4 General

4.1 Relationship between minimum requirements and test requirements

The present document is interwork specification for NR UE, covering RF characteristics and minimum performance requirements. Conformance to the present specification is demonstrated by fulfilling the test requirements specified in the conformance specification 3GPP TS 38.521-3 [5].

The Minimum Requirements given in this specification make no allowance for measurement uncertainty. The test specification TS 38.521-3 [5] defines test tolerances. These test tolerances are individually calculated for each test. The test tolerances are used to relax the minimum requirements in this specification to create test requirements. For some requirements, including regulatory requirements, the test tolerance is set to zero.

The measurement results returned by the test system are compared - without any modification - against the test requirements as defined by the shared risk principle.

The shared risk principle is defined in Recommendation ITU-R M.1545 [6].

4.2 Applicability of minimum requirements

- a) In this specification the Minimum Requirements are specified as general requirements and additional requirements. Where the Requirement is specified as a general requirement, the requirement is mandated to be met in all scenarios
- b) For specific scenarios for which an additional requirement is specified, in addition to meeting the general requirement, the UE is mandated to meet the additional requirements.
- c) The spurious emissions power requirements are for the long-term average of the power. For the purpose of reducing measurement uncertainty it is acceptable to average the measured power over a period of time sufficient to reduce the uncertainty due to the statistical nature of the signal
- d) Terminal that supports EN-DC configuration shall meet E-UTRA requirements as specified in TS 36.101 [4] and NR requirements as in TS 38.101-1 [2] and TS 38.101-2 [3] unless otherwise specified in this specification
- e) All the requirements for intra-band contiguous and non-contiguous EN-DC apply under the assumption of the same uplink-downlink and special subframe configurations in the E-UTRA and slot format indicated by UL-DL-configuration-common in the NR for the EN-DC.
- f) For EN-DC combinations with CA configurations for E-UTRA and/or NR, all the requirements for E-UTRA and/or NR all the requirements for E-UTRA and/or NR intra-band contiguous and non-contiguous CA apply under the assumption of the same slot format indicated by UL-DL-configuration-common in the PCell and SCells for NR and the same uplink-downlink and special subframe configurations in Pcell and SCells for E-UTRA.

A terminal which supports an inter-band EN-DC configuration shall support the same E-UTRA bandwidth combination sets it signals the support for in E-UTRA CA configuration part of E-UTRA – NR DC and shall support the same NR bandwidth combination sets it signals the support for in NR CA configuration part of E-UTRA – NR DC.

A terminal which supports an inter-band EN-DC configuration with a certain UL configuration shall support the all lower order DL configurations of the lower order EN-DC combinations, which have this certain UL configuration and the fallbacks of this UL configuration.

Terminal that supports inter-band NR-DC between FR1 and FR2 configuration shall meet the requirements for corresponding CA configuration (suffix A), unless otherwise specified.

4.3 Specification suffix information

Unless stated otherwise the following suffixes are used for indicating at 2nd level subclause, shown in Table 4.3-1.

Table 4.3-1: Definition of suffixes

| Clause suffix | Variant |
|---------------|--|
| None | Single Carrier |

5 Operating bands and channel arrangement

5.1 General

The channel arrangements presented in this clause are based on the operating bands and channel bandwidths defined in the present release of specifications.

NOTE: Other operating bands and channel bandwidths may be considered in future releases.

Requirements throughout the RF specifications are in many cases defined separately for different frequency ranges (FR). The frequency ranges in which NR can operate according to this version of the specifications are identified as described in Table 5.1-1.

Table 5.1-1: Definition of frequency ranges

| Frequency range designation | Corresponding frequency range |
|-----------------------------|-------------------------------|
| FR1 | 410 MHz – 7125 MHz |
| FR2 | 24250 MHz – 52600 MHz |

The present specification covers band combinations including

- at least one FR1 operating band and one FR2 operating band for carrier aggregation and dual connectivity operations;
- at least one E-UTRA operating band for dual connectivity operations.

5.2 Operating bands

NR is designed to operate in FR1 operating bands defined in TS 38.101-1 [2] and FR2 operating bands defined in TS 38.101-2 [3]. E-UTRA is designed to operate in operating bands defined in TS 36.101 [4].

5.2A Operating bands for CA

5.2A.1 Inter-band CA between FR1 and FR2

NR carrier aggregation are designed to operate in the operating bands defined in Table 5.2A.1-1. The band combinations include at least one FR1 operating band and one FR2 operating band.

5.3 UE Channel bandwidth

5.3A UE Channel bandwidth for CA

5.3A.1 Inter-band CA between FR1 and FR2

For inter-band NR CA between FR1 and FR2, a carrier aggregation configuration is a combination of operating bands, each supporting a carrier aggregation bandwidth class as specified in clause 5.3A.5 of TS 38.101-1 [2] and clause 5.3A.4 of TS 38.101-2 [3] independently.

5.3B UE Channel bandwidth for EN-DC

For intra-band contiguous EN-DC, the aggregated channel bandwidth is sum of the individual NR and E-UTRA channel bandwidths assuming nominal EN-DC channel with 0 kHz offset spacing as specified in subclause 5.4.

$$ENBW = BW_{NR_Channel} + BW_{E-UTRA_Channel}$$

In the case where the NR sub-block and/or the E-UTRA sub-block itself is composed of intra-band contiguous CA carriers, the EN-DC aggregated channel bandwidth is the sum of the aggregated channel bandwidths of the NR and E-UTRA sub-blocks assuming nominal EN-DC channel spacing between the NR sub-block and E-UTRA sub-block.

$$ENBW = BW_{NR_Channel_CA} + BW_{E-UTRA_Channel_CA}$$

For NR inter-band dual connectivity specified in 5.2B.7, the corresponding NR CA configurations in 5.5A.1, i.e., dual uplink inter-band carrier aggregation between FR1 and FR2 with uplink assigned to two NR bands, are applicable to Dual Connectivity.

NOTE 1: Requirements for the dual connectivity configurations are defined in the section corresponding NR uplink CA between FR1 and FR2 configurations, unless otherwise specified.

Intra-band contiguous EN-DC configurations are defined using intra-band contiguous EN-DC bandwidth class notation where the first EN-DC bandwidth class letter indicates the number of contiguous E-UTRA carriers and the second EN-DC bandwidth class letter indicates the number of contiguous NR carriers. Applicable contiguous intraband EN-DC bandwidth classes are listed in Table 5.3.B-1.

Table 5.3.B-1: Intra-band contiguous EN-DC bandwidth classes

| Intra-band contiguous EN-DC bandwidth class | Number of contiguous CC | |
|---|-------------------------|----|
| | E-UTRA | NR |
| AA | 1 | 1 |

5.3B.1 Intra-band EN-DC in FR1

5.3B.1.1 General

The requirements for intra-band EN-DC in this specification are defined for EN-DC configurations with associated bandwidth combination sets.

For each EN-DC configuration, requirements are specified for all bandwidth combinations contained in a *bandwidth combination set*, which is indicated per supported band combination in the UE radio access capability. A UE can indicate support of several bandwidth combination sets per band combination.

5.3B.1.2 BCS for Intra-band contiguous EN-DC

For intra-band contiguous EN-DC, an EN-DC configuration is a single operating band supporting an intra-band contiguous EN-DC bandwidth class.

Bandwidth combination sets for intra-band contiguous EN-DC are specified in Table 5.3B.1.2-1.

5.4 Void

5.4A Channel arrangement for CA

The channel arrangement for CA operations in FR1 and FR2 as specified in TS 38.101-1 [2] and TS 38.101-2 [3], respectively.

5.4B Channel arrangement for DC

The channel arrangement for intra-band EN-DC operations in FR1 is specified in TS 36.101 [4] and TS 38.101-1 [2], respectively.

5.4B.1 Channel spacing for intra-band EN-DC carriers

The spacing between carriers will depend on the deployment scenario, the size of the frequency block available and the channel bandwidths. The nominal channel spacing between and E-UTRA carrier and an adjacent NR carrier for intra-band contiguous EN-DC is defined as following:

- For NR operating bands with 100 kHz channel raster,

$$\text{Nominal Channel spacing} = (BW_{E-UTRA_Channel} + BW_{NR_Channel})/2$$

- For NR operating bands with 15 kHz channel raster,

$$\text{Nominal Channel spacing} = (BW_{E-UTRA_Channel} + BW_{NR_Channel})/2 + \{-5\text{kHz}, 0\text{kHz}, 5\text{kHz}\}$$

- For NR operating bands with 30 kHz channel raster,

$$\text{Nominal Channel spacing} = (BW_{E-UTRA_Channel} + BW_{NR_Channel})/2 + \{-10\text{kHz}, 0\text{kHz}, 10\text{kHz}\}$$

where $BW_{E-UTRA_Channel}$ and $BW_{NR_Channel}$ are the channel bandwidths of the E-UTRA and NR carriers. The channel spacing can be adjusted depending on the channel raster to optimize performance in a particular deployment scenario.

For intra-band non-contiguous EN-DC the channel spacing between E-UTRA and NR carriers shall be larger than the nominal channel spacing defined in this subclause.

5.5B Configuration for DC

5.5B.1 General

The operating bands and bandwidth classes are specified for operation with EN-DC, NGEN-DC, NE-DC or NR-DC configured. The EN-DC, NGEN-DC or NE-DC band combinations include at least one E-UTRA operating band.

For EN-DC or NE-DC configurations indicated by column “Single Uplink allowed” (e.g., problematic band combinations as defined in TS 38.306) in tables in this section the UE may indicate capability of not supporting simultaneous dual and triple uplink operation due to possible intermodulation interference to its own primary downlink channel bandwidth of PCell or PSCell if the intermodulation order is 2 or if the intermodulation order is 3 for the combinations when both operating bands are between 450 MHz – 960 MHz or between 1427 MHz – 2690 MHz. In case for the EN-DC or NE-DC configurations listed in tables in this section for which the intermodulation products caused by the dual and triple uplink operation fall into the receive band but do not interfere with the own primary downlink channel bandwidth of PCell or PSCell as defined in Annex-I the UE is mandated to operate in dual and triple uplink mode. Single Uplink is also allowed for certain band combinations where intermodulation or reverse intermodulation products could create difficulty for meeting emission requirements.

