

Draft **EN 300 607-1** V7.0.0 (1999-07)

European Standard (Telecommunications series)

**Digital cellular telecommunications system (Phase 2+);
Mobile Station (MS) conformance specification;
Part 1: Conformance specification
(GSM 11.10-1 version 7.0.0 Release 1998)**

| Intellectual Property Rights..... | 41 |
| Foreword | 41 |
| 1 Scope | 42 |
| 2 References | 42 |
| 3 Definitions, conventions, and applicability | 49 |
| 3.1 Mobile station definition and configurations | 49 |
| 3.2 Applicability | 49 |
| 3.2.1 Applicability of this specification..... | 49 |
| 3.2.2 Applicability of the individual tests..... | 49 |
| 3.2.3 Applicability to terminal equipment..... | 77 |
| 3.3 Definitions | 78 |
| 3.4 Conventions for mathematical notations..... | 78 |
| 3.4.1 Mathematical signs..... | 78 |
| 3.4.2 Powers to the base 10..... | 78 |
| 3.5 Conventions on electrical terms | 78 |
| 3.5.1 Radio Frequency (RF) input signal level..... | 78 |
| 3.5.2 Reference sensitivity level..... | 79 |
| 3.5.3 Power level of fading signal | 79 |
| 3.6 Terms on test conditions | 79 |
| 3.6.1 Radio test conditions | 79 |
| 4 Test Equipment | 81 |
| 4.1 Terms used to describe test equipment in this EN | 81 |
| 4.2 Functional requirements of test equipment | 81 |
| 5 Testing methodology in general (layers 1, 2, and 3)..... | 81 |
| 5.1 Testing of optional functions and procedures | 81 |
| 5.2 Test interfaces and facilities..... | 81 |
| 5.3 Different protocol layers | 82 |
| 5.4 Information to be provided by the apparatus supplier..... | 82 |
| 5.5 Definitions of transmit and receive times..... | 82 |
| 6 Reference test methods | 82 |
| 6.1 General..... | 82 |
| 6.2 Choice of frequencies in the frequency hopping mode | 83 |
| 6.3 "Ideal" radio conditions | 83 |
| 6.4 Standard test signals..... | 83 |
| 6.5 Power (control) levels..... | 83 |
| 7 Implicit testing | 84 |
| 8 Measurement uncertainty | 84 |
| 9 Format of tests..... | 84 |
| 10 Generic call set up procedures | 84 |
| 10.1 Generic call set-up procedure for mobile terminating speech calls..... | 84 |
| 10.2 Generic call set-up procedure for mobile originating speech calls | 90 |
| 10.3 Generic call set-up procedure for mobile terminating data calls..... | 93 |
| 10.4 Generic call set-up procedure for mobile originating data calls..... | 96 |
| 10.5 Generic call set-up procedure for mobile terminating multislot configuration, minimum number of timeslots allocated..... | 100 |
| 10.6 Generic call set-up procedure for mobile originating multislot configuration, minimum number of timeslots allocated..... | 103 |
| 11 General tests | 107 |
| 11.1 Verification of support and non-support of services (multiple numbering scheme or ISDN)..... | 107 |

| | | |
|------------|---|-----|
| 11.1.1 | Mobile Terminated (MT) calls..... | 107 |
| 11.1.2 | Mobile Originated (MO) calls..... | 108 |
| 11.2 | Verification of support of the single numbering scheme..... | 109 |
| 11.3 | Verification of non-support of services (Advice of Charge Charging (AoCC))..... | 110 |
| 11.4 | Verification of non-support of services (call hold) | 112 |
| 11.5 | Verification of non-support of services (multiparty)..... | 113 |
| 11.6 | Verification of non-support of feature (Fixed Dialling Number (FDN)) | 113 |
| 11.7 | IMEI Security | 114 |
| 11.8 | Coding of the Bearer Capability information element | 115 |
| 11.8.1 | Network to MS Direction | 116 |
| 11.8.1.1 | BS 21 to 26 - Asynchronous Service | 116 |
| 11.8.1.1.1 | BS 21 | 116 |
| 11.8.1.1.2 | BS 22 | 120 |
| 11.8.1.1.3 | BS 24 | 120 |
| 11.8.1.1.4 | BS 25 | 120 |
| 11.8.1.1.5 | BS 26 | 120 |
| 11.8.1.1.6 | BS 23 | 120 |
| 11.8.1.2 | BS 31 to 34 - Synchronous Service | 121 |
| 11.8.1.2.1 | BS 32 | 121 |
| 11.8.1.2.2 | BS 31 | 125 |
| 11.8.1.2.3 | BS 33 | 126 |
| 11.8.1.2.4 | BS 34 | 126 |
| 11.8.1.3 | BS 61 - Alternate Speech / Data | 126 |
| 11.8.1.3.1 | Speech/Asynchronous Data, Transparent..... | 127 |
| 11.8.1.3.2 | Speech/Asynchronous Data, Non Transparent..... | 129 |
| 11.8.1.3.3 | Speech/Synchronous Data..... | 131 |
| 11.8.1.4 | BS 81 - Speech followed by Data | 132 |
| 11.8.1.4.1 | Speech followed by Asynchronous Data..... | 132 |
| 11.8.1.4.2 | Speech followed by Synchronous Data | 132 |
| 11.8.1.5 | TS 61 - Alternate Speech / Facsimile group 3 | 132 |
| 11.8.1.5.1 | TS 61 - Alternate Speech / Facsimile group 3, Transparent..... | 133 |
| 11.8.1.5.2 | TS 61 - Alternate Speech / Facsimile group 3, Non-Transparent..... | 134 |
| 11.8.1.6 | TS 62 - Automatic Facsimile group 3..... | 135 |
| 11.8.2 | MS to SS direction | 135 |
| 11.8.2.1 | BS 21 to 26 - Asynchronous Service | 135 |
| 11.8.2.1.1 | BS 21 | 136 |
| 11.8.2.1.2 | BS 22 | 140 |
| 11.8.2.1.3 | BS 24 | 140 |
| 11.8.2.1.4 | BS 25 | 140 |
| 11.8.2.1.5 | BS 26 | 140 |
| 11.8.2.1.6 | BS 23 | 140 |
| 11.8.2.2 | BS 31 to 34 - Synchronous Service | 141 |
| 11.8.2.2.1 | BS 32 | 141 |
| 11.8.2.2.2 | BS 31 | 145 |
| 11.8.2.2.3 | BS 33 | 146 |
| 11.8.2.2.4 | BS 34 | 146 |
| 11.8.2.3 | BS 41 to 46 - PAD Access Asynchronous..... | 147 |
| 11.8.2.3.1 | ²⁾ BS 41..... | 147 |
| 11.8.2.3.2 | BS 42 | 149 |
| 11.8.2.3.3 | BS 44 | 149 |
| 11.8.2.3.4 | BS 45 | 149 |
| 11.8.2.3.5 | BS 46 | 149 |
| 11.8.2.3.6 | BS 43 | 149 |
| 11.8.2.4 | BS 51 to 53 - Packet Service Synchronous..... | 150 |
| 11.8.2.4.1 | ²⁾ BS 51..... | 150 |
| 11.8.2.4.2 | BS 52 | 150 |
| 11.8.2.4.3 | BS 53 | 150 |
| 11.8.2.5 | BS 61 - Alternate Speech / Data | 151 |
| 11.8.2.5.1 | Speech/Asynchronous Data, Transparent..... | 151 |
| 11.8.2.5.2 | Speech/Asynchronous Data, Non Transparent..... | 153 |

| | | |
|------------|---|-----|
| 11.8.2.5.3 | Speech/Synchronous Data..... | 155 |
| 11.8.2.6 | BS 81 - Speech followed by Data..... | 156 |
| 11.8.2.6.1 | Speech followed by Asynchronous Data..... | 156 |
| 11.8.2.6.2 | Speech followed by Synchronous Data..... | 156 |
| 11.8.2.7 | TS 61 - Alternate Speech / Facsimile group 3 | 156 |
| 11.8.2.7.1 | TS 61 - Alternate Speech / Facsimile group 3, Transparent..... | 157 |
| 11.8.2.7.2 | TS 61 - Alternate Speech / Facsimile group 3, Non Transparent..... | 158 |
| 11.8.2.8 | TS 62 - Automatic Facsimile group 3..... | 159 |
| 11.8.2.9 | TS 11 and TS 12- Speech | 159 |
| 11.8.2.9.1 | Support of only full/half rate speech version 1 | 159 |
| 11.8.2.9.2 | Support of speech full rate version 2 (Enhanced Full Rate)..... | 159 |
| 12 | Transceiver..... | 162 |
| 12.1 | Conducted spurious emissions | 162 |
| 12.1.1 | MS allocated a channel | 162 |
| 12.1.2 | MS in idle mode | 164 |
| 12.2 | Radiated spurious emissions | 165 |
| 12.2.1 | MS allocated a channel | 166 |
| 12.2.2 | MS in idle mode | 168 |
| 12.3 | Conducted spurious emissions for MS supporting the R-GSM frequency band | 169 |
| 12.3.1 | MS allocated a channel | 169 |
| 12.3.2 | MS in idle mode | 172 |
| 12.4 | Radiated spurious emissions for MS supporting the R-GSM frequency band | 173 |
| 12.4.1 | MS allocated a channel | 174 |
| 12.4.2 | MS in idle mode | 176 |
| 13 | Transmitter | 178 |
| 13.1 | Frequency error and phase error | 178 |
| 13.2 | Frequency error under multipath and interference conditions..... | 181 |
| 13.3 | Transmitter output power and burst timing..... | 183 |
| 13.4 | Output RF spectrum..... | 191 |
| 13.5 | Intermodulation attenuation | 197 |
| 13.6 | Frequency error and phase error in HSCSD multislot configurations..... | 199 |
| 13.7 | Transmitter output power and burst timing in HSCSD configurations | 203 |
| 13.8 | Output RF spectrum in HSCSD multislot configuration..... | 210 |
| 13.9 | Output RF spectrum for MS supporting the R-GSM band..... | 217 |
| 13.10 | [Reserved for future GSM test]..... | 222 |
| 13.11 | [Reserved for future GSM test]..... | 222 |
| 13.12 | [Reserved for future GSM test]..... | 222 |
| 13.13 | [Reserved for future GSM test]..... | 222 |
| 13.14 | [Reserved for future GSM test]..... | 222 |
| 13.15 | [Reserved for future GSM test]..... | 222 |
| 13.16 | GPRS transmitter tests | 222 |
| 13.16.1 | Frequency error and phase error in GPRS multislot configuration | 222 |
| 13.16.3 | Output RF spectrum in GPRS multislot configuration..... | 234 |
| 14 | Receiver | 241 |
| 14.1 | Bad frame indication..... | 247 |
| 14.1.1 | Bad frame indication - TCH/FS | 247 |
| 14.1.1.1 | Bad frame indication - TCH/FS - Random RF input | 247 |
| 14.1.1.2 | Bad frame indication - TCH/FS - Frequency hopping and downlink DTX | 249 |
| 14.1.2 | Bad frame indication - TCH/HS..... | 250 |
| 14.1.2.1 | Bad frame indication - TCH/HS - Random RF input..... | 250 |
| 14.1.2.2 | Bad frame indication - TCH/HS - Frequency hopping and downlink DTX..... | 251 |
| 14.1.3 | Bad frame indication - TCH/FS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network..... | 252 |
| 14.1.4 | Bad frame indication - TCH/HS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network..... | 254 |
| 14.2 | Reference sensitivity | 257 |
| 14.2.1 | Reference sensitivity - TCH/FS..... | 257 |
| 14.2.2 | Reference sensitivity - TCH/HS (Speech frames) | 259 |

| | | |
|---------------|---|-----|
| 14.2.3 | Reference sensitivity - FACCH/F..... | 262 |
| 14.2.4 | Reference sensitivity - FACCH/H..... | 263 |
| 14.2.5 | Reference sensitivity - full rate data channels..... | 264 |
| 14.2.6 | Reference sensitivity - half rate data channels..... | 265 |
| 14.2.7 | Reference sensitivity - TCH/EFS..... | 266 |
| 14.2.8 | Reference sensitivity - full rate data channels in multislot configuration..... | 268 |
| 14.2.9 | Reference sensitivity - TCH/FS for MS supporting the R-GSM band..... | 270 |
| 14.3 | Usable receiver input level range..... | 272 |
| 14.4 | Co-channel rejection..... | 273 |
| 14.4.1 | Co-channel rejection - TCH/FS..... | 273 |
| 14.4.2 | Co-channel rejection - TCH/HS..... | 275 |
| 14.4.3 | Co-channel rejection - TCH/HS (SID frames)..... | 277 |
| 14.4.4 | Co-channel rejection - FACCH/F..... | 279 |
| 14.4.5 | Co-channel rejection - FACCH/H..... | 280 |
| 14.4.6 | Co-channel rejection - TCH/EFS..... | 281 |
| 14.4.7 | Receiver performance in the case of frequency hopping and co-channel interference on one carrier..... | 282 |
| 14.4.7.1 | Definition and applicability..... | 282 |
| 14.4.7.2 | Conformance Requirement..... | 283 |
| 14.4.7.3 | Test Purpose..... | 283 |
| 14.4.7.4 | Method Of Test..... | 283 |
| 14.4.7.4.1 | Initial conditions..... | 283 |
| 14.4.7.5 | Test requirements..... | 283 |
| 14.5 | Adjacent channel rejection..... | 284 |
| 14.5.1 | Adjacent channel rejection - speech channels..... | 284 |
| 14.5.2 | Adjacent channel rejection - control channels..... | 286 |
| 14.6 | Intermodulation rejection..... | 288 |
| 14.6.1 | Intermodulation rejection - speech channels..... | 288 |
| 14.6.2 | Intermodulation rejection - control channels..... | 290 |
| 14.7 | Blocking and spurious response..... | 291 |
| 14.7.1 | Blocking and spurious response - speech channels..... | 291 |
| 14.7.2 | Blocking and spurious response - control channels..... | 295 |
| 14.7.3 | Blocking and spurious response - speech channels for MS supporting the R-GSM band..... | 298 |
| 14.7.4 | Blocking and spurious response - control channels for MS supporting the R-GSM band..... | 301 |
| 14.8 | AM suppression..... | 304 |
| 14.8.1 | AM suppression - speech channels..... | 304 |
| 14.8.2 | AM suppression - control channels..... | 305 |
| 14.9 | Paging performance at high input levels..... | 307 |
| 14.10 | <i>[Reserved for future GSM test]</i> | 308 |
| 14.11 | <i>[Reserved for future GSM test]</i> | 308 |
| 14.12 | <i>[Reserved for future GSM test]</i> | 308 |
| 14.13 | <i>[Reserved for future GSM test]</i> | 308 |
| 14.14 | <i>[Reserved for future GSM test]</i> | 308 |
| 14.15 | <i>[Reserved for future GSM test]</i> | 308 |
| 14.16 | GPRS receiver tests..... | 308 |
| 14.16.1 | Minimum Input level for Reference Performance..... | 309 |
| 14.16.1.1 | Definition and applicability..... | 309 |
| 14.16.1.2 | Conformance requirement..... | 310 |
| 14.16.1.3 | Test purpose..... | 311 |
| 14.16.1.4 | Method of test..... | 311 |
| 14.16.1.4.1 | Initial conditions..... | 311 |
| 14.16.1.4.2 | Procedure..... | 312 |
| 14.16.1.5 | Test requirements..... | 313 |
| 14.16.2 | Co-channel rejection..... | 313 |
| 14.16.2.1 | Co-channel rejection for packet channels..... | 313 |
| 14.16.2.1.1 | Definition and applicability..... | 313 |
| 14.16.2.1.2 | Conformance requirement..... | 313 |
| 14.16.2.1.3 | Test purpose..... | 314 |
| 14.16.2.1.4 | Method of test..... | 314 |
| 14.16.2.1.4.1 | Initial conditions..... | 314 |
| 14.16.2.1.4.2 | Procedure..... | 314 |

| | | |
|-------------|--|-----|
| 14.16.2.1.5 | Test requirements..... | 315 |
| 15 | Timing advance and absolute delay | 316 |
| 16 | Reception time tracking speed | 322 |
| 17 | Access times during handover | 324 |
| 17.1 | Intra cell channel change..... | 324 |
| 17.2 | Inter cell handover | 326 |
| 18 | Temporary reception gaps..... | 329 |
| 18.1 | Temporary reception gaps, single slot | 329 |
| 18.2 | Temporary reception gaps in HSCSD multislot configurations | 330 |
| 19 | Channel release after unrecoverable errors..... | 333 |
| 19.1 | Channel release after unrecoverable errors -1 | 333 |
| 19.2 | Channel release after unrecoverable errors - 2..... | 334 |
| 19.3 | Channel release after unrecoverable errors - 3..... | 335 |
| 20 | Cell selection and reselection | 337 |
| 20.1 | Cell selection | 338 |
| 20.2 | Cell selection with varying signal strength values..... | 340 |
| 20.3 | Basic cell reselection | 342 |
| 20.4 | Cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters | 344 |
| 20.5 | Cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages..... | 346 |
| 20.6 | Cell reselection timings..... | 348 |
| 20.7 | Priority of cells | 350 |
| 20.8 | Cell reselection when C1 (serving cell) < 0 for 5 seconds | 351 |
| 20.9 | Running average of the surrounding cell BCCH carrier signal levels..... | 352 |
| 20.10 | Running average of the serving cell BCCH carrier signal level..... | 354 |
| 20.11 | Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list | 355 |
| 20.12 | Decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers ... | 356 |
| 20.13 | Decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers..... | 357 |
| 20.14 | Emergency calls | 358 |
| 20.15 | Cell reselection due to MS rejection "LA not allowed" | 359 |
| 20.16 | Downlink signalling failure..... | 361 |
| 20.17 | Cell selection if no suitable cell found in 10 s | 362 |
| 20.18 | Cell reselection due to MS rejection "Roaming not allowed in this LA" | 363 |
| 20.19 | Cell selection on release of SDCCH and TCH | 365 |
| 20.20 | Multiband cell selection and reselection..... | 366 |
| 20.20.1 | Multiband cell selection and reselection / Cell Selection | 366 |
| 20.20.2 | Multiband cell selection and reselection / Cell reselection..... | 368 |
| 20.21 | R-GSM cell selection and reselection | 371 |
| 20.21.1 | R-GSM cell selection | 372 |
| 20.21.2 | R-GSM cell selection with varying signal strength values | 374 |
| 20.21.3 | R-GSM basic cell reselection | 376 |
| 20.21.4 | R-GSM cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters | 378 |
| 20.21.5 | R-GSM cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages | 380 |
| 20.21.6 | R-GSM cell reselection timings | 381 |
| 20.21.7 | R-GSM priority of cells..... | 383 |
| 20.21.8 | R-GSM cell reselection when C1 (serving cell) < 0 for 5 seconds..... | 385 |
| 20.21.9 | R-GSM running average of the surrounding cell BCCH carrier signal levels | 386 |
| 20.21.10 | R-GSM running average of the serving cell BCCH carrier signal level | 387 |
| 20.21.11 | Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list..... | 388 |
| 20.21.12 | R-GSM decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers..... | 389 |
| 20.21.13 | R-GSM decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers | 390 |

| | | |
|-------------|---|-----|
| 20.21.14 | R-GSM emergency calls..... | 391 |
| 20.21.15 | R-GSM cell reselection due to MS rejection "LA not allowed" | 393 |
| 20.21.16 | R-GSM downlink signalling failure | 394 |
| 20.21.17 | R-GSM cell selection if no suitable cell found in 10 s | 396 |
| 20.21.18 | R-GSM cell reselection due to MS rejection "Roaming not allowed in this LA" | 397 |
| 20.21.19 | R-GSM cell selection on release of SDCCH and TCH | 398 |
| 20.22 | GPRS Cell Selection and Reselection..... | 400 |
| 20.22.1 | Cell selection..... | 401 |
| 20.22.1.1 | Definition and applicability | 401 |
| 20.22.1.2 | Conformance requirement | 401 |
| 20.22.1.3 | Test purpose | 402 |
| 20.22.1.4 | Method of test..... | 403 |
| 20.22.1.4.1 | Initial conditions | 403 |
| 20.22.1.4.2 | Procedure | 403 |
| 20.22.1.5 | Test requirements | 403 |
| 20.22.2 | Cell reselection in Packet Idle mode | 403 |
| 20.22.2.1 | Definition and applicability | 403 |
| 20.22.2.2 | Conformance requirement | 403 |
| 20.22.2.3 | Test purpose | 404 |
| 20.22.2.4 | Method of test..... | 404 |
| 20.22.2.4.1 | Initial conditions | 404 |
| 20.22.2.4.2 | Procedure | 404 |
| 20.22.2.5 | Test Requirements | 404 |
| 20.22.3 | Priority of cells..... | 405 |
| 20.22.3.1 | Definition and applicability | 405 |
| 20.22.3.2 | Conformance requirement | 405 |
| 20.22.3.3 | Test purpose | 405 |
| 20.22.3.4 | Method of Test | 405 |
| 20.22.3.4.1 | Initial Conditions | 405 |
| 20.22.3.4.2 | Procedure | 406 |
| 20.22.3.5 | Test Requirements | 406 |
| 20.22.4 | Cell re-selection with cells in different routing area..... | 406 |
| 20.22.4.1 | Definition and applicability | 406 |
| 20.22.4.2 | Conformance requirement | 406 |
| 20.22.4.3 | Test purpose | 407 |
| 20.22.4.4 | Method of Test | 407 |
| 20.22.4.4.1 | Initial Conditions | 407 |

| 26.1.2 | Structured sequence of the tests | 474 |
| 26.1.3 | General rules for message parameters | 475 |
| 26.1.4 | General rules for layer 3 testing | 475 |
| 26.1.5 | Format of layer 3 test descriptions | 475 |
| 26.2 | Initial tests..... | 477 |
| 26.2.1 | Channel request | 477 |
| 26.2.1.1 | Channel request / initial time | 477 |
| 26.2.1.2 | Channel request / repetition time | 478 |
| 26.2.1.3 | Channel request / random reference | 480 |
| 26.2.2 | IMSI detach and IMSI attach | 481 |
| 26.2.3 | Sequenced MM / CM message transfer..... | 485 |
| 26.2.4 | Establishment cause | 486 |
| 26.3 | Test of MS functions in idle mode..... | 494 |
| 26.3.1 | Initial conditions..... | 494 |
| 26.3.2 | MS indication of available PLMNs..... | 496 |
| 26.3.3 | MS will send only if BSS is "on air" | 497 |
| 26.3.4 | Manual mode of PLMN selection | 497 |
| 26.4 | Lower layer failures in layer 3 testing..... | 500 |
| 26.4.1 | Introduction..... | 500 |
| 26.4.2 | Layer 1 reception failures..... | 500 |
| 26.4.3 | Data link layer failures | 500 |
| 26.4.4 | Lower layer failures, used for the tests in clause 25 | 500 |
| 26.5 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions | 501 |
| 26.5.1 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown protocol discriminator..... | 501 |
| 26.5.2 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / TI and skip indicator..... | 502 |
| 26.5.2.1 | TI and skip indicator / RR | 502 |
| 26.5.2.1.1 | TI and skip indicator / RR / Idle Mode | 502 |
| 26.5.2.1.2 | TI and skip indicator / RR / RR-Connection established | 503 |
| 26.5.2.2 | TI and skip indicator / MM..... | 504 |
| 26.5.2.3 | TI and skip indicator / CC | 506 |
| 26.5.3 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / undefined or unexpected message type | 508 |
| 26.5.3.1 | Undefined or unexpected message type / undefined message type / CC..... | 508 |
| 26.5.3.2 | Undefined or unexpected message type / undefined message type / MM..... | 509 |
| 26.5.3.3 | Undefined or unexpected message type / undefined message type / RR..... | 511 |
| 26.5.3.4 | Undefined or unexpected message type / unexpected message type / CC | 512 |
| 26.5.4 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unforeseen information elements in the non-imperative message part | 513 |
| 26.5.4.1 | Unforeseen information elements in the non-imperative message part / duplicated information elements..... | 513 |
| 26.5.5 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / non- semantical mandatory IE errors..... | 515 |
| 26.5.5.1 | Non-semantical mandatory IE errors / RR..... | 515 |
| 26.5.5.1.1 | Non-semantical mandatory IE errors / RR / missing mandatory IE error..... | 515 |
| 26.5.5.1.1.1 | Non-semantical mandatory IE errors / RR / missing mandatory IE error / special case | 515 |
| 26.5.5.1.1.2 | Non-semantical mandatory IE errors / RR / missing mandatory IE error / general case | 516 |
| 26.5.5.1.2 | Non-semantical mandatory IE errors / RR / comprehension required..... | 517 |
| 26.5.5.2 | Non-semantical mandatory IE errors / MM..... | 518 |
| 26.5.5.2.1 | Non-semantical mandatory IE errors / MM / syntactically incorrect mandatory IE..... | 518 |
| 26.5.5.2.2 | Non-semantical mandatory IE errors / MM / syntactically incorrect mandatory IE..... | 520 |
| 26.5.5.2.3 | Non-semantical mandatory IE errors / MM / comprehension required..... | 521 |
| 26.5.5.3 | Non-semantical mandatory IE errors / CC..... | 523 |
| 26.5.5.3.1 | Non-semantical mandatory IE errors / CC / missing mandatory IE | 523 |
| 26.5.5.3.1.1 | Non-semantical mandatory IE errors / CC / missing mandatory IE / disconnect message | 523 |

| | | |
|--------------|---|-----|
| 26.5.5.3.1.2 | Non-semantic mandatory IE errors / CC / missing mandatory IE / general case | 524 |
| 26.5.5.3.2 | Non-semantic mandatory IE errors / CC / comprehension required..... | 525 |
| 26.5.6 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown IE, comprehension not required..... | 526 |
| 26.5.6.1 | Unknown information elements in the non-imperative message part / MM | 526 |
| 26.5.6.1.1 | Unknown IE, comprehension not required / MM / IE unknown in the protocol | 526 |
| 26.5.6.1.2 | Unknown IE, comprehension not required / MM / IE unknown in the message | 528 |
| 26.5.6.2 | Unknown information elements in the non-imperative message part / CC | 529 |
| 26.5.6.2.1 | Unknown information elements in the non-imperative message part / CC / Call establishment ... | 529 |
| 26.5.6.2.2 | Unknown information elements in the non-imperative message part / CC / disconnect..... | 530 |
| 26.5.6.2.3 | Unknown information elements in the non-imperative message part / CC / release | 531 |
| 26.5.6.2.4 | Unknown information elements in the non-imperative message part / CC / release complete | 533 |
| 26.5.6.3 | Unknown IE in the non-imperative message part, comprehension not required / RR..... | 534 |
| 26.5.7 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / spare bits..... | 536 |
| 26.5.7.1 | Spare bits / RR..... | 536 |
| 26.5.7.1.1 | Spare bits / RR / paging channel | 536 |
| 26.5.7.1.2 | Spare bits / RR / BCCH | 537 |
| 26.5.7.1.3 | Spare bits / RR / AGCH | 538 |
| 26.5.7.1.4 | Spare bits / RR / Connected Mode | 541 |
| 26.5.7.2 | Spare bits / MM..... | 542 |
| 26.5.7.3 | Spare bits / CC..... | 544 |
| 26.5.8 | Default contents of messages | 546 |
| 26.6 | Test of the elementary procedures for radio resource management | 549 |
| 26.6.1 | Immediate assignment | 549 |
| 26.6.1.1 | Immediate assignment / SDCCH or TCH assignment | 549 |
| 26.6.1.2 | Immediate assignment / extended assignment | 550 |
| 26.6.1.3 | Immediate assignment / assignment rejection..... | 553 |
| 26.6.1.4 | Immediate assignment / ignore assignment..... | 554 |
| 26.6.1.5 | Immediate assignment after immediate assignment reject | 556 |
| 26.6.2 | Test of paging..... | 557 |
| 26.6.2.1 | Normal paging | 557 |
| 26.6.2.1.1 | Paging / normal / type 1 | 557 |
| 26.6.2.1.2 | Paging / normal / type 2 | 560 |
| 26.6.2.1.3 | Paging / normal / type 3 | 562 |
| 26.6.2.2 | Paging / extended..... | 563 |
| 26.6.2.3 | Paging / reorganization | 567 |
| 26.6.2.3.1 | Paging / reorganization / procedure 1 | 567 |
| 26.6.2.3.2 | Paging / reorganization / procedure 2 | 570 |
| 26.6.2.4 | Paging / same as before | 571 |
| 26.6.2.5 | Paging / multislot CCCH | 572 |
| 26.6.3 | Test of measurement report..... | 574 |
| 26.6.3.1 | Measurement / no neighbours..... | 574 |
| 26.6.3.2 | Measurement / all neighbours present | 577 |
| 26.6.3.3 | Measurement / barred cells and non-permitted NCCs | 582 |
| 26.6.3.4 | Measurement / DTX | 586 |
| 26.6.3.5 | Measurement / Frequency Formats..... | 591 |
| 26.6.3.6 | Measurement / multiband environment..... | 595 |
| 26.6.4 | Test of the channel assignment procedure | 600 |
| 26.6.4.1 | Dedicated assignment / successful case | 600 |
| 26.6.4.2 | Dedicated assignment / failure..... | 612 |
| 26.6.4.2.1 | Dedicated assignment / failure / failure during active state..... | 612 |
| 26.6.4.2.2 | Dedicated assignment / failure / general case..... | 614 |
| 26.6.5 | Test of handover..... | 615 |
| 26.6.5.1 | Handover / successful / active call / non-synchronized | 616 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized | 631 |
| 26.6.5.3 | Handover / successful / active call / finely synchronized..... | 651 |
| 26.6.5.4 | Handover / successful / call under establishment / finely synchronized | 656 |
| 26.6.5.5 | Pre-synchronized handovers | 666 |
| 26.6.5.5.1 | Handover / successful / active call / pre-synchronized / Timing Advance IE not included..... | 666 |

| | | |
|------------|---|-----|
| 26.6.5.5.2 | Handover / successful / call being established / pre-synchronized / timing advance IE is included / reporting of observed time difference requested | 668 |
| 26.6.5.6 | Handover / successful / active call / pseudo synchronized | 670 |
| 26.6.5.7 | Handover / successful / active call / non-synchronized / reporting of observed time difference requested..... | 672 |
| 26.6.5.8 | Handover / layer 3 failure | 674 |
| 26.6.5.9 | Handover / layer 1 failure | 675 |
| 26.6.6 | Test of frequency redefinition | 676 |
| 26.6.6.1 | Frequency redefinition..... | 676 |
| 26.6.7 | Test of the channel mode modify procedure | 682 |
| 26.6.7.1 | Test of the channel mode modify procedure / full rate | 682 |
| 26.6.7.2 | Test of the channel mode modify procedure / half rate..... | 684 |
| 26.6.8 | Test of ciphering mode setting | 686 |
| 26.6.8.1 | Ciphering mode / start ciphering..... | 687 |
| 26.6.8.2 | Ciphering mode / no ciphering | 688 |
| 26.6.8.3 | Ciphering mode / old cipher key..... | 690 |
| 26.6.8.4 | Ciphering mode / change of mode, algorithm and key | 691 |
| 26.6.8.5 | Ciphering mode / IMEISV request | 699 |
| 26.6.9 | Test of additional assignment..... | 701 |
| 26.6.10 | Test of partial release | 701 |
| 26.6.11 | Test of classmark..... | 701 |
| 26.6.11.1 | Classmark change | 701 |
| 26.6.11.2 | Classmark interrogation..... | 703 |
| 26.6.12 | Test of channel release | 704 |
| 26.6.12.1 | Channel release / SDCCH..... | 704 |
| 26.6.12.2 | Channel release / SDCCH - no L2 ACK..... | 706 |
| 26.6.12.3 | Channel release / TCH-F | 707 |
| 26.6.12.4 | Channel release / TCH-F - no L2 ACK | 708 |
| 26.6.13 | Test of starting time..... | 710 |
| 26.6.13.1 | Dedicated assignment with starting time / successful case / time not elapsed | 711 |
| 26.6.13.2 | Dedicated assignment with starting time / successful case / time elapsed | 713 |
| 26.6.13.3 | Dedicated assignment with starting time and frequency redefinition / failure case / time not elapsed..... | 715 |
| 26.6.13.4 | Dedicated assignment with starting time and frequency redefinition / failure case / time elapsed | 718 |
| 26.6.13.5 | Handover with starting time / successful case / time not elapsed..... | 720 |
| 26.6.13.6 | Handover with starting time / successful case / time elapsed..... | 723 |
| 26.6.13.7 | Handover with starting time and frequency redefinition / failure case / time not elapsed..... | 725 |
| 26.6.13.8 | Handover with starting time and frequency redefinition / failure case / time elapsed..... | 727 |
| 26.6.13.9 | Immediate assignment with starting time / successful case / time not elapsed..... | 730 |
| 26.6.13.10 | Immediate assignment with starting time / successful case / time elapsed..... | 732 |
| 26.6.14 | Default contents of GSM 900 layer 3 messages for RR tests | 734 |
| 26.6.15 | Default contents of DCS 1 800 layer 3 messages for RR tests | 745 |

Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available **free of charge** from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://www.etsi.org/ipr>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This European Standard (Telecommunications series) has been produced by Technical Committee Special Mobile Group (SMG), and is now submitted for the ETSI standards One-step Approval Procedure.

The present document describes the technical characteristics and methods of test for Mobile Stations (MSs), operating in the 900 MHz and 1 800 MHz frequency band (GSM 900 and DCS 1 800) within the digital cellular telecommunications system.

The present document is part 1 of a multi-part EN covering the Digital cellular telecommunications system (Phase 2+); Mobile Station (MS) conformance specification, as identified below:

- Part 1: Conformance specification**
Reference: GSM 11.10-1.
- Part 2: Protocol Implementation Conformance Statement (PICS) proforma specification.
Reference: GSM 11.10-2.
- Part 3: Layer 3 (L3) Abstract Test Suite (ATS).
Reference: GSM 11.10-3.

The specification from which the present document has been derived was originally based on CEPT documentation, hence the presentation of the present document may not be entirely in accordance with the ETSI/PNE rules.

| Proposed national transposition dates | |
|--|---------------------------------|
| Date of latest announcement of this EN (doa): | 3 months after ETSI publication |
| Date of latest publication of new National Standard or endorsement of this EN (dop/e): | 6 months after doa |
| Date of withdrawal of any conflicting National Standard (dow): | 6 months after doa |

1 Scope

The present document describes the technical characteristics and methods of test for Mobile Stations (MS), for the Pan European digital cellular communications system and Personal Communication Systems (PCS) operating in the 900 MHz and 1 800 MHz band (GSM 900 and DCS 1 800), standardized by ETSI Special Mobile Group (SMG).

A subset of the tests is referenced in the GSM Common Technical Regulations (CTRs) and is used for regulatory conformance testing according to the EEC procedures for Telecommunications Terminal Equipment (TTE) type approval (EC Directive 91/263/EEC; also known as the "Terminal Directive" or "Second Phase Directive"). The remaining tests can be used to verify conformance with the GSM core technical specifications for those requirements that are not considered "essential" in the sense of the EC Directive 91/263/EEC (Article 4).

The present document covers the minimum characteristics considered necessary in order to provide sufficient performance for mobile equipment and to prevent interference to other services or to other users, and to the PLMNs.

It does not necessarily include all the characteristics which may be required by a user or subscriber, nor does it necessarily represent the optimum performance achievable.

It applies to the public land mobile radio service in the GSM 900 and DCS 1 800 systems, using constant envelope modulation and operating on radio frequencies in the 900 and 1 800 MHz bands respectively with a channel separation of 200 kHz and carrying 8 full rate channels or 16 half rate channels per carrier according to the TDMA principle.

The present document is part of the GSM-series of technical specifications. The present document neither replaces any of the other GSM technical specifications or GSM related ETSs or ENs, nor is it created to provide full understanding of (or parts of) the GSM 900 and DCS 1 800 systems. The present document lists the requirements, and provides the methods of test for testing a MS for conformance to the GSM standard.

For a full description of the system, reference should be made to all the GSM technical specifications or GSM related ETSs or ENs. Clause 2 provides a complete list of the GSM technical specifications, GSM related ETSs, ENs, and ETRs, on which this conformance test specifications is based.

The present document applies to the unit which includes the hardware to establish a connection across the radio interface.

If there is a difference between this conformance test EN, and any other GSM technical specification or GSM related ETS or EN, then the other GSM technical specification or GSM related ETS or EN shall prevail.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.
- A non-specific reference to an ETS shall also be taken to refer to later versions published as an EN with the same number.

3 Definitions, conventions, and applicability

For abbreviations and acronyms, see GSM 01.04.

3.1 Mobile station definition and configurations

In this EN, a MS can be:

- a vehicle mounted station;
- a portable station;
- a handheld station;
- a vehicle mounted/portable station;
- a vehicle mounted/handheld station.

A MS is the complete equipment configuration which may take part in a communication. However, this may not be the MS as it is offered to a test house for conformance testing.

In general, the MS, as it will be presented to a test house for conformance testing, is the station without all the additional Terminal Equipment (TE). Such a piece of hardware is also called a Mobile Termination (MT), but in this EN, the expression MS is used for any form of MS hardware as it is offered to the test house.

Figure 3-1

During the tests, the interfaces of the MT shall be connected to a System Simulator (SS), which will also emulate the TE. For some tests, it may be necessary to establish a pre-configured setup of the MS.

EXAMPLE: For reception of automatic fax group 3 to a fax machine on the R-interface, the MS needs configuration information about the presence of such a machine on that interface.

As an alternative, the TE may be physically integrated.

For a more detailed description of MS-configurations, see GSM 02.06.

3.2 Applicability

3.2.1 Applicability of this specification

If a MS is equipped with a connector, to connect terminal equipment on an S or R reference point as defined in GSM 04.02, then testing of the MS may include testing of appropriate functioning to and from this connector.

This EN does not apply to TE which is to be connected to that connector, even if it is delivered with the MS.

3.2.2 Applicability of the individual tests

The applicability of each individual test is identified in the following table.

Table 3.1: Applicability of tests

| Clause | Title | Applicability |
|---------------|---|--|
| 11.1.1 | Mobile Terminated (MT) calls | Each MT Bearer Service and MT Teleservice supported by the MS |
| 11.1.2 | Mobile Originated (MO) calls | Each MO Bearer Service and MO Teleservice supported by the MS |
| 11.2 | Verification of support of the single numbering scheme | All MS |
| 11.3 | Verification of non-support of services (Advice of Charge Charging (AOCC)) | MS which do not support AOCC |
| 11.4 | Verification of non-support of services (call hold) | MS which support AOCC and do not support the Call Hold supplementary service |
| 11.5 | Verification of non-support of services (multiparty) | MS which support Call Hold and AOCC, but do not support the Multi-Party supplementary service |
| 11.6 | Verification of non-support of feature (Fixed Dialling Number (FDN)) | MS which do not support FDN |
| 11.7 | IMEI Security | All MS |
| 12.1.1 | Conducted spurious emissions, MS allocated a channel | All MS with a permanent antenna connector |
| 12.1.2 | Conducted spurious emissions, MS in idle mode | All MS with a permanent antenna connector |
| 12.2.1 | Radiated spurious emissions, MS allocated a channel | All MS. The test at extreme voltages does not apply to MS where a practical connection to an external power supply is not possible |
| 12.2.2 | Radiated spurious emissions, MS in idle mode | All MS. The test at extreme voltages does not apply to MS where a practical connection to an external power supply is not possible |
| 12.3.1 | Conducted spurious emissions, MS allocated a channel for MS supporting the R-GSM band | R-GSM MS with a permanent antenna connector |
| 12.3.2 | Conducted spurious emissions, MS in idle mode for MS supporting the R-GSM band | R-GSM MS with a permanent antenna connector |
| 12.4.1 | Radiated spurious emissions, MS allocated a channel for MS supporting the R-GSM band | R-GSM MS. The test at extreme voltages does not apply to MS where a practical connection to an external power supply is not possible |
| 12.4.2 | Radiated spurious emissions, MS in idle mode for MS supporting the R-GSM band | R-GSM MS. The test at extreme voltages does not apply to MS where a practical connection to an external power supply is not possible |
| 13.1 | Frequency error and phase error | All MS |
| 13.2 | Frequency error under multipath and interference conditions | All MS |
| 13.3 | Transmitter output power and burst timing | All MS |
| 13.4 | Output RF spectrum | All MS |
| 13.5 | Intermodulation attenuation | DCS 1 800 MS |
| 13.6 | Frequency error and phase error in HSCSD multislots configuration | Multislots MS |
| 13.7 | Reserved for future use | |
| 13.8 | Output RF spectrum in HSCSD multislots configuration | Multislots MS |
| 13.9 | Output RF spectrum for MS supporting the R-GSM band | R-GSM MS |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|--------|--|---|
| 14.1.1 | Bad frame indication - TCH/FS | MS supporting speech |
| 14.1.2 | Bad frame indication - TCH/HS | MS supporting half-rate speech |
| 14.2.1 | Reference sensitivity - TCH/FS | MS supporting speech |
| 14.2.2 | Reference sensitivity - TCH/HS (Speech frames) | MS supporting half-rate speech |
| 14.2.3 | Reference sensitivity - FACCH/F | All MS |
| 14.2.4 | Reference sensitivity - FACCH/H | MS supporting half rate channels |
| 14.2.5 | Reference sensitivity - full rate data channels | MS supporting data |
| 14.2.6 | Reference sensitivity - half rate data channels | MS supporting half-rate data |
| 14.2.7 | Reference sensitivity - TCH/EFS | MS supporting TCH/EFS |
| 14.2.9 | Reference sensitivity - TCH/FS for MS supporting the R-GSM band | R-GSM MS supporting speech |
| 14.3 | Usable receiver input level range | MS supporting speech |
| 14.4.1 | Co-channel rejection - TCH/FS | MS supporting speech |
| 14.4.2 | Co-channel rejection - TCH/HS | MS supporting half-rate speech |
| 14.4.3 | Co-channel rejection - TCH/HS (SID frames) | MS supporting half-rate speech |
| 14.4.4 | Co-channel rejection - FACCH/F | All MS |
| 14.4.5 | Reference sensitivity - half rate data channels | MS supporting half rate data |
| 14.4.6 | Co-channel rejection - speech channels | MS supporting speech |
| 14.5.1 | Adjacent channel rejection - speech channels | MS supporting speech |
| 14.5.2 | Adjacent channel rejection - control channels | MS not supporting speech |
| 14.6.1 | Intermodulation rejection - speech channels | MS supporting speech |
| 14.6.2 | Intermodulation rejection - control channels | MS not supporting speech |
| 14.7.1 | Blocking and spurious response - speech channels | MS supporting speech |
| 14.7.2 | Blocking and spurious response - control channels | MS not supporting speech |
| 14.7.3 | Blocking and spurious response - speech channels for MS supporting the R-GSM band | R-GSM MS supporting speech |
| 14.7.4 | Blocking and spurious response - control channels for MS supporting the R-GSM band | R-GSM MS not supporting speech |
| 14.8.1 | AM suppression - speech channels | MS supporting speech |
| 14.8.2 | AM suppression - control channels | MS not supporting speech |
| 15 | Timing advance and absolute delay | All MS |
| 16 | Reception time tracking speed | All MS |
| 17.1 | Intra cell channel change | All MS |
| 17.2 | Inter cell handover | All MS |
| 18 | Temporary reception gaps | MS which do not have an application layer always running which performs a normal release of the call due to loss of traffic |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|---|
| 19.1 | Channel release after unrecoverable errors -1 | MS which do not have an application layer always running which performs a normal release of the call due to loss of traffic |
| 19.2 | Channel release after unrecoverable errors - 2 | MS which do not have an application layer always running which performs a normal release of the call due to loss of traffic |
| 19.3 | Channel release after unrecoverable errors - 3 | MS which do not have an application layer always running which performs a normal release of the call due to loss of traffic |
| 20.1 | Cell selection | All MS |
| 20.2 | Cell selection with varying signal strength values | All MS |
| 20.3 | Basic cell reselection | All MS |
| 20.4 | Cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters | All MS |
| 20.5 | Cell reselection using parameters transmitted in the System Information type 2bis, type 7 and type 8 messages | All MS. Test purpose 2 is only applicable to EGSM900 and DCS 1 800 MS |
| 20.6 | Cell reselection timings | All MS |
| 20.7 | Priority of cells | All MS |
| 20.8 | Cell reselection when C1 (serving cell) < 0 for 5 seconds | All MS |
| 20.9 | Running average of the surrounding cell BCCH carrier signal levels | All MS |
| 20.10 | Running average of the serving cell BCCH carrier signal level | All MS |
| 20.11 | Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list | All MS |
| 20.12 | Decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers | All MS |
| 20.13 | Decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers | All MS |
| 20.14 | Emergency calls | MS supporting speech |
| 20.15 | Cell reselection due to MS rejection "LA not allowed" | All MS |
| 20.16 | Downlink signalling failure | All MS |
| 20.17 | Cell selection if no suitable cell found in 10 s | All MS |
| 20.18 | Cell reselection due to MS rejection "Roaming not allowed in this LA" | All MS |
| 20.19 | Cell selection on release of SDCCH and TCH | All MS |
| 20.20.1 | Multiband cell selection and reselection / Cell selection | MS supporting simultaneous multiband operation |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|----------|--|--|
| 20.20.2 | Multiband cell selection and reselection / Cell reselection | MS supporting simultaneous multiband operation |
| 20.21.1 | R-GSM cell selection | R-GSM MS |
| 20.21.2 | R-GSM cell selection with varying signal strength values | R-GSM MS |
| 20.21.3 | R-GSM basic cell reselection | R-GSM MS |
| 20.21.4 | R-GSM cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters | R-GSM MS |
| 20.21.5 | R-GSM cell reselection using parameters transmitted in the System Information type 2bis, type 7 and type 8 messages | R-GSM MS |
| 20.21.6 | R-GSM cell reselection timing | R-GSM MS |
| 20.21.7 | R-GSM priority of cells | R-GSM MS |
| 20.21.8 | R-GSM cell reselection when C1 (serving cell) < 0 for 5 seconds | R-GSM MS |
| 20.21.9 | R-GSM running average of the surrounding cell BCCH carrier signal levels | R-GSM MS |
| 20.21.10 | R-GSM running average of the serving cell BCCH carrier signal level | R-GSM MS |
| 20.21.11 | R-GSM updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list | R-GSM MS |
| 20.21.12 | R-GSM decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers | R-GSM MS |
| 20.21.13 | R-GSM decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers | R-GSM MS |
| 20.21.14 | R-GSM emergency calls | R-GSM MS supporting speech |
| 20.21.15 | R-GSM cell reselection due to MS rejection "LA not allowed" | R-GSM MS |
| 20.21.16 | R-GSM downlink signalling failure | R-GSM MS |
| 20.21.17 | R-GSM cell selection if no suitable cell found in 10 s | R-GSM MS |
| 20.21.18 | R-GSM cell reselection due to MS rejection "Roaming not allowed in this LA" | R-GSM MS |
| 20.21.19 | R-GSM cell selection on release of SDCCH and TCH | R-GSM MS |
| 21.1 | Signal strength | All MS |
| 21.2 | Signal strength selectivity | All MS |
| 21.3 | Signal quality under static conditions | MS supporting speech |
| 21.4 | Signal quality under TU50 propagation conditions | All MS |
| 21.5 | Received signal measurements in HSCSD multislots configuration | Multislots MS |
| 22.1 | Transmit power control timing and confirmation, single slot | All MS |
| 22.2 | Transmit power control timing and confirmation in HSCSD multi slot configuration | Multislots MS |
| 23 | Single frequency reference | All MS |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|--------------|---|---|
| 25.2.1.1.1 | Initialization when contention resolution required, Normal initialization | All MS |
| 25.2.1.1.2.1 | Initialization failure, Loss of UA frame | All MS |
| 25.2.1.1.2.2 | Initialization failure, UA frame with different information field | All MS |
| 25.2.1.1.2.3 | Initialization failure, Information frame and supervisory frames in response to an SABM frame | All MS |
| 25.2.1.1.3 | Initialization denial | All MS |
| 25.2.1.1.4 | Total initialization failure | All MS |
| 25.2.1.2.1 | Normal initialization without contention resolution | All MS |
| 25.2.1.2.2 | Initialization failure | All MS |
| 25.2.1.2.3 | Initialization denial | All MS |
| 25.2.1.2.4 | Total initialization failure | All MS |
| 25.2.2.1 | Sequence counting and I frame acknowledgements | All MS |
| 25.2.2.2 | Receipt of an I frame in the timer recovery state | All MS |
| 25.2.2.3 | Segmentation and concatenation | All MS |
| 25.2.3 | Normal layer 2 disconnection | All MS |
| 25.2.4.1 | I frame loss (MS to SS) | All MS |
| 25.2.4.2 | RR response frame loss (SS to MS) | All MS |
| 25.2.4.3 | RR response frame loss (MS to SS) | All MS |
| 25.2.5.1 | I frame with C bit set to zero | All MS |
| 25.2.5.2 | SABM frame with C bit set to zero | All MS |
| 25.2.6.1 | N(S) sequence error | All MS |
| 25.2.6.2 | N(R) sequence error | All MS |
| 25.2.6.3 | Improper F bit | All MS |
| 25.2.7 | Test on receipt of invalid frames | All MS |
| 26.2.1.1 | Channel request / initial time | All MS |
| 26.2.1.2 | Channel request / repetition time | All MS |
| 26.2.1.3 | Channel request / random reference | All MS |
| 26.2.2 | IMSI detach and IMSI attach | Procedure 1, All MS Procedure 2, MS where SIM removal is possible without powering down Procedure 3, All MS |
| 26.2.3 | Sequenced MM / CC message transfer | All MS |
| 26.2.4 | Establishment cause, Procedure 1 | MS supporting a service on a traffic channel |
| 26.2.4 | Establishment cause, Procedure 2 | MS supporting a service on a half-rate channel |
| 26.2.4 | Establishment cause, Procedure 3 | MS supporting speech |
| 26.2.4 | Establishment cause, Procedure 4 | MS supporting a data service |
| 26.2.4 | Establishment cause, Procedure 5 | All MS |
| 26.2.4 | Establishment cause, Procedure 6 | All MS |
| 26.2.4 | Establishment cause, Procedure 7 | MS supporting a non call related supplementary service operation |
| 26.2.4 | Establishment cause, Procedure 8 | MS supporting SMS/PP MO |
| 26.3.2 | MS indication of available PLMNs | All MS |
| 26.3.3 | MS will send only if BSS is "on air", steps a - c | All MS |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|---|--|
| 26.3.3 | MS will send only if BSS is "on air", step d | MS supporting speech |
| 26.3.4 | Manual mode of PLMN selection | All MS |
| 26.5.1 | Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown protocol discriminator | All MS |
| 26.5.2.1.1 | TI and skip indicator / RR / Idle Mode | All MS |
| 26.5.2.1.2 | TI and skip indicator / RR / RR-Connection established | All MS |
| 26.5.2.2 | TI and skip indicator / MM | All MS |
| 26.5.2.3 | TI and skip indicator / CC | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.3.1 | Undefined or unexpected message type / undefined message type / CC | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.3.2 | Undefined or unexpected message type / undefined message type / MM | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.3.3 | Undefined or unexpected message type / undefined message type / RR | All MS |
| 26.5.3.4 | Undefined or unexpected message type / unexpected message type / CC | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.4.1 | Unforeseen information elements in the non-imperative message part / duplicated information elements | All MS |
| 26.5.5.1.1.1 | Non-semantic mandatory IE errors / RR / missing mandatory IE error / special case | All MS |
| 26.5.5.1.1.2 | Non-semantic mandatory IE errors / RR / missing mandatory IE error / general case | All MS |
| 26.5.5.1.2 | Non-semantic mandatory IE errors / RR / comprehension required | All MS |
| 26.5.5.2.1 | Non-semantic mandatory IE errors / MM / syntactically incorrect mandatory IE | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.5.2.2 | Non-semantic mandatory IE errors / MM / syntactically incorrect mandatory IE | All MS |
| 26.5.5.2.3 | Non-semantic mandatory IE errors / MM / comprehension required | All MS |
| 26.5.5.3.1.1 | Non-semantic mandatory IE errors / CC / missing mandatory IE / disconnect message | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.5.3.1.2 | Non-semantic mandatory IE errors / CC / missing mandatory IE / general case | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.5.3.2 | Non-semantic mandatory IE errors / CC / comprehension required | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.6.1.1 | Unknown IE, comprehension not required / MM / IE unknown in the protocol | All MS |
| 26.5.6.1.2 | Unknown IE, comprehension not required / MM / IE unknown in the message | All MS |
| 26.5.6.2.1 | Unknown information elements in the non-imperative message part / CC / Call establishment | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.6.2.2 | Unknown information elements in the non-imperative message part / CC / disconnect | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.6.2.3 | Unknown information elements in the non-imperative message part / CC / release | MS supporting CC protocol for at least one Bearer Capability |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|---|---|
| 26.5.6.2.4 | Unknown information elements in the non-imperative message part / CC / release complete | MS supporting CC protocol for at least one Bearer Capability |
| 26.5.6.3 | Unknown IE in the non-imperative message part, comprehension not required / RR | All MS |
| 26.5.7.1.1 | Spare bits / RR / paging channel | All MS |
| 26.5.7.1.2 | Spare bits / RR / BCCH | All MS |
| 26.5.7.1.3 | Spare bits / RR / AGCH | All MS |
| 26.5.7.1.4 | Spare bits / RR / Connected Mode | All MS |
| 26.5.7.2 | Spare bits / MM | All MS |
| 26.5.7.3 | Spare bits / CC | All MS |
| 26.6.1.1 | Immediate assignment / SDCCH or TCH assignment | First test, All MS Second test, MS supporting TCH/F Third test, MS supporting TCH/H |
| 26.6.1.2 | Immediate assignment / extended assignment | All MS |
| 26.6.1.3 | Immediate assignment / assignment rejection | All MS |
| 26.6.1.4 | Immediate assignment / ignore assignment | All MS |
| 26.6.1.5 | Immediate assignment after immediate assignment reject | All MS |
| 26.6.2.1.1 | Paging / normal / type 1 | All MS |
| 26.6.2.1.2 | Paging / normal / type 2 | All MS |
| 26.6.2.1.3 | Paging / normal / type 3 | All MS |
| 26.6.2.2 | Paging / extended | All MS |
| 26.6.2.3.1 | Paging / reorganization / procedure 1 | All MS |
| 26.6.2.3.2 | Paging / reorganization / procedure 2 | All MS |
| 26.6.2.4 | Paging / same as before | All MS |
| 26.6.2.5 | Paging / multislot CCCH | All MS |
| 26.6.3.1 | Measurement / no neighbours | MS supporting CC protocol for at least one Bearer Capability |
| 26.6.3.2 | Measurement / all neighbours present | MS supporting CC protocol for at least one Bearer Capability |
| 26.6.3.3 | Measurement / barred cells and non-permitted NCCs | MS supporting CC protocol for at least one Bearer Capability |
| 26.6.3.4 | Measurement / DTX | MS supporting CC protocol for at least one Bearer Capability |
| 26.6.3.5 | Measurement / Frequency Formats | MS supporting CC protocol for at least one Bearer Capability |
| 26.6.3.6 | Measurement / Multiband environment | MS supporting CC protocol for at least one bearer capability |
| 26.6.4.1 | Dedicated assignment / successful case | MS supporting a TCH |
| 26.6.4.2.1 | Dedicated assignment / failure / failure during active state, k = 1 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.4.2.1 | Dedicated assignment / failure / failure during active state, k = 2 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.4.2.2 | Dedicated assignment / failure / general case | MS supporting TCH |
| 26.6.5.1 | Handover / successful / active call / non-synchronized, M = 1 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.1 | Handover / successful / active call / non-synchronized, M = 2 | MS supporting TCH/F and supporting CC-state U10 |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|---|
| 26.6.5.1 | Handover / successful / active call / non-synchronized, M = 3 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.1 | Handover / successful / active call / non-synchronized, M = 4 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.1 | Handover / successful / active call / non-synchronized, M = 5 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.1 | Handover / successful / active call / non-synchronized, M = 6 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.1 | Handover / successful / active call / non-synchronized, M = 7 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.1 | Handover / successful / active call / non-synchronized, M = 8 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 1 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 2 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 3 | MS supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 4 | MS supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 5 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 6 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 7 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 8 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 9 | MS supporting TCH/F and supporting CC-state U10 |
| (continued) | | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|---|
| 26.6.5.2 | Handover / successful / call under establishment / non-synchronized, M = 10 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.3 | Handover / successful / active call / finely synchronized, M = 1 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.3 | Handover / successful / active call / finely synchronized, M = 2 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.4 | Handover / successful / call under establishment / finely synchronized, M = 1 | MS supporting CC-state U10 |
| 26.6.5.4 | Handover / successful / call under establishment / finely synchronized, M = 2 | MS supporting CC-state U10 |
| 26.6.5.4 | Handover / successful / call under establishment / finely synchronized, M = 3 | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.4 | Handover / successful / call under establishment / finely synchronized, M = 4 | MS supporting TCH/H and supporting CC-state U10 |
| 26.6.5.5.1 | Handover / successful / active call / pre-synchronized / Timing Advance IE not included | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.5.2 | Handover / successful / call being established / pre-synchronized / timing advance IE is included / reporting of observed time difference requested. | MS supporting TCH/F and supporting CC-state U10 |
| (continued) | | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|---|---|
| 26.6.5.6 | Handover / successful / active call / pseudo synchronized | MS supporting TCH/F and supporting the pseudo synchronized handover procedure and supporting CC-state U10 |
| 26.6.5.7 | Handover / successful / active call / non-synchronized / reporting of observed time difference requested. | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.8 | Handover / layer 3 failure | MS supporting TCH/F and supporting CC-state U10 |
| 26.6.5.9 | Handover / layer 1 failure | MS supporting CC-state U10 |
| 26.6.6.1 | Frequency redefinition, R = 1 | All MS |
| 26.6.6.1 | Frequency redefinition, R = 2 | MS supporting TCH/F |
| 26.6.6.1 | Frequency redefinition, R = 3 | MS supporting TCH/H |
| 26.6.7.1 | Test of the channel mode modify procedure / full rate | MS supporting TCH/H |
| 26.6.7.2 | Test of the channel mode modify procedure / half rate | MS supporting TCH/F |
| 26.6.8.1 | Ciphering mode / start ciphering, k = 1 | MS supporting CC state U10 and supporting encryption algorithm A5/1 |
| 26.6.8.1 | Ciphering mode / start ciphering, k = 2 | MS supporting CC state U10 and supporting encryption algorithm A5/2 |
| 26.6.8.2 | Ciphering mode / no ciphering | MS supporting CC state U10 |
| 26.6.8.3 | Ciphering mode / old cipher key | MS supporting CC state U10 and supporting encryption algorithm A5/1 and/or A5/2 |
| 26.6.8.4 | Ciphering mode / change of mode, algorithm and key | MS supporting CC state U10 and supporting encryption algorithm A5/1 and/or A5/2 |
| 26.6.8.5 | Ciphering mode / IMEISV request | All MS |
| 26.6.11.1 | Classmark change | MS supporting CC-state U10 and supporting more than one power class |
| 26.6.11.2 | Classmark interrogation | All MS |
| 26.6.12.1 | Channel release / SDCCH | All MS |
| 26.6.12.2 | Channel release / SDCCH - no L2 ACK | All MS |
| 26.6.12.3 | Channel release / TCH-F | MS supporting TCH/F |
| 26.6.12.4 | Channel release / TCH-F - no L2 ACK | MS supporting TCH/F |
| 26.6.13.1 | Dedicated assignment with starting time / successful case / time not elapsed | All MS |
| 26.6.13.2 | Dedicated assignment with starting time / successful case / time elapsed | All MS |
| 26.6.13.3 | Dedicated assignment with starting time and frequency redefinition / failure case / time not elapsed | All MS |
| 26.6.13.4 | Dedicated assignment with starting time and frequency redefinition / failure case / time elapsed | All MS |
| 26.6.13.5 | Handover with starting time / successful case / time not elapsed | All MS |
| 26.6.13.6 | Handover with starting time / successful case / time elapsed | All MS |
| 26.6.13.7 | Handover with starting time and frequency redefinition / failure case / time not elapsed | All MS |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|--------------|--|---|
| 26.6.13.8 | Handover with starting time and frequency redefinition / failure case / time elapsed | All MS |
| 26.6.13.9 | Immediate assignment with starting time / successful case / time not elapsed | All MS |
| 26.6.13.10 | Immediate assignment with starting time / successful case / time elapsed | All MS |
| 26.7.1 | TMSI reallocation | All MS |
| 26.7.2.1 | Authentication accepted | All MS |
| 26.7.2.2 | Authentication rejected | All MS |
| 26.7.3.1 | General Identification | All MS |
| 26.7.3.2 | Handling of IMSI shorter than the maximum length | All MS |
| 26.7.4.1 | Location updating / accepted | All MS |
| 26.7.4.2.1 | Location updating / rejected / IMSI invalid | All MS |
| 26.7.4.2.2 | Location updating / rejected / PLMN not allowed, test 1 | MS supporting speech |
| 26.7.4.2.2 | Location updating / rejected / PLMN not allowed, test 2 | All MS |
| 26.7.4.2.3 | Location updating / rejected / location area not allowed | All MS |
| 26.7.4.2.4 | Location updating / rejected / national roaming, Procedure 1 | All MS |
| 26.7.4.2.4 | Location updating / rejected / national roaming, Procedure 2 | MS supporting speech |
| 26.7.4.2.4 | Location updating / rejected / national roaming, Procedure 3 | All MS |
| 26.7.4.2.4 | Location updating / rejected / national roaming, Procedure 4 | All MS |
| 26.7.4.2.4 | Location updating / rejected / national roaming, Procedure 5 | MS supporting SIM removal without powering down |
| 26.7.4.3.1 | Location updating / abnormal cases / random access fails | All MS |
| 26.7.4.3.2 | Location updating / abnormal cases / attempt counter less or equal to 4, LAI different | All MS |
| 26.7.4.3.3 | Location updating / abnormal cases / attempt counter equal to 4 | All MS |
| 26.7.4.3.4 | Location updating / abnormal cases / attempt counter less or equal to 4, stored LAI equal to broadcast LAI | All MS |
| 26.7.4.4 | Location updating / release / expiry of T3240 | All MS |
| 26.7.4.5.1 | Location updating / periodic spread | All MS |
| 26.7.4.5.2 | Location updating / periodic normal / test 1 | All MS |
| 26.7.4.5.3 | Location updating / periodic normal / test 2 | All MS |
| 26.7.4.5.4.1 | Location updating / periodic HPLMN search / MS waits time T | All MS |
| 26.7.4.5.4.2 | Location updating / periodic HPLMN search / MS in manual mode | All MS |
| 26.7.4.5.4.3 | Location updating / periodic HPLMN search / MS waits at least two minutes and at most T minutes | All MS |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|---|--|
| 26.7.4.6 | Location updating / interworking of attach and periodic | All MS |
| 26.7.5.2 | MM connection / establishment with cipher | All MS |
| 26.7.5.3 | MM connection / establishment without cipher | All MS |
| 26.7.5.4 | MM connection / establishment rejected | All MS |
| 26.7.5.5 | MM connection / establishment rejected cause 4 | All MS |
| 26.7.5.6 | MM connection / expiry T3230 | All MS |
| 26.7.5.7.1 | MM connection / abortion by the network / cause #6 | All MS |
| 26.7.5.7.2 | MM connection / abortion by the network / cause not equal to #6 | MS supporting a non call related supplementary service operation |
| 26.7.5.8.1 | MM connection / follow-on request pending / test 1 | All MS |
| 26.7.5.8.2 | MM connection / follow-on request pending / test 2 | MS supporting the follow on request procedure |
| 26.7.5.8.3 | MM connection / follow-on request pending / test 3 | All MS |
| 26.8.1.2.1.1 | Outgoing call / U0 null state / MM connection requested | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.2.1 | Outgoing call / U0.1 MM connection pending / CM service rejected | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.2.2 | Outgoing call / U0.1 MM connection pending / CM service accepted | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.2.3 | Outgoing call / U0.1 MM connection pending / lower layer failure | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.3.1 | Outgoing call / U1 call initiated / receiving CALL PROCEEDING | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.3.2 | Outgoing call / U1 call initiated / rejecting with RELEASE COMPLETE | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.3.3 | Outgoing call / U1 call initiated / T303 expiry | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.3.4 | Outgoing call / U1 call initiated / lower layer failure | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.3.5 | Outgoing call / U1 call initiated / receiving ALERTING | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.3.6 | Outgoing call / U1 call initiated / entering state U10 | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.3.7 | Outgoing call / U1 call initiated / unknown message received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.1 | Outgoing call / U3 MS originating call proceeding / ALERTING received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.2 | Outgoing call / U3 MS originating call proceeding / CONNECT received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.3 | Outgoing call / U3 MS originating call proceeding / PROGRESS received without in band information | MS supporting at least one MO circuit switched basic service |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|---|--|
| 26.8.1.2.4.4 | Outgoing call / U3 MS originating call proceeding / PROGRESS with in band information | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.5 | Outgoing call / U3 MS originating call proceeding / DISCONNECT with in band tones | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.6 | Outgoing call / U3 MS originating call proceeding / DISCONNECT without in band tones | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.7 | Outgoing call / U3 MS originating call proceeding / RELEASE received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.8 | Outgoing call / U3 MS originating call proceeding / termination requested by the user | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.9 | Outgoing call / U3 MS originating call proceeding / traffic channel allocation | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.10 | Outgoing call / U3 MS originating call proceeding / timer T310 time-out | MS supporting at least one MO circuit switched basic service |
| | (continued) | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|--|
| 26.8.1.2.4.11 | Outgoing call / U3 MS originating call proceeding / lower layer failure | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.12 | Outgoing call / U3 MS originating call proceeding / unknown message received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.4.13 | Outgoing call / U3 MS originating call proceeding / Internal alerting indication | MS supporting at least one MO circuit switched basic service for telephony |
| 26.8.1.2.5.1 | Outgoing call / U4 call delivered / CONNECT received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.5.2 | Outgoing call / U4 call delivered / termination requested by the user | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.5.3 | Outgoing call / U4 call delivered / DISCONNECT with in band tones | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.5.4 | Outgoing call / U4 call delivered / DISCONNECT without in band tones | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.5.5 | Outgoing call / U4 call delivered / RELEASE received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.5.6 | Outgoing call / U4 call delivered / lower layer failure | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.5.7 | Outgoing call / U4 call delivered / traffic channel allocation | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.5.8 | Outgoing call / U4 call delivered / unknown message received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.6.1 | U10 call active / termination requested by the user | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.6.2 | U10 call active / RELEASE received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.6.3 | U10 call active / DISCONNECT with in band tones | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.6.4 | U10 call active / DISCONNECT without in band tones | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.6.5 | U10 call active / RELEASE COMPLETE received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.6.6 | U10 call active / SETUP received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.7.1 | U11 disconnect request / clear collision | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.7.2 | U11 disconnect request / RELEASE received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.7.3 | U11 disconnect request / timer T305 time-out | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.7.4 | U11 disconnect request / lower layer failure | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.7.5 | U11 disconnect request / unknown message received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.8.1 | U12 disconnect indication / call releasing requested by the user | MS supporting bearer capability for speech |
| 26.8.1.2.8.2 | U12 disconnect indication / RELEASE received | MS supporting bearer capability for speech |
| 26.8.1.2.8.3 | U12 disconnect indication / lower layer failure | MS supporting bearer capability for speech |
| 26.8.1.2.8.4 | U12 disconnect indication / unknown message received | MS supporting bearer capability for speech |
| | (continued) | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|---|
| 26.8.1.2.9.1 | Outgoing call / U19 release request / timer T308 time-out | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.9.2 | Outgoing call / U19 release request / 2nd timer T308 time-out | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.9.3 | Outgoing call / U19 release request / RELEASE received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.9.4 | Outgoing call / U19 release request / RELEASE COMPLETE received | MS supporting at least one MO circuit switched basic service |
| 26.8.1.2.9.5 | Outgoing call / U19 release request / lower layer failure | MS supporting at least one MO circuit switched basic service |
| 26.8.1.3.1.1 | Incoming call / U0 null state / SETUP received with a non supported bearer capability | All MS |
| 26.8.1.3.2.1 | Incoming call / U6 call present / automatic call rejection | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.3.1 | Incoming call / U9 mobile terminating call confirmed / alerting or immediate connecting | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.3.2 | Incoming call / U9 mobile terminating call confirmed / TCH assignment | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.3.3 | Incoming call / U9 mobile terminating call confirmed / termination requested by the user | MS supporting at least one MT circuit switched basic service for which immediate connect is not used, and supporting sending DISCONNECT when in CC-state U9 |
| 26.8.1.3.3.4 | Incoming call / U9 mobile terminating call confirmed / DISCONNECT received | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.3.5 | Incoming call / U9 mobile terminating call confirmed / RELEASE received | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.3.6 | Incoming call / U9 mobile terminating call confirmed / lower layer failure | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.3.7 | Incoming call / U9 mobile terminating call confirmed / unknown message received | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.4.1 | Incoming call / U7 call received / call accepted | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.4.2 | Incoming call / U7 call received / termination requested by the user | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.4.3 | Incoming call / U7 call received / DISCONNECT received | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.4.4 | Incoming call / U7 call received / RELEASE received | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.4.5 | Incoming call / U7 call received / lower layer failure | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| | (continued) | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|--|
| 26.8.1.3.4.6 | Incoming call / U7 call received / unknown message received | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.4.7 | Incoming call / U7 call received / TCH assignment | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.4.8 | Incoming call / U7 call received / RELEASE COMPLETE received | MS supporting at least one MT circuit switched basic service for which immediate connect is not used |
| 26.8.1.3.5.1 | Incoming call / U8 connect request / CONNECT acknowledged | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.5.2 | Incoming call / U8 connect request / timer T313 time-out | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.5.3 | Incoming call / U8 connect request / termination requested by the user | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.5.4 | Incoming call / U8 connect request / DISCONNECT received with in-band information | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.5.5 | Incoming call / U8 connect request / DISCONNECT received without in-band information | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.5.6 | Incoming call / U8 connect request / RELEASE received | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.5.7 | Incoming call / U8 connect request / lower layer failure | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.5.8 | Incoming call / U8 connect request / TCH assignment | MS supporting at least one MT circuit switched basic service |
| 26.8.1.3.5.9 | Incoming call / U8 connect request / unknown message received | MS supporting at least one MT circuit switched basic service |
| 26.8.1.4.1.1 | In-call functions / DTMF information transfer / basic procedures | MS supporting MO DTMF protocol control procedure |
| 26.8.1.4.2.1 | In-call functions / User notification / MS terminated | MS supporting at least one circuit switched basic service |
| 26.8.1.4.3.1 | In-call functions / channel changes / a successful channel change in active state/ Handover and Assignment Command | MS supporting at least one MT circuit switched basic service |
| 26.8.1.4.3.2 | In-call functions / channel changes / an unsuccessful channel change in active mode/ Handover and Assignment Command | MS supporting at least one MT circuit switched basic service |
| 26.8.1.4.4.1 | In-call functions / MS terminated in-call modification / modify when new mode is not supported | MS supporting at least one circuit switched basic service |
| 26.8.1.4.5.1 | In-call functions / MS originated in-call modification / a successful case of modifying | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| 26.8.1.4.5.2 | In-call functions / MS originated in-call modification / modify rejected | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| 26.8.1.4.5.3 | In-call functions / MS originated in-call modification / an abnormal case of acceptance | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| | (continued) | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|--------------|--|---|
| 26.8.1.4.5.4 | In-call functions / MS originated in-call modification / an abnormal case of rejection | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| 26.8.1.4.5.5 | In-call functions / MS originated in-call modification / time-out of timer T323 | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| 26.8.1.4.5.6 | In-call functions / MS originated in-call modification / a successful channel change in state mobile originating modify | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| 26.8.1.4.5.7 | In-call functions / MS originated in-call modification / an unsuccessful channel change in state mobile originating modify | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| 26.8.1.4.5.8 | In-call functions / MS originated in-call modification / unknown message received | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| 26.8.1.4.5.9 | In-call functions / MS originated in-call modification / a release complete received | MS supporting at least one dual mode bearer capability service (BS61, BS81 or TS61) |
| 26.8.2.1 | Call Re-establishment/call present, re-establishment allowed | MS supporting at least one bearer capability |
| 26.8.2.2 | Call Re-establishment/call present, re-establishment not allowed | MS supporting at least one MO circuit switched basic service |
| 26.8.2.3 | Call Re-establishment/call under establishment, transmission stopped | MS supporting at least one MO circuit switched basic service |
| 26.8.3 | User to user signalling | MS supporting at least one MT circuit switched basic service |
| 26.9.2 | Structured procedures / MS originated call / early assignment | MS supporting at least one MO teleservice |
| 26.9.3 | Structured procedures / MS originated call / late assignment | MS supporting at least one MO teleservice |
| 26.9.4 | Structured procedures / MS terminated call / early assignment | MS supporting at least one MT basic service |
| 26.9.5 | Structured procedures / MS terminated call / late assignment | MS supporting at least one MT teleservice |
| 26.9.6.1.1 | Structured procedures / emergency call / idle updated / preferred channel rate | MS supporting speech |
| 26.9.6.1.2 | Structured procedures / emergency call / idle updated, non-preferred channel rate | MS supporting half-rate speech |
| 26.9.6.2.1 | Structured procedures / emergency call / idle, no IMSI / accept case | MS supporting speech |
| 26.9.6.2.2 | Structured procedures / emergency call / idle, no IMSI / reject case | MS supporting speech |
| 26.10.2.1 | E-GSM or R-GSM signalling / RR / Measurement | MS supporting E-GSM or R-GSM and supporting CC-state U10 |
| 26.10.2.2 | E-GSM or R-GSM signalling / RR / Immediate assignment | MS supporting E-GSM or R-GSM |
| 26.10.2.3 | E-GSM or R-GSM signalling / RR / channel assignment procedure | MS supporting E-GSM or R-GSM |
| 26.10.2.4.1 | E-GSM or R-GSM signalling / RR / Handover / Successful handover | MS supporting E-GSM or R-GSM and supporting CC-state U10 |
| 26.10.2.4.2 | E-GSM or R-GSM signalling / RR / Handover / layer 1 failure | MS supporting E-GSM or R-GSM and supporting CC-state U10 |
| 26.10.2.5 | E-GSM or R-GSM signalling / RR / Frequency Redefinition | MS supporting E-GSM or R-GSM |
| (continued) | | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|--|
| 26.10.3.1 | E-GSM or R-GSM signalling / Structured procedure / Mobile originated call | MS supporting E-GSM or R-GSM and supporting at least one MO teleservice |
| 26.10.3.2 | E-GSM or R-GSM signalling / Structured procedures / emergency call | MS supporting E-GSM or R-GSM and supporting speech |
| 26.11.2.1 | Multiband signalling / RR / Immediate assignment procedure | MS supporting simultaneous multiband operation |
| 26.11.2.2.1 | Multiband signalling / RR / Handover / successful / active call / non-synchronized | MS supporting simultaneous multiband operation and supporting TCH/F and supporting CC-state U10 |
| 26.11.2.2.2 | Multiband signalling / RR / Handover / layer 1 failure | MS supporting simultaneous multiband operation and supporting CC-state U10 |
| 26.11.2.3 | Multiband signalling / RR / Measurement reporting | MS supporting simultaneous multiband operation and supporting CC protocol for at least one Bearer Capability |
| 26.11.3.1.1 | Multiband signalling / MM / Location updating / accepted | MS supporting simultaneous multiband operation |
| 26.11.3.1.2 | Multiband signalling / MM / Location updating / periodic | MS supporting simultaneous multiband operation |
| 26.11.5.1 | Multiband signalling / Structured procedures / MS originated call / early assignment | MS supporting simultaneous multiband operation and supporting at least one MO teleservice |
| 26.11.5.2 | Multiband signalling / Structured procedures / MS terminated call / late assignment | MS supporting simultaneous multiband operation and supporting at least one MT teleservice |
| 26.12.1 | EFR signalling / test of the channel mode modify procedure | MS supporting EFR speech |
| 26.12.2.1 | EFR signalling / Handover / active call / successful case | MS supporting EFR speech |
| 26.12.2.2 | EFR signalling / Handover / successful / call under establishment / non-synchronized | MS supporting EFR speech |
| 26.12.3 | EFR signalling / Structured procedures / MS originated call / late assignment | MS supporting EFR speech |
| 26.12.4 | EFR signalling / Structured procedures / MS terminated call / early assignment | MS supporting EFR speech |
| 26.12.5 | EFR signalling / Structured procedures / emergency call | MS supporting EFR speech |
| 26.13.1.1.1 | Multislot signalling / RR / Measurement symmetric | MS supporting Multislot class and state of multislot connection |
| 26.13.1.1.2 | Multislot signalling / RR / Measurement asymmetric | MS supporting Multislot class and state of multislot connection |
| 26.13.1.1.3 | Multislot signalling / RR / Measurement asymmetric/Change of the reported subchannel | MS supporting Multislot class and state of multislot connection |
| 26.13.1.2.1 | Multislot signalling / RR / Dedicated assignment / successful case | MS supporting Multislot Class and radio interface rates: 12kbps, 6kbps. |
| 26.13.1.2.2 | Multislot signalling / RR / Dedicated assignment / failure / general case | MS supporting Multislot Class and radio interface rates: 12kbps, 6kbps. |
| | (continued) | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|---|---|
| 26.13.1.3.1 | Multislot signalling / RR / Handover / successful / active call / non-synchronized | MS supporting Multislot class, state U10 of the Call Control protocol and radio interface rates: 12kbps, 6kbps. |
| 26.13.1.3.2 | Multislot signalling / RR / Handover / successful / call under establishment / non-synchronized / resource upgrading | MS supporting Multislot class and state U10 of the Call Control protocol |
| 26.13.1.3.3 | Multislot signalling / RR / Handover / successful / active call / finely synchronized / resource downgrading | MS supporting Multislot class and state U10 of the Call Control protocol |
| 26.13.1.3.4 | Multislot signalling / RR / Handover / successful / call under establishment / finely synchronized / relocation of channels | MS supporting Multislot class and state U10 of the Call Control protocol |
| 26.13.1.3.5 | Multislot signalling / RR / Handover / successful / call under establishment / pre-synchronized / resource upgrading | MS supporting Multislot class and state U10 of the Call Control protocol |
| 26.13.1.4 | Multislot signalling / RR / Test of the channel mode modify procedure | MS supporting Multislot class and radio interface rates: 12kbps, 6kbps |
| 26.13.1.5 | Multislot signalling / RR / Early classmark sending | MS supporting Multislot class |
| 26.13.2.1.1 | Multislot signalling / CC / In-call functions / User initiated service level upgrade / successful | MS supporting Multislot class |
| 26.13.2.1.2 | Multislot signalling / CC / In-call functions / User initiated service level downgrade / successful | MS supporting Multislot class |
| 26.13.2.1.3 | Multislot signalling / CC / In-call functions / User initiated service level upgrade / Time-out of T323 | MS supporting Multislot class |
| 26.13.2.1.4 | Multislot signalling / CC / In-call functions / User initiated service level upgrade / modify reject | MS supporting Multislot class |
| 26.13.3.1 | Multislot signalling / Structured procedures / MS originated call / early assignment / HSCSD / non-transparent | MS supporting Multislot class |
| 26.13.3.2 | Multislot signalling / Structured procedures / MS originated call / late assignment / HSCSD / non-transparent | MS supporting Multislot class |
| 26.13.3.3 | Multislot signalling / Structured procedures / MS originated call / early assignment / HSCSD / transparent | MS supporting Multislot class |
| 26.13.3.4 | Multislot signalling / Structured procedures / MS terminated call / early assignment / HSCSD / non-transparent | MS supporting Multislot class and immediate connection |
| 26.13.3.5 | Multislot signalling / Structured procedures / MS originated call / early assignment / HSCSD / transparent | MS supporting Multislot class and immediate connection |
| | (continued) | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|---|
| 26.14.1.1 | Notification / notification indication | MS supporting VGCS/VBS listening |
| 26.14.1.2 | Notification / NCH position | MS supporting VGCS/VBS listening |
| 26.14.1.3 | Notification / Reduced NCH monitoring | MS supporting VGCS/VBS listening |
| 26.14.1.4 | Notification / limited service | MS supporting VGCS/VBS listening |
| 26.14.2.1 | Paging / Paging indication | MS supporting VGCS/VBS listening |
| 26.14.2.2 | Paging / Notification | MS supporting VGCS/VBS listening |
| 26.14.3.1 | RR Procedures / frequency redefinition | MS supporting VGCS talking or VBS originating |
| 26.14.3.2 | RR Procedures / assignment | MS supporting VGCS talking or VBS originating |
| 26.14.3.3 | RR Procedures / handover / successful in group transmit mode | MS supporting VGCS talking or VBS originating |
| 26.14.3.4 | RR Procedures / handover / successful at group call establishment | MS supporting VGCS/VBS originating |
| 26.14.3.5 | RR Procedures / handover / failure | MS supporting VGCS talking or VBS originating |
| 26.14.3.6 | RR Procedures / Measurement / all neighbours present | MS supporting VGCS talking or VBS originating |
| 26.14.4.1 | Uplink Access / uplink investigation | MS supporting VGCS talking |
| 26.14.4.2 | Uplink Access / uplink access | MS supporting VGCS talking |
| 26.14.4.3 | Uplink Reply in VGCS receive mode | MS supporting VGCS talking |
| 26.14.5.1 | Leaving group receive mode | MS supporting VGCS/VBS listening |
| 26.14.5.2 | Leaving group transmit mode | MS supporting VGCS talking |
| 26.14.6.1 | GCC/BCC Procedures / MO call establishment | MS supporting VGCS/VBS originating |
| 26.14.6.2 | GCC/BCC Procedures / Transaction Identifier | MS supporting VGCS talking or VBS originating |
| 26.14.6.3 | GCC/BCC Procedures / Call Termination / originator / group transmit mode | MS supporting VGCS/VBS originating |
| 26.14.6.4 | GCC/BCC Procedures / Call Termination / originator/ group receive mode | MS supporting VGCS originating |
| 26.14.6.5 | GCC/BCC Procedures / Call Termination / not originator | MS supporting VGCS listening |
| 26.14.6.6 | GCC/BCC Procedures / GCC states | MS supporting VGCS listening |
| 26.14.6.7 | GCC/BCC Procedures / BCC states | MS supporting VBS originating |
| 26.14.7.1 | Error Handling / short message length, unknown message type and TI | MS supporting VGCS or VBS originating |
| 26.14.7.2 | Error Handling / incorrect information elements | MS supporting VGCS or VBS listening |
| 26.14.7.3 | Error Handling / Message not addressing VGCS receive mode | MS supporting VGCS or VBS listening |
| 26.14.8.1 | Structured procedures / very early and early assignments | MS supporting VGCS or VBS originating |
| 26.14.9.1 | Cell change / same LA | MS supporting VGCS or VBS listening |
| 26.14.9.2 | Cell change / different LA | MS supporting VGCS or VBS listening |
| 26.14.9.3 | Cell change / different PLMN | MS supporting VGCS or VBS listening |
| (continued) | | |

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|-----------|---|--|
| 27.1.1 | MS identification by short IMSI - Normal case | ME supporting either ID-1 or Plug-in SIM |
| 27.1.2 | MS identification by short IMSI - Phase 1 DCS SIM | DCS ME supporting either ID-1 or Plug-in SIM |
| 27.2 | MS identification by short TMSI | ME supporting either ID-1 or Plug-in SIM |
| 27.3 | MS identification by long TMSI | ME supporting either ID-1 or Plug-in SIM |
| 27.4 | MS identification by long IMSI, TMSI updating and cipher key sequence number assignment | ME supporting either ID-1 or Plug-in SIM |
| 27.5 | Forbidden PLMNs, location updating and undefined cipher key | ME supporting either ID-1 or Plug-in SIM |
| 27.6 | MS updating forbidden PLMNs | ME supporting either ID-1 or Plug-in SIM |
| 27.7 | MS deleting forbidden PLMNs | ME supporting either ID-1 or Plug-in SIM |
| 27.8 | MS updating the PLMN selector list | ME supporting either ID-1 or Plug-in SIM |
| 27.9 | MS recognizing the priority order of the PLMN selector list | ME supporting either ID-1 or Plug-in SIM |
| 27.10 | MS access control management | ME supporting either ID-1 or Plug-in SIM |
| 27.11.1.1 | Bit/character duration during the transmission from the ME to the SIM | ME supporting either ID-1 or Plug-in SIM |
| 27.11.1.2 | Bit/character duration during the transmission from the SIM simulator to the ME | ME supporting either ID-1 or Plug-in SIM |
| 27.11.1.3 | Inter-character delay | ME supporting either ID-1 or Plug-in SIM |
| 27.11.1.4 | Error handling during the transmission from the ME to the SIM simulator | ME supporting either ID-1 or Plug-in SIM |
| 27.11.1.5 | Error handling during transmission from the SIM simulator to the ME | ME supporting either ID-1 or Plug-in SIM |
| 27.11.2.1 | Acceptance of SIMs with internal RST | ME supporting either ID-1 or Plug-in SIM |
| 27.11.2.2 | Acceptance of SIMs with active low RST | ME supporting either ID-1 or Plug-in SIM |
| 27.11.2.3 | Characters of the answer to reset | ME supporting either ID-1 or Plug-in SIM |
| 27.11.2.4 | PTS procedure | ME supporting either ID-1 or Plug-in SIM |
| 27.11.2.5 | Reset repetition | ME supporting either ID-1 or Plug-in SIM |
| 27.11.3 | Command processing, procedure bytes | ME supporting either ID-1 or Plug-in SIM |
| 27.12.1 | Operating speed in authentication procedure | ME supporting either ID-1 or Plug-in SIM |
| 27.12.2 | Clock stop | ME supporting either ID-1 or Plug-in SIM |
| 27.13.1 | Contact pressure | ME supporting either ID-1 or Plug-in SIM |
| 27.13.2 | Shape of contacts for IC card SIM card reader | ME supporting either ID-1 or Plug-in SIM |
| 27.14.1 | Entry of PIN | All ME |
| 27.14.2 | Change of PIN | All ME |
| 27.14.3 | Disabling the PIN | ME supporting either ID-1 or Plug-in SIM and supporting a feature to disable the PIN |
| 27.14.4 | PUK entry | ME supporting either ID-1 or Plug-in SIM |
| 27.14.5 | Entry of PIN2 | ME supporting a feature requiring entry of PIN2 (e.g. AoC or FDN) |
| 27.14.6 | Change of PIN2 | ME supporting PIN2 |
| 27.14.7 | PUK2 entry | ME supporting either ID-1 or Plug-in SIM and supporting PIN2 |
| 27.15 | Abbreviated Dialling Numbers (ADN) | ME supporting either ID-1 or Plug-in SIM and supporting ADN |
| 27.16 | MMI reaction to SIM status encoding | ME supporting either ID-1 or Plug-in SIM |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|---|--|
| 27.17.1.1 | Phase preceding ME power on | All ME |
| 27.17.1.2 | Phase during SIM power on | ME with either 5V SIM interface, 3V SIM interface or 5V/3V SIM interface |
| 27.17.1.3 | Phase during ME power off with clock stop forbidden | ME with either 5V SIM interface, 3V SIM interface or 5V/3V SIM interface |
| 27.17.1.4 | Phase during ME power off with clock stop allowed | ME with either 5V SIM interface, 3V SIM interface or 5V/3V SIM interface |
| 27.17.1.5.1 | Reaction of 3V only MEs on SIM type recognition failure | ME with a 3V SIM interface |
| 27.17.1.5.2 | Reaction of 3V only MEs on type recognition of 5V only SIMs | ME with a 3V SIM interface |
| 27.17.1.5.3 | Reaction of 3V technology MEs on type recognition of 5V only SIMs | ME with a 5V/3V SIM interface |
| 27.17.1.5.4 | Reaction of 3V technology MEs on type recognition of 3V technology SIMs | ME with a 5V/3V SIM interface |
| 27.17.2.1.1 | Electrical tests on contact C1, Test 1 | ME with either 5V SIM interface, 3V SIM interface or 5V/3V SIM interface |
| 27.17.2.1.2 | Electrical tests on contact C1, Test 2 | ME with either 5V SIM interface, 3V SIM interface or 5V/3V SIM interface |
| 27.17.2.2 | Electrical tests on contact C2 | ME with either 5V SIM interface, 3V SIM interface or 5V/3V SIM interface |
| 27.17.2.3 | Electrical tests on contact C3 | ME with either 5V SIM interface, 3V SIM interface or 5V/3V SIM interface |

| 27.18.1 | ME and SIM with FND activated | ME supporting either ID-1 or Plug-in SIM and supporting FDN |
| 27.18.2 | ME and SIM with FND deactivated | ME supporting either ID-1 or Plug-in SIM and supporting FDN |
| 27.18.3 | Enabling, disabling and updating of FND | ME supporting either ID-1 or Plug-in SIM and supporting FDN |
| 27.19 | Phase identification | ME supporting either ID-1 or Plug-in SIM |
| 27.20 | SIM presence detection | All ME |
| 27.21.1 | AoC not supported by SIM | ME supporting AoCC |
| 27.21.2 | Maximum frequency of ACM updating | ME supporting AoC |
| 27.21.3 | Call terminated when ACM greater than ACMmax | ME supporting AoCC |
| 27.21.4 | Response codes of increase command | ME supporting AoC |
| 28.2 | Constraining the access to a single number (GSM 02.07 category 3) | MS supporting autocalling |
| 28.3 | Constraining the access to a single number (GSM 02.07 categories 1 and 2) | MS supporting autocalling |
| 28.4 | Behaviour of the MS when its list of blacklisted numbers is full | MS supporting autocalling |
| 29.2.1 | Verification of synchronization | MS supporting data services in transparent mode |
| 29.2.2 | Filtering of channel control information for transparent BCs | MS supporting the MT2 configuration |
| 29.2.3.1 | Negotiation of Radio Channel Requirement (RCR) | MS with an external data interface |
| 29.2.3.2 | Negotiation of Connection Element (CE) | MS with an external data interface |
| 29.2.3.3 | Negotiation of Number of Stop Bits, Number of Data bits, and Parity | MS supporting asynchronous data services |
| 29.2.3.4 | Negotiation of Modem Type | MS supporting non-transparent data services |
| | | |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|--|---|
| 29.2.3.5 | Negotiation of Intermediate Rate | MS supporting non-transparent services on a TCH/F with a user rate of 4,8 kbit/s or lower |
| 29.2.3.6 | Negotiation of User Information Layer 2 Protocol | MS supporting asynchronous bearer services in non-transparent mode |
| 29.2.3.7 | Negotiation between TS 61 and TS 62: Mobile Originated call. | MS supporting TS 61 |
| 29.2.3.8 | Negotiation between TS 61 and TS 62: Mobile Terminated call. | MS supporting TS 62 and not supporting TS 61 |
| 29.2.4 | Data Rate Adaptation for Synchronous Transparent Bearer Capabilities | MS supporting data over the Um-interface |
| 29.2.6.1 | Data Rate Adaptation | MS supporting MT0 or MT2 configuration and supporting data over the Um-interface and supporting asynchronous data Bearer services |
| 29.2.6.2 | Passage of the Break Signal | MS supporting MT2 configuration |
| 29.2.6.3 | Overspeed/Underspeed Handling (Local Terminal) | MS supporting MT2 configuration |
| 29.2.6.4 | Overspeed/Underspeed Handling (Remote Terminal) | MS supporting MT2 configuration |
| 29.2.7 | Interchange circuit mapping for transparent bearer capabilities | MS supporting MT2 configuration |
| 29.3.1.1 | Normal initialization done by the MS | MS supporting at least one non-transparent bearer service |
| 29.3.1.2.1 | Loss of UA frame | MS supporting at least one non-transparent bearer service |
| 29.3.1.2.2 | Total loss of UA frame | MS supporting at least one non-transparent bearer service |
| 29.3.2.2.1 | N(S) sequence number | MS supporting at least one non-transparent bearer service |
| 29.3.2.2.2 | Transmission window | MS supporting at least one non-transparent bearer service |
| 29.3.2.2.3 | Busy condition | MS supporting at least one non-transparent bearer service |
| 29.3.2.3.1 | N(R) sequence number | MS supporting at least one non-transparent bearer service |
| 29.3.2.3.2 | Busy condition | MS supporting at least one non-transparent bearer service |
| 29.3.2.4.1 | REJ frame | MS supporting at least one non-transparent bearer service |
| 29.3.2.4.2. | SREJ frame | MS supporting at least one non-transparent bearer service |
| 29.3.2.4.3 | I+S reject frame | MS supporting at least one non-transparent bearer service |
| 29.3.2.5.1 | Rejection with REJ or SREJ supervisory frames | MS supporting at least one non-transparent bearer service |
| 29.3.2.5.2 | Retransmission of REJ or SREJ frames | MS supporting at least one non-transparent bearer service |
| 29.3.2.5.3 | I+S reject frame | MS supporting at least one non-transparent bearer service |
| 29.3.2.6.1 | SS in checkpoint recovery mode | MS supporting at least one non-transparent bearer service |
| 29.3.2.6.2 | End of the window | MS supporting at least one non-transparent bearer service |

(continued)

Table 3.1 (continued): Applicability of tests

| Clause | Title | Applicability |
|---------------|---|--|
| 29.3.2.6.3 | End of a sequence | MS supporting at least one non-transparent bearer service |
| 29.3.2.6.4 | Time-out of one frame | MS supporting at least one non-transparent bearer service |
| 29.3.2.6.5 | No response to checkpointing | MS supporting at least one non-transparent bearer service |
| 29.3.2.6.6 | Incorrect response to checkpointing | MS supporting at least one non-transparent bearer service |
| 29.3.2.6.7 | Total loss of response to checkpointing | MS supporting at least one non-transparent bearer service |
| 29.3.2.6.8 | Retransmission of a sequence | MS supporting at least one non-transparent bearer service |
| 29.3.2.6.9 | N2 retransmission of a sequence | MS supporting at least one non-transparent bearer service |
| 29.3.3.1 | Negotiation initiated by the SS | MS supporting at least one non-transparent bearer service |
| 29.3.3.2 | Negotiation initiated by the MS | MS supporting at least one non-transparent bearer service MS supporting the use of non-default RLP parameters |
| 29.3.3.3 | Collision of XID frames | MS supporting at least one non-transparent bearer service MS supporting the use of non-default RLP parameters |
| 29.3.3.4 | Loss of XID frames | MS supporting at least one non-transparent bearer service |
| 29.3.3.5 | Total loss of XID frames | MS supporting at least one non-transparent bearer service MS supporting the use of non-default RLP parameters |

| 33.2.6 | Congestion tone | All MS |
| 33.2.7 | Authentication failure tone | All MS |
| 33.2.8 | Number unobtainable tone | All MS |
| 33.2.9 | Call dropped tone | All MS |
| 33.3 | Network selection / indication | All MS |
| 33.4 | Invalid and blocked PIN indicators | All MS |
| 33.5 | Service indicator | All MS |
| 33.6 | Subscription identity management | All MS |
| 33.7 | Barring of outgoing calls | MS supporting barring of outgoing calls |
| 33.8 | Prevention of unauthorized calls | MS supporting prevention of unauthorized calls |
| 34.2.1 | SMS mobile terminated | MS supporting SMS MT/PP and supporting CC-state U10 |
| 34.2.2 | SMS mobile originated | MS supporting SMS MO/PP and supporting CC-state U10 |
| 34.2.3 | Test of memory full condition and memory available notification: | MS supporting SMS MT/PP and storing of short messages in the SIM |
| 34.2.4 | Test of the status report capabilities and of SMS-COMMAND: | MS supporting status report capabilities |
| 34.2.5.1 | Short message class 0 | MS supporting SMS MT/PP and display of received short messages |
| 34.2.5.2 | Test of class 1 short messages | MS supporting storing of received Class I Short Messages and display of stored Short Messages |
| 34.2.5.3 | Test of class 2 short messages | MS supporting storing of received Class II Short Messages in the SIM |
| 34.2.7 | Test of the replace mechanism for SM type 1-7 | MS supporting Replace Short Messages and display of received Short Messages |
| 34.2.8 | Test of the reply path scheme | MS supporting reply procedures, display of received Short Messages and submitting Short Messages |
| 34.3 | Short message service cell broadcast | All MS |
| 35 | Low battery voltage detection | All MS |

3.2.3 Applicability to terminal equipment

If a MS is delivered for conformance testing, and it contains physically integrated TE, then this EN applies to the complete MS including that TE.

