_{\mathbf{2}}\right\rangle$ |
| :---: | :---: |
| 0 | $\langle 0,0,0\rangle$ |
| 1 | $<1,1,1\rangle$ |

## Annex A (informative): Change history

| 09/09/08 | RAN_41 | RP-080669 | 0044 | - | DCI format1C | 8.3 .0 | 8.4 .0 |
| 09/09/08 | RAN_41 | RP-080669 | 0045 | - | Miscellaneous corrections | 8.3 .0 | 8.4 .0 |
| 11/09/08 | RAN_41 | RP-080736 | 0046 | 1 | Correction on downlink multi-user MIMO | 8.3 .0 | 8.4 .0 |
| 09/09/08 | RAN_41 | RP-080669 | 0047 | - | Corrections to DL DCI Formats In case of Ambiguous Payload Sizes | 8.3.0 | 8.4.0 |
| 09/09/08 | RAN_41 | RP-080669 | 0048 | - | CR for RE provisioning for the control information in case of CQIonly transmission on PUSCH | 8.3.0 | 8.4 .0 |
| 09/09/08 | RAN_41 | RP-080669 | 0091 | 2 | Coding and multiplexing of multiple ACK/NACK in PUSCH | 8.3 .0 | 8.4 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0050 | 2 | Clarification of input bits corresponding to 2-bit HARQ-ACK and 2bit RI | 8.4.0 | 8.5.0 |
| 03/12/08 | RAN_42 | RP-080983 | 0053 | - | Editorial corrections to 36.212 | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0055 | - | Miscellaneous Corrections | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0057 | - | Clarification of mapping of information bits | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN 42 | RP-080983 | 0058 | - | Completion of 36.212 CR47 (R1-083421) for "new" DCI Formats | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0059 | - | Change for determining DCI format 1A TBS table column indicator for broadcast control | 8.4.0 | 8.5.0 |
| 03/12/08 | RAN_42 | RP-080983 | 0061 | 2 | Defining DCI format 1A for downlink data arrival | 8.4 .0 | 8.5.0 |
| 03/12/08 | RAN_42 | RP-080983 | 0063 | 1 | ACK/NACK transmission on PUSCH for LTE TDD | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN 42 | RP-080983 | 0065 | - | Correction in 36.212 related to TDD downlink HARQ processes | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0067 | 1 | Correction of control MCS offset and SRS symbol puncturing | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0068 | 1 | DCI format 2/2A | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0069 | - | Correction to zero padding in DCI format 1 | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0071 | - | Clarification of RI bit field mapping for PUCCH | 8.4 .0 | 8.5.0 |
| 03/12/08 | RAN_42 | RP-080983 | 0072 | - | Clarifying RNTI bit mapping for PDCCH CRC scrambling | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0073 | - | Clarification on BCH transport block size | 8.4 .0 | 8.5 .0 |
| 03/12/08 | RAN_42 | RP-080983 | 0076 | - | Clarification on the number of PUCCH-based CQI/PMI bits when reported on PUSCH | 8.4.0 | 8.5.0 |
| 04/03/09 | RAN_43 | RP-090235 | 77 | 1 | Corrections to Transmitted Rank Indication | 8.5 .0 | 8.6 .0 |
| 04/03/09 | RAN_43 | RP-090235 | 79 | 1 | Correction to the bundled ACK/NACK and DAI transmission | 8.5.0 | 8.6 .0 |
| 04/03/09 | RAN 43 | RP-090235 | 80 | 2 | Corrections to transmission modes | 8.5.0 | 8.6 .0 |
| 04/03/09 | RAN 43 | RP-090235 | 81 | 1 | Correction on ACKNACK transmission on PUSCH for LTE TDD | 8.5 .0 | 8.6 .0 |
| 04/03/09 | RAN_43 | RP-090235 | 82 | 2 | Corrections to CQI and RI fields description | 8.5 .0 | 8.6 .0 |
| 04/03/09 | RAN_43 | RP-090235 | 83 | - | Clarifying DCI format 1A and DCI Format 1B | 8.5 .0 | 8.6 .0 |
| 04/03/09 | RAN_43 | RP-090235 | 92 | 1 | Clarification on channel coding for UCI HARQ-ACK | 8.5 .0 | 8.6 .0 |
| 27/05/09 | RAN_44 | RP-090528 | 87 | - | Clarify some parameters for determining control resources on PUSCH | 8.6 .0 | 8.7 .0 |
| 01/12/09 | RAN_46 | RP-091168 | 89 | - | Clarification on bitwidth of RI | 8.7 .0 | 8.8.0 |
| 01/12/09 | RAN_46 | RP-091168 | 94 | - | Correction to Channel interleaver for PUSCH RE Mapping | 8.7 .0 | 8.8.0 |
| 01/12/09 | RAN_46 | RP-091177 | 88 | 1 | Editorial corrections to 36.212 | 8.8.0 | 9.0.0 |
| 01/12/09 | RAN_46 | RP-091257 | 95 | 1 | Introduction of enhanced dual layer transmission | 8.8 .0 | 9.0 .0 |
| 16/03/10 | RAN 47 | RP-100210 | 96 | 1 | MCCH change notification using DCI format 1C | 9.0 .0 | 9.1 .0 |
| 16/03/10 | RAN_47 | RP-100211 | 97 | - | Addition of missing reference to DCI format 2B + typo corrections | 9.0.0 | 9.1.0 |