For EN-DC combinations of order 3 or higher, “Single Uplink allowed” UL configurations captured in Table 5.5B.2-1, Table 5.5B.3-1, and Table 5.5B.4-1 apply.

If multiple UL DC configurations are listed for multiple DL DC configurations, valid uplink configurations are such that uplink does not have more carriers than downlink.

5.5B.2 Intra-band contiguous EN-DC

Supported channel bandwidths for E-UTRA operating bands are defined in [4] and for NR operating bands in TS 38.101-1 [2].

Table 5.5B.2-1: Intra-band contiguous EN-DC configurations

| EN-DC configuration | Uplink EN-DC configuration (NOTE 1) | Single UL allowed |
|--|-------------------------------------|-------------------|
| DC_(n)41AA ⁵ DC_(n)41CA ⁵ DC_(n)41DA ⁵ | DC_(n)41AA | Yes ³ |
| DC_(n)41CA ⁵ DC_(n)41DA ⁵ | DC_41A_n41A | Yes ³ |
| DC_(n)71AA | DC_(n)71AA | No ⁴ |
| NOTE 1: Uplink EN-DC configurations are the configurations supported by the present release of specifications. NOTE 2: Requirements in this specification apply for NR SCS of 15 kHz only. NOTE 3: Single UL allowed due to potential emission issues, not self-interference. NOTE 4: For UE(s) supporting dynamic power sharing it is mandatory to do dual simultaneous UL. For UE(s) not supporting dynamic power sharing single UL is allowed. NOTE 5: The minimum requirements only apply for non-simultaneous Tx/Rx between all carriers. | | |

5.5B.3 Intra-band non-contiguous EN-DC

Supported channel bandwidths for E-UTRA operating bands are defined in TS 36.101 [4] and for NR operating bands in TS 38.101-1 [2].

Table 5.5B.3-1: Intra-band non-contiguous EN-DC configurations

| DC_41A_n41A ³ DC_41C_n41A ³ DC_41D_n41A ³ | DC_41A_n41A | Yes ⁴ |
| NOTE 1: Uplink EN-DC configurations are the configurations supported by the present release of specifications. NOTE 2: Only single switched UL is supported in Rel.15 NOTE 3: The minimum requirements only apply for non-simultaneous Tx/Rx between all carriers. NOTE 4: Single UL allowed due to potential emission issues, not self-interference. | | |

The intra-band requirements also apply for these carriers when applicable EN-DC configuration is a subset of a higher order EN-DC configuration.</p> <p>NOTE 5: The frequency range above 3600 MHz for Band n78 is not used in this combination.</p> <p>NOTE 6: The frequency range below 2506 MHz for Band 41 is not used in this combination.</p> <p>NOTE 7: Applicable for UE supporting inter-band EN-DC with mandatory simultaneous Rx/Tx capability.</p> <p>NOTE 8: The frequency range in band n28 is restricted for this band combination to 703 - 733 MHz for the UL and 758-788 MHz for the DL.</p> <p>NOTE 9: The combination is not used alone as fall back mode of other band combinations in which UL in Band 42 is not used.</p> <p>NOTE 10: The maximum power spectral density imbalance between downlink carriers is within [6] dB. The power spectral density imbalance condition also applies for these carriers when applicable EN-DC configuration is a subset of a higher order EN-DC configuration.</p> | | |

6 Transmitter characteristics

6.1 General

Unless otherwise stated the transmitter characteristics are specified at the antenna connector(s) of the UE for the bands operating on frequency range 1 and over the air of the UE for the bands operating on frequency range 2. The requirements for frequency range 1 and frequency range 2 can be verified separately. For the carrier in frequency range 1, requirements can be verified with NR FR2 link disabled. For the carrier in frequency range 2, requirements can be verified in OTA mode with E-UTRA connecting to the network by OTA without calibration.

Unless otherwise stated, requirements for NR transmitter written in TS 38.101-1 [2] and TS 38.101-2 [3] apply and are assumed anchor agnostic. Requirements are verified under conditions where anchor resources do not interfere NR operation.

6.2 Void

6.2A Transmitter power for CA

6.2A.1 UE maximum output power for CA

6.2A.1.1 Inter-band CA between FR1 and FR2

Table 6.2A.1.1-1: Void

For inter-band NR CA in FR1 and FR2 combined, the UE shall meet each transmitter power requirement specified in clause 6.2.1 of TS 38.101-1 [2] and clause 6.2.1 TS 38.101-2 [3] independently.

6.2A.2 UE maximum output power reduction for CA

6.2A.2.1 Inter-band CA between FR1 and FR2

For inter-band NR CA between FR1 and FR2, UE maximum output power reduction specified in TS 38.101-1 [2] and TS 38.101-2 [3] apply for each frequency range respectively.

6.2A.3 UE additional maximum output power reduction for CA

For inter-band NR CA between FR1 and FR2, UE additional maximum output power reduction specified in TS 38.101-1 [2] and TS 38.101-2 [3] apply for each frequency range respectively.

6.2A.4 Configured output power for CA

The UE maximum output power reduction (MPR) specified in this subclause is applicable for UEs configured with EN-DC when NS_01 is indicated in the MCG and the SCG. The MPR applies subject to indication in the field *modifiedMPRbehavior* for the SCG [2].

6.2B.2.1 Intra-band contiguous EN-DC

6.2B.2.1.1 General

When the UE is configured for intra-band contiguous EN-DC, the UE determines the total allowed maximum output power reduction as specified in this subclause.

For UE supporting dynamic power sharing the following:

- for the MCG, MPR_c in accordance with [4]
- for the SCG,

$$MPR'_c = MPR_{NR} = \text{MAX}(MPR_{\text{single,NR}}, MPR_{\text{ENDC}})$$

- for the total configured transmission power,

$$MPR_{\text{tot}} = P_{\text{PowerClass,EN-DC}} - \min(P_{\text{PowerClass,EN-DC}}, 10 \cdot \log_{10}(10^{((P_{\text{PowerClass,E-UTRA}} - MPR_{\text{E-UTRA}})/10)} + 10^{((P_{\text{PowerClass,NR}} - MPR_{\text{NR}})/10)}))$$

where

$$MPR_{\text{E-UTRA}} = \text{MAX}(MPR_{\text{single,E-UTRA}}, MPR_{\text{ENDC}})$$

Where M_A is defined as follows

$$\begin{aligned} M_A = & \quad [15] \quad ; \quad 0 \leq B < 0.5 \\ & \quad [10] \quad ; \quad 0.5 \leq B < 1.0 \\ & \quad [8] \quad ; \quad 1.0 \leq B < 2.0 \\ & \quad [6] \quad ; \quad 2.0 \leq B \end{aligned}$$

Where:

- for the total configured transmission power,

$$\text{MPR}_{\text{tot}} = P_{\text{PowerClass,EN-DC}} - \min(P_{\text{PowerClass,EN-DC}}, 10 * \log_{10}(10^{((P_{\text{PowerClass,E-UTRA}} - \text{MPR}_{\text{E-UTRA}})/10)} + 10^{((P_{\text{PowerClass,NR}} - \text{MPR}_{\text{NR}})/10)}))$$

where

$$MPR_{E-UTRA} = \text{MAX}(MPR_{\text{single},E-UTRA}, MPR_{\text{ENDC}})$$

with

- $MPR_{\text{single},E-UTRA}$ is the MPR defined for the E-UTRA transmission in [4]
- $MPR_{\text{single},NR}$ is the MPR defined for the NR transmission in [2]

Where:

For UEs supporting dynamic power sharing,

$$B = (\text{LCRB}_{\text{alloc},E-UTRA} * 12 * \text{SCS}_{E-UTRA} + \text{LCRB}_{\text{alloc},NR} * 12 * \text{SCS}_{NR}) / 1,000.000$$

6.2B.3.1.2 A-MPR for NS_04

6.2B.3.1.2.0 General

When the UE is configured for B41/n41 intra-band contiguous EN-DC and it receives IE NS_04, the UE determines the total allowed maximum output power reduction as specified in this subclause. The A-MPR for EN-DC defined in this section is used instead of MPR defined in 6.2B.2.2, not additively, so EN-DC MPR = 0 when NS_04 is signaled.

For UE supporting dynamic power sharing the following:

- for the MCG, $A-MPR_c$ in accordance with [4]
- for the SCG,

$$A-MPR'_c = A-MPR_{NR} = \text{MAX}(A-MPR_{\text{single,NR}}, A-MPR_{IM3})$$

- for the total configured transmission power,

$$A-MPR_{\text{tot}} = P_{\text{PowerClass,EN-DC}} - \min(P_{\text{PowerClass,EN-DC}}, 10 \cdot \log_{10}(10^{(P_{\text{PowerClass,E-UTRA}} - A-MPR_{E-UTRA})/10} + 10^{(P_{\text{PowerClass,NR}} - A-MPR_{NR})/10}))$$

where

$$A-MPR_{E-UTRA} = \text{MAX}(A-MPR_{\text{single,E-UTRA}} + MPR_{\text{single,E-UTRA}}, A-MPR_{IM3})$$

with

- $A-MPR_{\text{single,E-UTRA}}$ is the A-MPR defined for the E-UTRA transmission in [4]
- $A-MPR_{\text{single,NR}}$ is the A-MPR defined for the NR transmission in [2]
- $MPR_{\text{single,E-UTRA}}$ is the MPR defined for the E-UTRA transmission in [4]

For UEs not supporting dynamic power sharing the following

- for the MCG,

$$A-MPR_c = \text{MAX}(A-MPR_{\text{single,E-UTRA}} + MPR_{\text{single,E-UTRA}}, A-MPR_{IM3})$$

- for the SCG,

$$A-MPR'_c = \text{MAX}(A-MPR_{\text{single,NR}}, A-MPR_{IM3})$$

where

- $A-MPR_{\text{single,E-UTRA}}$ is the A-MPR defined for the E-UTRA transmission in [4]
- $A-MPR_{\text{single,NR}}$ is the A-MPR defined for the NR transmission in [2]
- $MPR_{\text{single,E-UTRA}}$ is the MPR defined for the E-UTRA transmission in [4]

The UE determines the Channel Configuration Case and the value of $A-MPR_{IM3}$ as follows:

If $F_{IM3,\text{low_block,low}} < 2490.5$ MHz

Channel Configuration Case B. $A-MPR_{IM3}$ defined in Subclause 6.2B.3.1.2.2

Else

Channel Configuration Case A. $A-MPR_{IM3}$ defined in Subclause 6.2B.3.1.2.1

where

- $F_{IM3,\text{low_block,low}} = (2 * F_{\text{low_channel,low_edge}}) - F_{\text{high_channel,high_edge}}$

- $F_{\text{low_channel,low_edge}}$ is the lowermost frequency of lower transmission bandwidth configuration.

$$B = (\text{LCRB}_{\text{alloc, E-UTRA}} * 12 * \text{SCS}_{\text{E-UTRA}} + 12 * \text{SCS}_{\text{NR}}) / 1,000,000$$

Where $\text{SCS}_{\text{NR}} = 15$ kHz is assumed in calculation of B.