This EN also applies to separate TE that is delivered for conformance testing with the MS. The MS is then tested as an MT0. In that case, the specific TE with which the MS is tested is documented in the test report.

3.3 Definitions

The following definitions are used in this EN:

idle updated:

The MS is defined to be "idle updated" if the following three conditions are fulfilled:

- its update status is U1 UPDATED (cf. GSM 04.08);
- it is in the MM state MM-IDLE (cf. GSM 04.08);
- it is in the RR idle mode (cf. GSM 04.08).

idle not updated:

The MS is defined to be "idle not updated" if the following three conditions are fulfilled:

- its update status is U2 NOT UPDATED (cf. GSM 04.08);
- it is in the MM state MM-IDLE (cf. GSM 04.08);
- it is in the RR idle mode (cf. GSM 04.08).

arbitrary:

If for a test, a test purpose, a test group, or a test suite, which uses a certain parameter the value of that parameter has to be chosen arbitrarily in a certain set of values, this means that:

- for each value in the set the MS is required to fulfil the requirements of the test, test purpose, test group, or test suite, but that
- the test, test purpose, test group, or test suite is only performed for one value in the set, the selection of which is made by the test operator.

3.4 Conventions for mathematical notations

For the purpose of this EN mathematical terms used throughout this EN are given in this subclause.

3.4.1 Mathematical signs

The "plus or minus" sign is expressed by " \pm ".

The sign "multiplied by" is expressed by "*".

The sign "divided by" is expressed by "/", or the common division bar.

The sign "greater than or equal to" is expressed by " \geq ".

The sign "less than or equal to" is expressed by " \leq ".

3.4.2 Powers to the base 10

Powers to the base 10 are expressed by "10Ex", where x is the exponent, e.g. 10E-5, 10E6.

3.5 Conventions on electrical terms

3.5.1 Radio Frequency (RF) input signal level

In general, the RF input signal level to the MS is expressed in terms of the received field strength E in dB μ V/m (assuming a 0 dBi gain antenna). This is related to the power level P in dBm by the following formula (see GSM 05.05)

GSM 900: $E \text{ (dB}\mu\text{V/m)} = P \text{ (dBm)} + 136,5$ (calculated for a frequency of 925 MHz).

DCS 1 800: $E \text{ (dB}\mu\text{V/m)} = P \text{ (dBm)} + 142,3$ (calculated for a frequency of 1 795 MHz).

According to annex 1 subclause A1.1.5.3, in all tests in which a handheld MS normally only equipped with integral antenna is the unit under test, the equivalent input signal level into a temporary test connector is determined from:

$$E_{in} = E_{req} + F$$

where:

- E_{in} = input signal level to a temporary antenna connector (dB μ Vemf);
- E_{req} = signal level required by the test (dB μ Vemf);
- F = coupling factor (dB) at the respective ARFCN.

Since F has to be determined by each test house individually, E_{in} cannot be given as a figure in test procedures.

If the case of integral antenna is applicable, the input signal level is then expressed in the test procedures as:

$$E_{req} \text{ dB}\mu\text{Vemf} (),$$

where the empty parenthesis is to be read as E_{in} .

Alternatively, the input signal level to the MS at the antenna connector can be expressed in $\text{dB}\mu\text{Vemf} ()$. This is related to the power level P in dBm by the following formula, assuming a 50 ohm antenna connector:

$$\text{Input signal level (dB}\mu\text{Vemf} ()) = P(\text{dBm}) + 113$$

3.5.2 Reference sensitivity level

In this EN the term:

Reference Sensitivity level ()

is used to indicate that the SS establishes reference sensitivity level taking account of any losses associated with the RF connection to the MS.

3.5.3 Power level of fading signal

The power level of a fading signal is defined as the total signal level averaged over time.

3.6 Terms on test conditions

3.6.1 Radio test conditions

The radio propagation conditions refer to multipath propagation models of GSM 05.05.

They are expressed by typical profiles:

- static;
- rural area (RA);
- hilly terrain (HT);
- urban area (TU); or for
- equalization test (EQ).

The non-static profiles are also related to typical speeds of movement of the MS expressed in km/h, e.g. TU1,5, TU3, TU50, HT100, EQ50.

In this EN the following conventions are used:

Table 3.2

| Term | for GSM 900 represents | for DCS 1 800 represents |
|--------|---------------------------|-----------------------------|
| RA | RA250 | RA130 |
| HT | HT100 | HT100 |
| TUhigh | TU50 | TU50 |
| TUlow | TU3 | TU1,5 |
| EQ | EQ50 | EQ50 |

For tests using ARFCN ranges the following table shall be used.

Table 3.3

| Term | P-GSM 900 | DCS 1 800 | E-GSM 900 | R-GSM 900 |
|------------------|------------------|------------------|------------------|---|
| Low ARFCN range | 1 to 5 | 513 to 523 | 975 to 980 | 955 to 960 (R-GSM) and 975 to 980 (E-GSM) |
| Mid ARFCN range | 60 to 65 | 690 to 710 | 60 to 65 | 60 to 65 |
| High ARFCN range | 120 to 124 | 874 to 884 | 120 to 124 | 120 to 124 |

NOTE 1: For definitions of P-GSM 900, DCS 1 800, E-GSM 900 and R-GSM 900 refer to GSM 05.05.

NOTE 2: In this EN the term "GSM 900" is used to cover the primary GSM band, the extended GSM band and the railway-GSM band.

NOTE3: For R-GSM two low ARFCN ranges are defined. Unless specified otherwise for a specific test the ARFCN range defined for E-GSM900 MS is used for the testing of MS supporting the R-GSM 900 frequency range.

4 Test Equipment

4.1 Terms used to describe test equipment in this EN

In order to perform MS conformity testing, the use of test equipment is necessary to provide the MS with stimulus signals and to analyse and record the resulting responses.

Throughout this EN the term "System Simulator" is used to describe the suite of test equipment required to interact with the following MS interfaces:

- antenna
- acoustic
- data port
- power supply
- DAI

The term "SIM simulator" is used to describe the test equipment required to interact with the SIM/ME interface.

A "test SIM" has the physical characteristics of a standard SIM card, (see 11.11) with specific parameters defined in annex 4.

4.2 Functional requirements of test equipment

This EN does not include a functional description of the test equipment required to perform the tests. These requirements should be deduced from the test descriptions and the information in annex 5.

Annex 5 describes the requirements for the test equipment which cannot be derived from, and which are assumed in, the conformance test descriptions described in this EN. Specifically, stimulus setting and measurement uncertainty requirements are defined in annex 5.

5 Testing methodology in general (layers 1, 2, and 3)

5.1 Testing of optional functions and procedures

Any function or procedure which is optional, as indicated in this EN, may be subject to a conformance test if it is implemented in the MS.

A declaration by the apparatus supplier (PICS/PIXIT) is used to determine whether an optional function/procedure has been implemented.

5.2 Test interfaces and facilities

The air interface (Um reference point) provides the main test interface for the purpose of performing conformance tests.

The SS layer 2 and layer 3 shall react with the MS on the air interface in accordance with the BSS requirements in the GSM 04.xx and 05.xx series recommendations, except where the description defines otherwise.

The provision of the following special conformance test facilities is mandatory where applicable:

- support of special conformance test functions, which are enabled by the insertion of a dedicated SIM for testing (test-SIM);
- provision of a Digital Audio Interface (only for MS which support speech services, or alternate speech/data services);
- for equipment which does not have a permanent external 50 ohm connector, a temporary 50 ohm antenna connector shall be provided in accordance with the requirements of annex 1 GC7;

- for MS supporting diversity, or for any other reason having more than one RF connector (or temporary connector in the case of integral antenna MS) the manufacturer shall supply coupling and / or terminating devices so that the tests can be performed via a single transmit / receive RF connection.

Furthermore, an optional Electrical Man Machine Interface (EMMI), is specified.

These special conformance test facilities, with the exception of the temporary antenna connector, are described in subclause 36.1.

Actions at the user side of the equipment under test (i.e. at the man-machine Interface, at the S- or R-interface, at the SIM-interface, execution of higher layer processes in the case of data services) are used to invoke actions at layers 1, 2 and 3 of the Dm-channel protocol within the equipment under test.

5.3 Different protocol layers

The conformance tests for each layer of the Dm-channel protocol are specified separately and the test configuration(s) to be used in testing each layer is specified in the subclause of this EN relating to the conformance tests for that layer.

5.4 Information to be provided by the apparatus supplier

The apparatus supplier shall provide two kinds of information:

- information with respect to the protocol: Protocol Implementation Conformance Statement (PICS);
- information with respect to the man machine interface: Protocol Implementation Extra Information required for Testing (PIXIT).

The complete list of the information to be provided by the apparatus supplier is a matter between the apparatus supplier and the test house but an example of the information to be supplied is given in informative annex 3 of this EN.

5.5 Definitions of transmit and receive times

The time a burst is received or transmitted is defined to be in the middle of the burst, i.e. transition from Bit Number BN74 to BN75 for all bursts except random access bursts, the middle of which is the transition from BN48 to BN49.

The reception/transmission time of speech or data blocks or a signalling frame (layer 2 and layer 3) is defined to be the reception/transmission time of the last burst containing part of the block or frame.

The start of a layer 2 or 3 frame is defined to be the time of the first burst containing part of the layer 2 or 3 frame. (The time of a burst is defined to be in the middle of the burst.)

The end of a layer 2 or 3 frame is defined to be the time of the last burst containing part of the layer 2 or 3 frame.

6 Reference test methods

6.1 General

Annex 1 gives reference test conditions to be used throughout this EN, unless otherwise specified. It consists of a part on general conditions, and a part on normal and extreme test conditions.

Unless otherwise specified, tests are run using the normal test conditions.

If a test is to be run using the extreme test conditions then this is identified in the test description.

For all tests, the MS is connected to the SS. This connection, unless otherwise specified, is to the permanent antenna connector for a MS which is equipped with one, or via the temporary antenna connector defined in annex 1, GC7, for a MS with an integral antenna, and not normally having a means of connecting an external antenna.

6.2 Choice of frequencies in the frequency hopping mode

For the tests using frequency hopping, 38 frequencies are used over

| | |
|------------|-----------------|
| P-GSM 900: | a 21 MHz band |
| E-GSM 900: | a [21] MHz band |
| R-GSM 900: | a 23 MHz band |
| DCS 1 800: | a 75 MHz band |

Table 6.1: Hopping frequencies

| | ARFCN |
|-----------|--|
| P-GSM900 | 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 38, 42, 45, 46, 50, 52, 54, 58, 59, 62, 66, 70, 73, 74, 78, 80, 82, 86, 87, 90, 94, 98, 101, 102, 106, 108, 110, 114 |
| E-GSM900 | 984, 988, 991, 992, 996, 998, 1000, 1004, 1005, 1008, 1012, 1016, 1019, 1020, 1022, 2, 6, 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 38, 42, 45, 46, 50, 52, 54, 58, 59, 62, 64 |
| R-GSM 900 | 955, 963, 966, 967, 971, 974, 984, 988, 991, 992, 996, 998, 1000, 1004, 1005, 1008, 1012, 1016, 1019, 1020, 1022, 2, 6, 10, 14, 17, 18, 22, 24, 26, 30, 31, 34, 38, 42, 45 |
| DCS 1 800 | 522, 539, 543, 556, 564, 573, 585, 590, 606, 607, 624, 627, 641, 648, 658, 669, 675, 690, 692, 709, 711, 726, 732, 743, 753, 760, 774, 777, 794, 795, 811, 816, 828, 837, 845, 858, 862, 879 |

NOTE: The range of frequencies available during tests under simulated fading conditions is restricted by the fading simulator bandwidth.

6.3 "Ideal" radio conditions

In this EN the following conditions are referenced by the term "ideal" radio conditions:

No multipath conditions

MS power control level:

GSM 900: 7

DCS 1 800: 3

RF level to MS: 63 dB μ V_{emf}() (not tests in subclause 14.4, 14.5 or 18.1.4)

RF level to MS: 20 dB above reference sensitivity level () (subclause 14.4 and 14.5)

RF level to MS: 28 dB μ V_{emf}() (tests in subclause 18.1.4)

6.4 Standard test signals

The standard test signals C0, C1, I0, I1 and I2 as used in this EN, are defined in annex 5.

6.5 Power (control) levels

In this EN, except where explicitly stated otherwise, if the MS is commanded to its minimum power (control) level, the SS is allowed to signal power control level 19 for GSM 900, and 15 for DCS 1 800. Furthermore, except where explicitly stated otherwise, if the MS is commanded to its maximum power (control) level, and if MS_TXPWR_MAX_CCH is set to the maximum output power of the MS, the SS is allowed to signal the power control level corresponding to the maximum output power for the power class of the MS. For a GSM 900 power class 2 MS, the SS is allowed to signal power control level 2.

7 Implicit testing

For some GSM features conformance is not verified explicitly in this EN. This does not imply that correct functioning of these features is not essential, but that these are implicitly tested to a sufficient degree in other tests. Examples for implicitly tested features are frequency hopping and encryption.

It should be noted that for these features some aspects have to be and are explicitly tested, e.g. the ability to switch to frequency hopping or non-hopping, and the ability to change the encryption mode setting.

8 Measurement uncertainty

The measured value relating to the corresponding limit shall be used to determine whether or not a terminal equipment meets the requirement. (ETR 028 annex B).

This process is often referred to as "shared risk".

9 Format of tests

In general the following basic format for tests is used:

- *.*.* Title
 - *.*.*.1 Definition and applicability

This sections provides, if necessary, a definition of the feature/function being tested and the applicability of the test to different MS (e.g. speech only, data only etc.).
 - *.*.*.2 Conformance requirement

This section details the core specification requirements being tested and includes any necessary core specification references.
 - *.*.*.3 Test purpose

This section details the purpose of the test.
 - *.*.*.4 Method of test
 - *.*.*.4.1 Initial conditions

If present this section defines the initial conditions to be established before running the test.
 - *.*.*.4.2 Procedure

This section details the test procedure.
 - *.*.*.5 Test requirements

This section details the conditions to be met for successful completion of the test.

[However for the Layer 3 tests, in general, a slightly modified format, as described below, is used:

- *.*.* Title
 - *.*.*.1 Conformance requirement
 - References
 - *.*.*.2 Test purpose
 - *.*.*.3 Method of test
 - Initial conditions
 - Related PICS/PIXIT statement
 - Foreseen final state of the MS
 - Test Procedure
 - Maximum duration of the test
 - Expected sequence]

10 Generic call set up procedures

10.1 Generic call set-up procedure for mobile terminating speech calls

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Terminating Speech call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

10.1.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see annex 1 TC.2.1)
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

10.1.2 Definition of system information messages

The following parameters shall be coded into the system information messages. Parameters shall be coded according to GSM 04.08.

The RACH Control Parameters IE shall be the same in SYSTEM INFORMATION TYPE 1, TYPE 2, TYPE 3 and TYPE 4 messages.

The Location Area Identification IE, Cell Selection Parameters IE, and P1 bit shall be the same in SYSTEM INFORMATION TYPE 3 and TYPE 4 messages.

SYSTEM INFORMATION TYPE 1

| Information Element | Value/remark |
|--------------------------|--|
| Cell channel description | Includes the hopping sequence ARFCNs, if hopping is used |
| RACH control parameters | |
| MAX RETRANS | Any Value |
| TX-INTEGER | Any Value |
| CELL BAR ACCESS | Not barred |
| CALL RE-ESTABLISHMENT | Not Allowed |
| EMERGENCY CALL | Allowed |
| ACCESS CONTROL CLASS | None Barred |
| (0...9, 11...15) | |
| SI1 rest octets | Spare Octets |

SYSTEM INFORMATION TYPE 2

| Information Element | Value/remark |
|-------------------------|---|
| BCCH Frequency list | Indicates seven surrounding cells on any ARFCN of the supported band, excluding ARFCNs in or immediately adjacent to those specified in subclause 6.2 |
| NCC permitted | |
| NCC PERMITTED | e.g. all NCCs permitted |
| RACH control parameters | |
| MAX RETRANS | Any Value |
| TX-INTEGER | Any Value |
| CELL BAR ACCESS | Not barred |
| CALL RE-ESTABLISHMENT | Not Allowed |
| EMERGENCY CALL | Allowed |
| ACCESS CONTROL CLASS | None Barred |
| (0...9, 11...15) | |

SYSTEM INFORMATION TYPE 3

| Information Element | Value/remark |
|------------------------------|---|
| Cell identity | |
| CI VALUE | 0001 hex (not relevant) |
| Location Area Identification | |
| MCC | 001 decimal (not relevant) |
| MNC | 01 decimal (not relevant) |
| LAC | 0001 hex (not relevant) |
| Control Channel Description | |
| ATT (IMSI att/det) | MS shall not apply (not relevant) |
| BS-AG-BLKS-RES | 0 blocks reserved (not relevant) |
| CCCH-CONF | Combined CCCH/SDCCH (not relevant) |
| BS-PA-MFRMS | 5 multiframes (not relevant) |
| T3212 | Infinite |
| Cell options | |
| PWRG | power control not set |
| DTX | MS must not use DTX |
| RADIO LINK TIME-OUT | 8 |
| Cell selection parameters | |
| CELL RESELECT HYSTERESIS | 0 dB |
| MS-TXPWR-MAX-CCH | Max. output power of MS |
| RXLEV-ACCESS-MIN | -90 dBm |
| ACS | There are no additional cell parameters included in SI7 and SI8 |
| NECI | New establishment cause not supported |
| RACH control parameters | |
| MAX RETRANS | Any Value |
| TX-INTEGER | Any Value |
| CELL BAR ACCESS | Not barred |
| CALL RE-ESTABLISHMENT | Not Allowed |
| EMERGENCY CALL | Allowed |
| ACCESS CONTROL CLASS | None Barred |
| (0...9, 11...15) | |
| SI3 rest octets | |
| P1 | C2 parameters not present |

SYSTEM INFORMATION TYPE 4

| Information Element | Value/remark |
|------------------------------|----------------------------|
| Location Area Identification | |
| MCC | 001 decimal (not relevant) |
| MNC | 01 decimal (not relevant) |
| LAC | 0001 hex (not relevant) |
| Cell selection parameters | |
| CELL RESELECT HYSTERESIS | 0 dB |
| MS-TXPWR-MAX-CCH | Max. output power of MS |
| RXLEV-ACCESS-MIN | -90 dBm |
| RACH control parameters | |
| MAX RETRANS | Any Value |
| TX-INTEGER | Any Value |
| CELL BAR ACCESS | Not barred |
| CALL RE-ESTABLISHMENT | Not Allowed |
| EMERGENCY CALL | Allowed |
| ACCESS CONTROL CLASS | None Barred |
| (0...9, 11...15) | |
| CBCH Channel Description | Omitted |
| CBCH Mobile Allocation | Omitted |
| SI4 rest octets | |
| P1 | C2 parameters not present |

SYSTEM INFORMATION TYPE 5

| Information Element | Value/remark |
|----------------------------|--------------------------------|
| Neighbour cell description | As BCCH Frequency list in SI 2 |

SYSTEM INFORMATION TYPE 6

| Information Element | Value/remark |
|------------------------------|----------------------------|
| Cell identity | |
| CI VALUE | 0001 hex (not relevant) |
| Location Area Identification | |
| MCC | 001 decimal (not relevant) |
| MNC | 01 decimal (not relevant) |
| LAC | 0001 hex (not relevant) |
| Cell options | |
| PWRG | power control not set |
| DTX | MS must not use DTX |
| RADIO LINK TIME-OUT | 8 |
| NCC permitted | |
| NCC PERMITTED | e.g. all NCCs permitted |

10.1.3 Procedure

An MS terminating call on a TCH/FS shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Sent on the correct paging subchannel Establishment cause indicates "answer to paging" |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | Message is contained in SABM |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | AUTHENTICATION REQUEST | SRES specifies correct value |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered SS starts ciphering Message contains the signal IE |
| 9 | SS | | |
| 10 | SS -> MS | SETUP | |
| 11 | MS -> SS | CALL CONFIRMED | |
| A12 | MS -> SS | CONNECT | |
| B12 | MS -> SS | ALERTING | An alerting indication as defined in a PICS/PIXIT statement given by the MS The MS is made to accept the call in a way described in a PICS/PIXIT statement |
| B13 | MS | | |
| B14 | MS | | |
| B15 | MS -> SS | CONNECT | |
| 16 | SS -> MS | ASSIGNMENT COMMAND | The TCH is through connected in both directions |
| 17 | MS -> SS | ASSIGNMENT COMPLETE | |
| 18 | MS | | |
| 19 | SS -> MS | CONNECT ACKNOWLEDGE | |

10.1.4 Specific message contents

PAGING REQUEST TYPE 1 (GSM 04.08, 9.1.22) to the MS

| Information Element | Value/remark |
|------------------------|------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal Paging |
| Channel Needed | spare, any channel |
| Mobile Identity 1 | |
| Odd/even no of digits | As applicable for TMSI |
| Type of Identity | TMSI |
| Identity digits | As applicable |
| Mobile Identity 2 | Omitted |
| P1 rest octets | Spare octets |

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|------------------------|-------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |
| Channel Description | |
| Channel Type | SDCCH/SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---------------------------|--------------|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrary |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|------------------------|------------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

SETUP (GSM 04.08, 9.3.23) to the MS

| Information Element | Value/remark |
|------------------------|--|
| Protocol Discriminator | CC |
| Transaction Identifier | SS orig. |
| Message Type | |
| Signal | any non-reserved value |
| Bearer capability 1 | Appropriate for the basic service selected for the test or omitted |

ASSIGNMENT COMMAND (GSM 04.08, 9.1.2) to the MS

| Information Element | Value/remark |
|------------------------|-----------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Channel Description | |
| Channel type | Bm + ACCHs |
| Time slot number | Arbitrary |
| Training seq. code | Default |
| Hopping | No |
| ARFCN | Default |
| Power level | Power control level 7 |
| Channel mode | Speech full rate |

CONNECT ACKNOWLEDGE (GSM 04.08, 9.3.6) to the MS

| Information Element | Value/remark |
|------------------------|--------------|
| Protocol Discriminator | CC |
| Transaction Identifier | SS orig. |
| Message Type | |

10.2 Generic call set-up procedure for mobile originating speech calls

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Originating Speech (MOC) call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

10.2.1 Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see [annex 1 TC.2.1])
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

10.2.2 Definition of system information messages

See subclause 10.1.2.

10.2.3 Procedure

An MS originating call on a TCH/FS shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | MS | | "called number" entered |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "originating call, NECI <> 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 9 | SS | | SS starts ciphering |
| 10 | MS -> SS | SETUP | |
| 11 | SS -> MS | CALL PROCEEDING | |
| 12 | SS -> MS | ALERTING | |
| 13 | MS | | An alerting indication as defined in an PICS/PIXIT statement is given by the MS |
| 14 | SS -> MS | ASSIGNMENT COMMAND | |
| 15 | MS -> SS | ASSIGNMENT COMPLETE | |
| 16 | SS -> MS | CONNECT | |
| 17 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 18 | MS | | The TCH is through connected in both directions |

10.2.4 Specific message contents

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|------------------------|-------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |
| Channel Description | |
| Channel Type | SDCCH/SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---------------------------|--------------|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrary |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|------------------------|------------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

CALL PROCEEDING (GSM 04.08, 9.3.3) to the MS

| Information Element | Value/remark |
|------------------------|-----------------------|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Repeat Indicator | Omitted |
| Bearer Capability 1 | Omitted |
| Bearer Capability 2 | Omitted |
| Facility | Omitted |
| Progress Indicator | Omitted |

ALERTING (GSM 04.08, 9.3.1) to the MS

| Information Element | Value/remark |
|------------------------|-----------------------|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| User-user | Omitted |

ASSIGNMENT COMMAND (GSM 04.08, 9.1.2) to the MS

| Information Element | Value/remark |
|------------------------|-----------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Channel Description | |
| Channel type | Bm + ACCHs |
| Time slot number | Arbitrary |
| Training seq. code | Default |
| Hopping | No |
| ARFCN | Default |
| Power level | Power control level 7 |
| Channel mode | Speech full rate |

CONNECT (GSM 04.08, 9.3.5) to the MS

| Information Element | Value/remark |
|------------------------|-----------------------|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| Connected number | Omitted |
| Connected Subaddress | Omitted |
| User-user | Omitted |

10.3 Generic call set-up procedure for mobile terminating data calls

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Terminating Data call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

10.3.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see annex 1 TC.2.1)
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

10.3.2 Definition of system information messages

See subclause 10.1.2.

10.3.3 Procedure

An MS terminating call on a TCH shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Sent on the correct paging subchannel |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 9 | SS | | SS starts ciphering |
| 10 | SS -> MS | SETUP | A call is set up according to the required characteristics of the test procedure. Bearer Capability and Signal IEs included |
| 11 | MS -> SS | CALL CONFIRMED | Bearer Capability shall or shall not be included according to the rules given in GSM 04.08 and GSM 07.01 |
| A12 | MS -> SS | CONNECT | |
| B12 | MS -> SS | ALERTING | An alerting indication as defined in a PICS/PIXIT statement given by the MS |
| B13 | MS | | The MS is made to accept the call in a way described in a PICS/PIXIT statement |
| B14 | MS | | |
| B15 | MS -> SS | CONNECT | |
| 16 | SS -> MS | ASSIGNMENT COMMAND | |
| 17 | MS -> SS | ASSIGNMENT COMPLETE | |
| 18 | MS | | The TCH is through connected in both directions |
| 19 | SS -> MS | CONNECT ACKNOWLEDGE | |

10.3.4 Specific message contents

PAGING REQUEST TYPE 1 (GSM 04.08, 9.1.22) to the MS

| Information Element | Value/remark |
|------------------------|------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal Paging |
| Channel Needed | spare, any channel |
| Mobile Identity 1 | |
| Odd/even no of digits | As applicable for TMSI |
| Type of Identity | TMSI |
| Identity digits | As applicable |
| Mobile Identity 2 | Omitted |
| P1 rest octets | Spare octets |

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|------------------------|-------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |
| Channel Description | |
| Channel Type | SDCCH/SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---------------------------|----------------------|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrarily selected |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|------------------------|------------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

10.4 Generic call set-up procedure for mobile originating data calls

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Originating Data call set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

10.4.1 Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see [annex 1 TC.2.1])
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

10.4.2 Definition of system information messages

See subclause 10.1.2.

10.4.3 Procedure

An MS originating call on a TCH shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | MS | | "called number" entered |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "originating call, NECI <> 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 7 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 9 | SS | | SS starts ciphering |
| 10 | MS -> SS | SETUP | |
| 11 | SS -> MS | CALL PROCEEDING | |
| 12 | SS -> MS | ALERTING | |
| 13 | MS | | An alerting indication as defined in an PICS/PIXIT statement is given by the MS |
| 14 | SS -> MS | ASSIGNMENT COMMAND | |
| 15 | MS -> SS | ASSIGNMENT COMPLETE | |
| 16 | SS -> MS | CONNECT | |
| 17 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 18 | MS | | The TCH is through connected in both directions |

10.4.4 Specific message contents

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|------------------------|-------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |
| Channel Description | |
| Channel Type | SDCCH/SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---------------------------|----------------------|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrarily selected |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|------------------------|------------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

CALL PROCEEDING (GSM 04.08, 9.3.3) to the MS

| Information Element | Value/remark |
|---|---|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Repeat Indicator | |
| Bearer Capability 1 | Present if and only if Bearer Capability 1 and Bearer Capability 2 are present in this message Present if negotiation of BC 1 or BC 2 necessary (e.g. reception of "Both" for CE parameter in SETUP), else omitted |
| Radio Channel Requirement | spare |
| Connection element | T (in case of "Both T (NT) preferred" received) |
| NIRR | No meaning |
| Other parameters | Same as sent by the MS in the SETUP, where applicable |
| Bearer Capability 2 | Present if dual BC-IE received and negotiation of either BC 1 or BC 2 necessary, else omitted |
| Radio Channel Requirement | spare |
| Connection element | T in case of "Both, T (NT) preferred" in the SETUP message else same as in the SETUP message |
| NIRR | No meaning |
| Other parameters | Same as sent by the MS in the SETUP, where applicable |
| NOTE: If both BC 1 and BC 2 are present, then one and only one of them shall indicate speech. | |
| Facility | Omitted |
| Progress Indicator | Omitted |

ALERTING (GSM 04.08, 9.3.1) to the MS

| Information Element | Value/remark |
|------------------------|-----------------------|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| User-user | Omitted |

ASSIGNMENT COMMAND (GSM 04.08, 9.1.2) to the MS

| Information Element | Value/remark |
|------------------------|---|
| Protocol Discriminator | RR |
| Transaction Identifier | Not used |
| Message Type | |
| Channel Description | |
| Channel type | Bm + ACCHs |
| Time slot number | Arbitrary |
| Training seq. code | Default |
| Hopping | No |
| FB no | Band no 0 |
| ARFCN | Default |
| Power level | Power control level 7 |
| Channel mode | If no negotiation took place: - Speech FR (resp. HR) if first BC IE in the SETUP indicated speech FR (resp. HR); - Set according to the table below if first BC - IE in the SETUP indicates data or fax If negotiation took place; - Speech FR (resp. HR) if first BC-IE in the CALL PROCEEDING indicated speech FR (resp. HR); - Set according to the table below if first BC - IE in the CALL PROCEEDING indicates data or fax |

Table 10-2: Correspondence between User rate (UR) and Channel Mode (CM) for transparent (T) and non transparent (NT) connections

| UR | 9,6kbit/s | 4,8kbit/s | 2,4kbit/s | 1,2kbit/s | 1,2/0,075kbit/s | 0,3kbit/s |
|----------|-----------|-----------|-----------|-----------|-----------------|-----------|
| CM T FR | 12FR | 6 FR | 3,6 FR | 3,6 FR | 3,6 FR | 3,6 FR |
| CM T HR | n.a | 6 HR | 3,6 HR | 3,6 HR | 3,6 HR | 3,6 HR |
| CM NT FR | 12 FR | 12 FR | 12 FR | 12 FR | 12 FR | 12 FR |
| CM NT HR | n.a | 6 HR | 6 HR | 6 HR | 6 HR | 6 HR |

CONNECT (GSM 04.08, 9.3.5) to the MS

| Information Element | Value/remark |
|------------------------|-----------------------|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| Connected number | Omitted |
| Connected Subaddress | Omitted |
| User-user | Omitted |

10.5 Generic call set-up procedure for mobile terminating multislot configuration, minimum number of timeslots allocated

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Terminating multislot connection set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

10.5.1 Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see annex 1 TC.2.1)
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

10.5.2 Definition of system information messages

See subclause 10.1.2.

10.5.3 Procedure

An MS terminating multislot connection shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Sent on the correct paging subchannel |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "answer to paging" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | Message is contained in SABM |
| 5 | MS -> SS | CLASSMARK CHANGE | Multislot class |
| 6 | SS -> MS | AUTHENTICATION REQUEST | |
| 7 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 8 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 9 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 10 | SS | | SS starts ciphering |
| 11 | SS -> MS | SETUP | A multislot connection is set up according to the required characteristics of the test procedure. Bearer Capability and Signal IEs included |
| 12 | MS -> SS | CALL CONFIRMED | Bearer Capability shall or shall not be included according to the rules given in GSM 04.08 and GSM 07.01 |
| A12 | MS -> SS | CONNECT | |
| B13 | MS -> SS | ALERTING | An alerting indication as defined in a PICS/PIXIT statement given by the MS |
| B14 | MS | | The MS is made to accept the call in a way described in a PICS/PIXIT statement |
| B15 | MS | | |
| B16 | MS -> SS | CONNECT | |
| 17 | SS -> MS | ASSIGNMENT COMMAND | In multislot allocation only one timeslot is allocated. |
| 18 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the TCH/Sm channel |
| 19 | MS | | The TCH(s) is through connected in both directions |
| 20 | SS -> MS | CONNECT ACKNOWLEDGE | |

10.5.4 Specific message contents

PAGING REQUEST TYPE 1 (GSM 04.08, 9.1.22) to the MS

| Information Element | Value/remark |
|------------------------|------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal Paging |
| Channel Needed | spare, any channel |
| Mobile Identity 1 | |
| Odd/even no of digits | As applicable for TMSI |
| Type of Identity | TMSI |
| Identity digits | As applicable |
| Mobile Identity 2 | Omitted |
| P1 rest octets | Spare octets |

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|------------------------|-------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |

| Channel Type | SDCCH/SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---------------------------|----------------------|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrarily selected |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|------------------------|------------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

SETUP (GSM 04.08, 9.3.23) to the MS

| Information Element | Value/remark |
|---------------------------|--|
| Protocol Discriminator | CC |
| Transaction Identifier | SS orig. |
| Message Type | |
| Bearer Capability | |
| Radio Channel Requirement | |
| Connection Element | T or NT and declared as supported by the MS (Not "Both ...") |
| NIRR | No meaning |
| Other parameters | Declared as supported by the MS |
| Signal | any non-reserved value |

ASSIGNMENT COMMAND (GSM 04.08, 9.1.2) to the MS

| Information Element | Value/remark |
|------------------------|--|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Channel Description 2 | |
| Channel type | TCH/F + FACCH/F and SACCH/M |
| Time slot number | Arbitrary |
| Training seq. code | Default |
| Hopping | No |
| ARFCN | Default |
| Power level | Power control level 7 |
| Multislot allocation | |
| - Downlink assignment | Only one timeslot is assigned in downlink direction. |
| - Uplink assignment | Only one timeslot is assigned in uplink direction. |

CONNECT ACKNOWLEDGE (GSM 04.08, 9.3.6) to the MS

| Information Element | Value/remark |
|------------------------|--------------|
| Protocol Discriminator | CC |
| Transaction Identifier | SS orig. |
| Message Type | |

10.6 Generic call set-up procedure for mobile originating multislot configuration, minimum number of timeslots allocated

In the test procedures described in this EN, unless otherwise stated in the test description, the Mobile Originating multislot connection set-up procedure shall be as described in this subclause.

NOTE: In test cases where a fading profile is required, a different and appropriate ARFCN may be selected, for instance if the fading simulator bandwidth does not allow use of the default ARFCN.

10.6.1 Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:

- The MS shall be operated under normal test conditions (see [annex 1 TC.2.1])
- The special Test-SIM (see annex 4) shall be inserted.
- The MS is "idle, updated", with a TMSI assigned and listening to the BCCH/CCCH of the active cell.

10.6.2 Definition of system information messages

See subclause 10.1.2.

10.6.3 Procedure

An MS originating multislot connection shall be established under ideal radio conditions and with Timing advance set to 0, as follows:

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | MS | | "called number" entered |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause indicates "originating call, NECI <> 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | Message is contained in SABM |
| 5 | MS -> SS | CLASSMARK CHANGE | Multislot class |
| 6 | SS -> MS | AUTHENTICATION REQUEST | |
| 7 | MS -> SS | AUTHENTICATION RESPONSE | SRES specifies correct value |
| 8 | SS -> MS | CIPHERING MODE COMMAND | SS starts deciphering after sending the message |
| 9 | MS -> SS | CIPHERING MODE COMPLETE | Shall be sent enciphered. All following messages shall be sent enciphered |
| 10 | SS | | SS starts ciphering |
| 11 | MS -> SS | SETUP | A multislot connection is set up according to the required characteristics of the test procedure. |
| 12 | SS -> MS | CALL PROCEEDING | |
| 13 | SS -> MS | ALERTING | |
| 14 | MS | | An alerting indication as defined in an PICS/PIXIT statement is given by the MS |
| 15 | SS -> MS | ASSIGNMENT COMMAND | In multislot allocation only one timeslot is allocated. |
| 16 | MS -> SS | ASSIGNMENT COMPLETE | Sent on TCH/Sm channel. |
| 17 | SS -> MS | CONNECT | |
| 18 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 19 | MS | | The TCH(s) is through connected in both directions |

10.6.4 Specific message contents

IMMEDIATE ASSIGNMENT (GSM 04.08, 9.1.18) to the MS

| Information Element | Value/remark |
|------------------------|-------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Page Mode | Normal |
| Channel Description | |
| Channel Type | SDCCH / SACCH 1(4) |
| Time slot number | zero |
| Training seq. code | same as BCCH |
| Hopping | No |
| ARFCN | ARFCN of the BCCH |
| Random Reference | |
| Random access info | As in CHAN REQ |
| N51, N32, N26 | As applicable |
| Timing Advance | 0 |
| Mobile allocation | length 0 due to hopping |
| IA rest octets | Spare octets |

AUTHENTICATION REQUEST (GSM 04.08, 9.2.2) to the MS

| Information Element | Value/remark |
|---------------------------|----------------------|
| Protocol Discriminator | MM |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering key seq. number | Arbitrary |
| Authent. parameter RAND | Arbitrarily selected |

CIPHERING MODE COMMAND (GSM 04.08, 9.1.9) to the MS

| Information Element | Value/remark |
|------------------------|------------------------------|
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | |
| Ciphering mode setting | Start ciphering |
| Algorithm Identifier | Supported by the MS |
| Cipher Response | IMEISV shall not be included |

CALL PROCEEDING (GSM 04.08, 9.3.3) to the MS

| Information Element | Value/remark |
|---------------------------|---|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Repeat Indicator | Present if and only if Bearer Capability 1 and Bearer Capability 2 are present in this message |
| Bearer Capability 1 | Present if negotiation of BC 1 necessary (e.g. reception of "Both" for CE parameter in SETUP), else omitted |
| Radio Channel Requirement | spare |
| Connection element | T (in case of "Both T (NT) preferred" received) |
| NIRR | No meaning |
| Other parameters | Same as sent by the MS in the SETUP, where applicable |
| Facility | Omitted |
| Progress Indicator | Omitted |

ALERTING (GSM 04.08, 9.3.1) to the MS

| Information Element | Value/remark |
|------------------------|-----------------------|
| Protocol Discriminator | CC |
| Transaction Identifier | As derived from SETUP |
| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| User-user | Omitted |

ASSIGNMENT COMMAND (GSM 04.08, 9.1.2) to the MS

| Information Element | Value/remark |
|------------------------|--|
| Protocol Discriminator | RR |
| Transaction Identifier | Not used |
| Message Type | |
| Channel Description 2 | |
| Channel type | TCH/F + FACCH/F + SACCH/M |
| Time slot number | Arbitrary |
| Training seq. code | Default |
| Hopping | No |
| FB no | Band no 0 |
| ARFCN | Default |
| Power level | Power control level 7 |
| Multislot allocation | |
| - Downlink assignment | Only one timeslot is assigned in downlink direction. |
| - Uplink assignment | Only one timeslot is assigned in uplink direction. |

CONNECT (GSM 04.08, 9.3.5) to the MS

| Message Type | |
| Facility | Omitted |
| Progress Indicator | Omitted |
| Connected number | Omitted |
| Connected Subaddress | Omitted |
| User-user | Omitted |

11 General tests

11.1 Verification of support and non-support of services (multiple numbering scheme or ISDN)

11.1.1 Mobile Terminated (MT) calls

11.1.1.1 Definition and applicability

This test applies to all MS. It is repeated for all Mobile Terminated Bearer Services / Teleservices according to GSM 02.02 and GSM 02.03 except Teleservices 21, 22 and 23.

11.1.1.2 Conformance requirement

1. The MS shall check the Information Elements for Bearer Capability in a received SETUP message, and if it agrees to the proposed set, it shall respond with a CALL CONFIRMED message.

GSM 04.08, 5.2.2.2; GSM 04.08, 5.2.2.3.

2. The MS in the "Null" state, U0, ready to receive a SETUP shall reject a SETUP with Information Elements for Bearer Capability which are incompatible with the Bearer Services / Teleservices supported by the MS, and shall send a RELEASE COMPLETE message.

GSM 04.08, 5.2.2.2; GSM 04.08, 5.2.2.3.1; GSM 07.01, 8.3.1; GSM 04.08, B.3.2.

11.1.1.3 Test purpose

1. To verify that the MS, for the case of the Multinumbering scheme or ISDN, accepts a SETUP message, where the Information Elements for Bearer Capability are compatible with the Bearer Services / Teleservices declared as supported by the MS, by sending a CALL CONFIRMED message.

This is verified for all Mobile Terminated Bearer Services / Teleservices declared as supported by the MS.

2. To verify that the MS in the "Null" state, U0, when receiving a SETUP message containing incompatible Information Elements for Bearer Capability will respond with a RELEASE COMPLETE message.

This is verified for all Mobile Terminated Bearer Services / Teleservices not declared as supported by the MS.

11.1.1.4 Method of test

11.1.1.4.1 Initial conditions

For an MS with an external interface the interface shall be setup in such a way that the MS is able to successfully receive the call for the service in question. The manufacturer shall state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this tests in one or several valid BC codings as presented in section 11.8.

The generic call set-up procedure shall be followed up to and including the reception of the CIPHERING MODE COMPLETE message from the MS.

11.1.1.4.2 Procedure

- a) For a Mobile Terminated Bearer Service / Teleservice declared as supported by the MS. The SS transmits a SETUP message.

The SETUP shall contain a single or dual BC-IE where the parameter values are arbitrarily selected among those declared as supported by the MS in PIXIT statements and corresponding to the Bearer Service / Teleservice being tested.

- b) If more than one BC-IE (or pair of) correspond to the Bearer Service / Teleservice being tested, step a) is repeated once (and only once) with another single or dual BC-IE. The BC-IE shall be chosen in such a way that as many parameters as possible are different from the previous BC-IE. In particular, if more than one value for the "Connection Element" parameter is possible, the new BC-IE shall contain a different value from the previous one for this parameter.
- c) Step a) and b) are repeated for all Bearer Services / Teleservices declared as supported by the MS.
- d) For an Mobile Terminated Bearer Service / Teleservice not declared as supported by the MS. The SS transmits SETUP. If the MS supports TS62 but not TS61, then TS61 is not tested.

The SETUP shall contain a single or dual BC-IE where the parameter values are arbitrarily selected among those defined in GSM 07.01 Annex II and corresponding to the Bearer Service / Teleservice being tested. The complete coding of the corresponding BC-IE(s) can be found in section 11.8.

- e) Step d) is repeated for all Bearer Services / Teleservices not declared as supported by the MS.

11.1.1.5 Test requirement

- 1) After steps a), b) and c), the MS shall send a CALL CONFIRMED message. The MS may contain a single or dual BC-IE. If present these IEs are not checked.
- 2) After steps d) and e), the MS shall send a RELEASE COMPLETE message with cause value 88 - incompatible destination.

11.1.2 Mobile Originated (MO) calls

11.1.2.1 Definition and applicability

This test applies to all MS able to initiate an MO call. It is repeated for all Mobile Originated Bearer Services / Teleservices according to GSM 02.02 and GSM 02.03 except Teleservices 21, 22 and 23, which are supported by the MS.

11.1.2.2 Conformance requirement

1. The MS shall set up a call with a SETUP message containing a single or multiple BC-IE and if required by the service, a single or multiple LLC according to the actual configuration of the MS. Two bearer capabilities can be present only in the cases described in GSM 07.01.

GSM 04.08, 5.2.2.2; GSM 04.08, 5.2.2.3.1; GSM 04.08, 9.3.2; GSM 07.01, 8.3.3.

2. The Repeat Indicator Information Element shall be included in the SETUP message, when the in-call modification procedure is used.

GSM 04.08, 9.3.2.

11.1.2.3 Test purpose

1. To verify that the MS generates a SETUP message which includes a single or multiple Bearer Capability and if required by the service, a single or multiple LLC, according to the actual configuration on the MS.

This is verified for all Mobile Originated Bearer Services / Teleservices described in GSM 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the SETUP message.

11.1.2.4 Method of test

11.1.2.4.1 Initial conditions

If possible, the MS shall be configured to initiate an outgoing call with a specified BC and with the corresponding LLC when the ITC value is "unrestricted digital" in the SETUP message. The manufacturer must state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an outgoing call can be initiated.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this test in one valid BC coding as presented in section 11.8.

11.1.2.4.2 Procedure

- a) The MS shall be made to initiate a call.
- b) If the MS can be configured to send a specific BC, the test is repeated with the MS configured for all possible preferred Bearer Services and Teleservices declared as supported by the MS. The complete coding of the corresponding BC-IE(s) can be found in section 11.8.

11.1.2.5 Test requirement

The MS shall send a SETUP message, which shall contain the BC among those declared as supported by the MS. If the MS is configured to send a specific BC, the SETUP message shall contain this particular BC. The BC-IE(s) shall be set according to GSM 07.01. When an ITC value is set to "unrestricted digital" the MS shall include the corresponding LLC information element.

Where two BCs are contained in the SETUP message, it shall be checked that the combination is allowed, according to GSM 07.01 and that a Repeat Indicator is also included.

11.2 Verification of support of the single numbering scheme

11.2.1 Definition and applicability

This test applies to all MS.

11.2.2 Conformance requirement

1. The MS shall respond to a SETUP message containing no BC-IE with a CALL CONFIRMED message including the single or multiple Bearer Capability, according to the actual configuration of the MS. Two bearer capabilities can be present only in the cases described in GSM 07.01.

GSM 04.08, 5.2.2.2; GSM 04.08, 5.2.2.3.1; GSM 04.08, 9.3.2; GSM 07.01, 8.3.3

2. The Repeat Indicator Information Element shall be included in the CALL CONFIRMED message, when the in-call modification procedure is used, and no Bearer Capability Information Element is included in the received SETUP message.

GSM 04.08, 9.3.2

11.2.3 Test purpose

1. To verify that the MS, for the case of the Single Numbering Scheme, accepts a SETUP message, where the Information Elements for Bearer Capability and Lower and Higher Layer Compatibility are not present by sending a CALL CONFIRMED message, which includes the single or multiple Bearer Capabilities, according to the actual configuration on the MS.

This is verified for one Mobile Terminated Bearer Service / Teleservice described in GSM 07.01 and declared as supported by the MS.

2. To verify that the MS includes a correctly encoded Repeat Indicator if it includes multiple Bearer Capabilities in the CALL CONFIRMED message.

11.2.4 Method of test

11.2.4.1 Initial conditions

The MS is setup to receive a call. If possible, the MS shall be configured to respond to an incoming call with a specified BC selected arbitrarily from those declared as supported by the MS, in the CALL CONFIRMED message, in reply to a SETUP message with no BC, LLC or HLC elements. The manufacturer must state how this is done in a PIXIT statement. The same applies to features which must be activated by MMI before an incoming call can be accepted.

The generic call set-up procedure shall be followed up to and including the reception of the CIPHERING MODE COMPLETE message from the MS.

The PIXIT statement for the service in question shall be consistent with the PICS statement made by the manufacturer and will result for this tests in one or several valid BC codings as presented in section 11.8.

11.2.4.2 Procedure

The SS transmits a SETUP message with no BC, LLC or HLC elements.

11.2.5 Test requirement

The MS shall send a CALL CONFIRMED message, which shall contain the BC among those declared as supported by the MS. If the MS is configured to respond with a specific BC, the CALL CONFIRMED message shall contain this particular BC. The BC-IE shall be coded according to GSM 07.01.

Where two BCs are contained in the CALL CONFIRMED message, it shall be checked that the combination is allowed, according to GSM 07.01 and that a Repeat Indicator is also included.

11.3 Verification of non-support of services (Advice of Charge Charging (AoCC))

11.3.1 Definition and applicability

This test applies to MS which do **not** support AoCC.

Test procedures (a) and (b) apply to MS which support MT calls.

Test procedure (c) applies to MS which support MO calls.

Test procedure (d) applies to MS which support at least one circuit switched basic service.

11.3.2 Conformance requirement

1. An MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AoCC information shall acknowledge the CONNECT message but ignore and not acknowledge the AoCC information sent within the CONNECT.
2. An MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.
3. An MS claiming to **not** support AoCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.
4. An MS claiming to **not** support AoCC and in the U10 call active state, on receipt of a FACILITY message containing AoCC information shall ignore and not acknowledge the AoCC information contained within the FACILITY.

GSM 03.86 sections 1.2, 1.3, 2.2, 2.3; GSM 04.86 section 2.

11.3.3 Test purpose

1. To verify that an MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a CONNECT message containing AoCC information acknowledges the CONNECT message but ignores and does not acknowledge the AoCC information sent within the CONNECT.
2. To verify that an MS claiming to **not** support AoCC and in the outgoing call / U4 call delivered state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.
3. To verify that an MS claiming to not support AoCC and in the incoming call / U9 call confirmed state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.
4. To verify that an MS claiming to **not** support AoCC and in the U10 call active state, on receipt of a FACILITY message containing AoCC information ignores and does not acknowledge the AoCC information contained within the FACILITY.

11.3.4 Method of test

11.3.4.1 Initial conditions

The generic call set up procedures are followed up to and including the reception, or transmission, of the ALERTING message by the MS.

11.3.4.2 Procedure

- a) For an Mobile Originated call in the U4 state the SS transmits CONNECT containing AoCC information.
- b) For an Mobile Originated call in the U4 state the SS transmits FACILITY containing AoCC information.
- c) For an Mobile Terminated call in the U9 state the SS transmits a FACILITY containing AoCC information.
- d) For a call in the U10 state the SS transmits a FACILITY containing AoCC information

11.3.5 Test requirement

The MS shall ignore the AoCC information sent to it in the Facility information elements as part of the CONNECT/FACILITY messages and not send any AoCC information acknowledgement. It shall be checked for 15 seconds that the MS does not transmit any AoCC information acknowledgement after the receipt of AoCC information.

11.4 Verification of non-support of services (call hold)

11.4.1 Definition and applicability

Applicable to MS which do **not** support the Call-Hold supplementary service. This test applies only to MSs that claim to support AoCC. This test applies only to MS which support MO calls.

11.4.2 Conformance requirement

An MS claiming to **not** support the Call Hold supplementary service and in the U10 call active state shall, when the appropriate Call Hold MMI command is entered:

- Fail to put the first call on hold.
- Fail to place the second call.
- Optionally provide some indication to the user of an error.

GSM 02.83; GSM 04.83

11.4.3 Test purpose

To verify that an MS claiming to **not** support the Call Hold supplementary service and in the U10 call active state, reacts in the following manner when the appropriate call hold MMI command is entered:

- MS fails to put the first call on hold
- MS fails to place the second call.
- Optionally provides some indication to the user of an error.

11.4.4 Method of test

11.4.4.1 Initial conditions

The mobile originating generic call set up procedures shall be followed up to and including the transmission by the MS of the CONNECT ACKNOWLEDGE to place the call in the U10 call active state.

11.4.4.2 Procedure

A second directory number is entered followed by "SEND" via the MMI.

11.4.5 Test requirement

The MS shall not send any HOLD messages on the dedicated channel. This is checked for 3 seconds.

The MS may however send other messages.

The MS may also give the user an indication of the error that has occurred.

11.5 Verification of non-support of services (multiparty)

11.5.1 Definition and applicability

Applicable for MSs that support the Call-Hold supplementary service but **not** the MultiParty supplementary service. This test applies only to MSs that support AoCC. This test applies only to MS which support MO calls.

11.5.2 Conformance requirement

An MS claiming to not support the MultiParty supplementary service and in the U10 call active state with one call and in the held state with another call shall, when the appropriate MultiParty MMI command is entered:

- Fail to combine the three parties in a MultiParty call.
- Optionally provide some indication to the user of an error.

GSM 02.83, 02.84; GSM 04.83, GSM 04.84.

11.5.3 Test purpose

To verify that an MS claiming to not support the MultiParty supplementary service and in the U10 call active state with one call and another call on hold, reacts in the following manner when the appropriate MultiParty MMI command is entered:

- Fails to combine the three parties in a MultiParty call.
- Optionally provides some indication to the user of an error.

11.5.4 Method of test

11.5.4.1 Initial conditions

The mobile originating generic call set up procedures shall be followed up to and including the transmission by the MS of the CONNECT ACKNOWLEDGE to place the call in the U10 call active state. A second directory number is then entered followed by send to put the first call on hold and place a second call.

11.5.4.2 Procedure

"3" followed by "SEND" is entered via the MMI.

11.5.5 Test requirement

The MS shall not send a FACILITY message, containing the build multiparty request, on the dedicated channel. This is checked for 3 seconds.

The MS may however send other messages.

The MS may also give the user an indication of the error that has occurred.

11.6 Verification of non-support of feature (Fixed Dialling Number (FDN))

11.6.1 Definition and applicability

This test applies to MS which do **not** support FDN. This test applies only to MS which support MO calls.

11.6.2 Conformance requirement

1. An MS claiming to **not** support FDN that has a SIM with FDN allocated and activated in its SIM Service Table (Service Number 3) and has FDN "enabled" shall refuse a request from the user to attempt an outgoing call.

2. An MS claiming to **not** support FDN that has a SIM with FDN allocated and activated in its SIM Service Table (Service Number 3) and has FDN "enabled" shall not respond to paging.
3. An MS claiming **not** to support FDN that has a SIM with FDN allocated and activated shall not attempt to rehabilitate the IMSI and Location Information Elementary Files of the SIM.

GSM 02.07 section B3.2, GSM 11.11 section 11.2.1.

11.6.3 Test purpose

1. To verify that an MS claiming to **not** support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled". i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, it refuses an attempt to make an outgoing call made by the user.
2. To verify that an MS claiming to **not** support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled". i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, it does not answer to paging.
3. To verify that an MS claiming **not** to support FDN and that has a SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled". i.e. AND, IMSI and Location Information Elementary Files are Invalidated inserted, does not attempt to rehabilitate IMSI and Location Information.

11.6.4 Method of test

11.6.4.1 Initial conditions

The ME is powered off. No SIM is inserted in the ME.

11.6.4.2 Procedure

- a) A SIM with FDN allocated and activated in its SIM Service Table and has FDN "enabled" is inserted in the ME and the MS is powered on.
- b) An outgoing CM connection is attempted by the user.
- c) The MS paged with its IMSI.
- d) The MS is powered off and the SIM is examined using a suitable tool to determine if the IMSI and Location Information Elementary Files have been Rehabilitated.

11.6.5 Test requirement

- 1) in step b), the MS shall not send a CHANNEL REQUEST message.
- 2) in step c), the MS shall not send a CHANNEL REQUEST message.
- 3) in step d), the IMSI and Location Information Elementary Files shall be Invalidated.

11.7 IMEI Security

11.7.1 Conformance requirements

11.7.1.1 Programming security

The manufacturer declares that concerning the programming security he has taken necessary and sufficient steps to ensure that either, the IMEI cannot be electrically changed once initially programmed, or, secure password techniques have been adopted to prevent unauthorized re-programming of the IMEI.

GSM 02.09, GSM 03.20.

11.7.1.2 Mechanical security

The manufacturer declares that he has taken necessary and sufficient steps to ensure that unauthorized individuals or organizations cannot economically replace the component in which the IMEI is stored and thereby provide the MS with a different IMEI.

GSM 02.09, GSM 03.20

11.7.1.3 Technical knowledge and availability of programme

The manufacturer declares that he takes the necessary measures to ensure that the technical knowledge for changing the IMEI (where applicable) will remain securely under his control and that the knowledge of the programme content will be restricted to his authorized representative(s) on a need to know basis.

GSM 02.09, GSM 03.20.

11.7.2 Test purpose

To verify that the physical protection of the IMEI is sufficiently secure.

11.7.3 Method of test

The manufacturer submitting his equipment for Type Approval shall make the declarations listed in the "Conformance Requirements".

The manufacturer shall give justification to support a claim that the requirements are met.

11.8 Coding of the Bearer Capability information element

This section describes the coding of the bearer capability IE in a SETUP and in a CALL CONFIRMED message according to GSM 07.01 and GSM 04.08.

More precisely, the matter of section 11.8.1 is the coding of the bearer capability IE in a mobile terminating SETUP and section 11.8.2 deals with the coding of the bearer capability IE in a mobile originating SETUP and in a CALL CONFIRMED message.

In the whole section "x", "y" and "X" have the following meanings:

- when a field is coded with values of "x", it means that several bit combinations are authorized and the allowable ones are described in the relevant paragraph or section;
- "y" means that the value of the spare bit can be set to either 0 or 1 at the sending side and that the receiving side shall accept either of these values;
- "X" in the hexadecimal coding of the Bearer Capability IE reflects all the possible values taken by an octet taking account of the number of bits coded as "x" or "y" and their place in the octet.

11.8.1 Network to MS Direction**11.8.1.1 BS 21 to 26 - Asynchronous Service****11.8.1.1.1 BS 21****11.8.1.1.1.1 3,1 kHz Audio, Transparent**

Depending of the user rate supported by the MS, the MS may have the following values:

| | | | | | | | | | |
|------------------------|---|---|---|---|---|---|---|---|------------|
| User Rate in Octet 6a: | - | - | - | - | 0 | 0 | 1 | 1 | 2,4 kbit/s |
|------------------------|---|---|---|---|---|---|---|---|------------|

| | | | | | | | | | |
|------------------------|---|---|---|---|---|---|---|---|------------|
| User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 0 | 0 | 4,8 kbit/s |
|------------------------|---|---|---|---|---|---|---|---|------------|

| | | | | | | | | | |
|------------------------|---|---|---|---|---|---|---|---|------------|
| User Rate in Octet 6a: | - | - | - | - | 0 | 1 | 0 | 1 | 9,6 kbit/s |
|------------------------|---|---|---|---|---|---|---|---|------------|

Depending on the support or not of both modes, Non Transparent and Transparent, the connection element field may have the following values:

| | | | | | | | | | |
|---------------------------------|---|---|---|---|---|---|---|---|-----------------|
| Connection element in Octet 6c: | - | 0 | 1 | - | - | - | - | - | Non transparent |
|---------------------------------|---|---|---|---|---|---|---|---|-----------------|

| | | | | | | | | | |
|---------------------------------|---|---|---|---|---|---|---|---|------------------------|
| Connection element in Octet 6c: | - | 1 | x | - | - | - | - | - | Both T or NT preferred |
|---------------------------------|---|---|---|---|---|---|---|---|------------------------|

If present, Octet 7 shall have the following value:

| | | | | | | | | | |
|---------|---|---|---|---|---|---|---|---|---------------------------|
| Octet 7 | 1 | 1 | 0 | 0 | 0 | 1 | 1 | 0 | Extension Layer 2 id X.25 |
|---------|---|---|---|---|---|---|---|---|---------------------------|

11.8.1.6 TS 62 - Automatic Facsimile group 3

The repeat Indicator in the Setup message is not available.

The BC GSM is coded as described in chapter 11.8.1.5.

11.8.2 MS to SS direction

In the whole section 11.8.2, "1)" and "2)" stand for:

1) Not applicable in a CALL CONFIRMED message.

2) Not applicable in a CALL CONFIRMED message responding to a SETUP message with no BC-IE (PSTN-originated call with single numbering scheme).

If the MS supports only Full Rate

12 Transceiver

12.1 Conducted spurious emissions

12.1.1 MS allocated a channel

12.1.1.1 Definition and applicability

Conducted spurious emissions, when the MS has been allocated a channel, are emissions from the antenna connector at frequencies other than those of the carrier and sidebands associated with normal modulation.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS with a permanent antenna connector.

12.1.1.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.1.

1.1 Under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

1.2 Under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

Table 12.1

| Frequency range | Power level in dBm | |
|-----------------------|--------------------|---------|
| | GSM900 | DCS1800 |
| 9 kHz to 1 GHz | -36 | -36 |
| 1 GHz to 12,75 GHz | -30 | |
| 1 GHz to 1710 MHz | | -30 |
| 1710 MHz to 1785 MHz | | -36 |
| 1785 MHz to 12,75 GHz | | -30 |

12.1.1.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz excluding the GSM900 and DCS 1 800 receive bands, from the MS when allocated a channel do not exceed the conformance requirements.
 - 1.1 Under normal voltage conditions.
 - 1.2 Under extreme voltage conditions.

NOTE: The band 9 - 100 kHz is not tested, because of test implementation problems.

12.1.1.4 Method of test

12.1.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS commands the MS to loop back its channel decoder output to channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

12.1.1.4.2 Procedure

- a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured at the connector of the transceiver, as the power level of any discrete signal, higher than the requirement in table 12.1 minus 6 dB, delivered into a 50 Ohm load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is according to table 12.2. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period with the exception of the idle frame.

NOTE: This ensures that both the active times (MS transmitting) and the quiet times are measured.

- b) The test is repeated under extreme voltage test conditions ([Annex 1, TC2.2 and TC3]).

Table 12.2

| Frequency range | Frequency offset | Filter bandwidth | Approx video bandwidth |
|---|--|--------------------------------------|------------------------------------|
| 100 kHz to 50 MHz | - | 10 kHz | 30 kHz |
| 50 to 500 MHz | - | 100 kHz | 300 kHz |
| 500 MHz to 12,75 GHz, excl. relevant TX band: P-GSM: 890 to 915 MHz; E-GSM: 880 to 915 MHz; DCS: 1710 to 1785 MHz, and the RX bands: 925 to 960 MHz; 1805 to 1880 MHz. | 0 to 10 MHz ≥ 10 MHz ≥ 20 MHz ≥ 30 MHz (offset from edge of relevant TX band) | 100 kHz 300 kHz 1 MHz 3 MHz | 300 kHz 1 MHz 3 MHz 3 MHz |
| relevant TX band: P-GSM: 890 to 915 MHz E-GSM: 880 to 915 MHz DCS: 1710 to 1785 MHz | 1,8 to 6,0 MHz > 6,0 MHz (offset from carrier) | 30 kHz 100 kHz | 100 kHz 300 kHz |

NOTE 1: The frequency ranges 925 MHz to 960 MHz and 1 805 MHz to 1 880 MHz are excluded as these ranges are tested in section [13.4].

NOTE 2: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.

NOTE 3: Due to practical implementation, the video bandwidth is restricted to a maximum of 3 MHz.

12.1.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.3.

Table 12.3

| Frequency range | | Power level in dBm | |
|-----------------|-----------|--------------------|---------|
| | | GSM900 | DCS1800 |
| 100 kHz to | 1 GHz | -36 | -36 |
| 1 GHz to | 12,75 GHz | -30 | |
| 1 GHz to | 1710 MHz | | -30 |
| 1710 MHz to | 1785 MHz | | -36 |
| 1785 MHz to | 12,75 GHz | | -30 |

12.1.2 MS in idle mode

12.1.2.1 Definition and applicability

Conducted spurious emissions are any emissions from the antenna connector, when the MS is in idle mode.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS with a permanent antenna connector.

12.1.2.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.4.

1.1 Under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

1.2 Under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

Table 12.4

| Frequency range | | Power level in dBm |
|-----------------|-----------|-----------------------|
| 9 kHz to | 880 MHz | -57 |
| 880 MHz to | 915 MHz | -59 |
| 915 MHz to | 1000 MHz | -57 |
| 1 GHz to | 1710 MHz | -47 |
| 1710 MHz to | 1785 MHz | -53 |
| 1785 MHz to | 12,75 GHz | -47 |

12.1.2.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz from the MS when in idle mode do not exceed the conformance requirements.

1.1 Under normal voltage conditions.

1.2 Under extreme voltage conditions.

NOTE: The band 9 - 100 kHz is not tested, because of test implementation problems.

12.1.2.4 Method of test

12.1.2.4.1 Initial conditions

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS_AG_BLKES_RES is set to 0 so that the MS receiver will operate continually.

The CCCH_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

12.1.2.4.2 Procedure

- a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured as the power level of any discrete signal, higher than the requirement in table 12.4 minus 6 dB, delivered into a 50 Ohm load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is set according to table 12.5. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

Table 12.5

| Frequency range | Filter bandwidth | Video bandwidth |
|---------------------|------------------|-----------------|
| 100 kHz to 50 MHz | 10 kHz | 30 kHz |
| 50 MHz to 12,75 GHz | 100 kHz | 300 kHz |

- b) The test is repeated under extreme voltage test conditions ([Annex 1, TC2.2 and TC3]).

12.1.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.6.

Table 12.6

| Frequency range | Power level in dBm |
|-----------------------|--------------------|
| 100 kHz to 880 MHz | -57 |
| 880 MHz to 915 MHz | -59 |
| 915 MHz to 1000 MHz | -57 |
| 1 GHz to 1710 MHz | -47 |
| 1710 MHz to 1785 MHz | -53 |
| 1785 MHz to 12,75 GHz | -47 |

12.2 Radiated spurious emissions

This test is performed either on an outdoor test site, fulfilling the requirements of [GC4 of Annex 1], or in an anechoic shielded chamber, fulfilling the requirements of ([GC5 of Annex 1]). Performing the measurement in the anechoic shielded chamber is preferred. The sample shall be placed at the specified height on the support.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then additional precautions are necessary to ensure correct measurement. These measures are familiar to test houses which perform spurious emissions tests and are:

- Raise/lower the test antenna through the specified height range during both the emission detection and substitution parts of the test.
- Perform a qualitative pre-search in a shielded environment for test sites where the ambient RF environment can prevent the detection of spurious emissions which exceed the limit.
- Detect emissions at a more sensitive threshold to that specified in section 12.2.1.4 to allow for destructive interference due to ground plane reflections at the test antenna search height.

12.2.1 MS allocated a channel

12.2.1.1 Definition and applicability

Radiated spurious emissions, when the MS has been allocated a channel, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of GSM 900 and DCS 1 800 MS. The test applies to all types of GSM 900 and DCS 1 800 MS with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

12.2.1.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.7 under normal voltage conditions; GSM 05.05, 4.3/4.3.3.
2. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.7 under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/annex D.2.

Table 12.7

| Frequency range | | Power level in dBm | |
|-----------------|----------|--------------------|---------|
| | | GSM900 | DCS1800 |
| 30 MHz to | 1 GHz | -36 | -36 |
| 1 GHz to | 4 GHz | -30 | |
| 1 GHz to | 1710 MHz | | -30 |
| 1710 MHz to | 1785 MHz | | -36 |
| 1785 MHz to | 4 GHz | | -30 |

12.2.1.3 Test purpose

1. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under normal voltage conditions.
2. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under extreme voltage conditions.

12.2.1.4 Method of test

12.2.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

NOTE: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The SS commands the MS to loop back its channel decoder output to its channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

12.2.1.4.2 Procedure

- a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS is detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

- b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which an emission has been detected, the MS shall be rotated to obtain maximum response and the effective radiated power of the emission determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.
- c) The measurement bandwidth, based on a 5 pole synchronously tuned filter, is set according to table 12.8. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period, with the exception of the idle frame.

NOTE 1: This ensures that both the active times (MS transmitting) and the quiet times are measured.

NOTE 2: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

- d) The measurements are repeated with the test antenna in the orthogonal polarization plane.
- e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

Table 12.8

| Frequency range | Frequency offset | Filter bandwidth | Approx video bandwidth |
|-------------------------|--|------------------|------------------------|
| 30 to 50 MHz | - | 10 kHz | 30 kHz |

| DCS: 1710 to 1785 MHz. | (offset from edge of relevant TX band) | | |
| relevant TX band: | | | |
| P-GSM: 890 to 915 MHz | 1,8 to 6,0 MHz | 30 kHz | 100 kHz |
| E-GSM: 880 to 915 MHz | $> 6,0$ MHz | 100 kHz | 300 kHz |
| DCS: 1710 to 1785 MHz | (offset from carrier) | | |

NOTE 1: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.

NOTE 2: Due to practical implementation of a SS, the video bandwidth is restricted to a maximum of 3 MHz.

12.2.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.7.

12.2.2 MS in idle mode

12.2.2.1 Definition and applicability

Radiated spurious emissions, when the MS is in idle mode, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of GSM 900 and DCS 1 800 MS. The test applies to all types of GSM 900 and DCS 1 800 MS with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

12.2.2.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.9. under normal voltage conditions; GSM 05.05, 4.3/4.3.3.
2. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.9. under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

Table 12.9

| Frequency range | | Power level in dBm |
|-----------------|----------|--------------------|
| 30 MHz to | 880 MHz | -57 |
| 880 MHz to | 915 MHz | -59 |
| 915 MHz to | 1000 MHz | -57 |
| 1 GHz to | 1710 MHz | -47 |
| 1710 MHz to | 1785 MHz | -53 |
| 1785 MHz to | 4 GHz | -47 |

12.2.2.3 Test purpose

1. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under normal voltage conditions.
2. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under extreme voltage conditions.

12.2.2.4 Method of test

12.2.2.4.1 Initial conditions

NOTE: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS_AG_BLKES_RES is set to 0 so that the MS receiver will operate continually.

The CCCH_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

12.2.2.4.2 Procedure

- a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS are detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

- b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which a spurious emission has been detected the MS is rotated to obtain a maximum response. The effective radiated power of the emission is determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.
- c) The measurement bandwidth based on a 5 pole synchronously tuned filter shall be according to table 12.10. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

NOTE: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

Table 12.10

| Frequency range | Filter bandwidth | Video bandwidth |
|------------------|------------------|-----------------|
| 30 MHz to 50 MHz | 10 kHz | 30 kHz |
| 50 MHz to 4 GHz | 100 kHz | 300 kHz |

- d) The measurements are repeated with the test antenna in the orthogonal polarization plane.
- e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

12.2.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.9.

12.3 Conducted spurious emissions for MS supporting the R-GSM frequency band

This section applies only to MS supporting the R-GSM frequency band

12.3.1 MS allocated a channel

12.3.1.1 Definition and applicability

Conducted spurious emissions, when the MS has been allocated a channel, are emissions from the antenna connector at frequencies other than those of the carrier and sidebands associated with normal modulation.

The requirements and this test apply to all types of R-GSM 900 MS with a permanent antenna connector.

12.3.1.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.11.
 - 1.1 Under normal voltage conditions; GSM 05.05, 4.3/4.3.3.
 - 1.2 Under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

Table 12.11

| Frequency range | Power level in dBm | |
|--------------------|--------------------|--|
| | R-GSM900 | |
| 9 kHz to 1 GHz | -36 | |
| 1 GHz to 12,75 GHz | -30 | |

12.3.1.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz excluding the R-GSM900 and DCS 1 800 receive bands, from the MS when allocated a channel do not exceed the conformance requirements.
 - 1.1 Under normal voltage conditions.
 - 1.2 Under extreme voltage conditions.

NOTE: The band 9 - 100 kHz is not tested, because of test implementation problems.

12.3.1.4 Method of test**12.3.1.4.1 Initial conditions**

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS commands the MS to loop back its channel decoder output to channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

12.3.1.4.2 Procedure

- a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured at the connector of the transceiver, as the power level of any discrete signal, higher than the requirement in table 12.11 minus 6 dB, delivered into a 50 Ohm load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is according to table 12.12. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period with the exception of the idle frame.

NOTE: This ensures that both the active times (MS transmitting) and the quiet times are measured.

- b) The test is repeated under extreme voltage test conditions ([Annex 1, TC2.2 and TC3]).

Table 12.12

| Frequency range | Frequency offset | Filter bandwidth | Approx video bandwidth |
|---|--|--------------------------------------|------------------------------------|
| 100 kHz to 50 MHz | - | 10 kHz | 30 kHz |
| 50 to 500 MHz | - | 100 kHz | 300 kHz |
| 500 MHz to 12,75 GHz, excl. relevant TX band: R-GSM: 876 to 915 MHz; ; , and the RX bands: 921 to 960 MHz; 1805 to 1880 MHz. | 0 to 10 MHz ≥ 10 MHz ≥ 20 MHz ≥ 30 MHz (offset from edge of relevant TX band) | 100 kHz 300 kHz 1 MHz 3 MHz | 300 kHz 1 MHz 3 MHz 3 MHz |
| relevant TX band: R-GSM: 876 to 915 MHz | 1,8 to 6,0 MHz > 6,0 MHz (offset from carrier) | 30 kHz 100 kHz | 100 kHz 300 kHz |

NOTE 1: The frequency ranges 921 MHz to 960 MHz and 1 805 MHz to 1 880 MHz are excluded as these ranges are tested in section [13.4].

NOTE 2: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.

NOTE 3: Due to practical implementation, the video bandwidth is restricted to a maximum of 3 MHz.

12.3.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.13.

Table 12.13

| Frequency range | Power level in dBm | |
|--------------------|--------------------|--|
| | R-GSM900 | |
| 100 kHz to 1 GHz | -36 | |
| 1 GHz to 12,75 GHz | -30 | |

12.3.2 MS in idle mode

12.3.2.1 Definition and applicability

Conducted spurious emissions are any emissions from the antenna connector, when the MS is in idle mode.

The requirements and this test apply to all types of R-GSM 900 MS with a permanent antenna connector.

12.3.2.2 Conformance requirement

1. The conducted spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.14.

1.1 Under normal voltage conditions; GSM 05.05, 4.3/4.3.3.

1.2 Under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

Table 12.14

| Frequency range | | Power level in dBm |
|-----------------|-----------|-----------------------|
| 9 kHz to | 880 MHz | -57 |
| 880 MHz to | 915 MHz | -59 |
| 915 MHz to | 1000 MHz | -57 |
| 1 GHz to | 1710 MHz | -47 |
| 1710 MHz to | 1785 MHz | -53 |
| 1785 MHz to | 12,75 GHz | -47 |

12.3.2.3 Test purpose

1. To verify that conducted spurious emissions, in the frequency band 100 kHz to 12,75 GHz from the MS when in idle mode do not exceed the conformance requirements.

1.1 Under normal voltage conditions.

1.2 Under extreme voltage conditions.

NOTE: The band 9 - 100 kHz is not tested, because of test implementation problems.

12.3.2.4 Method of test

12.3.2.4.1 Initial conditions

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS_AG_BLKES_RES is set to 0 so that the MS receiver will operate continually.

The CCCH_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

12.3.2.4.2 Procedure

- a) Measurements are made in the frequency range 100 kHz to 12,75 GHz. Spurious emissions are measured as the power level of any discrete signal, higher than the requirement in table 12.14 minus 6 dB, delivered into a 50 Ohm load.

The measurement bandwidth based on a 5 pole synchronously tuned filter is set according to table 12.15. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

Table 12.15

| Frequency range | Filter bandwidth | Video bandwidth |
|---------------------|------------------|-----------------|
| 100 kHz to 50 MHz | 10 kHz | 30 kHz |
| 50 MHz to 12,75 GHz | 100 kHz | 300 kHz |

- b) The test is repeated under extreme voltage test conditions ([Annex 1, TC2.2 and TC3]).

12.3.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.16.

Table 12.16

| Frequency range | Power level in dBm |
|-----------------------|--------------------|
| 100 kHz to 880 MHz | -57 |
| 880 MHz to 915 MHz | -59 |
| 915 MHz to 1000 MHz | -57 |
| 1 GHz to 1710 MHz | -47 |
| 1710 MHz to 1785 MHz | -53 |
| 1785 MHz to 12,75 GHz | -47 |

12.4 Radiated spurious emissions for MS supporting the R-GSM frequency band

This section applies only to MS supporting the R-GSM frequency band.

This test is performed either on an outdoor test site, fulfilling the requirements of [GC4 of Annex 1], or in an anechoic shielded chamber, fulfilling the requirements of ([GC5 of Annex 1]). Performing the measurement in the anechoic shielded chamber is preferred. The sample shall be placed at the specified height on the support.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then additional precautions are necessary to ensure correct measurement. These measures are familiar to test houses which perform spurious emissions tests and are:

- Raise/lower the test antenna through the specified height range during both the emission detection and substitution parts of the test.
- Perform a qualitative pre-search in a shielded environment for test sites where the ambient RF environment can prevent the detection of spurious emissions which exceed the limit.
- Detect emissions at a more sensitive threshold to that specified in section 12.4.1.4 to allow for destructive interference due to ground plane reflections at the test antenna search height.

12.4.1 MS allocated a channel

12.4.1.1 Definition and applicability

Radiated spurious emissions, when the MS has been allocated a channel, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of R-GSM 900 MS. The test applies to all types of R-GSM with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

12.4.1.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.17 under normal voltage conditions; GSM 05.05, 4.3/4.3.3.
2. The radiated spurious power emitted by the MS, when allocated a channel, shall be no more than the levels in table 12.17 under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/annex D.2.

Table 12.17

| Frequency range | | Power level in dBm | |
|-----------------|-------|--------------------|--|
| | | R-GSM900 | |
| 30 MHz to | 1 GHz | -36 | |
| 1 GHz to | 4 GHz | -30 | |

12.4.1.3 Test purpose

1. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under normal voltage conditions.
2. To verify that radiated spurious emissions from the MS when allocated a channel do not exceed the conformance requirements under extreme voltage conditions.

12.4.1.4 Method of test

12.4.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel in the Mid ARFCN range.

NOTE: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The SS commands the MS to loop back its channel decoder output to its channel encoder input.

The SS sends Standard Test Signal C1.

The SS sets the MS to operate at its maximum output power.

12.4.1.4.2 Procedure

- a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS is detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

- b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which an emission has been detected, the MS shall be rotated to obtain maximum response and the effective radiated power of the emission determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.
- c) The measurement bandwidth, based on a 5 pole synchronously tuned filter, is set according to table 12.18. The power indication is the peak power detected by the measuring system.

The measurement on any frequency shall be performed for at least one TDMA frame period, with the exception of the idle frame.

NOTE 1: This ensures that both the active times (MS transmitting) and the quiet times are measured.

NOTE 2: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

- d) The measurements are repeated with the test antenna in the orthogonal polarization plane.
- e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

Table 12.18

| Frequency range | Frequency offset | Filter bandwidth | Approx video bandwidth |
|-------------------------|--|------------------|------------------------|
| 30 to 50 MHz | - | 10 kHz | 30 kHz |
| 50 to 500 MHz | - | 100 kHz | 300 kHz |
| 500 MHz to 4 GHz, | 0 to 10 MHz | 100 kHz | 300 kHz |
| excl. relevant TX band: | ≥ 10 MHz | 300 kHz | 1 MHz |
| R-GSM: 876 to 915 MHz; | ≥ 20 MHz | 1 MHz | 3 MHz |
| | ≥ 30 MHz | 3 MHz | 3 MHz |
| | (offset from edge of relevant TX band) | | |
| relevant TX band: | 1,8 to 6,0 MHz | 30 kHz | 100 kHz |
| R-GSM: 876 to 915 MHz | $> 6,0$ MHz | 100 kHz | 300 kHz |
| | (offset from carrier) | | |

NOTE 1: The filter and video bandwidths, and frequency offsets are only correct for measurements on an MS transmitting on a channel in the Mid ARFCN range.

NOTE 2: Due to practical implementation of a SS, the video bandwidth is restricted to a maximum of 3 MHz.

12.4.1.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.17.

12.4.2 MS in idle mode

12.4.2.1 Definition and applicability

Radiated spurious emissions, when the MS is in idle mode, are any emissions radiated by the cabinet and structure of the mobile station, including all interconnecting cables.

This is also known as "cabinet radiation".

The requirements apply to all types of R-GSM 900 MS. The test applies to all types of R-GSM 900 with the exception of the test at extreme voltages for an MS where a practical connection, to an external power supply, is not possible.

NOTE: A "practical connection" shall be interpreted to mean it is possible to connect extreme voltages to the MS without interfering with the configuration of the MS in a way which could invalidate the test.

12.4.2.2 Conformance requirement

1. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.19. under normal voltage conditions; GSM 05.05, 4.3/4.3.3.
2. The radiated spurious power emitted by the MS, when in idle mode, shall be no more than the levels in table 12.19. under extreme voltage conditions; GSM 05.05, 4.3/4.3.3/Annex D.2.