- for the MCG, $A\text{-MPR}_c$ in accordance with [4]
- for the SCG,

$$A\text{-MPR}'_c = A\text{-MPR}_{\text{NR}} = \text{MAX}(A\text{-MPR}_{\text{single, NR}}, A\text{-MPR}_{\text{EN-DC}})$$

| W_{gap} | $A\text{-MPR}_{\text{ACLROverlap}}$ |
|--|-------------------------------------|
| $< BW_{\text{channel, E-UTRA}} + BW_{\text{channel, NR}}$ | 4 dB |

The measured total maximum output power P_{UMAX} over both CGs/RATs, measured over the transmission reference time duration is

$$P_{\text{UMAX}} = 10 \log_{10} [p_{\text{UMAX, c, E-UTRA}} + p_{\text{UMAX, f, c, NR}}],$$

where $p_{\text{UMAX, c, E-UTRA}}$ and $p_{\text{UMAX, c, NR}}$ denotes the measured output power of serving cell c for E-UTRA and NR respectively, expressed in linear scale.

For UEs indicating support of dynamicPowerSharing, the measured total configured maximum output power P_{UMAX} shall be within the following bounds:

$$P_{\text{CMAX_L}} - T_{\text{LOW}}(P_{\text{CMAX_L}}) \leq P_{\text{UMAX}} \leq P_{\text{CMAX_H}} + T_{\text{HIGH}}(P_{\text{CMAX_H}})$$

with the tolerances $T_{\text{LOW}}(P_{\text{CMAX_L}})$ and $T_{\text{HIGH}}(P_{\text{CMAX_H}})$ for applicable values of $P_{\text{CMAX_L}}$ and $P_{\text{CMAX_H}}$ specified in Table 6.2B.4.1.1-2.

When an UL subframe transmission p from E-UTRA overlap with a physical channel q from the NR, then for P_{UMAX} evaluation, the E-UTRA subframe p is taken as reference period T_{REF} and always considered as the reference measurement duration and the following rules are applicable.

T_{REF} and T_{eval} are specified in Table 6.2B.4.1.1-1 when same or different subframes and physical channel durations are used in aggregated carriers. $P_{\text{PowerClass, EN-DC}}$ shall not be exceeded by the UE during any evaluation period of time.

Table 6.2B.4.1.1-1: P_{CMAX} evaluation window

| transmission duration | T _{REF} | T _{eval} |
|---|------------------|--|
| Different transmission duration in different RAT carriers | E-UTRA Subframe | Min($T_{\text{no_hopping}}$, Physical Channel Length) |

For each T_{REF} , the $P_{\text{CMAX_H}}$ is evaluated per T_{eval} and given by the maximum value over the transmission(s) within the T_{eval} as follows:

where $P_{\text{CMAX_L_E-UTRA,c}}$ and $P_{\text{CMAX_H_E-UTRA,c}}$ are the limits for a serving cell c as specified in TS 36.101 [4] subclause 6.2.5 modified by P_{LTE} as follows:

$$P_{\text{CMAX_L_E-UTRA,c}} = \text{MIN} \{ P_{\text{EMAX, EN-DC}}, (P_{\text{PowerClass, EN-DC}} - \Delta P_{\text{PowerClass, EN-DC}}), \text{MIN}(P_{\text{EMAX,c}}, P_{\text{LTE}}) - \Delta t_{\text{C_E-UTRA,c}}, (P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}) - \text{MAX}(MPR_c + A-MPR_c + \Delta T_{\text{IB,c}} + \Delta T_{\text{C_E-UTRA,c}} + \Delta T_{\text{ProSe}}, P-MPR_c) \}$$

where

- $P_{\text{EMAX,EN-DC}}$ is the value given by the field *p-maxUE-FR1* of the *RRCConnectionReconfiguration-v1530 IE* as defined in [8];
- P_{LTE} is the value given by the field *p-maxEUTRA-r15* of the *RRCConnectionReconfiguration-v1510 IE* as defined in [8];

- P_{NR} is the value given by the field $p\text{-NR-FRI}$ of the *PhysicalCellGroupConfig* IE as defined in [9];
- $\Delta T_{c,E\text{-UTRA},c} = 1.5$ dB when NOTE 2 in Table 6.2.2-1 in TS 36.101 [4] applies for a serving cell c , otherwise $\Delta T_{c,E\text{-UTRA},c} = 0$ dB;
- $\Delta T_{c,NR,c} = 1.5$ dB when NOTE 3 in Table 6.2.1-1 in TS 38.101-1 [2] applies for a serving cell c , otherwise $\Delta T_{c,NR,c} = 0$ dB;

- $\Delta P_{\text{PowerClass,EN-DC}} = 3$ dB for a power class 2 capable EN-DC UE when E-UTRA UL/DL configuration is 0 or 6; or E-UTRA UL/DL configuration is 1 and special subframe configuration is 0 or 5; or the IE $p\text{-maxUE-FRI}$ as defined in TS 38.331 [7] is provided and set to the maximum output power of the default power class or lower; otherwise $\Delta P_{\text{PowerClass,EN-DC}} = 0$ dB;

If the transmissions from NR and E-UTRA do not overlap, then the complete subclauses for configured transmitted power for E-UTRA and NR respectively from their own specifications apply with the modifications specified above. The lower value between $P_{\text{PowerClass, EN-DC}}$ or $P_{\text{EMAX, EN-DC}}$ shall not be exceeded at any time by UE.

The total configured maximum transmission power for both synchronous and non-synchronous operation is

$$P_{\text{Total}}^{EN-DC} = \text{MIN} \{ P_{\text{EMAX, EN-DC}}, P_{\text{PowerClass, EN-DC}} - \Delta P_{\text{PowerClass, EN-DC}} \}$$

If the UE does not support dynamic power sharing,

$$P_{\text{Total}}^{EN-DC} = \text{MIN} \{ P_{\text{EMAX, EN-DC}}, P_{\text{PowerClass, EN-DC}} - \Delta P_{\text{PowerClass, EN-DC}} \} + 0.3 \text{ dB}$$

$$P_{\text{UMAX}} = 10 \log_{10} [p_{\text{UMAX},c,E\text{-UTRA}} + p_{\text{UMAX},c,NR}],$$

where $p_{\text{UMAX},c,E\text{-UTRA}}$ and $p_{\text{UMAX},c,NR}$ denotes the measured output power of serving cell c for E-UTRA and NR respectively, expressed in linear scale.

The measured total configured maximum output power P_{UMAX} shall be within the following bounds:

$$P_{\text{CMAX}_L} - T_{\text{LOW}}(P_{\text{CMAX}_L}) \leq P_{\text{UMAX}} \leq P_{\text{CMAX}_H} + T_{\text{HIGH}}(P_{\text{CMAX}_H})$$

with the tolerances $T_{\text{LOW}}(P_{\text{CMAX}_H})$ and $T_{\text{HIGH}}(P_{\text{CMAX}_H})$ for applicable values of P_{CMAX} specified in Table 6.2B.4.1.3-2.

When an UL subframe transmission p from E-UTRA overlap with a physical-channel q from the NR, then for P_{UMAX} evaluation, the E-UTRA subframe p is taken as reference period T_{REF} and always considered as the reference measurement duration and the following rules are applicable.

While P_{CMAX_L} is computed as follows:

$$P_{CMAX_L} = \text{MIN} \{ P_{CMAX_EN-DC_L}(p,q), P_{CMAX_EN-DC_L}(p,q+I), \dots, P_{CMAX_EN-DC_L}(p,q+n) \}$$

with exception that

- if no symbol of slot i_1 of the NR that is indicated as uplink or flexible by *TDD-UL-DL-ConfigurationCommon* or *TDD-UL-DL-ConfigDedicated* overlaps with subframe i_2 of the E-UTRA; or
- if NR slot(s) that is indicated as downlink by *TDD-UL-DL-ConfigurationCommon* or *TDD-UL-DL-ConfigDedicated* does not overlap with subframe i_2 of the E-UTRA; then

The configured maximum output power P_{CMAX_NR,c}(q) in physical-channel q for the configured NR carrier shall be set within the bounds:

$$P_{\text{CMAX}_{L,f,c,NR}}(q) \leq P_{\text{CMAX},f,c,NR}(q) \leq P_{\text{CMAX}_{H,f,c,NR}}(q)$$

where P_{CMAX_L_NR,c} and P_{CMAX_H_NR,c} are the limits for a serving cell c as specified in subclause 6.2.4 of TS 38.101-1 [2] modified by P_{NR} as follows:

$$P_{\text{CMAX_L,f,c, NR}} = \text{MIN} \{ P_{\text{EMAX, NE-DC}}, (P_{\text{PowerClass, NE-DC}} - \Delta P_{\text{PowerClass, NE-DC}}), \text{MIN}(P_{\text{EMAX,c}}, P_{\text{NR}}) - \Delta T_{\text{C_NR, c}}, (P_{\text{PowerClass}} - \Delta P_{\text{PowerClass}}) - \text{MAX}(\text{MPR}_c + \text{A-MPR}_c + \Delta T_{\text{IB,c}} + \Delta T_{\text{C_NR, c}} + \Delta T_{\text{RxSRS}}, P\text{-MPR}_c) \}$$

- P_{LTE} signalled by RRC as p-MaxEUTRA in [36.331]
- P_{NR} signalled by RRC as p-NR-FR1 defined in [38.331]
- $\Delta T_{\text{c,E-UTRA, c}} = 1.5\text{dB}$ when NOTE 2 in Table 6.2.2-1 in TS 36.101 [4] applies for a serving cell c , otherwise $\Delta T_{\text{c,E-UTRA, c}} = 0\text{dB}$;
- $\Delta T_{\text{C_NR, c}} = 1.5\text{dB}$ when NOTE 3 in Table 6.2.1-1 in TS 38.101-1 [2] applies for a serving cell c , otherwise $\Delta T_{\text{C_NR, c}} = 0\text{dB}$;
- $\Delta T_{\text{IB, c}}$ specified in subclause 6.2B.4.2.3 for NE-DC, the individual Power Class defined in table 6.2B.1.3a and any other additional power reductions parameters specified in subclauses 6.2B.2.3a for NE-DC are applicable to $P_{\text{CMAX_E-UTRA, c}}$ and $P_{\text{CMAX_NR, c}}$ evaluations.
- $\Delta P_{\text{PowerClass, NE-DC}} = 3\text{ dB}$ for a power class 2 capable NE-DC UE when LTE UL/DL configuration is 0 or 6; or LTE UL/DL configuration is 1 and special subframe configuration is 0 or 5; or the IE *p-maxUE-FR1* as defined in TS 38.331 [7] is provided and set to the maximum output power of the default power class or lower; otherwise $\Delta P_{\text{PowerClass, NE-DC}} = 0\text{ dB}$;

If the transmissions from NR and E-UTRA do not overlap, then the complete subclauses for configured transmitted power for E-UTRA and NR respectively from their own specifications apply with the modifications specified above. The lower value between $P_{\text{PowerClass, NE-DC}}$ or $P_{\text{EMAX, NE-DC}}$ shall not be exceeded at any time by UE.

$P_{\text{Total}}^{\text{NE-DC}} = 10\log_{10}(\hat{P}_{\text{total}}^{\text{NE-DC}})$ with $P_{\text{Total}}^{\text{NE-DC}}$ the configured maximum transmission power for NE-DC operation as specified in subclause 7.6 of [10].

The total configured maximum transmission power for both synchronous and non-synchronous operation is

$$P_{\text{Total}}^{\text{NE-DC}} = \text{MIN} \{ P_{\text{EMAX, NE-DC}}, P_{\text{PowerClass, NE-DC}} - \Delta P_{\text{PowerClass, NE-DC}} \}$$

If the UE does not support dynamic power sharing,

$$P_{\text{Total}}^{\text{NE-DC}} = \text{MIN} \{ P_{\text{EMAX, NE-DC}}, P_{\text{PowerClass, NE-DC}} - \Delta P_{\text{PowerClass, NE-DC}} \} + 0.3\text{ dB}$$

If the NE-DC UE does not support dynamic power sharing, then the complete subclauses for configured transmitted power for E-UTRA and NR respectively from their own specifications TS 36.101 [4] and TS 38.101-1 [2] respectively apply with the modifications specified above and $P_{\text{Total}}^{\text{NE-DC}}$ applies.

When a UE supporting dynamic sharing is configured for overlapping E-UTRA uplink and NR uplink transmissions, the UE can set its configured maximum output power $P_{\text{CMAX_E-UTRA, c}}$ and $P_{\text{CMAX_NR, c}}$ for the configured E-UTRA and NR uplink carriers, respectively, and its configured maximum transmission power for NE-DC operation, $\hat{P}_{\text{Total}}^{\text{NE-DC}}$, as specified above.

The measured total maximum output power P_{UMAX} over both CGs/RATs, measured over the transmission reference time duration is

$$P_{\text{UMAX}} = 10 \log_{10} [p_{\text{UMAX, c, E-UTRA}} + p_{\text{UMAX, c, NR}}],$$

where $p_{\text{UMAX, c, E-UTRA}}$ and $p_{\text{UMAX, c, NR}}$ denotes the measured output power of serving cell c for E-UTRA and NR respectively, expressed in linear scale.

The measured total configured maximum output power P_{UMAX} shall be within the following bounds:

$$P_{\text{CMAX_L}} - T_{\text{LOW}}(P_{\text{CMAX_L}}) \leq P_{\text{UMAX}} \leq P_{\text{CMAX_H}} + T_{\text{HIGH}}(P_{\text{CMAX_H}})$$

with the tolerances $T_{\text{LOW}}(P_{\text{CMAX_L}})$ and $T_{\text{HIGH}}(P_{\text{CMAX_H}})$ for applicable values of P_{CMAX} specified in Table 6.2B.4.1.3a-2.

When an UL subframe transmission p from E-UTRA overlap with a physical-channel q from the NR, then for P_{UMAX} evaluation, the E-UTRA subframe p is taken as reference period T_{REF} and always considered as the reference measurement duration and the following rules are applicable.

T_{REF} and T_{eval} are specified in Table 6.2B.4.1.3a-1 when same or different subframe and physical-channel durations are used in aggregated carriers. $P_{PowerClass, NE-DC}$ shall not be exceeded by the UE during any evaluation period of time.

Table 6.2B.4.1.3a-1: P_{CMAX} evaluation window

| transmission duration | T_{REF} | T_{eval} |
|---|--------------|---|
| Different transmission duration in different RAT carriers | LTE Subframe | $\text{Min}(T_{no_hopping}, \text{Physical Channel Length})$ |

For each T_{REF} , the P_{CMAX_H} is evaluated per T_{eval} and given by the maximum value over the transmission(s) within the T_{eval} as follows:

$$P_{CMAX_H} = \text{MAX} \{ P_{CMAX_NE-DC_H}(p, q), P_{CMAX_NE-DC_H}(p, q+I), \dots, P_{CMAX_NE-DC_H}(p, q+n) \}$$

where $P_{CMAX_NE-DC_H}$ are the applicable upper limits for each overlapping scheduling unit pairs (p, q) , $(p, q+I)$, up to $(p, q+n)$ for each applicable T_{eval} duration, where $q+n$ is the last NR UL physical-channel overlapping with LTE subframe p .

While P_{CMAX_L} is computed as follows:

$$P_{CMAX_L} = \text{MIN} \{ P_{CMAX_NE-DC_L}(p, q), P_{CMAX_NE-DC_L}(p, q+I), \dots, P_{CMAX_NE-DC_L}(p, q+n) \}$$

where $P_{CMAX_NE-DC_L}$ are the applicable lower limits for each overlapping scheduling unit pairs (p, q) , $(p, q+I)$, up to $(p, q+n)$ for each applicable T_{eval} duration, where $q+n$ is the last NR UL physical-channel overlapping with LTE subframe p .

With

$$P_{CMAX_NE-DC_H}(p, q) = \text{MIN} \{ 10 \log_{10} [p_{CMAX_H_E-UTRA, c}(p) + p_{CMAX_H, f, c, NR, c}(q)], P_{EMAX, NE-DC}, P_{PowerClass, NE-DC} \}$$

And:

$$a = 10 \log_{10} [p_{CMAX_E-UTRA, c}(p) + p_{CMAX, f, c, NR}(q)] > P_{Total}^{NE-DC}$$

If $a = \text{TRUE}$

$$P_{CMAX_NE-DC_L}(p, q) = \text{MIN} \{ 10 \log_{10} [p_{CMAX_L_E-UTRA, c}(p)], P_{EMAX, NE-DC}, P_{PowerClass, NE-DC} \}$$

Else

$$P_{CMAX_NE-DC_L}(p, q) = \text{MIN} \{ 10 \log_{10} [p_{CMAX_L_E-UTRA, c}(p) + p_{CMAX_L, f, c, NR, c}(q)], P_{EMAX, NE-DC}, P_{PowerClass, NE-DC} \}$$

where

- $p_{CMAX_H_E-UTRA, c}(p)$ is the E-UTRA higher limit of the maximum configured power expressed in linear scale;
- $p_{CMAX_H_NR, c}(q)$ is the NR higher limit of the maximum configured power expressed in linear scale;
- $p_{CMAX_L_E-UTRA, c}(p)$ is the E-UTRA lower limit of the maximum configured power expressed in linear scale;
- $p_{CMAX_L_NR, c}(q)$ is the NR lower limit of the maximum configured power expressed in linear scale;
- $P_{PowerClass, NE-DC}$ is defined in subclause 6.2B.1a.3-1 for inter-band NE-DC;
- $p_{CMAX_E-UTRA, c}(p)$ is the linear value of $P_{CMAX_E-UTRA, c}(p)$, the real configured max power for E-UTRA
- $p_{CMAX, f, c, NR}(q)$ is the linear value of $P_{CMAX, f, c, NR}(q)$, the real configured max power of NR

When E-UTRA and NR transmissions overlap and the condition a = TRUE, P_{UMAX,f,c,NR}(q) for MCG, under nominal conditions, shall meet

$$P_{UMAX,f,c,NR}(q) \leq 10\log(p_{CMAX,H,f,c,NR}(q)) + T_{HIGH}(10\log(p_{CMAX,H,f,c,NR}(q)))$$

where P_{CMAX_L}, P_{CMAX_H}, and P_{UMAX} are specified above with the tolerances T_{LOW} and T_{HIGH} specified in Table 6.2B.4a.1.3-2 for applicable values of P_{CMAX_L} and P_{CMAX_H}.

6.2B.4.2 $\Delta T_{IB,c}$ for DC

6.2B.4.2.0 General

For the UE which supports inter-band EN-DC or NE-DC configuration, $\Delta T_{IB,c}$ in Tables below applies where unless otherwise stated, the same $\Delta T_{IB,c}$ is applicable to NR band(s) part for DC configurations which have the same NR operating band combination. Unless otherwise stated, $\Delta T_{IB,c}$ is set to zero.

6.2B.4.2.1 Intra-band contiguous EN-DC

$\Delta T_{IB,c}$ is not applicable for intra-band contiguous EN-DC.

6.2B.4.2.2 Intra-band non-contiguous EN-DC

$\Delta T_{IB,c}$ is not applicable for intra-band non-contiguous EN-DC.

Occupied bandwidth requirement for E-UTRA single carrier and CA operation specified in subclauses 6.6.1 and 6.6.1A of [4] and for NR single carrier and CA operation specified in subclause 6.5.1 of [2] and subclause 6.5.1 and 6.5A.1 of [3] apply.