Table 12.19

| Frequency range | | Power level in dBm |
|-----------------|----------|--------------------|
| 30 MHz to | 880 MHz | -57 |
| 880 MHz to | 915 MHz | -59 |
| 915 MHz to | 1000 MHz | -57 |
| 1 GHz to | 1710 MHz | -47 |
| 1710 MHz to | 1785 MHz | -53 |
| 1785 MHz to | 4 GHz | -47 |

12.4.2.3 Test purpose

1. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under normal voltage conditions.
2. To verify that radiated spurious emissions from the MS when in idle mode do not exceed the requirements under extreme voltage conditions.

12.4.2.4 Method of test

12.4.2.4.1 Initial conditions

NOTE: The power supply shall be connected to the MS such that the physical configuration does not change in a way that could have an effect on the measurement. In particular, the battery pack of the MS should not normally be removed. In cases where no practical connection can be made to the power supply, the MS's intended battery source shall be used.

The BCCH message content from the serving cell shall ensure that Periodic Location Updating is not used and that page mode is continuously set to Paging Reorganization and BS_AG_BLKES_RES is set to 0 so that the MS receiver will operate continually.

The CCCH_CONF shall be set to 000. 1 basic physical channel used for CCCH not combined with SDCCHs.

The BCCH allocation shall either be empty or contain only the serving cell BCCH.

NOTE: This is to ensure that the receiver does not scan other ARFCN. Scanning other ARFCN could lead to a moving in frequency of the spurious and therefore to the possibility of either not measuring a spurious emission or measuring it more than once.

The MS is in MM state "idle, updated".

12.4.2.4.2 Procedure

- a) Initially the test antenna is closely coupled to the MS and any spurious emission radiated by the MS are detected by the test antenna and receiver in the range 30 MHz to 4 GHz.

NOTE: This is a qualitative step to identify the frequency and presence of spurious emissions which are to be measured in subsequent steps.

- b) The test antenna separation is set to the appropriate measurement distance and at each frequency at which a spurious emission has been detected the MS is rotated to obtain a maximum response. The effective radiated power of the emission is determined by a substitution measurement. In case of an anechoic shielded chamber pre-calibration may be used instead of a substitution measurement.
- c) The measurement bandwidth based on a 5 pole synchronously tuned filter shall be according to table 12.20. The power indication is the peak power detected by the measuring system.

The measurement time on any frequency shall be such that it includes the time during which the MS receives a TDMA frame containing the paging channel.

NOTE: For these filter bandwidths some difficulties may be experienced with noise floor above required measurement limit. This will depend on the gain of the test antenna, and adjustment of the measuring system bandwidth is permissible. Alternatively, for test frequencies above 900 MHz, the test antenna separation from the MS may be reduced to 1 metre.

Table 12.20

| Frequency range | Filter bandwidth | Video bandwidth |
|------------------|------------------|-----------------|
| 30 MHz to 50 MHz | 10 kHz | 30 kHz |
| 50 MHz to 4 GHz | 100 kHz | 300 kHz |

- d) The measurements are repeated with the test antenna in the orthogonal polarization plane.
- e) The test is repeated under extreme voltage test conditions (see [Annex 1, TC2.2]).

12.4.2.5 Test requirement

The power of any spurious emission shall not exceed the levels given in table 12.19.

13 Transmitter

13.1 Frequency error and phase error

13.1.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS, or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS.

13.1.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm, or accurate to within 0,1 ppm compared to signals received from the BS.
 - 1.1 Under normal conditions; GSM 05.10, 6.1.
 - 1.2 Under vibration conditions; GSM 05.10, 6.1; GSM 05.05, annex D D.2.3.
 - 1.3 Under extreme conditions; GSM 05.10, 6.1; GSM 05.05, 4.4; GSM 05.05, annex D D.2.1, D.2.2.
2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees.
 - 2.1 Under normal conditions; GSM 05.05, 4.6.
 - 2.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.
 - 2.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.
3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.
 - 3.1 Under normal conditions; GSM 05.05, 4.6.
 - 3.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.
 - 3.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

13.1.3 Test purpose

1. To verify that the MS carrier frequency error does not exceed 0,1 ppm:
 - 1.1 Under normal conditions.
 - 1.2 When the MS is being vibrated.
 - 1.3 Under extreme conditions.

NOTE: The transmit frequency accuracy of the SS is expected to be sufficient to ensure that the difference between 0,1 ppm absolute and 0,1 ppm compared to signals received from the BS would be small enough to be considered insignificant.

- 2 To verify that the RMS phase error on the useful part of the bursts transmitted by the MS does not exceed conformance requirement 2:
 - 2.1 Under normal conditions.
 - 2.2 When the MS is being vibrated.
 - 2.3 Under extreme conditions.
- 3 To verify that the maximum phase error on the useful part of the bursts transmitted by the MS does not exceed conformance requirement 3.
 - 3.1 Under normal conditions.
 - 3.2 When the MS is being vibrated.
 - 3.3 Under extreme conditions.

13.1.4. Method of test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

13.1.4.1 Initial conditions

A call is set up according to the Generic call setup procedure.

The SS commands the MS to hopping mode (table 6.1).

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The SS activates ciphering mode.

NOTE: Ciphering mode is active during this test to give a pseudo-random bit stream to the modulator.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see 36.2.1.1).

The SS generates Standard Test Signal C1 of annex 5.

13.1.4.2 Procedure

- a) For one transmitted burst, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of $2/T$, where T is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.
- b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in GSM 05.04, the expected phase trajectory.
- c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.

c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$$\varnothing_m = \varnothing_m(0) \dots \varnothing_m(n)$$

where the number of samples in the array $n+1 \geq 294$.

c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$$\varnothing_c = \varnothing_c(0) \dots \varnothing_c(n).$$

c.3) The error array is represented by the vector:

$$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\} \dots \{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0) \dots \varnothing_e(n).$$

c.4) The corresponding sample numbers form a vector $t = t(0) \dots t(n)$.

c.5) By regression theory the slope of the samples with respect to t is k where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

c.6) The frequency error is given by $k/(360 * \gamma)$, where γ is the sampling interval in s and all phase samples are measured in degrees.

c.7) The individual phase errors from the regression line are given by:

$$\varnothing_e(j) - k * t(j).$$

c.8) The RMS value \varnothing_e of the phase errors is given by:

$$\varnothing_e(\text{RMS}) = \left[\frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

- d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.
- e) The SS instructs the MS to its maximum power control level, all other conditions remaining constant. Steps a) to d) are repeated.

- f) The SS instructs the MS to the minimum power control level, all other conditions remaining constant. Steps a) to d) are repeated.
- g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4.

During the vibration steps a) to f) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

- h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.
- i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

NOTE: The series of samples taken to determine the phase trajectory could also be used, with different post-processing, to determine the transmitter burst characteristics of 13.3. Although described independently, it is valid to combine the tests of 13.1 and 13.3, giving both answers from single sets of captured data.

13.1.5 Test requirements

13.1.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than $10E-7$.

13.1.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

13.2 Frequency error under multipath and interference conditions

13.2.1 Definition and applicability

The frequency error under multipath and interference conditions is a measure of the ability of the MS to maintain frequency synchronization with the received signal under conditions of Doppler shift, multipath reception and interference.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS.

13.2.2 Conformance requirement

1. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm, or 0,1 ppm compared to signals received from the BS for signal levels down to 3 dB below the reference sensitivity level.
 - 1.1 Under normal conditions; GSM 05.10, 6/6.1.
 - 1.2 Under extreme conditions; GSM 05.10, 6/6.1; GSM 05.05 annex D D.2.1, D.2.2.
2. The MS carrier frequency error for each burst shall be accurate to within 0,1 ppm, or 0,1 ppm compared to signals received from the BS for 3 dB less carrier to interference ratio than the reference interference ratios (GSM 05.10, 6/6.1).

13.2.3 Test purpose

1. To verify that the MS carrier frequency error at reference sensitivity, under conditions of multipath and Doppler shift does not exceed 0,1 ppm + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

1.1 Under normal conditions.

1.2 Under extreme conditions.

NOTE: Although the conformance requirement states that frequency synchronization should be maintained for input signals 3 dB below reference sensitivity. Due to the Radio Link Failure counter this test condition cannot be established. Hence all tests in this section are conducted at reference sensitivity level.

2. To verify that the MS carrier frequency error, under interference conditions and TUlow fading profile, does not exceed 0,1 ppm + the frequency error due to the Doppler shift of the received signal and the assessment error in the MS.

NOTE: The test adds the effect of Doppler shift to the requirements as the conformance requirement refers to signals input to the MS receiver whereas the frequency reference for measurement will not take account of the Doppler shift.

13.2.4 Method of test

This test uses the same measurement process as test 13.1 for the MS operating under various RF conditions.

NOTE: The BA list sent on the BCCH and the SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCH but if they are provided none will be within 5 channels of the ARFCN used for the serving BCCH or TCH.

13.2.4.1 Initial conditions

The MS is brought into the idle updated state on a serving cell with BCCH in the mid ARFCN range.

13.2.4.2 Procedure

- a) The level of the serving cell BCCH is set to 10 dB above the reference sensitivity level() and the fading function set to RA. The SS waits 30 s for the MS to stabilize to these conditions. The SS is set up to capture the first burst transmitted by the MS during call establishment. A call is initiated by the SS on a channel in the mid ARFCN range as described for the generic call set up procedure but to a TCH at level 10 dB above the reference sensitivity level() and fading function set to RA.
- b) The SS calculates the frequency accuracy of the captured burst as described in test 13.1.
- c) The SS sets the serving cell BCCH and TCH to the reference sensitivity level() applicable to the type of MS, still with the fading function set to RA and then waits 30 s for the MS to stabilize to these conditions.
- d) The SS shall capture subsequent bursts from the traffic channel in the manner described in test 13.1.

NOTE: Due to the very low signal level at the MS receiver input the MS receiver is liable to error. The "looped back" bits are therefore also liable to error, and hence the SS does not know the expected bit sequence. The SS will have to demodulate the received signal to derive (error free) the transmitter burst bit pattern. Using this bit pattern the SS can calculate the expected phase trajectory according to the definition within GSM 05.04.

- e) The SS calculates the frequency accuracy of the captured burst as described in test 13.1.

- f) Steps d) and e) are repeated for 5 traffic channel bursts spaced over a period of not less than 20 s.
- g) The initial conditions are established again and steps a) to f) are repeated but with the fading function set to HT100.
- h) The initial conditions are established again and steps a) to f) are repeated but with the fading function set to TU50.
- i) The initial conditions are established again and steps a) and b) are repeated but with the following differences:
- the levels of the BCCH and TCH are set to 18 dB above reference sensitivity level().
 - two further independent interfering signals are sent on the same nominal carrier frequency as the BCCH and TCH and at a level 10 dB below the level of the TCH and modulated with random data, including the midamble.
 - the fading function for all channels is set to TULow.
- j) The SS waits 100 s for the MS to stabilize to these conditions.
- k) Repeat steps d) to f), except that at step f) the measurement period must be extended to 200 s and the number of measurements increased to 20.
- l) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the Low ARFCN range.
- m) The initial conditions are established again and steps a) to k) are repeated for ARFCN in the High ARFCN range.
- n) Repeat step h) under extreme test conditions (see annex 1, TC2.2).

13.2.5 Test requirements

The frequency error, with reference to the SS carrier frequency as measured in repeats of step e), for each measured burst shall be less than the values shown in table 13-1.

Table 13-1: Requirements for frequency error under multipath, Doppler shift and interference conditions

| GSM 900 | | DCS 1 800 | |
|-----------------------|---------------------------|-----------------------|---------------------------|
| Propagation condition | Permitted frequency error | Propagation condition | Permitted frequency error |
| RA250 | +/- 300 Hz | RA130 | +/- 400 Hz |
| HT100 | +/- 180 Hz | HT100 | +/- 350 Hz |
| TU50 | +/- 160 Hz | TU50 | +/- 260 Hz |
| TU3 | +/- 230 Hz | TU1,5 | +/- 320 Hz |

13.3 Transmitter output power and burst timing

13.3.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The transmit burst timing is the envelope of the RF power transmitted with respect to time. The timings are referenced to the transition from bit 13 to bit 14 of the Training Sequence ("midamble") before differential decoding. The timing of the modulation is referenced to the timing of the received signal from the SS.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS.

13.3.2 Conformance requirement

1. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of ± 2 dB under normal conditions; GSM 05.05, 4.1.1, first table.
2. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of $\pm 2,5$ dB under extreme conditions; GSM 05.05, 4.1.1, first table; GSM 05.05 annex D D.2.1, D.2.2.
3. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, second table (for GSM 900) or third table (for DCS 1 800), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of $\pm 3, 4$ or 5 dB under normal conditions; GSM 05.05, 4.1.1, second or third table.
4. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, second table (for GSM 900) or third table (for DCS 1 800), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of $\pm 4, 5$ or 6 dB under extreme conditions; GSM 05.05, 4.1.1, second or third table; GSM 05.05 annex D D.2.1, D.2.2.
5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be $2 \pm 1,5$ dB; GSM 05.05, 4.1.1.
6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in GSM 05.05, annex B top figure:
 - 6.1 Under normal conditions; GSM 05.05, 4.5.2..
 - 6.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.
7. When accessing a cell on the RACH and before receiving the first power command during a communication on a DCCH or TCH (after an IMMEDIATE ASSIGNMENT), all GSM and class 2 DCS 1 800 MS shall use the power control level defined by the MS_TXPWR_MAX_CCH parameter broadcast on the BCCH of the cell, or if MS_TXPWR_MAX_CCH corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast. A Class 3 DCS 1 800 MS shall use the POWER_OFFSET parameter.
8. The transmissions from the MS to the BS, measured at the MS antenna, shall be $468,75 - TA$ bit periods behind the transmissions received from the BS, where TA is the last timing advance received from the current serving BS. The tolerance on these timings shall be ± 1 bit period:
 - 8.1 Under normal conditions; GSM 05.10, 6.4.
 - 8.2 Under extreme conditions; GSM 05.10, 6.4, GSM 05.05 annex D D.2.1, D.2.2.
9. The transmitted power level relative to time for a random access burst shall be within the power/time template given in GSM 05.05, annex B bottom figure:
 - 9.1 Under normal conditions; GSM 05.05, 4.5.2.
 - 9.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.
10. The MS shall use a TA value of 0 for the Random Access burst sent:
 - 10.1 Under normal conditions; GSM 05.10, 6.6.
 - 10.2 Under extreme conditions; GSM 05.10, 6.6, GSM 05.05 annex D D.2.1, D.2.2.

13.3.3 Test purpose

1. To verify that the maximum output power of the MS, under normal conditions, is within conformance requirement 1.
2. To verify that the maximum output power of the MS, under extreme conditions, is within conformance requirement 2.
3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS and have output power levels, under normal conditions, within conformance requirement 3.
4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.
5. To verify that the step in the output power transmitted by the MS at consecutive power control levels is within conformance requirement 5 under normal conditions.
6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6:
 - 6.1 Under normal conditions.
 - 6.2 Under extreme conditions.
7. To verify that the MS uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.
8. To verify that, for normal bursts, the MS transmissions to the BS are timed within conformance requirement 8:
 - 8.1 Under normal conditions.
 - 8.2 Under extreme conditions.
9. To verify that the output power relative to time, when sending an access burst is within conformance requirement 9:
 - 9.1 Under normal conditions.
 - 9.2 Under extreme conditions.
10. To verify that, for an access burst, the MS transmission to the BS is timed within conformance requirement 10:
 - 10.1 Under normal conditions.
 - 10.2 Under extreme conditions.

13.3.4 Methods of test

Two methods of test are described, separately for:

- 1) equipment fitted with a permanent antenna connector and for
- 2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this EN using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

13.3.4.1 Method of test for equipment with a permanent antenna connector

13.3.4.1.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

13.3.4.1.2 Procedure

a) Measurement of normal burst transmitter output power

The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least $2/T$, where T is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.

The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.

b) Measurement of normal burst timing delay

The burst timing delay is the difference in time between the timing reference identified in a) and the corresponding transition in the burst received by the MS immediately prior to the MS transmit burst sampled.

c) Measurement of normal burst power/time relationship

The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).

d) Steps a) to c) are repeated with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.

e) The SS commands the MS to the maximum power control level supported by the MS and steps a) to c) are repeated for ARFCN in the Low and High ranges.

f) Measurement of access burst transmitter output power

The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a handover procedure or a new request for radio resource. In the case of a handover procedure the Power Level indicated in the HANDOVER COMMAND message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the MS_TXPWR_MAX_CCH parameter. If the power class of the MS is DCS 1 800 Class 3, the MS shall also use the POWER_OFFSET parameter.

The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.

The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.

g) Measurement of access burst timing delay

The burst timing delay is the difference in time between the timing reference identified in f) and the MS received data on the common control channel.

- h) Measurement of access burst power/time relationship

The array of power samples measured in f) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in f).

- i) Depending on the method used in step f) to cause the MS to send an Access Burst, the SS sends either a HANDOVER COMMAND with power control level set to 10 or it changes the System Information elements MS_TXPWR_MAX_CCH and for DCS 1 800 the POWER_OFFSET on the serving cell BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 900 or +10 dBm for DCS 1 800) and then steps f) to h) are repeated.
- j) Steps a) to i) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

13.3.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of section 13.3.4.1 will be applied.

The tests in this section are performed on an unmodified test sample.

13.3.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS_TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

13.3.4.2.2 Procedure

- a) With the initial conditions set according to subclause 13.3.4.2.1 the test procedure in 13.3.4.1.2 is followed up to and including step i), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by $n \times 45$ degrees for all values of n in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

- b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form P_{nc} , where n = MS rotation and c = channel number.

For each channel number used compute:

$$P_{ac}(\text{Watts into dipole}) = \frac{1}{8} * \sum_{n=0}^{n=7} P_{nc}$$

from which: $P_{ac}(\text{Tx dBm}) = 10\log_{10}(P_{ac}) + 30 + 2,15$

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation $n = 0$ is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to i) of 13.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way,
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to i) of 13.3.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

13.3.5 Test requirements

- a) The transmitter output power, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13-2 or table 13-3 within the tolerances also shown in table 13-2 or table 13-3.

GSM 900 only - begin**Table 13-2: GSM 900 transmitter output power for different power classes**

| Power class | | | | Power control level | Transmitter output power | Tolerances | |
|-------------|---|---|---|---------------------|--------------------------|------------|-----------|
| 2 | 3 | 4 | 5 | | dBm | normal | extreme |
| . | | | | 2 | 39 | +/-2 dB | +/-2,5 dB |
| . | . | | | 3 | 37 | +/-3 dB*) | +/-4 dB*) |

| . | . | . | 14 | 2 | +/-5 dB | +/-6 dB |
| . | . | . | 15 | 0 | +/-5 dB | +/-6 dB |

*) When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

DCS 1 800 only - end

- b) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB.
- c) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13-1 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

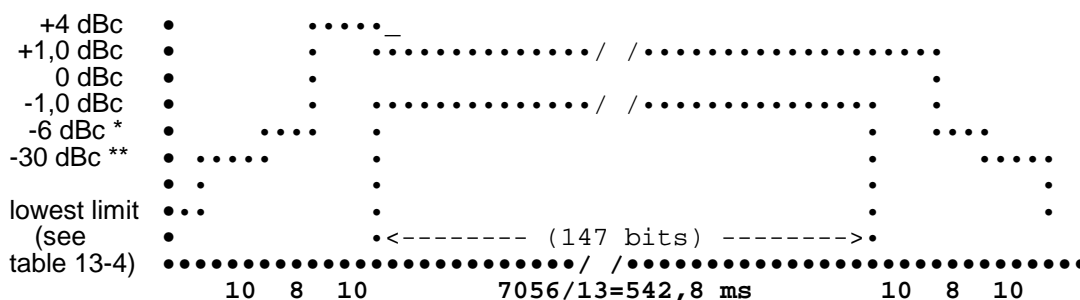

Figure 13-1: Power / time template for normal bursts

* For GSM900 MS: -4 dBc for power control level 16

-2 dBc for power control level 17

-1 dBc for power control levels 18 and 19

For DCS1800 MS: -4 dBc for power control level 11

-2 dBc for power control level 12

-1 dBc for power control levels 13, 14 and 15

** For GSM900 MS:

-30 dBc or -17 dBm, whichever is the higher

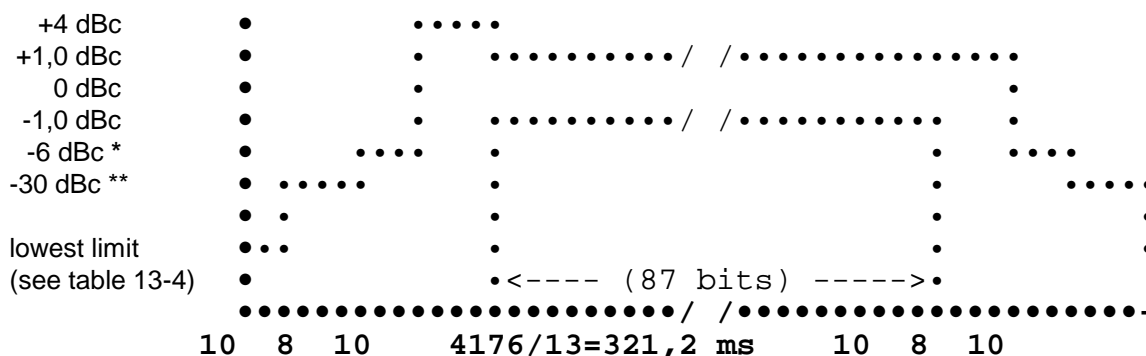

For DCS1800 MS:

-30 dBc or -20 dBm, whichever is the higher

Table 13-4: Lowest measurement limit for power / time template

| | lowest limit |
|---------|--|
| GSM900 | -59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is equal to -59 dBc or -36 dBm, whichever is the highest |
| DCS1800 | -48 dBc or -48 dBm whichever is the highest |

- d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.
- e) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.
- f) The centre of the transmitted normal burst as defined by the transition of bits 13/14 of the midamble shall be 3 timeslot periods (1731 μ s) \pm 1 bit period (\pm 3,69 μ s) after the centre of the corresponding received burst.
- g) The power/time relationship of the measured samples for access bursts shall be within the limits of the power time template of figure 13-2 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

**Figure 13-2: Power / time template for access burst**

- * For GSM900 MS: -4 dBc for power control level 16
 -2 dBc for power control level 17
 -1 dBc for power control levels 18 and 19
 For DCS1800 MS: -4 dBc for power control level 11
 -2 dBc for power control level 12
 -1 dBc for power control levels 13, 14 and 15
- ** For GSM900 MS: -30 dBc or -17 dBm, whichever is the higher
 For DCS1800 MS: -30 dBc or -20 dBm, whichever is the higher

- h) The centre of the transmitted access burst shall be an integer number of timeslot periods less 30 bit periods relative to any CCCH midamble centre with a tolerance of \pm 1 bit period (\pm 3,69 μ s).

13.4 Output RF spectrum

13.4.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS.

13.4.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in GSM 05.05, 4.2.1, table a) for GSM 900 or table b) for DCS 1 800, with the following lowest measurement limits:

- -36 dBm below 600 kHz offset from the carrier,
- -51 dBm for GSM 900 or -56 dBm for DCS 1 800 from 600 kHz out to less than 1 800 kHz offset from the carrier,
- -46 dBm for GSM 900 or -51 dBm for DCS 1 800 at and beyond 1 800 kHz offset from the carrier,

but with the following exceptions at up to -36 dBm:

- up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,
- up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; GSM 05.05, 4.2.1.

1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table "a) Mobile Station:".

2.1 Under normal conditions; GSM 05.05, 4.2.2.

2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.

3. When allocated a channel, the power emitted by the MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; GSM 05.05, 4.3.3.

13.4.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1.

1.1 Under normal conditions.

1.2 Under extreme conditions.

2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 when a reasonable margin is allowed for the effect of spectrum due to modulation.

2.1 Under normal conditions.

2.2 Under extreme conditions.

3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3.

13.4.4 Method of test

13.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see 36.2.1.1). This is to set a defined random pattern for the transmitter.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dB μ V_{emf}().

13.4.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

- a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.
- b) The other settings of the spectrum analyser are set as follows:
 - Zero frequency scan
 - Resolution bandwidth: 30 kHz
 - Video bandwidth: 30 kHz
 - Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

The MS is commanded to its maximum power control level.

- c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.
- d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the band 925 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

- e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).
- f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

| | |
|------------------|------------------|
| FT | |
| FT + 100 kHz | FT - 100 kHz |
| FT + 200 kHz | FT - 200 kHz |
| FT + 250 kHz | FT - 250 kHz |
| FT + 200 kHz * N | FT - 200 kHz * N |

where N = 2, 3, 4, 5, 6, 7, and 8
and FT = RF channel nominal centre frequency.

- g) The spectrum analyser settings are adjusted to:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 100 kHz
- Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level.

- h) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

| | |
|--------------|--------------|
| FT + 400 kHz | FT - 400 kHz |
| FT + 600 kHz | FT - 600 kHz |
| FT + 1,2 MHz | FT - 1,2 MHz |
| FT + 1,8 MHz | FT - 1,8 MHz |

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

- i) Step h) is repeated for power control levels 7 and 11.
- j) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.
- k) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.
- l) Steps a) b) f) g) and h) are repeated under extreme test conditions (annex 1, TC2.2). except that at step g) the MS is commanded to power control level 11.

13.4.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 880 to 915 MHz or 1710 to 1785 MHz, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a DCS 1 800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), h), j), k) and l) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13-5 for GSM 900 or table 13-6 for DCS 1 800 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

Table 13-5a: GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset

| | power levels in dB relative to the measurement at FT | | | | |
|--|--|-----|-----|-----|--------------|
| Power level | Frequency offset (kHz) | | | | |
| (dBm) | 0-100 | 200 | 250 | 400 | 600 to <1800 |
| 39 | +0,5 | -30 | -33 | -60 | -66 |
| 37 | +0,5 | -30 | -33 | -60 | -64 |
| 35 | +0,5 | -30 | -33 | -60 | -62 |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -51 |

Table 13-6: DCS 1 800 Spectrum due to modulation out to less than 1 800 kHz offset

| | power levels in dB relative to the measurement at FT | | | | |
|--|--|-----|-----|-----|--------------|
| Power level | Frequency offset (kHz) | | | | |
| (dBm) | 0-100 | 200 | 250 | 400 | 600 to <1800 |
| <= 36 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -56 |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13-7 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

Table 13-7: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)

| power levels in dB relative to the measurement at FT | | | | | | |
|--|------------------|---------|---------|---------|------------------|---------|
| GSM900 | | | | DCS1800 | | |
| Power | Frequency offset | | | Power | Frequency offset | |
| level | kHz | | | level | kHz | |
| (dBm) | 1800 to | 3000 to | >= 6000 | (dBm) | 1800 to | >= 6000 |
| | < 3000 | < 6000 | | | < 6000 | |
| 39 | -69 | -71 | -77 | 36 | -71 | -79 |
| 37 | -67 | -69 | -75 | 34 | -69 | -77 |
| 35 | -65 | -67 | -73 | 32 | -67 | -75 |
| <= 33 | -63 | -65 | -71 | 30 | -65 | -73 |
| | | | | 28 | -63 | -71 |
| | | | | 26 | -61 | -69 |
| | | | | <= 24 | -59 | -67 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | |
| | -46 | -46 | -46 | | -51 | -51 |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.
- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.
- e) The MS spurious emissions in the bands 925 - 935 MHz, 935 - 960 MHz and 1 805 - 1 880 MHz, measured in step d), for all types of MS, shall not exceed the values shown in table 13-8 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted.

Table 13-8: Spurious emissions in the MS receive bands

| Band (MHz) | Spurious emissions level (dBm) |
|--------------|--------------------------------|
| 925 to 935 | -67 |
| 935 to 960 | -79 |
| 1805 to 1880 | -71 |

- f) For the power ramp sidebands of steps h) and i) the power levels must not exceed the values shown in table 13-9 for GSM 900 or table 13-10 for DCS 1 800.

Table 13-9: GSM Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency | | | |
|-------------|--|---------|----------|----------|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

Table 13-10: DCS 1 800 Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency | | | |
|-------------|--|---------|----------|----------|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 36 dBm | -16 dBm | -21 dBm | -21 dBm | -24 dBm |
| 34 dBm | -18 dBm | -21 dBm | -21 dBm | -24 dBm |
| 32 dBm | -20 dBm | -22 dBm | -22 dBm | -25 dBm |
| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13-9 and table 13-10 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

13.5 Intermodulation attenuation

13.5.1 Definition and applicability

The intermodulation attenuation is the ratio, in dB, of the power level of the wanted signal to the power level of the highest intermodulation component.

The requirements and this test apply to all types of DCS 1 800 MS.

13.5.2 Conformance requirement

The maximum level of any intermodulation product shall be no less than 50 dB below the level of the wanted signal when an interfering CW signal is applied, within the transmit band, at a frequency offset of 800 kHz and with a power level 40 dB below the power level of the wanted signal; GSM 05.05, 4.7.3.

13.5.3 Test purpose

To verify that the MS intermodulation attenuation is no less than conformance requirement 1.

13.5.4 Method of test

NOTE 1: When the measurements are performed precautions must be taken, so that non-linearities in the selective measuring device do not influence the results appreciably. Furthermore it should be ensured that intermodulation components which may be generated by non-linear elements in the test equipment (e.g. signal generator, circulators, selective measuring device) are sufficiently reduced. The RF transmit equipment under test and the test signal source should be physically separated in such a way that the measurement is not influenced by direct radiation.

NOTE 2: In the case of an MS which does not normally include an antenna connector, the coupling loss of the temporary antenna connector must be taken into account.

13.5.4.1 Initial conditions

The antenna output of the MS is connected to the SS via a coupling device, presenting to the MS a load with an impedance of 50 ohms. The coupling device may consist of a circulator with one port connected by a coaxial cable to the output terminal of the MS, the second port correctly terminated with 50 ohms into a selective measuring device (e.g. a spectrum analyser) and the third port connected to the interfering test signal source via an isolator.

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power.

13.5.4.2 Procedure

- a) The interfering test signal will be unmodulated and the frequency will be 800 kHz above the transmit frequency of the MS under test. the power level is adjusted to give the equivalent of 40 dB below the transmit power level of the MS, if both the MS transmit power and the interfering test signal were measured with a correct termination but with the other signal absent.
- b) The frequency selective measuring device is set to measure peak hold in a bandwidth of 300 kHz. Any intermodulation components in the MS transmit band, are then measured.
- c) Steps a) and b) are repeated with the test signal at a frequency 800 kHz below the transmitted frequency.

13.5.5 Test requirements

The level of each intermodulation component, in the MS transmit band, shall be no less than 50 dB below the level of the transmit power of the wanted MS carrier.

13.6 Frequency error and phase error in HSCSD multislot configurations

13.6.1 Definition and applicability

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS, or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS and multiband GSM 900 / DCS 1800 which are capable of HSCSD multislot operation.

13.6.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm, or accurate to within 0,1 ppm compared to signals received from the BS.
 - 1.1 Under normal conditions; GSM 05.10, 6.1.
 - 1.2 Under vibration conditions; GSM 05.10, 6.1; GSM 05.05, annex D D.2.3.
 - 1.3 Under extreme conditions; GSM 05.10, 6.1; GSM 05.05, 4.4; GSM 05.05, annex D D.2.1, D.2.2.

2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees.
 - 2.1 Under normal conditions; GSM 05.05, 4.6.
 - 2.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.
 - 2.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.
3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.
 - 3.1 Under normal conditions; GSM 05.05, 4.6.
 - 3.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.
 - 3.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

13.6.3 Test purpose

1. To verify that in a multislot configuration the MS carrier frequency error does not exceed 0,1 ppm:
 - 1.1 Under normal conditions.
 - 1.2 When the MS is being vibrated.
 - 1.3 Under extreme conditions.

NOTE: The transmit frequency accuracy of the SS is expected to be sufficient to ensure that the difference between 0,1 ppm absolute and 0,1 ppm compared to signals received from the BS would be small enough to be considered insignificant.
2. To verify that the RMS phase error on the useful part of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 2:
 - 2.1 Under normal conditions.
 - 2.2 When the MS is being vibrated.
 - 2.3 Under extreme conditions.
3. To verify that the maximum phase error on the useful part of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 3.
 - 3.1 Under normal conditions.
 - 3.2 When the MS is being vibrated.
 - 3.3 Under extreme conditions.

13.6.4 Method of test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

13.6.4.1 Initial conditions

A call is set up according to the generic call setup procedure for multislot HSCSD.

The SS commands the MS to hopping mode (table 13.6.1).

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The SS activates ciphering mode.

NOTE: Ciphering mode is active during this test to give a pseudo-random bit stream to the modulator.

The SS sets the MS to operate in a multislot configuration with maximum number of transmitted time slots.

The SS commands the MS to complete the traffic channel multislot loop back including signalling of erased frames.

The SS generates Standard Test Signal C1 of annex 5.

13.6.4.2 Procedure

- a) For one transmitted burst on the last multislot subchannel, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of $2/T$, where T is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.
- b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in GSM 05.04, the expected phase trajectory.
- c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.

- c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$$\varnothing_m = \varnothing_m(0) \dots \varnothing_m(n)$$

where the number of samples in the array $n+1 \geq 294$.

- c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$$\varnothing_c = \varnothing_c(0) \dots \varnothing_c(n).$$

- c.3) The error array is represented by the vector:

$$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\} \dots \{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0) \dots \varnothing_e(n).$$

- c.4) The corresponding sample numbers form a vector $t = t(0) \dots t(n)$.

c.5) By regression theory the slope of the samples with respect to t is k where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

c.6) The frequency error is given by $k/(360 * \gamma)$, where γ is the sampling interval in s and all phase samples are measured in degrees.

c.7) The individual phase errors from the regression line are given by:

$$\varnothing_e(j) - k * t(j).$$

c.8) The RMS value \varnothing_e of the phase errors is given by:

$$\varnothing_e(\text{RMS}) = \left[\frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

- d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.
- e) The SS instructs the MS to its maximum power control level on each multislot subchannel, all other conditions remaining constant. Steps a) to d) are repeated.
- f) The SS instructs the MS to the minimum power control level on each multislot subchannel, all other conditions remaining constant. Steps a) to d) are repeated.
- g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4.

During the vibration steps a) to f) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

- h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.
- i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

NOTE: The series of samples taken to determine the phase trajectory could also be used, with different post-processing, to determine the transmitter burst characteristics of 'Transmitter output power and burst timing in multislot configuration'. Although described independently, it is valid to combine these two tests, giving both answers from single sets of captured data.

13.6.5 Test requirements

13.6.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than $10\text{E-}7$.

13.6.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

13.7 Transmitter output power and burst timing in HSCSD configurations

13.7.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The transmit burst timing is the envelope of the RF power transmitted with respect to time. The timings are referenced to the transition from bit 13 to bit 14 of the Training Sequence ("midamble") before differential decoding. The timing of the modulation is referenced to the timing of the received signal from the SS.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS and multiband GSM 900 / DCS 1800 which are capable of HSCSD multislot operation.

13.7.2 Conformance requirement

1. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of ± 2 dB under normal conditions; GSM 05.05, 4.1.1, first table.
2. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of $\pm 2,5$ dB under extreme conditions; GSM 05.05, 4.1.1, first table; GSM 05.05 annex D D.2.1, D.2.2.
3. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, second table (for GSM 900) or third table (for DCS 1 800), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of $\pm 3, 4$ or 5 dB under normal conditions; GSM 05.05, 4.1.1, second or third table.
4. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, second table (for GSM 900) or third table (for DCS 1 800), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of $\pm 4, 5$ or 6 dB under extreme conditions; GSM 05.05, 4.1.1, second or third table; GSM 05.05 annex D D.2.1, D.2.2.
5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be $2 \pm 1,5$ dB; GSM 05.05, 4.1.1.
6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in GSM 05.05, annex B top figure. In multislot configurations where the bursts in two or more consecutive time slots are actually transmitted at the same frequency, the template of annex B shall be respected at the beginning and the end of the series of consecutive bursts. The output power during the guard period between every two consecutive active timeslots shall not exceed the level allowed for the useful part of the first timeslot or the level allowed for the useful part of the second timeslot plus 3dB, whichever is the highest:
 - 6.1 Under normal conditions; GSM 05.05, 4.5.2..
 - 6.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.
7. In multislot configurations, bidirectional subchannels shall be individually power controlled; GSM 05.08, 4.2.

8. When accessing a cell on the RACH and before receiving the first power command during a communication on a DCCH or TCH (after an IMMEDIATE ASSIGNMENT), all GSM and class 2 DCS 1 800 MS shall use the power control level defined by the MS_TXPWR_MAX_CCH parameter broadcast on the BCCH of the cell, or if MS_TXPWR_MAX_CCH corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast. A Class 3 DCS 1 800 MS shall use the POWER_OFFSET parameter.
9. The transmissions from the MS to the BS, measured at the MS antenna, shall be 468,75 - TA bit periods behind the transmissions received from the BS, where TA is the last timing advance received from the current serving BS. The tolerance on these timings shall be +/- 1 bit period:
 - 9.1 Under normal conditions; GSM 05.10, 6.4.
 - 9.2 Under extreme conditions; GSM 05.10, 6.4, GSM 05.05 annex D D.2.1, D.2.2.
10. The transmitted power level relative to time for a random access burst shall be within the power/time template given in GSM 05.05, annex B bottom figure:
 - 10.1 Under normal conditions; GSM 05.05, 4.5.2.
 - 10.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.
11. The MS shall use a TA value of 0 for the Random Access burst sent:
 - 11.1 Under normal conditions; GSM 05.10, 6.6.
 - 11.2 Under extreme conditions; GSM 05.10, 6.6, GSM 05.05 annex D D.2.1, D.2.2.

13.7.3 Test purpose

1. To verify that the maximum output power of the MS in HSCSD multislot configuration, under normal conditions, is within conformance requirement 1.
2. To verify that the maximum output power of the MS in HSCSD multislot configuration, under extreme conditions, is within conformance requirement 2.
3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS in HSCSD multislot configuration and have output power levels, under normal conditions, within conformance requirement 3.
4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.
5. To verify that the step in the output power transmitted by the MS in HSCSD multislot configuration at consecutive power control levels is within conformance requirement 5 under normal conditions.
6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6 in HSCSD multislot configuration:
 - 6.1 Under normal conditions.
 - 6.2 Under extreme conditions.
7. To verify that the MS in HSCSD multislot configuration uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.

8. To verify that, for normal bursts, the MS transmissions to the BS are timed within conformance requirement 8 in HSCSD multislot configuration:
 - 8.1 Under normal conditions.
 - 8.2 Under extreme conditions.
9. To verify that the output power relative to time, when sending an access burst is within conformance requirement 9 in HSCSD multislot configuration:
 - 9.1 Under normal conditions.
 - 9.2 Under extreme conditions.
10. To verify that, for an access burst, the MS transmission to the BS is timed within conformance requirement 10 in HSCSD multislot configuration:
 - 10.1 Under normal conditions.
 - 10.2 Under extreme conditions.
11. To verify that, power is individually controlled on bidirectional HSCSD subchannels

13.7.4 Methods of test

Two methods of test are described, separately for:

- 1) equipment fitted with a permanent antenna connector and for
- 2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this EN using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

13.7.4.1 Method of test for equipment with a permanent antenna connector

13.7.4.1.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for HSCSD multislot configuration on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power and MS to operate in its highest number of uplink slots. MS TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

13.7.4.1.2 Procedure

- a) Measurement of normal burst transmitter output power

The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least $2/T$, where T is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.

The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.

- b) Measurement of normal burst timing delay

The burst timing delay is the difference in time between the timing reference identified in a) and the corresponding transition in the burst received by the MS immediately prior to the MS transmit burst sampled.

c) Measurement of normal burst power/time relationship

The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).

d) Steps a) to c) are repeated on each multislot subchannel with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.

e) The SS commands the MS to the maximum power control level supported by the MS and steps a) to c) are repeated on each multislot subchannel for ARFCN in the Low and High ranges.

f) The SS commands the MS to the maximum power control level in the first multislot subchannel allocated and to the minimum power control level in the second multislot subchannel allocated. Any further timeslots allocated are to be set to the maximum power control level. Steps a) to c) and corresponding measurements on each subchannel are repeated.

g) Measurement of access burst transmitter output power

The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a handover procedure or a new request for radio resource. In the case of a handover procedure the Power Level indicated in the HANDOVER COMMAND message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the MS_TXPWR_MAX_CCH parameter. If the power class of the MS is DCS 1 800 Class 3, the MS shall also use the POWER_OFFSET parameter.

The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.

The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.

h) Measurement of access burst timing delay

The burst timing delay is the difference in time between the timing reference identified in g) and the MS received data on the common control channel.

i) Measurement of access burst power/time relationship

The array of power samples measured in g) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in g).

j) Depending on the method used in step g) to cause the MS to send an Access Burst, the SS sends either a HANDOVER COMMAND with power control level set to 10 or it changes the System Information elements MS_TXPWR_MAX_CCH and for DCS 1 800 the POWER_OFFSET on the serving cell BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 900 or +10 dBm for DCS 1 800) and then steps g) to i) are repeated.

k) Steps a) to j) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

13.7.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of section 13.7.4.1 will be applied.

The tests in this section are performed on an unmodified test sample.

13.7.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power. MS_TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

13.7.4.2.2 Procedure

- a) With the initial conditions set according to subclause 13.7.4.2.1 the test procedure in 13.7.4.1.2 is followed up to and including step j), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by $n \cdot 45$ degrees for all values of n in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

- b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form P_{nc} , where n = MS rotation and c = channel number.

For each channel number used compute:

$$P_{ac}(\text{Watts into dipole}) = \frac{1}{8} * \sum_{n=0}^{n=7} P_{nc}$$

$$\text{from which: } P_{ac}(\text{Tx dBm}) = 10\log_{10}(P_{ac}) + 30 + 2,15$$

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation $n = 0$ is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

- c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to j) of 13.7.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

d) Measurements at extreme test conditions.

NOTE: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way,
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to j) of 13.7.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

13.7.5 Test requirements

- a) The transmitter output power on each subchannel, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the MS power class, shall be at the relevant level shown in table 13.7-1 or table 13.7-2 within the tolerances also shown in table 13.7-1 or table 13.7-2.

GSM 900 only - begin

Table 13.7-1: GSM 900 transmitter output power for different power classes

| Power class | | | | Power control level | Transmitter output power | Tolerances | |
|-------------|---|---|---|---------------------|--------------------------|------------|-----------|
| 2 | 3 | 4 | 5 | | dBm | normal | extreme |
| . | | | | 2 | 39 | +/-2 dB | +/-2,5 dB |
| . | . | | | 3 | 37 | +/-3 dB*) | +/-4 dB*) |
| . | . | | | 4 | 35 | +/-3 dB | +/-4 dB |
| . | . | . | | 5 | 33 | +/-3 dB*) | +/-4 dB*) |
| . | . | . | | 6 | 31 | +/-3 dB | +/-4 dB |
| . | . | . | . | 7 | 29 | +/-3 dB*) | +/-4 dB*) |
| . | . | . | . | 8 | 27 | +/-3 dB | +/-4 dB |
| . | . | . | . | 9 | 25 | +/-3 dB | +/-4 dB |
| . | . | . | . | 10 | 23 | +/-3 dB | +/-4 dB |
| . | . | . | . | 11 | 21 | +/-3 dB | +/-4 dB |
| . | . | . | . | 12 | 19 | +/-3 dB | +/-4 dB |
| . | . | . | . | 13 | 17 | +/-3 dB | +/-4 dB |
| . | . | . | . | 14 | 15 | +/-3 dB | +/-4 dB |
| . | . | . | . | 15 | 13 | +/-3 dB | +/-4 dB |
| . | . | . | . | 16 | 11 | +/-5 dB | +/-6 dB |
| . | . | . | . | 17 | 9 | +/-5 dB | +/-6 dB |
| . | . | . | . | 18 | 7 | +/-5 dB | +/-6 dB |
| . | . | . | . | 19 | 5 | +/-5 dB | +/-6 dB |

*) When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

GSM 900 only - end

DCS 1 800 only - begin

Table 13.7-2: DCS 1 800 transmitter output power for different power classes

| Power class | | | Power control level | Transmitter output power | Tolerances | |
|-------------|---|---|---------------------|--------------------------|-------------|-----------|
| 1 | 2 | 3 | | | normal | extreme |
| | | . | 29 | 36 | +/-2,0 dB | +/-2,5 dB |
| | | . | 30 | 34 | +/-3,0 dB | +/-4,0 dB |
| | | . | 31 | 32 | +/-3,0 dB | +/-4,0 dB |
| . | . | . | 0 | 30 | +/-3,0 dB*) | +/-4 dB*) |
| . | . | . | 1 | 28 | +/-3 dB | +/-4 dB |
| . | . | . | 2 | 26 | +/-3 dB | +/-4 dB |
| . | . | . | 3 | 24 | +/-3 dB*) | +/-4 dB*) |
| . | . | . | 4 | 22 | +/-3 dB | +/-4 dB |
| . | . | . | 5 | 20 | +/-3 dB | +/-4 dB |
| . | . | . | 6 | 18 | +/-3 dB | +/-4 dB |
| . | . | . | 7 | 16 | +/-3 dB | +/-4 dB |
| . | . | . | 8 | 14 | +/-3 dB | +/-4 dB |
| . | . | . | 9 | 12 | +/-4 dB | +/-5 dB |
| . | . | . | 10 | 10 | +/-4 dB | +/-5 dB |
| . | . | . | 11 | 8 | +/-4 dB | +/-5 dB |
| . | . | . | 12 | 6 | +/-4 dB | +/-5 dB |
| . | . | . | 13 | 4 | +/-4 dB | +/-5 dB |
| . | . | . | 14 | 2 | +/-5 dB | +/-6 dB |
| . | . | . | 15 | 0 | +/-5 dB | +/-6 dB |

*) When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

DCS 1 800 only - end

- b) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB.
- c) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13.7-2 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

Figure 13.7-2: Power / time template for normal bursts

* For GSM900 MS: -4 dBc for power control level 16

-2 dBc for power control level 17

-1 dBc for power control levels 18 and 19

For DCS1800 MS:

-4 dBc for power control level 11

-2 dBc for power control level 12

-1 dBc for power control levels 13, 14 and 15

** For GSM900 MS:

-30 dBc or -17 dBm, whichever is the higher

For DCS1800 MS:

-30 dBc or -20 dBm, whichever is the higher

Table 13.7-3: Lowest measurement limit for power / time template

| | lowest limit |
|---------|---|
| GSM900 | -59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is -59 dBc or -36 dBm, whichever is the highest |
| DCS1800 | -48 dBc or -48 dBm whichever is the highest |

- d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.
- e) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.
- f) The centre of the transmitted normal burst as defined by the transition of bits 13/14 of the midamble shall be 3 timeslot periods (1731 μ s) \pm 1 bit period (\pm 3,69 μ s) after the centre of the corresponding received burst.
- g) The power/time relationship of the measured samples for access bursts shall be within the limits of the power time template of figure 13.7-3 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

**Figure 13.7-3: Power / time template for access burst**

- * For GSM900 MS: -4 dBc for power control level 16
 -2 dBc for power control level 17
 -1 dBc for power control levels 18 and 19
 For DCS1800 MS: -4 dBc for power control level 11
 -2 dBc for power control level 12
 -1 dBc for power control levels 13, 14 and 15
- ** For GSM900 MS: -30 dBc or -17 dBm, whichever is the higher
 For DCS1800 MS: -30 dBc or -20 dBm, whichever is the higher

- h) The centre of the transmitted access burst shall be an integer number of timeslot periods less 30 bit periods relative to any CCCH midamble centre with a tolerance of \pm 1 bit period (\pm 3,69 μ s).

13.8 Output RF spectrum in HSCSD multislot configuration

13.8.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS and multiband GSM 900 / DCS 1800 which are capable of HSCSD multislot operation.

13.8.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in GSM 05.05, 4.2.1, table a) for GSM 900 or table b) for DCS 1 800, with the following lowest measurement limits:
 - -36 dBm below 600 kHz offset from the carrier,
 - -51 dBm for GSM 900 or -56 dBm for DCS 1 800 from 600 kHz out to less than 1 800 kHz offset from the carrier,
 - -46 dBm for GSM 900 or -51 dBm for DCS 1 800 at and beyond 1 800 kHz offset from the carrier,but with the following exceptions at up to -36 dBm:
 - up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,
 - up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.
 - 1.1 Under normal conditions; GSM 05.05, 4.2.1.
 - 1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.
2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table "a) Mobile Station:".
 - 2.1 Under normal conditions; GSM 05.05, 4.2.2.
 - 2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.
3. When allocated a channel, the power emitted by the MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; GSM 05.05, 4.3.3.

13.8.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1 in the multislot configurations.
 - 1.1 Under normal conditions.
 - 1.2 Under extreme conditions.
2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 in the multislot configurations when a reasonable margin is allowed for the effect of spectrum due to modulation.
 - 2.1 Under normal conditions.
 - 2.2 Under extreme conditions.
3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3 in the multislot configurations.

13.8.4 Method of test

13.8.4.1 Initial conditions

A call is set up according to the generic call set up procedure for multislot HSCSD.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dB μ V_{emf} ().

The SS sets the MS to operate in a multislot configuration where is maximum number of transmitting timeslots. Maximum power level is set in all channels.

13.8.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

- a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.
- b) The other settings of the spectrum analyser are set as follows:
 - Zero frequency scan
 - Resolution bandwidth: 30 kHz
 - Video bandwidth: 30 kHz
 - Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst in one of the active time slots is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

- c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.
- d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the band 925 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

- e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).
- f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT

FT + 100 kHz

FT - 100 kHz

FT + 200 kHz

FT - 200 kHz

FT + 250 kHz

FT - 250 kHz

FT + 200 kHz * N

FT - 200 kHz * N

where N = 2, 3, 4, 5, 6, 7, and 8
and FT = RF channel nominal centre frequency.

- g) Steps a) to f) is repeated except that in step a) the spectrum analyzer is gated so that the burst of the next active time slot is measured.
- h) The spectrum analyser settings are adjusted to:
- Zero frequency scan
 - Resolution bandwidth: 30 kHz
 - Video bandwidth: 100 kHz
 - Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level in every transmitted time slot.

- i) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

FT + 400 kHz

FT - 400 kHz

FT + 600 kHz

FT - 600 kHz

FT + 1,2 MHz

FT - 1,2 MHz

FT + 1,8 MHz

FT - 1,8 MHz

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

- j) Step i) is repeated for power control levels 7 and 11.

- k) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.
- l) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.
- m) Steps a) b) f) h), and i) are repeated under extreme test conditions (annex 1, TC2.2). except that at step h) the MS is commanded to power control level 11.

13.8.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 880 to 915 MHz or 1710 to 1785 MHz, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a DCS 1 800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), i), k), l) and m) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 1 for GSM 900 or table 2 for DCS 1 800 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

Table 1: GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset

| | power levels in dB relative to the measurement at FT | | | | |
|--|--|-----|-----|-----|--------------|
| Power level | Frequency offset (kHz) | | | | |
| (dBm) | 0-100 | 200 | 250 | 400 | 600 to <1800 |
| 39 | +0,5 | -30 | -33 | -60 | -66 |
| 37 | +0,5 | -30 | -33 | -60 | -64 |
| 35 | +0,5 | -30 | -33 | -60 | -62 |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -51 |

Table 2: DCS 1 800 Spectrum due to modulation out to less than 1 800 kHz offset

| | power levels in dB relative to the measurement at FT | | | | |
|--|--|-----|-----|-----|--------------|
| Power level | Frequency offset (kHz) | | | | |
| (dBm) | 0-100 | 200 | 250 | 400 | 600 to <1800 |
| <= 36 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -56 |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 3 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

Table 3: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)

| power levels in dB relative to the measurement at FT | | | | | | |
|--|------------------|---------|---------|-------------|------------------|---------|
| GSM900 | | | | DCS1800 | | |
| Power level | Frequency offset | | | Power level | Frequency offset | |
| (dBm) | kHz | | | (dBm) | kHz | |
| | 1800 to | 3000 to | >= 6000 | | 1800 to | >= 6000 |
| | < 3000 | < 6000 | | | < 6000 | |
| 39 | -69 | -71 | -77 | 36 | -71 | -79 |
| 37 | -67 | -69 | -75 | 34 | -69 | -77 |
| 35 | -65 | -67 | -73 | 32 | -67 | -75 |
| <= 33 | -63 | -65 | -71 | 30 | -65 | -73 |
| | | | | 28 | -63 | -71 |
| | | | | 26 | -61 | -69 |
| | | | | <= 24 | -59 | -67 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | |
| | -46 | -46 | -46 | | -51 | -51 |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.
- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.

- e) The MS spurious emissions in the bands 925 - 935 MHz, 935 - 960 MHz and 1 805 - 1 880 MHz, measured in step d), for all types of MS, shall not exceed the values shown in table 4 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted.

Table 4: Spurious emissions in the MS receive bands

| Band (MHz) | Spurious emissions level (dBm) |
|--------------|--------------------------------|
| 925 to 935 | -67 |
| 935 to 960 | -79 |
| 1805 to 1880 | -71 |

- f) For the power ramp sidebands of steps h), i) and k) the power levels must not exceed the values shown in table 5 for GSM 900 or table 6 for DCS 1 800.

Table 5: GSM Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency | | | |
|-------------|--|---------|----------|----------|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

Table 6: DCS 1 800 Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency | | | |
|-------------|--|---------|----------|----------|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 36 dBm | -16 dBm | -21 dBm | -21 dBm | -24 dBm |
| 34 dBm | -18 dBm | -21 dBm | -21 dBm | -24 dBm |
| 32 dBm | -20 dBm | -22 dBm | -22 dBm | -25 dBm |
| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 5 and table 6 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

13.9 Output RF spectrum for MS supporting the R-GSM band

13.9.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of R-GSM 900.

13.9.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in GSM 05.05, 4.2.1, table a) for R-GSM 900 with the following lowest measurement limits:

- -36 dBm below 600 kHz offset from the carrier,
- -51 dBm for R-GSM 900 from 600 kHz out to less than 1 800 kHz offset from the carrier,
- -46 dBm for R-GSM 900 at and beyond 1 800 kHz offset from the carrier,

but with the following exceptions at up to -36 dBm:

- up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,
- up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.

1.1 Under normal conditions; GSM 05.05, 4.2.1.

1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.

2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table "a) Mobile Station:".

2.1 Under normal conditions; GSM 05.05, 4.2.2.

2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.

3. When allocated a channel, the power emitted by the MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm, in the band 921 to 925 MHz shall be no more than -60 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; GSM 05.05, 4.3.3.

13.9.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1.

1.1 Under normal conditions.

1.2 Under extreme conditions.

2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 when a reasonable margin is allowed for the effect of spectrum due to modulation.

2.1 Under normal conditions.

2.2 Under extreme conditions.

3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3.

13.9.4 Method of test

13.9.4.1 Initial conditions

A call is set up according to the generic call set up procedure.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low R-GSM ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to handover the MS between the three channels tested at the appropriate time.

The SS commands the MS to complete the traffic channel loop back without signalling of erased frames (see 36.2.1.1). This is to set a defined random pattern for the transmitter.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dB μ V_{emf}().

13.9.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

- a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.
- b) The other settings of the spectrum analyser are set as follows:
 - Zero frequency scan
 - Resolution bandwidth: 30 kHz
 - Video bandwidth: 30 kHz
 - Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

The MS is commanded to its maximum power control level.

- c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.
- d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the band 921 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

- e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).
- f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

| | |
|------------------|------------------|
| FT | |
| FT + 100 kHz | FT - 100 kHz |
| FT + 200 kHz | FT - 200 kHz |
| FT + 250 kHz | FT - 250 kHz |
| FT + 200 kHz * N | FT - 200 kHz * N |

where N = 2, 3, 4, 5, 6, 7, and 8
and FT = RF channel nominal centre frequency.

- g) The spectrum analyser settings are adjusted to:

- Zero frequency scan
- Resolution bandwidth: 30 kHz
- Video bandwidth: 100 kHz
- Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level.

- h) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

| | |
|--------------|--------------|
| FT + 400 kHz | FT - 400 kHz |
| FT + 600 kHz | FT - 600 kHz |
| FT + 1,2 MHz | FT - 1,2 MHz |
| FT + 1,8 MHz | FT - 1,8 MHz |

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

- i) Step h) is repeated for power control levels 7 and 11.
- j) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the Low R-GSM ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.
- k) Steps b), f), g) and h) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step g) the MS is commanded to power control level 11 rather than maximum power.
- l) Steps a), b), f), g) and h) are repeated under extreme test conditions (annex 1, TC2.2). except that at step g) the MS is commanded to power control level 11.

13.9.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 876 to 915 MHz or 1710 to 1785 MHz, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 921 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz for R-GSM 900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), h), j), k) and l) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13.9-1 for R-GSM 900 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

Table 13.9-1a: R-GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset

| | power levels in dB relative to the measurement at FT | | | | |
|--|--|-----|-----|-----|--------------|
| Power level | Frequency offset (kHz) | | | | |
| (dBm) | 0-100 | 200 | 250 | 400 | 600 to <1800 |
| 39 | +0,5 | -30 | -33 | -60 | -66 |
| 37 | +0,5 | -30 | -33 | -60 | -64 |
| 35 | +0,5 | -30 | -33 | -60 | -62 |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -51 |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13.9-2 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

Table 13.9-2: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)

| Power levels in dB relative to the measurement at FT | | | |
|--|------------------|---------|---------|
| R-GSM900 | | | |
| Power | Frequency offset | | |
| level | kHz | | |
| (dBm) | 1800 to | 3000 to | >= 6000 |
| | < 3000 | < 6000 | |
| 39 | -69 | -71 | -77 |
| 37 | -67 | -69 | -75 |
| 35 | -65 | -67 | -73 |
| <= 33 | -63 | -65 | -71 |
| The values above are subject to the minimum absolute levels (dBm) below | | | |
| | -46 | -46 | -46 |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.
- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.
- e) The MS spurious emissions in the bands 921 – 925, 925 - 935 MHz, 935 - 960 MHz and 1 805 - 1 880 MHz, measured in step d), for all types of MS, shall not exceed the values shown in table 13.9-3 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted.

Table 13.9-3: Spurious emissions in the R-GSM MS receive bands

| Band (MHz) | Spurious emissions level (dBm) |
|---------------|-----------------------------------|
| 921 to 925 | -60 |
| 925 to 935 | -67 |
| 935 to 960 | -79 |
| 1805 to 1880 | -71 |

- f) For the power ramp sidebands of steps h) and i) the power levels must not exceed the values shown in table 13.9-4 for GSM 900.

Table 13.9-4: R-GSM Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency | | | |
|-------------|--|---------|----------|----------|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13.9-4 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

13.16 **GPRS transmitter tests**

13.16.1 **Frequency error and phase error in GPRS multislot configuration**

13.16.1.1 **Definition and applicability**

The frequency error is the difference in frequency, after adjustment for the effect of the modulation and phase error, between the RF transmission from the MS and either:

- the RF transmission from the BS, or
- the nominal frequency for the ARFCN used.

The phase error is the difference in phase, after adjustment for the effect of the frequency error, between the RF transmission from the MS and the theoretical transmission according to the intended modulation.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS which are capable of GPRS multislot operation.

13.16.1.2 Conformance requirement

1. The MS carrier frequency shall be accurate to within 0,1 ppm compared to signals received from the BS.
 - 1.1 Under normal conditions; GSM 05.10, 6.1.
 - 1.2 Under vibration conditions; GSM 05.10, 6.1; GSM 05.05, annex D D.2.3.
 - 1.3 Under extreme conditions; GSM 05.10, 6.1; GSM 05.05, 4.4; GSM 05.05, annex D D.2.1, D.2.2.
2. The RMS phase error (difference between the phase error trajectory and its linear regression on the active part of the time slot) for each burst shall not be greater than 5 degrees.
 - 2.1 Under normal conditions; GSM 05.05, 4.6.
 - 2.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.
 - 2.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.
3. The maximum peak deviation during the useful part of each burst shall not be greater than 20 degrees.
 - 3.1 Under normal conditions; GSM 05.05, 4.6.
 - 3.2 Under vibration conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.3.
 - 3.3 Under extreme conditions; GSM 05.05, 4.6; GSM 05.05, annex D D.2.1, D.2.2.

13.16.1.3 Test purpose

1. To verify that in a multislot configuration the MS carrier frequency error does not exceed 0.1 ppm:
 - 1.1 Under normal conditions
 - 1.2 When the MS is being vibrated
 - 1.3 Under extreme conditions
2. To verify that the RMS phase error on the useful parts of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 2:
 - 2.1 Under normal conditions
 - 2.2 When the MS is being vibrated
 - 2.3 Under extreme conditions
3. To verify that the maximum phase error on the useful parts of the bursts transmitted by the MS in a multislot configuration does not exceed conformance requirement 3:
 - 3.1 Under normal conditions
 - 3.2 When the MS is being vibrated
 - 3.3 Under extreme conditions

13.16.1.4 Method of the test

NOTE: In order to measure the accuracy of the frequency and phase error a sampled measurement of the transmitted phase trajectory is obtained. This is compared with the theoretically expected phase trajectory. The regression line of the difference between the expected trajectory and the measured trajectory is an indication of the frequency error (assumed constant through the burst), whilst the departure of the phase differences from this trajectory is a measure of the phase error. The peak phase error is the value furthest from the regression line and the RMS phase error is the root mean square average of the phase error of all samples.

13.16.1.4.1 Initial conditions

A call is set up according to the generic call setup procedure for multislot GPRS. The SS commands the MS to hopping mode (table 13.6.1, GSM 11.10).

NOTE: It is not necessary to test in hopping mode but is done here as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to make sure bursts are taken from a few different channels.

The SS activates ciphering mode.

NOTE: Ciphering mode is active during this test to give a pseudo-random bit stream to the modulator.

The SS sets the MS to operate in a multislot configuration with maximum number of transmitted time slots.

The SS commands the MS to complete the multislot PDTCH loop back, type (G), see 04.14, 5.2.1

The SS generates Standard Test Signal C1 of annex 5.

13.16.1.4.2 Procedure

- a) For one transmitted burst on the last slot of the multislot configuration, the SS captures the signal as a series of phase samples over the period of the burst. These samples are evenly distributed over the duration of the burst with a minimum sampling rate of $2/T$, where T is the modulation symbol period. The received phase trajectory is then represented by this array of at least 294 samples.
- b) The SS then calculates, from the known bit pattern and the formal definition of the modulator contained in GSM 05.04, the expected phase trajectory.
- c) From a) and b) the phase trajectory error is calculated, and a linear regression line computed through this phase trajectory error. The slope of this regression line is the frequency error of the mobile transmitter relative to the simulator reference. The difference between the regression line and the individual sample points is the phase error of that point.
 - c.1) The sampled array of at least 294 phase measurements is represented by the vector:

$$\varnothing_m = \varnothing_m(0) \dots \varnothing_m(n)$$

where the number of samples in the array $n+1 \geq 294$.

- c.2) The calculated array, at the corresponding sampling instants, is represented by the vector:

$$\varnothing_c = \varnothing_c(0) \dots \varnothing_c(n).$$

- c.3) The error array is represented by the vector:

$$\varnothing_e = \{\varnothing_m(0) - \varnothing_c(0)\} \dots \{\varnothing_m(n) - \varnothing_c(n)\} = \varnothing_e(0) \dots \varnothing_e(n).$$

- c.4) The corresponding sample numbers form a vector $t = t(0) \dots t(n)$.

- c.5) By regression theory the slope of the samples with respect to t is k where:

$$k = \frac{\sum_{j=0}^{j=n} t(j) * \varnothing_e(j)}{\sum_{j=0}^{j=n} t(j)^2}$$

- c.6) The frequency error is given by $k/(360 * g)$, where g is the sampling interval in s and all phase samples are measured in degrees.

- c.7) The individual phase errors from the regression line are given by:

$$\varnothing_e(j) - k * t(j).$$

- c.8) The RMS value \varnothing_e of the phase errors is given by:

$$\varnothing_e(\text{RMS}) = \left[\frac{\sum_{j=0}^{j=n} \{\varnothing_e(j) - k * t(j)\}^2}{n+1} \right]^{1/2}$$

- d) Steps a) to c) are repeated for 20 bursts, not necessarily contiguous.
- e) The SS instructs the MS to its maximum power control level by setting the power control parameter ALPHA (α) to 0 and GAMMA_TN (Γ_{CH}) for each timeslot to the desired power level in the Packet Uplink Assignment message (Closed Loop Control, see 05.08. Annex B.2), all other conditions remaining constant. Steps a) to d) are repeated.
- f) The SS instructs the MS to the minimum power control level, all other conditions remaining constant. Steps a) to d) are repeated.
- g) The MS is hard mounted on a vibration table and vibrated at the frequency/amplitudes specified in annex 1, TC4.

During the vibration steps a) to f) are repeated.

NOTE: If the call is terminated when mounting the MS to the vibration table, it will be necessary to establish the initial conditions again before repeating steps a) to f).

- h) The MS is re-positioned on the vibration table in the two orthogonal planes to the plane used in step g). For each of the orthogonal planes step g) is repeated.

- i) Steps a) to f) are repeated under extreme test conditions (see annex 1, TC2.2).

13.16.1.5.1 Frequency error

For all measured bursts, the frequency error, derived in step c.6), shall be less than $10E-7$.

13.16.1.5.2 Phase error

For all measured bursts, the RMS phase error, derived in step c.8), shall not exceed 5 degrees.

For all measured bursts, each individual phase error, derived in step c.7), shall not exceed 20 degrees.

13.16.2 Transmitter output power in GPRS multislot configuration

13.16.2.1 Definition and applicability

The transmitter output power is the average value of the power delivered to an artificial antenna or radiated by the MS and its integral antenna, over the time that the useful information bits of one burst are transmitted.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS and multiband GSM 900 / DCS 1800 which are capable of GPRS multislot operation.

13.16.2.2 Conformance requirement

1. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of ± 2 dB under normal conditions; GSM 05.05, 4.1.1, first table.
2. The MS maximum output power shall be as defined in GSM 05.05, 4.1.1, first table, according to its power class, with a tolerance of $\pm 2,5$ dB under extreme conditions; GSM 05.05, 4.1.1, first table; GSM 05.05 annex D D.2.1, D.2.2.
3. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, second table (for GSM 900) or third table (for DCS 1 800), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 1), with a tolerance of $\pm 3, 4$ or 5 dB under normal conditions; GSM 05.05, 4.1.1, second or third table.
4. The power control levels shall have the nominal output power levels as defined in GSM 05.05, 4.1.1, second table (for GSM 900) or third table (for DCS 1 800), from the lowest power control level up to the maximum output power corresponding to the class of the MS (for tolerance on maximum output power see conformance requirements 2), with a tolerance of $\pm 4, 5$ or 6 dB under extreme conditions; GSM 05.05, 4.1.1, second or third table; GSM 05.05 annex D D.2.1, D.2.2.
5. The output power actually transmitted by the MS at consecutive power control levels shall form a monotonic sequence and the interval between power control levels shall be $2 \pm 1,5$ dB; GSM 05.05, 4.1.1.
6. The transmitted power level relative to time for a normal burst shall be within the power/time template given in GSM 05.05, annex B top figure. In multislot configurations where the bursts in two or more consecutive time slots are actually transmitted at the same frequency the template of annex B shall be respected during the useful part of each burst and at the beginning and the end of the series of consecutive bursts. The output power during the guard period between every two consecutive active

timeslots shall not exceed the level allowed for the useful part of the first timeslot or the level allowed for the useful part of the second timeslot plus 3 dB, whichever is the highest.:

6.1 Under normal conditions; GSM 05.05, 4.5.2..

6.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

7. When accessing a cell on the PRACH or RACH and before receiving the first power control parameters during packet transfer on PDCH, all GSM and class 1 and class 2 DCS 1 800 MS shall use the power control level defined by the GPRS_MS_TXPWR_MAX_CCH parameter broadcast on the PBCCH or MS_TXPWR_MAX_CCH parameter broadcast on the BCCH of the cell. When MS_TXPWR_MAX_CCH is received on the BCCH, a class 3 DCS 1800 MS shall add to it the value POWER_OFFSET broadcast on the BCCH. If MS_TXPWR_MAX_CCH or the sum defined by: MS_TXPWR_MAX_CCH plus POWER_OFFSET corresponds to a power control level not supported by the MS as defined by its power class, the MS shall act as though the closest supported power control level had been broadcast.
8. The transmitted power level relative to time for a Random Access burst shall be within the power/time template given in GSM 05.05, annex B bottom figure:
 - 9.1 Under normal conditions; GSM 05.05, 4.5.2.
 - 9.2 Under extreme conditions; GSM 05.05, 4.5.2, GSM 05.05 annex D D.2.1, D.2.2.

13.16.2.3 Test purpose

1. To verify that the maximum output power of the MS in GPRS multislot configuration, under normal conditions, is within conformance requirement 1.
2. To verify that the maximum output power of the MS in GPRS multislot configuration, under extreme conditions, is within conformance requirement 2.
3. To verify that all power control levels, relevant to the class of MS, are implemented in the MS in GPRS multislot configuration and have output power levels, under normal conditions, within conformance requirement 3.
4. To verify that all power control levels have output power levels, under extreme conditions, within conformance requirement 4.
5. To verify that the step in the output power transmitted by the MS in GPRS multislot configuration at consecutive power control levels is within conformance requirement 5 under normal conditions.
6. To verify that the output power relative to time, when sending a normal burst is within conformance requirement 6 in GPRS multislot configuration:
 - 6.1 Under normal conditions.
 - 6.2 Under extreme conditions.
7. To verify that the MS in GPRS multislot configuration uses the maximum power control level according to its power class if commanded to a power control level exceeding its power class.
8. To verify that the output power relative to time, when sending an access burst is within conformance requirement 8 in GPRS multislot configuration:
 - 9.1 Under normal conditions.
 - 9.2 Under extreme conditions.

13.16.2.4 Methods of test

Two methods of test are described, separately for:

- 1) equipment fitted with a permanent antenna connector and for
- 2) equipment fitted with an integral antenna, and which cannot be connected to an external antenna except by the fitting of a temporary test connector as a test fixture.

NOTE: The behaviour of the MS in the system is determined to a high degree by the antenna, and this is the only transmitter test in this ETS using the integral antenna. Further studies are ongoing on improved testing on the integral antenna, taking practical conditions of MS use into account.

13.16.2.4.1 Method of test for equipment with a permanent antenna connector

13.16.2.4.1.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for GPRS multislot configuration on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power and MS to operate in its highest number of uplink slots. The SS controls the power level by setting the concerned time slot's power control parameter ALPHA (α) to 0 and GAMMA_TN (Γ_{CH}) to the desired power level in the Packet Uplink Assignment message (Closed Loop Control, see 05.08. Annex B.2) GPRS_ MS TXPWR_MAX_CCH / MS TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

13.16.2.4.1.2 Procedure

- a) Measurement of normal burst transmitter output power

The SS takes power measurement samples evenly distributed over the duration of one burst with a sampling rate of at least $2/T$, where T is the bit duration. The samples are identified in time with respect to the modulation on the burst. The SS identifies the centre of the useful 147 transmitted bits, i.e. the transition from bit 13 to bit 14 of the midamble, as the timing reference.

The transmitter output power is calculated as the average of the samples over the 147 useful bits. This is also used as the 0 dB reference for the power/time template.

- b) Measurement of normal burst power/time relationship

The array of power samples measured in a) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in a).

- c) Steps a) to b) are repeated on each timeslot within the multislot configuration with the MS commanded to operate on each of the power control levels defined, even those not supported by the MS.
- d) The SS commands the MS to the maximum power control level supported by the MS and steps a) to b) are repeated on each timeslot within the multislot configuration for ARFCN in the Low and High ranges.
- e) The SS commands the MS to the maximum power control level in the first timeslot allocated within the multislot configuration and to the minimum power control level in the second timeslot allocated. Any further timeslots allocated are to be set to the maximum power control level. Steps a) to b) and corresponding measurements on each timeslot within the multislot configuration are repeated.
- f) Measurement of access burst transmitter output power

The SS causes the MS to generate an Access Burst on an ARFCN in the Mid ARFCN range, this could be either by a cell re-selection or a new request for radio resource. In the case of a cell re-selection procedure the Power Level indicated in the PSI3 message is the maximum power control level supported by the MS. In the case of an Access Burst the MS shall use the Power Level indicated in the GPRS_MS_TXPWR_MAX_CCH parameter. If the power class of the MS is DCS 1 800 Class 3 and the Power Level is indicated by the MS_TXPWR_MAX_CCH parameter, the MS shall also use the POWER_OFFSET parameter.

The SS takes power measurement samples evenly distributed over the duration of the access burst as described in a). However, in this case the SS identifies the centre of the useful bits of the burst by identifying the transition from the last bit of the synch sequence. The centre of the burst is then five data bits prior to this point and is used as the timing reference.

The transmitter output power is calculated as the average of the samples over the 87 useful bits of the burst. This is also used as the 0 dB reference for the power/time template.

g) Measurement of access burst power/time relationship

The array of power samples measured in f) are referenced in time to the centre of the useful transmitted bits and in power to the 0 dB reference, both identified in f).

h) Depending on the method used in step f) to cause the MS to send an Access Burst, the SS sends either a PACKET CELL CHANGE ORDER along with power control level set to 10 in PSI3 parameter GPRS_MS_TXPWR_MAX_CCH or it changes the (Packet) System Information elements (GPRS_MS_TXPWR_MAX_CCH and for DCS 1 800 the POWER_OFFSET on the serving cell PBCCH/BCCH in order to limit the MS transmit power on the Access Burst to power control level 10 (+23 dBm for GSM 900 or +10 dBm for DCS 1 800) and then steps f) to g) are repeated.

i) Steps a) to h) are repeated under extreme test conditions (annex 1, TC2.2) except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

13.16.2.4.2 Method of test for equipment with an integral antenna

NOTE: If the MS is equipped with a permanent connector, such that the antenna can be disconnected and the SS be connected directly, then the method of section 13.16.2.4.1 will be applied.

The tests in this section are performed on an unmodified test sample.

13.16.2.4.2.1 Initial conditions

The MS is placed in the anechoic shielded chamber (annex 1, GC5) or on the outdoor test site, on an isolated support, in the position for normal use, at a distance of at least 3 metres from a test antenna, connected to the SS.

NOTE: The test method described has been written for measurement in an anechoic shielded chamber. If an outdoor test site is used then, in addition, it is necessary to raise/lower the test antenna through the specified height range to maximize the received power levels from both the test sample and the substitution antenna.

A call is set up by the SS according to the generic call set up procedure for GPRS multislots configuration on a channel with ARFCN in the Mid ARFCN range, power control level set to Max power and MS to operate in its highest number of uplink slots. The SS controls the power level by setting the concerned timeslot's power control parameter ALPHA (α) to 0 and GAMMA_TN (Γ_{CH}) to the desired power level in the Packet Uplink Assignment message (Closed Loop Control, see 05.08. Annex B.2) GPRS_MS_TXPWR_MAX_CCH / MS_TXPWR_MAX_CCH is set to the maximum value supported by the Power Class of the Mobile under test. For DCS 1 800 mobile stations the POWER_OFFSET parameter is set to 6 dB.

13.16.2.4.2.2 Procedure

a) With the initial conditions set according to subclause 13.16.2.4.2.1 the test procedure in 13.16.2.4.1.2 is followed up to and including step h), except that in step a), when measurements are done at maximum power for ARFCN in the Low, Mid and High range, the measurement is made eight times with the MS rotated by $n \cdot 45$ degrees for all values of n in the range 0 to 7.

The measurements taken are received transmitter output power measurements rather than transmitter output power measurements, the output power measurement values can be derived as follows.

- b) Assessment of test site loss for scaling of received output power measurements.

The MS is replaced by a half-wave dipole, resonating at the centre frequency of the transmit band, connected to an RF generator.

The frequency of the RF signal generator is set to the frequency of the ARFCN used for the 24 measurements in step a), the output power is adjusted to reproduce the received transmitter output power averages recorded in step a).

For each indication the power, delivered by the generator (in Watts) to the half-wave dipole, is recorded. These values are recorded in the form P_{nc} , where n = MS rotation and c = channel number.

For each channel number used compute:

$$P_{ac}(\text{Watts into dipole}) = \frac{1}{8} * \sum_{n=0}^{n=7} P_{nc}$$

from which: $P_{ac}(\text{Tx dBm}) = 10\log_{10}(P_{ac}) + 30 + 2,15$

The difference, for each of the three channels, between the actual transmitter output power averaged over the 8 measurement orientations and the received transmitter output power at orientation $n = 0$ is used to scale the received measurement results to actual transmitter output powers for all measured power control levels and ARFCN, which can then be checked against the requirements.

- c) Temporary antenna connector calibration factors (transmit)

A modified test sample equipped with a temporary antenna connector is placed in a climatic test chamber and is linked to the SS by means of the temporary antenna connector.

Under normal test conditions, the power measurement and calculation parts of steps a) to j) of 13.16.2.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

NOTE: The values noted here are related to the output transmitter carrier power levels under normal test conditions, which are known after step b). Therefore frequency dependent calibration factors that account for the effects of the temporary antenna connector can be determined.

- d) Measurements at extreme test conditions.

NOTE: Basically the procedure for extreme conditions is:

- the power/time template is tested in the "normal" way,
- the radiated power is measured by measuring the difference with respect to the radiated power under normal test conditions.

Under extreme test conditions steps a) to h) of 13.16.2.4.1.2 are repeated except that the repeats at step d) are only performed for power control level 10 and the minimum power control level of the MS.

The transmitter output power under extreme test conditions is calculated for each burst type, power control level and for every frequency used by adding the frequency dependent calibration factor, determined in c), to the values obtained at extreme conditions in this step.

13.16.2.5 Test requirements

- a) The transmitter output power, under every combination of normal and extreme test conditions, for normal bursts and access bursts, at each frequency and for each power control level applicable to the

MS power class, shall be at the relevant level shown in table 13.16.2-1 or table 13.16.2-2 within the tolerances also shown in table 13.16.2-1 or table 13.16.2-2

GSM 900 only - begin

Table 13.16.2-1: GSM 900 transmitter output power for different power classes

| Power class | | | | Power control level | Transmitter output power | Tolerances | |
|-------------|---|---|---|---------------------|--------------------------|------------|-----------|
| 2 | 3 | 4 | 5 | | dBm | normal | extreme |
| . | | | | 2 | 39 | +/-2 dB | +/-2,5 dB |
| . | . | | | 3 | 37 | +/-3 dB*) | +/-4 dB*) |

| . | . | . | 9 | 12 | +/-4 dB | +/-5 dB |
| . | . | . | 10 | 10 | +/-4 dB | +/-5 dB |
| . | . | . | 11 | 8 | +/-4 dB | +/-5 dB |
| . | . | . | 12 | 6 | +/-4 dB | +/-5 dB |
| . | . | . | 13 | 4 | +/-4 dB | +/-5 dB |
| . | . | . | 14 | 2 | +/-5 dB | +/-6 dB |
| . | . | . | 15 | 0 | +/-5 dB | +/-6 dB |

*) When the power control level corresponds to the power class of the MS, then the tolerances shall be 2,0 dB under normal test conditions and 2,5 dB under extreme test conditions.

DCS 1 800 only - end

- b) The difference between the transmitter output power at two adjacent power control levels, measured at the same frequency, shall not be less than 0,5 dB and not be more than 3,5 dB.
- c) The power/time relationship of the measured samples for normal bursts shall be within the limits of the power time template of figure 13-7-2 (GSM 11.10) at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

* For GSM900 MS: -4 dBc for power control level 16
 -2 dBc for power control level 17
 -1 dBc for power control levels 18 and 19
 For DCS1800 MS: -4 dBc for power control level 11
 -2 dBc for power control level 12
 -1 dBc for power control levels 13, 14 and 15

** For GSM900 MS: -30 dBc or -17 dBm, whichever is the higher
 For DCS1800 MS: -30 dBc or -20 dBm, whichever is the higher

| | lowest limit |
|---------|---|
| GSM900 | -59 dBc or -54 dBm whichever is the highest, except for the timeslot preceding the active slot, for which the allowed level is -59 dBc or -36 dBm, whichever is the highest |
| DCS1800 | -48 dBc or -48 dBm whichever is the highest |

- d) All the power control levels, for the type and power class of the MS as stated by the manufacturer, shall be implemented in the MS.
- e) When the transmitter is commanded to a power control level outside of the capability corresponding to the type and power class of the MS as stated by the manufacturer, then the transmitter output power shall be within the tolerances for the closest power control level corresponding to the type and power class as stated by the manufacturer.
- f) The power/time relationship of the measured samples for access bursts shall be within the limits of the power time template of figure 13-7-3 at each frequency, under every combination of normal and extreme test conditions and at each power control level measured.

* For GSM900 MS: -4 dBc for power control level 16

| | |
|-------------------|---|
| | -2 dBc for power control level 17 |
| | -1 dBc for power control levels 18 and 19 |
| For DCS1800 MS: | -4 dBc for power control level 11 |
| | -2 dBc for power control level 12 |
| | -1 dBc for power control levels 13, 14 and 15 |
| ** For GSM900 MS: | -30 dBc or -17 dBm, whichever is the higher |
| For DCS1800 MS: | -30 dBc or -20 dBm, whichever is the higher |

13.16.3. Output RF spectrum in GPRS multislot configuration

13.16.3.1 Definition and applicability

The output RF spectrum is the relationship between the frequency offset from the carrier and the power, measured in a specified bandwidth and time, produced by the MS due to the effects of modulation and power ramping.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS and multiband GSM 900 / DCS 1800 which are capable of GPRS multislot operation.

13.16.3.2 Conformance requirement

1. The level of the output RF spectrum due to modulation shall be no more than that given in GSM 05.05, 4.2.1, table a) for GSM 900 or table b) for DCS 1 800, with the following lowest measurement limits:
 - -36 dBm below 600 kHz offset from the carrier,
 - -51 dBm for GSM 900 or -56 dBm for DCS 1 800 from 600 kHz out to less than 1 800 kHz offset from the carrier,
 - -46 dBm for GSM 900 or -51 dBm for DCS 1 800 at and beyond 1 800 kHz offset from the carrier,
 but with the following exceptions at up to -36 dBm:
 - up to three bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz in the combined range 600 kHz to 6000 kHz above and below the carrier,
 - up to 12 bands of 200 kHz width centred on a frequency which is an integer multiple of 200 kHz at more than 6 000 kHz offset from the carrier.
 - 1.1 Under normal conditions; GSM 05.05, 4.2.1.
 - 1.2 Under extreme conditions; GSM 05.05, 4.2.1; GSM 05.05, annex D D.2.1, D.2.2.
2. The level of the output RF spectrum due to switching transients shall be no more than given in GSM 05.05, 4.2.2, table "a) Mobile Station:".
 - 2.1 Under normal conditions; GSM 05.05, 4.2.2.
 - 2.2 Under extreme conditions; GSM 05.05, 4.2.2; GSM 05.05 annex D D.2.1, D.2.2.
3. When allocated a channel, the power emitted by the MS, in the band 935 to 960 MHz shall be no more than -79 dBm, in the band 925 to 935 MHz shall be no more than -67 dBm and in the band 1 805 to 1 880 MHz shall be no more than -71 dBm except in five measurements in each of the bands 925 to 960 MHz and 1 805 to 1 880 MHz where exceptions at up to -36 dBm are permitted. Under normal conditions; GSM 05.05, 4.3.3.

13.16.3.3 Test purpose

1. To verify that the output RF spectrum due to modulation does not exceed conformance requirement 1 in the GPRS multislot configurations.
 - 1.1 Under normal conditions.
 - 1.2 Under extreme conditions.
2. To verify that the output RF spectrum due to switching transients does not exceed conformance requirement 2 in the GPRS multislot configurations when a reasonable margin is allowed for the effect of spectrum due to modulation.
 - 2.1 Under normal conditions.
 - 2.2 Under extreme conditions.
3. To verify that the MS spurious emissions in the MS receive band do not exceed conformance requirement 3 in the GPRS multislot configurations.

13.16.3.4 Method of test**13.16.3.4.1 Initial conditions**

A call is set up according to the generic call set up procedure for multislot GPRS with the highest number of uplink slots.

The SS commands the MS to hopping mode. The hopping pattern includes only three channels, namely one with an ARFCN in the Low ARFCN range, a second one with an ARFCN in the Mid ARFCN range and the third one with an ARFCN in the High ARFCN range.

The SS commands the MS to complete the multislot loop back type G (see 04.14. 5.2). This is to set a defined random pattern for the transmitter.

The SS sends Standard Test Signal C1 (annex 5) to the MS at a level of 23 dB μ Vemf().

NOTE 1: Although the measurement is made whilst the MS is in hopping mode, each measurement is on one single channel.

NOTE 2: This test is specified in hopping mode as a simple means of making the MS change channel, it would be sufficient to test in non hopping mode and to cell re-select the MS between the three channels tested at the appropriate time.

13.16.3.4.2 Procedure

NOTE: When averaging is in use during frequency hopping mode, the averaging only includes bursts transmitted when the hopping carrier corresponds to the nominal carrier of the measurement.

- a) In steps b) to h) the FT is equal to the hop pattern ARFCN in the Mid ARFCN range.
- b) The other settings of the spectrum analyser are set as follows:
 - Zero frequency scan
 - Resolution bandwidth: 30 kHz
 - Video bandwidth: 30 kHz
 - Video averaging: may be used, depending on the implementation of the test

The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst in one of the active time slots is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser. Only measurements during transmitted bursts on the nominal carrier of the measurement are included. The spectrum analyser averages over the gated period and over 200 or 50 such bursts, using numerical and/or video averaging.

- c) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 50 bursts at all multiples of 30 kHz offset from FT to < 1 800 kHz.
- d) The resolution and video bandwidth on the spectrum analyser are adjusted to 100 kHz and the measurements are made at the following frequencies:

on every ARFCN from 1 800 kHz offset from the carrier to the edge of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the 2 MHz either side of the relevant transmit band for each measurement over 50 bursts.

at 200 kHz intervals over the band 925 - 960 MHz for each measurement over 50 bursts.

at 200 kHz intervals over the band 1805 - 1880 MHz for each measurement over 50 bursts.

- e) The MS is commanded to its minimum power control level. The spectrum analyser is set again as in b).
- f) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured over 200 bursts at the following frequencies:

FT

FT + 100 kHz FT - 100 kHz

FT + 200 kHz FT - 200 kHz

FT + 250 kHz FT - 250 kHz

FT + 200 kHz * N FT - 200 kHz * N

where N = 2, 3, 4, 5, 6, 7, and 8
and FT = RF channel nominal centre frequency.

- g) Steps a) to f) is repeated except that in step a) the spectrum analyzer is gated so that the burst of the next active time slot is measured.
- h) The spectrum analyser settings are adjusted to:
- Zero frequency scan
 - Resolution bandwidth: 30 kHz
 - Video bandwidth: 100 kHz
 - Peak hold

The spectrum analyser gating of the signal is switched off.

The MS is commanded to its maximum power control level in every transmitted time slot.

- i) By tuning the spectrum analyser centre frequency to the measurement frequencies the power level is measured at the following frequencies:

| | |
|--------------|--------------|
| FT + 400 kHz | FT - 400 kHz |
| FT + 600 kHz | FT - 600 kHz |
| FT + 1,2 MHz | FT - 1,2 MHz |
| FT + 1,8 MHz | FT - 1,8 MHz |

where FT = RF channel nominal centre frequency.

The duration of each measurement (at each frequency) will be such as to cover at least 10 burst transmissions at FT.

- j) Step i) is repeated for power control levels 7 and 11.
- k) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the Low ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.
- l) Steps b), f), h) and i) are repeated with FT equal to the hop pattern ARFCN in the High ARFCN range except that in step h) the MS is commanded to power control level 11 rather than maximum power.
- m) Steps a) b) f) h), and i) are repeated under extreme test conditions (annex 1, TC2.2). except that at step h) the MS is commanded to power control level 11.

13.16.3.5 Test requirements

For absolute measurements, performed on a temporary antenna connector, in the frequency band 880 to 915 MHz or 1710 to 1785 MHz, the temporary antenna connector coupling factor, determined according to 13.3.4.2.2 and annex 1 GC7, for the nearest relevant frequency, will be used.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 925 to 960 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for GSM 900 MS. For a DCS 1 800 MS 0 dB will be assumed.

For absolute measurements, performed on a temporary antenna connector, in the frequency band 1805 to 1880 MHz, the temporary antenna connector coupling factor, will be as determined according to annex 1 GC7 for DCS 1 800 MS. For GSM 900 MS 0 dB will be assumed.

The figures in the tables below, at the listed frequencies from the carrier (kHz), are the maximum level (dB) relative to a measurement in 30 kHz bandwidth on the carrier (reference GSM 05.05 section 4.2.1).

- a) For the modulation sidebands out to less than 1 800 kHz offset from the carrier frequency (FT) measured in step c), f), i), k), l) and m) the measured power level in dB relative to the power level measured at FT, for all types of MS, shall not exceed the limits derived from the values shown in table 13.16.3-1 for GSM 900 or table 13.16.3-2 for DCS 1 800 according to the actual transmit power and frequency offset from FT. However any failures in the combined range 600 kHz to less than 1 800 kHz above and below the carrier may be counted towards the exceptions allowed in test requirements c) below.

Table 13.16.3-1: GSM 900 Spectrum due to modulation out to less than 1 800 kHz offset

| | power levels in dB relative to the measurement at FT | | | | |
|--|--|-----|-----|-----|--------------|
| Power level | Frequency offset (kHz) | | | | |
| (dBm) | 0-100 | 200 | 250 | 400 | 600 to <1800 |
| 39 | +0,5 | -30 | -33 | -60 | -66 |
| 37 | +0,5 | -30 | -33 | -60 | -64 |
| 35 | +0,5 | -30 | -33 | -60 | -62 |
| <= 33 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -51 |

Table 13.16.3-2: DCS 1 800 Spectrum due to modulation out to less than 1 800 kHz offset

| | power levels in dB relative to the measurement at FT | | | | |
|--|--|-----|-----|-----|--------------|
| Power level | Frequency offset (kHz) | | | | |
| (dBm) | 0-100 | 200 | 250 | 400 | 600 to <1800 |
| <= 36 | +0,5 | -30 | -33 | -60 | -60 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | |
| | -36 | -36 | -36 | -36 | -56 |

NOTE 1: For frequency offsets between 100 kHz and 600 kHz the requirement is derived by a linear interpolation between the points identified in the table with linear frequency and power in dB relative.

- b) For the modulation sidebands from 1 800 kHz offset from the carrier frequency (FT) and out to 2 MHz beyond the edge of the relevant transmit band, measured in step d), the measured power level in dB relative to the power level measured at FT, shall not exceed the values shown in table 13.16.3-3 according to the actual transmit power, frequency offset from FT and system on which the MS is designed to operate. However any failures in the combined range 1 800 kHz to 6 MHz above and

below the carrier may be counted towards the exceptions allowed in test requirements c) below, and any other failures may be counted towards the exceptions allowed in test requirements d) below.

Table 13.16.3-3: Spectrum due to modulation from 1 800 kHz offset to the edge of the transmit band (wideband noise)

| power levels in dB relative to the measurement at FT | | | | | | |
|--|------------------|------------|------------|-----------------|------------------|------------|
| GSM900 | | | | DCS1800 | | |
| Power level | Frequency offset | | | Power level | Frequency offset | |
| (dBm) | kHz | | | (dBm) | kHz | |
| | 1800 to | 3000 to | >= 6000 | | 1800 to | >= 6000 |
| | < 3000 | < 6000 | | | < 6000 | |
| 39 | -69 | -71 | -77 | 36 | -71 | -79 |
| 37 | -67 | -69 | -75 | 34 | -69 | -77 |
| 35 | -65 | -67 | -73 | 32 | -67 | -75 |
| <= 33 | -63 | -65 | -71 | 30 | -65 | -73 |
| | | | | 28 | -63 | -71 |
| | | | | 26 | -61 | -69 |
| | | | | <= 24 | -59 | -67 |
| The values above are subject to the minimum absolute levels (dBm) below. | | | | | | |
| | -46 | -46 | -46 | | -51 | -51 |

- c) Any failures (from a) and b) above) in the combined range 600 kHz to 6 MHz above and below the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, spurious emissions are allowed in up to three 200 kHz bands centred on an integer multiple of 200 kHz so long as no spurious emission exceeds -36 dBm. Any spurious emissions measured in a 30 kHz bandwidth which spans two 200 kHz bands can be counted towards either 200 kHz band, whichever minimizes the number of 200 kHz bands containing spurious exceptions.
- d) Any failures (from b) above) beyond 6 MHz offset from the carrier should be re-checked for allowed spurious emissions. For each of the three ARFCN used, up to twelve spurious emissions are allowed so long as no spurious emission exceeds -36 dBm.
- e) The MS spurious emissions in the bands 925 - 935 MHz, 935 - 960 MHz and 1 805 - 1 880 MHz, measured in step d), for all types of MS, shall not exceed the values shown in table 13.16.3-4 except in up to five measurements in the band 925 to 960 MHz and five measurements in the band 1 805 to 1 880 MHz where a level up to -36 dBm is permitted.

Table 13.16.3-4: Spurious emissions in the MS receive bands

| Band (MHz) | Spurious emissions level (dBm) |
|--------------|--------------------------------|
| 925 to 935 | -67 |
| 935 to 960 | -79 |
| 1805 to 1880 | -71 |

- f) For the power ramp sidebands of steps h), i) and k) the power levels must not exceed the values shown in table 13.16.3-5 for GSM 900 or table 13.16.3-6 for DCS 1 800.

Table 13.16.3-5: GSM Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency | | | |
|-------------|--|---------|----------|----------|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 39 dBm | -13 dBm | -21 dBm | -21 dBm | -24 dBm |
| 37 dBm | -15 dBm | -21 dBm | -21 dBm | -24 dBm |
| 35 dBm | -17 dBm | -21 dBm | -21 dBm | -24 dBm |
| 33 dBm | -19 dBm | -21 dBm | -21 dBm | -24 dBm |
| 31 dBm | -21 dBm | -23 dBm | -23 dBm | -26 dBm |
| 29 dBm | -23 dBm | -25 dBm | -25 dBm | -28 dBm |
| 27 dBm | -23 dBm | -26 dBm | -27 dBm | -30 dBm |
| 25 dBm | -23 dBm | -26 dBm | -29 dBm | -32 dBm |
| 23 dBm | -23 dBm | -26 dBm | -31 dBm | -34 dBm |
| <= +21 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

Table 13.16.3-6: DCS 1 800 Spectrum due to switching transients

| Power level | Maximum level for various offsets from carrier frequency | | | |
|-------------|--|---------|----------|----------|
| | 400 kHz | 600 kHz | 1200 kHz | 1800 kHz |
| 36 dBm | -16 dBm | -21 dBm | -21 dBm | -24 dBm |
| 34 dBm | -18 dBm | -21 dBm | -21 dBm | -24 dBm |
| 32 dBm | -20 dBm | -22 dBm | -22 dBm | -25 dBm |
| 30 dBm | -22 dBm | -24 dBm | -24 dBm | -27 dBm |
| 28 dBm | -23 dBm | -25 dBm | -26 dBm | -29 dBm |
| 26 dBm | -23 dBm | -26 dBm | -28 dBm | -31 dBm |
| 24 dBm | -23 dBm | -26 dBm | -30 dBm | -33 dBm |
| 22 dBm | -23 dBm | -26 dBm | -31 dBm | -35 dBm |
| <= +20 dBm | -23 dBm | -26 dBm | -32 dBm | -36 dBm |

NOTE 2: These figures are different from the requirements in GSM 05.05 because at higher power levels it is the modulation spectrum which is being measured using a peak hold measurement. This allowance is given in the table.

NOTE 3: The figures for table 13.16.3-5 and table 13.16.3-6 assume that, using the peak hold measurement, the lowest level measurable is 8 dB above the level of the modulation specification using the 30 kHz bandwidth gated average technique for 400 kHz offset from the carrier. At 600 and 1200 kHz offset the level is 6 dB above and at 1 800 kHz offset the level is 3 dB above. The figures for 1 800 kHz have assumed the 30 kHz bandwidth spectrum due to modulation specification at <1 800 kHz.

14 Receiver

In this section on receiver measurements, the procedures to test equipment which is fitted with a permanent antenna connector, and the procedures to test equipment which is designed to only be used with an integral antenna, are in general combined into one single test description.

Tests on Mobile Stations fitted with an integral antenna and having no means of connecting an external antenna are specified in terms of received field strength. In order to perform tests on such Mobile Stations without the need for separated access to a calibrated test site a temporary antenna connector is used as defined in annex 1 section 1.1.3 (General Conditions).

In practice the temporary antenna connector may be used for transmitter measurements described in section 3, but the calibration factors determined in [Annex 1] will not be directly usable. The detailed calibration, when needed, for transmission tests are described in the relevant sections of 3.

Wherever in this section, for FACCH tests, the SS is required to send a Layer 3 message not requiring a Layer 3 response from the MS the message can be a TEST INTERFACE message or a STATUS message, possibly with an unknown Protocol Discriminator.

Testing philosophy

Certain assumptions concerning the functional mechanisms of GSM receivers have been made in order to define tests that will verify the receiver performance without excessive redundancy and excessive test times.

The receiver functions can be divided into:

- Analogue RF and IF stages that are affected by input levels, temperature and power supply levels.
- Demodulator that is affected by input levels and interfering signals.
- Decoders that are affected by the different logical channels and input levels.

The tests are designed to stress each of these blocks with a minimum of redundancy.

Statistical testing of receiver BER/FER performance

Error Definition

1) Frame Erasure Ratio (FER)

A frame is defined as erased if the error detection functions in the receiver, operating in accordance with GSM 05.03, indicate an error (BFI = 1). For full rate or half rate speech this is the result of the 3 bit cyclic redundancy check (CRC) as well as other processing functions that cause a Bad Frame Indication (BFI). For signalling channels it is the result of the FIRE code or any other block code used. For data traffic FER is not defined.

2) Residual Bit Error Ratio (RBER)

The Residual Bit Error Ratio is defined as the Bit Error Ratio (BER) in frames which have not been declared as erased.

3) Bit Error Ratio (BER)

The Bit Error Ratio is defined as the ratio of the bits wrongly received to all data bits sent.

4) Unreliable Frame Ratio (UFR)

The Unreliable Frame Ratio is defined as the ratio of frames declared as erased (BFI=1), or unreliable (UFI=1), to the total number of frames transmitted. An unreliable frame is indicated by setting the UFI flag (UFI=1) and an erased frame is indicated by setting the BFI flag (BFI=1). (See GSM 06.21.)

5) Erased SID Frame Ratio (ESIDR)

A SID Frame is erased (SID=0) when the MS does not detect a valid transmitted SID frame as a valid SID frame (SID=2), or an invalid SID frame (SID=1). The Erased SID Frame Ratio is defined as the ratio of erased SID frames (SID=0), to the total number of valid SID frames transmitted. (See GSM 06.41.)

6) Erased Valid SID Frame Ratio (EVSIDR).

An Erased Valid SID Frame is declared when the MS does not detect a valid transmitted SID frame as a valid SID frame (SID=2) and (BFI=0 and UFI=0). The Erased Valid SID Frame Ratio is defined as the ratio of erased valid SID frames (SID=0), or (SID=1), or ((BFI or UFI)=1), to the total number of valid SID frames transmitted. (See GSM 06.41.)

Test method

Each test is performed in the following manner:

- a) Set up the required test conditions.
- b) Perform the test for at least the minimum number of samples (frames, bits or bits from non erased frames) and record the number of offered samples and the number of occurred events (frame, bit or residual bit errors).
- c) Terminate the test and determine the test result ("pass" or "fail") by comparing the measured error rate against the test limit error rate.

It is permitted to run the test over more samples than the value stated for minimum number of samples. The effect of increasing the number of samples is always to give a higher probability that a good unit will pass and a lower risk that a bad unit will pass, according to the definitions of good and bad unit in this section.

Test criteria

The limits on number of samples and test limit error rate shall be defined in order to comply with different requirements:

- 1) to keep reasonably low the risk of passing a bad unit for each individual test;
- 2) to have high probability of passing a good unit for each individual test;
- 3) to perform measurements with a high degree of statistical significance;
- 4) to keep the test time as low as possible.

The risk of passing a bad unit (point 1) should be kept lower than 0,2 %. The performance on a full rate channel, or a half rate data channel, is generally considered "bad" if its BER (or FER) performance is 1,5 times worse than that specified in AWGN (Additive White Gaussian Noise) and 1,26 times worse than that specified in multipath environment. These values have been adopted (taking into account the expected shapes of the BER performance) in order not to pass a unit with performance worse than the specifications by more than 1 dB.

The performance on a half rate speech channel, is generally considered "bad" if the BER (or FER, or UFR) is worse than that specified, multiplied by the factors given in table 14-1. These values have been adopted (taking into account the expected shapes of the BER performance) in order not to pass a unit with performance worse than the specifications by more than 1 dB.

Table 14-1: TCH/HS "bad" unit multiplication factors

| Propagation Conditions | GSM 900 | | | | DCS 1 800 | | | |
|---|------------------|---------------------------------|---------------|---------------|------------------|---------------------------------|---------------|---------------|

| | 1,3 | | | | 1,3 | | | |

The probability of passing a good unit operating on the specification limit of performance (point 2) should be at least 99,7 %.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events (point 3) not lower than 200 in AWGN channel and not lower than 600 in a multipath environment, and to test a BER (or FER) performance 1,22 times worse than that specified in AWGN and 1,12 times worse than that specified in a multipath environment (this corresponds to testing a performance, at the most, 0,5 dB worse than that specified).

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14-1.

Table 14-2: Minimum test time according to propagation profile

| Propagation Conditions | GSM 900 | | | | DCS 1 800 | | | |
|------------------------|---------|--------|----|----|-----------|--------|-----|----|
| | TUlow | TUhigh | HT | RA | TUlow | TUhigh | HT | RA |
| Min. test time (s) | 500 | 30 | 15 | 6 | 500 | 15 | 7,5 | 6 |

Tables 14-3 and 14-4 detail, for the different test conditions, the minimum number of samples required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

As can be seen in the tables, in some of the cases in which both FER and RBER have to be tested on the same channel, the length of time for the FER measurement has been adopted for the RBER measurement. This is longer than that required for the RBER only according to the discussed criteria, but allows the use of a test limit error rate closer to the specified error rate while maintaining the same statistical significance. When, as is normal, it is desired to perform the FER and RBER tests, the closer test limit error rate for the RBER measurement can be achieved without increasing the total test time. It is always possible to extend the length of any test and further improve the statistical significance of that test.

Table 14-3: Test conditions for GSM 900

| Type of test | Type of channel | Propagation/ frequency conditions | Speci- fied FER/ BER % | Test limit FER/ BER % | Minimum No of samples | Prob that good unit will pass % | Bad unit BER/ FER % | Risk that bad unit will pass |

NOTE 1: α is a parameter which ranges from 1 to 1,6. The value of α for a RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions. For example, the value of α may be different for a TUhigh sensitivity test and an RA sensitivity test. The value of α is determined by dividing the measured error rate for the FER test by the value of the test limit error rate listed in the limits section of the test corresponding to $\alpha=1$; if the result of the division is lower than 1, a value of $\alpha=1$ shall be used, if the value of $\alpha > 1,6$ the FER test has failed (the normal treatment of stimulus uncertainties applies). The probabilities that a good unit will pass and the risks that a bad unit will pass, listed in the table are valid for $\alpha=1$, and would be slightly different for other values of α .

NOTE 2: In order to save time the sensitivity and co-channel rejection tests for the TCH/F2,4 channel does not comply with the above said constraints.

In fact, a bad unit which performs 2 times (instead of 1,26) worse than that specified is accounted for, so reducing the required number of events to 150, instead of 600. On the other hand, the specified RBER is in this case $10E-5$ and, on the basis of simulations and hardware validation results, doubling this RBER results in a drop in performance of less than 1 dB.

14.1 Bad frame indication

14.1.1 Bad frame indication - TCH/FS

14.1.1.1 Bad frame indication - TCH/FS - Random RF input

14.1.1.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting speech.

14.1.1.1.2 Conformance requirement

On a full rate speech TCH (TCH/FS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b

14.1.1.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

14.1.1.1.4 Method of test

14.1.1.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

14.1.1.1.4.2 Procedure

- a) The SS simulates a BSS in DTX mode. During the period when no transmission would occur the SS transmits a GSM carrier modulated with random data at a level 11 dB above reference sensitivity level(). The SACCH is transmitted normally at a level 20 dB above reference sensitivity(). The SID frame is transmitted in its correct time interval with valid information at a level 20 dB above reference sensitivity level(). During transmission of SACCH or SID frames the random data is discontinued.
- b) The SS transmits at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

14.1.1.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

| | |
|----------------------------|---------------------------------|
| Test limit error rate: | 0,041 % |
| Minimum number of samples: | 492 000 (excluding SID frames). |

During loop back of SID frames no BFI shall be set.

14.1.1.2 Bad frame indication - TCH/FS - Frequency hopping and downlink DTX

14.1.1.2.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting speech.

14.1.1.2.2 Conformance requirement

On a speech TCH (TCH/FS or TCH/HS), when DTX is activated with frequency hopping through C0 where bursts comprising SID frames, SACCH frames and dummy bursts are received at a level 20 dB above the reference sensitivity level and with no transmissions at the other bursts of the TCH, the overall reception performance shall be such that, on average less than one undetected bad speech frame (false bad frame indication BFI) shall be measured in one minute for MS. GSM 05.05, 6.4 c.

14.1.1.2.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

14.1.1.2.4 Method of test

14.1.1.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

14.1.1.2.4.2 Procedure

- a) The SS sets downlink DTX on.
- b) The SS performs the measurement over at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS only transmits SID frames, SACCH frames and dummy bursts, with no transmission of TCH bursts. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

14.1.1.2.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

| | | |
|----------------------------|---------|-------------------------|
| Test limit error rate: | 0,041 % | |
| Minimum number of samples: | 492 000 | (excluding SID frames). |

During loop back of SID frames no BFI shall be set.

14.1.2 Bad frame indication - TCH/HS

14.1.2.1 Bad frame indication - TCH/HS - Random RF input

14.1.2.1.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting half rate speech.

14.1.2.1.2 Conformance requirement

On a half rate speech TCH (TCH/HS) with a random RF input, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b.

14.1.2.1.3 Test purpose

1. To verify that the BFI performance does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

14.1.2.1.4 Method of test

14.1.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS commands the MS to complete traffic channel loop back A and signal frames detected with BFI=1 as erased.

NOTE 1: Test loop A is defined in clause 36. Frames detected with BFI=1 are signalled as erased on the uplink.

NOTE 2: DTX is used during the test to prevent the MS dropping the call.

14.1.2.1.4.2 Procedure

- a) The SS simulates a BSS in DTX mode. During the periods when no transmission would occur, the SS transmits a GSM carrier modulated with random data, at a level 11 dB above reference sensitivity level(). The SACCH is transmitted normally, at a level 20 dB above reference sensitivity(). The SID frame is transmitted in its correct time interval, with valid information, at a level 20 dB above reference sensitivity level(). During transmission of SACCH or SID frames, the random data is discontinued.

- b) The SS transmits at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

14.1.2.1.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

| | | |
|----------------------------|---------|-------------------------|
| Test limit error rate: | 0,041 % | |
| Minimum number of samples: | 492 000 | (excluding SID frames). |

During loop back of SID frames no BFI shall be set.

14.1.2.2 Bad frame indication - TCH/HS - Frequency hopping and downlink DTX

14.1.2.2.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

The requirements and this test only apply to MS supporting half rate speech.

14.1.2.2.2 Conformance requirement

On a half rate speech TCH (TCH/HS), when DTX is activated with frequency hopping through C0 where bursts comprising SID frames, SACCH frames and dummy bursts are received at a level 20 dB above the reference sensitivity level and with no transmissions at the other bursts of the TCH, the overall reception performance shall be such that, on average less than one undetected bad speech frame (false bad frame indication BFI) shall be measured in one minute for MS. GSM 05.05, 6.4 c.

14.1.2.2.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

14.1.2.2.4 Method of test

14.1.2.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

14.1.2.2.4.2 Procedure

- a) The SS sets downlink DTX on.
- b) The SS performs the measurement over at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS only transmits SID frames, SACCH frames and dummy bursts, with no transmission of TCH bursts. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

14.1.2.2.5 Test requirements

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

| | | |
|----------------------------|---------|-------------------------|
| Test limit error rate: | 0,041 % | |
| Minimum number of samples: | 492 000 | (excluding SID frames). |

During loop back of SID frames no BFI shall be set.

14.1.3 Bad frame indication - TCH/FS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network

14.1.3.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a full rate speech TCH (TCH/FS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

Annex A of GSM 05.02 requires that a phase 2 MS behave properly in a phase 1 network.

The requirements and this test only apply to MS supporting speech.

14.1.3.2 Conformance requirement

On a full rate speech TCH (TCH/FS) in DTX conditions with a transmitted burst 20 dB above reference sensitivity and static conditions, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b.

14.1.3.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

14.1.3.4 Method of test**14.1.3.4.1 Initial conditions**Initial conditions 1

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|--|-----------------------------------|---|
| Dummy bursts with (BN61, BN 62,...) mapped from the TSC bits of normal bursts. See section A.2.1.3 of GSM 05.02 | Partial SID information. See section A.2.2.1 of GSM 05.02. | 0 | 0 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

Initial conditions 2

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|--|-----------------------------------|---|
| Partial SID information. See section A.2.1.4 of GSM 05.02 | Partial SID information. See section A.2.2.1 of GSM 05.02. | 1 | 1 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

Initial conditions 3

A call is set up according to the generic call set up procedure on a TCH/FS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|--|--|-----------------------------------|---|
| Dummy bursts with 'C0 filling training sequence'. See section A.2.1.4 of GSM 05.02 | Dummy bursts mixed bits. See section A.2.2.2 of GSM 05.02. | 1 | 1 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

14.1.3.4.2 Procedure

The two following steps are repeated 3 times, once for each initial condition specified in the previous clause.

- a) The SS sets downlink DTX on.
- b) The SS transmits at least the minimum number of samples of frames of TCH/FS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

14.1.3.5 Test requirements

after each repetition of steps a) + b) the following requirements are applied:

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

| | | |
|----------------------------|---------|-------------------------|
| Test limit error rate: | 0,041 % | |
| Minimum number of samples: | 492 000 | (excluding SID frames). |

During loop back of SID frames no BFI shall be set.

14.1.4 Bad frame indication - TCH/HS - Frequency hopping and downlink DTX - Phase 2 MS in a phase 1 network

14.1.4.1 Definition and applicability

The performance of the Bad Frame Indication (BFI) is a measure of the effectiveness of the MS under DTX conditions. It includes the effect of the 3 bit Cyclic Redundancy Check (CRC) and all other processing associated with the DTX function. The BFI is measured on a half rate speech TCH (TCH/HS) by counting the number of undetected bad frames whilst the input signal is a randomly modulated carrier.

Annex A of GSM 05.02 requires that a phase 2 MS behave properly in a phase 1 network.

The requirements and this test only apply to MS supporting half rate speech.

14.1.4.2 Conformance requirement

On a half rate speech TCH (TCH/HS) in DTX conditions with a transmitted burst 20 dB above reference sensitivity and static conditions, the overall reception performance shall be such that, on average, less than one undetected bad speech frame (false bad frame indication) in 60 seconds will be measured; GSM 05.05, 6.4 b.

14.1.4.3 Test purpose

1. To verify that the BFI performance in case of frequency hopping including the C0 radio frequency does not exceed the conformance requirement with an allowance for the statistical significance of the test.
2. To verify that on reception of a SID frame the BFI is not set.

14.1.4.4 Method of test**14.1.4.4.1 Initial conditions**Initial conditions 1

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|--|-----------------------------------|---|
| Dummy bursts with (BN61, BN 62,...) mapped from the TSC bits of normal bursts. See section A.2.1.3 of GSM 05.02 | Partial SID information. See section A.2.2.1 of GSM 05.02. | 0 | 0 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

Initial conditions 2

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|---|--|-----------------------------------|---|
| Partial SID information. See section A.2.1.4 of GSM 05.02 | Partial SID information. See section A.2.2.1 of GSM 05.02. | 1 | 1 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

Initial conditions 3

A call is set up according to the generic call set up procedure on a TCH/HS with a transmitted burst 20 dB above reference sensitivity. Random frequency hopping on two channels including the C0 radio frequency with ARFCNs with at least 5 channels separation shall be used, power control level set to maximum power.

When downlink DTX is activated with frequency hopping including the C0 radio frequency, the following configuration applies for filling the bursts on the C0 carrier:

| C0 filling on the TCH | Half burst filling | Dummy bursts stealing flag | Half burst Filling stealing flag |
|--|--|-----------------------------------|---|
| Dummy bursts with 'C0 filling training sequence'. See section A.2.1.4 of GSM 05.02 | Dummy bursts mixed bits. See section A.2.2.2 of GSM 05.02. | 1 | 1 |

The SS commands the MS to complete the traffic channel loop back and signal the bad frame indication.

NOTE: DTX is used during the test to prevent the MS dropping the call.

14.1.4.4.2 Procedure

The two following steps are repeated 3 times, once for each initial condition specified in the previous clause.

- a) The SS sets downlink DTX on.
- b) The SS transmits at least the minimum number of samples of frames of TCH/HS information and checks the BFI of the looped back signal from the MS. The SS records the number of frames where the bad frame indication is not set. During transmission by the SS of SID frames the SS checks that the BFI is not set.

NOTE 1: Further explanations on the mechanism of signalling the BFI to the SS will be found in clause 36.

NOTE 2: In some cases the MS decodes half SID frames correctly even if these are not transmitted completely. Therefore, in case that a MS detects a good SID frame, the SS has to consider the received bits in detail.

14.1.4.5 Test requirements

After each repetition of steps a) + b) the following requirements are applied:

The BFI performance is accepted if the measured rate of undetected bad frames does not exceed the test limit error rate:

| | | |
|----------------------------|---------|-------------------------|
| Test limit error rate: | 0,041 % | |
| Minimum number of samples: | 492 000 | (excluding SID frames). |

During loop back of SID frames no BFI shall be set.

14.2 Reference sensitivity

14.2.1 Reference sensitivity - TCH/FS

14.2.1.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

14.2.1.2 Conformance requirement

1. At reference sensitivity level, the TCH/FS FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
2. At reference sensitivity level, the TCH/FS class I RBER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
3. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM 05.05: GSM 05.05, 6.2.
4. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

14.2.1.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

14.2.1.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\text{ })$ to $35 \text{ dB}\mu\text{Vemf}(\text{ })$.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.

14.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range for DCS 1800 and ARFCN 70 for GSM 900, power control level set to maximum power.

NOTE: For GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

14.2.1.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) the SS sets the amplitude of the wanted signal to reference sensitivity level ().
- c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- g) Steps a) to d) are repeated under extreme test conditions.
- h) Steps a) to g) are repeated for TCH/FS with ARFCNs in the Low ARFCN range for DCS 1800 and ARFCN 5 for GSM 900 and the High ARFCN range.

NOTE: For GSM 900 ARFCN 5 is tested since this is the 72nd harmonic of the 13 MHz clock normally used internally in a MS.

- i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.
- j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in section 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level(). This implicitly tests adjacent time slot rejection.

14.2.1.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-5 or 14-6:

Table 14-5: Limits for GSM 900 sensitivity

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS | | | | | | | | |
| FER | $6,742 \cdot \alpha$ | 8900 | | | | | $0,122 \cdot \alpha$ | 164000 |
| class Ib(RBER) | $0,42/\alpha$ | 1000000 | | | | | $0,41/\alpha$ | 20000000 |
| class II(RBER) | 8,333 | 120000 | 7,5 | 24000 | 9,333 | 60000 | 2,439 | 8200 |

Table 14-6: Limits for DCS 1 800 sensitivity

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS | | | | | | | | |
| FER | $4,478 \cdot \alpha$ | 13400 | | | | | $0,122 \cdot \alpha$ | 164000 |
| class Ib(RBER) | $0,32/\alpha$ | 1500000 | | | | | $0,41/\alpha$ | 20000000 |
| class II(RBER) | 8,333 | 60000 | 7,5 | 24000 | 9,333 | 30000 | 2,439 | 8200 |

where α is a parameter which can range from 1 to 1.6. The value of α for a RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

14.2.2 Reference sensitivity - TCH/HS (Speech frames)

14.2.2.1 Definition and applicability

The reference sensitivity level is the signal level at the MS receiver input at which a certain BER and FER and UFR for speech frames must be achieved.

The requirements and this test apply to MS supporting half rate speech.

14.2.2.2 Conformance requirement

1. At reference sensitivity level, the TCH/HS FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
2. At reference sensitivity level, the TCH/HS class Ib RBER (BFI=0) shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05 6.2.
3. At reference sensitivity level, the TCH/HS class II RBER (BFI=0) shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
4. At reference sensitivity level, the TCH/HS UFR shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05 6.2.
5. At reference sensitivity level, the TCH/HS class Ib RBER ((BFI or UFI)=0) shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.

14.2.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under TUhigh propagation conditions with an allowance for the statistical significance of the test.
5. To verify that the MS does not exceed conformance requirement 5 under TUhigh propagation conditions with an allowance for the statistical significance of the test.

14.2.2.4 Method of test

14.2.2.4.1 Initial conditions

The BA list sent on the BCCH and SACCH indicates at least six surrounding cells, with at least one near to each band edge. It is not necessary to generate any of these BCCHs, but if provided, the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\text{ })$ to $35 \text{ dB}\mu\text{Vemf}(\text{ })$.

The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

14.2.2.4.2 Procedure

- a) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop A.

NOTE: Test loop A is defined in clause 36. Frames detected with BFI=1 are signalled as erased on the uplink.

- b) The fading function is set to TUhigh.
- c) The SS sets the amplitude of the wanted signal to reference sensitivity level ().
- d) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- e) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- f) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- g) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- h) Steps d) and e) are repeated, with the SS fading function set in turn to RA and HT.

- j) The SS increases the amplitude of the wanted signal to 20 dB above reference sensitivity level.
- k) The SS commands the MS to open test loop A and close test loop D.

NOTE: Test loop D is defined in clause 36. Frames marked as erased (BFI=1) or unreliable (UFI=1) are signalled to the SS on the uplink.

- l) The fading function is set to TUhigh.
- m) The SS sets the amplitude of the wanted signal to reference sensitivity level ().
- n) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the erased/unreliable frame indication.
- p) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased/unreliable.
- q) The SS also determines the unreliable frame events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased/unreliable.

14.2.2.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, shall not exceed the test limit error rate values given in table 14-7 or 14-8:

Table 14-7: Limits for GSM 900 sensitivity

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | |
|----------------------------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/HS (FER) | 4,598 | 13050 | 8,500 | 20000 | 7,600 | 20000 |
| TCH/HS Class Ib (BFI=0) | 0,404 | 148500 | | | | |
| TCH/HS Class II (BFI=0) | 7,725 | 25500 | | | | |
| TCH/HS (UFR) | 6,250 | 9600 | | | | |
| TCH/HS Class Ib ((BFI or UFI)=0) | 0,269 | 227000 | | | | |

Table 14-8: Limits for DCS 1800 sensitivity

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | |
|----------------------------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/HS (FER) | 4,706 | 12750 | 8,735 | 20000 | 7,600 | 20000 |
| TCH/HS Class Ib (BFI=0) | 0,426 | 141000 | | | | |
| TCH/HS Class II (BFI=0) | 7,725 | 25500 | | | | |
| TCH/HS (UFR) | 6,383 | 9400 | | | | |
| TCH/HS Class Ib ((BFI or UFI)=0) | 0,291 | 206000 | | | | |

14.2.3 Reference sensitivity - FACCH/F

14.2.3.1 Definition and applicability

The reference sensitivity for control channels is the signal level at the MS receiver input at which a certain FER must be achieved.

The requirements and this test apply to all types of MS.

14.2.3.2 Conformance requirement.

At reference sensitivity level, the FACCH/F FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6.2).

14.2.3.3 Test purpose.

To verify that the MS does not exceed the conformance requirement under TUhigh propagation condition with an allowance for the statistical significance of the test.

14.2.3.4 Method of test

14.2.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/F with an ARFCN in the Low ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

14.2.3.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) The SS sets the amplitude of the wanted signal to reference sensitivity level ().
- c) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the low signal level the MS may not be able to acknowledge the Layer 2 frame with an RR frame and the SS will repeat the Layer 2 frame. Each repeated L2 frame will be counted and will indicate a frame erasure event.
- d) The SS determines the frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

14.2.3.5 Test Requirements

The error rates measured shall not exceed the test limit error rate values given in table 14-9.

Table 14-9: Limits for FACCH/F sensitivity

| Channels | Type of measurements | Propagation | GSM 900 | | DCS 1 800 | |
|----------|----------------------|-------------|-------------------------|-----------------------|-------------------------|-----------------------|
| | | | Test limit error rate % | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| FACCH/F | FER | TUhigh | 8,961 | 6696 | 4,368 | 13736 |

14.2.4 Reference sensitivity - FACCH/H

14.2.4.1 Definition and applicability

The reference sensitivity for control channels is the signal level at the MS receiver input at which a certain FER must be achieved.

The requirements and this test apply to MS supporting half rate channels.

14.2.4.2 Conformance requirement.

At reference sensitivity level, the FACCH/H FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6.2).

14.2.4.3 Test purpose.

To verify that the MS does not exceed the conformance requirement under TUhigh propagation condition with an allowance for the statistical significance of the test.

14.2.4.4 Method of test

14.2.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/H with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

14.2.4.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) The SS sets the amplitude of the wanted signal to reference sensitivity level ().
- c) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the low signal level the MS may not be able to acknowledge the Layer 2 frame with an RR frame and the SS will repeat the Layer 2 frame. Each repeated L2 frame will be counted and will indicate a frame erasure event.
- d) The SS determines the frame erasure events during at least the minimum number of samples of FACCH/H frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

14.2.4.5 Test requirements

The error rates measured shall not exceed the test limit error rate values given in table 14-10.

Table 14-10: Limits for FACCH/H sensitivity

| Channels | Type of measurements | Propagation | GSM 900 | | DCS 1 800 | |
|----------|----------------------|-------------|-------------------------|-----------------------|-------------------------|-----------------------|
| | | | Test limit error rate % | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| FACCH/H | FER | TUhigh | 7,728 | | 8,064 | |

14.2.5 Reference sensitivity - full rate data channels

14.2.5.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to MS supporting data.

14.2.5.2 Conformance Requirement.

1. At reference sensitivity level, the TCH/F9,6, TCH/F4,8 and TCH/F2,4 BER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6,2).

14.2.5.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under HT propagation condition with an allowance for the statistical significance of the test.

14.2.5.4 Method of test

14.2.5.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(F9,6, F4,8, or F2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create the traffic channel loop back signalling erased frames. (36.2.1.1.1).

14.2.5.4.2 Procedure

- a) The fading function is set to HT.
- b) The SS sets the amplitude of the wanted signal level to reference sensitivity level ().
- c) The SS compares transmitted data with received data for at least the minimum number of samples of consecutive bits and records every error bit as an error event.
- d) The SS sets the wanted signal level to 28 dB μ V_{emf}.
- e) The SS commands the MS to open the TCH loop.
- f) The SS commands the MS to another of the supported data channels.
- g) Steps b) to f) are repeated for all supported full rate data channels.

14.2.5.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-11.

Table 14-11: Limits for full rate data channel sensitivity

| Channels | Type of measurements | Propagation | GSM 900 | | DCS 1 800 | |
|----------|----------------------|-------------|-------------------------|-----------------------|-------------------------|-----------------------|
| | | | Test limit error rate % | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| TCH/F9,6 | BER | HT | 0,778 | 180000 | 0,784 | 76500 |
| TCH/F4,8 | BER | HT | 0,011 | 5350000 | 0,011 | 5350000 |
| TCH/F2,4 | BER | HT | 0,001 | 11900000 | 0,001 | 11900000 |

14.2.6 Reference sensitivity - half rate data channels

14.2.6.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to MS supporting half rate data.

14.2.6.2 Conformance Requirement.

1. At reference sensitivity level, the TCH/H4,8 and TCH/H2,4 BER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6.2).

14.2.6.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under HT propagation condition with an allowance for the statistical significance of the test.

14.2.6.4 Method of test

14.2.6.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(H4,8 or H2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create the traffic channel loop back signalling erased frames. (36.2.1.1.1).

14.2.6.4.2 Procedure

- a) The fading function is set to HT.
- b) The SS sets the amplitude of the wanted signal level to reference sensitivity level ().
- c) The SS compares transmitted data with received data for at least the minimum number of samples of consecutive bits and records every error bit as an error event.
- d) The SS sets the wanted signal level to 28 dB μ V_{emf}.
- e) The SS commands the MS to open the TCH loop.
- f) The SS commands the MS to another of the supported data channels.
- g) Steps b) to f) are repeated for all supported data channels.

14.2.6.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-12.

Table 14-12: Limits for half rate data channel sensitivity

| Channels | Type of measurements | Propagation | GSM 900 | | DCS 1 800 | |
|----------|----------------------|-------------|-------------------------|-----------------------|-------------------------|-----------------------|
| | | | Test limit error rate % | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| TCH/H4,8 | BER | HT | 0,778 | 180000 | - | - |
| TCH/H2,4 | BER | HT | 0,011 | 5350000 | - | - |

14.2.7 Reference sensitivity - TCH/EFS

14.2.7.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

14.2.7.2 Conformance requirement

1. At reference sensitivity level, the TCH/EFS FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
2. At reference sensitivity level, the TCH/EFS class I RBER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
3. At reference sensitivity level, the TCH/EFS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
4. At reference sensitivity level, the TCH/EFS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

14.2.7.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

14.2.7.4 Method of test

- NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range 15 dBmV_{emf}() to 35 dBmV_{emf}().
- NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.
- NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.

14.2.7.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/EFS with an ARFCN in the Mid ARFCN range for DCS 1800 and ARFCN 70 for GSM 900, power control level set to maximum power.

- NOTE: For GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

14.2.7.4.2 Procedure

- a) The fading function is set to TUhigh.
 - b) the SS sets the amplitude of the wanted signal to reference sensitivity level ().
 - c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
 - d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
 - e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
 - f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
 - g) Steps a) to d) are repeated under extreme test conditions.
 - h) Steps a) to g) are repeated for TCH/EFS with ARFCNs in the Low ARFCN range for DCS 1800 and ARFCN 5 for GSM 900 and the High ARFCN range.
- NOTE: For GSM 900 ARFCN 5 is tested since this is the 72nd harmonic of the 13 MHz clock normally used internally in a MS.
- i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.
 - j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in section 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level(). This implicitly tests adjacent time slot rejection.

14.2.7.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-4 or 14-13a, 14-13b:

Table 14-13a: Limits for GSM 900 sensitivity

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|-----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/EFS | | | | | | | | |
| FER | 8,867 | 8900 | | | | | 0,122 | 164000 |
| class Ib(RBER) | 0,224 | 1000000 | | | | | 0,110 | 20000000 |
| class II (RBER) | 7,500 | 120000 | 7,500 | 24000 | 9,350 | 60000 | 2,439 | 8200 |

Table 14-13b: Limits for DCS 1 800 sensitivity

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/EFS | | | | | | | | |
| FER | 4,475 | 13400 | | | | | 0,122 | 164000 |
| class Ib(RBER) | 0,130 | 1500000 | | | | | 0,110 | 20000000 |
| class II(RBER) | 8,333 | 60000 | 7,500 | 24000 | 9,498 | 30000 | 2,439 | 8200 |

14.2.8 Reference sensitivity - full rate data channels in multislot configuration

14.2.8.1 Definition and applicability

The reference sensitivity for data channels is the signal level at the MS receiver input at which a certain BER must be achieved.

The requirements and this test apply to all types of GSM 900 and DCS 1800 and multiband GSM 900 / DCS 1800 MS which are capable of HSCSD multislot operation.

14.2.8.2 Conformance Requirement.

- At reference sensitivity level, the TCH/F9,6, TCH/F4,8 and TCH/F2,4 BER shall meet the reference sensitivity performance of table 1 in GSM 05.05; (GSM 05.05, 6,2).

14.2.8.3 Test purpose

- To verify that the MS does not exceed conformance requirement 1 in all multislot classes under HT propagation condition with an allowance for the statistical significance of the test.

14.2.8.4 Method of test**14.2.8.4.1 Initial conditions**

A call is set up according to the generic call set up procedure for multislot HSCSD on a TCH with an ARFCN in the Mid ARFCN range. One of the supported TCH/(F9,6, F4,8, or F2,4) shall be used.

The SS sets the MS to operate in a worst case configuration where the overlapping of the transmitting and receiving timeslots are maximized. If it needs the use of timing advance, it is set to 63. If overlapping is not possible, transmitting and receiving timeslots should be as close as possible.

The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on all the channels.

The SS commands the MS to create the loop back of the closest channel to the transmitting timeslot.

14.2.8.4.2 Procedure

- a) The fading function is set to HT.
- b) The SS commands the MS to close the TCH loop.
- c) The SS sets the amplitude of the wanted signal level to reference sensitivity level () in all subchannels.
- d) The SS compares transmitted data with received data in all channels for at least the minimum number of samples of consecutive bits and records every error bit as an error event.
- e) The SS sets the wanted signal level to 28 dBmV_{emf}.
- f) The SS commands the MS to open the TCH loop.
- g) The SS commands the MS to another of the supported data channels
- h) Steps b) to g) are repeated for all supported full rate data channels.

14.2.8.5 Test requirements

The Max-events measured for different channels shall not exceed the values given in table 14-15.

Table 14-15: Limits for full rate data channel sensitivity

| Channels | Type of measurements | Propagation | GSM 900 | | DCS 1 800 | |
|----------|----------------------|-------------|-------------------------|-----------------------|-------------------------|-----------------------|
| | | | Test limit error rate % | Minimum No of samples | Test limit error rate % | Minimum No of samples |
| TCH/F9,6 | BER | HT | 0,778 | 180000 | 0,784 | 76500 |
| TCH/F4,8 | BER | HT | 0,011 | 5350000 | 0,011 | 5350000 |
| TCH/F2,4 | BER | HT | 0,001 | 11900000 | 0,001 | 11900000 |

14.2.9 Reference sensitivity - TCH/FS for MS supporting the R-GSM band

14.2.9.1 Definition and applicability

The reference sensitivity is the signal level at the MS receiver input at which a certain BER and FER must be achieved.

The requirements and this test apply to R-GSM MS supporting speech.

14.2.9.2 Conformance requirement

1. At reference sensitivity level, the TCH/FS FER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
2. At reference sensitivity level, the TCH/FS class I RBER shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
3. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM 05.05; GSM 05.05, 6.2.
4. At reference sensitivity level, the TCH/FS class II RBER shall meet the reference sensitivity, performance of table 1 in GSM under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.

14.2.9.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the reference sensitivity conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS does not exceed conformance requirement 1 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, RA and HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4 under STATIC and TUhigh propagation conditions with an allowance for the statistical significance of the test.

14.2.9.4 Method of test

NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\text{ })$ to $35 \text{ dB}\mu\text{Vemf}(\text{ })$.

NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.

NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.

14.2.9.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with ARFCN 70 for R-GSM 900, power control level set to maximum power.

NOTE: For R-GSM 900 ARFCN 70 is tested since this is the 73rd harmonic of the 13 MHz clock normally used internally in a MS.

The SS transmits Standard Test Signal C1 on the traffic channel.

The SS commands the MS to create traffic channel loop back signalling erased frames.

14.2.9.4.2 Procedure

- a) The fading function is set to TUhigh.
- b) the SS sets the amplitude of the wanted signal to reference sensitivity level ().
- c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS determines the number of residual bit error events for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- e) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- f) The SS also determines the frame erasure events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully, if it is not signalled as erased.
- g) Steps a) to d) are repeated under extreme test conditions.
- h) Steps a) to g) are repeated for TCH/FS with ARFCN 5 and 964 for R-GSM 900 and the High ARFCN range.

NOTE: For R-GSM 900 ARFCN 5 and 964 are tested since they are the 72nd and 71st harmonic of the 13 MHz clock normally used internally in a MS.i) Steps b) to d) are repeated with the SS fading function set in turn to RA and HT.

- j) Steps b) to g) are repeated, with the SS fading function set to static and the MS is commanded by the SS into hopping mode using the hopping sequence defined in section 6.

The amplitude of the wanted signal is set according to step b). All the other time slots, except the active ones, are set to 20 dB above reference sensitivity level(). This implicitly tests adjacent time slot rejection.

14.2.9.5 Test requirements

The error rates measured for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the test limit error rate values given in table 14-5b .

Table 14-5b: Limits for GSM 900 sensitivity

| Channels | Propagation conditions TUhigh | | Propagation conditions RA | | Propagation conditions HT | | Static conditions | |
|----------------|-------------------------------|------------------------|---------------------------|------------------------|---------------------------|------------------------|-------------------------|------------------------|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| TCH/FS | | | | | | | | |
| FER | 6,742* α | 8900 | | | | | 0,122* α | 164000 |
| class Ib(RBER) | 0,42/ α | 1000000 | | | | | 0,41/ α | 20000000 |
| class II(RBER) | 8,333 | 120000 | 7,5 | 24000 | 9,333 | 60000 | 2,439 | 8200 |

14.3 Usable receiver input level range

14.3.1 Definition and applicability

The usable receiver input level range is the range of the radio frequency input level of a specified modulated signal over which bit error ratio or frame erasure ratios stay between specified limits.

The requirements and this test apply to MS supporting speech.

14.3.2 Conformance requirement

1. The receiver input level range requirements of GSM 05.05 section 6.1 for TCH/FS class II RBER under static and EQ propagation conditions shall be met:
 - 1.1 Under normal conditions.
 - 1.2 Under extreme conditions.

14.3.3 Test purpose

1. To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.
 - 1.1 Under normal conditions.
 - 1.2 Under extreme conditions.

14.3.4 Method of test

14.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the Mid ARFCN range, power control level set to maximum.

The SS transmits Standard Test Signal C1 on the TCH/FS.

The SS commands the MS to create traffic channel loop back signalling erased frames. (36.2.1.1.2).

14.3.4.2 Procedure

- a) The SS compares the data that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding.

The SS tests the bit error ratio for the non-protected bits of TCH/FS class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II. The number of error events is recorded.

- b) Step a) is repeated with the amplitude of the wanted signal increased to an input level at the receiver input of 73 dB μ V_{emf}().

- c) Step a) is repeated with the amplitude of the wanted signal increased to an input level at the receiver input of:
- GSM 900: 98 dB μ V_{emf}()
DCS 1 800: 90 dB μ V_{emf}().
- d) The SS fading function is set to EQ.
- e) Step a) is repeated with the amplitude of the wanted signal set to respectively 20 dB above reference sensitivity level() and 73dB μ V_{emf}() at the receiver input.
- f) The test is repeated under extreme test conditions.

14.3.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-14. This shall apply for any combination of normal and extreme test voltages and ambient temperature, for the different propagation conditions and for any level of input signal to the receiver.

Table 14-14: Limits for input level range

| Propagation conditions | GSM 900 | | DCS 1 800 | |
|--|-------------------------|------------------------|-------------------------|------------------------|
| | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| Static ≤ 73 dB μ V _{emf} () | 0,012 | 1640000 | 0,012 | 1640000 |
| Static 98 dB μ V _{emf} () | 0,122 | 164000 | | |
| Static 90 dB μ V _{emf} () | | | 0,122 | 164000 |
| EQ | 3,25 | 120000 | 3,25 | 60000 |

14.4 Co-channel rejection

14.4.1 Co-channel rejection - TCH/FS

14.4.1.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting speech.

14.4.1.2 Conformance requirement

- At reference co-channel interference the TCH/FS FER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
- At reference co-channel interference the TCH/FS class Ib BER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
- At reference co-channel interference the TCH/FS class II BER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

14.4.1.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TU_{high} with frequency hopping and TU_{low} with no frequency hopping with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TU_{high} with frequency hopping and TU_{low} with no frequency hopping, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under propagation condition TU_{high} with frequency hopping and TU_{low} with no frequency hopping with an allowance for the statistical significance of the test.

14.4.1.4 Method of test

14.4.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

The SS commands the MS to create the traffic channel loop back, signalling erased frames. (36.1.2.1.1.1).

14.4.1.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TU_{low}.

- b) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.
- f) Steps a) to e) are repeated except that in step a) both the wanted and interfering signal are TU_{high} hopping and the SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in section 6.

14.4.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-15.

Table 14-15: Limits for co-channel rejection

| Channel | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|-----------------|---------------------|-----------------------|-------------------------|------------------------|
| TCH/FS | FER | TUlow/No FH | $24 \cdot \alpha$ | 25000 |
| TCH/FS Class Ib | RBER | TUlow/No FH | $2,091/\alpha$ | 3300000 |
| TCH/FS Class II | RBER | TUlow/No FH | 4,3 | 2000000 |
| TCH/FS | FER | TUhigh/FH | $3,371 \cdot \alpha$ | 17800 |
| TCH/FS class Ib | RBER | TUhigh/FH | $0,215/\alpha$ | 2000000 |
| TCH/FS class II | RBER | TUhigh/FH | 8,333 | 1200000 |

The parameter α can range from 1 to 1.6. The value of α for the RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

14.4.2 Co-channel rejection - TCH/HS

14.4.2.1 Definition and applicability

The requirements and this test apply to MS supporting half rate speech.

14.4.2.2 Conformance requirement

1. At reference cochannel interference, the TCH/HS FER (shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
2. At reference cochannel interference, the TCH/HS class Ib BER (BFI=0) shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
3. At reference cochannel interference, the TCH/HS class II BER (BFI=0) shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
4. At reference cochannel interference, the TCH/HS UFR shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
5. At reference cochannel interference, the TCH/HS class Ib RBER ((BFI or UFI)=0) shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

14.4.2.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TUhigh with frequency hopping, with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TUhigh with frequency hopping, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 1, under propagation conditions TUhigh with frequency hopping, with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 4, under propagation condition TUhigh with frequency hopping, with an allowance for the statistical significance of the test.
5. To verify that the MS does not exceed conformance requirement 4, under propagation condition TUhigh with frequency hopping, with an allowance for the statistical significance of the test.

14.4.2.4 Method of test

14.4.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

14.4.2.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

- b) The fading characteristic of the wanted and the interfering signal is set to TUhigh. The SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

The hopping pattern is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in section 6.

- c) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop A.

NOTE: Test loop A is defined in clause 36. Frames marked with BFI=1 are signalled as erased on the uplink.

- d) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

- e) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.

- f) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.

- g) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

- h) The SS commands the MS to open test loop A and close test loop D.

NOTE: Test loop D is defined in clause 36. Frames marked as erased (BFI=1), or unreliable (UFI=1), are signalled to the SS on the uplink.

- j) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the erased/unreliable frame indication.

- k) The SS determines the number of residual bit error events for the bits of the class Ib, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased/unreliable.

- l) The SS also determines the unreliable frame events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased/unreliable.

14.4.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-16 or table 14-17.

Table 14-16: Limits for GSM 900 co-channel rejection

| Channel/Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---------------------------------------|-----------------------|-------------------------|------------------------|
| TCH/HS FER | TUhigh/FH | 5,607 | 10700 |
| TCH/HS Class Ib RBER (BFI=0) | TUhigh/FH | 0,325 | 184700 |
| TCH/HS Class II RBER (BFI=0) | TUhigh/FH | 7,961 | 25500 |
| TCH/HS UFR | TUhigh/FH | 6,834 | 8780 |
| TCH/HS Class Ib RBER ((BFI or UFI)=0) | TUhigh/FH | 0,235 | 255000 |

Table 14-17: Limits for DCS 1800 co-channel rejection

| Channel/Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---------------------------------------|-----------------------|-------------------------|------------------------|
| TCH/HS FER | TUhigh/FH | 5,607 | 10700 |
| TCH/HS Class Ib RBER (BFI=0) | TUhigh/FH | 0,325 | 184700 |
| TCH/HS Class II RBER (BFI=0) | TUhigh/FH | 7,961 | 25500 |
| TCH/HS UFR | TUhigh/FH | 6,834 | 8780 |
| TCH/HS Class Ib RBER ((BFI or UFI)=0) | TUhigh/FH | 0,235 | 255000 |

14.4.3 Co-channel rejection - TCH/HS (SID frames)

14.4.3.1 Definition and applicability

The requirements and this test apply to MS supporting half rate speech.

14.4.3.2 Conformance requirement

- At reference cochannel interference, the TCH/HS ESIDR, for SID frames indicated as SID=0 shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
- At reference cochannel interference, the TCH/HS RBER for SID frames indicated as SID=1 or SID=2, shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
- At reference cochannel interference, the TCH/HS EVSIDR for SID frames indicated as (SID=0), or (SID=1), or ((BFI or UFI)=1), shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
- At reference cochannel interference, the TCH/HS RBER for SID frames indicated as SID=2 and (BFI or UFI)=0, shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

14.4.3.3 Test purpose

- To verify that the MS does not exceed conformance requirement 1 under propagation condition TUlow, with an allowance for the statistical significance of the test.
- To verify that the MS does not exceed conformance requirement 2 under propagation condition TUlow, with an allowance for the statistical significance of the test.
- To verify that the MS does not exceed conformance requirement 3 under propagation condition TUlow, with an allowance for the statistical significance of the test.

4. To verify that the MS does not exceed conformance requirement 4 under propagation condition TUlow, with an allowance for the statistical significance of the test.

14.4.3.4 Method of test

14.4.3.4.1 Initial conditions

The BCCH data indicates that uplink DTX shall be disabled.

A call is set up according to the generic call set up procedure on a TCH/HS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

14.4.3.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

- b) The fading function is set to TUlow.

- c) The SS commands the MS to create traffic channel loop back signalling erased frames using test loop E.

NOTE: Test loop E is defined in clause 36. Frames marked with (SID=0) shall be signalled as erased on the uplink.

- d) The SS transmits continuously SID frames on the downlink. The SID codeword is transmitted correctly, but the SID information contains random data.

- e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

- f) The SS determines the number of residual bit error events for the class 1 SID bits, which do not belong to the SID codeword, by examining sequences of at least the minimum number of samples of consecutive class 1 SID bits. Bits are taken only from those frames not signalled as erased.

- g) The SS also determines the erased SID events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased. Bits comprising the SID codeword are excluded.

- h) The SS commands the MS to open test loop E and close test loop F.

NOTE: Test loop F is defined in clause 36. Frames marked with (SID=0), or (SID=1), or ((BFI or UFI)=1), shall be signalled as erased on the uplink.

- j) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

- k) The SS determines the number of residual bit error events for the class 1 SID bits, which do not belong to the SID codeword, by examining sequences of at least the minimum number of samples of consecutive class 1 SID bits. Bits are taken only from those frames not signalled as erased.

- l) The SS also determines the erased valid SID events by examining sequences of at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

14.4.3.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14-18.

Table 14-18: Limits for co-channel rejection

| Channel/Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|-------------------------------------|-----------------------|-------------------------|------------------------|
| ESIDR | TUlow | 19,152 | 25000 |
| SID RBER (SID=1 or 2) | TUlow | 0,560 | 500000 |
| EVSIDR | TUlow | 24,000 | 25000 |
| SID RBER (SID=2 and (BFI or UFI)=0) | TUlow | 0,022 | 2678000 |

14.4.4 Co-channel rejection - FACCH/F

14.4.4.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to all types of MS.

14.4.4.2 Conformance requirement

At reference cochannel interference the FACCH/F FER shall meet the reference interference performance of table 2 in GSM 05.05; (GSM 05.05, 6.3).

14.4.4.3 Test purpose

To verify that the MS does not exceed the conformance requirement under propagation condition TUlow with an allowance for the statistical significance of the test.

14.4.4.4 Method of test

14.4.4.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the mid ARFCN range. For MS supporting speech this shall be a TCH/FS. For MS not supporting speech one of the supported TCH/ (F9,6, F4,8, or F2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

14.4.4.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

- d) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the co-channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

14.4.4.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-14.

Table 14-19: Limits for co-channel rejection

| Channel | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---------|---------------------|-----------------------|-------------------------|------------------------|
| FACCH/F | FER | TUlow/No FH | 24 | 25000 |

14.4.5 Co-channel rejection - FACCH/H

14.4.5.1 Definition and applicability

The requirements and this test apply to MS supporting half rate channels.

14.4.5.2 Conformance requirement

At reference cochannel interference the FACCH/H FER shall meet the reference interference performance of table 2 in GSM 05.05; (GSM 05.05, 6.3).

14.4.5.3 Test purpose

To verify that the MS does not exceed the conformance requirement under propagation condition TUlow with an allowance for the statistical significance of the test.

14.4.5.4 Method of test

14.4.5.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the mid ARFCN range. For MS supporting half rate speech this shall be a TCH/HS. For MS not supporting speech one of the supported TCH/(H4,8, or H2,4) shall be used. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

14.4.5.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

- d) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the co-channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/H frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degrade.

14.4.5.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-20.

Table 14-20: Limits for co-channel rejection

| Channel | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|---------|---------------------|-----------------------|-------------------------|------------------------|
| FACCH/H | FER | TUlow/No FH | 24,000 | 25000 |

14.4.6 Co-channel rejection - TCH/EFS**14.4.6.1 Definition and applicability**

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting speech.

14.4.6.2 Conformance requirement

1. At reference co-channel interference the TCH/EFS FER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
2. At reference co-channel interference the TCH/EFS class Ib BER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.
3. At reference co-channel interference the TCH/EFS class II BER shall meet the reference interference performance of table 2 in GSM 05.05; GSM 05.05, 6.3.

14.4.6.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping, with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 3 under propagation condition TUhigh with frequency hopping and TUlow with no frequency hopping with an allowance for the statistical significance of the test.

14.4.6.4 Method of test**14.4.6.4.1 Initial conditions**

A call is set up according to the generic call set up procedure on a TCH/EFS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel (wanted signal).

The SS commands the MS to create the traffic channel loop back, signalling erased frames. (36.1.2.1.1.1).

14.4.6.4.2 Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 9 dB below that of the wanted signal.

The fading characteristic of the wanted and the interfering signal is TUlow.

- b) The SS compares the modulation of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS determines the number of residual bit error events for the bits of class II, by examining at least the minimum number of samples of consecutive bits of class II. Bits are taken only from those frames not signalled as erased.
- d) The SS determines the number of residual bit error events for the bits of the class Ib, by examining at least the minimum number of samples of consecutive bits of class Ib. Bits are only taken from those frames not signalled as erased.
- e) The SS also determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.
- f) Steps a) to e) are repeated except that in step a) both the wanted and interfering signal are TUhigh hopping and the SS commands the MS into hopping mode. A hop pattern covering at least 10 frequencies in a range not exceeding 5 MHz is used.

The hopping band is centred around an ARFCN in the Mid ARFCN range. The hopping frequencies are chosen from those defined in section 6.

14.4.6.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-21.

Table 14-21: Limits for co-channel rejection

| Channel | Type of measurement | Propagation condition | Test limit error rate % | Minimum No. of samples |
|------------------|---------------------|-----------------------|-------------------------|------------------------|
| TCH/EFS | FER | TUlow/No FH | 24 | 25000 |
| TCH/EFS Class Ib | RBER | TUlow/No FH | 0,209 | 3300000 |
| TCH/EFS Class II | RBER | TUlow/No FH | 3,039 | 2000000 |
| TCH/EFS | FER | TUhigh/FH | 3,357 | 17800 |
| TCH/EFS class Ib | RBER | TUhigh/FH | 0,115 | 2000000 |
| TCH/EFS class II | RBER | TUhigh/FH | 8,333 | 1200000 |

14.4.7 Receiver performance in the case of frequency hopping and co-channel interference on one carrier**14.4.7.1 Definition and applicability**

The GSM receiver is specified to be able to handle one out of four carriers being strongly interfered with, if frequency hopping is applied. This is used in networks to increase the capacity.

The requirement and this test apply to all MS supporting speech.

14.4.7.2 Conformance Requirement

Under the following conditions:

- a useful signal, cyclic frequency hopping over four carriers under static conditions, with equal input levels 20 dB above reference sensitivity level;
- a random, continuous, GMSK-modulated interfering signal on only one of the carriers at a level 10 dB higher than the useful signal,

the FER for TCH/FS shall be less than 5%; GSM 05.05, 6.6.

14.4.7.3 Test Purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

14.4.7.4 Method Of Test

14.4.7.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS channel in hopping mode, power control level set to maximum power. A cyclic hop pattern covering four frequencies with a minimum carrier distance of 600 kHz is used.

The SS transmits Standard Test Signal C1 on the traffic channel with a power level 20 dB above reference sensitivity level (wanted signal). No fading is applied.

The SS commands the MS to create the traffic channel loop back, signalling erased frames.

14.4.7.4.2 Test Procedure

- a) In addition to the wanted signal, the SS produces an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal) on one of the hopping frequencies of the wanted signal, and on the timeslot used by the wanted signal. The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. Its amplitude is 10 dB above that of the wanted signal. No fading characteristics are applied.
- b) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS determines the frame erasure events by examining at least the minimum number of samples of consecutive frames and assuming a frame is received successfully it is not signalled as erased.

14.4.7.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate value given in the following table:

| Channel | Type of measurement | Propagation condition | Test limit error rate (%) | Minimum No. of samples |
|---------|---------------------|-----------------------|---------------------------|------------------------|
| TCH/FS | FER | Static | 6.1 | 3300 |

14.5 Adjacent channel rejection

14.5.1 Adjacent channel rejection - speech channels

14.5.1.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted signal in the adjacent channel.

The adjacent channel can be adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this section.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test .2.1.

The requirements and this test apply to MS supporting speech.

14.5.1.2 Conformance requirement

1. With adjacent channel interference at 200 kHz above and below the wanted signal and signal level 9 dB above the wanted signal level:
 - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for TCH/FS shall be within the requirements of table 2 in GSM 05.05; GSM 05.05, 6.3.
 - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class Ib RBER shall be within the requirements of table 2 in GSM 05.05; GSM 05.05, 6.3.
 - 1.3 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class II RBER shall be within the requirements of table 2 in GSM 05.05; GSM 05.05, 6.3.
 - 1.4 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the Class II RBER shall be within the requirements of table 2 in GSM 05.05 under extreme test conditions; GSM 05.05, 6.3, GSM 05.05, annex D D.2.1, D.2.2.
2. For adjacent channel interference at 400 kHz above and below the wanted signal frequency and signal level 41 dB above the wanted signal level:
 - 2.1 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FER for TCH/FS shall be better than:
GSM 900: $10,2 \cdot \alpha$ %; GSM 05.05, 6.3
DCS 1 800: $5,1 \cdot \alpha$ %; GSM 05.05, 6.3.
 - 2.2 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class Ib RBER shall be better than:
GSM 900: $0,72/\alpha$ %; GSM 05.05, 6.3
DCS 1 800: $0,45/\alpha$ %; GSM 05.05, 6.3.
 - 2.3 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class II RBER shall be better than:
GSM 900: 8,8 %; GSM 05.05, 6.3
DCS 1 800: 8,9 %; GSM 05.05, 6.3.
 - 2.4 For a TUhigh faded wanted signal and a static adjacent channel interferer, the Class II RBER shall be better than:
GSM 900: 8,8 %;
DCS 1 800: 8,9 %;.

under extreme test conditions; GSM 05.05, 6.3, annex D D.2.1, D.2.2.

14.5.1.3 Test purpose

- 1 To verify that with a TUhigh adjacent channel interferer at 200 kHz above and below the wanted TUhigh signal frequency and signal level 9 dB above the wanted signal level:
 - 1.1 Conformance requirement 1.1 is met with an allowance for the statistical significance of the test.
 - 1.2 Conformance requirement 1.2 is met with an allowance for the statistical significance of the test.
 - 1.3 Conformance requirement 1.3 is met with an allowance for the statistical significance of the test.
 - 1.4 Conformance requirement 1.4 is met with an allowance for the statistical significance of the test.
- 2 To verify that with a static adjacent channel interferer at 400 kHz above and below a TUhigh wanted signal frequency and signal level 41 dB above the wanted signal level:
 - 2.1 Conformance requirement 2.1 is met with an allowance for the statistical significance of the test.
 - 2.2 Conformance requirement 2.2 is met with an allowance for the statistical significance of the test.
 - 2.3 Conformance requirement 2.3 is met with an allowance for the statistical significance of the test.
 - 2.4 Conformance requirement 2.4 is met with an allowance for the statistical significance of the test.

14.5.1.4 Method of test

14.5.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH/FS with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS commands the MS to create the traffic channel loop back signalling erased frames.

The SS transmits Standard Test Signal C1 on the TCH (wanted signal).

14.5.1.4.2 Procedure

- a) In addition to the wanted signal, the SS transmits an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal.

The fading characteristic of the wanted and the unwanted signal is set to TUhigh.

The unwanted signal is transmitted at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to 9dB above that of the wanted signal.

- b) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- c) The SS tests the frame erasure compliance for the TCH/FS by examining at least the minimum number of samples of consecutive frames. The number of frame erasure events is recorded.
- d) The SS determines the number of residual bit error events for the bits of the class Ib and class II, by examining sequences of at least the minimum number of samples of consecutive bits of class Ib and class II, Bits are only taken from those frames for which no bad frame indication was given.
- e) The measurement of steps c) and d) is repeated with the unwanted signal on a frequency at the same displacement from, but below, the frequency of the wanted signal.
- f) The measurement of steps c) to e) shall be repeated for a displacement of the unwanted signal of 400 kHz, and with the amplitude of the unwanted signal 41 dB above the level of the wanted input signal, and the unwanted signal static.
- g) Steps c) to f) are repeated under extreme test conditions.

14.5.1.5 Test requirements

Table 14-22: Limits for adjacent channel selectivity

| Interference at | Channel | Type of measurement | GSM 900 | | DCS 1 800 | |
|-----------------|-----------------------------|---------------------|-------------------------|------------------------|-------------------------|------------------------|
| | | | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| 200 kHz | TCH/FS class Ib class II | FER | $6,742 \cdot \alpha$ | 8900 | $3,371 \cdot \alpha$ | 17800 |
| | | RBER | $0,420/\alpha$ | 1000000 | $0,270/\alpha$ | 2000000 |
| | | RBER | 8,333 | 600000 | 8,333 | 1200000 |
| 400 kHz | TCH/FS class Ib class II | FER | $11,461 \cdot \alpha$ | 8900 | $5,714 \cdot \alpha$ | 10500 |
| | | RBER | $0,756/\alpha$ | 1000000 | $0,483/\alpha$ | 1200000 |
| | | RBER | 9,167 | 600000 | 9,167 | 720000 |

The error rates measured in this test shall not exceed the test limit error rate given in table 14-22. This shall apply for any combination of normal and extreme test voltages and ambient temperature, and with the interfering signals at either side of the wanted frequency.

The parameter α can range from 1 to 1,6. The value of α for the RBER test on TCH/FS class Ib bits under particular measurement conditions shall be the same as that determined in the FER test on TCH/FS under the same conditions.

NOTE: A static unwanted signal is used to avoid a potential problem with the implementation of the fading simulator.

14.5.2 Adjacent channel rejection - control channels

14.5.2.1 Definition and applicability

The adjacent channel selectivity is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted signal in the adjacent channel.

The adjacent channel can be the adjacent in the RF spectrum or in time. There are therefore two types of adjacent channel selectivity:

- 1) Adjacent RF channel selectivity which is specifically tested in this section.
- 2) Adjacent Time Slot selectivity, which is implicitly tested in test 14.2.1.

The requirements and this test apply to MS not supporting speech.

14.5.2.2 Conformance requirement

1. For adjacent channel interference at 200 kHz above and below the wanted signal frequency and signal level 9 dB above the wanted signal level:
 - 1.1 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for the FACCH/F does not exceed the requirements of table 2 in GSM 05.05; GSM 05.05, 6.3.
 - 1.2 For a TUhigh faded wanted signal and a TUhigh adjacent channel interferer, the FER for the FACCH/F does not exceed the requirements of table 2 in GSM 05.05 under extreme test conditions; GSM 05.05, 6.3, annex D D.2.1, D.2.2.
2. With adjacent channel interference at 400 kHz above and below the wanted signal frequency and signal level 41 dB above the wanted signal level:
 - 2.1 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FER for the FACCH/F shall be better than:

GSM 900: 17,1 %; GSM 05.05, 6.3
 DCS 1 800: 6,1 %; GSM 05.05, 6.3.

- 2.2 For a TUhigh faded wanted signal and a static adjacent channel interferer, the FACCH/F shall be better than:

GSM 900: 17,1 %
 DCS 1 800: 6,1 %.

under extreme test conditions; GSM 05.05, 6.3, annex D D.2.1, D.2.2.

14.5.2.3 Test purpose

- 1 To verify that with TUhigh adjacent channel interference at 200 kHz above and below a TUhigh wanted signal frequency and signal level 9 dB above the wanted signal level:
 - 1.1 Conformance requirement 1.1 is met with an allowance for the statistical significance of the test.
 - 1.2 Conformance requirement 1.2 is met with an allowance for the statistical significance of the test.
2. To verify that with static adjacent channel interference at 400 kHz above and below a TUhigh wanted signal frequency and signal level 41 dB above the wanted signal level:
 - 2.1 Conformance requirement 2.1 is met with an allowance for the statistical significance of the test.
 - 2.2 Conformance requirement 2.2 is met with an allowance for the statistical significance of the test.

14.5.2.4 Method of test

14.5.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH in the mid ARFCN range. Any one of the supported TCH/(F9,6, F4,8, or F2,4) shall be used.

The SS transmits the Standard Test Signal C1 on the TCH (wanted signal).

14.5.2.4.2 Procedure

- a) In addition to the wanted signal, the SS transmits an independent, uncorrelated interfering signal, Standard Test Signal I1 (unwanted signal).

The unwanted signal is continuous and has no fixed relationship with the bit transitions of the wanted signal. The fading characteristic of the wanted and the unwanted signal is TUhigh.
 The unwanted signal is transmitted at a nominal frequency 200 kHz above the nominal frequency of the wanted signal. Its amplitude is set to 9dB above that of the wanted signal.

- b) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to the adjacent channel interference, the MS may not be able to acknowledge the Layer 2 frame. Each repeated L2 frame indicates a frame erasure event. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

- c) The measurement of step b) is repeated with the unwanted signal on a frequency at the same displacement from, but below, the frequency of the wanted signal.
- d) The measurement of steps a) to c) is repeated for a displacement of the unwanted signal of 400 kHz, and with the amplitude of the unwanted signal 41 dB above the level of the wanted input signal, and the unwanted signal static.
- e) Steps a) to d) are repeated under extreme test conditions.

14.5.2.5 Test requirements**Table 14-23: Limits for adjacent channel selectivity**

| Interference at | Channel | Type of measurement | GSM 900 | | DCS 1 800 | |
|-----------------|---------|---------------------|-------------------------|------------------------|-------------------------|------------------------|
| | | | Test limit error rate % | Minimum No. of samples | Test limit error rate % | Minimum No. of samples |
| 200 kHz | FACCH/F | FER | 10,640 | 5639 | 3,808 | 15756 |
| 400 kHz | FACCH/F | FER | 19,152 | 3133 | 6,832 | 8782 |

The error rates measured in this test shall not exceed the test limit error rates given in table 14-23. This shall apply for any combination of normal and extreme test voltages and ambient temperature, and with the interfering signals at either side of the wanted frequency.

NOTE: A static unwanted signal is used to avoid a potential problem with the noise floor of the fading simulator.

14.6 Intermodulation rejection**14.6.1 Intermodulation rejection - speech channels****14.6.1.1 Definition and applicability**

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency.

The requirements and this test apply to MS supporting speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

14.6.1.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency the Class II RBER for TCH/FS shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 5.2.

14.6.1.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

14.6.1.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

14.6.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel.

14.6.1.4.2 Procedure

- The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level (see table 14-24).
- The SS commands the MS to create the loop back facility signalling erased frames.

- c) The SS produces a static wanted signal, and two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above that of the receiver. This signal is static and unmodulated.

The second interfering signal is on an ARFCN eight above that of the receiver. This signal is static, continuous and modulated by random data.

The amplitude of both the interfering signals is set according to table 14-24.

- d) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

The SS tests the RBER compliance of class II bits by examining at least the minimum number of samples of consecutive bits. Bits only taken from those frames which do not signal frame erasure. The number of error events is recorded.

- e) The measurement of step d) is repeated with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- f) Steps b) to e), are repeated but with the receiver operating on an ARFCN in the Low ARFCN range.
- g) Steps b) to e), are repeated but with the receiver operating on an ARFCN in the High ARFCN range.
- h) Steps a) to g) are repeated under extreme test conditions.

Table 14-24: Intermodulation test signal levels

| | GSM 900 | | DCS 1 800 | |
|--|----------|----------|-------------|---------|
| | Small MS | Other MS | Class 1 & 2 | Class 3 |
| WANTED SIGNAL dB μ V _{emf} () | 15 | 13 | 17 | 15 |
| FIRST INTERFERER dB μ V _{emf} () | 64 | 74 | 64 | 68 |
| SECOND INTERFERER dB μ V _{emf} () | 63 | 63 | 64 | 68 |

NOTE: Some of the levels in table 14-24 are different to those specified in GSM 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

14.6.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-25.

This shall apply under normal condition and under any combination of normal and extreme test voltages and ambient temperature, and with the two interfering signals at either side of the wanted frequency.

Table 14-25: Limits for intermodulation rejection

| Channel | Propagation conditions | Type of measurement | Test limit error rate % | Minimum No. of samples |
|--------------------|------------------------|---------------------|-------------------------|------------------------|
| TCH/FS Class II | Static | RBER | 2,439 | 8200 |

14.6.2 Intermodulation rejection - control channels

14.6.2.1 Definition and applicability

The intermodulation rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of two or more unwanted signals with a specific frequency relationship to the wanted signal frequency.

The requirements and this test apply to MS not supporting speech.

For E-GSM 900 MS this test is only performed in the P-GSM band.

14.6.2.2 Conformance requirement

In the presence of two unwanted signals with a specific frequency relationship to the wanted signal frequency the FER for FACCH/F shall meet the reference sensitivity performance of table 1 in GSM 05.05; GSM 05.05, 5.2.

14.6.2.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

14.6.2.4 Method of test

NOTE: The measurements address the third order intermodulation, which represents the most serious case.

14.6.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure on a TCH with an ARFCN in the Mid ARFCN range, power control level set to maximum.

The SS transmits Standard Test Signal C1 on the traffic channel. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level (see table 14-25).

14.6.2.4.2 Procedure

- a) The SS produces a TUhigh wanted signal, and two static interfering (unwanted) signals at the same time. There is no correlation in the modulation between the signals.

The first interfering signal is on a frequency equal to the centre frequency of an ARFCN four above that of the receiver. This signal is static and unmodulated.

The second interfering signal is on an ARFCN eight above that of the receiver. This signal is static, continuous and modulated by random data.

The amplitude of both the interfering signals is set according to table 14-26.

- b) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. The SS determines the number of frame erasure events during at least the minimum number of samples of FACCH/F frames.

NOTE: These frames will not be consecutive but it is expected that the statistical significance of the tests will not be unduly degraded.

- c) The measurement of step b) is repeated with the two unwanted signals having frequencies corresponding to ARFCN four and eight below the ARFCN of the wanted signal.
- d) Steps a) to c), are repeated but with the receiver operating on an ARFCN in the Low ARFCN range.

- e) Steps a) to c), are repeated but with the receiver operating on an ARFCN in the High ARFCN range.
- f) Steps a) to e) are repeated under extreme test conditions.

Table 14-26: Intermodulation test signal levels

| | GSM 900 | | DCS 1 800 | |
|---------------------------------------|----------|----------|-------------|---------|
| | Small MS | Other MS | Class 1 & 2 | Class 3 |
| WANTED SIGNAL dB μ Vemf() | 15 | 13 | 17 | 15 |
| FIRST INTERFERER dB μ Vemf() | 64 | 74 | 64 | 68 |
| SECOND INTERFERER dB μ Vemf() | 63 | 63 | 64 | 68 |

NOTE: Some of the levels in table 14-26 are different to those specified in GSM 05.05 due to the consideration of the effect of modulation sideband noise from the second interferer.

14.6.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-27.

This shall apply under normal condition and under any combination of normal and extreme test voltages and ambient temperature, and with the two interfering signals at either side of the wanted frequency.

Table 14-27: Limits for intermodulation rejection

| Channel | Propagation conditions | Type of measurement | GSM 900 | | DCS 1 800 | |
|---------|------------------------|---------------------|-------------------------|----------------------------|-------------------------|------------------------|
| | | | Test limit error rate % | Minimum No. of max-samples | Test limit error rate % | Min No. of max-samples |
| FACCH/F | TUhigh/No FH | FER | 8,961 | 6696 | 4,368 | 13736 |

14.7 Blocking and spurious response

14.7.1 Blocking and spurious response - speech channels

14.7.1.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to MS supporting speech.

14.7.1.2 Conformance requirement

- The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

The reference sensitivity performance as specified in table 1 of GSM 05.05 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency f_0 , 3 dB above the reference sensitivity level as specified in GSM 05.05 section 6.2;

- a continuous, static sine wave signal at a level as in the table of GSM 05.05 section 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

with the following exceptions, called spurious response frequencies:

- a) GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group);

DCS 1 800: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group);
- b) out of band, for a maximum of 24 occurrences (which if below f_0 and grouped shall not exceed three contiguous occurrences per group).

where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dB μ V (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

14.7.1.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

14.7.1.4 Method of test

14.7.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

14.7.1.4.2 Procedure

- a) The SS produces a static wanted signal and a static interfering signal at the same time. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level.
- b) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated in step c) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR \pm 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- c) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) below:-

- i) The total frequency range formed by:-
P-GSM 900 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

E-GSM 900 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$.

DCS 1 800 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$.
and
the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.

Measurements are made at 200 kHz intervals.
- ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.
- iii) The frequencies:
 $mF_{lo} + IF_1$,
 $mF_{lo} - IF_1$,
 mFR ,
where m is all positive integers greater than or equal to 2 such that either sum lies in the range
100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:-

F_{lo} - local oscillator applied to first receiver mixer
 $IF_1 \dots IF_n$ - are the n intermediate frequencies
 F_{lo} , IF_1 , $IF_2 \dots IF_n$ shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3.

- d) The level of the unwanted signal is set according to table 14-28.

Table 14-28: Level of unwanted signals

| | GSM 900 | | DCS 1 800 |
|----------------------------------|---------------------------------------|----------|-----------|
| | Small MS | Other MS | |
| FREQUENCY | LEVEL IN dB μ V _m f() | | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 | 70 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 | 70 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 90 | 80 |
| 915 MHz to FR - 3 MHz | 90 | 90 | - |
| FR + 3 MHz to 980 MHz | 90 | 90 | - |
| 1785 MHz to FR - 3 MHz | - | - | 87 |
| FR + 3 MHz to 1920 MHz | - | - | 87 |
| 835 MHz to <915 MHz | 113 | 113 | |
| >980 MHz to 1000 MHz | 113 | 113 | |
| 100 kHz to <835 MHz | 90 | 90 | |
| >1000 MHz to 12,75 GHz | 90 | 90 | |
| 100 kHz to 1705 MHz | - | - | 113 |
| >1705 MHz to <1785 MHz | - | - | 101 |
| >1920 MHz to 1980 MHz | - | - | 101 |
| >1980 MHz to 12,75 GHz | - | - | 90 |

NOTE 1: These values differ from GSM 05.05 because of practical generator limits in the SS.

NOTE 2: For an E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to <915 MHz is relaxed to 108 dB μ V_mf().

- e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

The SS tests the RBER compliance for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II, where bits are taken only from those frames for which no bad frame indication was given. The number of error events is recorded.

If a failure is indicated it is noted and counted towards the allowed exemption totals.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also tested. This process is repeated until all channels constituting the group of failures is known.

14.7.1.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-29.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

Table 14-29: Limits for blocking

| Channel | Type of measurement | Test limit error rate % | Minimum number of samples |
|--------------------|---------------------|-------------------------|---------------------------|
| TCH/FS Class II | RBER | 2,439 | 8200 |

The following exceptions are allowed:

GSM 900: A maximum of six failures in the frequency band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

DCS 1 800: A maximum of twelve failures in the band 1785 MHz to 1920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1785 MHz and 1920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.1.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dB μ V_{emf}() and the performance requirement is once again that that stated in the table above.

The number Error rate measured in this test shall not exceed the test limit error rate values given in table 14-29.

No failures are allowed at this lower unwanted signal level.

14.7.2 Blocking and spurious response - control channels

14.7.2.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to MS not supporting speech.

14.7.2.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

The reference sensitivity performance as specified in table 1 of GSM 05.05 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency f_0 , 3 dB above the reference sensitivity level as specified in GSM 05.05 section 6.2;
- a continuous, static sine wave signal at a level as in the table of GSM 05.05 section 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

with the following exceptions, called spurious response frequencies:-

- a) GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group),

DCS 1 800: in band, for a maximum of twelve occurrences (which if grouped shall not exceed three contiguous occurrences per group).
- b) out of band, for a maximum of 24 occurrences (which if below f_0 and grouped shall not exceed three contiguous occurrences per group).

where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dB μ V (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

14.7.2.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

14.7.2.4 Method of test

14.7.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

14.7.2.4.2 Procedure

- a) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to interfering signals, the MS may not be able to acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.
- b) The SS is set to produce a TUhigh wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level.
- c) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated at step f) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where n = 2, 3, 4, 5, etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

- i) The total frequency range formed by:-

P-GSM 900 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 12,5 \text{ MHz})$.

E-GSM 900 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 17,5 \text{ MHz})$.

DCS 1 800 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 37,5 \text{ MHz})$.

and

the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.
Measurement are made at 200 kHz intervals.

- ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.

- iii) The frequencies:

$mF_{lo} + IF_1$,
 $mF_{lo} - IF_1$,
 mFR ,

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:-

| | |
|---------------------------------------|---|
| F_{lo} - | local oscillator applied to first receiver mixer |
| $IF_1 \dots IF_n$ - | are the n intermediate frequencies |
| F_{lo} , IF_1 , $IF_2 \dots IF_n$ | shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3. |

- e) The level of the unwanted signal is set according to table 14-30.

Table 14-30: Level of unwanted signals

| | GSM 900 | | DCS 1 800 |
|----------------------------------|---------------------------|----------|-----------|
| | Small MS | Other MS | |
| FREQUENCY | LEVEL IN dB μ Vemf() | | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 | 70 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 | 70 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 90 | 80 |
| 915 MHz to FR - 3 MHz | 90 | 90 | - |
| FR + 3 MHz to 980 MHz | 90 | 90 | - |
| 1785 MHz to FR - 3 MHz | - | - | 87 |
| FR + 3 MHz to 1920 MHz | - | - | 87 |
| 835 MHz to <915 MHz | 113 | 113 | |
| >980 MHz to 1000 MHz | 113 | 113 | |
| 100 kHz to <835 MHz | 90 | 90 | |
| >1000 MHz to 12,75 GHz | 90 | 90 | |
| 100 kHz to 1705 MHz | - | - | 113 |
| >1705 MHz to <1785 MHz | - | - | 101 |
| >1920 MHz to 1980 MHz | - | - | 101 |
| >1980 MHz to 12,75 GHz | - | - | 90 |

NOTE 1: These values differ from GSM 05.05 because of practical generator limits in the SS.

NOTE 2: For an E-GSM 900 MS the level of the unwanted signal in the band 905 MHz to < 915 MHz is relaxed to 108 dB μ Vemf().

- f) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

14.7.2.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate given in table 14-31.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

Table 14-31: Limits for blocking

| Channel | Type of measurement | GSM 900 | | DCS 1 800 | |
|---------|---------------------|-----------------------|------------------------|-----------------------|------------------------|
| | | Test limit error rate | Minimum No. of samples | Test limit error rate | Minimum No. of samples |
| FACCH/F | FER | 8,961 | 6696 | 4,368 | 13736 |

The following exceptions are allowed:

GSM 900: A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

DCS 1 800: A maximum of twelve failures in the band 1785 MHz to 1 920 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 1785 MHz and 1 920 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.2.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dB μ Vemf() and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

14.7.3 Blocking and spurious response - speech channels for MS supporting the R-GSM band

14.7.3.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to R-GSM MS supporting speech.

14.7.3.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

The reference sensitivity performance as specified in table 1 of GSM 05.05 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency f_0 , 3 dB above the reference sensitivity level as specified in GSM 05.05 section 6.2;
- a continuous, static sine wave signal at a level as in the table of GSM 05.05 section 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

With the following exceptions, called spurious response frequencies:

- a) R-GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group);
- b) out of band, for a maximum of 24 occurrences (which if below f_0 and grouped shall not exceed three contiguous occurrences per group).

Where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dB μ V (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

14.7.3.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

14.7.3.4 Method of test

14.7.3.4.1 Initial conditions

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

14.7.3.4.2 Procedure

- a) The SS produces a static wanted signal and a static interfering signal at the same time. The amplitude of the wanted signal is set to 4 dB above the reference sensitivity level.
- b) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated in step c) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- c) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) below:-

- i) The total frequency range formed by:-
R-GSM 900 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 19,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 19,5 \text{ MHz})$.

And the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.

Measurements are made at 200 kHz intervals.

- ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.

- iii) The frequencies:
 $mF_{lo} + IF_1$,
 $mF_{lo} - IF_1$,
 mFR ,
where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:-

| | |
|---------------------------------|---|
| F_{lo} - | local oscillator applied to first receiver mixer |
| $IF_1 \dots IF_n$ - | are the n intermediate frequencies |
| $F_{lo}, IF_1, IF_2 \dots IF_n$ | shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3. |

- d) The level of the unwanted signal is set according to table 14-28b.

Table 14-28b: Level of unwanted signals for R-GSM MS

| | R-GSM 900 | |
|----------------------------------|--|----------|
| | Small MS | Other MS |
| FREQUENCY | LEVEL IN dB μ V _{emf} () | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 90 |
| 915 MHz to FR - 3 MHz | 90 | 90 |
| FR + 3 MHz to 980 MHz | 90 | 90 |
| 1785 MHz to FR - 3 MHz | - | - |
| FR + 3 MHz to 1920 MHz | - | - |
| 835 MHz to <876 MHz | 113 | 113 |
| 876 MHz to 880 MHz | 106 | 113 |
| 880 MHz to 915 MHz | 106 | 108 |
| >980 MHz to 1000 MHz | 113 | 113 |
| 100 kHz to <835 MHz | 90 | 90 |
| >1000 MHz to 12,75 GHz | 90 | 90 |

NOTE: These values differ from GSM 05.05 because of practical generator limits in the SS.

- e) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.

The SS tests the RBER compliance for the bits of class II, by examining sequences of at least the minimum number of samples of consecutive bits of class II, where bits are taken only from those frames for which no bad frame indication was given. The number of error events is recorded.

If a failure is indicated it is noted and counted towards the allowed exemption totals.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also tested. This process is repeated until all channels constituting the group of failures is known.

14.7.3.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate values given in table 14-29b.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

Table 14-29b: Limits for blocking

| Channel | Type of measurement | Test limit error rate % | Minimum number of samples |
|-----------------|---------------------|-------------------------|---------------------------|
| TCH/FS Class II | RBER | 2,439 | 8200 |

The following exceptions are allowed:

R-GSM 900: A maximum of six failures in the frequency band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 failures in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.3.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dB μ V_{emf}() and the performance requirement is once again that that stated in the table above.

The number Error rate measured in this test shall not exceed the test limit error rate values given in table 14-29b.

No failures are allowed at this lower unwanted signal level.