6.5B.2 Out-of-band emissions for DC

6.5B.2.1 Intra-band contiguous EN-DC

The out of band emissions are unwanted emissions immediately outside the EN-DC aggregated channel bandwidth resulting from the modulation process and non-linearity in the transmitter but excluding spurious emissions. This out of band emission limit is specified in terms of a spectrum emission mask and an adjacent channel leakage power ratio.

Unless otherwise stated, the OOB limits specified for the DC combination in this subclause supercede any OOB requirements specified for each sub-block in the respective TS [4] and [2].

The requirements apply to the sum of transmissions across all antenna connectors.

6.5B.2.1.1 Spectrum emissions mask

The spectrum emission mask of the UE applies to frequencies (Δf_{OOB}) starting from the \pm edge of the EN-DC aggregated channel bandwidth. For frequencies offset greater than Δf_{OOB} as specified in Table 6.5B.2.1.1-1 the spurious requirements in subclause 6.5B.3 are applicable.

The general spectrum emission for intra-band contiguous EN-DC is specified in Table 6.5B.2.1.1-1.

The power of any UE emission shall not exceed the levels specified in Table 6.5B.2.1.1-1 for the specified EN-DC aggregated channel bandwidth.

Table 6.5B.2.1.1-1. General spectrum emission mask for intra-band contiguous EN-DC

| Δf_{OOB} (MHz) | Spectrum emission limit (dBm) | Measurement bandwidth |
|--|--|-----------------------|
| $\pm 0 - 1$ | $\text{Max}(\text{Round}(10 \cdot \log(0.15/\text{ENBW})), -24)$ | 30 kHz |
| $\pm 1 - 5$ | -10 | 1 MHz |
| $\pm 5 - \text{ENBW}$ | -13 | 1 MHz |
| $\pm \text{ENBW} - (\text{ENBW}+5)$ | -25 | 1 MHz |
| NOTE: ENBW refers to the aggregated channel bandwidth in MHz as defined in subclause 5.3B. | | |

6.5B.2.1.2 Additional spectrum emissions mask

6.5B.2.1.2.1 Requirements for network signalled value "NS_35"

When NS_35 is indicated in the MCG and NS_35 is indicated in the SCG, the requirements in Table 6.5B.2.1.2.1-1 apply in the frequency ranges immediately adjacent and outside the aggregated sub-blocks of the EN-DC configuration for DC_(n)71AA.

Table 6.5B.2.1.2.1-1: Additional requirements

| Δf_{OOB} (MHz) | Frequency offset of measurement filter centre frequency, f_{offset} | Minimum requirement (dBm) | Measurement bandwidth |
|--|--|---------------------------|-----------------------|
| $0 \text{ MHz} \leq \Delta f < 0.1 \text{ MHz}$ | $0.015 \text{ MHz} \leq f_{\text{offset}} < 0.085 \text{ MHz}$ | -13 | 30 kHz |
| $0.1 \text{ MHz} \leq \Delta f < \text{ENBW}$ | $0.15 \text{ MHz} \leq f_{\text{offset}} < \text{ENBW} - 0.05 \text{ MHz}$ | -13 | 100 kHz |
| $\text{ENBW} \leq \Delta f < \text{ENBW} + 5 \text{ MHz}$ | $\text{ENBW}+0.5 \text{ MHz} \leq f_{\text{offset}} < \text{ENBW} + 4.5 \text{ MHz}$ | -25 | 1 MHz |
| NOTE 1: ENBW is the aggregated bandwidth of an E-UTRA sub-block and an adjacent NR sub-block; there is no frequency separation between the said sub-blocks. The sub-block bandwidths include any internal guard bands. | | | |

6.5B.2.1.2.2 Requirements for network signalled value "NS_04"

Additional spectrum emission requirements are signalled by the network to indicate that the UE shall meet an additional requirement for a specific deployment scenario as part of the cell handover/broadcast message.

The Band 41/n41 SEM transition point from -13 dBm/MHz to -25 dBm/MHz is based on the emission bandwidth. The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power. Since the 26 dB emission bandwidth is implementation dependent, the transmission bandwidths occupied by RBs is used for the SEM. The emission bandwidth for E-UTRA carriers is document in TS 36.101 [4], and the emission bandwidth for NR carriers is documented in TS 38.101-1 [2]. The total emission bandwidth for contiguous intra-band EN-DC is the sum of the emission bandwidth for each CC plus the guard band between contiguous CCs.

When "NS_04" is indicated in the cell, the power of any UE emission shall not exceed the levels specified in Table 6.5B.2.1.2.2-1.

Table 6.5B.2.1.2.2-1: DC_(n)41 SEM with NS_04

| Δf_{OoB} MHz | Spectrum emission limit (dBm) / measurement bandwidth for each ENBW | | | | | Measurement bandwidth |
|---|--|-----------|-----------|-----------|-------------|--------------------------|
| | 15 MHz | 20 MHz | 40 MHz | 50 MHz | > 50 MHz | |
| $\pm 0 - 1$ | -10 | -10 | -10 | | | 2 % ENBW |
| | | | | -10 | | 1 MHz |
| $\pm 1 - 5$ | -10 | | | | | 1 MHz |
| $\pm 5 - X$ | -13 | | | | | |
| $\pm X - (\text{ENBW} + 5 \text{ MHz})$ | -25 | | | | | |
| NOTE: X is defined as the sum of the emission bandwidth of the component carriers plus the guard band between contiguous CCs. | | | | | | |

6.5B.2.1.3 Adjacent channel leakage ratio

For EN-DC operation with an E-UTRA sub-block immediately adjacent to an NR sub-block, the ACLR is defined as the ratio of the filtered mean power centred on the aggregated sub-block bandwidth ENBW to the filtered mean power centred on an adjacent bandwidth of the same size ENBW at nominal channel spacing. The UE shall meet the ACLR minimum requirement $\text{EN-DC}_{\text{ACLR}}$ specified in Table 6.5B.2.1.3-1 with ENBW the sum of the sub-block bandwidths.

The assigned channel power and adjacent channel power are measured with rectangular filters with measurement bandwidths specified in 6.5B.2.1.3-1.

Table 6.5B.2.1.3-1: ACLR for intra-band EN-DC (contiguous sub-blocks)

| Parameter | Unit | Value |
|---|------|--------------------------------------|
| $\text{EN-DC}_{\text{ACLR}}$ for PC3 | dBc | 30 |
| $\text{EN-DC}_{\text{ACLR}}$ for PC2 | dBc | 31 |
| Measurement bandwidth of EN-DC channel | | $1.00 \cdot \text{ENBW}$ |
| Measurement bandwidth of adjacent channel | | $0.95 \cdot \text{ENBW}$ |
| Frequency offset of adjacent channel | | ENBW / $-\text{ENBW}$ |
| NOTE 1: ENBW is the aggregated bandwidth in MHz as defined in subclause 5.3B. | | |
| NOTE 2: The frequency offset is that in between the centre frequencies of the measurement filters | | |

6.5B.2.2 Intra-band non-contiguous EN-DC

6.5B.2.2.1 Spectrum emissions mask

The spectral emission mask for intra-band non-contiguous EN-DC is a composite of the emission mask for each CC with the level set to the maximum value from each mask for each frequency outside of the transmission bandwidth of either carrier. A composite spectrum emission mask is a combination of individual CC spectrum emissions masks. Where two masks overlap the most relaxed is used. Composite spectrum emission mask applies to frequencies up to $\pm \Delta f_{\text{OoB}}$ starting from the edges of the sub-blocks. If for some frequency an individual CC spectrum emission mask overlaps with the bandwidth of another CC then the emission mask does not apply for that frequency.

6.5B.2.2.2 Additional spectrum emissions mask

When additional spectrum emission mask or masks apply, the additional SEM(s) shall be used to calculate the composite SEM described in 6.5B.2.2.1.

6.5B.2.2.3 Adjacent channel leakage ratio

For intra-band non-contiguous EN-DC, the EN-DC Adjacent Channel Leakage power Ratio (EN-DC_{ACLR}) is the ratio of the sum of the filtered mean powers centred on the assigned E-UTRA and NR sub-block frequencies to the filtered mean power centred on an adjacent channel frequency at nominal channel spacing. In case the sub-block gap bandwidth W_{gap} is smaller than a E-UTRA or NR sub-block bandwidth, no EN-DC_{ACLR} requirement is set for the corresponding sub-block for the gap. The assigned EN-DC sub-block power and adjacent channel power are measured with rectangular filters with measurement bandwidths specified in [4] for the E-UTRA sub-block, and [2],[3] for the NR sub-block. If the measured adjacent channel power is greater than -50dBm then the EN-DC_{ACLR} shall be higher than the value specified in for E-UTRA_{ACLR} and NR_{ACLR}.

6.5B.2.3 Inter-band EN-DC within FR1

Unless otherwise stated, the OOB requirements specified in subclause 6.6.2.1 of [4], sub-clause 6.6.2 of [4] and subclause 6.5.2 of [2] apply for each component carrier.

6.5B.2.3a Inter-band NE-DC within FR1

Unless otherwise stated, the OOB requirements specified in subclause 6.6.2.1 of [4], sub-clause 6.6.2 of [4] and subclause 6.5.2 of [2] apply for each component carrier.

6.5B.2.4 Inter-band EN-DC including FR2

6.5B.2.5 Inter-band EN-DC including both FR1 and FR2

Unless otherwise stated, out-of-band emissions requirement for E-UTRA single carrier and CA operation specified in subclauses 6.6.2 of [4] and for NR single carrier and CA operation specified in subclause 6.5.2 of [2] and subclause 6.5.2 and 6.5A.2 of [3] apply.

6.5B.3 Spurious emissions for DC

6.5B.3.1 Intra-band contiguous EN-DC

6.5B.3.1.1 General spurious emissions

The general spurious emissions requirements specified in subclause 6.6.3.1 of [4] and subclause 6.5.3.1 of [2] apply beyond any frequencies for which the out-of-band emissions requirements in subclause 6.5B.2.1 apply.

6.5B.3.1.2 Spurious emission band UE co-existence

The requirements in Table 6.5B.3.1.2-1 apply on each component carrier with all component carriers are active.

Table 6.5B.3.1.2-1: Requirements for intra-band contiguous EN-DC

| EN-DC Configuration | Spurious emission | | | | | | |

| | NR Band n77, n78 and n79 | | | | | | |

| NOTE 1: F _{DL_low} and F _{DL_high} refer to each E-UTRA frequency band specified in Table 5.5-1 | | | | | | | |
| NOTE 2: As exceptions, measurements with a level up to the applicable requirements defined in Table 6.6.3.1-2 are permitted for each assigned E-UTRA carrier used in the measurement due to 2 nd , 3 rd , 4 th or 5 th harmonic spurious emissions. Due to spreading of the harmonic emission the exception is also allowed for the first 1 MHz frequency range immediately outside the harmonic emission on both sides of the harmonic emission. This results in an overall exception interval centred at the harmonic emission of (2 MHz + N x L _{CRB} x 180 kHz), where N is 2, 3, 4, 5 for the 2 nd , 3 rd , 4 th or 5 th harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval | | | | | | | |
| NOTE 3: These requirements also apply for the frequency ranges that are less than F _{OOB} (MHz) in Table 6.6.3.1-1 and Table 6.6.3.1A-1 [4] from the edge of the channel bandwidth. | | | | | | | |

NOTE: To simplify the above Table, E-UTRA band numbers are listed for bands which are specified only for E-UTRA operation or both E-UTRA and NR operation. NR band numbers are listed for bands which are specified only for NR operation.

6.5B.3.2 Intra-band non-contiguous EN-DC

6.5B.3.2.1 General spurious emissions

The general spurious emissions requirements specified in subclause 6.6.3.1 of [4] and subclause 6.5.3.1 of [2] apply beyond any frequencies for which the out-of-band emissions requirements in subclause 6.5B.2.2 apply. If for some frequency an individual CC spurious emission requirement overlaps with the general spectrum emission mask or the bandwidth of another CC then it does not apply.

6.5B.3.2.2 Spurious emission band UE co-existence

The requirements in Table 6.5B.3.2.2-1 apply with all component carriers are active.

NOTE: To simplify the above Table, E-UTRA band numbers are listed for bands which are specified only for E-UTRA operation or both E-UTRA and NR operation. NR band numbers are listed for bands which are specified only for NR operation.

6.5B.3.3 Inter-band EN-DC within FR1

6.5B.3.3.1 General spurious emissions

The general spurious emissions requirements specified in subclause 6.6.3.1 of [4], subclause 6.5.3.1 of [2] and [3] apply for each component carrier. For the case of inter-band EN-DC with a single carrier per cell group, the general spurious emissions requirements also apply with both downlink carrier and both both uplink carriers active. Limits on configured maximum output power for the uplink according to subclause 6.2B.4 apply.

NOTE: The general spurious emission requirements with both uplink carriers active are allowed to be verified for only a single inter-band EN-DC configuration per NR band. Furthermore, the requirements are allowed to be verified by measuring spurious emissions at the specific frequencies where second and third order intermodulation products generated by the two transmitted carriers can occur.

6.5B.3.3.2 Spurious emission band UE co-existence

This clause specifies the requirements for the specified EN-DC, for coexistence with protected bands. The requirements in Table 6.5B.3.3.2-1 apply on each component carrier with all component carriers are active.

NOTE 1: F_{DL_low} and F_{DL_high} refer to each E-UTRA frequency band specified in Table 5.5-1 in TS 36.101 [4].

NOTE 2: As exceptions, measurements with a level up to the applicable requirements defined in Table 6.6.3.1-2 are permitted for each assigned E-UTRA carrier used in the measurement due to 2nd, 3rd, 4th or 5th harmonic spurious emissions. Due to spreading of the harmonic emission the exception is also allowed for the first 1 MHz frequency range immediately outside the harmonic emission on both sides of the harmonic emission. This results in an overall exception interval centred at the harmonic emission of (2 MHz + N x L_{CRB} x 180 kHz), where N is 2, 3, 4, 5 for the 2nd, 3rd, 4th or 5th harmonic respectively. The exception is allowed if the measurement bandwidth (MBW) totally or partially overlaps the overall exception interval.

NOTE 3: Applicable when co-existence with PHS system operating in 1884.5 - 1915.7 MHz

NOTE 4: Applicable only when the assigned E-UTRA carrier is confined within 824 MHz and 849 MHz for UE category M1, M2 and UE category NB1 and NB2.

NOTE 5: These requirements also apply for the frequency ranges that are less than F_{OOB} (MHz) in Table 6.6.3.1-1 and Table 6.6.3.1A-1 from the edge of the channel bandwidth.

NOTE 6: This requirement is applicable for any channel bandwidths within the range 2500 - 2570 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 2560.5 - 2562.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 2552 - 2560 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB.

NOTE 7: For these adjacent bands, the emission limit could imply risk of harmful interference to UE(s) operating in the protected operating band.

NOTE 8: This requirement is applicable for any channel bandwidths within the range 1920 - 1980 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 1927.5 - 1929.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 1930 - 1938 MHz the requirement is applicable only for an uplink

NOTE 9: Applicable when the assigned E-UTRA carrier is confined within 718 MHz and 748 MHz and when the channel bandwidth used is 5 or 10 MHz.

NOTE 10: As exceptions, measurements with a level up to the applicable requirement of -36 dBm/MHz is permitted for each assigned E-UTRA carrier used in the measurement due to 2nd harmonic spurious emissions. An exception is allowed if there is at least one individual RB within the transmission bandwidth (see Figure 5.6-1) for which the 2nd harmonic totally or partially overlaps the measurement bandwidth (MBW).

NOTE 11: As exceptions, measurements with a level up to the applicable requirement of -38 dBm/MHz is permitted for each assigned E-UTRA carrier used in the measurement due to 3rd harmonic spurious emissions. An exception is allowed if there is at least one individual RB within the transmission bandwidth (see Figure 5.6-1) for which the 3rd harmonic totally or partially overlaps the measurement bandwidth (MBW).

NOTE 12: This requirement is applicable only for the following cases: A: for carriers of 5 MHz channel bandwidth when carrier centre frequency (F_c) is within the range 902.5 MHz ≤ F_c < 907.5 MHz with an uplink transmission bandwidth less than or equal to 20 RB; B: for carriers of 5 MHz channel bandwidth when carrier centre frequency (F_c) is within the range 907.5 MHz ≤ F_c ≤ 912.5 MHz without any restriction on uplink transmission bandwidth; C: for carriers of 10 MHz channel bandwidth when carrier centre frequency (F_c) is F_c = 910 MHz with an uplink transmission bandwidth less than or equal to 32 RB with RB_{start} > 3.

NOTE 13: This requirement applies for 5, 10, 15 and 20 MHz E-UTRA channel bandwidth allocated within 1744.9MHz and 1784.9MHz.

NOTE 14: This requirement is applicable for 5 and 10 MHz E-UTRA channel bandwidth allocated within 718-728MHz. For carriers of 10 MHz bandwidth, this requirement applies for an uplink transmission bandwidth less than or equal to 30 RB with RB_{start} > 1 and RB_{start} < 48.

NOTE 15: Applicable when NS_05 in section 6.6.3.3.1 is signalled by the network.

NOTE 16: This requirement is applicable for any channel bandwidths within the range 1920 - 1980 MHz with the following restriction: for carriers of 15 MHz bandwidth when carrier centre frequency is within the range 1927.5 - 1929.5 MHz and for carriers of 20 MHz bandwidth when carrier centre frequency is within the range 1930 - 1938 MHz the requirement is applicable only for an uplink transmission bandwidth less than or equal to 54 RB.

NOTE 17: This requirement is applicable in the case of a 10 MHz E-UTRA carrier confined within 703 MHz and 733 MHz, otherwise the requirement of -25 dBm with a measurement bandwidth of 8 MHz applies.

| EN-DC Configuration | Spurious emission | | | |
|---|-------------------|-----------------------|---------------------|-----------|
| | Protected band | Frequency range (MHz) | Maximum Level (dBm) | MBW (MHz) |
| NOTE 18: This requirement is only applicable for E-UTRA carriers with bandwidth confined within 1885 - 1920 MHz (requirement for carriers with at least 1RB confined within 1880 - 1885 MHz is not specified). This requirement applies for an uplink transmission bandwidth less than or equal to 54 RB for E-UTRA carriers of 15 MHz bandwidth when carrier center frequency is within the range 1892.5 - 1894.5 MHz and for E-UTRA carriers of 20 MHz bandwidth when carrier center frequency is within the range 1895 - 1903 MHz. | | | | |
| NOTE 19: This requirement applies when the E-UTRA and NR carriers are confined within 2545 – 2575 MHz or 2595 - 2645 MHz and the channel bandwidth is 10 or 20 MHz | | | | |

NOTE: To simplify the above Table, E-UTRA band numbers are listed for bands which are specified only for E-UTRA operation or both E-UTRA and NR operation. NR band numbers are listed for bands which are specified only for NR operation.

6.5B.4 Additional spurious emissions

6.5B.4.1 General

These requirements are specified in terms of an additional spectrum emission requirement. Additional spurious emission requirements are signalled by the network to indicate that the UE shall meet an additional requirement for a specific deployment scenario as part of the cell handover/broadcast message.

NOTE: For measurement conditions at the edge of each frequency range, the lowest frequency of the measurement position in each frequency range should be set at the lowest boundary of the frequency range plus MBW/2. The highest frequency of the measurement position in each frequency range should be set at the highest boundary of the frequency range minus MBW/2. MBW denotes the measurement bandwidth defined for the protected band.

6.5B.4.1.1 Minimum requirement (network signalled value "NS_04")

When "NS 04" is indicated in the cell, the power of any UE emission shall not exceed the levels specified in Table 6.5B.4.1.1-1. This requirement also applies for the frequency ranges that are less than F_{OoB} (MHz) in Table 6.6.3.1-1 from the edge of the channel bandwidth.

Table 6.5B.4.1.1-1: Additional requirements

| Frequency band (MHz) | Channel bandwidth / Spectrum emission limit (dBm) | Measurement bandwidth |
|------------------------|---|---|
| $2495 \leq f < 2496$ | -13 | 1 % of Channel BW for contiguous BW up to 100 MHz, 1 MHz for contiguous BW > 100 MHz |
| $2490.5 \leq f < 2495$ | -13 | 1 MHz |
| $0 < f < 2490.5$ | -25 | 1 MHz |

6.5B.5.3a Inter-band NE-DC within FR1

The transmit intermodulation requirement specified in subclauses 6.7.1 and 6.7.1A of [4] and subclauses 6.5.4 and 6.5A.4 of [2] apply for each component carrier in E-UTRA bands and NR bands, respectively.