14.7.4 Blocking and spurious response - control channels for MS supporting the R-GSM band

14.7.4.1 Definition and applicability

Blocking is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted input signal, on frequencies other than those of the spurious responses or the adjacent channels, without exceeding a given degradation.

The requirements and this test apply to R-GSM MS not supporting speech.

14.7.4.2 Conformance requirement

1. The blocking characteristics of the receiver are specified separately for in-band and out-of-band performance as identified in GSM 05.05 section 5.1.

The reference sensitivity performance as specified in table 1 of GSM 05.05 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency f_0 , 3 dB above the reference sensitivity level as specified in GSM 05.05 section 6.2;
- a continuous, static sine wave signal at a level as in the table of GSM 05.05 section 5.1 and at a frequency (f) which is an integer multiple of 200 kHz.

With the following exceptions, called spurious response frequencies:-

- a) R-GSM 900: in band, for a maximum of six occurrences (which if grouped shall not exceed three contiguous occurrences per group),
- b) out of band, for a maximum of 24 occurrences (which if below f_0 and grouped shall not exceed three contiguous occurrences per group).

Where the above performance shall be met when the continuous sine wave signal (f) is set to a level of 70 dB μ V (emf) (i.e. -43 dBm). GSM 05.05, 5.1.

14.7.4.3 Test purpose

1. To verify that the in band blocking performance is met without exceeding the total number of allowed in band spurious responses. An allowance is made for the statistical significance of the test.
2. To verify that at selected out of band frequencies, the out of band blocking performance is met without exceeding the total number of allowed out of band spurious responses. An allowance is made for the statistical significance of the test.

NOTE: Not all of the possible out of band frequencies are tested as this results in excessive test time. However, the total number of out of band spurious responses, specified in GSM 05.05, are allowed to ensure a fair test of the MS.

14.7.4.4 Method of test**14.7.4.4.1 Initial conditions**

A call is set up according to the generic call set up procedure, except the BCCH frequency list shall be empty, on a TCH with an arbitrary ARFCN in the range supported by the MS. The power control level is set to maximum power.

The SS transmits Standard Test Signal C1 on the traffic channel. (TCH frequency FR).

14.7.4.4.2 Procedure

- a) The SS sends a Layer 3 message which does not require a Layer 3 response from the MS. Due to interfering signals, the MS may not be able to acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.
- b) The SS is set to produce a TUhigh wanted signal and a static interfering signal at the same time. The SS sets the amplitude of the wanted signal to 4 dB above the reference sensitivity level.
- c) The unwanted signal is a C.W. signal (Standard test signal IO) of frequency FB. It is applied in turn on the subset of frequencies calculated at step f) in the overall range 100 kHz to 12,75 GHz, where FB is an integer multiple of 200 kHz.

However, frequencies in the range FR +/- 600 kHz are excluded.

NOTE: Allowance must be made for possible spurious signals arising from the SS. These are particularly likely at sub harmonic frequencies nFB where $n = 2, 3, 4, 5$, etc.

- d) The frequencies at which the test is performed (adjusted to an integer multiple of 200 kHz channels most closely approximating the absolute frequency of the calculated blocking signal frequency) are the combined frequencies from i), ii) and iii) which follow:

- i) The total frequency range formed by:-

R-GSM 900 the frequencies between $F_{lo} + (IF_1 + IF_2 + \dots + IF_n + 19,5 \text{ MHz})$
and $F_{lo} - (IF_1 + IF_2 + \dots + IF_n + 19,5 \text{ MHz})$.

and

the frequencies + 100 MHz and - 100 MHz from the edge of the relevant receive band.
Measurement are made at 200 kHz intervals.

- ii) The three frequencies IF_1 , $IF_1 + 200 \text{ kHz}$, $IF_1 - 200 \text{ kHz}$.

- iii) The frequencies:

$mF_{lo} + IF_1$,
 $mF_{lo} - IF_1$,
 mFR ,

where m is all positive integers greater than or equal to 2 such that either sum lies in the range 100 kHz to 12,75 GHz.

The frequencies in step ii) and iii) lying in the range of frequencies defined by step i) above need not be repeated.

Where:-

| | |
|---------------------------------|---|
| F_{lo} - | local oscillator applied to first receiver mixer |
| $IF_1 \dots IF_n$ - | are the n intermediate frequencies |
| $F_{lo}, IF_1, IF_2 \dots IF_n$ | shall be declared by the manufacturer in the PIXIT statement GSM 11.10 annex 3. |

- e) The level of the unwanted signal is set according to table 14-30b.

Table 14-30b: Level of unwanted signals

| | GSM 900 | |
|----------------------------------|---------------------------|----------|
| | Small MS | Other MS |
| FREQUENCY | LEVEL IN dB μ Vemf() | |
| FR +/- 600 kHz to FR +/- 800 kHz | 70 | 75 |
| FR +/- 800 kHz to FR +/- 1,6 MHz | 70 | 80 |
| FR +/- 1,6 MHz to FR +/- 3 MHz | 80 | 90 |
| 915 MHz to FR - 3 MHz | 90 | 90 |
| FR + 3 MHz to 980 MHz | 90 | 90 |
| 835 MHz to <876 MHz | 113 | 113 |
| 876 MHz to 880 MHz | 106 | 113 |
| 880 MHz to 915 MHz | 106 | 108 |
| >980 MHz to 1000 MHz | 113 | 113 |
| 100 kHz to <835 MHz | 90 | 90 |
| >1000 MHz to 12,75 GHz | 90 | 90 |

NOTE: These values differ from GSM 05.05 because of practical generator limits in the SS.

- f) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

In the case of failures discovered at the predicted frequencies at steps f ii), iii) or iv) the test is repeated on the adjacent channels +/- 200 kHz away. If either of these two frequencies fail then the next channel 200 kHz beyond is also be tested. This process is repeated until all channels constituting the group of failures is known.

14.7.4.5 Test requirements

The error rate measured in this test shall not exceed the test limit error rate given in table 14-31b.

This shall apply under normal test voltage and ambient temperature, and with the interfering signal at any frequency in the range specified.

Table 14-31b: Limits for blocking

| | | GSM 900 | | DCS 1 800 | |
|---------|---------------------|-----------------------|------------------------|-----------------------|------------------------|
| Channel | Type of measurement | Test limit error rate | Minimum No. of samples | Test limit error rate | Minimum No. of samples |
| FACCH/F | FER | 8,961 | 6696 | 4,368 | 13736 |

The following exceptions are allowed:

R-GSM 900: A maximum of six failures in the band 915 MHz to 980 MHz (which, if grouped, shall not exceed three 200 kHz channels per group).

A maximum of 24 in the combined bands 100 kHz to 915 MHz and 980 MHz to 12,75 GHz (which, if below FR and grouped, shall not exceed three 200 kHz channels per group).

If the number of failures do not exceed the maximum allowed figures stated above, the test of 14.7.4.4 is repeated at the frequencies at which the failures occurred. The level of the unwanted signal is set to 70 dB μ Vemf() and the performance requirement is once again that stated above.

The number of Error Events recorded in this test shall not exceed the test limit error rate values given above, when using the maximum number of samples.

No failures are allowed at this lower unwanted signal level.

14.8 AM suppression

14.8.1 AM suppression - speech channels

14.8.1.1 Definition and applicability

AM suppression is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted TDMA modulated interferer.

The requirements and this test apply to MS supporting speech.

14.8.1.2 Conformance requirement

The reference sensitivity performance as specified in table 1 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency f_0 , 3 dB above the reference sensitivity level as specified in GSM 05.05 section 5.2.
- a single frequency (f), in the relevant receive band, $|f - f_0| \geq 6\text{MHz}$, which is an integer multiple of 200 kHz, a GSM TDMA signal modulated by any 148-bits subsequence of the 511-bits pseudo random bit sequence, defined in CCITT Recommendation O.153 fascicle IV.4, at a level as defined in the table below. The interferer shall have one timeslot active and the frequency shall be at least 2 channels separated from any identified spurious responses. The transmitted bursts shall be synchronized to but, delayed in time between 61 and 86 bit periods relative to the bursts of the wanted signal. GSM 05.05, 5.2.

| MS type | Signal level |
|---------|-----------------|
| GSM900 | -31 dBm |
| DCS1800 | -29 / -31 * dBm |

- * The -31 dBm level shall apply to DCS1800 class 1 and class 2 MS meeting the -102 dBm reference sensitivity level requirement according to GSM 05.05, 6.2.

14.8.1.3 Test purpose

To verify that the AM suppression performance of the MS meets the conformance requirement with an allowance for the statistical significance of the test.

14.8.1.4 Method of test

14.8.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure, on a TCH/FS with an ARFCN in the mid ARFCN range. The power control level is set to maximum power.

The SS transmits standard Test Signal C1 on the traffic channel (TCH frequency FR).

The SS commands the MS to create traffic channel loop back signalling erased frames.

This test is performed after test 14.7.

14.8.1.4.2 Procedure

- a) The SS produces a static wanted signal with an amplitude 4 dB above reference sensitivity level.

b) The SS produces an interfering signal as described below:

- static fading profile;
- at an in band frequency greater than 6 MHz separated from FR and separated by at least two ARFCNs from any spurious responses.

NOTE: Spurious responses are identified by test cases 14.7.1 and 14.7.2.

- at a level as described in table 14-32.
- GSM TDMA modulated by random data with one timeslot active.
- synchronized to, but delayed between 61 and 86 bit periods to the bursts of the wanted signal.

Table 14-32: Interferer signal level

| MS type | Signal level (dB μ V _{emf}) |
|---------|--|
| GSM900 | 82 |
| DCS1800 | 84 |

- c) The SS compares the data of the signal that it sends to the MS with the signal which is looped back from the receiver after demodulation and decoding, and checks the frame erasure indication.
- d) The SS tests the RBER compliance of class II bits by examining at least the minimum number of samples of consecutive bits. Bits only taken from those frames which do not signal frame erasure. The number of error events is recorded.

14.8.1.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14.27.

Table 14-33: Limits for AM suppression

| Channel | Propagation conditions | Type of measurement | Test limit error rate % | Minimum No. of samples |
|-----------------|------------------------|---------------------|-------------------------|------------------------|
| TCH/FS Class II | Static | RBER | 2,439 | 8200 |

14.8.2 AM suppression - control channels

14.8.2.1 Definition and applicability

AM suppression is a measure of the ability of the receiver to receive a modulated wanted input signal in the presence of an unwanted TDMA modulated interferer.

The requirements and this test apply to MS not supporting speech.

14.8.2.2 Conformance requirement

The reference sensitivity performance as specified in table 1 shall be met when the following signals are simultaneously input to the receiver:

- a useful signal at frequency f_0 , 3 dB above the reference sensitivity level as specified in GSM 05.05 section 5.2.
- a single frequency (f), in the relevant receive band, $|f - f_0| \geq 6\text{MHz}$, which is an integer multiple of 200 kHz, a GSM TDMA signal modulated by any 148-bits subsequence of the 511-bits pseudo random bit sequence, defined in CCITT Recommendation O.153 fascicle IV.4, at a level as defined in the table below. The interferer shall have one timeslot active and the frequency shall be at least 2 channels separated from any identified spurious responses. The transmitted bursts shall be synchronized to but,

delayed in time between 61 and 86 bit periods relative to the bursts of the wanted signal. GSM 05.05, 5.2.

| MS type | Signal level |
|---------|-----------------|
| GSM900 | -31 dBm |
| DCS1800 | -29 / -31 * dBm |

- * The -31 dBm level shall apply to DCS1800 class 1 and class 2 MS meeting the -102 dBm reference sensitivity level requirement according to GSM 05.05, 6.2.

14.8.2.3 Test purpose

To verify that the AM suppression performance of the MS meets the conformance requirement with an allowance for the statistical significance of the test.

14.8.2.4 Method of test

14.8.2.4.1 Initial conditions

A call is set up according to the generic call set up procedure, on a TCH with an ARFCN in the mid ARFCN range. The power control level is set to maximum power.

The SS transmits standard Test Signal C1 on the traffic channel (TCH frequency FR).

This test is performed after test 14.7.

14.8.2.4.2 Procedure

- a) The SS produces a TUhigh wanted signal with an amplitude 4 dB above reference sensitivity level.
- b) The SS produces an interfering signal as described below:
 - static fading profile;
 - at an in band frequency greater than 6 MHz separated from FR and separated by at least two ARFCNs from any spurious responses.

NOTE: Spurious responses are identified by test cases 14.7.1 and 14.7.2.

- at a level as described in table 14-34.
- GSM TDMA modulated by random data with one timeslot active.
- synchronized to, but delayed between 61 and 86 bit periods to the bursts of the wanted signal.

Table 14-34: Interferer signal level

| MS type | Signal level (dB μ V _{emf}) |
|---------|---|
| GSM900 | 82 |
| DCS1800 | 84 |

- c) The SS sends the status message. Due to interfering signals, the MS may not be able acknowledge the Layer 2 frame. Frame erasures are indicated by repeated L2 frames.
- d) The SS determines the number of frame erasure events during at least the minimum number of samples. If a failure is indicated, it is noted and counted towards the allowed exemption total.

14.8.2.5 Test requirements

The error rates measured in this test shall not exceed the test limit error rate values given in table 14.35.

Table 14-35: Limits for AM suppression

| Channel | Propagation conditions | Type of measurement | GSM 900 | | DCS 1 800 | |
|---------|------------------------|---------------------|-------------------------|----------------------------|-------------------------|------------------------|
| | | | Test limit error rate % | Minimum No. of max-samples | Test limit error rate % | Min No. of max-samples |
| FACCH/F | TUhigh/No FH | FER | 8,961 | 6696 | 4,368 | 13736 |

14.9 Paging performance at high input levels

14.9.1 Definition and applicability

The paging performance at high input levels is the signal level at the MS receiver input at which a certain FER for the PCH must be achieved.

The requirements and this test apply to all types of MS.

14.9.2 Conformance requirement

The paging performance at high input levels requirements of GSM 05.05 section 6.5 a) for PCH under static propagation conditions shall be met from 20 dB above reference sensitivity level up to -15 dBm for GSM900 and -23 dBm for DCS1800.

14.9.3 Test purpose

To verify that the MS does not exceed the conformance requirement with an allowance for the statistical significance of the test.

14.9.4 Method of test

14.9.4.1 Initial conditions

System Simulator:

1 cell, Tx-Integer = 3, MAX RETRANS is set to minimum. The CCCH is combined with SDCCH. BS_PA_MFRMS = 9 to achieve worst case sleep mode (DRX). The signal level at the receiver input is set to:

GSM 900: -15 dBm
DCS 1800: -23 dBm.

Mobile Station:

The MS has a valid TMSI. It is "idle updated". The MS should have been powered up immediately before running the test, i.e. if a Location update is necessary the MS must be switched off and on again.

14.9.4.2 Procedure

The MS is paged and the SS starts timer T3113. If a CHANNEL REQUEST is received before expiry of T3113 the SS sends an IMMEDIATE ASSIGNMENT REJECT. The sequence is performed 4 times.

Between two consecutive executions the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

14.9.5 Test requirements

If the MS answers all pagings with a CHANNEL REQUEST the requirements are met.

NOTE: The probability for a good MS to fail this test is less than 1%.

14.16 **GPRS receiver tests**

Statistical testing of receiver BLER performance

Error Definition

Block Error Ratio (BLER):

The Block Error Ratio is the ratio of blocks received in error to the total number of received blocks, where a block is defined as received in error if the error detection functions in the receiver, operating in accordance with GSM 05.03, indicate an error as a the result of the Block Check Sequence (BCS).

For USF the Block Error Ratio is the ratio of incorrectly interpreted USF to the total number of received USF.

Test criteria

In the receiver tests for circuit switched channels, test error rates have been defined in order not to pass MS with a performance worse than the specification by 1 dB, with tests to to be performed at the sensitivity and interference levels defined in GSM 05.05. For circuit switched channels GSM 05.05 defines the error rates at a fixed sensitivity or interference level.

For packet switched channels GSM 05.05 defines the receive or interference level at which a fixed Block Error Ratio is met. Therefore, for GPRS the receiver is tested with a 1 dB offset in the receive level and the interference level.

If the error events can be assumed to be random independent variables, outputs of stationary random processes with identical Gaussian distributions, the previous figures suggest a number of events not lower than 200 in AWGN channel and not lower than 600 in a multipath environment.

For multipath propagation conditions the hypothesis of stationary random processes does not generally hold. In case of non frequency hopping operation mode, the radio channel may be assumed to change 10 times per wavelength of travelled distance and to be short term stationary in between. So, in this case, the required observation time for having good statistical properties should not be lower (with some rounding) than that reported in table 14.16-1.

Table 14.16-1: Minimum test time according to propagation profile

| Propagation Conditions | GSM 900 | | | | DCS 1 800 | | | |
|------------------------|---------|--------|----|----|-----------|--------|-----|----|
| | TUlow | TUhigh | HT | RA | TUlow | TUhigh | HT | RA |
| Min. test time (s) | 500 | 30 | 15 | 6 | 500 | 15 | 7,5 | 6 |

Table 14.16-2 details, for the different test conditions, the minimum number of blocks required in order to meet points 1) to 3): the corresponding test time (point 4) can be consequently computed.

Table 14.16-2: Test conditions

| Type of test | Type of channel | Propagation/ frequency conditions | Speci- fied BLER % | Minimum No of blocks |
|--------------|--------------------|---|--------------------------|---------------------------------|
| Sensitivity | PDTCH/CS-1 | static | 10 | 2000 |

14.16.1 Minimum Input level for Reference Performance

14.16.1.1 Definition and applicability

The minimum input level is the signal level at the MS receiver input at which a certain BLER is met.

The requirements and this test apply to MS supporting packet channels.

14.16.1.2 Conformance requirement

1. The block error rate (BLER) performance shall not exceed 10 % at input levels according to the Table below.

| Type of channel | | Propagation conditions | | | | |
|------------------|-----|------------------------|-----------------|--------------------|------------------|------------------|
| | | static | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) | HT100 (no FH) |
| GSM 900 | | | | | | |
| PDTCH/CS-1 | dBm | -104 | -104 | -104 | -104 | -103 |
| PDTCH/CS-2 | dBm | -104 | -100 | -101 | -101 | -99 |
| PDTCH/CS-3 | dBm | -104 | -98 | -99 | -98 | -96 |
| PDTCH/CS-4 | dBm | -101 | -90 | -90 | * | * |
| DCS 1 800 | | | | | | |
| PDTCH/CS-1 | dBm | -104 | -104 | -104 | -104 | -103 |
| PDTCH/CS-2 | dBm | -104 | -100 | -100 | -101 | -99 |
| PDTCH/CS-3 | dBm | -104 | -98 | -98 | -98 | -94 |
| PDTCH/CS-4 | dBm | -101 | -88 | -88 | * | * |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

GSM 900 small MS +2 dB
DCS 1800 class 1 or 2 MS +4 dB
DCS 1800 class 3 MS +2 dB

GSM 05.05, Table 1a; GSM 05.05, 6.2.

2. The block error rate (BLER) performance shall not exceed 1 % at input levels according to the Table below.

| Type of channel | | Propagation conditions | | | | |
|------------------|-----|------------------------|-----------------|--------------------|------------------|------------------|
| | | static | TU50 (no FH) | TU50 (ideal FH) | RA250 (no FH) | HT100 (no FH) |
| GSM 900 | | | | | | |
| USF/CS-1 | dBm | < -104 | -103 | -104 | -104 | -104 |
| USF/CS-2 to 4 | dBm | < -104 | -104 | -104 | -104 | -104 |
| DCS 1 800 | | | | | | |
| USF/CS-1 | dBm | < -104 | -104 | -104 | -104 | -104 |
| USF/CS-2 to 4 | dBm | < -104 | -104 | -104 | -104 | -104 |

The input levels given in the above Table are referenced to normal GSM 900 MS, and have to be corrected by the following values for other MS:

GSM 900 small MS +2 dB
DCS 1800 class 1 or 2 MS +4 dB
DCS 1800 class 3 MS +2 dB

GSM 05.05, Table 1a; GSM 05.05, 6.2.

3. The BLER shall not exceed the the conformance requirements given in 1. - 2. under extreme conditions; GSM 05.05, 6.2, GSM 05.05, annex D D.2.1, D.2.2.
4. The reference sensitivity performance specified above need not be met in the following cases:

for MS at the static channel, if the received level on either of the two adjacent timeslots to the wanted exceed the wanted timeslot by more than 20 dB;

for MS on a multislot configuration, if the received level on any of the timeslots belonging to the same multislot configuration as the wanted time slot, exceed the wanted time slot by more than 6 dB.

The interfering adjacent time slots shall be static with valid GSM signals in all cases.

GSM 05.05, 6.2.

- 5) For an MS allocated a USF on a PDCH with a random RF input or a valid PDCH signal with a random USF not equal to the allocated USF, the overall reception shall be such that the MS shall detect the allocated USF in less than 1% of the radio blocks. This requirement shall be met for all input levels up to -40 dBm.
GSM 05.05, 6.4

14.16.1.3 Test purpose

NOTE: This test is performed under STATIC propagation conditions to allow implicit testing of the ability of the MS to hop over the full band. The tests under dynamic propagation conditions are better suited to test the minimum input level for reference BLER performance conformance but cannot test hopping over the full band due to limited bandwidth of available fading simulators.

1. To verify that the MS sends a Packet Not Acknowledge in the Packet Downlink Ack/Nack in case of a the Block Check Sequence indicating a Block Error.
2. To verify that the MS does not exceed conformance requirement 1 for CS-3 and CS-4 under STATIC, TUhigh, HT and RA propagation conditions with an allowance for the statistical significance of the test.
3. To verify that the MS does not exceed conformance requirement 2 under HT propagation conditions with an allowance for the statistical significance of the test.
4. To verify that the MS does not exceed conformance requirement 3 under STATIC, TUhigh, HT and RA propagation conditions for the PDTCH, and HT propagation conditions for the USF, with an allowance for the statistical significance of the test.
5. To verify that the MS meets the conformance requirements also 1 and 2 for the conditions allowed by conformance requirement 4, with an allowance for the statistical significance of the test.
6. To verify that the MS meets conformance requirement 5, with an allowance for the statistical significance of the test.

14.16.1.4 Method of test

14.16.1.4.1 Initial conditions

- NOTE 1: The BA list sent on the BCCH and SACCH will indicate at least six surrounding cells with at least one near to each band edge. It is not necessary to generate any of these BCCHs but, if provided the signal strengths of BCCHs shall be in the range $15 \text{ dB}\mu\text{Vemf}(\text{ })$ to $35 \text{ dB}\mu\text{Vemf}(\text{ })$. Surrounding cell signal levels and cell reselection parameters are set so that the MS will not try a cell reselection
- NOTE 2: The ARFCN of any BCCH shall not be co-channel or on adjacent channels to the wanted traffic channel.
- NOTE 3: When frequency hopping is used, the traffic channel may fall on any of the ARFCNs defined in section 6.
- NOTE 4: The fading and interference for the different timeslots in a multislot configuration shall be uncorrelated.
- NOTE 5: The PSI1 message is included in the PACCH when the MS is in packet transfer mode. The PBCCH_CHANGE_MARK value in PSI1 is not changed. This, together with preventing cell reselection as per Note 1, ensures that the MS is highly unlikely to suspend the TBF (GSM 04.60 clause 5.5.1.4.2 Suspension of operation to receive system operation), and thus making the effect of TBF suspension statistically insignificant for the test result.

A call is set up according to the generic call set up procedure for packet switched on an ARFCN in the Mid range, on the maximum number of receive timeslots, with the MS transmitting at maximum power.

14.16.1.4.2 Procedure

- a) The SS transmits packets under TU50 propagation conditions, using CS-3 coding at a level of 1 dB above the level given in conformance reference 1. Out of the 400 blocks transmitted by the SS, 20 blocks are sent with incorrect BCS, at (pseudo) random positions. The SS checks, for the blocks it transmitted with incorrect BCS, whether or not the MS Packet Downlink Ack/Nack as sent by the MS indicates these blocks as not acknowledged.
- b) The SS transmits packets under static conditions, with the MS commanded to hopping mode using the hopping sequence used in clause 6, and using CS-3 coding to the MS on all allocated timeslots, at a level of 1 dB above the level given in the table in conformance requirement 1. On the time slots not allocated to the MS, the SS transmits at a level of 20 dB above the level given in the table in conformance requirement 1. This implicitly tests adjacent time slot rejection.
- c) The SS counts the number of blocks transmitted with CS-3 and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can sent this message.

- d) Once the number of blocks transmitted with CS-3 as counted in step c) reaches or exceeds the minimum number of blocks as given in Table 14-x, the SS calculates the Block error ratio. The SS resets both counters.
- e) The SS repeats step b) to d) with the following four fading conditions and hopping modes: TUhigh/noFH, TUhigh/FH, HT/noFH and RA/noFH. For these tests with fading channels, the SS does not transmit on the timeslots not allocated to the MS.
- f) The SS repeats steps b) to e) using CS-4 coding.
- g) The SS repeats steps b) to f) under extreme test conditions.
- h) This step is only performed for a multislot MS. The SS establishes the normal test conditions, and repeats steps b) to d) with only one of the active timeslots at 1 dB above the level at which the reference sensitivity performance shall be met, and all other timeslots belonging to the same multislot configuration at a level of 6 dB above this timeslot.
- i) The SS establishes the normal test conditions, and sets the fading function to HT/noFH.
- j) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, transmitting at a level of 1 dB above the level given in the table in conformance requirement 2.
- k) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.
- l) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step k) reaches or exceeds the minimum number of blocks as given in Table 14-x, the SS calculates the Block error ratio. The SS resets both counters.
- m) The SS repeats steps j) to l) using USF/CS2 to 4 coding.
- n) The SS repeats steps i) to m) under extreme test conditions.
- o) The SS establishes normal test condition and a static channel. The SS sets the value of the USF/CS-1 to all values randomly, with the exception of the one allocated to the MS, transmitting at 3 dB below the level at which reference performance shall be met, and counts the number of times the MS transmits on the uplink. This is done for 2000 blocks.

14.16.1.5 Test requirements

In step a) the Packet Downlink Ack/Nack as sent by the MS shall indicate every block transmitted by the SS with incorrect BCS as not acknowledged.

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

In step o) the MS shall transmit no more than 25 times.

14.16.2 Co-channel rejection

14.16.2.1 Co-channel rejection for packet channels

14.16.2.1.1 Definition and applicability

The co-channel rejection is a measure of the capability of the receiver to receive a wanted modulated signal without exceeding a given degradation due to the presence of an unwanted modulated signal, both signals being at the nominal frequency of the receiver.

The requirements and this test apply to MS supporting packet channels.

14.16.2.1.2 Conformance requirement

1. The block error rate (BLER) performance shall not exceed 10 % at co-channel interference ratios (C/I_c) exceeding those according to the Table below.

| Type of channel | | TUlow (no FH) | Propagation conditions | | RA (no FH) |
|------------------|----|------------------|------------------------|----------------------|---------------|
| | | | TUhigh (no FH) | TUhigh (ideal FH) | |
| GSM 900 | | | | | |
| PDTCH/CS-1 | dB | 13 | 10 | 9 | 9 |
| PDTCH/CS-2 | dB | 15 | 14 | 13 | 13 |
| PDTCH/CS-3 | dB | 16 | 16 | 15 | 16 |
| PDTCH/CS-4 | dB | 19 | 23 | 23 | - |
| DCS 1 800 | | | | | |
| PDTCH/CS-1 | dB | 13 | 9 | 9 | 9 |
| PDTCH/CS-2 | dB | 15 | 13 | 13 | 13 |
| PDTCH/CS-3 | dB | 16 | 16 | 16 | 16 |
| PDTCH/CS-4 | dB | 19 | 25 | 25 | - |

GSM 05.05, Table 2a; GSM 05.05, 6.2.

2. The block error rate (BLER) performance shall not exceed 1 % at co-channel interference ratios (C/I_c) exceeding those according to the Table below.

| Type of channel | | TUlow (no FH) | Propagation conditions | | RA (no FH) |
|------------------|----|------------------|------------------------|----------------------|---------------|
| | | | TUhigh (no FH) | TUhigh (ideal FH) | |
| GSM 900 | | | | | |
| USF/CS-1 | dB | 19 | 12 | 10 | 10 |
| USF/CS-2 to 4 | dB | 18 | 10 | 9 | 8 |
| DCS 1 800 | | | | | |
| USF/CS-1 | dB | 19 | 10 | 10 | 10 |
| USF/CS-2 to 4 | dB | 18 | 9 | 9 | 7 |

14.16.2.1.3 Test purpose

1. To verify that the MS does not exceed conformance requirement 1 under propagation condition TULow/no FH, TUhigh/noFH, TUhigh/FH and RA/no FH with an allowance for the statistical significance of the test.
2. To verify that the MS does not exceed conformance requirement 2 under propagation condition TUhigh/noFH, with an allowance for the statistical significance of the test.

14.16.2.1.4 Method of test

14.16.2.1.4.1 Initial conditions

A call is set up according to the generic call set up procedure with an ARFCN in the mid ARFCN range, power control level set to maximum power.

The SS transmits Standard Test Signal C1.

In addition to this wanted signal (C), the SS produces an independent, uncorrelated interfering signal (I).

This unwanted signal is random, continuous and GSM-modulated, and has no fixed relationship with the bit transitions of the wanted signal.

14.16.2.1.4.2 Procedure

- a) The SS transmits packets using CS-1 coding to the MS on all allocated timeslots.
- b) The fading characteristic of the wanted and the interfering signal is TULow, no FH applies.
- c) The co-channel interference level is set to 1 dB above the level given in the table in conformance requirement 1. The interferer shall have the same frequency hopping sequence as the wanted signal, as well as be subject to the same fading profile.
- d) The SS counts the number of blocks transmitted with current coding scheme and the number of these blocks not acknowledged based on the content of the Ack/Nack Description information element (see 04.60, 12.3) in the Packet Downlink Ack/Nack as sent from the MS to the SS on the PACCH.

Note: Due to the error rates related to the USF, the MS is likely to occasionally miss its USF for transmitting the Packet Downlink Ack/Nack. As this requirement is not verified in this part of the test, the SS then again assigns uplink resources so the MS can send this message.

- e) Once the number of blocks transmitted with the current coding scheme as counted in step d) reaches or exceeds the minimum number of blocks as given in Table 14-x, the SS calculates the Block error ratio. The SS resets both counters.
- f) In case of CS-1, CS-2 or CS-4 the SS repeats step c) to e) with the following three fading conditions and hopping modes: TUhigh/noFH, TUhigh/FH, and RA/noFH. In case of CS-3 the SS repeats step c) to e) with the fading condition and hopping mode TUhigh/FH only
- g) The SS repeats the steps b) to f) for each of the coding schemes CS-2, CS-3 and CS-4.
- h) The SS establishes the normal test conditions, and sets the fading function to TUhigh/noFH.
- i) The SS sets the value of the USF/CS-1 such as to allocate the uplink to the MS, using a co-channel interference level of 1 dB above the level given in the table in conformance requirement 2.
- j) The SS counts the number of times the USF is allocated to the MS, and the number of times the MS does not transmit while being allocated the uplink.

- k) Once the number of USF/CS-1 allocating the uplink for the MS as counted in step j) reaches or exceeds the minimum number of blocks as given in Table 14-x, the SS calculates the Block error ratio. The SS resets both counters.
- l) The SS repeats steps i) to k) using USF/CS2 coding.

14.16.2.1.5 Test requirements

The block error ratio, as calculated by the SS for different channels and under the different propagation conditions, under any combination of normal and extreme test voltages and ambient temperatures, shall not exceed the conformance requirement.

15 Timing advance and absolute delay

15.1 Definition and applicability

Timing advance (TA) is a time offset in bits as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

NOTE: For normal or dummy bursts, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS.

15.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of ± 1 bit period.
GSM 05.10, 6.4; GSM 05.10, 6.6.
- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of ± 1 bit period.
GSM 05.10, 6.4.
- 3) When the MS receives a new value of TA on the SACCH, it shall implement the new value of TA at the first TDMA frame belonging to the next reporting period, after the SACCH frame containing the new TA value.
GSM 05.10, 6.5.
- 4) The MS shall signal the used TA to the BS, in the L1 header of the uplink SACCH message.
GSM 05.10, 6.4, GSM 04.04, 7.2.

15.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.
- 4) To verify that the MS implements a new timing advance value as signalled on the SACCH as in the requirement.
- 5) To verify that the MS sends the TA used on the uplink SACCH as in the requirement.

15.4 Method of test

15.4.1 Initial conditions

The SS sends "MAXRETRANS = 7" and "TX-INTEGGER = 3" on the BCCH.

The MS is brought into MM state "idle, updated".

15.4.2 Procedure

- a) The SS pages the MS after 10 s.
- b) The SS does not respond to the first 7 CHANNEL REQUEST messages from the MS. The SS responds to the 8th CHANNEL REQUEST from the MS on the RACH by sending an IMMEDIATE ASSIGNMENT message, with TA set to 0.
- c) The SS continues to set up a call according to the generic call set up procedure.
- d) The SS signals the TA values 10, 20, 30, 40, 50, 60, 63, and one random value other than these values to the MS in consecutive SACCH blocks.

The SS determines the TA value set in the L1 header on the uplink SACCH for each timing advance.

The SS measures the absolute delay for all bursts.

15.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of +/- 1 bit period:

access bursts: 3 timeslots (= 45/26 ms)

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

The MS shall use the new timing advance at the first TDMA frame belonging to the next reporting period after the SACCH frame containing the new TA value.

The TA field in the uplink SACCH L1 header shall contain to the most recently ordered TA value.

15.5 GPRS Timing advance and absolute delay

15.5.1 Definition and applicability

Timing advance (TA) is a time offset in bits as sent to the MS by the BS. The MS shall advance its transmissions to the BS by the timing advance relative to 3 timeslots behind transmissions received from the BS.

The absolute delay is the delay between a common burst reference point within the received and the transmitted RF burst.

The timing advance procedure is used to derive the correct value for timing advance that the MS has to use for the uplink transmission of radio blocks.

The timing advance procedure comprises two parts:

- initial timing advance estimation;
- continuous timing advance update.

NOTE: For normal or dummy bursts, the common burst reference point is defined to be the transition from bit 13 to bit 14 of the midamble. For an access burst it is defined to be the transition from bit 48 to bit 49 of the burst.

Equivalently the delay can be referenced to the modulator input vs. the demodulator output or to the differential encoder input vs. the differential decoder output, provided the measured delay is corrected for the additional delays in the signal path.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS supporting GPRS.

15.5.2 Conformance requirement

- 1) The random access burst transmission, measured at the MS antenna, shall use a TA of 0, and therefore be 3 timeslots behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 bit period.
GSM 05.10, 6.4; GSM 05.10, 6.6.
- 2) The normal burst transmission, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, with an absolute tolerance of +/- 1 bit period. In case of a multislot configuration, the MS shall use a common timebase for transmission of all channels. In this case, the MS may optionally use a timeslot length of 157 bit periods on timeslots TN = 0 and 4, and 156 bit periods on timeslots with TN = 1, 2, 3, 5, 6 and 7, rather than 156,25 bit periods on all timeslots. In case of a packet switched multislot configuration the common timebase shall be derived from all timeslots monitored by the MS. In this case, the MS may assume that the BTS uses a timeslot length of 156,25 bit periods on all timeslots
GSM 05.10, 6.4.
- 3) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Within the packet resource assignments (see GSM 04.08 and GSM 04.60) for uplink or downlink messages the MS gets the Timing Advance Index (TAI). The MS shall send access bursts on the subchannel defined by the TAI on the PTCCH using TA=0.
GSM 05.10 6.5.2
- 4) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives the updated value of TA from the BTS on the downlink PTCCH, it shall always use the last received TA value for the uplink transmission.
GSM 05.10 6.5.2
- 5) For an MS in Packet transfer mode, except MS class A in dedicated mode:

Upon initiation of the continuous timing advance procedure the MS shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.
GSM 05.10 6.5.2
- 6) For an MS in Packet transfer mode, except MS class A in dedicated mode:

The network may request the MS to send 4 access bursts to calculate a new TA value. For this purpose the network sets the system information element CONTROL_ACK_TYPE to indicate that the MS is to respond with a PACKET_CONTROL_ACKNOWLEDGEMENT consisting of 4 access bursts (see GSM 04.60), and sends a PACKET_POLLING_REQUEST to the MS. In this case, the MS shall transmit 4 consecutive access bursts on the assigned resources.
GSM 05.10 6.5.2
- 7) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a resource assignment or power control/timing advance message (see GSM 04.60), the MS shall use the included TA value until it receives a new value on PTCCH.
GSM 05.10 6.5.2
- 8) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receive a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, the MS shall start the packet transfer after the TA value is received on the PTCCH.

GSM 05.10 6.5.2

- 9) For an MS in Packet transfer mode, except MS class A in dedicated mode:

If the MS receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating that a default timing advance shall be used, the MS shall not use the continuous timing advance procedure.
GSM 05.10 6.5.2

- 10) For an MS in Packet transfer mode, except MS class A in dedicated mode:

When the MS receives a new or updated TA value on the downlink PTCCH or downlink PACCH, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA value.
GSM 05.10, 6.9

Note: A MS class A in dedicated mode has to follow the procedures described in GSM 05.10 subclause 6.5.1.

15.5.3 Test purpose

- 1) To verify that the MS uses a TA value of 0 for the access burst.
- 2) To verify that the MS meets the absolute receive/transmit delay requirement for the access burst.
- 3) To verify that the MS meets the absolute receive/transmit delay requirement for normal bursts.
- 4) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, when it receives an updated value of TA from the BTS on the downlink PTCCH, uses the last received TA value for the uplink transmission, respecting conformance requirement 10.
- 5) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, upon initiation of the continuous timing advance procedure shall disregard the TA values on PTCCH until it has sent its first access burst on PTCCH.
- 6) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet polling message as defined in conformance requirement 6, sends 4 access bursts on a network assigned uplink resource.
- 7) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a resource assignment or power control/timing advance message (see GSM 04.60), uses the included TA value until it receives a new value on PTCCH.
- 8) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating to the MS that it can only start the uplink transmission on PDTCH after the timing advance is obtained by the continuous update procedure, it starts the packet transfer after the TA value is received on the PTCCH respecting conformance requirement 10.
- 9) To verify that an MS in Packet transfer mode, except for a GPRS Class A MS in dedicated mode, if it receives a packet resource assignment (see GSM 04.08 and GSM 04.60) indicating that a default timing advance shall be used, does not use the continuous timing advance procedure.

15.5.4 Method of test

15.5.4.1 Initial conditions

The SS sets the Packet System Information 1 parameter CONTROL_ACK_TYPE to "0".

The MS is brought into packet idle mode.

15.5.4.2 Procedure

- a) The SS pages MS on the PPCH. The SS measures the receive/transmit delay for each burst.
- b) The MS is brought into packet transfer mode. The SS transmits a packet resource assignment to the MS with a valid TAI. The SS transmits a TA value on the PTCCH for this TAI which is not 0 nor 1. The SS measures the receive/transmit delay for each burst.
- c) The SS transmits a number of different TA values on the PTCCH for the TAI assigned to the MS. The SS also changes the TA values on the PTCCH for the other TAI in such a way that there is no correlation between TA values. The SS measures the receive/transmit delay for each burst.
- d) The SS transmits a new TA value, different by more than 1 from the previously transmitted one, in such a way that the MS can only correctly receive the last (4th) occurrence of the new TA value. The SS measures the receive/transmit delay for each burst.
- e) The MS is made to send a Packet Channel Request. The SS responds with a Packet Queuing Notification. After 10 s the SS sends a Packet Polling, addressing the MS with its Temporary Queuing Identity. The SS measures the receive/transmit delay for each burst.

Note: The 10 s is an arbitrary value.

- f) The SS sends a Packet Uplink Assignment to the MS with valid TIMING_ADVANCE_INDEX, TIMING_ADVANCE_TIMESLOT_NUMBER, and TIMING_ADVANCE_VALUE. As part of the subsequent continuous timing advance update procedure, the SS sends a timing advance value on the downlink PTCCH for the MS, that is different from the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.
- g) The SS sends a Packet Uplink Assignment to the MS with valid TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER corresponding to the PTCCH, and with the TIMING_ADVANCE_VALUE field not present. The SS allocates uplink resources to the MS in such a way that the allocated uplink resources occur before the uplink PTCCH allocated to the MS. The SS measures the receive/transmit delay for each burst.
- h) The SS sends a Packet Uplink Assignment to the MS with TIMING_ADVANCE_VALUE set to a value different from the last one ordered on the PTCCH, and the TIMING_ADVANCE_INDEX and TIMING_ADVANCE_TIMESLOT_NUMBER fields not present. The SS continues to transmit TA values on the PTCCH. These shall be different from the TA value TIMING_ADVANCE_VALUE in the Packet Uplink Assignment. The SS measures the receive/transmit delay for each burst.

15.5.5 Test requirement

The measured receive/transmit delay for each burst shall equal the following nominal values with an absolute tolerance of +/- 1 bit period.

access bursts: 3 timeslots (= 45/26 ms)

normal bursts: 3 timeslots (= 45/26 ms) minus the last TA value received from the SS.

In step a) the MS shall transmit an access burst on the PRACH.

In step b) the MS shall send access bursts on the PTCCH on the subchannel defined by the TAI with TA = 0.

In step c) the MS shall use the updated TA values.

In step d) the MS shall use the updated TA value.

In step e) the MS shall transmit 4 access bursts.

In step f) the MS shall use the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment first, and change to the Timing Advance value transmitted on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

After step h) the MS shall not transmit on the allocated resources before it received a Timing Advance value on the downlink PTCCH in response to the sending of an access burst on the uplink PTCCH.

In step h) the last TA value received from the SS is the TIMING_ADVANCE_VALUE in the Packet Uplink Assignment.

16 Reception time tracking speed

16.1 Definition and applicability

Reception time tracking speed is the speed at which the MS adapts its transmit time to a change in the timing of the received signal.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS.

16.2 Conformance requirement

If the MS determines that the timing difference with signals received from the BS exceeds 2 μ s, the MS shall adjust its timebase in steps of 1/4 bit period, in intervals not less than 1 s and not greater than 2 s until the timing difference is less than 1/2 bit period at 3 dB below reference sensitivity and 3 dB less carrier to interference ratio than the reference interference ratios.

GSM 05.10, 6/6.2.

16.3 Test purpose

- 1) To verify that the MS adapts its transmit time to the timing of the received signal as in the conformance requirement under TUHigh propagation conditions at 2 dB above reference sensitivity level().
- 2) To verify that the MS adapts its transmit time to the timing of the received signal as in the conformance requirement under RA propagation conditions at 2 dB above reference sensitivity level().

NOTE: This test is performed at a level higher than in the conformance requirement because of test implementation problems.

16.4 Method of test

16.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a channel in the Mid ARFCN range.

The SS sets TUHigh.

16.4.2 Procedure

- a) After 10 s the SS sets the input signal level to 2 dB above reference sensitivity level().
- b) For the last second before step c) the SS takes an average receive/transmit delay of all bursts in that 1 s.
- c) The SS increases the delay of the transmitted signal to the MS by a 2 bit step (about 7,4 μ s) and keeps this delay for 20 s.
- d) The SS measures the absolute receive/transmit delay for each burst.
- e) The SS increases the input signal level to 5 dB above reference sensitivity level() and sets propagation condition RA.
- f) The SS repeats steps a) to d).

16.5 Test requirement

The MS shall adjust the timing of its transmit burst back to the correct receive/transmit timing delay. All burst timings shall be within the shaded part of 16.1.

bits change
of transmit
timing

$t=0$ is the time at which the SS makes the transmission timing step change in c) of subclause 16.4.2.

Figure 16.1

17 Access times during handover

17.1 Intra cell channel change

17.1.1 Definition and applicability

The access times are:

- the time between either receipt by the MS of the last timeslot of the message block containing an ASSIGNMENT COMMAND or HANDOVER COMMAND and the time it has to be ready to transmit on the new channel, and
- the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS. For E-GSM 900 and R-GSM 900 MS this test is performed in the P-GSM band (ref. table 3.3 P-GSM 900ARFCN ranges).

17.1.2 Conformance requirement

- 1) When for an intracell channel change, the MS receives an ASSIGNMENT COMMAND command or a HANDOVER COMMAND it shall be ready to transmit on the new channel within 120 ms of the last timeslot of the message block containing the command.
GSM 05.10, 6.8.
- 2) For an intracell channel change, the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.
GSM 05.10, 6.8.

17.1.3 Test purpose

- 1) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or a new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 120 ms of the last timeslot containing the ASSIGNMENT COMMAND.
- 2) To verify that the MS, when commanded to perform an intracell channel change to a new ARFCN and/or a new timeslot number within the same cell, if the starting time is not used in the ASSIGNMENT COMMAND, is ready to transmit on the new channel within 20 ms of the last complete speech/data frame or message block sent on the old channel.

17.1.4 Method of test

17.1.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a channel in the Low ARFCN range on timeslot 1.

17.1.4.2 Procedure

- a) The SS sends an ASSIGNMENT COMMAND to the MS allocating a channel in the high ARFCN range on timeslot 2, and with a power command of 7. These old and new carriers have a relative frequency tolerance of 0, and a relative timing tolerance of 1/4 bit.
- b) The SS, after it has sent the ASSIGNMENT COMMAND, measures the reception time of bursts received on the new channel, and the time at which transmission ceases on the old channel.

Figure 17-1: Access time - Intra cell channel change (Test Requirement 1)

Figure 17-2: Access time - Intra cell channel change (Test Requirement 2)

17.1.5 Test requirement

- 1) The MS shall transmit its first burst on the new channel within 131 ms from the last timeslot of the message block containing the ASSIGNMENT COMMAND.

NOTE 1: The requirement time of 120 ms, at which the MS shall be ready to transmit, will expire right at the beginning of a new downlink burst on timeslot 2, which will be the last burst of a traffic channel block. The following frame could be an IDLE frame and the MS would then transmit in the next frame. Taking into account the 3 timeslot shift between up and downlink, and the 1/4 bit relative timing tolerance between the carriers, means that the MS may first transmit on the new channel after 131 ms (120 ms + 2 frames + 3 timeslots + 1/4 bit period). See figure 17-1.

- 2) The MS shall transmit its first burst on the new channel within 27,7 ms from the last complete speech or data frame or message block sent on the old channel.

NOTE 2: The requirement time of 20 ms, at which the MS shall be ready to transmit, will expire at just over 4 frames after the sending of the last bit on the old channel. The next frame could be an IDLE frame and the MS would then transmit in the following frame. This equates to 6 frames so in the worst case, including the 1/4 bit relative timing tolerance between the carriers, the MS may take 27,7 ms before starting transmissions on the new channel.

17.2 Inter cell handover

17.2.1 Definition and applicability

The access times are:

- the time between receipt by the MS of the last timeslot of the message block containing a HANDOVER COMMAND and the time it has to be ready to transmit on the new channel, and
- the time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS.

17.2.2 Conformance requirement

- 1) When the MS receives a HANDOVER COMMAND it shall be ready to transmit on the new channel within 120 ms of the last timeslot of the message block containing the HANDOVER COMMAND.

GSM 05.10, 6.8

- 2) The time between the end of the last complete speech or data frame or message block sent on the old channel and the time the MS is ready to transmit on the new channel shall be less than 20 ms.
GSM 05.10, 6.8.
- 3) When the MS receives a new TA value in response to a handover access burst, the MS shall be ready to transmit using the new TA value within 40 ms of the end of the last timeslot of the message block containing the new TA.
GSM 05.10, 6.9.
- 4) The MS shall use a TA value of 0 for the handover access bursts sent.
GSM 05.10, 6.6.

17.2.3 Test purpose

- 1) To verify that the MS, when commanded to handover on a new ARFCN and a new timeslot number in a new, not synchronized cell, starting time not used in the HANDOVER COMMAND, will be ready to transmit on the new channel within 120 ms of the last timeslot containing the HANDOVER COMMAND.
- 2) To verify that the MS, when commanded to handover on a new ARFCN and a new timeslot number in a new, not synchronized cell, starting time not used in the HANDOVER COMMAND, will be ready to transmit on the new channel within 20 ms of the last complete speech or data frame or message block sent on the old channel.
- 3) To verify that the MS, when it receives a new TA value in response to a handover access burst, is ready to transmit using the new TA value within 50 ms of the end of the last timeslot of the message block containing the new TA value.
- 4) To verify that the MS uses a TA value of 0 for the handover access burst sent.

17.2.4 Method of test

17.2.4.1 Initial conditions

The SS establishes two non-synchronized cells, A and B, under ideal radio conditions. A is the old cell and B is the target for the handover.

The SS uses two traffic channels with the following properties:

| | | GSM900 | DCS1800 |
|--------|--------|---------|---------|
| Cell A | TN | 2 | 2 |
| | ARFCN | 1 | 512 |
| | offset | +267 Hz | +320 Hz |
| Cell B | TN | 0 | 0 |
| | ARFCN | 124 | 885 |
| | offset | -267 Hz | -320 Hz |

NOTE: This offset is representing worst cases for Doppler shift at 250 km/h and 130 km/h for GSM and DCS respectively, and a frequency inaccuracy of 0,05 ppm.

The BCCH for the two cells have the following differences in timing:

| | |
|----------------|----|
| Timer T1 | 50 |
| Timer T2 | 15 |
| Timer T3 | 40 |
| 1/4 bit number | 17 |
| Timeslots | 2 |

The SS sets up a call according to the generic call set up procedure on the channel in cell A.

17.2.4.2 Procedure

- a) The SS sends a HANDOVER COMMAND on the main DCCH on cell A ordering the MS to go to the channel in cell B. The power command is set to 7.
- b) After the SS has sent HANDOVER COMMAND it measures the reception time of bursts received on the new channel and the time at which transmission ceases on the old channel.
- c) The SS also measures the absolute transmit/receive delay for the access bursts on the new channel.
- d) The SS sends the PHYSICAL INFORMATION with TA set to 50. The SS then measures the reception time and absolute delay of the bursts transmitted on the new cell.

17.2.5 Test requirement

- 1) The MS shall transmit its first burst on cell B within 142,6 ms from the last timeslot of the message block containing the HANDOVER COMMAND.

NOTE 1: The requirement time of 120 ms, at which the MS shall be ready to transmit, will expire right at the end of the last burst of a downlink traffic channel block on the old channel. Due to the two timeslot difference in cell timing, the two timeslots difference in the channel allocation and the 15 frames difference in multiframe timing, this point could occur 2,5 frames before the end of the last burst of a downlink traffic channel block on the new channel. The following frame could be an IDLE frame and the MS would then transmit in the next frame. Taking into account the three timeslot shift between up and downlink, and the 17 1/4 bit periods timing difference between the two carriers, means that the MS may first transmits on the new channel after 142,6 ms (120 ms + 2,5 frames + 2 frames + 3 timeslots + 17 1/4 bit periods).

- 2) The MS shall transmit its first burst on cell B within 39,2 ms from the last complete speech or data frame or message block sent on cell A.

NOTE 2: The requirement time of 20 ms, at which the MS shall be ready to transmit, will expire at just over 4 frames after the sending of the last bit on the old channel. Due to the two timeslot difference in cell timing, the two timeslots difference in the channel allocation and the 15 frames difference in multiframe timing, this point could occur 2 frames before the end of the last burst of an uplink traffic channel block on the new channel. The following frame could be an IDLE frame and the MS would then transmit in the next frame. This equates to 8,5 frames so in the worst case the MS may take 39,2 ms between cessation of transmission on the old channel and transmission beginning on the new channel.

- 3) The MS shall transmit using the TA value in the PHYSICAL INFORMATION within 50 ms from the end of the last timeslot of the message block containing the new TA value.
- 4) The measured absolute delay for the access bursts in steps c) and d) shall equal 3 timeslots (=45/26 ms), with an absolute tolerance of +/- 1 bit.

18 Temporary reception gaps

18.1 Temporary reception gaps, single slot

18.1.1 Definition and applicability

A temporary reception gap is a limited period of time in which the RF reception is interrupted. During this gap the MS shall maintain the frequency and timing of its transmission within specifications.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

18.1.2 Conformance requirement

- 1) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS. The MS shall use the same frequency source for both RF frequency generation and clocking the timebase.
GSM 05.10, 6.7; GSM 05.10 6.1.
- 2) The MS shall time its transmissions to the BTS according to signals received from the BTS. The MS transmissions to the BTS, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, where TA is the last timing advance received from the current serving BTS.
GSM 05.10, 6.4.
- 3) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS.
GSM 05.10, 6.7.

18.1.3 Test purpose

- 1) To verify that, during a temporary total loss of signal of up to 63 SACCH block periods, the MS carrier frequency is accurate to within 0,2 ppm of the signals previously received from the BTS.
- 2) To verify that, the MS transmissions to the BTS, measured at the MS antenna, is 3 timeslots behind the transmissions received from the BTS, with a tolerance of +/-1 bit period.
- 3) To verify that, during a temporary total loss of signal, of up to 63 SACCH block periods, the MS transmission timing may have drifted resulting in an error not greater than +/- 6,048 μ s (0,2 ppm of 63 SACCH blocks).

18.1.4 Method of test

18.1.4.1 Initial conditions

The SS signals RADIO_LINK_TIMEOUT = 64 and "DTX OFF" on the BCCH.

The MS is brought into MM state "idle, updated".

After 10 s, the SS continues to set up a call according to the generic call set up procedure.

18.1.4.2 Procedure

- a) The SS, in a TDMA frame immediately following the transmission of a complete SACCH block, removes the downlink signal for 63 SACCH blocks.

NOTE: This gives the maximum temporary reception gap.

- b) The SS measures the frequency and timing of the MS transmissions immediately before, and at least 5 times at approximately equally spaced intervals during the gap, one of these measurements being at the end of the gap.
- c) The SS resumes transmission for a period sufficient to allow the MS reception of 1 SACCH block.
- d) The SS again removes downlink transmission for a period equal to at least 3 SACCH blocks. The SS measures the frequency and timing of the MS transmissions immediately before and during this second reception gap.

18.1.5 Test requirement

- 1) The MS carrier frequency shall be accurate to within 0,2 ppm compared to signals received from the SS.
- 2) The receive/transmit delay timing shall be 3 timeslots +/- 1 bit.
- 3) During the second reception gap the MS shall maintain transmission for a period up to but not exceeding 3 SACCH blocks.
- 4) During the first, maximum, reception gap the MS transmission timing may have drifted resulting in an error of not greater than +/- 6,048 μ s.

NOTE: The SS determines the error at the start of the reception gap from the first measurement of MS transmission frequency and timing.

18.2 Temporary reception gaps in HSCSD multislot configurations**18.2.1 Definition and applicability**

A temporary reception gap is a limited period of time in which the RF reception is interrupted. During this gap the MS shall maintain the frequency and timing of its transmission within specifications.

The requirements and this test apply to all types of GSM 900, DCS 1 800 MS and multiband GSM 900 / DCS 1800 which are capable of HSCSD multislot operation, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

18.2.2 Conformance requirement

- 1) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS. The MS shall use the same frequency source for both RF frequency generation and clocking the timebase.
GSM 05.10, 6.7; GSM 05.10 6.1.
- 2) The MS shall time its transmissions to the BTS according to signals received from the BTS. The MS transmissions to the BTS, measured at the MS antenna, shall be 3 timeslots - TA behind the transmissions received from the BTS, where TA is the last timing advance received from the current serving BTS.
GSM 05.10, 6.4.
- 3) During a temporary total loss of signal, of up to 64 SACCH block periods, the MS shall update its timebase with a clock which is accurate to within 0,2 ppm, or to within 0,2 ppm of the signals previously received from the BTS.
GSM 05.10, 6.7.

18.2.3 Test purpose

- 1) To verify that, during a temporary total loss of signal of up to 63 SACCH block periods on the main multislot channel, the MS carrier frequency is accurate to within 0,2 ppm of the signals previously received from the BTS.
- 2) To verify that, the MS transmissions to the BTS, measured at the MS antenna, is 3 timeslots behind the transmissions received from the BTS, with a tolerance of +/-1 bit period.
- 3) To verify that, during a temporary total loss of signal, of up to 63 SACCH block periods on the main multislot channel, the MS transmission timing may have drifted resulting in an error not greater than +/- 6,048 μ s (0,2 ppm of 63 SACCH blocks).
- 4) To verify that, during a temporary loss of more than 64 SACCH block periods on other than the main channel in symmetric configuration, the MS meet the requirements 1, 2 and 3.

18.2.4 Method of test

18.2.4.1 Initial conditions

The SS signals RADIO_LINK_TIMEOUT = 64 and "DTX OFF" on the BCCH.

The MS is brought into MM state "idle, updated".

After 10 s, the SS continues to set up a call according to the generic call set up procedure for multislot HSCSD.

The SS commands the MS to operate in a highest possible asymmetric configuration, with a maximum number of downlink timeslots.

18.2.4.2 Procedure

- a) The SS, in a TDMA frame immediately following the transmission of a complete SACCH block, removes the downlink signal for 63 SACCH blocks of the main channel.

NOTE: This gives the maximum temporary reception gap.
- b) The SS measures the frequency and timing of the MS transmissions immediately before, and at least 5 times at approximately equally spaced intervals during the gap, one of these measurements being at the end of the gap.
- c) The SS resumes transmission for a period sufficient to allow the MS reception of 1 SACCH block.
- d) The SS again removes downlink transmission for a period equal to at least 3 SACCH blocks of the main channel. The SS measures the frequency and timing of the MS transmissions immediately before and during this second reception gap.
- e) SS signals RADIO_LINK_TIMEOUT=64 and commands the MS to operate in a highest possible symmetric multislot configuration, with a maximum number of uplink timeslots.
- f) For a symmetric multislot configuration steps a) and b) are repeated with the exception that a 69 SACCH blocks are removed from a channel other than the main channel.

18.2.5 Test requirement

- 1) The MS carrier frequency shall be accurate to within 0,2 ppm compared to signals received from the SS.
- 2) The receive/transmit delay timing shall be 3 timeslots +/- 1 bit.

- 3) During the second reception gap the MS shall maintain transmission for a period up to but not exceeding 3 SACCH blocks.
- 4) During the first, maximum, reception gap the MS transmission timing may have drifted resulting in an error of not greater than $\pm 6,048 \mu\text{s}$.
- 5) During the last reception gap, the MS shall maintain transmission.

NOTE: The SS determines the error at the start of the reception gap from the first measurement of MS transmission frequency and timing.

19 Channel release after unrecoverable errors

NOTE: It is not possible to explicitly verify the correct functioning of all aspects of the radio link failure algorithm in the MS. Therefore 3 tests are used to implicitly verify correct implementation.

19.1 Channel release after unrecoverable errors -1

19.1.1 Definition and applicability

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

19.1.2 Conformance requirement

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.
GSM 05.08, 5.2.
- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.
GSM 05.08, 5.2.
- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.
GSM 05.08, 5.2.
- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see GSM 04.08) has been established.
GSM 05.08, 5.2.

19.1.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.
- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.
- 4) To verify that the MS declares RADIO_LINK_FAILURE, and clears the RR connection when S = 0.

19.1.4 Method of test

19.1.4.1 Initial conditions

The SS sends a randomly chooses value N for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE-ESTABLISHMENT is not allowed.

19.1.4.2 Procedure

- a) A MS originated call is set up according to the generic call set up procedure.
- b) The SS sends 32 error free SACCH messages, followed by N SACCH messages that contain unrecoverable errors, and then continuously sends error free SACCH messages.

NOTE: The SS shall continue sending error free SACCH messages for a time that allows the MS to release the RR connection.

- c) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to b).

19.1.5 Test requirement

After receiving the N SACCH messages with unrecoverable errors, the MS shall abort the RR-connection, i.e. there is no more MS activity on the SACCH channel.

19.2 Channel release after unrecoverable errors - 2**19.2.1 Definition and applicability**

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

19.2.2 Conformance requirement

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.
GSM 05.08, 5.2.
- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.
GSM 05.08, 5.2.
- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.
GSM 05.08, 5.2.
- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see GSM 04.08) has been established.
GSM 05.08, 5.2.

19.2.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.
- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.

19.2.4 Method of test

19.2.4.1 Initial conditions

The SS sends a randomly chooses value N for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE-ESTABLISHMENT is not allowed.

19.2.4.2 Procedure

- a) A MS originated call is set up according to the generic call set up procedure.
- b) The SS sends 2 SACCH messages with unrecoverable errors followed by one error free SACCH message. This step is repeated 64 times.
- c) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to b).

19.2.5 Test requirement

The MS shall not abort the RR-connection.

19.3 Channel release after unrecoverable errors - 3

19.3.1 Definition and applicability

Channel release after unrecoverable errors is a procedure to abort the call if the radio link has been severely corrupted for some time, according to a link failure criterion.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS, except where an application layer is always running which would perform a normal release of the call due to loss of traffic (see PICS/PIXIT).

19.3.2 Conformance requirements

- 1) If the MS is unable to decode a SACCH message, the radio link counter S is decreased by 1. In the case of a successful reception of a SACCH message S is increased by 2. In any case S shall not exceed the value of RADIO_LINK_TIMEOUT. If S reaches 0 a radio link failure shall be declared.
GSM 05.08, 5.2.
- 2) The MS shall continue transmitting as normal on the uplink until S reaches 0.
GSM 05.08, 5.2.
- 3) The algorithm shall start after the assignment of a dedicated channel and S shall be initialized to RADIO_LINK_TIMEOUT.
GSM 05.08, 5.2.
- 4) (Re-)initialization and start of the algorithm shall be done whenever the MS switches to a new channel (this includes the old channel in assignment and handover failure cases), at the latest when the main signalling link (see GSM 04.08) has been established.
GSM 05.08, 5.2.

19.3.3 Test purpose

- 1) To verify correct handling of the radio link counter S.
- 2) To verify that the MS that is transmitting continues to transmit as normal on the uplink until S reaches 0.
- 3) To verify that the algorithm starts after the assignment of a dedicated channel, with S initialized to RADIO_LINK_TIMEOUT.
- 4) To verify that the MS declares RADIO_LINK_FAILURE, and clears the RR connection when S = 0.

19.3.4 Method of test**19.3.4.1 Initial conditions**

The SS sends a randomly chooses value N for the parameter RADIO_LINK_TIMEOUT on the BCCH. CALL RE_ESTABLISHMENT is not allowed.

19.3.4.2 Procedure

- a) A MS originated call is set up according to the generic call set up procedure.
- b) The SS sends 32 error free SACCH messages, followed by 3 SACCH messages with unrecoverable errors, and the sends 1 error free SACCH message. This step is repeated N - 2 times.
- c) The SS shall continuously send error free SACCH messages.

NOTE: The SS shall continue sending error free SACCH messages for a time that allows the MS to release the RR connection.

- d) The SS sets N to a different but randomly chosen value, and broadcasts this on the BCCH. The SS repeats steps a) to c).

19.3.5 Test requirement

After receiving the 3 * (N - 2) erroneous SACCH messages the MS shall abort the RR-connection, i.e. there is no more activity on the SACCH channel.

20 Cell selection and reselection

In the following paragraphs some explanatory text is given concerning the nature of the tests in this section and the general behaviour of the SS is described.

Since the conformance requirements of most of the tests in this section cannot be tested explicitly, testing is done implicitly by testing the MS behaviour from its responses to the SS.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. Each of these cell control channels are non-combined with SDCCHs. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. For multiband tests it is assumed that at least one of the BCCH carriers and one of the monitored random access channels is in a different frequency band from the others. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any MS all the carriers are in its supported band(s) of operation. For an E-GSM mobile station at least one of the carriers is in the extension band and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this section:

- The SS is continuously paging the MS on all carriers at the start of the test and does not respond to RACH requests from the MS. Where a test specifies that the MS is not paged on a particular carrier, only idle paging is transmitted according to GSM 04.08, 3.2.2.2.
- The default values of the system information data fields given in table 20.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the MS signal level measurements is assumed to be ± 6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1 or C2 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be ± 3 dB for the signal levels used in the tests of this section, except for section 20.20, where the relative accuracy is assumed to be ± 5 dB if the measurements are on different frequency bands. A difference of at least 5 dB is allowed for cases of discrimination between C1 or C2 values on different carriers, except for section 20.20, where a difference of at least 10 dB is allowed if the measurements are on different frequency bands.

NOTE 1: The accuracy of MS signal level measurements is specified in GSM 05.08. For all of the tests in this section, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in GSM 05.08 is ± 10 % except for PENALTY_TIME where it is ± 2 seconds. In the tests of this section, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is ± 2 % and the SS tolerance on power level ± 1 dB.

Table 20.1: Default values of the system information fields

| Parameter | GSM 04.08 reference | Abbr. | Normal Setting |
|--------------------------|---------------------|-------|---|
| Cell channel description | 10.5.2.1 | - | Any values |
| MAX retrans | 10.5.2.29 | - | 1 |
| TX-integer | 10.5.2.29 | - | Any value |
| CELL_BAR_QUALIFY | 10.5.2.35 | CBQ | 0 |
| CELL_BAR_ACCESS | 10.5.2.29 | CBA | 0 (not barred) |
| AC CN | 10.5.2.29 | AC | All 0 |
| RE | 10.5.2.29 | RE | 0 (re-establishment allowed) |
| NCC | 10.5.2.2 | NCC | Any value |
| Cell Identity | 10.5.1.1 | - | Any value |
| MCC, MNC | 10.5.1.3 | PLMN | MS Home PLMN |
| LAC | 10.5.1.3 | LAC | 1111 (Hex) |
| ATT | 10.5.2.11 | - | 0 (Attach/Detach not allowed) |
| BS_AG_BLKES_RES | 10.5.2.11 | - | Any values |
| CCCH_CONF | 10.5.2.11 | - | 1 basic physical channel used for CCCH, non-combined with SDCCHs. |
| T3212 | 10.5.2.11 | - | Any values |
| BS_PA_MFRMS | 10.5.2.11 | BPM | 5 frames |
| Cell Options | 10.5.2.3 | - | Any values |
| CELL_RESELECT_HYSTERESIS | 10.5.2.4 | CRH | 4 dB |
| MS_TXPWR_MAX_CCH | 10.5.2.4 | MTMC | Max. output power of MS |
| RXLEV_ACCESS_MIN | 10.5.2.4 | RAM | -90 dBm |
| CELL_RESELECT_OFFSET | 10.5.2.35 | CRO | 0 |
| TEMPORARY_OFFSET | 10.5.2.35 | TO | 0 |
| PENALTY_TIME | 10.5.2.35 | PT | 0 |
| Power Offset | 10.5.2.35 | PO | 0 |
| BA ARFCN | 10.5.2.22 | BA | All 0 except: |
| | | | For GSM900, both P-GSM and E-GSM ARFCNs are broadcast: GSM ARFCNs 3, 9, 18, 25, 41, 43, 49, 50, 54, 58, 62, 66, 70, 80, 92, 124, broadcast in SYSTEM INFORMATION type 2 E-GSM ARFCNs 985, 989, 995, 1010, 1014 broadcast in SYSTEM INFORMATION type 2bis |
| | | | For DCS1800 ARFCNs 512, 543, 568, 589, 602, 641, 662, 683, 696, 711, 732, 754, 794, 851, 870, 871, 872, 884 broadcast in SYSTEM INFORMATION TYPE 2. |
| | | | For multiband tests, ARFCNs 3, 18, 41, 49, 62, 70, 92, 124 broadcast in SYSTEM INFORMATION TYPE 2 (GSM cell) and TYPE 2ter (DCS cell), and ARFCNs 512, 568, 602, 662, 696, 732, 794, 870 broadcast in SYSTEM INFORMATION TYPE 2 (DCS cell) and TYPE 2ter (GSM cell) |

20.1 Cell selection

20.1.1 Definition and applicability

Cell selection is a process in which a MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably

decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.1.2 Conformance requirement

1. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 seconds of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; GSM 05.08, 6.1.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
 - 2.1 (i) It should be a cell of the selected PLMN
 - 2.2 (ii) It should not be "barred" (see section 3.5.1)
 - 2.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6.

GSM 03.22, 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; GSM 03.22, 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; GSM 05.08, 6.4.

20.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that:
 - 2.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
 - 2.2 The MS does not select a cell which is "barred".
 - 2.3 The MS does not select a cell with $C1 < 0$.
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with $C1 < 0$.

20.1.4 Method of test

20.1.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 48 / -65 | 38 / -75 | 43 / -70 | 33 / -80 | 28 / -85 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -67 | -90 | -88 | -98 | |
| MNC | | | 01 | | | |
| MCC | | | 002 | | | |
| C1 | 25 | -8 | 20 | 8 | 13 | |
| C2 | 25 | -8 | 20 | 8 | 13 | |

For an E-GSM MS carrier 2 and carrier 4 ARFCNs are chosen in the E-GSM band, carrier 1 and carrier 3 ARFCNs in the P-GSM band.

20.1.4.2 Procedure

- The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- The MS is switched on.
- The MS is switched off.
- The SS monitors carriers 1 and 3 for RA requests from the MS
- The MS is switched on.

20.1.5 Test requirements

- After step b), the first response from the MS shall be on carrier 4 within 33 seconds. There shall be no response from the MS on carrier 2.
- After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 seconds.

20.2 Cell selection with varying signal strength values

20.2.1 Definition and applicability

For definition see conformance requirement.

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.2.2 Conformance requirement

- The MS shall:

The MS shall search all RF channels in the system (124 for GSM, 174 for E-GSM and 374 for DCS 1 800), take readings of received RF signal strength on each RF channel, and calculate the received level average for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, the measurement samples from the different RF carriers being spread evenly during this period. GSM 05.08, 6.2.

- 1.1 The MS shall search all RF channels in the system (124 for GSM, 174 for E-GSM and 374 for DCS 1 800), take readings of received RF signal strength on each RF channel, and calculate the received level average for each.
- 1.2 The averaging is based on at least five measurement samples per RF carrier spread over T_{av} (3 to 5 s).
- 1.3 The measurement samples from the different RF carriers being spread evenly during this period.

2. These quantities are termed the "receive level averages", shall be unweighted averages of the received signal strengths measured in dBm. GSM 05.08, 6.1.

20.2.3 Test purpose

1. To verify that:
 - 1.1 The MS meets conformance requirement 1.1.
 - 1.2 The MS meets conformance requirement 1.2.
 - 1.3 The MS meets conformance requirement 1.3.
- 2 To verify that the MS meets conformance requirement 2.

20.2.4 Method of test

20.2.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 23 / -90 | 58 / -55 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 13 / -100 | 13 / -100 | | | | |
| C1 | 10 | 53 | | | | |

For an E-GSM MS carrier 1 ARFCN is chosen in the E-GSM band.

The manufacturer of the equipment shall declare his averaging time T_{av} . This time is the time between the first and the last measurement sample taken on one carrier during one averaging period.

20.2.4.2 Procedure

- a) The SS transmits on carriers 1 and 2. After a period of $b \cdot T_{av}$ carrier 2 reduces its transmit level to -85 dBm (28 dBμV emf()). After a further period of $a \cdot T_{av}$, carrier 2 increases its transmit level again to -55 dBm (58 dBμV emf()). Switching of carrier 2 continues with these levels and duty cycle until the end of the test.

T_{av} is the averaging time declared by the manufacturer.

The parameters a and b are chosen according to the following rules:

$$(a + b) \cdot T_{av} > T_{av}$$

$$0 < a \cdot T_{av} < \frac{2}{3} \cdot T_{av}$$

$$0,5 \cdot T_{av} < b \cdot T_{av} < T_{av}$$

In the equations $<$ and $>$ means at least one TDMA frame less or greater than the given value.

While satisfying the conditions given above:

a is chosen to be as close as possible to $\frac{2}{3}$.

b is chosen to be as close as possible to 0,5.

- b) The MS is switched on.
- c) The SS monitors all RA requests from MS on carriers 1 and 2.

20.2.5 Test requirements

In step c), the first response from the MS shall be on carrier 2 within 33 seconds.

NOTE 1: With the selected duty cycle it can be guaranteed that a "good" MS passes the test even at the worst case situations. The minimum averaged value of carrier 2 is in any case higher or equal to -75 dBm which is still 6 dB above carrier 1's level (for a "good" MS).

NOTE 2: With the selected levels and duty cycle the probability that a "bad" MS (i.e. MS that averages over shorter period than 3 s) fails the test is maximized. However, it can not be guaranteed that all the MSs not fulfilling the conformance requirement of averaging or uniform sampling will fail this test.

20.3 Basic cell reselection

20.3.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

1.1 (iii) The cell camped on (current serving cell) has become barred.

1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

The MS will then reselect a new cell in order to fulfil the process goal.; GSM 03.22, 4.5.

NOTE 1: Criterion (i) is tested in section 20.8 (Cell reselection when $C1(\text{serving cell}) < 0$ for 5 seconds).

NOTE 2: Criterion (ii) is tested section 20.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in section 20.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

2.1 (ii) It should not be "barred".

2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. GSM 03.22, 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in section 20.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.
4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

- ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds. This indicates that it is a better cell. GSM 05.08, 6.6.2.
5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 seconds; GSM 05.08, 6.6.1.

20.3.3 Test purpose

1. To verify that:
 - 1.1 The MS meets conformance requirement 1.1.
 - 1.2 The MS meets conformance requirement 1.2.
2. To verify that:
 - 2.1 The MS does not reselect a cell which is barred.
 - 2.2 The MS does not reselect a cell which has a $C1 < 0$.
3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are not used.
4. To verify that the MS takes into account the CELL_RESELECT_HYSTERESIS parameter when reselecting a cell in a different location area.
5. To verify that the MS decodes the CELL_BAR_ACCESS and CELL_BAR_QUALIFY parameters from the BCCH every 30 seconds.

20.3.4 Method of test

20.3.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-------------------------------------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 43 / -70 | 33 / -80 | 43 / -70 | 38 / -75 | 38 / -75 | |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -90 | -85 | -67 | |
| CRH | 10 dB | | | | | |
| LAC | | | different from other carriers | | | |
| CBA | | | | 1 | | |
| CBQ | | | | 0 | | |
| C1 | 15 | 10 | 20 | 10 | -8 | |
| C2 | 15 | 10 | 20 | 10 | -8 | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

20.3.4.2 Procedure

- a) The SS activates carriers 1, 2, 4 and 5. The MS is not paged on carrier 1. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.

- c) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dB μ V_{emf} (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.
- d) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.
- e) The MS is switched off.
- f) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5.
- g) The MS is switched on.
- h) After 33 seconds, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.
- i) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 seconds. (The MS should reselect and camp onto carrier 1).
- j) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.
- k) The SS increases the level of carrier 3 to 53 dB μ V_{emf} (C2 increases to 30 dB.).

20.3.5 Test requirements

- 1) After step b), there shall be no response from the MS on carriers 2, 4, or 5 within 50 seconds.
- 2) In step c), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.

NOTE 1: 5 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 18,4 seconds, allow 20 seconds.

- 3) In step h), the MS shall respond on carrier 1 within 50 seconds of setting CBA=1 on carrier 2.

NOTE 2: 33 seconds for the MS to read the BCCH of carrier 2 (30 seconds + 10 %), 15 seconds for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 seconds.

- 4) After step j), there shall be no response from the MS within 50 seconds.
- 5) After step k), the MS shall respond on carrier 3 within 20 seconds.

20.4 Cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters

20.4.1 Definition and applicability

This test is applicable for all types of GSM 900 and DCS 1 800 MSs

20.4.2 Conformance requirement

- 1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

20.4.3 Test purpose

- 1. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are used.
- 2. To verify DCS 1 800 MS correctly calculate the C2 parameter when the POWER_OFFSET parameter is present.

20.4.4 Method of test**20.4.4.1 Initial conditions**

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 53 / -60 | 43 / -70 | 48 / -65 | 48 / -65 | | |
| RXLEV_ACCESS_MIN (dBm) | -80 | -100 | -85 | -85 | | |
| PT | | 11111 | 40 s | 60 s | | |
| CRO | | 16 dB | 20 dB | 20 dB | | |
| TO | | | 20 dB | 20 dB | | |
| K = 1 | | | | | | |
| C1 | 20 | 30 | 20 | 20 | | |
| C2 | 20 | 14 | 20 -> 40 | 20 -> 40 | | |
| K = 2 (DCS1800 Class 3 MS only) | | | | | | |
| POWER_OFFSET | 0 | 2 | 6 | 6 | | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

20.4.4.2 Procedure

For testing of GSM MS, the test procedure is performed for execution counter K = 1.

For testing of DCS 1 800 MS, the test procedure is performed for execution counter K = 1 and 2

On execution counter K = 1, the POWER_OFFSET Parameter is not present.

On execution counter K = 2, the POWER_OFFSET parameter is present.

- The SS activates carriers 1 and 2. The MS is not paged on carrier 1. The SS monitors carrier 2 for RA requests from the MS.
- The MS is switched on.
- The SS increases the level of carrier 2 to 54 dBμVemf (C2 becomes 25 dB).
- When the SS receives a response on carrier 2, the SS stops paging on that carrier and waits for 20 seconds (The MS should reselect and camp onto carrier 2).
- The SS activates carriers 3 and 4 and continuously pages the MS on these carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

20.4.4.3 Requirements

For execution counter K = 1 and K = 2.

- After step b), there shall be no response from the MS on carrier 2 within 50 seconds.
- After step c), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.
- After step e), there shall be no response from the MS on carrier 3 within 38 seconds of activating the carriers but, the MS shall respond on carrier 3 within 90 seconds. The response on carrier 3 shall be before any response on carrier 4.

NOTE: Minimum time of 38 seconds set by penalty timer on carrier 3 less 2 second tolerance. Maximum time, total of 33 seconds to read BCCH of carrier 3, 42 seconds for expiry of penalty timer on carrier 3, 15 seconds for reselection, since the MS will already have running averages on carriers 3 and 4, when the penalty timers expire, allow 90 seconds.

20.5 Cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages

20.5.1 Definition and applicability

System information (SI) type 7 and 8 are transmitted on the BCCH Ext when the system information type 4 message does not contain all information needed for cell selection.

The system information type 2 bis message is used when the system information type 2 message does not contain all neighbour cell ARFCNs.

The system information type 2 ter message is used when system information type 2 messages broadcast by one cell which are system information 2 or both system information 2 and 2bis do not contain all neighbour cell ARFCNs.

Test purposes 1 and 3 are applicable to all types of GSM900 and DCS1800 MS.

Test purpose 2 is only applicable for E-GSM and DCS 1 800 MS. This is reflected in initial conditions step d).

Test purpose 4 is only applicable to an E-GSM MS. This is reflected in initial conditions step f), test procedures d) and e) and test requirements clause 3).

20.5.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection. GSM 05.08, 6.4.
2. Whilst in idle mode, an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation. GSM 05.08, 6.6.1.
3. Mobile stations shall treat all ARFCNs in the set {0, 1, 2 ... 1023} as valid ARFCN values even if the mobile station is unable to transmit or receive on that ARFCN. GSM 04.08, 10.5.2.1b.
4. An E-GSM MS shall correctly decodes parameters transmitted in the system information type 2 ter message. GSM 04.08, 9.1.34:

20.5.3 Test purpose

1. To verify that the MS correctly calculates the C2 criterion when the parameters affecting cell reselection are transmitted in the system information type 7 and 8 messages.
2. To verify that E-GSM and DCS 1 800 MS decode parameters transmitted in the system information type 2 bis message.
3. To verify that the MS treats ARFCNs as valid ARFCNs even if the MS is unable to transmit or receive on that ARFCN.
4. To verify that an E-GSM mobile correctly decode parameters transmitted in the system information type 2 ter message.

20.5.4 Method of test

20.5.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 *) | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|--------------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 53 / -60 | 32 / -81 | 40 / -73 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 23 / -90 | 30 / -83 | | | |
| BS_AG_BLKES_RES | 1 | 1 | 1 | | | |
| PT | | 0 | 0 | | | |
| CRO | | 16 dB | 10 dB | | | |
| TO | | 0 dB | 0 dB | | | |
| C1 | 30 | 9 | 10 | | | |
| C2 | 30 | 25 | 20 | | | |

*) : Carrier 3 is off for P-GSM and DCS 1800 MS. Carrier 3 is only required for E-GSM MS.

- b) The ARFCNs of carriers 1, 2 and 3 are chosen from those in table 20.1.
- c) The cell reselection parameters PENALTY_TIME, CELL_RESELECT_OFFSET and TEMPORARY_OFFSET are transmitted in the SI3, SI7 and SI8 messages on carrier 2. They are not transmitted in SI4 and the ADDITIONAL RESELECT PARAM IND parameter is set to 1.
- d) The SI2bis message is transmitted on carrier 1 and contains the ARFCN of carrier 2 and ARFCNs 43, 70, 500, 550, 990 and 995. For an E-GSM MS and a DCS 1 800 MS, the ARFCN of carrier 2 is not transmitted in the SI2 message.
- e) Carriers 1 and 2 are synchronized, but staggered in frame number so that the transmission of the SI3 message on carrier 2, coincides with the paging block which the MS is listening to on carrier 1.

NOTE: Under these conditions, the MS can only decode the parameters affecting cell reselection from the SI7 or SI8 messages.

To achieve this, the following conditions are used:

BS_PA_MFRMS = 4

IMSI mod 1000 = 12

FN carrier 1 = FN carrier 2-21, for simultaneously transmitted frames.

- f) For an E-GSM MS, the SI3 message on carrier 2 indicates that SI2ter is used on carrier 2. SI2ter message contains the ARFCN of carrier 3 and ARFCNs 45, 76, 891, 905. The ARFCN of carrier 3 is transmitted neither in the SI2 nor in the SI2bis messages on carriers 1 and 2.

20.5.4.2 Test Procedure

- a) The SS activates the channels. The MS is not paged on carrier 1.
- b) The MS is switched on.
- c) After 50 seconds, the SS increases the level of carrier 2 to 42 dBμVemf().
- d) For an E-GSM MS only, after 30 seconds, the SS increases the level of carrier 3 to 60 dBμVemf().

20.5.5 Test Requirements

- 1) After step b), there shall be no response from the MS on carrier 2. For an E-GSM MS there shall also be no response on carrier 3.
- 2) After increasing the level of carrier 2 in step c), the MS shall respond on carrier 2 within 20 seconds.
- 3) After increasing the level of carrier 3 in step d), an E-GSM mobile shall respond on carrier 3 within 20 seconds.

20.6 Cell reselection timings

20.6.1 Definition and applicability

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.6.2 Conformance requirement

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - 1.1 ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds,
 - 1.2 In case ii) above, cell reselection shall not take place if there was a cell reselection within the previous 15 seconds.
 - 1.3 Cell reselection for any other reason (see GSM 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 seconds if another suitable cell can be found.;

GSM 05.08, 6.6.2.

20.6.3 Test purpose

1. To verify that:
 - 1.1 The MS does not perform a cell reselection when the C2 value for a non serving cell does not exceed the C2 value of the serving cell for a period of at least 5 seconds.
 - 1.2 The MS meets conformance requirement 1.2 with an allowance for the uncertainty of the test.
 - 1.3 When the MS performs an immediate cell reselection due to an unsuccessful random access attempt, the cell that the MS was camped onto is not returned to within 5 seconds when another suitable cell exists.

20.6.4 Method of test

20.6.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|--|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level (dBμV emf() / dBm) | 56 / -57 | 46 / -67 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 29 / -84 | 33 / -80 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

Below is an alternative table of parameters for use with test equipment that cannot reach the upper RF levels as specified in the table above. These carrier levels are reduced by 5 dB and will not effect the purpose of the test case:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|--|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level (dBμV emf() / dBm) | 51 / -62 | 41 / -72 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 24 / -89 | 28 / -85 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

The BA(BCCH) list only contains 5 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 5 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=5 (default value) the MS will maintain a running average on surrounding cells over a period of 5 seconds.

20.6.4.2 Procedure

- a) The SS activates the channels. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 50 seconds, the SS starts paging continuously on carriers 1 and 2 for 20 seconds. The SS monitors carriers 1 and 2 for RA requests from the MS.
- d) The SS stops paging on carriers 1 and 2 and waits for 20 seconds. (The MS should revert to carrier 1 due to cell reselection.)
- e) The SS starts paging continuously on carrier 2.
- f) The SS increases the transmit level of carrier 2 by 20 dB for a period of 4 s and then reduces the level back to the original value.
- g) The SS increases the transmit level of carrier 2 by 20dB and waits for the MS to access on carrier 2. The SS records the time t from the increase in the level of carrier 2 to the first response from the MS.
- h) The SS stops paging on carrier 2 and decreases the transmit level of carrier 2 back to the original value.
- j) The SS waits 20 seconds. (The MS should revert to carrier 1 due to cell reselection.)
- k) The SS increases the transmit level of carrier 2 by 20 dB. After t+2 seconds, the SS starts paging continuously on carrier 1 and reduces the level of carrier 2 back to the original level.

20.6.5 Test requirements

- 1) In step c), the MS shall transmit 2 RA requests on carrier 1 followed by 2 RA requests on carrier 2. Subsequent RA requests on carrier 1 shall not occur within 4,5 s of the second RA request on carrier 1.
- 2) In step f), there shall be no access on carrier 2 within 34 seconds of increasing the level of carrier 2.
- 3) After step g), the MS shall respond on carrier 2.
- 4) In step k) , there shall be no response on carrier 1 within 11 seconds after the level of carrier 2 is reduced back to the original level.

NOTE: The 11 seconds is derived from (t+15) seconds minimum cell reselection timer minus (t+2) seconds from the start of step k) up to the reduction of the level of carrier 2. A further 2 seconds are subtracted to cover for any uncertainty introduced by the RA process occurring after step g).

20.7 Priority of cells

20.7.1 Definition and applicability

In general, cell prioritization is a means of encouraging MSs to select some suitable cells in preference to others.

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.7.2 Conformance requirement

1. During cell selection a cell with low priority indication will only be selected if a suitable cell of normal priority cannot be found; GSM 03.22, 3.5.2.1.
2. Table 1a. Parameters affecting cell priority for cell selection

| CELL_BAR_QUALIFY | CELL_BAR_ACCESS | Cell selection priority | Status for cell reselection |
|------------------|-----------------|-------------------------|-----------------------------|
| 0 | 0 | normal | normal |
| 0 | 1 | barred | barred |
| 1 | 0 | low | normal (see note 2) |
| 1 | 1 | low | normal (see note 2) |

GSM 05.08, table 1.a

3. If all the following conditions are met then the "Cell selection priority" and the "Status for cell reselection" shall be set to normal:
 - the cell belongs to the MS HPLMN
 - the MS is in cell test operation mode
 - the CELL_BAR_ACCESS is set to "1"
 - the CELL_BAR_QUALIFY is set to "0"
 - the Access Control class 15 is barred

GSM 05.08, table 1.a

20.7.3 Test purpose

1. To verify that the MS does not select a cell of low priority when a suitable cell of normal priority exists with a lower received signal strength.
2. To verify that the MS takes into account CELL_BAR_ACCESS and CELL BAR _QUALIFY when performing cell selection and reselection.
3. To verify that the MS meets conformance requirement 3.

20.7.4 Method of test

20.7.4.1 Initial conditions

Parameters changed from Default values table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 33 / -80 | 43 / -70 | 33 / -80 | 23 / -90 | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 3 / -110 | 23 / -90 | 13 / -100 | 13 / -100 | | |
| CBA | 0 | 1 | 1 | 0 | | |
| CBQ | 1 | 1 | 0 | 0 | | |
| Access class 15 | barred | barred | barred | barred | | |
| C1 | 30 | 20 | 20 | 10 | | |

20.7.4.2 Procedure

- The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 4.
- The MS is switched on.
- The MS is switched off. The SS deactivates the carriers.
- The MS is placed in cell test operation mode.

NOTE: Cell test mode is a mode of operation defined in SIM administrative data field.

- The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 3.
- The MS is switched on.

20.7.5 Test requirements

- After step b), the first response from the MS shall be on carrier 4 within 33 seconds, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 seconds.
- After step f), the first response from the MS shall be on carrier 3 within 33 seconds, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 seconds.

20.8 Cell reselection when C1 (serving cell) < 0 for 5 seconds

20.8.1 Definition and applicability

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.8.2 Conformance requirement

- At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high. GSM 05.08, 6.6.2.
- While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - The path loss criterion parameter C1 (see section 3.6) indicates that the path loss to the cell has become too high.; GSM 03.22, 4.5.

20.8.3 Test purpose

- To verify that the MS meets conformance requirement 1.
- To verify that the MS meets conformance requirement 2.

20.8.4 Method of test

20.8.4.1 Initial conditions

Parameters changed from Default values table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 43 / -70 | 23 / -90 | | | | |
| CRO | 30 dB | | | | | |
| TO | 0 | | | | | |
| PT | 0 | | | | | |
| C1 | 20 | 10 | | | | |
| C2 | 50 | 10 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9s.

20.8.4.2 Procedure

- The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- The MS is switched on.
- The SS reduces signal level on carrier 1 to -80 dBm / 33 dBμV emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dBμV emf(). (C1 becomes -10 dB and C2, 20 dB during this period).
- The SS reduces signal level on carrier 1 to -80 dBm / 33 dBμV emf()

20.8.5 Test requirements

- After step b), there shall be no access on carrier 1 or carrier 2, within 50 seconds.
- After step c), there shall be no access on carrier 2 within 30 seconds.
- After step d), the MS shall access on carrier 2 within 20 seconds.

20.9 Running average of the surrounding cell BCCH carrier signal levels

20.9.1 Definition and applicability

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.9.2 Conformance requirement

- Whilst in idle mode an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation (BA - See table 1). A running average of received level in the preceding 5 to

Max. $\{5, ((5 * N + 6) \text{ DIV } 7) * \text{BS_PA_MFRMS} / 4\}$

seconds shall be maintained for each carrier in the BCCH allocation. N is the number of non-serving cell BCCH carriers in BA and the parameter BS_PA_MFRMS is defined in GSM 05.02; GSM 05.08, 6.6.1.

2. The same number of measurement samples shall be taken for all non-serving cell BCCH carriers of the BA list, and the samples allocated to each carrier shall as far as possible be uniformly distributed over each evaluation period.; GSM 05.08, 6.6.1

20.9.3 Test purpose

1. To verify that if the MS calculates a received level average (over 5 seconds) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.
2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluation period.

20.9.4 Method of test

20.9.4.1 Initial conditions

Parameters changed from Default values table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

BS_PA_MFRMS is set to 4 for this test.

The BA(BCCH) list only contains 7 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 7 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=4 the MS will maintain a running average on surrounding cells over a period of 5 seconds.

20.9.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS starts switching the level of carrier 2 between -80 dBm and -57 dBm every 2,7 seconds and continues to do so until the end of the test.
- d) The SS decreases the level of carrier 1 to -76 dBm.

NOTE: As a result of the switching in levels, the running average on carrier 2 will be between -66dBm and -71dBm, assuming that samples are distributed over five consecutive paging blocks.

20.9.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2, within 50 seconds..
- 2) After step c), there shall be no access from the MS on carrier 1 or 2 within 25 seconds

NOTE: Any potential access on is likely to occur within 20 seconds.

- 3) After step d), the MS shall access on carrier 2 within 20 seconds.

20.10 Running average of the serving cell BCCH carrier signal level

20.10.1 Definition and applicability

The MS is required to monitor continuously the BCCH carrier signal level of the serving cell (and to compare it to the BCCH carrier signal levels of the non-serving cells) to guarantee that it is camped on the most suitable cell.

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.10.2 Conformance requirement

1. For the serving cell, receive level measurement samples shall be taken at least for each paging block of the MS. The receive level average shall be a running average determined using samples collected over a period of 5 s or five consecutive paging blocks of that MS, whichever is the greater period. New receiving level average values shall be calculated as often as possible.; GSM 05.08, 6.6.1.

20.10.3 Test purpose

1. To verify that by using suitable varying levels of signal strength for the serving cell, the MS performs a running average over 5 consecutive paging blocks.

20.10.4 Method of test

20.10.4.1 Initial conditions

Parameters changed from Default values table 20.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 63 / -50 | 39 / -74 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 40 | 16 | | | | |
| C2 | 40 | 16 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9s.

20.10.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) After 50 seconds the SS starts switching the level of carrier 1 between -80 dBm and -50 dBm every 3 seconds.

NOTE: As a result of the switching in levels, the running average on carrier 1 will be between -62 dBm and -68 dBm over five consecutive paging blocks.

- d) The SS increases the level of carrier 2 to -56 dBm.

20.10.5 Test requirement

- 1) After step c), the MS shall not access on carrier 2, within 25 seconds.
- 2) After step d), the MS shall access on carrier 2, within 30 seconds.

NOTE 1: 13,75 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 27,15 seconds, allow 30 seconds.

20.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list**20.11.1 Definition and applicability**

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.11.2 Conformance requirement

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; GSM 05.08, 6.6.1.
2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 seconds; GSM 05.08, 6.6.1.

20.11.3 Test purpose

1. To verify that MS meets conformance requirement 1.
2. To verify that MS meets conformance requirement 2.

20.11.4 Method of test**20.11.4.1 Initial conditions**

Six BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf ()/dBm) | 53 / -60 | 48 / -65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 / -80 | 38 / -75 |
| RXLEV_ACCESS_MIN | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 seconds. Hence 5 seconds is also the updating time of the list of six strongest neighbour carriers.

20.11.4.2 Procedure

- a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- b) The MS is switched on.

- c) After 60 seconds, the SS activates carrier 7 and pages the MS continuously on this carrier. The SS monitors carrier 7 for RA requests from the MS.

20.11.5 Test requirements

- 1) The MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 seconds to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 seconds (+10 %)), 33 seconds to read BCCH, 15 seconds for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 seconds.

20.12 Decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers

20.12.1 Definition and applicability

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.12.2 Conformance requirement

1. The MS shall attempt to decode the BCCH data block that contains the parameters affecting cell reselection for each of the 6 strongest non-serving cell BCCH carriers at least every 5 minutes; GSM 05.08, 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in section 20.3.

20.12.3 Test purpose

1. To verify that the MS decodes the BCCH data block that contains the parameters affecting cell reselection for a non-serving cell BCCH carrier, (which is in the list of six strongest neighbour cells), at least every 5 minutes. This is achieved by changing the BCCH data such that the value of C2 for the non serving cell exceeds the value of C2 for the serving cell, and observing that the MS performs cell reselection within 5 minutes plus the time allowed for cell reselection after the change of the BCCH data.

20.12.4 Method of test

20.12.4.1 Initial conditions

Parameters changed from Default values table 20.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

20.12.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

20.12.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 seconds.
- 2) After step c), the MS shall access on carrier 2 within 345 s of the change in the BCCH data of carrier 2.

NOTE: 330 s for decode of BCCH of carrier 2 (300 s +10 %), 15 seconds for reselection of carrier 2, since the MS already has a running average on carrier 2.

20.13 Decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers

20.13.1 Definition and applicability

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.13.2 Conformance requirement

1. The MS shall attempt to check the BSIC for each of the 6 strongest non-serving cell BCCH carriers at least every 30 seconds, to confirm that it is monitoring the same cell. If a change of BSIC is detected then the carrier shall be treated as a new carrier and the BCCH data redetermined; GSM 05.08, 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in section 20.3.

20.13.3 Test purpose

1. To verify that the MS will check the BSIC of the non-serving cell, which is in the list of six strongest neighbour cells, by changing the BSIC and the BCCH data of the non-serving cell such that the value of C2 for that cell exceeds the value of C2 of the serving cell, and observing that the MS performs cell reselection within the time allowed to check the BSIC, redetermine the BCCH data and perform cell reselection.

20.13.4 Method of test

20.13.4.1 Initial conditions

Parameters changed from Default values table 20.1 are below:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

20.13.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the BSIC of carrier 2 by changing the Base Station Colour Code (BCC) part of the BSIC. The SS also changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change to the BCCH data the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

20.13.5 Test requirements

- 1) In step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 seconds.
- 2) After step c), the MS shall access on carrier 2 within 85 s of the change in the BSIC value (and BCCH data) of carrier 2.

NOTE: 33 seconds for check of BSIC on carrier 2, 33 seconds for decode of BCCH of carrier 2, 15 seconds for reselection of carrier 2, since the MS already has a running average on carrier 2, allow 85 seconds.

20.14 Emergency calls**20.14.1 Definition and applicability**

This test is applicable for GSM 900 and DCS 1 800 MSs supporting speech.

20.14.2 Conformance requirement

1. When in a limited service state, the MS shall be able to initiate emergency calls; GSM 05.08, 6.8.
2. When in a limited service state and if not camped on a cell, the MS shall monitor the signal strength of all 124 (for GSM), all 174 (for E-GSM) or all 374 (for DCS 1 800) RF channels, and search for a BCCH carrier which has $C1 > 0$ and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; GSM 05.08, 6.8.
3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of GSM 03.22, 4.5 & 3.7, except that a zero value of CELL_RESELECT_HYSTERESIS shall be used; GSM 05.08, 6.8.

20.14.3 Test purpose

1. To verify that the MS shall be able to initiate emergency calls when no suitable cells of the selected PLMN are available, but at least one acceptable cell is available.
2. To verify that the MS selects a cell with $C1 > 0$ and $CBA = 0$ when no suitable cells of the selected PLMN are available.
3. To verify that the MS, when performing cell reselection in the limited service state, uses CELL_RESELECT_HYSTERESIS = 0.

20.14.4 Method of test**20.14.4.1 Initial conditions**

Parameters changed from Default values table 20.1 are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-------------------------------------|----------------------|-------------|-------------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | 33 / -80 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 43 / -70 | 23 / -90 | | | |
| CELL_BAR_ACCESS MCC,MNC | 1 (barred) forbidden | 0 forbidden | 0 forbidden | | | |
| CELL_RESELECT_HYST | 0 | 0 | 14 dB | | | |
| C1 | 15 | -10 | 10 | | | |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and is in the SIM's forbidden PLMN's list.

20.14.4.2 Procedure

- a) The SS activates the carriers. The SS monitors for RA attempts from the MS on carriers 1, 2 and 3 for the duration of the test.
- b) The MS is switched on.
- c) 50 seconds after switch on, an emergency call is initiated on the MS.
- d) The SS changes the CBA of carrier 1 to 0.

NOTE: The MS should reselect to carrier 1 because it should not take into account the CELL_RESELECT_HYST value of 14 but use 0 instead.

- e) After 345 s an emergency call is initiated on the MS.

NOTE: 330 seconds to detect change of BCCH data, 15 seconds to perform reselection of carrier 1, since the MS already has a running average on carrier 1.

20.14.5 Test requirements

- 1) In step c), the first access by the MS shall be on carrier 3.
- 2) In step e), the first access from the MS shall be on carrier 1.

20.15 Cell reselection due to MS rejection "LA not allowed"

20.15.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This process goes on while camping on a cell which pertains to an LA which is placed in the list of "forbidden LAIs for regional provision of service".

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.15.2 Conformance requirement

1. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS stores this LAI in a list of "forbidden LAIs for regional provision of service", to prevent repeated attempts to access a cell of the forbidden LA, GSM 03.22, 3.3.
2. If the MS has received the cause 'LA not allowed', it shall ignore this fact when selecting a cell to camp on, i.e. it shall not reject a cell for camping on because that cell is part of a LA where this cause has been received, GSM 03.22, 3.5.4.
3. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection, GSM 03.22, 4.4.2
4. A new LU attempt shall only be performed when a new LA (or new PLMN) is entered according to the cell reselection procedure, GSM 03.22, 3.3 & figure 4.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

20.15.3 Test purpose

1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purposes 2,3 and 4.
2. To verify that the MS will not reject a cell for camping on because that cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.
3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection:
Cell reselection is triggered if there is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).
GSM 03.22, 3.4 & 4.5.
4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered, GSM 03.22, 3.3 & figure 4.

20.15.4 Method of test**20.15.4.1 Initial conditions**

Parameters changed from Default values table (table 20.1)

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 54 / -59 | 44 / -69 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 53 / -60 | 35 / -78 | 29 / -84 | | | |
| CRH | 14 | 0 | 10 | | | |
| LAC | H1111 | H2222 | H1111 | | | |
| ATT | 1 | 1 | 1 | | | |
| C1 | 10 | 19 | 15 | | | |
| C2 | 10 | 19 | 15 | | | |

20.15.4.2 Procedure

- a) The SS activates the carriers. The SS monitors all RA requests from MS on carriers 1, 2 & 3 until step e) has been completed. Only idle-paging is sent on all channels.
- b) The MS is switched on.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "LA not allowed"
- d) 30 seconds after the MS has returned to idle mode (channel release after LU reject), the MS is manually commanded to set up an emergency call.

NOTE 1: C2 of carrier 3 > C2 of carrier 1. Carriers 1 and 3 belong to the same LA.

- e) The SS rejects the CM service request from the MS, with a CM service reject message with cause value #17 (Network Failure).

NOTE 2: Cause values #4 (IMSI unknown in VLR) or #6 (Illegal ME) lead to unwanted behaviour of the mobile.

- f) 10 seconds after the MS has returned to idle mode (channel release after CM service reject), the SS increases the level of carrier 2 to 65 dBμV emf().

NOTE 3: C2 of carrier 2 = 30, now larger than C2 of carrier 3 + CRH.

- g) The SS shall accept any LU on carrier 2.

20.15.5 Test requirements

- 1) After step b), the MS shall respond on carrier 1 within 33 s.
- 2) In step d), the MS shall access on carrier 3 with a channel request message, within 15 seconds of being commanded to set up the emergency call.
- 3) After increasing the level of carrier 2 in step f), the MS shall reselect and access onto carrier 2 requesting an LU within 30 seconds.

NOTE 1: 13,75 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 27,15 seconds, allow 30 seconds.

20.16 Downlink signalling failure

20.16.1 Definition and applicability

See conformance requirement.

20.16.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. When the MS camps on a cell, DSC shall be initialized to a value equal to the nearest integer to $90/N$ where N is the BS_PA_MFRMS parameter for that cell (see GSM 05.02).
2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1, (however never beyond the nearest integer to $90/N$).
3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, GSM 03.22, 4.5 (ii) and GSM 05.08, 6.5.

NOTE: The network sends the paging subchannel for a given MS every BS_PA_MFRMS multiframes. The requirement for network transmission on the paging subchannel is specified in GSM 04.08. The MS is required to attempt to decode a message every time its paging subchannel is sent.

20.16.3 Test purpose

1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to $90/N$). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

20.16.4 Method of test**20.16.4.1 Initial conditions**

Two BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table (table 20.1) are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|----------------|----------------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) C1 = C2 | 43 / -70 20 | 33 / -80 10 | OFF | OFF | OFF | OFF |

NOTE: The DSC counter will have a value 18 (90/5).

20.16.4.2 Procedure

- a) The MS is switched on. On carrier 1 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS (idle paging). On carrier 2 the MS is paged continuously in all paging blocks.
- b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see GSM 05.03, 4.3 & 4.1.2 or other lower layer error) in four successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on four successive paging blocks should decrease the DSC to 2.

- c) The SS monitors all accesses on both carriers for 30 s.
- d) The SS sends corrupted data in five successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 2: Sending random, data on five successive paging blocks should decrease the DSC to < 0 and cause a cell reselection.

- e) The SS monitors all accesses on both carriers for 30 s.

20.16.5 Test requirements

- 1) There shall be no access to carrier 2 in test steps a) and c).
- 2) The MS shall access on carrier 2 at test step e) within 15 seconds.

20.17 Cell selection if no suitable cell found in 10 s**20.17.1 Definition and applicability**

See conformance requirement.

20.17.2 Conformance requirement

If no suitable cell is found in cell reselection process within 10 seconds, the cell selection algorithm of GSM 03.22 shall be performed, GSM 05.08; 6.6.2.

20.17.3 Test purpose

To verify that the MS fulfils the conformance requirement

20.17.4 Method of test**20.17.4.1 Initial conditions**

One BCCH carrier is established with the system information contents of table 20.1.

Parameters changed from Default values table (table 20.1) are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 43 / -70 | OFF | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | | | | | |

20.17.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on carrier 1.
- b) After the MS indicates service the SS reduces the transmit level of carrier 1 to 13 dBμV emf() (so that C1 of carrier 1 becomes -10) and turns on a new carrier (carrier 2) at a level of 33 dBμV emf(). Carrier 2 shall not be in the MS BA list (i.e. it shall not be one of the carriers that MS has been monitoring after camped on carrier 1)
- c) The SS shall monitor all accesses on carriers 1 and 2 for 60 s.

NOTE: The access on carrier 2 should not take longer than 50 s. (5 seconds to rxlev averages, 5 s for C1<0 duration, 10 s for searching another suitable cell, 30 s for cell selection), 60 s is a safe time to wait.

20.17.5 Test requirements

The MS shall access on carrier 2 at test step c) within 60 s.

20.18 Cell reselection due to MS rejection "Roaming not allowed in this LA"**20.18.1 Definition and applicability**

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

The MS looks for suitable neighbour cells which satisfies 4 constraints including that It should not be in an LA which is in the list of "forbidden LAs for roaming".

This test is applicable for all types of GSM 900 and DCS 1 800 MSs.

20.18.2 Conformance requirement

1. To prevent repeated attempts to have roaming service on a not allowed LA, when the MS is informed that an LA is forbidden, the LA is added to a list of "forbidden LAs for roaming" which is stored in the MS, GSM 03.22; 3.1.
2. If the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure shall be started, GSM 03.22; 4.3.3 L3, GSM 04.08; 4.4.4.7.
3. The MS can only perform camping on a suitable cell, which:
 - should not be in an LA which is in the list of "forbidden LAs for roaming" GSM 03.22, 3.2.1.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

20.18.3 Test purpose

1. To verify that if an LU is rejected with cause "Roaming not allowed in this LA", that the LAI of that cell is written into a forbidden list which prevents the MS from camping onto any cell in that LA.
2. To verify that if the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure is initiated. This is verified indirectly by test purpose 3, in that the new LA is accessed as part of cell selection, hence CRH is disregarded.
3. To verify that if an LU is rejected, when attempting LU in a LA with LAI = LAI1, with cause "Roaming not allowed in this LA" and only cells of the selected PLMN are available, the MS will only camp and attempt LU in any LA with LAI \neq LAI1.

20.18.4 Method of test**20.18.4.1 Initial conditions**

Parameters changed from Default values table (table 20.1)

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|---------------------|---------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dB μ V emf() / dBm) | 63 / -50 | 53 / -60 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dB μ V emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| MNC | MNC \neq HPLMN | MNC \neq HPLMN | | | | |
| MCC | MCC of HPLMN | MCC of HPLMN | | | | |
| CRH | 0 | 0 | | | | |
| LAC | H1111 | H2222 | | | | |
| ATT | 1 | 1 | | | | |
| C1 | 40 | 30 | | | | |
| C2 | 40 | 30 | | | | |

20.18.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on all carriers.
- b) The SS monitors all RA requests from MS on carriers 1 & 2.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "Roaming not allowed in this LA".
- d) The SS shall accept any LU on carrier 2.
- e) The SS monitors all RA requests from MS on carriers 1 to 2.

20.18.5 Test requirements

- 1) The MS should respond on carrier 1 within 33 s of switch on.
- 2) After LU reject, the MS shall initiate the Network Selection Procedure and access onto Carrier 2 as part of cell selection within 33 seconds from returning to idle mode after the LU reject.

NOTE: The timing requirement in b) is given only for testing purposes only. No timing requirements are defined for the Network Selection Procedure, but the time allowed for cell selection (see 20.1) should be adequate.

- 3) After the LU reject on carrier 1, there shall be no more access attempts on this carrier.

20.19 Cell selection on release of SDCCH and TCH

20.19.1 Definition and applicability

20.19.2 Conformance requirement

1. When the SS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible camp on the BCCH carrier of the cell whose channel has just been released. If the full BCCH data for that cell was not decoded in the preceding 30s, the MS shall then attempt to decode the full BCCH data. Until the MS has decoded the BCCH data required for determining the paging group, it shall also monitor all paging blocks on timeslot 0 of the BCCH carrier for possible paging messages that might address it. If the MS receives a page before having decoded the full BCCH data for the cell, the MS shall store the page and respond once the full BCCH data has been decoded, provided that the cell is not barred and the MSs access class is allowed. GSM 05.08, 6.7.

20.19.3 Test purpose

1. To verify that on release of a TCH or an SDCCH, the MS camps as quickly as possible on the BCCH carrier of the cell whose channel has just been released.

NOTE: This is implicitly tested by the MS responding to a paging request. The decoding of BCCH data cannot be explicitly tested. However, the MS shall monitor for paging messages which may address it if it decodes the BCCH.

20.19.4 Method of test

20.19.4.1 Initial conditions

- a) Parameters changed from default values in table 20.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBmV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBmV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| BS_PA_MFRMS | 2 | 2 | | | | |
| ATT | 1 | | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

- b) Carrier 1 is configured to have a combined control channel.
- c) Carrier 2 is configured to have a non combined control channel.

20.19.4.2 Test procedure

- a) The SS activates the carriers. No paging messages are transmitted on carrier 1 or carrier 2.
- b) The MS is switched on.
- c) In response to the MS access for IMSI attach, the SS allocates a combined SDDCH/4, accepts the IMSI attach procedure and then releases the link. After 0,5 seconds but within 1 second of transmitting the UA frame on completion of the IMSI attach procedure, the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.
- d) When the MS responds to paging, the SS establishes a call on a traffic channel.
- e) The SS increases the level of carrier 2 to 63 dBmV emf().

- f) After 10 seconds the SS performs a handover to another TCH, with the parameters of carrier 2 indicated in the CELL DESCRIPTION information element of the HANDOVER COMMAND message.
- g) After a further 10 seconds, the SS clears down the call. After 0,5 seconds but within 1 second of transmitting the UA frame, the SS transmits a single PAGING REQUEST on carrier 2 in the appropriate paging block of the MS.

20.19.5 Test requirements

- 1) After step b) the MS shall access in order to commence an IMSI attach procedure on carrier 1 within 33 seconds.
- 2) In step c), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

20.20 Multiband cell selection and reselection

20.20.1 Multiband cell selection and reselection / Cell Selection

20.20.1.1 Definition and applicability

Multiband cell selection is a process in which a multiband MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on, irrespective of frequency band. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

This test is applicable for multiband GSM 900 / DCS 1 800 MSs supporting simultaneous multiband operation.

20.20.1.2 Conformance requirement

- 1. A multiband MS shall search all channels within its bands of operation (124 for P-GSM, 174 for E-GSM and 374 for DCS). The number of channels searched will be the sum of channels on each band of operation; GSM 05.08, 6.2.
- 2. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 seconds of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; GSM 05.08, 6.1.
- 3. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
 - 3.1 (i) It should be a cell of the selected PLMN
 - 3.2 (ii) It should not be "barred" (see section 3.5.1)
 - 3.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6.

GSM 03.22, 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection

- 4. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; GSM 03.22, 3.2.1.

5. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; GSM 05.08, 6.4.

20.20.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that the MS meets conformance requirement 2 in a multiband environment.
3. To verify that:
 - 3.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
 - 3.2 The MS does not select a cell which is "barred".
 - 3.3 The MS does not select a cell with $C1 < 0$.
4. To verify that the MS selects suitable cells in descending order of received signal strength, irrespective of frequency band.
5. To verify that the MS does not select a cell with $C1 < 0$.

20.20.1.4 Method of test

20.20.1.4.1 Initial conditions

Parameters changed from the default values in table 20.1.

| Parameter | Carrier 1 (GSM) | Carrier 2 (GSM) | Carrier 3 (DCS) | Carrier 4 (GSM) | Carrier 5 (DCS) | Carrier 6 |
|--|--------------------|--------------------|--------------------|--------------------|--------------------|-----------|
| RF Signal Level (dBmV emf() / dBm) | 48 / -65 | 36 / -77 | 43 / -70 | 33 / -80 | 23 / -90 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -69 | -90 | -88 | -98 | |
| MNC | | | 01 | | | |
| MCC | | | 002 | | | |
| MS_TXPWR_MAX_CCH | 7 | 7 | | 7 | | |
| C1 | 25 | -8 | 20 | 8 | 8 | |
| C2 | 25 | -8 | 20 | 8 | 8 | |

Carrier 1, carrier 2 and carrier 4 ARFCNs are chosen in the GSM 900 band, carrier 3 and carrier 5 ARFCNs in the DCS 1 800 band.

20.20.1.4.2 Procedure

- a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The MS is switched off.
- d) The SS monitors carriers 1 and 3 for RA requests from the MS
- e) The MS is switched on.
- f) The MS is switched off.
- g) The SS is reconfigured and sets MCC of carrier 3 to 001 (same as the other carriers).
- h) The SS activates the carriers and monitors carriers 3, 4 and 5 for RA requests from the MS.

- i) The MS is switched on.
- j) The MS is switched off.

20.20.1.4.3 Related PICS/PIXIT statement(s)

Support for stored list cell selection Yes/No.

20.20.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 seconds. If the MS supports stored list cell selection MS may be also on carrier 5. There shall be no response from the MS on carrier 2.
- 2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 seconds.
- 3) After step i), the first response from the MS shall be on carrier 3 within 33 seconds. If the MS supports stored list cell selection the first response may be also on carrier 4 or carrier 5.

20.20.2 Multiband cell selection and reselection / Cell reselection

20.20.2.1 Definition and applicability

While camped on a cell of the selected PLMN the multiband MS may need to select a different cell (irrespective of frequency band used) in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This test is applicable for multiband GSM 900 / DCS 1 800 MSs supporting simultaneous multiband operation.

20.20.2.2 Conformance requirement

- 1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; GSM 05.08, 6.6.1.
- 2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 seconds; GSM 05.08, 6.6.1.
- 3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

20.20.2.3 Test purpose

- 1. To verify that MS meets conformance requirement 1.
- 2. To verify that MS meets conformance requirement 2.
- 3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, and PENALTY_TIME parameters are used to give different priorities to different frequency bands.

20.20.2.4 Method of test

20.20.2.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.1.

Parameters changed from Default values table 20.1 are below:

| Parameter | Carrier 1 (GSM) | Carrier 2 (GSM) | Carrier 3 (GSM) | Carrier 4 (DCS) | Carrier 5 (DCS) | Carrier 6 (DCS) | Carrier 7 (DCS) |
|---------------------------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
| RF signal level (dBmV emf ()/dBm) | 53 / -60 | 48 / -65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 / -80 | 43 / -70 |
| RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| PT | | | | | | | 11111 |
| CRO | | | | | | | 20 dB |
| MS_TXPWR_MAX_CCH | 7 | 7 | 7 | | | | |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 40 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 20 |

Carrier 1, 2 and 3 ARFCNs are chosen in the GSM 900 band, carrier 4, 5, 6 and 7 ARFCNs in the DCS 1 800 band.

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 seconds. Hence 5 seconds is also the updating time of the list of six strongest neighbour carriers.

20.20.2.4.2 Procedure

- The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- The MS is switched on.
- After 60 seconds, the SS deactivates carrier 4 and activates carrier 7 and pages the MS continuously on carrier 7. The SS monitors carrier 7 for RA requests from the MS.
- The MS is switched off.
- The SS is reconfigured and sets PT = 0 and CRO = 0 on carrier 7 (thus increasing C2 to 40 dB).
- The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- The MS is switched on.
- After 60 seconds, the SS deactivates carrier 4 and activates carrier 7 and pages the MS continuously on carrier 7. The SS monitors carrier 7 for RA requests from the MS.
- 20 seconds after receiving an RA request on carrier 7 the SS sets PT = 11111 and CRO = 20 dB on carrier 7 (thus decreasing C2 to 20dB), stops paging on carrier 7, and pages the MS continuously on carrier 1. The SS monitors carrier 1 for RA requests from the MS.
- The MS is switched off.

20.20.2.5 Test requirements

- After step c) there shall be no response from the MS on carrier 7 within 55 s of activating carrier 7.
- After step h) the MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 seconds to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 seconds (+10 %)), 33 seconds to read BCCH, 15 seconds for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 seconds.

- 3) After step i) the MS shall access on carrier 1 within 55 s of setting PT and CRO on carrier 7.

20.21 R-GSM cell selection and reselection

This clause is applicable for the MS supporting R-GSM band except when otherwise stated.

In the following paragraphs some explanatory text is given concerning the nature of the tests in this section and the general behaviour of the SS is described.

Since the conformance requirements of most of the tests in this section cannot be tested explicitly, testing is done implicitly by testing the MS behaviour from its responses to the SS.

The SS transmits one BCCH carrier per cell as indicated in the initial conditions for each test. These are referred to as carrier 1, carrier 2, etc. It is assumed that the SS can simultaneously transmit seven BCCH carriers and monitor three random access channels. For multiband tests it is assumed that at least one of the BCCH carriers and one of the monitored random access channels is in a different frequency band from the others. In some cases, a test is performed in multiple stages in order that the requirements can be tested within the above constraints.

For any MS all the carriers are in its supported band(s) of operation. For an R-GSM mobile station at least one of the carriers is chosen between ARFCN 955-974 and one of the carriers is in the primary band.

Unless otherwise stated in the method of test, in all of the tests of this section:

- The SS is continuously paging the MS on all carriers at the start of the test and does not respond to RACH requests from the MS. Where a test specifies that the MS is not paged on a particular carrier, only idle paging is transmitted according to GSM 04.08, 3.2.2.2.
- The default values of the system information data fields given in table 20.21.1 are used.
- The SIM is in the idle updated state in the default location area with a TMSI assigned at the beginning of each test.
- The ARFCNs used for the carriers in each test are chosen from those in table 20.21.1 with adjacent carriers separated by a minimum of three channels.

The absolute accuracy of the MS signal level measurements is assumed to be ± 6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1 or C2 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be ± 3 dB for the signal levels used in the tests of this section, except for section 20.20, where the relative accuracy is assumed to be ± 5 dB if the measurements are on different frequency bands. A difference of at least 5 dB is allowed for cases of discrimination between C1 or C2 values on different carriers, except for section 20.20, where a difference of at least 10 dB is allowed if the measurements are on different frequency bands.

NOTE 1: The accuracy of MS signal level measurements is specified in GSM 05.08. For all of the tests in this section, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in GSM 05.08 is ± 10 % except for PENALTY_TIME where it is ± 2 seconds. In the tests of this section, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is ± 2 % and the SS tolerance on power level ± 1 dB.

Table 20.21.1: Default values of the system information fields

| Parameter | GSM 04.08 reference | Abbr. | Normal Setting |
|--------------------------|---------------------|-------|---|
| Cell channel description | 10.5.2.1 | - | Any values |
| MAX retrans | 10.5.2.29 | - | 1 |
| TX-integer | 10.5.2.29 | - | Any value |
| CELL_BAR_QUALIFY | 10.5.2.35 | CBQ | 0 |
| CELL_BAR_ACCESS | 10.5.2.29 | CBA | 0 (not barred) |
| AC CN | 10.5.2.29 | AC | All 0 |
| RE | 10.5.2.29 | RE | 0 (re-establishment allowed) |
| NCC | 10.5.2.2 | NCC | Any value |
| Cell Identity | 10.5.1.1 | - | Any value |
| MCC, MNC | 10.5.1.3 | PLMN | MS Home PLMN |
| LAC | 10.5.1.3 | LAC | 1111 (Hex) |
| ATT | 10.5.2.11 | - | 0 (Attach/Detach not allowed) |
| BS_AG_BLKES_RES | 10.5.2.11 | - | Any values |
| T3212 | 10.5.2.11 | - | Any values |
| BS_PA_MFRMS | 10.5.2.11 | BPM | 5 frames |
| Cell Options | 10.5.2.3 | - | Any values |
| CELL_RESELECT_HYSTERESIS | 10.5.2.4 | CRH | 4 dB |
| MS_TXPWR_MAX_CCH | 10.5.2.4 | MTMC | Max. output power of MS |
| RXLEV_ACCESS_MIN | 10.5.2.4 | RAM | -90 dBm |
| CELL_RESELECT_OFFSET | 10.5.2.35 | CRO | 0 |
| TEMPORARY_OFFSET | 10.5.2.35 | TO | 0 |
| PENALTY_TIME | 10.5.2.35 | PT | 0 |
| Power Offset | 10.5.2.35 | PO | 0 |
| BA ARFCN | 10.5.2.22 | BA | All 0 except: |
| | | | For GSM900, both P-GSM and R-GSM ARFCNs are broadcast: GSM ARFCNs 3, 9, 18, 25, 41, 43, 49, 50, 54, 58, 62, 66, 70, 80, 92, 124, broadcast in SYSTEM INFORMATION type 2 R-GSM ARFCNs 956, 960, 969, 985, 989, 995, 1010, 1014 broadcast in SYSTEM INFORMATION type 2bis |
| | | | For DCS1800 ARFCNs 512, 543, 568, 589, 602, 641, 662, 683, 696, 711, 732, 754, 794, 851, 870, 871, 872, 884 broadcast in SYSTEM INFORMATION TYPE 2. |
| | | | For multiband tests, ARFCNs 3, 18, 41, 49, 62, 70, 92, 124 broadcast in SYSTEM INFORMATION TYPE 2 (GSM cell) and TYPE 2ter (DCS cell), and ARFCNs 512, 568, 602, 662, 696, 732, 794, 870 broadcast in SYSTEM INFORMATION TYPE 2 (DCS cell) and TYPE 2ter (GSM cell) |

20.21.1 R-GSM cell selection

20.21.1.1 Definition and applicability

Cell selection is a process in which a MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

20.21.1.2 Conformance requirement

1. The MS shall be able to select the correct (fourth strongest) cell and be able to respond to paging on that cell within 30 seconds of switch on, when the three strongest cells are not suitable. This assumes a valid SIM, with PIN disabled and ideal radio conditions; GSM 05.08, 6.1.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
 - 2.1 (i) It should be a cell of the selected PLMN
 - 2.2 (ii) It should not be "barred" (see section 3.5.1)
 - 2.3 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6.

GSM 03.22, 3.2.1.

NOTE: Criteria (iii) is not applicable for Cell Selection.

3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it; GSM 03.22, 3.2.1.
4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection; GSM 05.08, 6.4.

20.21.1.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that:
 - 2.1 The MS does not select a cell of a PLMN which is not the selected PLMN.
 - 2.2 The MS does not select a cell which is "barred".
 - 2.3 The MS does not select a cell with $C1 < 0$.
3. To verify that the MS selects suitable cells in descending order of received signal strength.
4. To verify that the MS does not select a cell with $C1 < 0$.

20.21.1.4 Method of test**20.21.1.4.1 Initial conditions**

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 48 / -65 | 38 / -75 | 43 / -70 | 33 / -80 | 28 / -85 | OFF |
| CBA | 1 | 0 | 0 | 0 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | -67 | -90 | -88 | -98 | |
| MNC | | | 01 | | | |
| MCC | | | 002 | | | |
| C1 | 25 | -8 | 20 | 8 | 13 | |
| C2 | 25 | -8 | 20 | 8 | 13 | |

Carrier 2 and carrier 4 are chosen between ARFCN 955 - 974. Carrier 1 is chosen between 975 - 1023, 0; and carrier 3 remains in the P-GSM band.

20.21.1.4.2 Procedure

- a) The SS activates the carriers and monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The MS is switched off.
- d) The SS monitors carriers 1 and 3 for RA requests from the MS
- e) The MS is switched on.

20.21.1.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 seconds. There shall be no response from the MS on carrier 2.
- 2) After step e), there shall be no response from the MS on either carrier 1 or carrier 3 within 33 seconds.

20.21.2 R-GMS cell selection with varying signal strength values

20.21.2.1 Definition and applicability

For definition see conformance requirement.

20.21.2.2 Conformance requirement

1. The MS shall:

The MS shall search all RF channels in the system (194 ARFCNs for R-GSM), take readings of received RF signal strength on each RF channel, and calculate the received level average for each. The averaging is based on at least five measurement samples per RF carrier spread over 3 to 5 s, the measurement samples from the different RF carriers being spread evenly during this period. GSM 05.08, 6.2.

- 1.1 The MS shall search all RF channels in the system (194 ARFCNs for R-GSM), take readings of received RF signal strength on each RF channel, and calculate the received level average for each.
- 1.2 The averaging is based on at least five measurement samples per RF carrier spread over T_{av} (3 to 5 s).
- 1.3 The measurement samples from the different RF carriers being spread evenly during this period.
2. These quantities are termed the "receive level averages", shall be unweighted averages of the received signal strengths measured in dBm. GSM 05.08, 6.1.

20.21.2.3 Test purpose

1. To verify that:
 - 1.1 The MS meets conformance requirement 1.1.
 - 1.2 The MS meets conformance requirement 1.2.
 - 1.3 The MS meets conformance requirement 1.3.
2. To verify that the MS meets conformance requirement 2.

20.21.2.4 Method of test**20.21.2.4.1 Initial conditions**

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 23 / -90 | 58 / -55 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 13 / -100 | 13 / -100 | | | | |
| C1 | 10 | 53 | | | | |

Carrier 1 is chosen between ARFCN 955 - 974.

The manufacturer of the equipment shall declare his averaging time T_{av} . This time is the time between the first and the last measurement sample taken on one carrier during one averaging period.

20.21.2.4.2 Procedure

- a) The SS transmits on carriers 1 and 2. After a period of $b \cdot T_{av}$ carrier 2 reduces its transmit level to -85 dBm (28 dBμV emf()). After a further period of $a \cdot T_{av}$, carrier 2 increases its transmit level again to -55 dBm (58 dBμV emf()). Switching of carrier 2 continues with these levels and duty cycle until the end of the test.

T_{av} is the averaging time declared by the manufacturer.

The parameters a and b are chosen according to the following rules:

$$(a + b) \cdot T_{av} > T_{av}$$

$$0 < a \cdot T_{av} < \frac{2}{3} \cdot T_{av}$$

$$0,5 \cdot T_{av} < b \cdot T_{av} < T_{av}$$

In the equations $<$ and $>$ means at least one TDMA frame less or greater than the given value.

While satisfying the conditions given above:

a is chosen to be as close as possible to $\frac{2}{3}$.

b is chosen to be as close as possible to 0,5.

- b) The MS is switched on.
- c) The SS monitors all RA requests from MS on carriers 1 and 2.

20.21.2.5 Test requirements

In step c), the first response from the MS shall be on carrier 2 within 33 seconds.

NOTE 1: With the selected duty cycle it can be guaranteed that a "good" MS passes the test even at the worst case situations. The minimum averaged value of carrier 2 is in any case higher or equal to -75 dBm which is still 6 dB above carrier 1's level (for a "good" MS).

NOTE 2: With the selected levels and duty cycle the probability that a "bad" MS (i.e. MS that averages over shorter period than 3 s) fails the test is maximized. However, it can not be guaranteed that all the MSs not fulfilling the conformance requirement of averaging or uniform sampling will fail this test.

20.21.3 R-GSM basic cell reselection

20.21.3.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

20.21.3.2 Conformance requirement

1. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:

- 1.1 (iii) The cell camped on (current serving cell) has become barred.

- 1.2 (iv) There is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).

The MS will then reselect a new cell in order to fulfil the process goal.; GSM 03.22, 4.5.

NOTE 1: Criterion (i) is tested in section 20.21.8 (Cell reselection when $C1(\text{serving cell}) < 0$ for 5 seconds).

NOTE 2: Criterion (ii) is tested section 20.21.16 (Downlink signalling failure).

NOTE 3: Criterion (v) is tested in section 20.21.6 (Cell reselection timings).

2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:

- 2.1 (ii) It should not be "barred".

- 2.2 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. GSM 03.22, 3.2.1.

NOTE 4: Criterion (i) is not relevant for cell reselection and for cell selection it is tested in section 20.21.1.

NOTE 5: Criterion (iv) refers to the C1 parameter.

3. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

4. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:

- i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high.

- ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds, except in the case of the new cell being in a different location area in which case the C2 value for the new cell shall exceed the C2 value of the serving cell by at least CELL_RESELECT_HYSTERESIS dB as defined by the BCCH data from the current serving cell, for a period of 5 seconds. This indicates that it is a better cell. GSM 05.08, 6.6.2.

5. The MS shall attempt to decode the full BCCH data of the serving cell at least every 30 seconds; GSM 05.08, 6.6.1.

20.21.3.3 Test purpose

1. To verify that:
 - 1.1 The MS meets conformance requirement 1.1.
 - 1.2 The MS meets conformance requirement 1.2.
2. To verify that:
 - 2.1 The MS does not reselect a cell which is barred.
 - 2.2 The MS does not reselect a cell which has a $C1 < 0$.
3. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are not used.
4. To verify that the MS takes into account the CELL_RESELECT_HYSTERESIS parameter when reselecting a cell in a different location area.
5. To verify that the MS decodes the CELL_BAR_ACCESS and CELL_BAR_QUALIFY parameters from the BCCH every 30 seconds.

20.21.3.4 Method of test**20.21.3.4.1 Initial conditions**

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-------------------------------------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 43 / -70 | 33 / -80 | 43 / -70 | 38 / -75 | 38 / -75 | |
| RXLEV_ACCESS_MIN (dBm) | -85 | -90 | -90 | -85 | -67 | |
| CRH | 10 dB | | | | | |
| LAC | | | different from other carriers | | | |
| CBA | | | | 1 | | |
| CBQ | | | | 0 | | |
| C1 | 15 | 10 | 20 | 10 | -8 | |
| C2 | 15 | 10 | 20 | 10 | -8 | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

20.21.3.4.2 Procedure

- a) The SS activates carriers 1, 2, 4 and 5. The MS is not paged on carrier 1. The SS monitors carriers 2, 4 and 5 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS stops paging on all carriers except carrier 2. The level of carrier 2 is increased to 43 dBμVemf (C2 becomes 20 dB), and the SS monitors carrier 2 for RA requests from the MS.
- d) When the SS receives a response from the MS on carrier 2, it stops paging the MS on this carrier.
- e) The MS is switched off.
- f) The SS is reconfigured and sets CBA = 1 on carriers 1 and 5.
- g) The MS is switched on.

- h) After 33 seconds, the SS starts paging continuously on carrier 1 and sets CBA=1 on carrier 2 and CBA=0 on carriers 1, 4 and 5.
- i) When the SS receives a response on carrier 1, it stops paging the MS and waits for 25 seconds. (The MS should reselect and camp onto carrier 1).
- j) The SS activates carrier 3, pages the MS continuously on this carrier and monitors carrier 3 for RA requests from the MS.
- k) The SS increases the level of carrier 3 to 53 dB μ V_{emf} (C2 increases to 30 dB.).

20.21.3.5 Test requirements

- 1) After step b), there shall be no response from the MS on carriers 2, 4, or 5 within 50 seconds.
- 2) In step c), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.

NOTE 1: 5 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 18,4 seconds, allow 20 seconds.
- 3) In step h), the MS shall respond on carrier 1 within 50 seconds of setting CBA=1 on carrier 2.

NOTE 2: 33 seconds for the MS to read the BCCH of carrier 2 (30 seconds + 10 %), 15 seconds for the MS to reselect cell 1, since the MS already has a running average on carrier 1, allow 50 seconds.
- 4) After step j), there shall be no response from the MS within 50 seconds.
- 5) After step k), the MS shall respond on carrier 3 within 20 seconds.

20.21.4 R-GSM cell reselection using TEMPORARY_OFFSET, CELL_RESELECT_OFFSET, POWER_OFFSET and PENALTY_TIME parameters

20.21.4.1 Definition and applicability

20.21.4.2 Conformance requirement

- 1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection; GSM 05.08, 6.4.

20.21.4.3 Test purpose

- 1. To verify that the MS calculates the C2 parameter correctly when the CELL_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are used.
- 2. To verify DCS 1 800 MS correctly calculate the C2 parameter when the POWER_OFFSET parameter is present.

20.21.4.4 Method of test

20.21.4.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 53 / -60 | 43 / -70 | 48 / -65 | 48 / -65 | | |
| RXLEV_ACCESS_MIN (dBm) | -80 | -100 | -85 | -85 | | |
| PT | | 11111 | 40 s | 60 s | | |
| CRO | | 16 dB | 20 dB | 20 dB | | |
| TO | | | 20 dB | 20 dB | | |
| K = 1 | | | | | | |
| C1 | 20 | 30 | 20 | 20 | | |
| C2 | 20 | 14 | 20 -> 40 | 20 -> 40 | | |
| K = 2 (DCS1800 Class 3 MS only) | | | | | | |
| POWER_OFFSET | 0 | 2 | 6 | 6 | | |

The BA(BCCH) list only contains the ARFCNs of the carriers used during the test.

20.21.4.4.2 Procedure

For testing of GSM MS, the test procedure is performed for execution counter K = 1.

For testing of DCS 1 800 MS, the test procedure is performed for execution counter K = 1 and 2

On execution counter K = 1, the POWER_OFFSET Parameter is not present.

On execution counter K = 2, the POWER_OFFSET parameter is present.

- The SS activates carriers 1 and 2. The MS is not paged on carrier 1. The SS monitors carrier 2 for RA requests from the MS.
- The MS is switched on.
- The SS increases the level of carrier 2 to 54 dBμVemf (C2 becomes 25 dB).
- When the SS receives a response on carrier 2, the SS stops paging on that carrier and waits for 20 seconds (The MS should reselect and camp onto carrier 2).
- The SS activates carriers 3 and 4 and continuously pages the MS on these carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

20.21.4.4.3 Requirements

For execution counter K = 1 and K = 2.

- After step b), there shall be no response from the MS on carrier 2 within 50 seconds.
- After step c), the MS shall respond on carrier 2 within 20 seconds of increasing the level of carrier 2.
- After step e), there shall be no response from the MS on carrier 3 within 38 seconds of activating the carriers but, the MS shall respond on carrier 3 within 90 seconds. The response on carrier 3 shall be before any response on carrier 4.

NOTE: Minimum time of 38 seconds set by penalty timer on carrier 3 less 2 second tolerance. Maximum time, total of 33 seconds to read BCCH of carrier 3, 42 seconds for expiry of penalty timer on carrier 3, 15 seconds for reselection, since the MS will already have running averages on carriers 3 and 4, when the penalty timers expire, allow 90 seconds.

20.21.5 R-GSM cell reselection using parameters transmitted in the System Information type 2bis, type 2ter, type 7 and type 8 messages

20.21.5.1 Definition and applicability

System information (SI) type 7 and 8 are transmitted on the BCCH Ext when the system information type 4 message does not contain all information needed for cell selection.

The system information type 2 bis message is used when the system information type 2 message does not contain all neighbour cell ARFCNs.

The system information type 2 ter message is used when system information type 2 messages broadcast by one cell which are system information 2 or both system information 2 and 2bis do not contain all neighbour cell ARFCNs.

20.21.5.2 Conformance requirement

1. The MS shall be able to calculate correctly the path loss criterion parameter C2 used for cell reselection. GSM 05.08, 6.4.
2. Whilst in idle mode, an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation. GSM 05.08, 6.6.1.
3. Mobile stations shall treat all ARFCNs in the set {0, 1, 2 ... 1023} as valid ARFCN values even if the mobile station is unable to transmit or receive on that ARFCN. GSM 04.08, 10.5.2.1b.
4. The MS shall correctly decodes parameters transmitted in the system information type 2 ter message. GSM 04.08, 9.1.34:

20.21.5.3 Test purpose

1. To verify that the MS correctly calculates the C2 criterion when the parameters affecting cell reselection are transmitted in the system information type 7 and 8 messages.
2. To verify that the MS decodes parameters transmitted in the system information type 2 bis message.
3. To verify that the MS treats ARFCNs as valid ARFCNs even if the MS is unable to transmit or receive on that ARFCN.
4. To verify that the MS correctly decodes parameters transmitted in the system information type 2 ter message.

20.21.5.4 Method of test

20.21.5.4.1 Initial conditions

- a) Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 53 / -60 | 32 / -81 | 40 / -73 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 23 / -90 | 30 / -83 | | | |
| BS_AG_BLKES_RES | 1 | 1 | 1 | | | |
| PT | | 0 | 0 | | | |
| CRO | | 16 dB | 10 dB | | | |
| TO | | 0 dB | 0 dB | | | |
| C1 | 30 | 9 | 10 | | | |
| C2 | 30 | 25 | 20 | | | |

- b) The ARFCNs of carriers 1, 2 and 3 are chosen from those in table 20.21.1 with carrier 3 chosen between ARFCN 955 - 974.
- c) The cell reselection parameters PENALTY_TIME, CELL_RESELECT_OFFSET and TEMPORARY_OFFSET are transmitted in the SI3, SI7 and SI8 messages on carrier 2. They are not transmitted in SI4 and the ADDITIONAL RESELECT PARAM IND parameter is set to 1.
- d) The SI2bis message is transmitted on carrier 1 and contains the ARFCN of carrier 2 and ARFCNs 43, 70, 500, 550, 958, 963, 990 and 995. The ARFCN of carrier 2 is not transmitted in the SI2 message.
- e) Carriers 1 and 2 are synchronized, but staggered in frame number so that the transmission of the SI3 message on carrier 2, coincides with the paging block which the MS is listening to on carrier 1.

NOTE: Under these conditions, the MS can only decode the parameters affecting cell reselection from the SI7 or SI8 messages.

To achieve this, the following conditions are used:

BS_PA_MFRMS = 4

IMSI mod 1000 = 12

FN carrier 1 = FN carrier 2-27, for simultaneously transmitted frames.

- f) The SI3 message on carrier 2 indicates that SI2ter is used on carrier 2. SI2ter message contains the ARFCN of carrier 3 and ARFCNs 45, 76, 891, 905. The ARFCN of carrier 3 is transmitted neither in the SI2 nor in the SI2bis messages on carriers 1 and 2.

20.21.5.4.2 Test Procedure

- a) The SS activates the channels. The MS is not paged on carrier 1.
- b) The MS is switched on.
- c) After 50 seconds, the SS increases the level of carrier 2 to 42 dB μ Vemf().
- d) After 30 seconds, the SS increases the level of carrier 3 to 60 dB μ Vemf().

20.21.5.5 Test Requirements

- 1) After step b), there shall be no response from the MS on carrier 2. There shall also be no response on carrier 3.
- 2) After increasing the level of carrier 2 in step c), the MS shall respond on carrier 2 within 20 seconds.
- 3) After increasing the level of carrier 3 in step d), the mobile shall respond on carrier 3 within 20 seconds.

20.21.6 R-GSM cell reselection timings

20.21.6.1 Definition and applicability

20.21.6.2 Conformance requirement

- 1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - 1.1 ii) The calculated value of C2 for a non-serving suitable cell exceeds the value of C2 for the serving cell for a period of 5 seconds,

- 1.2 In case ii) above, cell reselection shall not take place if there was a cell reselection within the previous 15 seconds.
- 1.3 Cell reselection for any other reason (see GSM 03.22) shall take place immediately, but the cell that the MS was camped on shall not be returned to within 5 seconds if another suitable cell can be found.;

GSM 05.08, 6.6.2.

20.21.6.3 Test purpose

1. To verify that:
- 1.1 The MS does not perform a cell reselection when the C2 value for a non serving cell does not exceed the C2 value of the serving cell for a period of at least 5 seconds.
- 1.2 The MS meets conformance requirement 1.2 with an allowance for the uncertainty of the test.
- 1.3 When the MS performs an immediate cell reselection due to an unsuccessful random access attempt, the cell that the MS was camped onto is not returned to within 5 seconds when another suitable cell exists.

20.21.6.4 Method of test

20.21.6.4.1 Initial conditions

Parameters changed from the default values in table 20.21.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|--|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level (dBμV emf() / dBm) | 56 / -57 | 46 / -67 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 29 / -84 | 33 / -80 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

Below is an alternative table of parameters for use with test equipment that cannot reach the upper RF levels as specified in the table above. These carrier levels are reduced by 5 dB and will not effect the purpose of the test case:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier |
|--|-----------|-----------|-----------|-----------|-----------|---------|
| RF Signal Level (dBμV emf() / dBm) | 51 / -62 | 41 / -72 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 24 / -89 | 28 / -85 | | | | |
| Max. Retrans | 00 | 00 | | | | |
| C1 | 27 | 13 | | | | |
| C2 | 27 | 13 | | | | |

The BA(BCCH) list only contains 5 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 5 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=5 (default value) the MS will maintain a running average on surrounding cells over a period of 5 seconds.

20.21.6.4.2 Procedure

- a) The SS activates the channels. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 50 seconds, the SS starts paging continuously on carriers 1 and 2 for 20 seconds. The SS monitors carriers 1 and 2 for RA requests from the MS.
- d) The SS stops paging on carriers 1 and 2 and waits for 20 seconds. (The MS should revert to carrier 1 due to cell reselection.)
- e) The SS starts paging continuously on carrier 2.
- f) The SS increases the transmit level of carrier 2 by 20 dB for a period of 4 s and then reduces the level back to the original value.
- g) The SS increases the transmit level of carrier 2 by 20dB and waits for the MS to access on carrier 2. The SS records the time t from the increase in the level of carrier 2 to the first response from the MS.
- h) The SS stops paging on carrier 2 and decreases the transmit level of carrier 2 back to the original value.
- j) The SS waits 20 seconds. (The MS should revert to carrier 1 due to cell reselection.)
- k) The SS increases the transmit level of carrier 2 by 20 dB. After $t+2$ seconds, the SS starts paging continuously on carrier 1 and reduces the level of carrier 2 back to the original level.

20.21.6.5 Test requirements

- 1) In step c), the MS shall transmit 2 RA requests on carrier 1 followed by 2 RA requests on carrier 2. Subsequent RA requests on carrier 1 shall not occur within 4,5 s of the second RA request on carrier 1.
- 2) In step f), there shall be no access on carrier 2 within 34 seconds of increasing the level of carrier 2.
- 3) After step g), the MS shall respond on carrier 2.
- 4) In step k) , there shall be no response on carrier 1 within 11 seconds after the level of carrier 2 is reduced back to the original level.

NOTE: The 11 seconds is derived from $(t+15)$ seconds minimum cell reselection timer minus $(t+2)$ seconds from the start of step k) up to the reduction of the level of carrier 2. A further 2 seconds are subtracted to cover for any uncertainty introduced by the RA process occurring after step g).

20.21.7 R-GSM priority of cells**20.21.7.1 Definition and applicability**

In general, cell prioritization is a means of encouraging MSs to select some suitable cells in preference to others.

20.21.7.2 Conformance requirement

1. During cell selection a cell with low priority indication will only be selected if a suitable cell of normal priority cannot be found; GSM 03.22, 3.5.2.1.
2. Table 1a. Parameters affecting cell priority for cell selection

| CELL_BAR_QUALIFY | CELL_BAR_ACCESS | Cell selection priority | Status for cell reselection |
|------------------|-----------------|-------------------------|-----------------------------|
| 0 | 0 | normal | normal |
| 0 | 1 | barred | barred |
| 1 | 0 | low | normal (see note 2) |
| 1 | 1 | low | normal (see note 2) |

GSM 05.08, table 1.a

3. If all the following conditions are met then the "Cell selection priority" and the "Status for cell reselection" shall be set to normal:

- the cell belongs to the MS HPLMN
- the MS is in cell test operation mode
- the CELL_BAR_ACCESS is set to "1"
- the CELL_BAR_QUALIFY is set to "0"
- the Access Control class 15 is barred

GSM 05.08, table 1.a

20.21.7.3 Test purpose

- To verify that the MS does not select a cell of low priority when a suitable cell of normal priority exists with a lower received signal strength.
- To verify that the MS takes into account CELL_BAR_ACCESS and CELL BAR _QUALIFY when performing cell selection and reselection.
- To verify that the MS meets conformance requirement 3.

20.21.7.4 Method of test

20.21.7.4.1 Initial conditions

Parameters changed from Default values table 20.21.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 33 / -80 | 43 / -70 | 33 / -80 | 23 / -90 | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 3 / -110 | 23 / -90 | 13 / -100 | 13 / -100 | | |
| CBA | 0 | 1 | 1 | 0 | | |
| CBQ | 1 | 1 | 0 | 0 | | |
| Access class 15 | barred | barred | barred | barred | | |
| C1 | 30 | 20 | 20 | 10 | | |

20.21.7.4.2 Procedure

- The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 4.
- The MS is switched on.
- The MS is switched off. The SS deactivates the carriers.
- The MS is placed in cell test operation mode.

NOTE: Cell test mode is a mode of operation defined in SIM administrative data field.

- The SS activates the carriers and monitors for RA requests from the MS on carriers 1, 2, and 3.
- The MS is switched on.

20.21.7.5 Test requirements

- 1) After step b), the first response from the MS shall be on carrier 4 within 33 seconds, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 seconds.
- 2) After step f), the first response from the MS shall be on carrier 3 within 33 seconds, followed by a response on carrier 1 before a response (if any) on carrier 2 within 50 seconds.

20.21.8 R-GSM cell reselection when C1 (serving cell) < 0 for 5 seconds**20.21.8.1 Definition and applicability****20.21.8.2 Conformance requirement**

1. At least every 5 s the MS shall calculate the value of C1 and C2 for the serving cell and recalculate C1 and C2 values for non serving cells (if necessary). The MS shall then check whether:
 - i) The path loss criterion (C1) for current serving cell falls below zero for a period of 5 seconds. This indicates that the path loss to the cell has become too high. GSM 05.08, 6.6.2.
2. While camped on a cell of the selected PLMN ("camped normally"), the MS may need to select a different cell ("normal cell reselection" state). The following events trigger a cell reselection:
 - (i) The path loss criterion parameter C1 (see section 3.6) indicates that the path loss to the cell has become too high.; GSM 03.22, 4.5.

20.21.8.3 Test purpose

1. To verify that the MS meets conformance requirement 1.
2. To verify that the MS meets conformance requirement 2.

20.21.8.4 Method of test**20.21.8.4.1 Initial conditions**

Parameters changed from Default values table 20.21.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 43 / -70 | 23 / -90 | | | | |
| CRO | 30 dB | | | | | |
| TO | 0 | | | | | |
| PT | 0 | | | | | |
| C1 | 20 | 10 | | | | |
| C2 | 50 | 10 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9s.

20.21.8.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.

- b) The MS is switched on.
- c) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB μ V emf() for 4 s. Then, the SS raises the level back to -50 dBm / 63 dB μ V emf(). (C1 becomes -10 dB and C2, 20 dB during this period).
- d) The SS reduces signal level on carrier 1 to -80 dBm / 33 dB μ V emf()

20.21.8.5 Test requirements

- 1) After step b), there shall be no access on carrier 1 or carrier 2, within 50 seconds.
- 2) After step c), there shall be no access on carrier 2 within 30 seconds.
- 3) After step d), the MS shall access on carrier 2 within 20 seconds.

20.21.9 R-GSM running average of the surrounding cell BCCH carrier signal levels

20.21.9.1 Definition and applicability

20.21.9.2 Conformance requirement

- 1. Whilst in idle mode an MS shall continue to monitor all BCCH carriers as indicated by the BCCH allocation (BA - See table 1). A running average of received level in the preceding 5 to

Max. $\{5, ((5 * N + 6) \text{ DIV } 7) * \text{BS_PA_MFRMS} / 4\}$

seconds shall be maintained for each carrier in the BCCH allocation. N is the number of non-serving cell BCCH carriers in BA and the parameter BS_PA_MFRMS is defined in GSM 05.02; GSM 05.08, 6.6.1.

- 2. The same number of measurement samples shall be taken for all non-serving cell BCCH carriers of the BA list, and the samples allocated to each carrier shall as far as possible be uniformly distributed over each evaluation period.; GSM 05.08, 6.6.1

20.21.9.3 Test purpose

- 1. To verify that if the MS calculates a received level average (over 5 seconds) for a non-serving suitable cell which results in the value of C2 exceeding the value of C2 for the serving cell, then cell reselection takes place to the non-serving cell.
- 2. To verify that by using suitable varying levels of signal strength for non serving cells, the MS samples on non serving cell BCCH carriers are as far as possible distributed uniformly over each evaluation period.

20.21.9.4 Method of test

20.21.9.4.1 Initial conditions

Parameters changed from Default values table 20.21.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

BS_PA_MFRMS is set to 4 for this test.

The BA(BCCH) list only contains 7 ARFCNs including the ARFCNs of the carriers used during the test.

NOTE: With 7 ARFCNs in the BA(BCCH) list and BS_PA_MFRMS=4 the MS will maintain a running average on surrounding cells over a period of 5 seconds.

20.21.9.4.2 Procedure

- The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- The MS is switched on.
- The SS starts switching the level of carrier 2 between -80 dBm and -57 dBm every 2,7 seconds and continues to do so until the end of the test.
- The SS decreases the level of carrier 1 to -76 dBm.

NOTE: As a result of the switching in levels, the running average on carrier 2 will be between -66dBm and -71dBm, assuming that samples are distributed over five consecutive paging blocks.

20.21.9.5 Test requirements

- After step b), there shall be no access from the MS on carrier 1 or carrier 2, within 50 seconds..
- After step c), there shall be no access from the MS on carrier 1 or 2 within 25 seconds

NOTE: Any potential access on is likely to occur within 20 seconds.

- After step d), the MS shall access on carrier 2 within 20 seconds.

20.21.10 R-GSM running average of the serving cell BCCH carrier signal level

20.21.10.1 Definition and applicability

The MS is required to monitor continuously the BCCH carrier signal level of the serving cell (and to compare it to the BCCH carrier signal levels of the non-serving cells) to guarantee that it is camped on the most suitable cell.

20.21.10.2 Conformance requirement

- For the serving cell, receive level measurement samples shall be taken at least for each paging block of the MS. The receive level average shall be a running average determined using samples collected over a period of 5 s or five consecutive paging blocks of that MS, whichever is the greater period. New receiving level average values shall be calculated as often as possible.; GSM 05.08, 6.6.1.

20.21.10.3 Test purpose

1. To verify that by using suitable varying levels of signal strength for the serving cell, the MS performs a running average over 5 consecutive paging blocks.

20.21.10.4 Method of test**20.21.10.4.1 Initial conditions**

Parameters changed from Default values table 20.21.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 63 / -50 | 39 / -74 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| C1 | 40 | 16 | | | | |
| C2 | 40 | 16 | | | | |

NOTE: With BS_PA_MFRMS = 5 (default value), the averaging time of the MS on the serving cell BCCH is 5,9s.

20.21.10.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) After 50 seconds the SS starts switching the level of carrier 1 between -80 dBm and -50 dBm every 3 seconds.

NOTE: As a result of the switching in levels, the running average on carrier 1 will be between -62 dBm and -68 dBm over five consecutive paging blocks.

- d) The SS increases the level of carrier 2 to -56 dBm.

20.21.10.5 Test requirement

- 1) After step c), the MS shall not access on carrier 2, within 25 seconds.
- 2) After step d), the MS shall access on carrier 2, within 30 seconds.

NOTE 1: 13,75 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 27,15 seconds, allow 30 seconds.

20.21.11 Updating the list of six strongest neighbour carriers and decoding the BCCH information of a new carrier on the list**20.21.11.1 Definition and applicability****20.21.11.2 Conformance requirement**

1. The list of the 6 strongest non-serving carriers shall be updated at least as often as the duration of the running average defined for measurements on the BCCH allocation and may be updated more frequently; GSM 05.08, 6.6.1.

2. When the MS recognizes that a new BCCH carrier has become one of the 6 strongest, the BCCH data shall be decoded for the new carrier within 30 seconds; GSM 05.08, 6.6.1.

20.21.11.3 Test purpose

1. To verify that MS meets conformance requirement 1.
2. To verify that MS meets conformance requirement 2.

20.21.11.4 Method of test

20.21.11.4.1 Initial conditions

Six BCCH carriers are established with the system information contents of table 20.21.1.

Parameters changed from Default values table 20.21.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 | Carrier 7 |
|------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf ()/dBm) | 53 / -60 | 48 / -65 | 43 / -70 | 38 / -75 | 33 / -80 | 33 / -80 | 38 / -75 |
| RXLEV_ACCESS_MIN | -90 | -90 | -90 | -90 | -90 | -90 | -110 |
| C1 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |
| C2 | 30 | 25 | 20 | 15 | 10 | 10 | 35 |

The BA(BCCH) list contains only eight ARFCNs and includes those of carriers 1 to 7.

BS_PA_MFRMS is set to 3 during this test.

NOTE: The combination of 8 carriers on the BA list and BS_PA_MFRMS = 3 leads to averaging time of 5 seconds. Hence 5 seconds is also the updating time of the list of six strongest neighbour carriers.

20.21.11.4.2 Procedure

- a) The SS activates carriers 1 to 6. The MS is not paged on any of the carriers.
- b) The MS is switched on.
- c) After 60 seconds, the SS activates carrier 7 and pages the MS continuously on this carrier. The SS monitors carrier 7 for RA requests from the MS.

20.21.11.5 Test requirements

- 1) The MS shall access on carrier 7 within 55 s of activating carrier 7.

NOTE: 5,5 seconds to notice new strongest carrier in top 6 (because the updating time for six strongest is 5 seconds (+10 %)), 33 seconds to read BCCH, 15 seconds for reselection, since the MS has already performed the running average on the new strongest carrier, allow 55 seconds.

20.21.12 R-GSM decoding the BCCH information of the neighbour carriers on the list of six strongest neighbour carriers

20.21.12.1 Definition and applicability

20.21.12.2 Conformance requirement

1. The MS shall attempt to decode the BCCH data block that contains the parameters affecting cell reselection for each of the 6 strongest non-serving cell BCCH carriers at least every 5 minutes; GSM 05.08, 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in section 20.21.3.

20.21.12.3 Test purpose

1. To verify that the MS decodes the BCCH data block that contains the parameters affecting cell reselection for a non-serving cell BCCH carrier, (which is in the list of six strongest neighbour cells), at least every 5 minutes. This is achieved by changing the BCCH data such that the value of C2 for the non serving cell exceeds the value of C2 for the serving cell, and observing that the MS performs cell reselection within 5 minutes plus the time allowed for cell reselection after the change of the BCCH data.

20.21.12.4 Method of test**20.21.12.4.1 Initial conditions**

Parameters changed from Default values table 20.21.1 are below,

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

20.21.12.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

20.21.12.5 Test requirements

- 1) After step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 seconds.
- 2) After step c), the MS shall access on carrier 2 within 345 s of the change in the BCCH data of carrier 2.

NOTE: 330 s for decode of BCCH of carrier 2 (300 s +10 %), 15 seconds for reselection of carrier 2, since the MS already has a running average on carrier 2.

20.21.13 R-GSM decoding the BSIC of the neighbour carriers on the list of six strongest neighbour carriers**20.21.13.1 Definition and applicability**

20.21.13.2 Conformance requirement

1. The MS shall attempt to check the BSIC for each of the 6 strongest non-serving cell BCCH carriers at least every 30 seconds, to confirm that it is monitoring the same cell. If a change of BSIC is detected then the carrier shall be treated as a new carrier and the BCCH data redetermined; GSM 05.08, 6.6.1.

NOTE: Verification of cell reselection as implicitly tested here is performed in section 20.21.3.

20.21.13.3 Test purpose

1. To verify that the MS will check the BSIC of the non-serving cell, which is in the list of six strongest neighbour cells, by changing the BSIC and the BCCH data of the non-serving cell such that the value of C2 for that cell exceeds the value of C2 of the serving cell, and observing that the MS performs cell reselection within the time allowed to check the BSIC, redetermine the BCCH data and perform cell reselection.

20.21.13.4 Method of test**20.21.13.4.1 Initial conditions**

Parameters changed from Default values table 20.21.1 are below:

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dB μ V emf() / dBm) | 38 / -75 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 | 15 | 10 | | | | |
| C2 | 15 | 10 | | | | |

20.21.13.4.2 Procedure

- a) The SS activates the carriers. The MS is not paged on carrier 1. The SS monitors carriers 1 and 2.
- b) The MS is switched on.
- c) The SS changes the BSIC of carrier 2 by changing the Base Station Colour Code (BCC) part of the BSIC. The SS also changes the RXLEV_ACCESS_MIN in the BCCH data of carrier 2 to be -100 dBm.

NOTE: With the above change to the BCCH data the C2 of carrier 2 becomes 20 whereas the C2 of carrier 1 stays at 15.

20.21.13.5 Test requirements

- 1) In step b), there shall be no access from the MS on carrier 1 or carrier 2 within 50 seconds.
- 2) After step c), the MS shall access on carrier 2 within 85 s of the change in the BSIC value (and BCCH data) of carrier 2.

NOTE: 33 seconds for check of BSIC on carrier 2, 33 seconds for decode of BCCH of carrier 2, 15 seconds for reselection of carrier 2, since the MS already has a running average on carrier 2, allow 85 seconds.

20.21.14 R-GSM emergency calls**20.21.14.1 Definition and applicability**

This test is applicable for R-GSM MSs supporting speech.

20.21.14.2 Conformance requirement

1. When in a limited service state, the MS shall be able to initiate emergency calls; GSM 05.08, 6.8.

2. When in a limited service state and if not camped on a cell, the MS shall monitor the signal strength of all 194 RF channels, and search for a BCCH carrier which has $C1 > 0$ and which is not barred. When such a carrier is found, the MS shall camp on that cell, irrespective of the PLMN identity; GSM 05.08, 6.8.
3. The MS shall perform cell reselection at least among the cells of the PLMN of the cell on which the MS has camped, according to the algorithm of GSM 03.22, 4.5 & 3.7, except that a zero value of CELL_RESELECT_HYSTERESIS shall be used; GSM 05.08, 6.8.

20.21.14.3 Test purpose

1. To verify that the MS shall be able to initiate emergency calls when no suitable cells of the selected PLMN are available, but at least one acceptable cell is available.
2. To verify that the MS selects a cell with $C1 > 0$ and $CBA = 0$ when no suitable cells of the selected PLMN are available.
3. To verify that the MS, when performing cell reselection in the limited service state, uses CELL_RESELECT_HYSTERESIS = 0.

20.21.14.4 Method of test

20.21.14.4.1 Initial conditions

Parameters changed from Default values table 20.21.1 are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-------------------------------------|-------------------------|----------------|----------------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 38 / -75 | 33 / -80 | 33 / -80 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 43 / -70 | 23 / -90 | | | |
| CELL_BAR_ACCESS MCC,MNC | 1 (barred) forbidden | 0 forbidden | 0 forbidden | | | |
| CELL_RESELECT_HYST | 0 | 0 | 14 dB | | | |
| C1 | 15 | -10 | 10 | | | |

NOTE: All the BCCH carriers belong to the same PLMN, which is not the MS's home PLMN and is in the SIM's forbidden PLMN's list.

20.21.14.4.2 Procedure

- a) The SS activates the carriers. The SS monitors for RA attempts from the MS on carriers 1, 2 and 3 for the duration of the test.
- b) The MS is switched on.
- c) 50 seconds after switch on, an emergency call is initiated on the MS.
- d) The SS changes the CBA of carrier 1 to 0.

NOTE: The MS should reselect to carrier 1 because it should not take into account the CELL_RESELECT_HYST value of 14 but use 0 instead.

- e) After 345 s an emergency call is initiated on the MS.

NOTE: 330 seconds to detect change of BCCH data, 15 seconds to perform reselection of carrier 1, since the MS already has a running average on carrier 1.

20.21.14.5 Test requirements

- 1) In step c), the first access by the MS shall be on carrier 3.
- 2) In step e), the first access from the MS shall be on carrier 1.

20.21.15 R-GSM cell reselection due to MS rejection "LA not allowed"

20.21.15.1 Definition and applicability

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

This process goes on while camping on a cell which pertains to an LA which is placed in the list of "forbidden LAIs for regional provision of service".

20.21.15.2 Conformance requirement

1. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS stores this LAI in a list of "forbidden LAIs for regional provision of service", to prevent repeated attempts to access a cell of the forbidden LA, GSM 03.22, 3.3.
2. If the MS has received the cause 'LA not allowed', it shall ignore this fact when selecting a cell to camp on, i.e. it shall not reject a cell for camping on because that cell is part of a LA where this cause has been received, GSM 03.22, 3.5.4.
3. In response to a registration attempt, when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection, GSM 03.22, 4.4.2
4. A new LU attempt shall only be performed when a new LA (or new PLMN) is entered according to the cell reselection procedure, GSM 03.22, 3.3 & figure 4.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

20.21.15.3 Test purpose

1. To verify that if an LU is rejected with cause "LA not allowed" that the LAI of that cell is written into a forbidden list which prevents the MS from performing LU onto another cell in that LA. This is verified indirectly in test purposes 2,3 and 4.
2. To verify that the MS will not reject a cell for camping on because that cell is part of a LA in the list of "forbidden LAIs for regional provision of service". This is verified indirectly by making the MS attempt an emergency call and checking that the channel request message is transmitted on the correct cell.
3. To verify that the MS when receiving an LU reject with cause value "LA not allowed", the MS continues to perform normal cell-reselection:
Cell reselection is triggered if there is a better cell (in terms of the path loss criterion C2) in the same LA, or a much better cell in another LA of the selected PLMN (using the CRH parameter).
GSM 03.22, 3.4 & 4.5.
4. To verify that a new LU attempt will be performed when a new LA (or new PLMN) is entered, GSM 03.22, 3.3 & figure 4.

20.21.15.4 Method of test

20.21.15.4.1 Initial conditions

Parameters changed from Default values table (table 20.21.1)

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 54 / -59 | 44 / -69 | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 53 / -60 | 35 / -78 | 29 / -84 | | | |
| CRH | 14 | 0 | 10 | | | |
| LAC | H1111 | H2222 | H1111 | | | |
| ATT | 1 | 1 | 1 | | | |
| C1 | 10 | 19 | 15 | | | |
| C2 | 10 | 19 | 15 | | | |

20.21.15.4.2 Procedure

- a) The SS activates the carriers. The SS monitors all RA requests from MS on carriers 1, 2 & 3 until step e) has been completed. Only idle-paging is sent on all channels.
- b) The MS is switched on.
- c) When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "LA not allowed"
- d) 30 seconds after the MS has returned to idle mode (channel release after LU reject), the MS is manually commanded to set up an emergency call.

NOTE 1: C2 of carrier 3 > C2 of carrier 1. Carriers 1 and 3 belong to the same LA.

- e) The SS rejects the CM service request from the MS, with a CM service reject message with cause value #17 (Network Failure).

NOTE 2: Cause values #4 (IMSI unknown in VLR) or #6 (Illegal ME) lead to unwanted behaviour of the mobile.

- f) 10 seconds after the MS has returned to idle mode (channel release after CM service reject), the SS increases the level of carrier 2 to 65 dBμV emf().

NOTE 3: C2 of carrier 2 = 30, now larger than C2 of carrier 3 + CRH.

- g) The SS shall accept any LU on carrier 2.

20.21.15.5 Test requirements

- 1) After step b), the MS shall respond on carrier 1 within 33 s.
- 2) In step d), the MS shall access on carrier 3 with a channel request message, within 15 seconds of being commanded to set up the emergency call.
- 3) After increasing the level of carrier 2 in step f), the MS shall reselect and access onto carrier 2 requesting an LU within 30 seconds.

NOTE 1: 13,75 seconds to perform running average, 10 seconds to detect C2 differences, 2,4 seconds to read BCCH of carrier 2, 1 second to perform RA. Total 27,15 seconds, allow 30 seconds.

20.21.16 R-GSM downlink signalling failure

20.21.16.1 Definition and applicability

See conformance requirement.

20.16.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. When the MS camps on a cell, DSC shall be initialized to a value equal to the nearest integer to $90/N$ where N is the BS_PA_MFRMS parameter for that cell (see GSM 05.02).
2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1, (however never beyond the nearest integer to $90/N$).
3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, GSM 03.22, 4.5 (ii) and GSM 05.08, 6.5.

NOTE: The network sends the paging subchannel for a given MS every BS_PA_MFRMS multiframes. The requirement for network transmission on the paging subchannel is specified in GSM 04.08. The MS is required to attempt to decode a message every time its paging subchannel is sent.

20.21.16.3 Test purpose

1. To verify that the MS initializes the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to $90/N$). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

20.21.16.4 Method of test**20.21.16.4.1 Initial conditions**

Two BCCH carriers are established with the system information contents of table 20.21.1.

Parameters changed from Default values table (table 20.21.1) are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 43 / -70 | 33 / -80 | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | 10 | | | | |

NOTE: The DSC counter will have a value 18 ($90/5$).

20.21.16.4.2 Procedure

- a) The MS is switched on. On carrier 1 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS (idle paging). On carrier 2 the MS is paged continuously in all paging blocks.
- b) After 40 s the SS sends corrupted data (using random data, wrong parity bits see GSM 05.03, 4.3 & 4.1.2 or other lower layer error) in four successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on four successive paging blocks should decrease the DSC to 2.

- c) The SS monitors all accesses on both carriers for 30 s.
- d) The SS sends corrupted data in five successive paging blocks to carrier 1 and then reverts to sending normal data.

NOTE 2: Sending random, data on five successive paging blocks should decrease the DSC to < 0 and cause a cell reselection.

- e) The SS monitors all accesses on both carriers for 30 s.

20.21.16.5 Test requirements

- 1) There shall be no access to carrier 2 in test steps a) and c).
- 2) The MS shall access on carrier 2 at test step e) within 15 seconds.

20.21.17 R-GSM cell selection if no suitable cell found in 10 s

20.21.17.1 Definition and applicability

See conformance requirement.

20.21.17.2 Conformance requirement

If no suitable cell is found in cell reselection process within 10 seconds, the cell selection algorithm of GSM 03.22 shall be performed, GSM 05.08; 6.6.2.

20.21.17.3 Test purpose

To verify that the MS fulfils the conformance requirement

20.21.17.4 Method of test

20.21.17.4.1 Initial conditions

One BCCH carrier is established with the system information contents of table 20.21.1.

Parameters changed from Default values table (table 20.21.1) are below

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|---------------------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF signal level (dBμV emf() / dBm) | 43 / -70 | OFF | OFF | OFF | OFF | OFF |
| C1 = C2 | 20 | | | | | |

20.21.17.4.2 Procedure

- a) The MS is switched on. Idle paging is sent on carrier 1.
- b) After the MS indicates service the SS reduces the transmit level of carrier 1 to 13 dBμV emf() (so that C1 of carrier 1 becomes -10) and turns on a new carrier (carrier 2) at a level of 33 dBμV emf(). Carrier 2 shall not be in the MS BA list (i.e. it shall not be one of the carriers that MS has been monitoring after camped on carrier 1)
- c) The SS shall monitor all accesses on carriers 1 and 2 for 60 s.

NOTE: The access on carrier 2 should not take longer than 50 s. (5 seconds to rxlev averages, 5 s for C1<0 duration, 10 s for searching another suitable cell, 30 s for cell selection), 60 s is a safe time to wait.

20.21.17.5 Test requirements

The MS shall access on carrier 2 at test step c) within 60 s.

20.21.18 R-GSM cell reselection due to MS rejection "Roaming not allowed in this LA"**20.21.18.1 Definition and applicability**

While camped on a cell of the selected PLMN the MS may need to select a different cell in order to fulfil the normal service state. This ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink.

The MS looks for suitable neighbour cells which satisfies 4 constraints including that It should not be in an LA which is in the list of "forbidden LAs for roaming".

20.21.18.2 Conformance requirement

1. To prevent repeated attempts to have roaming service on a not allowed LA, when the MS is informed that an LA is forbidden, the LA is added to a list of "forbidden LAs for roaming" which is stored in the MS, GSM 03.22; 3.1.
2. If the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure shall be started, GSM 03.22; 4.3.3 L3, GSM 04.08; 4.4.4.7.
3. The MS can only perform camping on a suitable cell, which:
 - should not be in an LA which is in the list of "forbidden LAs for roaming" GSM 03.22, 3.2.1.

NOTE: LA stands for "Location Area" and LU stands for "Location Update".

20.21.18.3 Test purpose

1. To verify that if an LU is rejected with cause "Roaming not allowed in this LA", that the LAI of that cell is written into a forbidden list which prevents the MS from camping onto any cell in that LA.
2. To verify that if the MS has received the cause "Roaming not allowed in this LA", in response to a LU attempt, the Network Selection Procedure is initiated. This is verified indirectly by test purpose 3, in that the new LA is accessed as part of cell selection, hence CRH is disregarded.
3. To verify that if an LU is rejected, when attempting LU in a LA with LAI = LAI1, with cause "Roaming not allowed in this LA" and only cells of the selected PLMN are available, the MS will only camp and attempt LU in any LA with LAI \neq LAI1.

20.21.18.4 Method of test**20.21.18.4.1 Initial conditions**

Parameters changed from Default values table (table 20.21.1)

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|--------------------------|--------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBμV emf() / dBm) | 63 / -50 | 53 / -60 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBμV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| MNC | MNC <> | MNC <> | | | | |
| MCC | HPLMN MCC of HPLMN | HPLMN MCC of HPLMN | | | | |
| CRH | 0 | 0 | | | | |
| LAC | H1111 | H2222 | | | | |
| ATT | 1 | 1 | | | | |
| C1 | 40 | 30 | | | | |
| C2 | 40 | 30 | | | | |

20.21.18.4.2 Procedure

- The MS is switched on. Idle paging is sent on all carriers.
- The SS monitors all RA requests from MS on carriers 1 & 2.
- When the MS performs an IMSI attach onto carrier 1, the SS shall reject it with cause "Roaming not allowed in this LA".
- The SS shall accept any LU on carrier 2.
- The SS monitors all RA requests from MS on carriers 1 to 2.

20.21.18.5 Test requirements

- The MS should respond on carrier 1 within 33 s of switch on.
- After LU reject, the MS shall initiate the Network Selection Procedure and access onto Carrier 2 as part of cell selection within 33 seconds from returning to idle mode after the LU reject.

NOTE: The timing requirement in b) is given only for testing purposes only. No timing requirements are defined for the Network Selection Procedure, but the time allowed for cell selection (see 20.21.1) should be adequate.

- After the LU reject on carrier 1, there shall be no more access attempts on this carrier.

20.21.19 R-GSM cell selection on release of SDCCH and TCH**20.21.19.1 Definition and applicability****20.21.19.2 Conformance requirement**

- When the SS releases a TCH or SDCCH and returns to idle mode, it shall, as quickly as possible camp on the BCCH carrier of the cell whose channel has just been released. If the full BCCH data for that cell was not decoded in the preceding 30s, the MS shall then attempt to decode the full BCCH data. Until the MS has decoded the BCCH data required for determining the paging group, it shall also monitor all paging blocks on timeslot 0 of the BCCH carrier for possible paging messages that might address it. If the MS receives a page before having decoded the full BCCH data for the cell, the MS

shall store the page and respond once the full BCCH data has been decoded, provided that the cell is not barred and the MSs access class is allowed. GSM 05.08, 6.7.

20.21.19.3 Test purpose

1. To verify that on release of a TCH or an SDCCH, the MS camps as quickly as possible on the BCCH carrier of the cell whose channel has just been released.

NOTE: This is implicitly tested by the MS responding to a paging request. The decoding of BCCH data cannot be explicitly tested. However, the MS shall monitor for paging messages which may address it if it decodes the BCCH.

20.21.19.4 Method of test

20.21.19.4.1 Initial conditions

- a) Parameters changed from default values in table 20.21.1

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|--|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBmV emf() / dBm) | 53 / -60 | 33 / -80 | OFF | OFF | OFF | OFF |
| RXLEV_ACCESS_MIN (dBmV emf() / dBm) | 23 / -90 | 23 / -90 | | | | |
| BS_PA_MFRMS | 2 | 2 | | | | |
| ATT | 1 | | | | | |
| C1 | 30 | 10 | | | | |
| C2 | 30 | 10 | | | | |

- b) Carrier 1 is configured to have a combined control channel.
- c) Carrier 2 is configured to have a non combined control channel.

20.21.19.4.2 Test procedure

- a) The SS activates the carriers. No paging messages are transmitted on carrier 1 or carrier 2.
- b) The MS is switched on.
- c) In response to the MS access for IMSI attach, the SS allocates a combined SDDCH/4, accepts the IMSI attach procedure and then releases the link. After 0,5 seconds but within 1 second of transmitting the UA frame on completion of the IMSI attach procedure, the SS transmits a single PAGING REQUEST in the appropriate paging block of the MS on carrier 1.
- d) When the MS responds to paging, the SS establishes a call on a traffic channel.
- e) The SS increases the level of carrier 2 to 63 dBmV emf().
- f) After 10 seconds the SS performs a handover to another TCH, with the parameters of carrier 2 indicated in the CELL DESCRIPTION information element of the HANDOVER COMMAND message.
- g) After a further 10 seconds, the SS clears down the call. After 0,5 seconds but within 1 second of transmitting the UA frame, the SS transmits a single PAGING REQUEST on carrier 2 in the appropriate paging block of the MS.

20.21.19.5 Test requirements

- 1) After step b) the MS shall access in order to commence an IMSI attach procedure on carrier 1 within 33 seconds.
- 2) In step c), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.
- 3) In step g), the MS shall respond to paging within 3 seconds of transmitting the PAGING REQUEST.

20.22 GPRS Cell Selection and Reselection

The absolute accuracy of the MS signal level measurements is assumed to be ± 6 dB. A difference of at least 8 dB is allowed for cases of discrimination between C1, C31, C32 values and 0.

The relative accuracy of the MS signal level measurements is assumed to be ± 3 dB for the signal levels used in the tests of this section. A difference of at least 5 dB is allowed for cases of discrimination between C1 and C31 and C32 values on different carriers.

NOTE 1: The accuracy of MS signal level measurements is specified in GSM 05.08. For all of the tests in this section, the signal levels used are greater than 1 dB above reference sensitivity level.

NOTE 2: The tolerance on timers specified in GSM 05.08 is $\pm 10\%$ except for PENALTY_TIME where it is ± 2 seconds. In the tests of this section, the test requirements include these tolerances. Consequently, the times stated in the test requirement sometimes differ from the corresponding timer in the conformance requirement.

Where pulsed signals are specified, the SS tolerance on pulse width is $\pm 2\%$ and the SS tolerance on power level ± 1 dB.

The cell re-selection tests defined in the following sections applies to the MSs attached to GPRS if a PBCCH exists in the serving cell. Otherwise the MS shall perform cell re-selection according to the idle mode procedures defined in clause 6 of GSM 05.08 and therefore tests defined in section 20 of GSM 11.10 apply.

Unless otherwise stated in the method of test, in all of the tests of this section:

- The SIM is in the idle updated state in the default registration area with a PTMSI assigned at the beginning of each test.
- All carriers support GPRS on BCCH without a separate PBCCH channel
- The Scheduling of Packet System information should be such that a complete set of consistent PSI messages can be decoded within 8 multiframes.

Table 20.22.1: Default values of the system information fields

| Parameter | GSM 04.60 reference | Abbr. | Normal Setting |
|-----------------------------------|---------------------|-------|--|
| PRIORITY_CLASS | 11.2.20 | PC | 1 |
| C31_HYST | 11.2.20 | C31H | 0 |
| RA_RESELECT_HYSTERESIS | 11.2.20 | RARH | 0 dB |
| HCS_THR | 11.2.20 | HT | -110dBm |
| GPRS_RESELECT_OFFSET | 11.2.20 | GRO | 0 dB |
| REPORTING_PERIOD | 11.2.23 | RP | 60s |
| NETWORK_CONTROL_ORDER | 11.2.23 | NCO | NC0 |
| GPRS_CELL_RESELECT_HYST | 11.2.20 | GCRH | 0 dB |
| GPRS_TEMPORARY_OFFSET | 11.2.20 | GTO | 0 db |
| GPRS_PENALTY_TIME | 11.2.20 | GPT | 0 s |
| SPLIT_PG_CYCLE | 5.5.1.5 | SPGC | 0 |
| GPRS_CELL_RESELECT_HYSTE RESIS | 11.2.20 | GCRH | 4 dB |
| GPRS_MS_TXPWR_MAX_CCH | 11.2.20 | GMTMC | Max. output power of MS |
| GPRS_RXLEV_ACCESS_MIN | 11.2.20 | GRAM | -90 dBm |
| C32_QUAL | 11.2.20 | C32Q | 0 |
| BA(GPRS) ARFCN | 11.2.20 | BA | All 0 except: For GSM900, both P-GSM and E-GSM ARFCNs are broadcast: GSM ARFCNs 3, 9, 18, 25, 41, 43, 49, 50, 54, 58, 62, 66, 70, 80, 92, 124, broadcast in PACKET SYSTEM INFORMATION type 3 E-GSM ARFCNs 985, 989, 995, 1010, 1014 broadcast in PACKET SYSTEM INFORMATION type 3 For DCS1800 ARFCNs 512, 543, 568, 589, 602, 641, 662, 683, 696, 711, 732, 754, 794, 851, 870, 871, 872, 884 broadcast in PACKET SYSTEM INFORMATION TYPE 3. |

20.22.1 Cell selection**20.22.1.1 Definition and applicability**

Cell selection is a process in which an MS, whenever a new PLMN is selected, attempts to find a suitable cell of that PLMN to camp on. Two methods of searching for a suitable cell are possible, normal cell selection and stored list cell selection. The process ensures that the MS is camped on a cell from which it can reliably decode downlink data and with which it has a high probability of communications on the uplink. Once the MS is camped on a cell, access to the network is allowed.