6.5B.5.5 Inter-band EN-DC including both FR1 and FR2

Transmit intermodulation requirement specified in subclauses 6.7.1 and 6.7.1A of [4] and subclauses 6.5.4 and 6.5A.4 of [2] apply for each component carrier in E-UTRA bands and NR bands, respectively.

7 Receiver characteristics

7.1 General

Unless otherwise stated the receiver characteristics are specified at the antenna connector(s) of the UE for the bands operating on frequency range 1 and over the air of the UE for the bands operating on frequency range 2. The requirements for frequency range 1 and frequency range 2 can be verified separately. For the carrier in frequency range 1, requirements can be verified with NR FR2 link disabled. For the carrier in frequency range 2, requirements can be verified in OTA mode with E-UTRA connecting to the network by OTA without calibration.

The requirements defined in this clause are the extra requirements compared with the single carrier requirements defined in [2] and [3].

Unless otherwise stated, the UL and DL reference measurement channels are the same with the configurations specified in [2] and [3].

Unless otherwise stated, requirements for NR receiver written in TS 38.101-1 [2] and TS 38.101-2 [3] apply and are assumed anchor agnostic. Requirements are verified under conditions where anchor resources do not interfere NR operation.

RX requirements for intra-band contiguous and non-contiguous EN-DC only apply for bands < 2.7GHz.

For intra-band non-contiguous EN-DC, the output power is configured as follows:

- One E-UTRA uplink carrier with the output power set to 4dB Below $P_{\text{CMAX,L}}$ and the NR band whose downlink is being tested has its uplink carrier output power set to minimum output power as defined in subclause 6.3.1 of [2].
- One NR uplink carrier with the output power set to 4dB Below $P_{\text{CMAX,L}}$ and the E-UTRA band whose downlink is being tested has its uplink carrier output power set to minimum output power as defined in subclause 6.3.2.1 of [4].

For the additional requirements for intra-band non-contiguous EN-DC of two sub-blocks, an in-gap test refers to the case when the interfering signal is located at a negative offset with respect to the assigned lowest channel frequency of the highest sub-block and located at a positive offset with respect to the assigned highest channel frequency of the lowest sub-block.

For the additional requirements for intra-band non-contiguous EN-DC of two sub-blocks, an out-of-gap test refers to the case when the interfering signal(s) is (are) located at a positive offset with respect to the assigned channel frequency of the highest carrier frequency or located at a negative offset with respect to the assigned channel frequency of the lowest carrier frequency.

For the additional requirements for intra-band non-contiguous EN-DC of two sub-blocks with channel bandwidth larger than or equal to 5 MHz, the existing adjacent channel selectivity requirements, in-band blocking requirements (for each case), and narrow band blocking requirements apply for in-gap tests only if the corresponding interferer frequency offsets with respect to the two measured carriers satisfy the following condition in relation to the sub-block gap size W_{gap} for at least one of the E-UTRA or NR sub-blocks, so that the interferer frequency position does not change the nature of the core requirement tested:

$$W_{\text{gap}} \geq 2 \cdot |\text{Interferer (offset)}| - \text{BW}_{\text{Channel}}$$

For the E-UTRA sub-block, the $F_{\text{Interferer (offset)}}$, for a sub-block with a single component carrier is the interferer frequency offset with respect to carrier as specified in subclause 7.5.1, subclause 7.6.1 and subclause 7.6.3 for the respective requirement in [4] and BW_{Channel} . $F_{\text{Interferer (offset)}}$ for the E-UTRA sub-block with two or more contiguous component carriers is the interference frequency offset with respect to the carrier adjacent to the gap is specified in subclause 7.5.1A, 7.6.1A and 7.6.3A in [4].

For the NR sub-block, the $F_{\text{Interferer (offset)}}$, for a sub-block with a single component carrier is the interferer frequency offset with respect to carrier as specified in subclause 7.5.1, subclause 7.6.1 and subclause 7.6.3 for the respective requirement in [2] and BW_{Channel} .

The interferer frequency offsets for adjacent channel selectivity, each in-band blocking case and narrow-band blocking shall be tested separately with a single in-gap interferer at a time.

7.3A Reference sensitivity for CA

7.3A.1 General

For NR CA operation NR single carrier REFSENS requirements defined in [2] and [3] apply to all downlink bands part of NR CA configurations listed in Table 5.2A.1-1 unless sensitivity degradation is allowed as defined in clause 7.3A.

7.3A.2 Reference sensitivity power level for CA

7.3A.3 $\Delta R_{\text{IB,c}}$ for CA

For the UE which supports inter-band NR CA configuration, the minimum requirement for reference sensitivity in subclause 7.3.2 in TS 38.101-1 [2] and subclause 7.3.2, 7.3A.2 in TS 38.101-2 [3] shall be increased by the amount given in $\Delta R_{\text{IB,c}}$ in Tables below. Unless otherwise stated, $\Delta R_{\text{IB,c}}$ is set to zero.

In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then

- When the operating band frequency range is ≤ 1 GHz, the applicable additional $\Delta R_{\text{IB,c}}$ shall be the average value for all band combinations defined in subclause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum $\Delta R_{\text{IB,c}}$ among the different supported band combinations involving such band shall be applied
- When the operating band frequency range is > 1 GHz, the applicable additional $\Delta R_{\text{IB,c}}$ shall be the maximum value for all band combinations defined in subclause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3] for the applicable operating bands.

7.3A.3.1 $\Delta R_{\text{IB,c}}$ for Inter-band CA between FR1 and FR2

Unless otherwise stated, $\Delta R_{\text{IB,c}}$ for NR FR1 band and FR2 band of inter-band CA defined in table 5.5A.1-1 is set to zero.

7.3B Reference sensitivity level for DC

7.3B.1 General

For EN-DC, E-UTRA and NR single carrier REFSENS requirements defined in [2], [3] and [4] apply to all downlink bands of EN-DC configurations listed in clause 5.5B, unless sensitivity degradation exception is allowed in this clause of this specification, section 7.3 in TS 38.101-1 [2] or section 7.3 in TS 36.101 [4]. Allowed exceptions specified in this clause also apply to any higher order EN-DC configuration combination containing one of the band combinations that exception is allowed for. Reference sensitivity exceptions are specified by applying maximum sensitivity degradation (MSD) into applicable REFSENS requirement. EN-DC REFSENS requirements shall be met for NR uplink transmissions using QPSK DFT-s-OFDM waveforms as defined in clause 7.3.2 [2]. Unless otherwise specified UL allocation uses the lowest SCS allowable for a given channel BW.

In case of interband EN-DC the receiver REFSENS requirements in this clause do not apply for 1.4 and 3 MHz E-UTRA carriers. For the case of inter-band EN-DC with a single carrier per cell group, in addition to the E-UTRA and NR single carrier REFSENS requirements defined in [2], [3], and [4], the REFSENS requirements specified therein also apply with both downlink carriers and both uplink carriers active unless sensitivity exceptions are allowed in this clause of this specification, section 7.3 in TS 38.101-1 [2] or section 7.3 in TS 36.101 [4]. Limits on configured maximum output power for the uplink according to subclause 6.2B.4 shall apply.

NOTE: For inter-band EN-DC, the reference sensitivity requirement with both uplink carriers active is allowed to be verified for only a single inter-band EN-DC configuration per NR band.

7.3B.2 Reference sensitivity for DC

7.3B.2.1 Intra-band contiguous EN-DC

For intra-band contiguous EN-DC configurations, the reference sensitivity power level REFSENS is the minimum mean power applied to each one of the UE antenna ports at which the throughput for the carrier(s) of the E-UTRA and NR CGs shall meet or exceed the requirements for the specified E-UTRA and NR reference measurement channels.

Sensitivity degradation is allowed for Intra-band contiguous EN-DC configurations listed in Table 7.3B.2.1-1 the reference sensitivity is defined only for the specific uplink and downlink test points which are specified in Table 7.3B.2.1-1 and E-UTRA and NR single carrier requirements do not apply.

Table 7.3B.2.1-1: Reference sensitivity (MSD) for intra-band contiguous EN-DC

| | n71 | 678 | 10 | 10 (RB _{end} = 51) | 632 | 29.4 | |

7.3B.2.2 Intra-band non-contiguous EN-DC

For intra-band non-contiguous EN-DC configurations, the reference sensitivity power level REFSENS is the minimum mean power applied to each one of the UE antenna ports at which the throughput for the carrier(s) of the E-UTRA and NR CGs shall meet or exceed the requirements for the specified E-UTRA and NR reference measurement channels.

For DC_3A_n3A intra-band non-contiguous EN-DC combination, only single switched UL is supported in rel.15 therefore, no MSD is specified and E-UTRA and NR single carrier requirements apply.

7.3B.2.3 Inter-band EN-DC within FR1

Reference sensitivity exceptions are specified for the condition when there is uplink transmission only in the aggressor band.

7.3B.2.3.1 Reference sensitivity exceptions due to UL harmonic interference for EN-DC in NR FR1

Sensitivity degradation is allowed for a band if it is impacted by UL harmonic interference from another band part of the same EN-DC configuration. Reference sensitivity exceptions for the victim band (high) are specified in Table 7.3B.2.3.1-1 with uplink configuration of the aggressor band (low) specified in Table 7.3B.2.3.1-2.

7.3B.2.3.5 MSD for intermodulation interference due to dual uplink operation for EN-DC in NR FR1

For EN-DC configurations in NR FR1 the UE may indicate capability of not supporting simultaneous dual uplink operation due to possible intermodulation interference overlapping in frequency to its own primary downlink channel bandwidth if

- the intermodulation order is 2;
- the intermodulation order is 3 when both operating bands are between 450 MHz – 960 MHz or between 1427 MHz – 2690 MHz

In case for the EN-DC in NR FR1 configurations the intermodulation products caused by dual uplink operation do not interfere with the own primary downlink channel bandwidth as defined in Annex-I the UE is mandated to operate in dual and triple uplink mode.

For EN-DC in NR FR1 with uplink and downlink assigned to E-UTRA and NR FR1 bands given in Table 7.3B.2.3.5.1-1, Table 7.3B.2.3.5.2-1 and Table 7.3B.2.3.5.3-1 the reference sensitivity is defined only for the specific uplink and downlink test points specified in Table 7.3B.2.3.5.1-1, Table 7.3B.2.3.5.2-1 and Table 7.3B.2.3.5.3-1. For these test points the reference sensitivity levels specified in clause 7.3.1 in [4] and 7.3.2.1 of [2] for the corresponding channel bandwidths or in clause 7.3.1 of [4] are relaxed by the amount of the parameter MSD given in Table 7.3B.2.3.5.1-1, Table 7.3B.2.3.5.2-1 and Table 7.3B.2.3.5.3-1.

The throughput on each of the CGs shall be $\geq 95\%$ of the maximum throughput of the respective reference measurement channels as specified in ... with parameters specified in Table 7.3B.2.3.5-1 with dual UL transmissions overlapping in time unless otherwise stated.

7.3B.2.3.5.3 Void

7.3B.2.3a Inter-band NE-DC within FR1

Reference sensitivity exceptions are specified for the condition when there is uplink transmission only in the aggressor band. This subclause addresses directly only NE-DC configurations that don't have a corresponding specified EN-DC configuration or specific NE-DC exceptions.

7.3B.2.3a.1 Reference sensitivity exceptions due to UL harmonic interference for NE-DC in NR FR1

Sensitivity degradation is allowed for a band if it is impacted by UL harmonic interference from another band part of the same NE-DC configuration. For the NE-DC configurations that have an EN-DC defined configuration, the reference sensitivity exceptions for the victim band (high) are specified in Table 7.3B.2.3.1-1 with uplink configuration of the aggressor band (low) specified in Table 7.3B.2.3.1-2 are applicable.

7.3B.2.4 Inter-band EN-DC including FR2

7.3B.2.4.1 Void

7.3B.2.5 Inter-band EN-DC including both FR1 and FR2

7.3B.2.5.1 Reference sensitivity exceptions due to UL harmonic interference for EN-DC including both FR1 and FR2

For inter-band EN-DC of E-UTRA and NR in both FR1 and FR2, the UE is allowed to apply each sensitivity degradation for EN-DC in FR1 specified in clause 7.3B.2.3 TS 38.101-3 and for EN-DC including FR2 specified in clause 7.3B.2.3 of TS 38.101-3 independently.

7.3B.3 $\Delta R_{IB,c}$, ΔR_{IBNC} for DC

7.3B.3.0 General

For the UE which supports inter-band EN-DC or NE-DC configuration, the minimum requirement for reference sensitivity in Table 7.3.1-1 and Table 7.3.1-1a in [4], subclause 7.3.2, 7.3A.2, 7.3C.2 in [2] and subclause 7.3.2, 7.3A.2 in [3] shall be increased by the amount given in $\Delta R_{IB,c}$, ΔR_{IBNC} in Tables below where unless otherwise stated, the same $\Delta R_{IB,c}$, ΔR_{IBNC} are applicable to NR band(s) part for DC configurations which have the same NR operating band combination. Unless otherwise stated, $\Delta R_{IB,c}$ or ΔR_{IBNC} is set to zero.

In case the UE supports more than one of band combinations for CA, SUL or DC, and an operating band belongs to more than one band combinations then

- When the operating band frequency range is ≤ 1 GHz, the applicable additional $\Delta R_{IB,c}$ shall be the average value for all band combinations defined in subclause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3], truncated to one decimal place that apply for that operating band among the supported band combinations. In case there is a harmonic relation between low band UL and high band DL, then the maximum $\Delta R_{IB,c}$ among the different supported band combinations involving such band shall be applied
- When the operating band frequency range is > 1 GHz, the applicable additional $\Delta R_{IB,c}$ shall be the maximum value for all band combinations defined in subclause 7.3A, 7.3B, 7.3C in this specification and 7.3A, 7.3B in TS 38.101-3 [3] for the applicable operating bands.

Unless $\Delta R_{IB,c}$ is specified for the NE-DC configuration, the specified $\Delta R_{IB,c}$ for the EN-DC configuration including same bands as the corresponding NE-DC configuration is applicable for the NE-DC configuration.

7.3B.3.3a Inter-band NE-DC within FR1

Unless $\Delta R_{IB,c}$ is specified in this section, the value of $\Delta R_{IB,c}$ for the correspondingly specified EN-DC configuration in subclause 7.3B.3.3 is applicable.

7.3B.3.4 Inter-band EN-DC including FR2

7.3B.3.4.1 $\Delta R_{IB,c}$ for EN-DC in two bands

Unless otherwise stated, $\Delta R_{IB,c}$ for E-UTRA and FR2 NR bands of inter-band EN-DC combinations defined in table 5.2B.5.1-1 is set to zero.

Table 7.3B.3.4.1-1: Void

7.3B.3.4.2 $\Delta R_{IB,c}$ for EN-DC three bands

Unless otherwise stated, $\Delta R_{IB,c}$ for FR2 NR bands is set to zero, and $\Delta R_{IB,c}$ for constituent E-UTRA bands for inter-band EN-DC defined in table 5.2B.5.2-1 is the same as those for the corresponding E-UTRA CA configuration specified in TS 36.101 [4], without the FR2 NR bands.

Annex A (normative): Measurement channels

A.1 General

The throughput values defined in the measurement channels specified in Annex A, are calculated and are valid per datastream (codeword). For multi-stream (more than one codeword) transmissions, the throughput referenced in the minimum requirements is the sum of throughputs of all datastreams (codewords).

The UE category entry in the definition of the reference measurement channel in Annex A is only informative and reveals the UE categories, which can support the corresponding measurement channel. Whether the measurement channel is used for testing a certain UE category or not is specified in the individual minimum requirements.

A.2 UL reference measurement channels for E-UTRA TDD Config 2

A.2.1 General

The measurement channels in the following subclauses are defined to derive the requirements in clause 6 (Transmitter Characteristics) and clause 7 (Receiver Characteristics). The measurement channels represent example configurations of physical channels for different data rates.

A.3 DL reference measurement channels for E-UTRA

A.3.1 General

The number of available channel bits varies across the sub-frames due to PBCH and PSS/SSS overhead. The payload size per sub-frame is varied in order to keep the code rate constant throughout a frame.

Unless otherwise stated, no user data is scheduled on subframes #5 in order to facilitate the transmission of system information blocks (SIB).

The algorithm for determining the payload size A is as follows; given a desired coding rate R and radio block allocation N_{RB}

1. Calculate the number of channel bits N_{ch} that can be transmitted during the first transmission of a given sub-frame.
2. Find A such that the resulting coding rate is as close to R as possible, that is,

$$\min \left| R - (A + 24 * (N_{CB} + 1)) / N_{ch} \right|, \text{ where } N_{CB} = \begin{cases} 0, & \text{if } C = 1 \\ C, & \text{if } C > 1 \end{cases}$$

subject to

- a) A is a valid TB size according to section 7.1.7 of TS 36.213 [6] assuming an allocation of N_{RB} resource blocks.
 - b) C is the number of Code Blocks calculated according to section 5.1.2 of TS 36.212 [5].
3. If there is more than one A that minimizes the equation above, then the larger value is chosen per default and the chosen code rate should not exceed 0.93.
 4. For TDD, the measurement channel is based on DL/UL configuration ratio of 3DL+DwPTS (10 OFDM symbol SSF7): 1UL

Annex H (normative): Modified MPR behavior

H.1 Indication of modified MPR behavior

This annex contains the definitions of the bits in the field *modifiedMPRbehavior* indicated in the IE RF-Parameters [7] by a UE supporting an MPR or A-MPR modified in a later release of this specification. *modifiedMPRbehavior* is indicated in [7] by an 8-bit bitmap per NR band.

Table H.1-1: Definitions of the bits in the field *modifiedMPRbehavior*

| NR Band | Index of field (bit number) | Definition (description of the supported functionality if indicator set to one) | Notes |
|---------|--------------------------------|--|---|
| n41 | 0 (leftmost bit) | - EN-DC contiguous intraband MPR as defined in clause 6.2B.2.1 of 38.101-3 v15.5.0 | - This bit may be set to 1 by a UE supporting DC_(n)41AA UE EN-DC |
| | 1 | - EN-DC non-contiguous intraband MPR as defined in clause 6.2B.2.2 of 38.101-3 v15.5.0 | - This bit may be set to 1 by a UE supporting DC_41A_n41A EN-DC |
| n71 | 0 (leftmost bit) | - EN-DC contiguous intraband MPR as defined in clause 6.2B.2.1 of 38.101-3 v15.5.0 | - This bit may be set to 1 by a UE supporting DC_(n)71AA UE EN-DC |

Annex I (normative): Dual uplink interferer

UE is mandated to support operation in dual uplink mode also in EN-DC configuration for FR1 listed in Table 7.3.2.1.5-1 or NE-DC configuration for FR1 and indicated by column single uplink allowed if the intermodulation products caused by the dual uplink operation do not interfere own primary downlink transmission channel bandwidth of PCell or PSCell. For intermodulation products falling into any secondary downlink channel bandwidth, UE single UL capability is not considered.

Formula for determining if the EN-DC in NR FR1 configuration with dual uplink operation interferes own downlink reception.

Interference bandwidth: $IBW = |a| * CBW1 + |b| * CBW2$

- $|a| + |b| = 2$ (or 3)
- CBW1 and CBW2 are the transmission bandwidth configurations of the UL channels

Center frequency of IBW: $f_{IBW} = |a * f1 + b * f2|$

- f1 and f2 are center frequency of the transmission bandwidth configurations of each UL channel

The range of IMD 2 (or 3): $[f_{IBW} - IBW/2, f_{IBW} + IBW/2]$

NOTE 1: UE shall be able to apply operations which are configured by RRC reconfiguration and corresponding HARQ timing on the transmission bandwidth.

NOTE 2: For identified difficult band combination, during two adjacent RRC reconfiguration, the changing of transmission bandwidth should not introduce IM2 and IM3, which will result in UE changing from 2Tx to 1Tx. Otherwise, UE behavior is not specified.

For DC_3A_n3A intra-band non-contiguous EN-DC combination, only single switched UL is supported in Rel-15.