20.22.1.2 Conformance requirement

1. The MS shall be able to select the strongest cell within 30 seconds of switch on. This assumes a valid SIM, with PIN disabled and ideal radio conditions, GSM 05.08, 6.1.
2. There are various requirements that a cell must satisfy before an MS can perform normal camping on it:
 - 2.1 (i) It should be a cell of the selected PLMN
 - 2.2 (ii) It should not be "barred" (see section 3.5.1)

- 2.3 (iii) It should not be in an LA which is in the list of "forbidden LAs for roaming";
- 2.4 (iv) The radio path loss between MS and BTS must be below a threshold set by the PLMN operator. This is estimated as shown in section 3.6. GSM 03.22, 3.2.1.

NOTE: Criteria 2.3 (iii) is not applicable for Cell Selection.

- 3. Initially the MS looks for a cell which satisfies these 4 constraints ("suitable cell") by checking cells in descending order of received signal strength. If a suitable cell is found, the MS camps on it, GSM 03.22, 3.2.1.
- 4. The MS shall be able to calculate correctly the path loss criterion parameter C1, used for cell selection and reselection, GSM 05.08, 6.4.

20.22.1.3 Test purpose

- 1. To verify that the MS meets conformance requirement 1. even when one of the other cells supports GPRS.
- 2. To verify that:
 - 2.1 The MS does not select a cell of a PLMN, which is not the selected PLMN.
 - 2.2 The MS does not select a cell which is "barred".
 - 2.4 The MS does not select a cell with $C1 < 0$.
- 3. To verify that the MS selects suitable cells in descending order of received signal strength.
- 4. To verify that the MS does not select a cell with $C1 < 0$.

20.22.1.4 Method of test**20.22.1.4.1 Initial conditions**

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm) | -75 | -80 | -70 | -60 | -70 | -80 |
| CBA | 0 | 0 | 0 | 1 | 0 | |
| RXLEV_ACCESS_MIN (dBm) | -90 | | -90 | -90 | -60 | |
| GPRS_RXLEV_ACCESS_MIN | | -90 | | | | -90 |
| MNC | | | 01 | | | |
| MCC | | | 002 | | | |
| C1 | 15 | 10 | 20 | 30 | -10 | |

Note 1: For an E-GSM MS carrier 1 and carrier 5 ARFCNs are chosen in the E-GSM band, carrier 3 and carrier 4 ARFCNs in the P-GSM band.

Note 2: Carrier 2 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 6.)

Note 3: Carriers 1,3,4 and 5 do not support GPRS.

20.22.1.4.2 Procedure

- The SS activates and pages on the MS on all carriers. All Carriers are monitored for RA requests from the MS.
- The MS is switched on.

20.22.1.5 Test requirements

- After step b), the first response from the MS shall be on carrier 1 within 33 seconds. There shall be no response from the MS on any other carrier

20.22.2 Cell reselection in Packet Idle mode**20.22.2.1 Definition and applicability**

This test is applicable for all types of GPRS mobiles

20.22.2.2 Conformance requirement

- At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

- The path loss criterion parameter (C1) for the serving cell falls below zero.
- A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among
 - those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion $C31 \geq 0$, or
 - all cells, if no cells fulfil the criterion $C31 \geq 0$.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.
GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

20.22.2.3 Test purpose

1. To verify that the MS reselects the correct cell based on the C32 parameter when GPRS_RESELECT_OFFSET, TEMPORARY_OFFSET and PENALTY_TIME parameters are transmitted in the System information messages.
2. To verify MS does not reselect on the basis of C31 as there are no HCS threshold values transmitted in the System information messages.

20.22.2.4 Method of test

20.22.2.4.1 Initial conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm) | -70 | -60 | -70 | -65 | -60 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -100 | -85 | -90 |
| GPT | | | | 40 s | |
| GRO | | | -20 dB | 20 dB | |
| GTO | | | | 20 dB | |
| C1 | 20 | | 30 | 20 | 30 |
| C32 | 20 | | 10 | 20-40 | 30 |

Note 1: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test.

Note 2: The HCS structure is omitted from the packet system information messages .

Note 3: Carrier 5 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2.)

20.22.2.4.2 Procedure

- a) The SS activates carriers 1 and 2. The MS is paged on Carriers 1 and 2. The SS starts monitoring carriers 1 and 2 for RA requests from the MS.
- b) The MS is switched on.
- c) The SS activates carriers 3 and 4. The MS is paged on both carriers. The SS monitors carriers 3 and 4 for RA requests from the MS.

20.22.2.5 Test Requirements

- 1) After step b) there should be a response on carrier 2 within 33 seconds.

Note: The SS should ensure that the MS final state is in Packet Idle mode on carrier 2.

2) After step d) there should be no response on carrier 4 within 38 seconds of activating the carrier but MS should respond on carrier 4 within 50 seconds of activating the carrier.

NOTE: Minimum time of 38 seconds set by penalty timer on carrier 4 less 2 second tolerance. Maximum time includes 42 seconds (40 seconds + 2 second tolerance) for expiry of penalty timer on carrier 4, 2 seconds to decode BCCH, 1 second for reselection, since the MS will already have running averages on carrier 4, when the penalty timers expire, allow 50 seconds.

20.22.3 Priority of cells

20.22.3.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

20.22.3.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

- (i) The path loss criterion parameter (C1) for the serving cell falls below zero.
- (ii) A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among
 - those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion $C31 \geq 0$, or
 - all cells, if no cells fulfil the criterion $C31 \geq 0$.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area: GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area: RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

20.22.3.3 Test purpose

1. To verify that the MS reselects to the correct cell by calculating C31 correctly when C31_HYST is set on the network.

20.22.3.4 Method of Test

20.22.3.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm) | -60 | -60 | -80 | -65 | -70 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 | -95 | -100 | -102 |
| C31_HYST = 1 | | | | | | |
| Priority Class | 1 | | 1 | 1 | 1 | 3 |
| GRO | | | 10 | 4 | 10 | 14 |
| HCS_THR | -90 | | -70 | -76 | -80 | -80 |
| GCRH | 10 | | | | | |
| C1 | 40 to 15 | | 20 | 30 | 30 | 32 |
| C31 | 20 to 5 | | -10 | 11 | 10 | 10 |
| C32 | 40 to 15 | | 20 | 24 | 30 | 36 |

Note1: GRO = GPRS_RESELECT_OFFSET, GCRH = GPRS_CELL_RESELECT_HYSTERESIS, RARH = RA_RESELECT_HYSTERESIS.

Note 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

Note 3: Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2.)

20.22.3.4.2 Procedure

- The MS is switched on and a call is set-up on carrier 2
- The SS waits 10 seconds.
- The RF level of Carriers 1 & 2 are reduced to -85 dBm (C1=decreases to 15)

20.22.3.5 Test Requirements

- After step c) the MS should respond on carrier 5 within 10 seconds. (Carrier 3 should be rejected as C31 < 0, Carrier 6 has a lower priority class than Carrier 4 and Carrier 5 so is rejected, even though C32 = 36, out of carrier 4 and 5, Carrier 5 has highest C32 value.

Note: Time allowed includes 5 sec for MS to determine C32 on neighbour cell is higher, 2 seconds to decode BCCH and 1 sec for re-selection.

20.22.4 Cell re-selection with cells in different routing area

20.22.4.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

20.22.4.2 Conformance requirement

At least for every new sample or every second, whichever is the greatest, the MS shall update RLA_P and calculate the value of C1, C31 and C32 for the serving cell and the non-serving cells; GSM 05.08, 10.1.2 The MS shall make a cell re-selection if:

- The path loss criterion parameter (C1) for the serving cell falls below zero.
- A non-serving suitable cell (see GSM 03.22) is evaluated to be better than the serving cell. The best cell is the cell with the highest value of C32 among
 - those cells that have the highest PRIORITY_CLASS among those that fulfil the criterion C31 ≥ 0, or
 - all cells, if no cells fulfil the criterion C31 ≥ 0.

If the parameter C32_QUAL is set, positive GPRS_RESELECT_OFFSET values shall only be applied to the neighbour cell with the highest RLA_P value of those cells for which C32 is compared above.

PRIORITY_CLASS and C32_QUAL are broadcast on PBCCH of the serving cell.

When evaluating the best cell, the following hysteresis values shall be subtracted from the C32 value for the neighbour cells:

- in standby state, if the new cell is in the same routing area: 0.
- in ready state, if the new cell is in the same routing area:
GPRS_CELL_RESELECT_HYSTERESIS. If the parameter C31_HYST is set, GPRS_CELL_RESELECT_HYSTERESIS shall also be subtracted from the C31 value for the neighbour cells.
- in standby or ready state, if the new cell is in a different routing area:
RA_RESELECT_HYSTERESIS.
- in case of a cell re-selection occurred within the previous 15 seconds: 5 dB.

GPRS_CELL_RESELECT_HYSTERESIS, C31_HYST and RA_RESELECT_HYSTERESIS are broadcast on PBCCH of the serving cell.

20.22.4.3 Test purpose

1. To verify that the MS reselects to the correct cell by calculating C32 correctly when one of the cells is in a different routing area.

20.22.4.4 Method of Test

20.22.4.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 | Carrier 6 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm) | -60 | -60 | -70 | -70 | -70 | -70 |
| RAI | | | | | Different | |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -80 | -100 | -100 | -80 |
| GRO | | | 4 | 4 | 6 | 4 |
| GCRH | 4 | | | | | |
| RARH | 14 | | | | | |
| C1 | 40 to 15 | | 10 | 30 | 30 | 10 |
| C32 | 40 to 15 | | 10 | 30 | 22 | 10 |

Note1: GRO = GPRS_RESELECT_OFFSET, GCRH = GPRS_CELL_RESELECT_HYSTERESIS, RARH = RA_RESELECT_HYSTERESIS.

Note 2: The BA(GPRS) list only contains the ARFCNs of the carriers used during the test. The HCS structure is transmitted in the Packet system information messages.

Note 3: Carrier 1 is the BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2.)

20.22.4.4.2 Procedure

- a) The MS is switched on and a call is set-up on carrier 2
- b) The SS waits 10 seconds.
- c) The RF level of Carriers 1 & 2 are reduced to -85 dBm (C1=decreases to 15)

20.22.4.5 Test Requirements

1. After step c) the MS should respond on carrier 4 within 10 seconds. (Carrier 5 C32=22 if RA_RESELECT_HYSTERESIS is used correctly by MS otherwise it will be 36 and MS will select carrier 5 incorrectly)

Note : Time allowed includes 5 sec for MS to determine C32 on neighbour cell is higher, 2 seconds to decode BCCH and 1 sec for re-selection.

20.22.5 Network controlled Cell re-selection in Transfer Mode**20.22.5.1 Definition and applicability**

This test is applicable for all types of GPRS mobiles

20.22.5.2 Conformance requirement

1. A cell re-selection command may be sent from the network to an MS. When the MS receives the command, it shall immediately re-select the cell according to the included cell description and change the network control mode according to the command (GSM 04. 60, GSM05.08: 10.1.4).

20.22.5.3 Test purpose

1. To verify the MS can correctly interpret the network control commands and reselect to the correct cell.

20.22.5.4 Method of Test**20.22.5.4.1 Initial Conditions**

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 | Carrier 5 |
|-----------------------------|-----------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm) | -60 | -60 | -80 | -70 | -70 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -100 | -100 | -100 | -100 | -100 |
| NETWORK_CONTROL_ORDER | NC2 | NC2 | NC0 | NC2 | NC2 |
| NC_REPORTING PERIOD_T (s) | 0.96 | 0.96 | | 0.96 | 0.96 |
| C1 | 40-20 | | 20-40 | 30 | |
| C32 | 40-20 | | 20-40 | 30 | |

Note 1: The HCS structure is omitted from the packet system information messages on all the cells. Therefore C31 is not used.

Note 2: Carrier 1 is a BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 2.) and Carrier 4 is a BCCH carrier which broadcasts the position of the PBCCH channel in the cell (Carrier 5.)

20.22.5.4.2 Procedure

- a) The MS is switched on and a call is set up on carrier 2.
- b) The RF level of carriers 1 and 2 are reduced to -80dBm. (C32 becomes 20).

- c) The SS waits 15 seconds after the RF level of carriers 1 and 2 are reduced before sending a reselect command to the MS to select carrier 4.
- d) The RF level of carrier 3 is increased to -60dBm. (C32 becomes 40).
- e) The SS waits 15 seconds after increasing the RF level of carrier 3 before the Network Control Order is changed to NC0 on carriers 4 and 5. The SS sends a RESET command to the MS.

20.22.5.5 Test Requirements

- 1) After step b) there should be no response on carriers 3, 4 or 5.
- 2) After step c) there should be a response on carrier 5 within 5 seconds of the re-select command. (The 5s = 2s for BCCH decoding + 2s for PBCCH decoding + 1s for re-selection + tolerance)
- 3) After step d) there should be no response on carriers 1, 2, 3.
- 4) After step e) there should be a response on carrier 3 within 3 seconds of the SS sending the RESET command. (The 3s = 2s for BCCH decoding + 1s for re-selection + tolerance).

20.22.6 Cell reselection timings

20.22.6.1 Definition and applicability

This test is applicable for all types of GPRS mobiles

20.22.6.2 Conformance requirement

At least for every sample or every second, whichever is greatest, the MS shall calculate the value of C1, C31 and C32 for the serving cell and recalculate C1, C31 and C32 values for non serving cells (if necessary). The MS shall make a cell re-selection if:

- i) The path loss criterion parameter (C1) for the serving cells falls below zero.

20.22.6.3 Test purpose

- 1. To verify that the MS meets conformance requirement 6.2 (i) within time allowed.

20.22.6.4 Method of Test

20.22.6.4.1 Initial Conditions

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|-----------------------------|-----------|-----------|-----------|-----------|
| RF Signal Level (dBm) | -70 | -70 | -60 | -60 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -90 | -90 | -100 | -100 |
| GRO | -20 | | | |
| SPLIT_PG_CYCLE | 4 | 4 | 4 | 4 |
| C1 | 20 | | 40 | |
| C32 | 0 | | 40 | |

Note 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

Note 2: The RLA_P should be updated every 3.84 seconds with SPLIT_PG_CYCLE=4

Note 3: Carriers 1 and 3 are the BCCH carriers which broadcast the position of the PBCCH channel in the cell (Carriers 2 and 4)

20.22.6.4.2 Procedure

- a) The SS activates all carriers and pages the MS on carrier 4. The SS starts to monitor carriers 3 and 4 for responses from the MS.
- b) The MS is switched on.
- c) The RF level of carriers 1 & 2 are reduced to -100 dBm for 8 seconds. (During this period C1 becomes -10). Then the SS raises the level back to -60 dBm. The SS waits 20 seconds.
- d) The SS reduces the RF level on carriers 1 & 2 to -100 dBm for 20 seconds

20.22.6.5 Test Requirements

- 1) After step c) there shall be no access on carrier 3 or carrier 4.
- 2) After step d) there shall be access on carrier 1 within 25 seconds (allow 20s for c1 average to reach -10 + 2s to decode BCCH + 2s to decode PBCCH)

20.22.7 Downlink signalling failure

20.22.7.1 Definition and applicability

This test is applicable for all types of GPRS MSs.

20.22.7.2 Conformance requirement

The downlink signalling failure criterion is based on the downlink signalling failure counter DSC.

1. If DRX period split is supported, DSC shall be initialised to a value equal to the nearest integer to $\max(10, 90/64 \cdot \text{SPLIT_PG_CYCLE})$ where SPLIT_PG_CYCLE is a parameter defined at GPRS attach (see 05.02)
2. Thereafter, whenever the MS attempts to decode a message in its paging subchannel; if a message is successfully decoded DSC is increased by 1, however never beyond the max value defined in 1.
3. Whenever the MS can not successfully decode a message in its paging subchannel the DSC is decreased by 4.
4. When DSC reaches 0, a downlink signalling failure shall be declared. A downlink signalling failure shall result in cell reselection, GSM 03.22, 4.5 (ii) and GSM 05.08, 6.5

NOTE: The network sends the paging subchannel for a given MS every $64/\text{SPLIT_PG_CYCLE}$ multiframes. The requirement for network transmission on the paging subchannel is specified in GSM 04.08. The MS is required to attempt to decode a message every time its paging subchannel is sent.

20.22.7.3 Test purpose

1. To verify that the MS initialises the DSC counter in accordance with the conformance requirement. This is verified indirectly.
2. To verify that whenever the MS successfully decodes a message on paging subchannel, the DSC is increased by 1, (however never beyond the nearest integer to max defined in 16.2.1). This is verified indirectly.
3. To verify that whenever the MS can not successfully decode a message on paging subchannel, the DSC decreased by 4. This is verified indirectly.
4. To verify that when the DSC reaches 0, a downlink signalling failure shall be declared and the MS will perform cell reselection.

20.22.7.4 Method of Test**20.22.7.4.1 Initial Conditions**

Parameters changed from the default values in table 20.22.1.

| Parameter | Carrier 1 | Carrier 2 | Carrier 3 | Carrier 4 |
|--|-----------|-----------|-----------|-----------|
| RF Signal Level (dBµV emf() / dBm) | -65 | -65 | -60 | -60 |
| GPRS_RXLEV_ACCESS_MIN (dBm) | -95 | -95 | -100 | -100 |
| SPLIT_PG_CYCLE | 4 | 4 | 4 | 4 |
| C1 | 30 | | 40 | |
| C32 | 30 | | 40 | |

Note 1: The HCS structure is omitted from the system information messages on all the cells. Therefore C31 is not used.

Note 2: With SPLIT_PG_CYCLE=4 DSC should be set to 10, Paging blocks occur every 832 frames or 3.84 seconds.

Note 3: Carrier 1 and 3 are BCCH carriers which broadcast the position of the PBCCH channel in the cell (Carrier 2 and 4.)

20.22.7.4.2 Procedure

- a) The MS is switched on. On carrier 4 valid layer 3 messages shall be sent in the paging blocks, but not paging the MS. On carrier 2 the MS is paged continuously in all paging blocks.
- b) After 40s the SS sends corrupted data (using random data, wrong parity bits see GSM 05.03, 4.3 & 4.1.2 or other lower layer error) in 2 successive paging blocks on carrier 4 and then reverts to sending normal data.

NOTE 1: Sending corrupted, i.e. non-decodable data on 2 successive paging blocks should decrease the DSC to 2.

- c) The SS monitors all accesses on both carriers for 40 s. (Allows the DSC counter to go back to maximum of 10, paging block every 3.84 secs)
- d) The SS sends corrupted data in 3 successive paging blocks on carrier 4 and then reverts to sending normal data..

NOTE 2: Sending corrupted, data on 3 successive paging blocks should decrease the DSC to < 0 (-2) and cause a cell reselection.

- e) The SS monitors all accesses on both carriers for 30s

20.22.7.5 Test requirements

- 1) There shall be no access on carriers 1 or 2 after step b).
- 2) The MS shall access on carrier 2 at test step e) within 5 seconds. (The time should be measured from the transmission of the complete 3rd successive paging block with errors and allows 4 secs for decoding BCCH and PBCCH).

21 Received signal measurements

For evaluating the reception quality (the basis for handover and power control) the following two criteria are used:

- signal strength (RXLEV)
- signal quality (RXQUAL).

21.1 Signal strength

21.1.1 Definition and applicability

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

The requirements and this test apply to all types of GSM 900, DCS 1 800 and multiband GSM 900 / DCS 1 800 MS.

21.1.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21-1
 - 1.1 under normal conditions, GSM 05.08, 8.1.2 and GSM 05.05, 6.2.
 - 1.2 under extreme conditions, GSM 05.08, 8.1.2, GSM 05.05, annex D.1, D.2.

Table 21-1: Tolerance for relative accuracy of receive signal measurement

| Absolute level of lower level signal dBm | | | | Tolerance dB | | | |
|--|--------------|---------------------|-----------------|--------------------|-------|--------------------|-------|
| GSM Small MS | GSM Other MS | DCS1800 Class 1 & 2 | DCS1800 Class 3 | Lower limit Single | Multi | Upper limit Single | Multi |
| ≥ -88 | ≥ -90 | ≥ -86 | ≥ -88 | 2 | 4 | 2 | 4 |
| ≥ -101 | ≥ -103 | ≥ -99 | ≥ -101 | 3 | 5 | 2 | 5 |
| < -101 | < -103 | < -99 | < -101 | 4 | 6 | 2 | 6 |

Single means that the measurements are on the same or different RF channel within the same frequency band.

Multi means that the measurements are on different RF channel on different frequency bands.

For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

2. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of ± 4 dB from -110 dBm to -70 dBm under normal conditions; GSM 05.08, 8.1.2.
3. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of ± 6 dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; GSM 05.08, 8.1.2.
4. If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.
5. The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in GSM 05.08; GSM 05.08, 8.1.4.

21.1.3 Test purpose

1. To verify that the RXLEV reported by the MS does not exceed conformance requirement 1.
 - 1.1 under normal conditions;
 - 1.2 under extreme conditions.
2. To verify that the RXLEV reported by the MS does not exceed conformance requirement 2 under normal conditions.
3. To verify that the RXLEV reported by the MS does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.
4. To verify that the RXLEV reported by the MS does not exceed conformance requirement 4.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

21.1.4 Method of test

21.1.4.1 Initial conditions

The SS is set to produce the BCCH of the serving cell at 63 dB μ Vemf() and the BCCHs of 6 surrounding cells at 28 dB μ Vemf(). The BCCH of the serving cell indicates these BCCHs, but not the BCCH of the serving cell. The ARFCN of the serving cell BCCH is chosen so as not to interfere with the other channels as shown in table 21-2. The fading profile for the BCCHs of the serving and surrounding cells will be set to static.

After 30 s, a call is set up according to the generic call set up procedure to an ARFCN, within the supported band of operation. The SACCH indicates the same surrounding cell BCCHs as the BCCH of the serving cell.

NOTE: The 30 s is to allow the MS to scan and find all BCCHs.

21.1.4.2 Procedure

- a) The levels of the TCH and BCCHs are set according to table 21-2 step 1. The SS waits 20 s before continuing.

Table 21-2: Signal levels at receiver input in dB μ Vemf()

| Step | ARFCN | TCH | BCCH1 | BCCH2 | BCCH3 | BCCH4 | BCCH5 | BCCH6 |
|---------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|-----------|
| | GSM900: | 1 | 62 | 124 | 20 | 40 | 80 | 100 |
| | DCS1800 | 512 | 700 | 885 | 585 | 660 | 790 | 835 |
| | Multiband | 1 | 885 | 62 | 124 | 40 | 100 | 512 |
| 1+m*21 | | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 |
| 2+m*21 | | 54,5-m*10 | 63,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 |
| 3+m*21 | | 54,5-m*10 | 62,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 17+m*21 | | 54,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 18+m*21 | | 44,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 21+m*21 | | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |

m = 0, 1, 2, 3, 4.

- b) The measurement is done in 105 steps. The initial signal levels of the TCH of the serving cell and the BCCHs of the surrounding cells are adjusted according to table 21-2. At each step the SS keeps the signal levels stable for one reporting period, except at steps 21+m*21 where the level is held stable for 1,75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell BCCHs in steps 1 + m * 21 and 21 + m * 21. The RXLEV values for BCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps $21+m*21$ is to allow an extra quarter reporting period for the MS to stabilize for steps $1+m*21$.

At steps 1 to 30 the SS simulates a base station with DTX off and at steps 31 to 105 the SS simulates a base station with DTX on.

At steps 1 to 30 the SS checks the accuracy of the measured signal strength of TCH by checking the values of the parameters RXLEV_FULL and RXLEV_SUB. At steps 31 to 105 the SS shall check only the value of the parameter RXLEV_SUB.

At step 64, within every 480 ms reporting period, out of the 4 SACCH and 8 SID timeslots the SS transmits the first six active timeslots of the TCH with signal level 39,5 dBμVemf() and the last six active timeslots of the TCH with signal level 29,5 dBμVemf().

c) Step b) is repeated under extreme conditions (annex 1, TC2,2 and TC3).

21.1.5 Test requirements

21.1.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions tested the following applies;

- a) For each of the steps 1, 21, 22, 42, 43, and 64, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.
- b) For each of the steps 63 and 85, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 for small MS and DCS 1 800 MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS and DCS 1 800 MS or 8 for other MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.
- c) For step 84, of the 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.
- d) For step 105, of the reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.

NOTE: It is not mandatory for the MS to report any of the BCCHs in step 105.

21.1.5.2 Relative accuracy at a single frequency (BCCH1)

For normal and each of the 4 extreme conditions tested the following applies;

For $n \leq 21$ and $RXLEV_1 = 63$

$RXLEV_n - (63 - n + r)$ shall be between:

-2 and +2

NOTE: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an RXLEV of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports RXLEV of 63.

Otherwise

$RXLEV_{(m*21+1)} - RXLEV_{(m*21+n)} - n + 1$ shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800 class 3 and Small GSM MS; or 2 to 75 for other MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800 class 3 and Small GSM MS; or 76 to 100 for other MS.

-4 and +2

for steps 97 to 105 for DCS 1 800 class 1/2 MS; or steps 99 to 105 for DCS 1 800 class 3 and Small GSM MS; or 101 to 105 for other MS.

where: $1 < n \leq 21$ and $0 \leq m \leq 4$ as identified in table 21-2, and r is the number of the last step where $RXLEV$ of 63 was reported.

NOTE: It is not mandatory for the MS to report BCCH1 for steps greater than 99 for GSM 900 Small MS or 101 for other GSM MS or 97 for a DCS 1 800 Class 1 or Class 2 MS and 99 for DCS 1 800 Class 3 MS. If the MS reports a level and the upper limit for this step in the above formulae implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

21.1.5.3 Absolute accuracy

For each BCCH reported, $|RXLEV_{MS} + m * 10 - 62|$ shall be no more than:

- 4 for steps 64 and 85 under normal conditions.
- 6 for steps 64 and 85 under extreme conditions.
- 6 for steps 1, 22 and 43 under normal and extreme conditions.

where: $0 \leq m \leq 4$ as identified in table 21-2.

21.2 Signal strength selectivity

21.2.1 Definition and applicability

The signal strength selectivity is a measure of the ability of the signal strength measuring part of the MS to discriminate against RF power from adjacent ARFCN. The $RXLEV$ selectivity figure corresponds to the amount by which the adjacent channel power shall be attenuated.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS.

21.2.2 Conformance requirement

The selectivity of the received signal measurement shall be as follows:

- for adjacent (200 kHz) channel; ≥ 16 dB
- for adjacent (400 kHz) channel; ≥ 48 dB
- for adjacent (600 kHz) channel; ≥ 56 dB

GSM 05.08, 8.1.2.

21.2.3 Test purpose

To verify that the MS meets the conformance requirement at the 200 kHz adjacent channel above and below the wanted.

21.2.4 Method of test

21.2.4.1 Initial conditions

For GSM 900:

A call is set up according to the generic call set up procedure on ARFCN 40 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 80.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level().

BCCH1 and 2 at ARFCN 41 and 79 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

For DCS 1 800:

A call is set up according to the generic call set up procedure on ARFCN 690 and with surrounding cell BCCH3 indicated in the BA list at ARFCN 790.

The RF level of the TCH and BCCH3 is set to 20 dB above reference sensitivity level().

BCCH1 and 2 at ARFCN 691 and 789 are off.

These conditions are kept for 30 s to ensure the MS has time to decode the BCCH.

21.2.4.2 Procedure

- a) The SS records the RXLEV values reported for the TCH and BCCH3.
- b) BCCH1 and 2 are set to 9 dB above the signal level of the TCH and BCCH3.

NOTE: The first adjacent channel interference requirement limits the level of BCCHs 1 and 2 to 9 dB. This ensures that the MS can maintain the call, and read BCCH3.

- c) These conditions are kept for 30 s.
- d) The SS records the RXLEV values reported for the TCH and BCCH3.

21.2.5 Test requirements

The values of RXLEV recorded in step d) shall be no more than 1 above the values recorded in step a).

NOTE: This one change in the reported value of RXLEV is calculated as follows: The level of the first adjacent interfering signal is such that C/I is -9 dB. With an RXLEV selectivity for the first adjacent channel of 16 dB, the power from the adjacent channel is equal to -7 dB with respect to the power level of the useful signal. The increase in power therefore is equal to $10\log(1 + 10^{-0,7}) = 0,71$ dB. Thus, the value of RXLEV could increase by 1.

21.3 Signal quality under static conditions

21.3.1 Signal quality under static conditions - TCH/FS

21.3.1.1 Definition and applicability

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in section 8.4 of GSM 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in section 8.2.4 of GSM 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL_FULL. In case downlink DTX is used, the assessment is based on 12 TDMA frames: RXQUAL_SUB.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS supporting speech on a full rate channel.

21.3.1.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in GSM 05.08, 8.2.4; GSM 05.08, 8.2.2 & 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; GSM 05.08, 8.2.3.

21.3.1.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given in as per the table in GSM 05.08, 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.
3. To verify that, for downlink DTX, the reported parameter RXQUAL_SUB is the received signal quality, averaged over the correct frames (SID).

21.3.1.4 Method of test

21.3.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a full rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The wanted signal is the standard test signal C1. It is at the nominal frequency of the receiver and its level is 28 dB μ V_{emf}(). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

21.3.1.4.2 Procedure

- a) The SS sets the level of the unwanted signal at a value for which the BER of the looped back bursts, averaged over the reporting period as defined in GSM 05.08, clause 8.4, is in the "Range of actual BER" for "Quality band" RXQUAL_i, given in the table of GSM 05.08, subclause 8.2.4, with i equal to 0.
- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases an event counter for each incorrect MS reported RXQUAL level and continues the test for Max-samples, as given in subclause 21.3.1.5 for every i. For i = 7, the test is performed in steps using 60 SACCH blocks. In between steps, at least 35 SACCH blocks, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE 1: This special procedure for i = 7 is due to the high error rates involved with testing RXQUAL₇, that could lead to the MS experiencing a radio link time-out.

- c) The SS repeats steps a) to b) for i equals 1, 2, ...,7.
- d) The SS removes the unwanted signal and sets downlink DTX on.
- e) The SS verifies that the MS reports RXQUAL_{SUB} = 0 and RXQUAL_{FULL} = 7.

NOTE 2: When testing RXQUAL_{SUB}, on a full rate speech channel, the MS has approximately twice as many bits as the SS to assess BER. The MS has both SID and SACCH bits, whereas the SS only has the looped back SID bits. Therefore it is only tested that the MS uses the correct frames for RXQUAL_{SUB} reporting by checking both RXQUAL_{SUB} and RXQUAL_{FULL} reports. No quantitative assessment is done.

- f) The SS releases the call.

21.3.1.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of max-events shown in the following tables, when the number of samples relevant to the case under test is equal to max-samples.

Table 21.3: Maximum number of incorrectly reported RXQUAL_{FULL} for TCH/FS

| CASE | Expected RXQUAL _{FULL} | Specified reporting error rate | Max-events | Max-samples |
|------|---------------------------------|--------------------------------|------------|-------------|
| 0 | RXQUAL ₀ | 10% | 200 | 1640 |
| 1 | RXQUAL ₁ | 25% | 200 | 666 |
| 2 | RXQUAL ₂ | 15% | 200 | 1093 |
| 3 | RXQUAL ₃ | 10% | 200 | 1640 |
| 4 | RXQUAL ₄ | 10% | 200 | 1640 |
| 5 | RXQUAL ₅ | 5% | 200 | 3279 |
| 6 | RXQUAL ₆ | 5% | 200 | 3279 |
| 7 | RXQUAL ₇ | 5% | 201 | 3300 |

NOTE: In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate, and the minimum number for Max-events, need to be increased. The following figures are used for static propagation conditions:

| specified error rate | multiplication factor | min. Max-events |
|----------------------|-----------------------|-----------------|
| ≤ 25 % | 1,22 | 200 |

21.3.2 Signal quality under static conditions - TCH/HS

21.3.2.1 Definition and applicability

The MS shall be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in section 8.4 of GSM 05.08. The MS shall map this BER into RXQUAL values using the coding scheme defined in section 8.2.4 of GSM 05.08. For the half rate channel without downlink DTX, the error assessment is based on 52 TDMA frames: RXQUAL_FULL. In case downlink DTX is used, the assessment is based on 12 TDMA frames: RXQUAL_SUB.

The requirement and this test apply to all types of GSM 900 and DCS 1 800 MS supporting speech on a half rate channel.

21.3.2.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. When the quality is assessed over the full-set and sub-set of frames, eight levels of RXQUAL are defined and shall be mapped to the equivalent BER before channel decoding as per the table in GSM 05.08, 8.2.4; GSM 05.08, 8.2.2 & 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe; GSM 05.08, 8.2.3.

21.3.2.3 Test purpose

1. To verify, under static propagation conditions, that the received signal quality is measured and mapped to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of one SACCH multiframe. The probability that the correct RXQUAL band is reported shall meet the values given as per the table in GSM 05.08, 8.2.4.
2. To verify that the reported parameters (RXQUAL) are the received signal quality, averaged over the reporting period of length one SACCH multiframe.
3. To verify that, for downlink DTX, the reported parameter RXQUAL_SUB is the received signal quality, averaged over the correct frames (SID).

21.3.2.4 Method of test

21.3.2.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a half rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter value is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces a wanted signal and an independent uncorrelated interfering (unwanted) signal, both with static propagation characteristics. The wanted signal is the standard test signal C1. It is at the nominal frequency of the receiver and its level is 28 dB μ V_{emf}(). The unwanted signal is the standard test signal I1, on the same timeslot on a nominal frequency 200 kHz above the nominal frequency of the wanted signal.

21.3.2.4.2 Procedure

- a) The SS sets the level of the unwanted signal at a value for which the BER of the looped back bursts, averaged over the reporting period as defined in GSM 05.08, clause 8.4, is in the "Range of actual BER" for "Quality band" RXQUAL_i, given in the table of GSM 05.08, subclause 8.2.4, with i equal to 0.

- b) The SS verifies that the MS reports RXQUAL and whether or not the reported level is correct by comparison with the RXQUAL level of the corresponding looped back bursts. The SS increases an event counter for each incorrect MS reported RXQUAL level and continues the test for Max-samples, as given in subclause 21.3.2.5 for every i . For $i = 7$, the test is performed in steps using 60 SACCH blocks. In between steps, at least 35 SACCH blocks, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE 1: This special procedure for $i = 7$ is due to the high error rates involved with testing RXQUAL_7, that could lead to the MS experiencing a radio link time-out.

- c) The SS repeats steps a) to b) for i equals 1, 2, ..., 7.
- d) The SS removes the unwanted signal and sets downlink DTX on.
- e) The SS verifies that the MS reports RXQUAL_SUB = 0 and RXQUAL_FULL = 7.

NOTE 2: When testing RXQUAL_SUB, on a half rate speech channel, the MS has approximately twice as many bits as the SS to assess BER. The MS has both SID and SACCH bits, whereas the SS only has the looped back SID bits. Therefore it is only tested that the MS uses the correct frames for RXQUAL_SUB reporting by checking both RXQUAL_SUB and RXQUAL_FULL reports. No quantitative assessment is done.

- f) The SS releases the call.

21.3.2.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of max-events shown in the following tables, when the number of samples relevant to the case under test is equal to max-samples.

Table 21.6: Maximum number of incorrectly reported RXQUAL_FULL for TCH/HS

| CASE | Expected RXQUAL_FULL | Specified reporting error rate | Max-events | Max-samples |
|------|----------------------|--------------------------------|------------|-------------|
| 0 | RXQUAL_0 | 10% | 200 | 1640 |
| 1 | RXQUAL_1 | 40% | 300 | 660 |
| 2 | RXQUAL_2 | 30% | 300 | 870 |
| 3 | RXQUAL_3 | 15% | 200 | 1093 |
| 4 | RXQUAL_4 | 15% | 200 | 1093 |
| 5 | RXQUAL_5 | 5% | 200 | 3279 |
| 6 | RXQUAL_6 | 5% | 200 | 3279 |
| 7 | RXQUAL_7 | 5% | 201 | 3300 |

NOTE: In order to have a testing performance corresponding to that in clause 14 for high error rates, the multiplication factor of the tested error rate with respect to the specified error rate, and the minimum number for Max-events, need to be increased. The following figures are used for static propagation conditions:

| specified error rate | multiplication factor | min. Max-events |
|----------------------|-----------------------|-----------------|
| ≤ 25 % | 1,22 | 200 |
| 30 - 40 % | 1,15 | 300 |
| > 40 % | 1,1 | 400 |

21.4 Signal quality under TU50 propagation conditions

21.4.1 Definition and applicability

The MS must be capable of measuring the received signal quality, which is specified in terms of bit error ratio (BER) before channel decoding averaged over the reporting period of length of one SACCH multiframe defined in section 8.4 of GSM 05.08. The MS has to map this BER into RXQUAL values using the coding scheme defined in section 8.2.4 of GSM 05.08. For the full rate channel without downlink DTX, the error assessment is based on 104 TDMA frames: RXQUAL_FULL.

The requirement and this test apply to all types of GSM 900 and DCS 1800 MS supporting speech on a full rate channel.

21.4.2 Conformance requirement

1. The received signal quality shall be measured by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of 1 SACCH multiframe. The assessed equivalent BER before channel decoding shall be mapped to the eight levels of RXQUAL using the coding scheme defined in section 8.2.4 of GSM 05.08; GSM 05.08 8.2.2, 8.2.4.
2. The reported parameters (RXQUAL) shall be the received signal quality, averaged over the reporting period of length one SACCH multiframe.

GSM 05.08, 8.2.3.

21.4.3 Test purpose

1. To verify, under TUhigh conditions, that the received signal quality is measured and reported to the eight levels of RXQUAL_FULL by the MS in a manner that can be related to an equivalent average BER before channel decoding (i.e. chip error ratio), assessed over the reporting period of length one SACCH multiframe for the TCH/FS. The probability that the correct RXQUAL band is reported shall meet the values given as per the Table in GSM 05.08 8.2.
2. To verify that the reported parameters (RXQUAL) is the received signal quality, averaged over the reporting period of length one SACCH multiframe.

21.4.4 Method of test

21.4.4.1 Initial conditions

The SS sets up a call according to the generic call set up procedure on a full rate speech channel in the mid ARFCN range. The RADIO_LINK_TIMEOUT parameter is set to maximum.

The SS commands the MS to establish the TCH burst-by-burst loop, see subclause 36.2.1.1.3.

The SS produces the standard test signal C1, with TUhigh propagation profile. It shall be at the nominal frequency of the receiver at a level of 28 dBμV_{emf}().

21.4.4.2 Procedure

- a) The SS counts the number of bit errors occurring in 50 SACCH multiframes and the relevant BER is computed. If this BER does correspond to one out of the 8 different cases shown in Table 21.7, the procedure is continued from step c).

Table 21.7

| CASE | Average BER (%) |
|------|-----------------|
| 0 | < 0,10 |
| 1 | 0,26 to 0,30 |
| 2 | 0,51 to 0,64 |
| 3 | 1,0 to 1,3 |
| 4 | 1,9 to 2,7 |
| 5 | 3,8 to 5,4 |
| 6 | 7,6 to 11 |
| 7 | > 15 |

- b) The SS generates an independent, uncorrelated interfering (unwanted) signal with TUhigh propagation profile. The unwanted signal is on the same channel as the wanted signal but has no fixed relationship with the bit transitions of the wanted signal, and is modulated with random data. The SS sets the level of this signal such that the BER computed on the basis of the number of bit errors occurring in 50 SACCH multiframes corresponds to one of the cases: case_i in Table 21.7.
- c) The SS verifies that the MS reports RXQUAL. The SS also computes the RXQUAL level for the multiframe based on the looped back bits. The SS compares the RXQUAL level it computed based on the looped back bits of the multiframe with the RXQUAL level reported by the MS for that multiframe. The reported level is considered correct if RXQUAL reported by the MS is equal to RXQUAL_i (with i = 0, 1, ... 7), or to one of the adjacent bands RXQUAL_(i-1) (with i = 1, 2, ..., 7) and RXQUAL_(i+1) (with i = 0, 1, ..., 6). For each failure (to be in the correct or one of the adjacent bands) that is found, if any, a counter Max-events_i is increased by one. This step is continued for Max_samples_i RXQUAL_i based on the looped back bits.

If the MS reports RXQUAL = 7 during the test period, then at least 35 SACCH multiframes, are transmitted with a level of the unwanted signal that allows the radio link counter in the MS to reach the maximum value.

NOTE: This special procedure for RXQUAL = 7 is due to the high error, that could lead to the MS experiencing a radio link time-out.

- d) The SS repeats steps b) and c) for all of the eight case_i.

21.4.5 Test requirements

The number of errors in reporting the RXQUAL bands recorded in each of the considered cases shall not exceed the corresponding value of Max-events shown in Table 21.8, when the number of samples relevant for the case is equal to Max_samples.

Table 21.8: Maximum number of incorrectly reported RXQUAL_FULL for TCH/FS

| CASE | Expected RXQUAL_FULL | Specified reporting error rate | Max-events | Max_samples |
|------|----------------------|--------------------------------|------------|-------------|
| 0 | RXQUAL_0/1 | 15% | 200 | 1093 |
| 1 | RXQUAL_1/0/2 | 15% | 200 | 1093 |
| 2 | RXQUAL_2/1/3 | 15% | 200 | 1093 |
| 3 | RXQUAL_3/2/4 | 10% | 200 | 1640 |
| 4 | RXQUAL_4/3/5 | 10% | 200 | 1640 |
| 5 | RXQUAL_5/4/6 | 10% | 200 | 1640 |
| 6 | RXQUAL_6/5/7 | 10% | 200 | 1640 |
| 7 | RXQUAL_7/6 | 10% | 200 | 1640 |

21.5 Received signal measurements in HSCSD multislot configuration

21.5.1 Signal strength

21.5.1.1 Definition and applicability

The MS reports RXLEV values related to the apparent received RF signal strength. It is necessary for these levels to attain sufficient accuracy for the correct functioning of the system.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 and multiband GSM 900 / DCS 1 800 MS which are capable of HSCSD multislot operation.

21.5.1.2 Conformance requirement

1. The RMS received signal level at the receiver input shall be measured by the MS over the full range of -110 dBm to -48 dBm with a relative accuracy between signals with levels up to 20 dB difference according to table 21.5-1
 - 1.1 under normal conditions, GSM 05.08, 8.1.2 and GSM 05.05, 6.2.
 - 1.2 under extreme conditions, GSM 05.08, 8.1.2, GSM 05.05, annex D.1, D.2.

Table 21.5-1: Tolerance for relative accuracy of receive signal measurement

| Absolute level of lower level signal dBm | | | | Tolerance dB | | | |
|--|--------------|---------------------|-----------------|--------------------|-------|--------------------|-------|
| GSM Small MS | GSM Other MS | DCS1800 Class 1 & 2 | DCS1800 Class 3 | Lower limit Single | Multi | Upper limit Single | Multi |
| ≥ -88 | ≥ -90 | ≥ -86 | ≥ -88 | 2 | 4 | 2 | 4 |
| ≥ -101 | ≥ -103 | ≥ -99 | ≥ -101 | 3 | 5 | 2 | 5 |
| < -101 | < -103 | < -99 | < -101 | 4 | 6 | 2 | 6 |

Single means that the measurements are on the same or different RF channel within the same frequency band.

Multi means that the measurements are on different RF channel on different frequency bands.

For measurements between ARFCN in different bands the 'Absolute level of lower level signal' column for the band including the lower level signal shall be used to determine which tolerance applies.

At extreme temperature conditions an extra 2 dB shall be added to the Multi limits in above table.

2. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of ± 4 dB from -110 dBm to -70 dBm under normal conditions; GSM 05.08, 8.1.2.
3. The RMS received signal level at the receiver input shall be measured with an absolute accuracy of ± 6 dB over the full range of -110 dBm to -48 dBm under both normal and extreme conditions; GSM 05.08, 8.1.2.
4. If the received signal level falls below the reference sensitivity level for the type of MS then the MS shall report a level between the reference sensitivity level and the actual received level, but with the tolerances given in conformance requirements 2. and 3. above.
5. The measured signal level shall be mapped to an RXLEV value between 0 and 63 as specified in GSM 05.08; GSM 05.08, 8.1.4.

21.5.1.3 Test purpose

1. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 1.
 - 1.1 under normal conditions;
 - 1.2 under extreme conditions.
2. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 2 under normal conditions.
3. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 3 under extreme conditions and under normal conditions from -48 dBm to -70 dBm.
4. To verify that the RXLEV reported by the MS in HSCSD multislot configuration does not exceed conformance requirement 4.

NOTE: Conformance requirement 5 is inherently tested in each of the test purposes 1. to 4.

21.5.1.4 Method of test

21.5.1.4.1 Initial conditions

The SS is set to produce the BCCH of the serving cell at 63 dBμVemf() and the BCCHs of 6 surrounding cells at 28 dBμVemf(). The BCCH of the serving cell indicates these BCCHs, but not the BCCH of the serving cell. The ARFCN of the serving cell BCCH is chosen so as not to interfere with the other channels as shown in table 21.5-2. The fading profile for the BCCHs of the serving and surrounding cells will be set to static.

After 30 s, a call is set up according to the generic call set up procedure for multislot HSCSD to an ARFCN, within the supported band of operation. The SACCH indicates the same surrounding cell BCCHs as the BCCH of the serving cell.

SS commands the MS to operate in the multislot class with maximum number of bidirectional channels.

NOTE: The 30 s is to allow the MS to scan and find all BCCHs.

21.5.1.4.2 Procedure

- a) The levels of the TCH and BCCHs are set according to table 21.5-2 step 1. The SS waits 20 s before continuing. Same TCH levels are set to all multislot subchannels.

Table 21.5-2: Signal levels at receiver input in dBμVemf()

| Step | ARFCN GSM900: DCS1800 | TCH 1 512 | BCCH1 62 700 | BCCH2 124 885 | BCCH3 20 585 | BCCH4 40 660 | BCCH5 80 790 | BCCH6 100 835 |
|---------|-----------------------------|-----------------|--------------------|---------------------|--------------------|--------------------|--------------------|---------------------|
| | Multiband | 1 | 885 | 62 | 124 | 40 | 100 | 512 |
| 1+m*21 | | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 | 64,5-m*10 |
| 2+m*21 | | 54,5-m*10 | 63,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 | 54,5-m*10 |
| 3+m*21 | | 54,5-m*10 | 62,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 17+m*21 | | 54,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 18+m*21 | | 44,5-m*10 | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| . | | . | . | . | . | . | 44,5-m*10 | 44,5-m*10 |
| 21+m*21 | | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 | 44,5-m*10 |

m = 0, 1, 2, 3, 4.

- b) The measurement is done in 105 steps. The initial signal levels of each multislot TCH of the serving cell and the BCCHs of the surrounding cells are adjusted according to table 21.5-2. At each step the SS keeps the signal levels stable for one reporting period, except at steps 21+m*21 where the level is held stable for 1,75 reporting periods. The RXLEV value for the period in which the change occurs (reported in the following period) is discarded. The SS records the RXLEV values reported for the surrounding cell BCCHs in steps 1 + m * 21 and 21 + m * 21. The RXLEV values for BCCH 1 are recorded by the SS for all 105 steps.

NOTE: This extension at steps 21+m*21 is to allow an extra quarter reporting period for the MS to stabilize for steps 1+m*21.

At steps 1 to 30 the SS simulates a base station with DTX off and at steps 31 to 105 the SS simulates a base station with DTX on.

At steps 1 to 30 the SS checks the accuracy of the measured signal strength of TCH by checking the values of the parameters RXLEV_FULL and RXLEV_SUB. At steps 31 to 105 the SS shall check only the value of the parameter RXLEV_SUB.

At step 64, within every 480 ms reporting period, out of the 4 SACCH and 8 SID timeslots the SS transmits the first six active timeslots of the TCH with signal level 39,5 dBμVemf() and the last six active timeslots of the TCH with signal level 29,5 dBμVemf().

- c) The SS sets signal levels for all multislot subchannels and BCCH as in step 50 of the table 21.5-2. The SS lowers the signal level on one of the subchannels in 6 steps of 1 dB. This is repeated on all subchannels. The SS simulates a base station with DTX off.
- d) Steps b) and c) are repeated under extreme conditions (annex 1, TC2,2 and TC3).

21.5.1.5 Test requirements

21.5.1.5.1 Relative accuracy of measurements on different ARFCN

For normal and each of the 4 extreme conditions for all multislot subchannels tested the following applies;

- a) For each of the steps 1, 21, 22, 42, 43, and 64, of the at least 7 (depending on the multislot class the MS is capable) reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 4 if the measurements are on the same or on different RF channel within the same frequency band and no more than 8 (12 for extreme temperature conditions) if the measurements are on different frequency bands.

- b) For each of the steps 63 and 85, of the at least 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 for small MS and DCS 1 800 MS or 4 for other MS if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 for small MS and DCS 1 800 MS or 8 for other MS (13 and 12 for extreme temperature conditions) if the measurements are on different frequency bands.
- c) For step 84, of the at least 7 reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 5 if the measurements are on the same or on different RF channel within the same frequency band and no more than 9 (13 for extreme temperature conditions) if the measurements are on different frequency bands.
- d) For step 105, of the reported RXLEV values checked, the difference between the minimum reported RXLEV value and the maximum reported RXLEV value shall be no more than 6 if the measurements are on the same or on different RF channel within the same frequency band and no more than 10 (14 for extreme temperature conditions) if the measurements are on different frequency bands.

NOTE: It is not mandatory for the MS to report any of the BCCHs in step 105.

21.5.1.5.2 Relative accuracy at a single frequency (BCCH1)

For normal and each of the 4 extreme conditions tested the following applies;

For $n \leq 21$ and $RXLEV_1 = 63$

$RXLEV_n - (63 - n + r)$ shall be between:

-2 and +2

NOTE: This formula allows for an MS with an absolute accuracy worse than +0,5 dB and therefore reporting an RXLEV of 63 for more than one step. The formula checks the relative accuracy from the lowest input level for which the MS last reports RXLEV of 63.

Otherwise

$RXLEV_{(m*21+1)} - RXLEV_{(m*21+n)} - n + 1$ shall be between:

-2 and +2

for steps 2 to 62 and 65 to 71 for DCS 1 800 class 1/2 MS; or steps 2 to 62 and 65 to 73 for DCS 1 800 class 3 and Small GSM MS; or 2 to 75 for other MS.

-3 and +2

for steps 63 and 72 to 96 for DCS 1 800 class 1/2 MS; or steps 63 and 74 to 98 for DCS 1 800 class 3 and Small GSM MS; or 76 to 100 for other MS.

-4 and +2

for steps 97 to 105 for DCS 1 800 class 1/2 MS; or steps 99 to 105 for DCS 1 800 class 3 and Small GSM MS; or 101 to 105 for other MS.

where: $1 < n \leq 21$ and $0 \leq m \leq 4$ as identified in table 21-2, and r is the number of the last step where RXLEV of 63 was reported.

NOTE: It is not mandatory for the MS to report BCCH1 for steps greater than 99 for GSM 900 Small MS or 101 for other GSM MS or 97 for a DCS 1 800 Class 1 or Class 2 MS and 99 for DCS 1 800 Class 3 MS. If the MS reports a level and the upper limit for this step in the above formulae implies a level below the reference sensitivity level for the type of MS, then the upper limit shall be considered as equal to a value corresponding to the reference sensitivity level.

21.5.1.5.3 Absolute accuracy

For each BCCH reported, $|RXLEV_{MS} + m * 10 - 62|$ shall be no more than:

- 4 for steps 64 and 85 under normal conditions.
- 6 for steps 64 and 85 under extreme conditions.
- 6 for steps 1, 22 and 43 under normal and extreme conditions.

where: $0 \leq m \leq 4$ as identified in table 21.5-2.

21.5.1.5.4 Relative accuracy of measurements of different subchannel

In step c) the RXLEV values reported for all subchannels are checked, allowing +/- 2 dB relative accuracy. Reporting shall be independent on all bidirectional subchannels.

22 Transmit power control timing and confirmation

22.1 Transmit power control timing and confirmation, single slot

22.1.1 Definition and applicability

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS_TXPWR_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS.

22.1.2 Conformance requirement

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; GSM 05.08, 4.2.
2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; GSM 05.08, 4.2.
3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; GSM 05.08, 4.7.
4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; GSM 05.08, 4.7.
5. In case of channel change the commanded power level shall be applied on the new channel immediately; GSM 05.08, 4.7.

22.1.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.
2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.
3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.
4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.
5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

22.1.4 Method of test

NOTE: The method of measuring the MS transmitter output power is given in section 13.3.

22.1.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure on a channel with ARFCN in the Mid ARFCN range (ref. table 3.3), power control level set to maximum power.

22.1.4.2 Procedure

- a) The SS signals minimum power control level to the MS in the SACCH.
- b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.
- d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- e) The SS now sets the SACCH TXPWR to 8.
- f) After 3 s the SS sets the SACCH TXPWR to 9.
- g) The SS measures the MS transmitter output power on TDMA frame 6.
- h) The SS sets the SACCH TXPWR to 8.
- i) The SS measures the MS transmitter output power on TDMA frame 6.
- j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.
- k) When the MS has changed channel its output power is measured on the first burst on the new channel.

22.1.5 Test requirements

NOTE: Refer to tables 13-2 , 13-3 and 13-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

- a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.
- b) In steps b) and d), the value of the MS_TXPWR_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.
- c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.
- d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

22.2 Transmit power control timing and confirmation in HSCSD multislot configurations

22.2.1 Definition and applicability

The RF power level to be employed by the MS is indicated by means of the 5 bit TXPWR field sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block.

When a power change is signalled the MS must change its power control level to the new level at a certain rate of change.

The MS shall confirm the power level that it is currently employing by setting the MS_TXPWR_CONF field in the uplink SACCH L1 header.

The requirements and this test apply to all types of GSM 900 and DCS 1 800 MS and multiband GSM 900 / DCS 1800 MS which are capable of HSCSD multislot operation.

22.2.2 Conformance requirement

1. The RF power control level to be employed by the MS is indicated by means of the power control information sent in the layer 1 header of each downlink SACCH message block and may be sent in a dedicated signalling block; GSM 05.08, 4.2.
2. The MS shall confirm the power level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the MS for the last burst of the previous SACCH period; GSM 05.08, 4.2.
3. Upon receipt of a command on the SACCH to change its RF power level, the MS shall change to the new level at a rate of one nominal 2 dB power control step every 60 ms; GSM 05.08, 4.7.
4. The change (in conformance requirement 3) shall commence at the first TDMA frame belonging to the next reporting period; GSM 05.08, 4.7.
5. In case of channel change the commanded power level shall be applied on the new channel immediately; GSM 05.08, 4.7.

22.2.3 Test purpose

1. To verify that the MS will set its transmitter output power in accordance with conformance requirement 1.
2. To verify that the MS will confirm the power level it is currently employing according to conformance requirement 2.
3. To verify that the MS, upon receipt of a command from the SACCH to change its RF power level, will change according to conformance requirement 3.
4. To verify that the MS will commence the change of power level at least by the sixth TDMA frame belonging to the next reporting period.
5. To verify that in case of new channel assignment the commanded power level is applied on the new channel according to conformance requirement 5.

22.2.4 Method of test

NOTE: The method of measuring the MS transmitter output power is given in section 13.3.

22.2.4.1 Initial conditions

A call is set up by the SS according to the generic call set up procedure for multislot configuration on a channel with ARFCN in the Mid ARFCN range (ref. table 3.3), power control level set to maximum power.

The SS commands the MS to operate in multislot configuration where it has highest possible number of Tx slots.

22.2.4.2 Procedure

- a) The SS signals minimum power control level to the MS in the SACCH for one of the subchannels.
- b) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- c) The SS now sets TXPWR in the SACCH to the maximum peak power appropriate to the class of the MS.
- d) The SS measures the MS transmitter output power on TDMA frames 6, 19, 32 and every subsequent 13th TDMA frame to TDMA frame 214. The SS also monitors the MS_TXPWR_CONF field in the uplink SACCH L1 header for the four SACCH multiframes after the SS signals the power change.
- e) The SS now sets the SACCH TXPWR to 8.
- f) After 3 s the SS sets the SACCH TXPWR to 9.
- g) The SS measures the MS transmitter output power on TDMA frame 6.
- h) The SS sets the SACCH TXPWR to 8.
- i) The SS measures the MS transmitter output power on TDMA frame 6.
- j) The channel assignment is changed and the demanded power within the channel assignment is set to the minimum power control level of the MS.
- k) When the MS has changed channel its output power is measured on the first burst on the new channel.
- l) Steps a) to k) are repeated on the next subchannel until each is tested.

22.2.5 Test requirements

NOTE: Refer to tables 13-2, 13-3 and 13-4 for relationship between the power class, power control level, transmitter output power and the relevant tolerances.

- a) In steps b) and d), the transmitter output power shall change by one power step towards the new level signalled for each measured burst until the MS is operating at the closest supported power control level and from then on, all transmissions shall be at that level.
- b) In steps b) and d), the value of the MS_TXPWR_CONF field in the uplink SACCH L1 header shall correspond to the actual power control level used for the last transmitted burst of the previous SACCH multiframe. The first one shall indicate the initial transmitted power control level, the subsequent ones shall change by 8 each time until the final power control level has been reached in which case that value shall be indicated.
- c) In steps g) and i) the transmitter output power of TDMA frame 6 shall correspond to the new commanded power control level.
- d) In step k) the MS output power, measured on the new channel shall correspond to the power control level in the channel assignment.

22.3 GPRS Uplink Power Control – Use of α and Γ_{CH} parameters

22.3.1 Definition and applicability

Power control is important for spectrum efficiency as well as for power consumption in a cellular system. Power control for a packet oriented connection is more complicated than for a circuit switched connection, since there is no continuous two-way connection.

The RF output power, P_{CH} , to be employed by the MS on each individual uplink PDCH shall be:

$$P_{CH} = \min(\Gamma_0 - \Gamma_{CH} - \alpha * (C + 48), P_{MAX}),$$

Where

| | |
|------------------|--|
| Γ_{CH} | is an MS and channel specific power control parameter, sent to the MS in an RLC control message (see GSM 04.60). |
| Γ_0 | = 39 dBm for GSM900 = 36 dBm for DCS1800 |
| α | is a system parameter, broadcast on PBCCH or optionally sent to MS in an RLC control message (see GSM 04.08 and 04.60). |
| C | is the normalised received signal level at the MS as defined in GSM 05.08, 10.2.3.1. |
| P _{MAX} | is the maximum allowed output power in the cell = GPRS_MS_TXPWR_MAX_CCH if PBCCH exists MS_TXPWR_MAX_CCH otherwise |

All power values are expressed in dBm. (Note that the constants Γ_0 and 48 are included only for optimising the coding of Γ_{CH} and C-value).

This is a flexible tool that can be used for different power control algorithms.

A pure open loop is achieved by setting $\alpha = 1$ and keeping Γ_{CH} constant. With this method the output power is based on the received signal level assuming the same path loss in uplink and downlink. This is useful in the beginning of a packet transmission.

A pure closed loop is achieved by setting $\alpha = 0$. With this method the output power is commanded by the network based on received signal level measurements made in the BTS in a similar way as for a circuit switched connection.

This test applies to all GSM900 and DCS1800 which support GPRS.

22.3.2 Conformance requirement

1. The MS shall use the same output power on all four bursts within one radio block. GSM 05.08, 10.2.1.
2. If a calculated output power is not supported by the MS, the MS shall use the supported output power which is closest to the calculated output power. GSM 05.08, 10.2.1.
3. When the MS receives new Γ_{CH} or α values, the MS shall use the new value to update P_{CH} 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value. GSM 05.08, 10.2.1.
4. The transmitted power shall be a monotonic function of the calculated output power and any change of 2 dB in the calculated value shall correspond to a change of 2 ± 1.5 dB in the transmitted value. The

MS may round the calculated output power to the nearest nominal output power value. GSM 05.08, 10.2.1.

22.3.3. Test purpose

1. To verify the MS uses that the same output power on all four bursts of a radio block under normal conditions.
2. To verify that the highest power supported by the MS is used if the calculated power is greater.
3. To verify that the MS applies new Γ_{CH} or α values 2 radio blocks after the end of the frame containing the last timeslot of the message block containing the new value.
4. To verify that any change of 2dB in the calculated power corresponds to a change of 2 ± 1.5 dB in the transmitted value under normal conditions.

NOTE: For changes in calculated power which are less than the tolerances specified for absolute power accuracy in a MS, the transmitted power as a function of calculated power cannot be tested for monotonicity. Monotonicity between power control steps is implicitly tested in section 13.16.

22.3.4 Method of test

22.3.4.1 Initial conditions

The SS establishes a BCCH and a PBCCH on the same carrier in the mid ARFCN range. GPRS_MS_TXPWR_MAX_CCH is set to the maximum level (39dBm for GSM and 36dBm for DCS). The Γ_{CH} value is set such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the Power Class of the MS under test. The α value is set to 0.

The MS and the SS establish an uplink TBF on the same ARFCN as the BCCH and PBCCH. The downlink power level is adjusted until a stable C-value of -52dBm is reported by the MS in the channel quality report (see GSM 05.08, 10.2.3).

22.3.4.2 Procedure

- a) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block.

The method of power measurement is described in section 13.16.

- b) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (5dBm for GSM900 and 0dBm for DCS1800). If the transmission of the RLC control message containing the new Γ_{CH} value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- c) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the power class of the MS under test. If the transmission of the RLC control message containing the new Γ_{CH} value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- d) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the value 4dB below the maximum power control level supported by the power class of the MS under test. The α value is set to 1.
- e) The SS shall decrement the α value with a step size of 0.1 until α equals 0. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- f) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step e). The SS shall then calculate the maximum and minimum

changes in output power measured for the following pairs of α values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .

NOTE

If the power values measured for the four bursts of the radio block with α equal to 1.0 are:

$$P_{m0}, P_{m1}, P_{m2}, P_{m3}$$

And, the power values measured for the four bursts of the radio block with α equal to 0.5 are:

$$P_{n0}, P_{n1}, P_{n2}, P_{n3}$$

Then,

$$P_{m(max)} = \text{MAX}(P_{m0}, P_{m1}, P_{m2}, P_{m3})$$

$$P_{m(min)} = \text{MIN}(P_{m0}, P_{m1}, P_{m2}, P_{m3})$$

$$P_{n(max)} = \text{MAX}(P_{n0}, P_{n1}, P_{n2}, P_{n3})$$

$$P_{n(min)} = \text{MIN}(P_{n0}, P_{n1}, P_{n2}, P_{n3})$$

The maximum and minimum step sizes are:

$$\text{STEP(MAX)} = P_{m(max)} - P_{n(min)}$$

$$\text{STEP(MIN)} = P_{m(min)} - P_{n(max)}$$

- g) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the midrange power control level supported by the MS under test. The α value is set to 0.
- h) The SS shall increment the α value with a step size of 0.1 until α equals 1. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- i) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step h). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of α values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .
- j) The SS shall modify the Γ_{CH} value such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (5dBm for GSM900 and 0dBm for DCS1800). The α value is set to 0.
- k) The SS shall increment the α value with a step size of 0.1 until α equals 1. For each step change in α value, if the transmission of the RLC control message containing the new α value is completed in radio block N, the SS shall trigger a transmitter output power measurement on each of the four bursts of radio block N+3.
- l) For each value of α , the SS shall note the maximum and minimum power values measured from the four bursts of the radio block in step k). The SS shall then calculate the maximum and minimum changes in output power measured for the following pairs of α values: 1.0 and 0.5; 0.9 and 0.4; 0.8 and 0.3; 0.7 and 0.2; 0.6 and 0.1; 0.5 and 0. The maximum change is calculated by subtracting the

minimum power measured from the smaller value of α from the maximum power measured for the larger value of α . The minimum step change is calculated by subtracting the maximum power measured from the smaller value of α from the minimum power measured for the larger value of α .

22.3.5 Test requirements

1. The power of all four bursts within the radio block measured in step a) and c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table:

| Power class | GSM 900 Nominal Maximum output power | DCS 1 800 Nominal Maximum output power | Tolerance (dB) for normal conditions |
|-------------|---|---|--|
| 1 | ----- | 1 W (30 dBm) | ± 2 |
| 2 | 8 W (39 dBm) | 0.25 W (24 dBm) | ± 2 |
| 3 | 5 W (37 dBm) | 4 W (36 dBm) | ± 2 |
| 4 | 2 W (33 dBm) | | ± 2 |
| 5 | 0.8 W (29 dBm) | | ± 2 |

2. The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM900 MS and 0dBm for a DCS1800 MS with an accuracy of ± 5 dB in both cases.
3. In steps f), i) and l), the maximum change in transmitted power between each identified pair of α values shall be 3.5dB.
4. In steps f), i) and l), the minimum change in transmitted power between each identified pair of α values shall be 0.5dB.

22.4 GPRS Uplink Power Control – Independence of TS Power Control

22.4.1 Definition and applicability

This test applies to all GSM900 and DCS1800 MS which support multislot GPRS on the uplink.

22.4.2 Conformance requirement

For a GPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH. GSM 05.08, 10.2.1.

22.4.3 Test purpose

To verify that for a GPRS multislot MS supporting 2 or more uplink PDCHs, power control shall be employed by the MS on each individual uplink PDCH.

22.4.4 Method of test

22.4.4.1 Initial conditions

The MS and the SS establish an uplink TBF with the maximum number of TS for the multislot class of the MS. Each TS is transmitting on its maximum power. The α -value is set to 0.

22.4.4.2. Procedure

- a) The SS shall modify the Γ_{CH} value of one TS such that $(\Gamma_0 - \Gamma_{CH})$ equals the minimum power control level supported by the MS under test (5dBm for GSM900 and 0dBm for DCS1800).
- b) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block of the TS under test.
- c) The SS shall trigger a transmitter output power measurement on each of the four bursts of any radio block of the other active TS.
- d) The SS shall modify the Γ_{CH} value for the TS under test such that $(\Gamma_0 - \Gamma_{CH})$ equals the maximum power control level supported by the MS under test.
- e) Steps a) to d) shall be repeated for each TS of the multislot configuration.

22.4.5. Test requirements

1. The power of all four bursts within the radio block measured in step b) shall be 5dBm for a GSM900 MS and 0dBm for a DCS1800 MS with an accuracy of ± 5 dB in both cases.
2. For all TS, the power of all four bursts within the radio block measured in step c) shall be within the accuracies specified for the power class of the mobile under test, as indicated in the following table:

| Power class | GSM 900 Nominal Maximum output power | DCS 1 800 Nominal Maximum output power | Tolerance (dB) for normal conditions |
|-------------|---|---|--|
| 1 | ----- | 1 W (30 dBm) | ± 2 |
| 2 | 8 W (39 dBm) | 0.25 W (24 dBm) | ± 2 |
| 3 | 5 W (37 dBm) | 4 W (36 dBm) | ± 2 |
| 4 | 2 W (33 dBm) | | ± 2 |
| 5 | 0.8 W (29 dBm) | | ± 2 |

23 Single frequency reference

23.1 Definition and applicability

The MS is required to use one single frequency reference for both RF generation/reception and baseband signals. A test method to verify this is not available.

The requirement applies to all types of GSM 900 and DCS 1 800 MS.

23.2 Conformance requirement

The MS shall use the same frequency source for both RF frequency generation and clocking the timebase; GSM 05.10, 6.1.

23.3 Test purpose

There is no test specified.

24 Tests of the layer 1 signalling functions

Testing of Layer 1 signalling functions is included in the tests in sections 15, 16, 17, 18, 19, 20, 21, 22, 23. Other Layer 1 functions are tested in sections 12, 13 and 14. Some testing of Layer 1 functions is integrated with Layer 3 signalling testing (26).

25 Tests of the layer 2 signalling functions

References:

- 1 ETSI ETS 300 555 (GSM 04.06) and ETS 300 557 (GSM 04.08), GSM 04.05.
- 2 CCITT Rec. X.290: OSI Conformance Testing Methodology and Framework for CCITT applications, Part 2: Abstract Test Suite Specification.

25.1 Introduction, objective and scope

25.1.1 General

The objective of section 25 is to provide detail of how Layer 2 of the MS is tested to verify conformance to the testable parameters given in GSM 04.06. The tests cover SAPI = 0, and they will be carried out on SDCCH and FACCH/F and on FACCH/H if the MS supports half-rate. Testing of unnumbered information transfer on SACCHs is covered implicitly by the test in section 26.6.3.

The testing is performed using the test configuration described in section 25.1.1.2. This configuration does not provide for testing of conformance of any maintenance functions.

The MS under test shall conform to the test configuration, and the Remote Single layer (RS) test method (CCITT X.290, section 8.1.4) will be used.

25.1.2 Test configurations

The Layer 2 test configuration defines the Layer 2 functional blocks of a MS being tested and the access arrangement between MS and tester.

NOTE: These functional blocks provide the Layer 2 basic capabilities which have to be implemented in accordance with the specification given in GSM 04.06. However, the definition of Layer 2 in the form of a number of functional blocks places no requirements on the Layer 2 implementation in a MS.

An example of a functional composition of the MS Layer 2 is given in GSM 04.05. These function blocks provide basic capabilities which have to be implemented in accordance with GSM 04.05 and GSM 04.06.

Also there are alternatives or options included in GSM 04.05 and GSM 04.06, these are provided as complementary capabilities.

25.1.3 Pre-conditions

Before carrying out any Layer 2 tests the tests specified in section 12, 13, 14 and 15 to 23 (Layer 1 tests) shall be performed.

Apart from powering up the MS to be tested and being able to establish a call the only access to the MS needed and used for Layer 2 testing is the radio interface. It therefore is necessary that the MS is able to synchronize to the System Simulator and to decode its BCCH and CCCH. Furthermore, the MS must be able to perform the following elementary Layer 3 procedures:

- Paging
- Immediate Assignment
- Dedicated Channel Assignment
- Handover
- Channel Release.

It is necessary that the tests are performed in the order specified, except where the starting point is set (25.1.5).

The data link is maintained by the MS and the SS sending fill frames (c.f. GSM 04.06, sect. 5.4.2.3) on the SDCCH when no other frames are to be transmitted. Fill frames are also sent on the FACCH while the channel mode is set to signalling. The default mode is signalling. The tests will normally be performed with

the MS sending fill frames on the main DCCH (i.e. FACCH or SDCCH). Consequently throughout the tests fill frames will be sent and received even while waiting for other Layer 2 frames. The scheduling of the fill frame sending cannot be specified as this sending is closely linked to the processing times in the MS. Therefore, the instants of transmission of fill frames cannot be tested nor the number of these transmissions however, in certain circumstances, the fact that a fill frame is sent can be used as proof that the MS requirement has been fulfilled.

25.1.4 Layer 2 test frames

The Layer 2 conformance test is accomplished by sequences of those frames which are contained in GSM 04.06 (Layer 2 frame repertoire etc.).

These frame sequences are under control of the System Simulator and are related to the state that the System Simulator perceives the MS to be in as a result of frames transferred across the MS-BS interface.

These frame sequences shall comply with the following rules:

- 1) The test sequences exchanged between the System Simulator and MS are assumed to be free from transmission errors.
- 2) The tester may introduce errors in the direction tester to MS by inserting wrong parameters in the address, control and length indication field.
- 3) The tester may simulate errors in the direction MS to tester by ignoring the receipt of frames from the MS.
- 4) The tester may violate the protocol rules related to the control of state variables to provoke sequence gaps.
- 5) There is no contention on the Dm channel at Layer 1 (Layer 1 point-to-point).
- 6) With respect to contention on the Dm channel at Layer 2, two distinct situations are defined:
 - i) Test of the protocol procedure supported by a single entity. In this case there is no contention on the Dm channel (one peer-to-peer information transfer invoked at a time). This test applies to all MSs and is performed for SAPI = 0.
 - ii) Test of Layer 2 multiplexing and MS processing capacity in terms of the number of SAPs and links which a MS is able to support simultaneously. In this case there is contention on the Dm channel at Layer 2 and this contention is resolved within Layer 2 based on the SAPI. This test applies to MSs which are designed for supporting SAPI in addition to SAPI = 0.

Examples of special GSM Layer 2 functions to be tested:

- Correct L2 functions on specific GSM control channels;
- Length indication;
- Fill bits;
- Segmentation, more data bit;
- SABM/UA containing information for contention resolution;
- Abnormal release.

25.1.5 Establishment of the dedicated physical resource

The System Simulator shall simulate a BS with BCCH/CCCH on one carrier. The MS shall be listening to this CCCH and able to respond to paging messages. The system simulator sends Paging Request to the MS on the paging channel. The MS shall respond with Channel Request on the random access channel. The system simulator sends Immediate Assign to the MS, thereby ordering the MS either to a SDCCH or to a TCH, that is FACCH. Each test is performed once on SDCCH, once on FACCH/F and once on FACCH/H if the MS supports half-rate. However tests that explicitly check SDCCH and FACCH are performed once if the MS does not support half-rate and twice (once with FACCH/F and once with FACCH/H) if the MS supports half-rate.

25.1.6 Release of the dedicated physical resource

After a test has been performed the System Simulator shall initiate the release of the SDCCH or FACCH, as laid out in GSM 04.08, section 7.1.6. This shall return the MS to the idle mode, i.e. the MS shall again be listening to the CCCH of the System Simulator.

25.2 Test sequences

Timing requirement:

The MS shall respond to a command within T200 as defined in GSM 04.06.

The MS shall repeat a command after time-out of T200 if the command has not been acknowledged as defined in GSM 04.06.

Constant bit values:

In each frame from the MS:

- bits 6 through 8 of the address field shall be set to zero as defined in GSM 04.06.
- except for test 25.2.7, the address extension bit (EA bit) shall be set to 1 as defined in GSM 04.06.
- except for test 25.2.7, the length indicator field extension bit (EL bit) shall be set to 1 as defined in GSM 04.06.

This shall be checked each time a frame from the MS is received.

Fill bits:

The fill bits transmitted with each frame from the MS whose length indicator L is less than N201 as defined in GSM 04.06 shall be set as defined in GSM 04.06.

Frame format description

The frames are described by the following parameter sets:

SABM (C, P, M = 0, L = 0) (* SABM without an information field*)
 SABM (C, P, M = 0, L > 0) (* SABM with an information field*)
 DISC (C, P, M = 0, L = 0)
 UA, (F, M = 0, L = 0) (* UA without an information field*)
 UA, (F, M = 0, L > 0) (* UA with an information field*)
 DM (R, F, M = 0, L = 0)
 RR (C, P, M = 0, L = 0, N(R))
 RR (R, F, M = 0, L = 0, N(R))
 REJ (C, P, M = 0, L = 0, N(R))
 REJ (R, F, M = 0, L = 0, N(R))
 I (C, P, M = 0, L < N201, N(S), N(R))
 I (C, P, M = 1, L = N201, N(S), N(R))
 UI (C, P = 0, M = 0, L = 0)
 UI (C, P = 0, M = 0, L < N201)

where:

C = command
 R = response
 P = poll
 F = final
 M = M bit
 L = length indicator
 N(S) = send sequence number
 N(R) = receive sequence number.

25.2.1 Initialization**25.2.1.1 Initialization when contention resolution required****25.2.1.1.1 Normal initialization****25.2.1.1.1.1 Test purpose**

To test the normal establishment of multiple frame operation between the SS and the MS when contention resolution is required.

25.2.1.1.1.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a UA frame.

The MS shall send a UI fill frame.

The SS waits for at least T200 after the UA to ensure the SABM frame is not repeated. This confirms that the UA has been received.

The MS is returned to the idle state as described in 25.1.1.6.

Expected sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM
information field = information field of SABM

25.2.1.1.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, 0 ≤ L ≤ N201
information field = Page Response

3: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

25.2.1.1.2 Initialization failure**25.2.1.1.2.1 Loss of UA frame****25.2.1.1.2.1.1 Test purpose**

To test the MS response to the loss of a Layer 2 UA frame during initialization.

25.2.1.1.2.1.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending an SABM frame.

The SS ignores the first SABM frame from the MS.

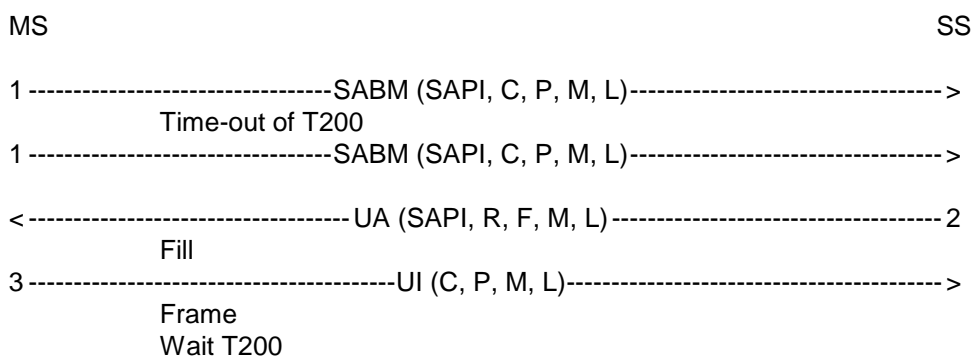

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

The SS responds with a UA frame.

The MS shall send a UI fill frame.

The SS waits for at least T200 to ensure the SABM frame is not repeated

The MS is returned to the initial condition by clearing of the call (not part of this test).

Expected sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM
 information field = information field of SABM

25.2.1.1.2.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$
information field = Page Response

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

3: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

25.2.1.1.2.2 UA frame with different information field**25.2.1.1.2.2.1 Test purpose**

To test that the MS will leave the channel and return to the idle state when multiple frame establishment fails because a UA frame with a different information field is received in response to the SABM frame.

To test that the MS will thereafter repeat the immediate assignment procedure returning to the idle state when multiple frame establishment fails because a UA frame with a different information field is received in response to the SABM frame.

To test that MS will not attempt to perform the immediate assignment procedure after the first repetition.

25.2.1.1.2.2.2 Method of test

The MS is paged as described in the general section for Layer 2 testing in section 25.1.5. The MS is now in a condition to test the Layer 2 aspects of multiple frame establishment with contention resolution and a UA frame with an information field different from the one in its SABM frame.

The MS shall send an SABM frame.

The SS shall respond with an UA frame whose information field is different from the one in the SABM frame.

The MS shall send an SABM frame.

The SS shall respond with an UA frame whose information field is different from the one in the SABM frame.

The SS shall wait for $3 \cdot T200$ to check that the MS does not send any L2 frames other than L2 fill frames on the assigned channel.

After a time equal to $3 \cdot T200$ the SS checks that there are no more Layer 2 frames on the assigned channel, for a period of 1 second.

NOTE 1: Possible fill frames are allowed in order to take into account processing time inside the MS.

NOTE 2: There are no further attempts of immediate assignment procedure after the repetition.

15 seconds after sending the UA frame in response to the repetition of the immediate assignment procedure the SS pages the MS according to 25.2.1.1.1, to make sure that the MS has returned to the idle state.

```

MS                                                                 SS
<-----PAGING REQUEST-----1
2 ----- CHANNEL REQUEST ----->
<-----IMMEDIATE ASSIGNMENT-----3
4 -----SABM (SAPI, C, P, M, L)----->
<----- UA (SAPI, R, F, M, L)-----5
6 ----- CHANNEL REQUEST ----->
<-----IMMEDIATE ASSIGNMENT-----7
8 -----SABM (SAPI, C, P, M, L)----->
<----- UA (SAPI, R, F, M, L)-----9
Wait for at least 3*T200, fill frames may occur.
There are no Layer 2 frames on the assigned channel for 1 second.
The MS is paged 15 seconds after step 9.
MS is in idle state.
<-----PAGING REQUEST-----10
11 ----- CHANNEL REQUEST ----->

```

The frames from the SS will be:

5,9: Two UA frames containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

25.2.1.1.2.2.3 Test requirements

The frames from the MS shall be:

4,8: Two SABM frames containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 < L \leq N201$
 information field = Page Response

25.2.1.1.2.3 Information frame and supervisory frames in response to an SABM frame

25.2.1.1.2.3.1 Test purpose

To test that the MS will ignore receipt of frames other than a UA when received in response to the SABM frame.

25.2.1.1.2.3.2 Method of test

As in 25.2.1.1.2.2, but instead of returning a UA frame the SS will respond with an I frame, RR frame, REJ frame. (So this test will actually be performed 3 times.). The MS shall ignore receipt of the frames sent by the SS and therefore resend its SABM frame after time-out of T200.

Expected Sequence

```

MS                                                                 SS
1 -----SABM (SAPI, C, P, M, L)----->
<----- I, RR, REJ (SAPI, C, P, M, L, N(R), N(S)) -----2
      Time-out of T200
1 -----SABM (SAPI, C, P, M, L)----->

```

The frames from the SS will be:

2: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, $0 \leq L \leq N201$ (arbitrary), N(R), N(S) arbitrary
information field arbitrary

or One RR frame containing:

SAPI = 0, C = 1, P = 1, N(R) arbitrary

or One REJ frame containing:

SAPI = 0, C = 1, P = 1, N(R) arbitrary

25.2.1.1.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$
information field = Page Response

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

25.2.1.1.3 Initialization denial

25.2.1.1.3.1 Test purpose

To test that the MS takes appropriate action if the network side indicates that it can not enter the multiple frame established state.

25.2.1.1.3.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a DM frame.

The SS then waits at least T200 for the MS to transmit.

The MS shall not repeat the SABM frame.

Expected Sequence

The frames from the SS will be:

2: One DM frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

25.2.1.1.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$
information field = Page Response

25.2.1.1.4 Total initialization failure**25.2.1.1.4.1 Test purpose**

To test the MS response to the lack of the system to respond to requests to initialize the data link.

25.2.1.1.4.2 Method of test

The MS is paged as described in the Layer 2 tests general section at 25.1.5.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

This is repeated until the MS has sent the SABM frame six times. The MS shall not send the SABM any more than six times.

The SS continues to send paging messages on the BCCH/CCCH and the test continues as in test 25.2.1.1.1.

Expected Sequence**25.2.1.1.4.3 Test requirements**

The frames from the MS shall be:

1: One SABM frame (occurs six times) containing:

SAPI = 0, C = 0, P = 1, M = 0, $\leq L \leq N201$
information field = Page Response

The subsequent SABM frames shall follow the previous SABM frame after time-out of timer T200.

25.2.1.2 Initialization, contention resolution not required

This procedure is used after a data link has been established with contention resolution and a new data link is established on a new channel e.g. handover, dedicated channel assignment.

25.2.1.2.1 Normal initialization without contention resolution**25.2.1.2.1.1 Test purpose**

To test the normal initialization of multiple-frame operation when contention resolution is not required.

25.2.1.2.1.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign an SDCCH.

The MS shall then continue the setup by sending a SABM frame without contention resolution.

The SS responds with a UA frame.

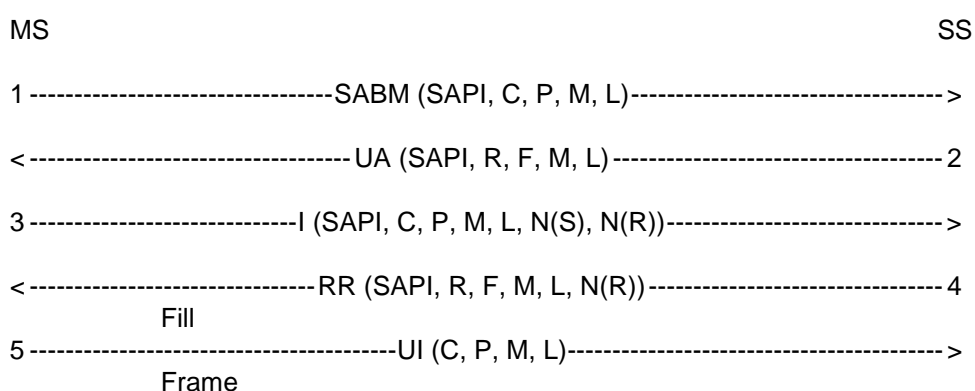

The MS shall then send an I frame containing the assignment complete message.

The SS shall acknowledge the I frame with an RR frame.

The SS then waits for the MS to send a UI fill frame.

The SS then initiates the dedicated channel assignment procedure to assign an FACCH.

The expected sequence is then repeated. The SS waits for at least T200 to ensure that the SABM is not repeated.

Expected Sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

4: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1

25.2.1.2.1.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 0
Information field = Assignment Complete

5 One UI frame containing:

C = 0, P = 0, M = 0, L = 0

25.2.1.2.2 Initialization failure**25.2.1.2.2.1 Test purpose**

To test the MS response to the loss of a Layer 2 UA frame during initialization.

25.2.1.2.2.2 Method of test

The SS initiates the dedicated channel assignment procedure to assign an SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

The SS responds with a UA frame.

The MS shall then send an I frame containing the assignment complete message.

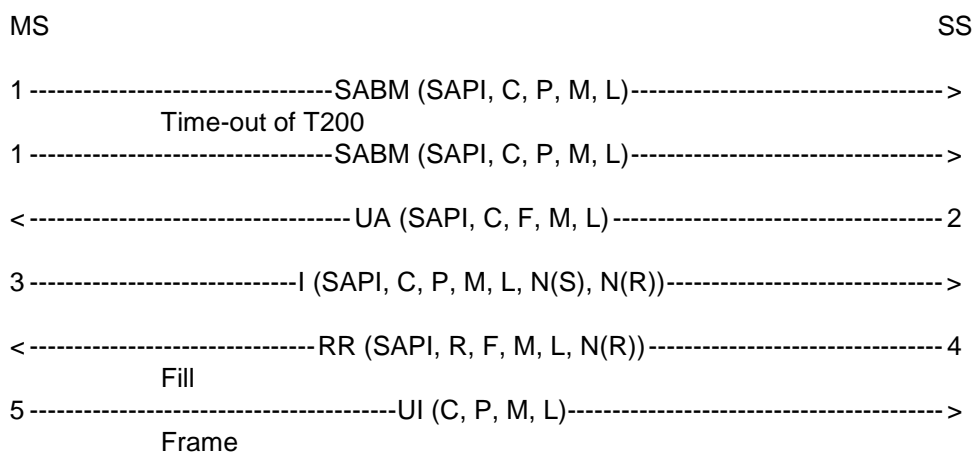

The SS shall acknowledge the I frame with an RR frame.

The SS then waits for the MS to send a UI fill frame.

The SS then initiates the dedicated channel assignment procedure to assign a FACCH.

The expected sequence is then repeated. The SS waits for at least T200 to ensure that the SABM is not repeated.

The MS is returned to the idle state as described in 25.1.1.6.

Expected Sequence

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

4: One RR frame containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1

25.2.1.2.2.3 Test requirements

The frames from the MS shall be:

1: One SABM frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

The second SABM frame shall follow the first SABM frame after time-out of timer T200.

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 0
Information field = Assignment Complete

5: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

25.2.1.2.3 Initialization denial**25.2.1.2.3.1 Test purpose**

To test that the MS takes appropriate action if the data link can not be initialized if the network side indicates the Layer 3 process is busy.

25.2.1.2.3.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign a SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS responds with a DM frame.

The SS then waits at least T200.

The MS shall not repeat the SABM frame. However the MS will attempt to re-establish the link on the previous channel.

The test is repeated, but a FACCH is assigned in place of the SDCCH.

Expected Sequence

The frames from the SS will be:

2: One DM frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

25.2.1.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

25.2.1.2.4 Total initialization failure

25.2.1.2.4.1 Test purpose

To test the MS response to the lack of the system to respond to requests to initialize the data link.

25.2.1.2.4.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

After the MS has sent the UI frame the SS initiates the dedicated channel assignment procedure to assign a SDCCH.

The MS shall then continue the setup by sending a SABM frame.

The SS ignores the first SABM frame from the MS.

The MS shall wait for time-out of timer T200 and then send a second SABM frame.

This is repeated until the MS has sent the SABM frame six times.

The MS shall not send the SABM any more than six times.

The test is repeated, but a FACCH is assigned in place of the SDCCH.

Expected Sequence**25.2.1.2.4.3 Test requirements**

The frames from the MS shall be:

1: One SABM frame (occurs six times) containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

The subsequent SABM frames shall follow the previous SABM frame after time-out of timer T200.

25.2.2 Normal information transfer**25.2.2.1 Sequence counting and I frame acknowledgements****25.2.2.1.1 Test purpose**

To test the operation of Layer 2 sequence numbering. Since there are 8 sequence numbers the test cycles through 9 information frame transfers.

25.2.2.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall acknowledge this I frame with an Identity Response I frame or a RR frame.

This is repeated a further 8 times as rapidly as possible assuming a window size 1.

The MS Layer 3 response time should be less than 4*T200 and therefore the MS responses to at least the 5th, 6th, 7th, 8th and 9th I frames must be an I frame on the SDCCH. On the FACCH it is possible that all MS responses at Layer 2 will be RR frames.

The frames from the SS will be:

1,3,5,7,9,11,13,15,17: One I frame (occurs nine times) containing:

$SAPI = 0, C = 1, P = 0, M = 0, 0 \leq L \leq N201$

$N(S) = 0, 1, 2, 3 \dots 7, 0$

$N(R) = (\text{number of I frames received in the test sequence hitherto}) \bmod 8$

information field = Identity Request (IMEI)

19, 21, and so on, until the SS has received 9 I frames from the MS: One RR frame containing:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0$

$N(R) = (\text{number of I frames received in the test sequence hitherto}) \bmod 8$

25.2.2.1.3 Test requirements

There shall be an integer $k \geq 0$ such that for $i = 1, 2, \dots, k + 9$ the following conditions (a) and (b) both hold:

(a) The MS sends 9 I frames and k RR frames during the test.

(b) The frames sent by the MS in step 2^i are:

(b1) If the frame is an RR frame (occurs k times): one RR frame containing:

$SAPI = 0, R = 1, F = 0, M = 0, L = 0$

$N(R) = ((\text{Value of } N(S) \text{ in the last received I frame from the SS}) + 1) \bmod 8$

(b2) If the frame is an I frame (occurs 9 times): one I frame containing:

$SAPI = 0, C = 0, P = 0, M = 0, 0 \leq L \leq N201$

$N(R) = ((\text{Value of } N(S) \text{ in the last received I frame from the SS}) + 1) \bmod 8$

$N(S) = (\text{number of I frame sent hitherto by the MS to SS excluding the actual I frame}) \bmod 8$

information field = Identity Response (IMEI)

Example of expected sequence (assuming $3 \times T_{200} < L_3$ reaction time $< 4 \times T_{200}$):

| MS | SS |
|---|----|
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 1 |
| 2-----RR (SAPI, R, M, L, N(R), F)-----> | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 3 |
| 4-----RR (SAPI, R, M, L, N(R), F)-----> | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 5 |
| 6-----RR (SAPI, R, M, L, N(R), F)-----> | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 7 |
| 8-----RR (SAPI, R, M, L, N(R), F)-----> | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 9 |
| 10-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 11 |
| 12-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 13 |
| 14-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 15 |
| 16-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 17 |
| 18-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----RR (SAPI, R, M, L, N(R), F)----- | 19 |
| 20-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----RR (SAPI, R, M, L, N(R), F)----- | 21 |
| 22-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----RR (SAPI, R, M, L, N(R), F)----- | 23 |
| 24-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----RR (SAPI, R, M, L, N(R), F)----- | 25 |
| 26-----I (SAPI, C, P, M, L, N(S), N(R))-----> | |
| <-----RR (SAPI, R, M, L, N(R), F)----- | 27 |

The frames from the SS will be:

1, 3, 5, 7, 9, 11, 13, 15, 17: One I frame (occurs nine times) containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$
 N(S) = 0, 1, 2, 3...7, 0
 N(R) = 0, 0, 0, 0, 0, 1, 2, 3, 4
 information field = Identity Request (IMEI)

19, 21, 23, 25, 27: One RR frame (occurs five times) containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0
 N(R) = 5, 6, 7, 0, 1

The frames from the MS shall be:

2, 4, 6, 8: One RR frame (occurs four times) containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0
 N(R) = 1, 2, 3, 4

10, 12, 14, 16, 18, 20, 22, 24, 26: One I frame (occurs nine times) containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$
 N(R) = 5, 6, 7, 0, 1, 1, 1, 1, 1
 N(S) = 0, 1, 2, 3, 4, 5, 6, 7, 0
 information field = Identity Response (IMEI)

25.2.2.2 Receipt of an I frame in the timer recovery state

25.2.2.2.1 Test purpose

To test that the MS is able to respond to I frames whilst in the timer recovery state.

25.2.2.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall respond with a RR frame though this may be incorporated with the Identity Response I frame.

The SS does not respond to the I frame.

The MS shall wait for expiry of timer T200 and then repeat the I frame but with the P bit set to 1.

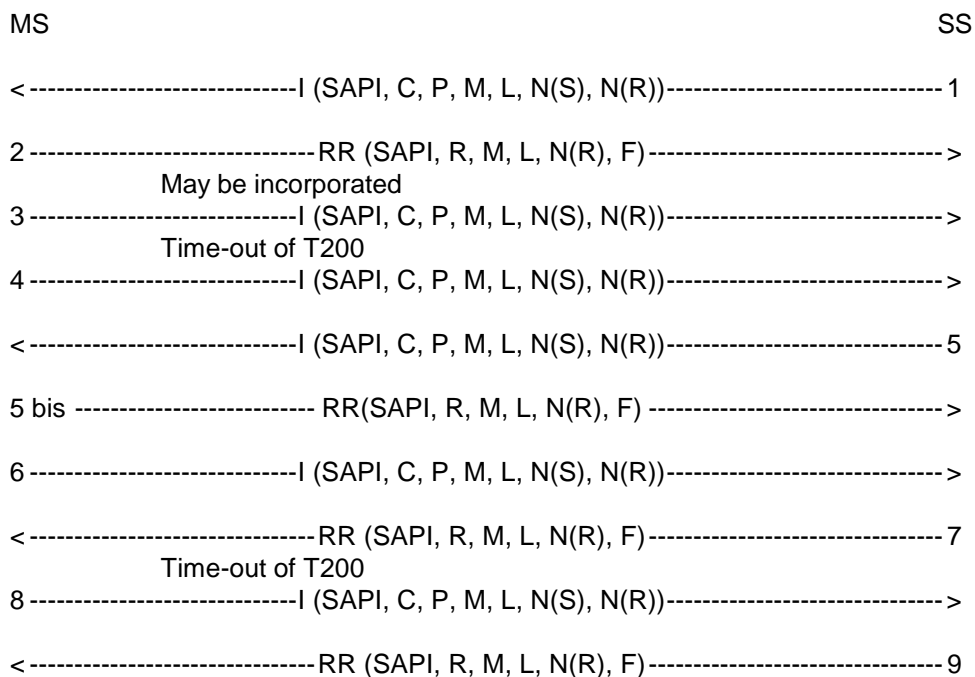

The SS then sends a valid Identity Request I frame asking for IMEI which does not acknowledge receipt of the I frame from the MS.

On the FACCH the MS may send an RR frame acknowledging the I frame.

The MS shall repeat the I frame, this frame will acknowledge receipt of the second I frame from the SS.

The SS then acknowledges receipt of the MS I frame by sending a RR frame.

The MS shall send the next I frame. The SS acknowledges this I frame.

Expected Sequence

The frames from the SS will be:

1, 5: One I frame (occurs twice) containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, 1, N(R) = 0
information field = Identity Request

7, 9: One RR frame (occurs twice) containing:

SAPI = 0, R = 0, F = 1, 0, M = 0, L = 0, N(R) = 1, 2

25.2.2.2.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

3, 8: One I frame (occurs twice) containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(R) = 1, 2, N(S) = 0, 1
information field = Identity Response

4, 6: One I frame (occurs twice) containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$, N(R) = 1, 2, N(S) = 0
information field = Identity Response

5 bis: (possible only on the FACCH) One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 2

25.2.2.3 Segmentation and concatenation

25.2.2.3.1 Test purpose

To test the proper use of segmentation and concatenation, suspend and resume.

25.2.2.3.2 Method of test

If the MS supports the UnStructuredSSData operation, then the MS is made to activate an unknown supplementary service as defined in GSM 02.30 with the following sequence *NN*si#: NN is chosen to be undefined in GSM 02.30 annex 2 and is an IA5. Total length of *NN*si# shall be 20 characters.

If the MS does not support the UnStructuredSSData operation, then the MS is made to initiate a call.

The SS responds with the Immediate Assign procedure firstly allocating a SDCCH and on the second repeat of the test a TCH.

The MS is brought into the multiple frame established state by continuing as described in test 25.2.1.1.1. The layer three message element in the SABM will be CM Serv Request.

The SS sends the UA and waits for 10 s. The SS then sends an I frame with CM Serv Accept.

The MS sends either:

- a REGISTER message which is segmented between two I frames;
- or
- a SETUP message.

The SS shall acknowledge only the I frame with more bit set to 1 (if any) but it shall not acknowledge the I frame with more bit set to 0.

The SS then performs a handover (in the case of SDCCH this shall be finely synchronized) while still on the assigned channel and without acknowledging the last I frame of the MS layer 3 message, making sure to fill the handover command to more than 21 octets (for example by using the cell channel description element).

On the SDCCH the MS will go into timer recovery and resend the last I frame of the layer 3 message with the P bit set to 1 when it acknowledges the two I frames of the handover command. On the FACCH the MS may simply acknowledge both I frames.

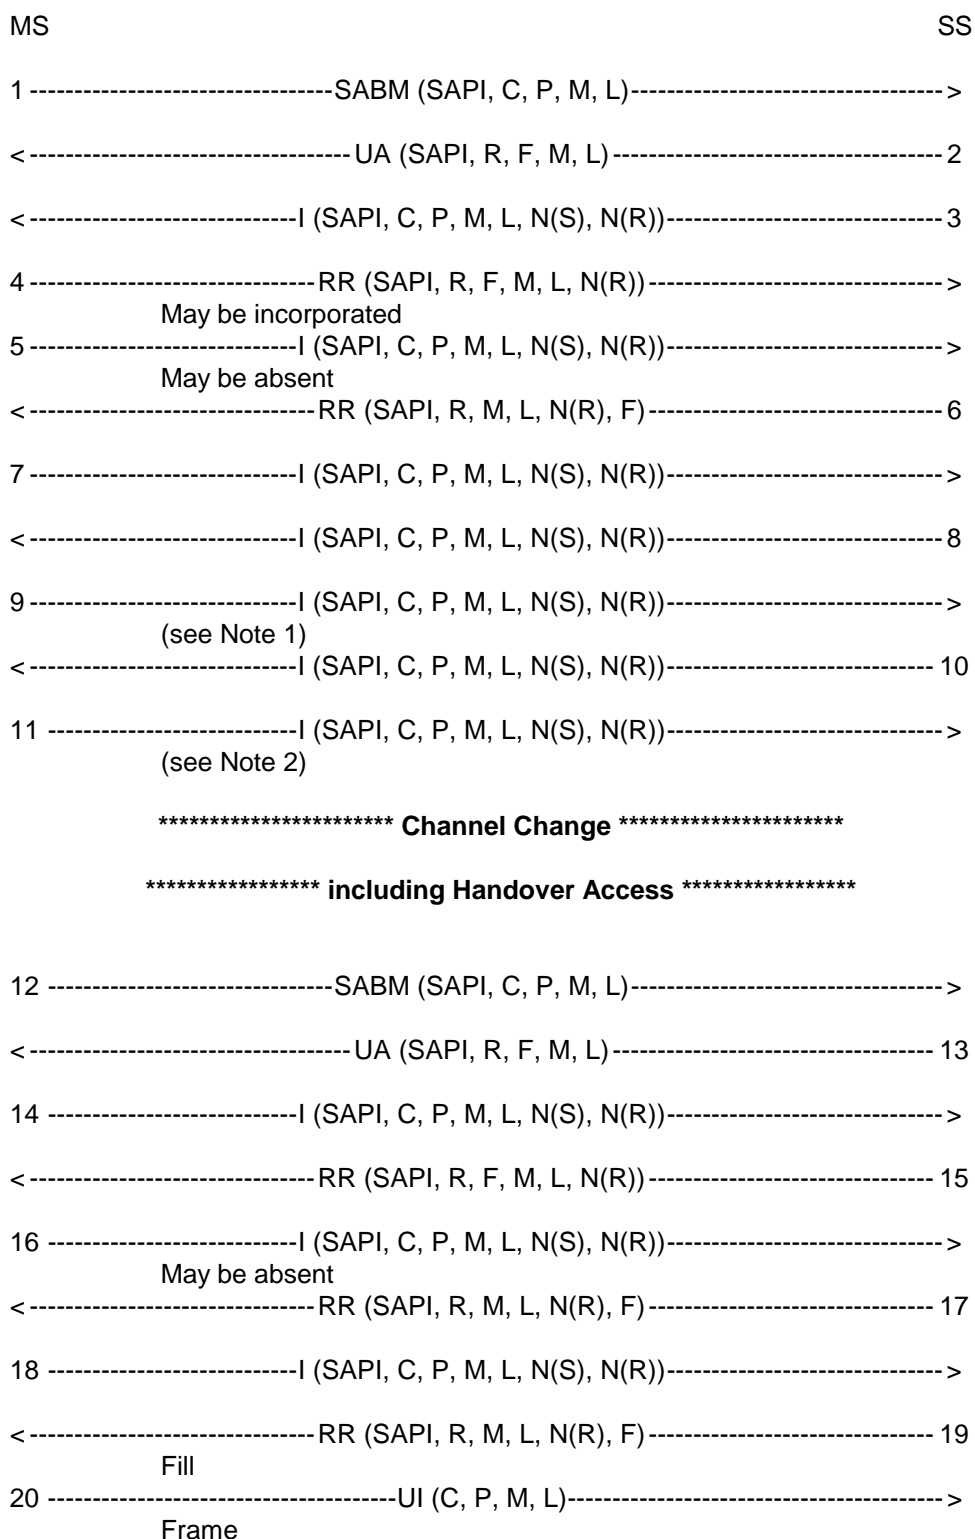

The MS does not attempt to resend the last I frame of the REGISTER or SETUP message on the old channel but instead goes to the new channel where it performs a random access using the Handover Access message and then multiple frame establishment without contention resolution as described in test 25.2.1.2.1.

The MS shall then send an I frame with the Handover complete message. Assuming this is a finely synchronized handover.

The SS acknowledges this I frame.

The MS shall then resend the previous REGISTER or SETUP message, that is all frames which are acknowledged in the usual way.

The test has to be repeated on the FACCH.

Expected Sequence

NOTE 1: The MS may send RR frames on the FACCH in addition to the I frames in 9 and 11.

NOTE 2: The I frame in 11 is optional.

The frames from the SS will be:

2: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = L of SABM
information field = information field of SABM

3: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 < L < N201$, N(S) = 0, N(R) = 0
information field = CM Service Accept

6: One RR frame containing: (This frame is sent only if frame 5 was received)

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1

8, 10: Two I frames containing:

SAPI = 0, C = 1, P = 0, M = 1, 0, L = N201, $\leq N201$, N(S) = 1, 2, N(R) = 1 or 0
information field = Handover

13: One UA frame containing:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

15, 17, 19: Two or three RR frames containing:

SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1, 2 or 1, 2, 3

25.2.2.3.3 Test requirements

The frames from the MS shall be:

1: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$
information field = CM Service Request

4: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

5, 7: Two I frames containing: (The first I frame may be missing)

SAPI = 0, C = 0, P = 0, M = 1, 0, L = N201, $\leq N201$, N(S) = 0, 1 or 0, N(R) = 1
information field = Register or Setup

9, 11: Two I frames containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 < L \leq N201$, N(S) = 1 or 0, N(R) = 2, 3
information field = Register or Setup

NOTE: The I frame in 11 is optional.

12: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

14: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 < L < N201$, N(S) = 0, N(R) = 0
information field = Handover Complete

16, 18: Two I frames containing: (The first I frame may be missing)

SAPI = 0, C = 0, P = 0, M = 1, 0, $L = N201$, $0 < L \leq N201$, N(S) = 1, 2 or 1, N(R) = 0
information field = Register or Setup

20: UI frame containing:

C = 0, P = 0, M = 0, L = 0

25.2.3 Normal layer 2 disconnection

25.2.3.1 Test purpose

To test the normal data link disconnection sequences.

25.2.3.2 Method of test

The data link is setup between the MS and the SS as in test 25.2.1.1.1.

The SS sends a Layer 2 Disconnect message to the MS.

The MS shall respond with a UA frame and return to the idle state; no more Layer 2 (I, S or U) frames, except possibly one or more "Fill" frames, shall be sent. The SS may receive "Fill" frames after the sending of the DISC frame. If this occurs this may only happen for up to T200 after the sending of the DISC frame. The checking for Layer 2 frames, and the recording of any "Fill" frames, is done for a time defined as $4 * T200$.

The SS confirms that the MS has returned to the idle state by performing test 25.2.1.1.1.

Expected Sequence

| | |
|---|----|
| MS | SS |
| <p><----- DISC (SAPI, C, P, M, L) ----- 1</p> <p>2----- UA (SAPI, R, M, L, F)-----></p> | |

The frames from the SS will be:

1: One DISC frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0

25.2.3.3 Test requirements

The frames from the MS shall be:

2: One UA frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0

No other Layer 2 (I, S or U) frames shall occur. If "Fill" frames are sent this may only be done for up to T200 after the sending of the DISC frame.

25.2.4 Test of link failure**25.2.4.1 I frame loss (MS to SS)****25.2.4.1.1 Test purpose**

To test that the MS repeats an I frame N200 times with T200 between two I frames and that the MS releases the layer 2 link after N200 repetitions of the I frame in the case when no answer to the I frame is received.

25.2.4.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

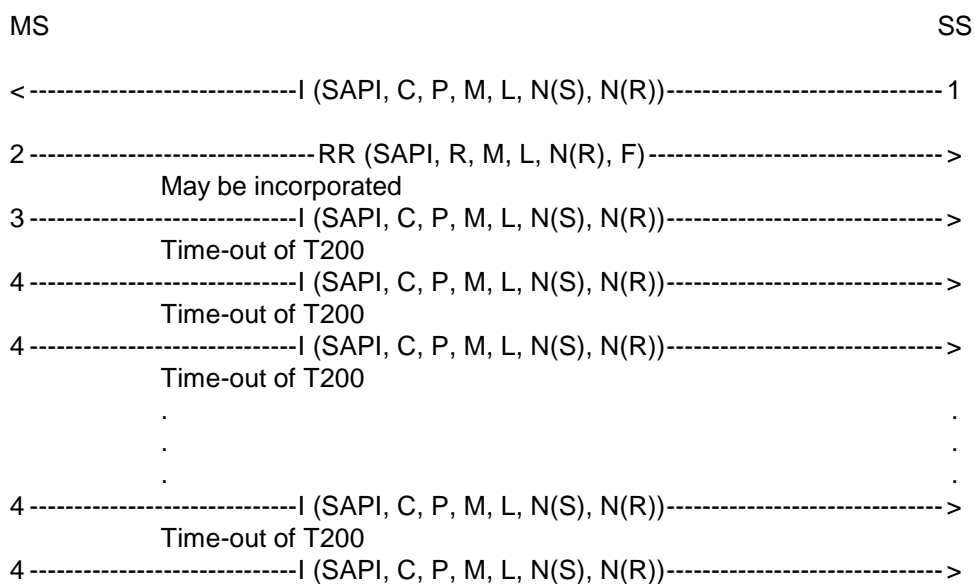

The SS sends an Identity Request message asking for IMEI to the MS.

The MS shall respond with a RR frame though this may be incorporated with the Identity Response I frame.

The SS does not respond to the I frame.

The MS shall wait for expiry of timer T200 and then repeat the I frame but with the P bit set to 1.

This is repeated until the MS has sent the I frame N200+1 times. The MS shall not send any layer 2 frame. This is checked for a time of $4 * T200$. The MS shall return to the idle state. This is checked by performing test 25.2.1.1.1.

Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 0
information field = Identity Request

25.2.4.1.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(R) = 1, N(S) = 0
information field = Identity Response

4: One I frame (occurs N200 times) containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$, N(R) = 1, N(S) = 0
information field = Identity Response

25.2.4.2 RR response frame loss (SS to MS)

Covered in test 25.2.2.2.

25.2.4.3 RR response frame loss (MS to SS)**25.2.4.3.1 Test purpose**

To test the Layer 2 recovery mechanism in the event of RR frame loss.

25.2.4.3.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends a I frame containing a Layer 3 message using PD=1111 (e.g. OFH) to the MS. The L3 message is TEST INTERFACE with tested device equal to 0.

The MS shall respond with a RR frame.

The SS ignores the RR frame from the MS but after T200 from the I frame sent by the SS the SS repeats the I frame but with the P bit set to 1. This simulates loss of the RR from the MS.

The MS shall respond with either an RR or REJ frame.

NOTE: This requirement is less restrictive than GSM 04.06.

Expected Sequence

| MS | SS |
|---|----|
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 1 |
| 2-----RR (SAPI, R, M, L, N(R), F)----- | > |
| Time-out of T200 | |
| <-----I (SAPI, C, P, M, L, N(S), N(R))----- | 3 |
| 4-----RR (SAPI, R, M, L, N(R), F)----- | > |
| OR | |
| 4-----REJ (SAPI, R, M, L, N(R), F)----- | > |

The frames from the SS will be:

1: One I frame containing:

$SAPI = 0, C = 1, P = 0, M = 0, L = 3, N(S) = 0, N(R) = 0$

3: One I frame containing:

$SAPI = 0, C = 1, P = 1, M = 0, L = 3, N(S) = 0, N(R) = 0$

25.2.4.3.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

$SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1$

4: One RR frame containing:

$SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1$

OR

4: One REJ frame containing:

$SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1$

25.2.5 Test of frame transmission with incorrect C/R values

Purpose of tests

To test that the MS will react correctly upon the reception of a frame with incorrect C/R value.

Initial Conditions

Perform the establishment of the dedicated physical resource according to 25.1.5 and initialize the link as in 25.2.1.1.1. Then proceed as stated below.

25.2.5.1 I frame with C bit set to zero

25.2.5.1.1 Test purpose

To test that the MS will take no action when it receives an I frame with the C bit set to zero (R).

25.2.5.1.2 Method of test

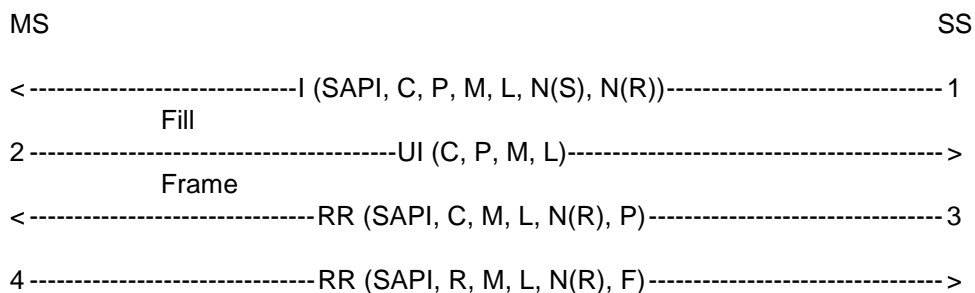

The data link is set up between the MS and the SS as in test 25.2.1.1.1.

The SS shall send an I frame with the C bit set to zero to the MS.

The SS shall then wait for at least 4 times T200 to make sure that the MS does not respond to that I frame but that the MS keeps sending fill frames.

The SS shall after 4 times T200 send a RR command, P bit set to 1.

The MS shall respond with a RR response, F bit set to 1.

Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 0, P = 1, M = 0, $0 \leq L \leq N201$, N(R) = 0, N(S) = 0
 Information field = Identity Request

3: One RR frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0

25.2.5.1.3 Test requirements

The frames from the MS shall be:

2: UI frames containing:

C = 0, P = 0, M = 0, L = 0

4: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 0

25.2.5.2 SABM frame with C bit set to zero**25.2.5.2.1 Test purpose**

To test that the MS will take no action when it receives an SABM frame with the C bit set to zero (R).

25.2.5.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS sends an I frame containing a Layer 3 message using PD=1111 (e.g. 0FH) in order to raise V(R) in the MS to 1. The L3 message is TEST INTERFACE with tested device equal to 0.

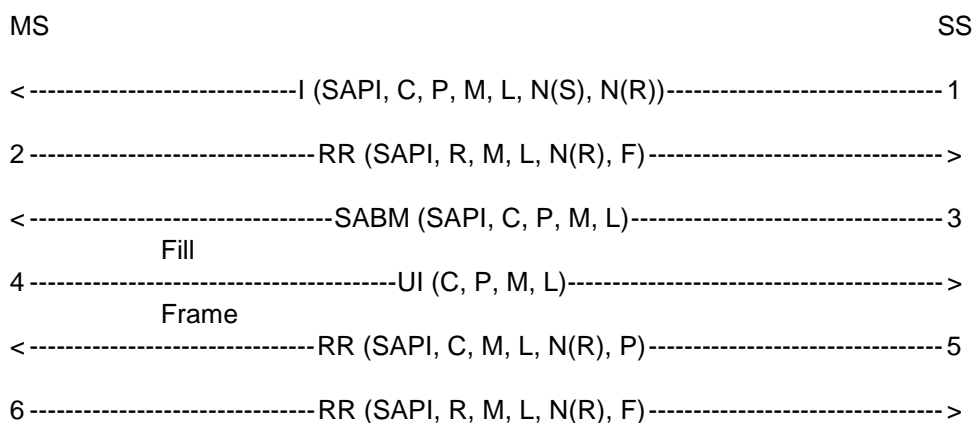

The MS shall acknowledge this by the appropriate RR frame.

The SS sends SABM with the C bit set to zero.

The SS shall after 4 times T200 send a RR command, P bit set to 1.

The MS shall respond with a RR response, F bit set to 1.

The MS is returned to the idle state as described in 25.2.1.1.6.

Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, L = 3, N(S) = 0, N(R) = 0

3: One SABM frame containing:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

5: One RR frame containing:

SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0

25.2.5.2.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

4: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

6: One RR frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1

25.2.6 Test of errors in the control field**Purpose of tests**

To test that the MS will react in the proper way to errors in the Control Field.

25.2.6.1 N(S) sequence error**25.2.6.1.1 Test purpose**

To test that the MS will ignore the contents of the I field of an out-of-sequence I frame from the SS.

25.2.6.1.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS shall send a correct I frame containing Identity Request.

The MS shall acknowledge this in a RR frame or piggy back the acknowledgement onto the I frame carrying Identity Response.

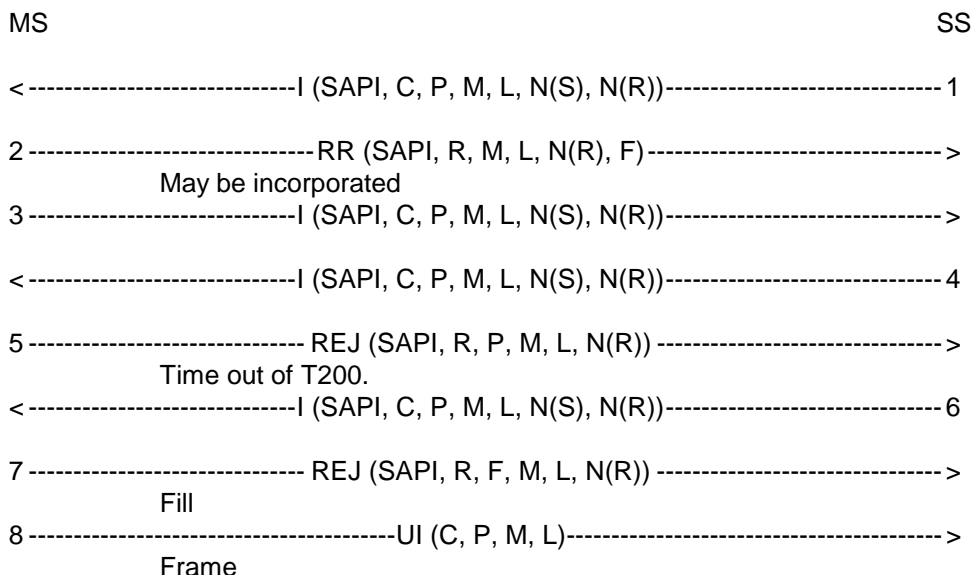

The SS shall then send an I frame containing Identity Request with incorrect N(S) but correctly acknowledging the MS's I frame; P bit set to zero.

The MS shall send a REJ frame.

The SS shall, after T200, send another I frame with incorrect N(S), P bit set to 1 this time.

The MS shall respond with a REJ, F bit set to 1.

The MS shall resume the transmission of fill frames.

Expected Sequence

The frames from the SS will be:

1: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 0
information field = Identity Request

4: One I frame containing:

SAPI = 0, C = 1, P = 0, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 1
information field = Identity Request

6: One I frame containing:

SAPI = 0, C = 1, P = 1, M = 0, $0 \leq L \leq N201$, N(S) = 0, N(R) = 1
information field = Identity Request

25.2.6.1.3 Test requirements

The frames from the MS shall be:

2: One RR frame containing:

SAPI = 0, R = 1, F = 0, M = 0, L = 0, N(R) = 1

3: One I frame containing:

SAPI = 0, C = 0, P = 0, M = 0, $0 \leq L \leq N201$, N(R) = 1, N(S) = 0
information field = Identity Response

5: One REJ frame containing:

SAPI = 0, R = 1, P = 0, M = 0, L = 0, N(R) = 1

7: One REJ frame containing:

SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 1

8: One UI frame containing:

C = 0, P = 0, M = 0, L = 0

25.2.6.2 N(R) sequence error**25.2.6.2.1 Test purpose**

To test that the MS will detect a N(R) sequence error and react in the proper way to it.

25.2.6.2.2 Method of test

The MS is brought into the multiple frame established state as described in test 25.2.1.1.1.

The SS shall send an I frame containing an information field of length N201 and an incorrect receive sequence number.

The MS may

- a) send a DISC frame within $N200 \cdot T200$ or
- b) perform a "local end release".

In case a) the SS shall respond with a UA frame. In case b) it detects a lower layer failure.

NOTE: The delay $N200 \cdot T200$ is specified for test purpose only. It is assumed that the L3 reaction time within the MS to command a release is less than this delay, which is less than the delay before the SS would detect a L2 failure.

Expected Sequence

The frames from the SS are:

1: One I frame:

SAPI = 0, C = 1, P = 0, M = 1, L = N201, N(R) = 1, N(S) = 0

In case a):

3: One UA frame:

SAPI = 0, R = 0, F = 1, M = 0, L = 0

25.2.6.2.3 Test requirements

The frame from the MS in case a) shall be:

2: One DISC frame:

SAPI = 0, C = 0, P = 1, M = 0, L = 0

25.2.6.3 Improper F bit

25.2.6.3.1 Test purpose

To test that the MS, being in the timer recovery state, will return to the multiple frame established state only after having received an RR response with the F bit set to 1. This test is covered in test 25.2.2.2.

25.2.7 Test on receipt of invalid frames

25.2.7.1 Test purpose

To test that the MS will ignore all invalid frames.

25.2.7.2 Method of test

The data link is set up between the MS and the SS as in test 25.2.1.1.1.

The SS shall then transmit an:

- RR frame with the Length indicator greater than zero and a faulty N(R)
- REJ frame with the EA bit set to zero and a faulty N(R)
- SABM frame with the EL bit set to zero
- DM frame with the Length indicator greater than zero
- DISC frame with the M bit set to 1
- UA frame with the EA bit set to zero
- I frame with the Length indicator greater than N201
- I frame with the M bit set to 1 and the Length indicator less than N201.
- command frames with correct Address and Length indicator field and a non-implemented control field.

After T200 the SS shall in every case transmit an RR command, P bit set to 1.

The MS shall respond with an RR response, F bit set to 1.

Expected Sequence

| MS | SS |
|---|----|
| <-----RR (SAPI, R, F, M, L, N(R))----- | 1 |
| Fill | |
| 2-----UI (C, P, M, L)-----> | |

```

The frames from the SS are:

1: One RR frame:

$SAPI = 0, R = 0, F = 0, M = 0, L > 0, N(R) = 1$

3: One REJ frame:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0, N(R) = 1, EA = 0$

4: One SABM frame:

$SAPI = 0, C = 1, P = 1, M = 0, L = 0, EL = 0$

5: One DM frame:

$SAPI = 0, R = 0, F = 1, M = 0, L > 0$

6: One DISC frame:

$SAPI = 0, C = 1, P = 1, M = 1, L = 0,$

7: One UA frame:

$SAPI = 0, R = 0, F = 0, M = 0, L = 0, EA = 0$

8: One I frame:

$SAPI = 0, C = 1, P = 0, M = 0, L > N201, N(R) = 0, N(S) = 6$

9: One I frame:

$SAPI = 0, C = 1, P = 0, M = 1, L < N201, N(R) = 0, N(S) = 7$

10: One RR frame:

$SAPI = 0, C = 1, P = 1, M = 0, L = 0, N(R) = 0$

12: One command frame with

Control Field = xxx1 1101

13: One command frame with

Control field = xxx1 1011

14: One command frame with

Control field = xxx1 0111

15: One command frame with

Control field = 01x1 1111

16: One command frame with

Control field = 1xx1 1111

17: One command frame with

Control field = 0011 0011

18: One command frame with

Control field = 1xx1 0011

NOTE: An "x" stands for an arbitrary bit value.

25.2.7.3 Test requirements

The frames from the MS shall be:

2: One UI frame (occurs fifteen times):

$C = 0, P = 0, M = 0, L = 0$

11: One RR frame (occurs fifteen times):

$SAPI = 0, R = 1, F = 1, M = 0, L = 0, N(R) = 0$

26 Testing of layer 3 functions

Ref.: GSM 04.08

NOTE: The tests on functioning of the elementary procedures in the MS are grouped as the description of those procedures in GSM 04.08. However, the test procedures are carried out in an order which is more logic for the purpose of testing.

26.1 Default conditions and structured sequence of tests

26.1.1 Default test conditions during layer 3 tests

During tests in section 26 the following default test conditions shall apply if not otherwise stated within the test description. In the table below, decimal values are normally used. Sometimes a hexadecimal value, indicated with a "H", or a binary value, indicated with a "B" is given.

| | GSM 900 | DCS 1 800 |
|--|---|---|
| General signalling conditions for all carriers | | |
| Ciphering | yes | yes |
| General RF-conditions for all carriers | | |
| Frequency hopping mode | Non-hopping | Non-hopping |
| Propagation profile | Static | Static |
| Downlink Input Level | 63 dB μ Vemf() | 63 dB μ Vemf() |
| Uplink output power | Minimum according to MS power class | Minimum according to MS power class |

These informations are provided by system information 1, 2, 3 and 4 messages.

The system information elements which are broadcast on the SACCH during the dedicated mode should be consistent with those sent on the BCCH when the MS was in idle mode prior to the channel request.

In addition, all fill paging messages sent on the paging sub-channels will have by default, their page mode set to NORMAL PAGING.

26.1.2 Structured sequence of the tests

The tests shall be performed in the order as indicated in the following table.

The validity of the tests depends upon the results of the tests performed before.

| | | |
|---|----|--------------------------|
| Channel request (basic test) | RR | 26.2.1 |
| Immediate assignment | RR | 26.6.1 |
| IMSI attach/detach (basic) | RR | 26.2.2 |
| Paging | RR | 26.6.2 |
| Test of the mobile station functions in idle mode | RR | 26.3 |
| Frequency redefinition | RR | 26.6.6 |

26.1.3 General rules for message parameters

The following rules concerning message parameters apply to section 26:

- 1) Those values of parameters which are a consequence of the context of a test and which are not specific to that test need not be defined.
- 2) If the value of a parameter of an uplink message (MS to Network) is specified in a test, the implicit meaning is that it has to be checked; if the value is not specified, it is not to be checked unless stated otherwise.
- 3) An optional field or optional Information Element of a downlink message (Network to MS), the presence of which is not a consequence of a test description, shall be absent in that test.
- 4) If an optional field or Information Element is not indicated for the uplink (MS to Network) - unless specified otherwise -, it may be included or not.
- 5) The Protocol Discriminator, Transaction Identifier and Message Type of all uplink messages have to be checked.

26.1.4 General rules for layer 3 testing

Unless otherwise specified, before the SS pages the MS, the MS must be given the necessary time to be able to receive paging (see section 20). In addition and unless otherwise specified, the SS must wait at least 1s after the last time slot of the message block containing a CHANNEL RELEASE, before sending a PAGING to the mobile (see 04.13).

In the signalling tests, where the following statement is used:

'the RF level of cell x is set sufficiently low to ensure that cell x is not suitable as defined in GSM 05.08 section 6.6.2'

this means that for the cell to be "not suitable" by virtue of its RF level, the RF level is to be lowered until C1 is below 0.

26.1.5 Format of layer 3 test descriptions

In sections 26.2, 26.5, 26.6, 26.7, 26.9, 26.10 and 26.11 a rigorous description technique is used which is defined here.

For every test, a subsection titled "method of test" and a subsection titled "expected sequence" define the exact test steps and the verifications to be performed in the test. These sections are normative and give requirements for the MS behaviour. The information of both subsections applies.

For the message contents further normative requirements for the MS behaviour are defined in the following parts which apply in the following order (starting with the highest) on basis of the general rules of 26.1.3:

- specifications in the "method of test" and "expected sequence" subsections;
- specifications in the subsection titled "specific message contents";
- specifications in the subsection "default message contents" at the end of the relevant sections 26.5, 26.6, 26.7, 26.9, 26.10 or 26.11;
- specifications of default conditions in 26.1.

The relevant section may contain the definition of abbreviations of L3 message names that are used in that section.

In many cases, a test description contains an introductory subsection explaining the background of the relevant procedures and explaining why the tests of that description are essential.

For every test, test purposes are given. In general conformance testing methodology, the correspondence between test purposes and test cases can be n to m: To one test purpose more than one test case may correspond (e.g. different test cases checking data variations); also a test case may serve more than one test purpose. In some contexts a structure of conformance test descriptions is advisable which specifies in one part (non-duplicated) test purposes with references to corresponding test suites serving the test purposes, in another part test suites realizing the test purposes; this structuring is especially useful for gaining completeness and avoiding duplications. In this specification, however, it is preferred to group descriptions by test cases. The reasons are:

- The structure is more sought to assist the test execution and evaluation than test development. It must be easy to determine why a wrong behaviour leads to a verdict.
- The structure is to be close to GSM 11.10 phase 1.

For every test purpose of a test, a conformance requirement is given.

For each conformance requirement in a test description, references to core specifications are given.

For every test, the related PICS/PIXIT statements that are necessary for performing the test are given.

For every test, initial conditions for both the System Simulator and the Mobile Station are given. Unless otherwise specified, these initial conditions apply together with the default conditions of 26.1, the initial conditions of the test prevailing over the default conditions of 26.1.

For every test, the foreseen final state of the MS after the test and the maximum duration of the test are specified. These parts are non-normative and do not contain a description of verifications to be performed. The contained information might be used for sequencing different tests and for the decision when a test is to be interrupted.

The expected sequence specifies the actions in numbered steps in a tabular form. In the column "direction", "SS -> MS" denotes a message sent from the SS to the MS, "MS -> SS" denotes a message sent from the MS to the SS, "SS" denotes an action at the SS, "MS" denotes an action at the MS (e.g. interaction with the user or higher layers). The column "message" defines the L3 messages to be sent or expected by the SS. In the "comments" column, further normative information is to be found, e.g. message parameters. In some cases, different alternative behaviours are possible in a test. Then test steps in alternative sequences are numbered as:

"A n", "A n+1", ..., "A n+k"
 "B n", "B n+1", ..., "B n+l"
 "C n", "C n+1", ..., "C n+m"
 etc. (n,m,l,k integers > 0)

and step numbering of a re-unified sequence resumes with the lowest of n+k+1, n+l+1, n+m+1.

In some cases the test steps of a test are to be repeated. Then an execution counter is introduced for the test.

26.2 Initial tests

26.2.1 Channel request

The random access procedure is used by the MS to ask for resources to the network. If it is not performed correctly, the MS could prevent other MSs from obtaining resources, or the network could be overloaded if the MS does not respect the duration between 2 CHANNEL REQUEST messages.

26.2.1.1 Channel request / initial time

26.2.1.1.1 Conformance requirement

- 1) The MS shall start the initial access procedure at the latest 0,7 second after reception of the paging message.
- 2) The MS shall spread the initial CHANNEL REQUEST with equal probability on the correct number of time slots.

Reference(s)

GSM 04.08 sections 3.3.1.1.2 and 3.3.2.2.

26.2.1.1.2 Test purpose

- 1) To verify that the MS answers to a PAGING message by sending a CHANNEL REQUEST message within 0,7 seconds after reception of the PAGING message.
- 2) To verify that the MS does not always use the same delay between reception of paging message and sending of the CHANNEL REQUEST message. If an MS uses a fixed delay, there is a high probability that different MSs of the same product series use the same delay. There would then be a high risk of collision.

26.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, Tx-Integer = 5. The CCCH is either combined or not with SDCCH. This is arbitrarily chosen.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

None.

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

Specific test parameters:

K = 200.

The MS is paged. The SS measures and stores the number of CCCH RACH slots between the sending of the PAGING REQUEST message and the reception of the CHANNEL REQUEST from the MS, excluding the slots containing the messages themselves. The SS sends an IMMEDIATE ASSIGNMENT REJECT. The sequence is performed K times.

Maximum Duration of Test

30 min.

Between two consecutive executions (for k and k+1), the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter k = 1, ... , K.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile Identity" IE contains the TMSI allocated to the MS. |
| 2 | SS | | The SS measures the number f of CCCH RACH slots between the sending of PAGING REQUEST message and the reception of a CHANNEL REQUEST message from the MS. |
| 3 | SS | | The SS stores f. f(k) shall be lower than 700/4,615+8 if the CCCH is not combined or lower than 81+8 if the CCCH is combined with SDCCH. |
| 4 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | the first "request reference" corresponds to the CHANNEL REQUEST sent by the MS. |

NOTE: The test limit has been computed to give a confidence of [99,74 %] that a unit which follows the requirements will pass. The number of samples (200) has been chosen to get a good compromise between the test time and the risk of passing a bad unit.

26.2.1.1.4 Test requirements

$S(n) = \text{CARD} \{k \mid f(k) = n\}$

The following requirements shall be met:

$S(n) \leq 41$ for all n.

NOTE: $\text{CARD} \{k \mid f(k) = n\}$ is mathematical notation for the number of times that f(k) equals n.

26.2.1.2 Channel request / repetition time**26.2.1.2.1 Conformance requirement**

- 1) The MS shall spread retransmissions of a CHANNEL REQUEST message, with equal probability on Tx-Integer timeslots and with the correct delay after the reception of the PAGING REQUEST.
- 2) The MS shall not retransmit another CHANNEL REQUEST message when Max-retrans is reached.

Reference(s)

GSM 04.08 section 3.3.1.1.2

26.2.1.2.2 Test purpose

- 1) To verify that the MS spreads retransmission of a CHANNEL REQUEST message with equal probability on Tx-Integer time slots and correctly applies the fixed delay when the following conditions apply:
 - the CCCH is combined or not combined with SDCCHs;
 - the maximum number of retransmissions is equal to one of the following values: 1, 2, 4, 7;
 - Tx-Integer is put to any of the allowed values among those which are greater or equal to 6.

- 2) To verify that the MS retransmits exactly Max_Retrans times a CHANNEL REQUEST message if the network never responds to the CHANNEL REQUEST message.

26.2.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell.

Tx-Integer is arbitrarily chosen in the set {6, 7, 8, 9, 10, 11, 12, 14, 16, 20, 25, 32, 50}.

Max_Retrans is arbitrarily chosen in the set {1,2,4,7}.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

None.

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

Specific test parameters

K equals the upper rounded value of $230/\text{Max_Retrans}$.

m equals the upper rounded value of $0,5 \cdot \text{Tx-Integer}$.

Counter M = 0.

Parameter S: according to table 3.1/GSM 04.08 (this parameter depend on the value chosen for Tx-Integer).

$N0 = \max(8, \text{Tx-Integer})$

The MS is paged. The MS sends a CHANNEL REQUEST message. The MS retransmits CHANNEL REQUEST messages Max_Retrans times. The SS measures the number of CCCH RACH slots $f(i,k)$ between the moment where a CHANNEL REQUEST message has been received, and the reception of the following CHANNEL REQUEST message, excluding the slots containing the messages themselves. The SS updates the counter M. The SS does not answer to the CHANNEL REQUEST messages Max_Retrans times. After the last CHANNEL REQUEST message in every sequence where k is lower than K, the SS sends an IMMEDIATE ASSIGNMENT REJECT. In the last sequence ($k = K$), the SS does not respond to the MS. The MS shall not send any other CHANNEL REQUEST message.

Maximum Duration of Test

The execution of one sequence (for one value k): 10s.

Between two consecutive executions (for k and k+1), the SS must wait for 35 seconds, which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter $k = 1, \dots, K$ for each of the 2 test cases.

| Step | Direction | Message | Comments |
|------|----------------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile Identity" = TMSI of the MS. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment Cause" = Answer to paging. |
| 3 | MS -> SS SS | CHANNEL REQUEST | Steps 3, 4, 5 are executed for execution counter $i = 1, \dots, \text{Max_Retrans}$. |
| 4 | | | "Establishment Cause" = Answer to paging. The SS measures the number $f(i,k)$ of CCCH RACH slots between: - the moment where the last CHANNEL REQUEST message has been received, and - the reception of the new CHANNEL REQUEST message from the MS, excluding the slots containing the messages themselves. $f(i,k)$ shall be in the set $\{S, S+1, \dots, S+T-1\}$ |
| 5 | SS | | If $f(i,k) - S \geq m$, $M = M+1$ |
| A6 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Depending on the value of k , step A6 or B6 is performed: $k < K$ The third "Request Reference" IE corresponds to the last CHANNEL REQUEST message received. The third "Wait Indication" IE specifies 0 second. Other fields do not address the MS under test. |
| B6 | SS | | $k = K$ The SS checks that the MS sends no more CHANNEL REQUEST messages. This is verified during 3 seconds. |
| 7 | SS | | $M / (K * \text{Max_Retrans})$ shall be inside the following interval: $[0,8 - m/\text{Tx-Integer} ; 1,2 - m/\text{Tx-Integer}]$ |

NOTE: The confidence interval in step 7, and the number of samples are chosen in such a way that the possibility of not accepting a correct MS is less than $[0,26 \ %]$.

26.2.1.3 Channel request / random reference

26.2.1.3.1 Conformance requirement

A CHANNEL REQUEST message sent by the MS shall include a random reference randomly drawn from a uniform probability distribution for every new transmission.

Reference(s)

GSM 04.08 section 3.3.1.1.23.3.1.2.

26.2.1.3.2 Test purpose

To verify that an MS produces different random references for a CHANNEL REQUEST. If a MS always produces the same random reference, it makes possible that different MSs of the same product series produce the same random reference.

26.2.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, CCCH not combined with SDCCH.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

None.

Foreseen Final State of the MS

The MS has a valid TMSI. It is in the MM-state "idle, updated" and in the RR idle-mode.

Test Procedure

Specific test parameters:

K = 7.

D = 4.

The SS sends a PAGING REQUEST message. The SS stores the "Random Reference" r(k) contained as a parameter in the CHANNEL REQUEST message sent by the MS. This sequence is performed K times, and it is verified that the MS produces different values r(k).

Maximum Duration of Test

6 min

Between two consecutive executions (for k and k+1), the SS must wait for an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel).

Expected Sequence

The sequence is executed for execution counter k = 1, ..., K.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | "Establishment Cause" = Answer to paging. The SS stores the "Random Reference" contained in the CHANNEL REQUEST message. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS | | |

26.2.1.3.4 Test requirements

At least D values of r(1),...,r(k) shall be different.

NOTE: D has been computed such that the probability of refusing a correct MS is less than [0,027 %].

26.2.2 IMSI detach and IMSI attach

The IMSI detach/attach procedures are used to indicate to the network that the MS is deactivated/activated. These procedures are allowed or not by the network (ATT flag set to "MSs in the cell shall apply IMSI attach and detach procedure" or "MSs in the cell are not allowed to apply IMSI attach and detach procedure").

If the IMSI attach procedure does not work correctly then the network would in certain situations not try to establish Mobile Terminating call even if the MS is "idle updated".

If an MS performs an unwanted IMSI detach procedure or does not perform IMSI detach when required, network resources are wasted.

26.2.2.1 Conformance requirement

- 1) When the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure", the MS shall not perform the IMSI detach procedure upon deactivation.
- 2) When the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure", the MS shall not perform the IMSI attach procedure upon activation.
- 3) The MS shall not perform the IMSI detach procedure if the Subscriber Identity Module is removed when the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure".
- 4) The MS shall not perform the IMSI attach procedure if the Subscriber Identity Module is inserted, when the Attach-detach flag in the Control Channel Description of the System Information Type 3 indicates "MSs in the cell are not allowed to apply IMSI attach and detach procedure".
- 5) The MS shall correctly perform the IMSI detach procedure, upon switch off, when it is required by the network to do so.
- 6) The MS shall correctly perform the IMSI attach procedure upon switch on when the IMSI attach procedure is required by the network. The MS shall correctly acknowledge the implicit TMSI reallocation procedure, which is part of this IMSI attach procedure, this means that the MS shall send a TMSI REALLOCATION COMPLETE message.
- 7) The MS shall correctly perform the IMSI detach procedure upon SIM removal when it is required by the network to do so.
- 8) The MS shall correctly perform the IMSI attach procedure, following SIM insertion and switch on when the IMSI attach procedure is required by the network. The MS shall correctly acknowledge the implicit TMSI reallocation procedure which is part of this IMSI attach procedure. This means that the MS shall send a TMSI REALLOCATION COMPLETE message.

Reference(s):

GSM 02.07, normative annex B, section B1.17.

GSM 04.08 sections 4.4.3 and 4.4.4.

26.2.2.2 Test purpose

- 1) To verify that the MS correctly performs IMSI detach/attach procedures when it is required by the network and upon deactivation/activation or SIM removal/insertion and does not perform these procedures when not required.
- 2) To verify that the mobile station acknowledges a re-allocated TMSI during IMSI attach.

26.2.2.3 Method of test**Initial Conditions**

System Simulator:

1 cell, default parameters.

For procedures 1 and 2 ATT flag is set to "MSs in the cell are not allowed to apply IMSI attach and detach procedure".

For procedures 3 and 4 ATT flag is set to "MSs in the cell should apply IMSI attach and detach procedure".

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

- a: SIM removal possible without removing power source Yes / No.
- b: On/off switch Yes / No.
- c: IMSI detach after SIM removal Yes / No.
- d: IMSI detach after removing power source Yes / No.

Foreseen Final State of the MS

The MS has a valid TMSI which may be different from the initial one. It is "idle updated".

Test Procedure

The SS indicates that IMSI detach/attach is not allowed. If possible the MS is switched off, then switched on, otherwise it has its power source removed and then restored (see b in PICS). The SS checks that the MS does not perform IMSI detach/attach procedures. If possible (if a = Yes, see PICS), the SIM is removed, then the SIM is inserted. The SS checks that the MS does not perform IMSI detach/attach procedures.

The SS indicates that IMSI detach/attach is allowed. After a delay of 35s the MS should have detected The SS indicates now, that IMSI detach/attach is allowed. If possible (if b = Yes, see PICS) the MS is switched off, otherwise it has its power source removed (if d = Yes, see PICS). The MS initiates an IMSI detach procedure. Then depending on what has been performed before, the MS is switched on or has its power source restored. It initiates an IMSI attach procedure. The location updating procedure contains an implicit TMSI reallocation. The SIM is removed. If (a = yes and c = yes) or (a = no and d = yes) the MS initiates an IMSI detach procedure. Then the SIM is inserted, it initiates an IMSI attach procedure, the location updating procedure contains an implicit TMSI reallocation.

Maximum Duration of Test

4 min

Expected Sequence**Procedure 1**

| Step | Direction | Message | Comments |
|------|-----------|---------|---|
| 1 | MS | | If possible the MS is switched off (see b in PICS), otherwise the MS has its power source removed. The MS shall not initiate the IMSI detach procedure. This is checked by the SS during 5 seconds. Depending on what has been performed in step 1, the MS is brought back to operation. The MS shall not initiate an IMSI attach procedure. This is checked by the SS during 30 seconds. |
| 2 | MS | | |
| 3 | MS | | |
| 4 | MS | | |

Procedure 2

| | | | |
|---|----|--|---|
| 1 | MS | | If possible (a = Yes, see PICS), the SIM is removed from the MS. The MS shall not initiate the IMSI detach procedure. This is checked by the SS during 5 seconds. The SIM is inserted in the MS. The MS shall not initiate an IMSI attach procedure. This is checked by the SS during 30 seconds. |
| 2 | MS | | |
| 3 | MS | | |
| 4 | MS | | |

Procedure 3

| | | | |
|----------------------|--|--|---|
| 1 | MS | | The MS is switched off, or has its power source removed, depending on value b in the PICS file. If b = Yes or d = Yes the MS initiates an IMSI detach procedure (steps A2, A3, A4, A5), otherwise the SS goes straight to step 6. |
| A2 A3 A4 A5 | MS -> SS SS -> MS MS -> SS SS -> MS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT IMSI DETACH INDICATION CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |
| 6 | MS | | Depending on what has been performed in step 1, the MS is brought back to operation. The MS initiates an IMSI attach procedure. |
| 7 8 9 | MS -> SS SS -> MS MS -> SS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT LOCATION UPDATING REQUEST | "Location Updating Type" = IMSI attach. |
| 10 | SS -> MS | LOCATION UPDATING ACCEPT | The SS allocates a new TMSI |
| 11 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |

Specific message contents:**SYSTEM INFORMATION TYPE 3 message:**

| Information Element | value/remark |
|--|---|
| Control Channel Description - Attach/Detach allowed | MS shall apply IMSI attach and detach procedures. |

Procedure 4

| | | | |
|----------------------|--|--|---|
| 1 | MS | | The SIM is removed from the MS. If (a = Yes and c = Yes) or (a = no and d = yes) in PICS, the MS initiates an IMSI detach procedure (steps A2, A3, A4, A5), otherwise the SS goes straight to step 6. |
| A2 A3 A4 A5 | MS -> SS SS -> MS MS -> SS SS -> MS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT IMSI DETACH INDICATION CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |
| 6 | MS | | The SIM is inserted in the MS. The MS initiates a IMSI attach procedure. |
| 7 8 9 | MS -> SS SS -> MS MS -> SS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT LOCATION UPDATING REQUEST | "Location Updating Type" = IMSI attach. |
| 10 | SS -> MS | LOCATION UPDATING ACCEPT | The SS allocates a new TMSI |
| 11 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits the disconnection of the main signalling link. |

Specific message contents:**SYSTEM INFORMATION TYPE 3 message:**

| Information Element | value/remark |
|--|---|
| Control Channel Description - Attach/Detach allowed | MS shall apply IMSI attach and detach procedures. |

26.2.3 Sequenced MM / CM message transfer

The RR sublayer of the MS shall have an associated send state variable V(SD) for sending MM and CM messages. This send state variable has been introduced to avoid the duplication of MM and CM messages. It is useful for the network after a handover or a change of channel to identify duplicated messages.

If the MS started V(SD) with 1 instead of 0 the network would incorrectly diagnose loss of message.

If the MS later on does not handle correctly incrementation of V(SD) the network would not be able to continue the dialogue.

26.2.3.1 Conformance requirement

The MS shall implement correctly the "send state variable V(SD)" ("Send duplicated"), included in transmitted MM and CM messages.

Reference(s)

GSM 04.08 section 3.1.4.3.

26.2.3.2 Test purpose

To verify that V(SD) is correctly set to 0 at the beginning of the establishment of the first RR connection and to verify that the MS handles correctly this variable in the special case of IDENTITY REQUEST messages, which are MM messages.

26.2.3.3 Method of test**Initial Conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

None.

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

The MS is paged. After reception of the PAGING RESPONSE message from the MS, the SS sends an IDENTITY REQUEST message. The MS sends an IDENTITY RESPONSE message where N(SD) = 0. The SS repeats its IDENTITY REQUEST message 10 times. The MS transmits IDENTITY RESPONSE message with the value 1 and 0 in the N(SD) field alternately.

Maximum Duration of Test

1 min

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | <p>N(SD) = 0 Steps 7, 8, 9 and 10 are repeated 5 times. N(SD) = 1.</p> <p>N(SD) = 0. After the sending of this message, the SS waits the disconnection of the main signalling link.</p> |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | IDENTITY REQUEST | |
| 6 | MS -> SS | IDENTITY RESPONSE | |
| 7 | SS -> MS | IDENTITY REQUEST | |
| 8 | MS -> SS | IDENTITY RESPONSE | |
| 9 | SS -> MS | IDENTITY REQUEST | |
| 10 | MS -> SS | IDENTITY RESPONSE | |
| 11 | SS -> MS | CHANNEL RELEASE | |

26.2.4 Establishment cause

The establishment cause set by the MS in the CHANNEL REQUEST message shall be consistent with the requested service or function, with the capabilities of the MS and with the indications given by the network.

If the MS uses a wrong establishment cause, the network might assign an inappropriate or incompatible resource.

In the case of Emergency call a wrong priority might be used.

If a reserved value is used, the network may discard the channel request.

26.2.4.1 Conformance requirements

In the CHANNEL REQUEST message, the MS shall include an establishment cause which correspond to the establishment cause given by the MM sublayer and the broadcasted NECI value, or which correspond to one of the establishment causes "answer to paging" given by the RR entity in response to a PAGING REQUEST message including the Channel Needed information.

Reference(s)

GSM 04.08 section 3.3.1.1.2

26.2.4.2 Test purpose

To verify that the establishment cause sent by the MS in the Max-Retrans+1 CHANNEL REQUEST messages is consistent with the requested service, with the capabilities of the MS and with the indications of the network in the following cases:

- 1) If the MS supports a service on a traffic channel:
when the NECI bit is set to 0 and call re-establishment is attempted and the call was established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise.
- 2) If the MS supports a service on half rate channel:
when the NECI bit is set to 1 and call re-establishment is attempted and the call was established on TCH/H.
- 3) If the MS supports speech:
 - 3.1 when the NECI bit is set to 0 and a speech call is attempted.
 - 3.2 when the NECI bit is set to 1 and a speech call is attempted.

- 4) If the MS supports a data service:
- 4.1 when the NECI bit is set to 0 and a data call is attempted.
 - 4.2 when the NECI bit is set to 1 and a data call is attempted for a service supported on half rate channel (if the MS does not support any data call on half rate channel any data service is used).
- 5)
- 5.1 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "any channel".
 - 5.2 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "SDCCH".
 - 5.3 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "TCH/F".
 - 5.4 when the NECI bit is set to 0 and the MS is paged with the paging indication set to "TCH/H or TCH/F".
- 6)
- 6.1 when the NECI bit is set to 0 and IMSI attach is attempted.
 - 6.2 when the NECI bit is set to 0 and normal location updating is attempted.
 - 6.3 when the NECI bit is set to 0 and periodic location updating is attempted.
 - 6.4 when the NECI bit is set to 0 and IMSI detach is attempted.
 - 6.5 when the NECI bit is set to 1 and IMSI attach is attempted.
 - 6.6 when the NECI bit is set to 1 and normal location updating is attempted.
 - 6.7 when the NECI bit is set to 1 and periodic location updating is attempted.
 - 6.8 when the NECI bit is set to 1 and IMSI detach is attempted.
- 7) If the MS supports a non call related supplementary service operation:
when the NECI bit is set to 0 and a supplementary service operation is attempted at the MS.
when the NECI bit is set to 1 and a supplementary service operation is attempted at the MS.
- 8) If the MS supports SMS/PP MO:
when the NECI bit is set to 0 and a mobile originated short message service transaction is attempted.
when the NECI bit is set to 1 and a mobile originated short message service transaction is attempted.

NOTE: To verify that when the MS supports speech and an emergency call is attempted and the NECI bit is set to 0, then the MS sends a CHANNEL REQUEST message with an establishment cause consistent with the requested service, with the capabilities of the MS and with the indications of the network is done in test 26.9.6.1.1 test purpose 1.

26.2.4.3 Method of test

Initial Conditions

System Simulator:

for all procedures: 1 cell, Max-Retrans = 7 slots. The NECI bit is set to 0.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT Statement(s)

| | | |
|----|---|----------|
| a: | MS supports speech on TCH/F | Yes / No |
| b: | MS supports speech on TCH/H | Yes / No |
| c: | MS supports data on TCH/F | Yes / No |
| d: | MS supports data on TCH/H | Yes / No |
| e: | MS only supports SDCCH | Yes / No |
| f: | MS supports a supplementary service operation | Yes / No |
| g: | MS supports SMS/PP MO | Yes / No |
| h: | On/Off switch | Yes / No |

NOTE: In the above PICS, data and speech refer to the Radio Resource Channel Mode.

Foreseen Final State of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedures

NOTE: If the procedures are chained, the SS shall ensure that at the beginning of each procedure, the initial conditions are reached and that the MS had enough time to decode the broadcasted parameters.

Procedure 1

If the MS supports a service on a traffic channel:

A call is established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise. The SS stops transmission on the SACCH. The MS attempts call reestablishment. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "110".

Procedure 2

If the MS supports a service on half rate channel:

The NECI bit is set to 1. A call is established on TCH/H. The SS stops transmission on the SACCH. The MS attempts call reestablishment. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "011010".

Procedure 3

If the MS supports speech:

A speech call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111". The NECI bit is set to 1. A speech call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111" if the MS does not support speech on half rate channel or "0100" if the MS supports speech on half rate channel.

Procedure 4

If the MS supports a data service:

A data call is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111". The NECI bit is set to 1. A data call is attempted for a service supported on half rate channel (if the MS does not support any data call on half rate channel any data service is used). The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "111" if the MS does not support a data service on half rate channel or "0101" if the MS supports a data service on half rate channel.

Procedure 5

The MS is paged with the paging indication set to "any channel". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100". The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "SDCCH". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001". The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "TCH/F". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100" if the MS capability is full rate only, "0010" if the MS capability is dual rate and "0001" if the MS capability is SDCCH only. The SS waits for a time sufficient for the MS to be "idle updated". The MS is paged with the paging indication set to "TCH/H or TCH/F". The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "100" if the MS capability is full rate only, "0011" if the MS capability is dual rate and "0001" if the MS capability is SDCCH only.

Procedure 6

This procedure is performed twice. Once for NECI = 0 and once for NECI = 1.

The MS is switched off or powered off. Then system information messages are altered so that IMSI attach/detach is allowed in the cell. The MS is switched on or powered on. The MS performs IMSI attach. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000" when NECI = 1, or "000" when NECI = 0. The IMSI attach procedure is followed. The location area code of the cell is changed, T3212 is set to 1 decihour. The MS performs a location updating. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000" when NECI = 1, or "000" when NECI = 0. The location updating procedure is followed. The SS waits for at least 7 minutes. The MS performs a periodic updating. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the values "0000". The location updating procedure is followed. The MS is switched off or powered off. If the MS has an On/off switch (see PICS), it attempts IMSI detach. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001" when NECI = 1, or "111" when NECI = 0.

Procedure 7

This procedure is performed twice. Once for NECI = 0 and once for NECI = 1.

If the MS supports a non call related supplementary service operation:

A supplementary service operation is attempted at the MS. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001".

Procedure 8

If the MS supports SMS/PP MO:

A mobile originated short message service transaction is attempted. The SS does not answer to Max-Retrans CHANNEL REQUEST messages and answers to the next CHANNEL REQUEST with an

IMMEDIATE ASSIGNMENT REJECT message. The SS checks that all CHANNEL REQUEST messages contain an establishment cause with the value "0001" when NECI = 1, or "111" when NECI = 0.

Maximum Duration of Test

For procedures 1, 2, 3, 4 and 5: 5 minutes, including 1 minute for any necessary operator actions.

For procedure 6: 20 minutes, including 2 minutes for any necessary operator actions.

For procedures 7, 8: 10 minutes, including 2 minutes for any necessary operator actions.

Expected Sequence

Procedure 1

This procedure is performed if the MS supports a service on a traffic channel.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | | | a call is established on TCH/H if the MS supports a service on half rate channel or on TCH/F otherwise. The generic call setup procedure is used. the SS stops transmission on the SACCH. all messages have establishment cause set to "110" |
| 2 | SS | | |
| 3 | MS -> SS | 8 CHANNEL REQUEST | |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 2

This procedure is performed if the MS supports a service on half rate channel.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS | | The NECI bit is set to 1, a call is established on TCH/H. The generic call setup procedure is used. the SS stops transmission on the SACCH. all messages have establishment cause set to "011010" |
| 2 | | | |
| 3 | SS | | |
| 4 | MS -> SS | 8 CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 3

This procedure is performed if the MS supports speech.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | MS | | a speech call is attempted all messages have establishment cause set to "111" |
| 2 | MS -> SS | 8 CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | The NECI bit is set to 1 The SS waits for 30 s a speech call is attempted all messages have establishment cause set to "0100" if the MS supports speech on half rate or set to "111" otherwise |
| 5 | SS | | |
| 6 | MS | | |
| 7 | MS -> SS | 8 CHANNEL REQUEST | |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 4

This procedure is performed if the MS supports a data service.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | MS | | a data call is attempted |
| 2 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "111" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | The NECI bit is set to 1 |
| 5 | SS | | The SS waits for 30 s |
| 6 | MS | | a data call is attempted for a service supported by the MS on half rate (for any data service if the MS does not support any data service on half rate) |
| 7 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to "0101" if the MS supports a data service on half rate or set to "111" otherwise |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 5

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = any channel all messages have establishment cause set to "100" |
| 2 | MS -> SS | 8 CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 4 | SS | | The SS waits for 5 seconds |
| 5 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = SDCCH all messages have establishment cause set to "0001" |
| 6 | MS -> SS | 8 CHANNEL REQUEST | |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 8 | SS | | The SS waits for 5 seconds |
| 9 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = TCH/F all messages have establishment cause set to "100" if the MS capability is full rate only or "0010" if the MS capability is dual rate or "0001" if the MS capability is SDCCH only |
| 10 | MS -> SS | 8 CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 12 | SS | | The SS waits for 5 seconds |
| 13 | SS -> MS | PAGING REQUEST TYPE 1 | paging indication = TCH/H or TCH/F all messages have establishment cause set to "100" if the MS capability is full rate only or "0011" if the MS capability is dual rate or "0001" if the MS capability is SDCCH only |
| 14 | MS -> SS | 8 CHANNEL REQUEST | |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 6

The sequence is executed for execution counter k = 1, 2.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 0 | SS | | When k = 1, NECI set to 0 When k = 2, NECI set to 1 |
| 1 | MS | | The MS is switched off or has its power source removed |
| 2 | SS | | IMSI attach/detach is set to "MSs in the cell shall apply IMSI attach and detach procedure" |
| 3 | MS | | The MS is switched on or powered on |
| 4 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "000" when k = 1 "0000" when k = 2 |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = IMSI attach |
| 7 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 8 | SS -> MS | CHANNEL RELEASE | |
| 9 | SS | | the LAC of the cell is changed and T3212 is set to 6 minutes |
| 10 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "000" when k = 1 "0000" when k = 2. The MS must send its first Channel Request within 33s after the LAC has been changed. |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 12 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = Normal location updating |
| 13 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 14 | SS -> MS | CHANNEL RELEASE | |
| 15 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "000" when k = 1 "0000" when k = 2. The MS must send its first Channel Request within 7 minutes after the preceeding Channel Release |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 17 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = Periodic updating |
| 18 | SS -> MS | LOCATION UPDATING ACCEPT | with no mobile identity |
| 19 | SS -> MS | CHANNEL RELEASE | |
| 20 | MS | | If possible (see PICS), the MS is switched off, otherwise it has its power source removed |
| 21 | MS | | If the MS was switched off it attempts IMSI detach |
| 22 | MS -> SS | 8 CHANNEL REQUEST | all messages have establishment cause set to: "111" when k = 1 "0001" when k = 2 |
| 23 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 7

The sequence is executed for execution counter k = 1, 2.

This procedure is performed if the MS supports a non call related supplementary service operation.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | MS | | a non call related supplementary service operation is attempted all messages have establishment cause set to: "111" when k = 1 "0001" when k = 2 |
| 2 | MS -> SS | 8 CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Procedure 8

This procedure is performed if the MS supports SMS/PP MO.

The sequence is executed for execution counter k = 1, 2.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 0 | SS | | When k = 1, NECI set to 0 When k = 2, NECI set to 1 a mobile originated short message service transaction is attempted all messages have establishment cause set to: "111" when k = 1 "0001" when k = 2 |
| 1 | MS | | |
| 2 | MS -> SS | 8 CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

26.3 Test of MS functions in idle mode

26.3.1 Initial conditions

The SIM shall contain a PLMN-Selector that contains only the HPLMN of the MS, and an empty forbidden PLMN list.

Related PICS/PIXIT statements

Type of mobile station (P-GSM 900, E-GSM 900, R-GSM 900 or DCS 1 800)

During the tests in 26.3.2 and 26.3.3, the following parameters apply according to the above PICS/PIXIT statement:

RACH control parameters

In cells

NOTE 4: The SIM should contain a PLMN-Selector that contains only the HPLMN of the MS, and an empty forbidden PLMN list.

26.3.2 MS indication of available PLMNs

26.3.2.1 Test purpose

To verify that a MS can present the available PLMNs to the user when asked to do so in manual mode according to the requirements of GSM 05.08 and GSM 02.11.

26.3.2.2 Method of test

- The MS is switched on, equipped with a SIM containing default values except for those values listed under section 26.3.1 (initial conditions).
- The MS is put into manual network selection mode (see PIXIT).

26.3.2.3 Test requirements

- 1) On entering manual network selection mode, the MS shall present a list of available PLMNs in all its bands of operation (MCC and MNC values, or any other valid indications, see PIXIT), within 2 minutes. Any PLMN shall only be presented once. The list shall include the MCC and MNC of:

GSM 900: cells 1 to 7, but not of cell 8.

DCS 1 800: cells 1 to 6, but not of cell 7.

Multiband: cells 2, 3, 4, 6, 7 and 1 or 5 (cell 1 and 5 have the same MCC and MNC), but not of cell 8.

26.3.3 MS will send only if BSS is "on air"

26.3.3.1 Test purpose

To verify that the MS will not produce any RF transmission if no BSS is received.

26.3.3.2 Method of test

- a) The RF-signal for the BCCHs of:

GSM 900: cell 1 to 8 is switched off.

DCS 1 800: cell 1 to 7 is switched off.

Multiband GSM/DCS: cell 1 to 8 is switched off.

- b) The SS shall wait 20 s to allow the MS to detect the loss of cells.
- c) By MMI, an attempt to originate a call is made.
- d) By MMI, an attempt to originate an emergency call is made.

Step d) is only performed if the MS supports speech (see PICS/PIXIT statement).

26.3.3.3 Test requirements

- 1) The MS must not give "service indication".
- 2) In steps c) and d) the MS shall not produce any RF output.

26.3.4 Manual mode of PLMN selection

26.3.4.1 Conformance requirements

In manual mode, the MS can try to obtain normal service on any available VPLMN and it shall try to obtain normal service on a VPLMN if and only if the user makes a manual selection of this VPLMN.

Reference

GSM 03.22 section 3.1.

26.3.4.2 Test purpose

To check that in manual mode the MS is able to obtain normal service on a PLMN which is neither the better nor a preferred PLMN and that it tries to obtain service on VPLMN if and only if the user selects it manually.

26.3.4.3 Method of test

Initial conditions

System Simulator:

2 cells, defaults parameter unless otherwise specified.

The SS transmits 2 BCCH carriers in the supported band(s) of the mobile station (for a multiband MS carrier A and B shall be in different bands) with the initial following parameters:

| | | level (dB μ V _{emf}) |
|-----------|--------|------------------------------------|
| carrier A | PLMN 1 | 38 |
| carrier B | PLMN 2 | 33 |

Mobile Station:

The MS is "idle updated" on PLMN1 (HPLMN) and is in manual mode.

The preferred PLMN list does not contain PLMN2, it contains PLMN 3.

Related PICS/PIXIT statement(s)

Description of the manual PLMN selector.

Support of multiband functionality

Foreseen final state of the MS

The MS is "idle updated".

Test procedure

For the different networks and during the whole test, "IMSI attach" flag is set in the BCCH data.

Carrier A is turned off. The MS does not attempt a location updating during 2 minutes.

Carrier A is turned back on with a different MCC-MNC (indicating PLMN 3) and with a higher level (48 dBmV_{emf}) than PLMN 2. The MS does not attempt a location updating during 2 minutes.

PLMN 2 is selected manually. The MS performs a location updating on PLMN 2. Carrier B is turned off. The MS does not attempt a location updating during 2 minutes.

Maximum duration of test

10 minutes

Expected Sequence

| Step | Direction | Message | Comments |
|-----------------------------|--|---|--|
| 1 2 | SS | | carrier A is turned off wait 2 min: the MS shall not send any CHANNEL REQUEST messages during this time |
| 3 4 | SS | | carrier A is turned on with a different MNC-NCC (PLMN3) and with a high level (48dBmVemf) wait 2 min: the MS shall not send any CHANNEL REQUEST messages during this time |
| 5 6 7 8 9 10 | MS MS -> SS SS -> MS MS -> SS SS -> MS SS -> MS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT LOCATION UPDATING REQUEST LOCATION UPDATING ACCEPT CHANNEL RELEASE | PLMN 2 selected manually on carrier B |
| 11 12 | SS | | carrier B is turned off wait 2 min: the MS shall not send any CHANNEL REQUEST messages during this time |

26.4 Lower layer failures in layer 3 testing

26.4.1 Introduction

The text in this section is intended to develop a standardized way of creating lower layer failures whilst testing the performance of Layer 3 signalling.

There are two groups of lower layer failures:

- 1) Detected by analysis of reception at Layer 1 (GSM 05.08, GSM 04.08),
- 2) Data link layer failures.

References

GSM 04.08, GSM 04.06, GSM 05.08

26.4.2 Layer 1 reception failures

The absence of reception of correct frames on the SACCH until the S counter reaches value 0 will be interpreted as a Layer 1 failure.

26.4.3 Data link layer failures

Many kinds of error cases can be caused in Layer 2. For example too many "T200 - time-out/retrying" - pairs.

NOTE 1: All types of data link failures are indicated similarly to the RR layer (Release Indication).

NOTE 2: All types of L1 failures are indicated similarly to each layer (Abort Indication, Error Indication).

26.4.4 Lower layer failures, used for the tests in clause 25

For L3 testing different lower layer failures are performed:

- 1) T100 time-out in Layer 1.
- 2) Too many T200 time-outs consecutively in Layer 2.

26.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions

26.5.1 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown protocol discriminator

An MS ignores messages with unknown protocol discriminator. This allows for the introduction of new messages which will be ignored by MS of earlier phases.

26.5.1.1 Conformance requirements

If the mobile station receives a standard L3 message with a protocol discriminator different from those specified in table 9.2/GSM 04.07, the mobile station shall ignore the message.

References

GSM 04.07, section 11.2.1.

26.5.1.2 Test purpose

To verify that a MS supporting TCH and the call control protocol ignores a message containing an undefined protocol discriminator in the special case of a message coded otherwise like a CC STATUS ENQUIRY message received by the MS having a mobile terminating call in CC-state U10, "active".

26.5.1.3 Method of test

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has been paged and an RR connection has been established.
If the MS supports the call control protocol, the test may alternatively be performed with the MS having a mobile terminating call in the CC-state U10, "active".

Related PICS/PIXIT statements

- At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

Same as in the initial conditions.

Test Procedure

The SS sends a message to the MS which is coded like a CC STATUS ENQUIRY message relating to the active call except for the fact that the protocol discriminator of the message is undefined.

Maximum duration of test

11 seconds.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | SS -> MS | UNKNOWN MESSAGE | The SS waits between 5 and 10 seconds verifying during this period that the MS does not send a L3 message on the main signalling link. |
| 2 | SS | | |

Specific message contents**UNKNOWN MESSAGE**

| Information element | Value/remark |
|------------------------|---|
| Protocol discriminator | 0000 |
| TI flag | transaction originated by SS |
| TI value | TI value of the active call if the test is performed in state U10 otherwise the value is arbitrary. |
| Message Type | H'34 |

26.5.2 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / TI and skip indicator**26.5.2.1 TI and skip indicator / RR**

The MS ignores RR messages with skip indicator different to 0. This allows for the introduction of new RR messages which will be ignored by MS of earlier phases, especially on the downlink CCCH and BCCH.

26.5.2.1.1 TI and skip indicator / RR / Idle Mode**26.5.2.1.1.1 Conformance requirements**

A radio resource message received with skip indicator different from 0000 shall be ignored.

Reference(s):

GSM 04.08, section 10.3.1.

26.5.2.1.1.2 Test purpose

To verify that the MS ignores an RR message with skip indicator different from H'0 in the special case of a PAGING REQUEST TYPE 1 message received in the MM-state "idle, updated" and in RR-idle mode.

26.5.2.1.1.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Test Procedure

For every binary value x in the range 0001 - 0110 (binary) and for binary value x = 1000, the following procedure is performed: The SS sends a PAGING REQUEST TYPE 1 message to the MS with skip indicator set to x. It is verified that the MS does not answer to the paging request message.

Maximum duration of test

5 seconds for each execution.

Expected sequence

The sequence is executed for execution counter k = 1,2,3,4,5,6,8.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The value of the skip indicator IE is the binary encoding of k. |
| 2 | SS | | During 3 seconds the SS verifies that the MS does not send any message on the RACH. |

Specific message contents

None.

26.5.2.1.2 TI and skip indicator / RR / RR-Connection established**26.5.2.1.2.1 Conformance requirements**

A radio resource message received with skip indicator different from H'0 shall be ignored.

Reference(s):

GSM 04.08, section 10.3.1.

26.5.2.1.2.2 Test purpose

To verify that the MS ignores RR messages with skip indicator different from H'0 in the case of a message being received during the RR-connection establishment in the MM-state "idle, updated" / "wait for network command" and in RR-connected mode.

26.5.2.1.2.3 Method of test**Initial conditions**

System Simulator:

1 cell, default parameters, max retrans = 2.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message to the MS with skip indicator set to H'0. The first CHANNEL REQUEST message will be answered with an IMMEDIATE ASSIGNMENT addressing the MS but with skip indicator set to H'1. Transmission of the second CHANNEL REQUEST message verifies that the MS has ignored the IMMEDIATE ASSIGNMENT message.

The second CHANNEL REQUEST message is answered by an IMMEDIATE ASSIGNMENT REJECT message addressing the MS but with skip indicator set to H'2 and a reject time set to 255 seconds. Transmission of the third CHANNEL REQUEST message verifies that the MS has ignored the IMMEDIATE ASSIGNMENT REJECT message.

The third CHANNEL REQUEST message from the MS will be answered with a correct IMMEDIATE ASSIGNMENT addressing the MS and having skip indicator set to H'0.

In the RR-Connected mode messages such as CIPHERING MODE COMMAND, HANDOVER COMMAND, ASSIGNMENT COMMAND and CHANNEL RELEASE are sent with the skip indicator <> H'0 and it is checked that the MS does not take any action on these commands.

Maximum duration of test

40 seconds.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The value of the skip indicator IE is H'0 |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | skip indicator set to H'1 |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | skip indicator = H'2, reject time = 255 seconds |
| 6 | MS -> SS | CHANNEL REQUEST | Cause, answer to paging |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT | skip indicator = H'0 |
| 8 | MS -> SS | PAGING RESPONSE | RR connection established |
| 9 | SS -> MS | AUTHENTICATION REQUEST | |
| 10 | MS -> SS | AUTHENTICATION RESPONSE | |
| 11 | SS -> MS | CIPHERING MODE COMMAND | skip indicator = H'3 |
| 12 | SS | | the SS neither starts ciphering nor deciphering |
| 13 | SS -> MS | IDENTITY REQUEST | with IMSI requested |
| 14 | MS -> SS | IDENTITY RESPONSE | to check the MS still uses unciphered mode |
| 15 | SS -> MS | ASSIGNMENT COMMAND | skip indicator = H'4 |
| 16 | SS | | SS checks no SABM is sent by the MS on the new channel |
| 17 | SS -> MS | HANDOVER COMMAND | skip indicator = H'5 |
| 18 | SS | | During 3 seconds the SS verifies that the MS does not send a handover failure or RR STATUS message on the old channel |
| 19 | SS -> MS | CHANNEL RELEASE | skip indicator = H'6 |
| 20 | SS -> MS | IDENTITY REQUEST | with IMSI requested |
| 21 | MS -> SS | IDENTITY RESPONSE | to check the RR connection is still established |
| 22 | SS -> MS | CHANNEL RELEASE | skip indicator = H'0 |
| 23 | SS | | The SS checks that the layer 2 connection is released |

Specific message contents

None.

26.5.2.2 TI and skip indicator / MM

The MS ignores MM messages with skip indicator different to 0. This allows for the introduction of new MM messages which will be ignored by MS of earlier phases.

26.5.2.2.1 Conformance requirements

A mobility management message received with skip indicator different from 0000 shall be ignored.

References

GSM 04.08, section 10.3.1.

26.5.2.2.2 Test purpose

To verify that the MS ignores an MM message with skip indicator different from H'0 in the special case of an IDENTITY REQUEST message received.

26.5.2.2.3 Method of test**Initial conditions**

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active", or alternatively, the MS has been paged and an RR connection has been established.

Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

Foreseen Final State of the MS

Same as in the initial conditions.

Test Procedure

For every binary value x in the range 0001 - 0110 and for the binary value x = 1000, the following procedure is performed: The SS sends an IDENTITY REQUEST message to the MS with skip indicator set to x. It is verified during 5 seconds that the MS does not answer to the IDENTITY REQUEST message.

Maximum duration of test

15 seconds.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'1. |
| 2 | SS | | The SS starts verifying that the MS does not send any L3 message on the main signalling link. This verification continues until step 16 of this test sequence. |
| 3 | SS | | The SS waits 1 second. |
| 4 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'2. |
| 5 | SS | | The SS waits 1 second. |
| 6 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'3. |
| 7 | SS | | The SS waits 1 second. |
| 8 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'4. |
| 9 | SS | | The SS waits 1 second. |
| 10 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'5. |
| 11 | SS | | The SS waits 1 second. |
| 12 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'6. |
| 13 | SS | | The SS waits 1 second. |
| 14 | SS -> MS | IDENTITY REQUEST | Skip indicator IE has value H'8. |
| 15 | SS | | The SS waits 5 seconds. |
| 16 | SS | | The SS stops verifying that the MS does not send any L3 message on the main signalling link. |

Specific message contents

None.

26.5.2.3 TI and skip indicator / CC**26.5.2.3.1 Conformance requirements**

- a) Whenever any call control message except SETUP or RELEASE COMPLETE is received specifying a transaction identifier with a value different from 111, which is not recognized as relating to an active call or to a call in progress, the receiving entity shall send a RELEASE COMPLETE message with cause value #81 "invalid transaction identifier value" using the received transaction identifier value and remain in the Null state.
- b1) When a RELEASE COMPLETE message is received specifying a transaction identifier with a value different from 111, which is not recognized as relating to an active call or to a call in progress, the MM-connection associated with that transaction identifier shall be released.
- b2) When a SETUP message is received with a transaction identifier flag set to "1", this message shall be ignored.
- b3) When a SETUP message is received specifying a transaction identifier which is recognized as relating to an active call or to a call in progress, this SETUP message shall be ignored.
- c) When a CC message with a TI value = 111 is received, this message shall be ignored.

References

GSM 04.08, section 8.3.

26.5.2.3.2 Test purpose

- a) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a DISCONNECT message which includes a transaction identifier with a value different from 111, which is not recognized as relating to an active call or a call in progress, sends a RELEASE COMPLETE message with cause value #81 and referring to the latter TI without changing the state of the active call (this is verified by use of the status enquiry procedure).

- b) To verify that the MS having a mobile terminating call in CC-state U10, "active", on receipt of a
- b1) RELEASE COMPLETE message which includes a transaction identifier with a value different from 111, which is not recognized as relating to an active call or a call in progress, or a
 - b2) SETUP message with TI flag referring to a transaction originated by the MS (in the special case where the TI value is equal to the TI value relating to the active call), or a
 - b3) SETUP message with TI referring to the active call,
- ignores that message without changing the state of the active call (this is verified by use of the status enquiry procedure).
- c) To verify that the MS ignores a CC message with a TI value of 111.

The test is only applicable to an MS supporting the call control protocol for at least one BC.

26.5.2.3.3 Method of test

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a mobile terminating call in CC-state U10, "active". No other call is active or in progress.

Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active". No other call is active or in progress.

Test Procedure

The SS sends a DISCONNECT message to the MS with a TI not relating to the active call. The MS shall respond with a RELEASE COMPLETE message including cause value #81 and specifying the same transaction. By means of the status enquiry procedure the SS checks that the CC-state of the active call did not change.

Then the SS sends the following call control messages to the MS;

- a RELEASE COMPLETE message, where the TI does not refer to the active call,
- a SETUP message with TI flag set to 1,
- a SETUP message with TI referring to the active call,
- a DISCONNECT message with a TI value of 111.

Each time the SS verifies that the MS does not respond to the message and each time the SS verifies by means of the status enquiry procedure that the CC-state of the active call has not been changed.

Maximum duration of test

40 seconds.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | DISCONNECT | TI flag = 0; TI does not refer to the active call. |
| 2 | MS -> SS | RELEASE COMPLETE | TI flag = 1; TI value is equal to TI value received in step 1; Cause IE indicates cause value #81. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 5 | SS -> MS | RELEASE COMPLETE | TI flag = 0; TI does not refer to the active call. |
| 6 | SS | | The SS verifies during 5 seconds that the MS does not send any L3 message on the main signalling link. |
| 7 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 8 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 9 | SS -> MS | SETUP | TI flag = 1; TI value is equal to TI value of the active call. |
| 10 | SS | | The SS verifies during 5 seconds that the MS does not send any L3 message on the main signalling link. |
| 11 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 12 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 13 | SS -> MS | SETUP | TI flag = 0; TI refers to the active call. |
| 14 | SS | | The SS verifies during 5 seconds that the MS does not send any L3 message on the main signalling link. |
| 15 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 16 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 17 | SS -> MS | DISCONNECT | TI flag = 0; TI value is 111. |
| 18 | SS | | The SS verifies during 5 seconds that the MS does not send any L3 message on the main signalling link. |
| 19 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 20 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

26.5.3 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / undefined or unexpected message type

26.5.3.1 Undefined or unexpected message type / undefined message type / CC

26.5.3.1.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

References

GSM 04.08, section 8.4; GSM 04.07, section 11.2.4.

26.5.3.1.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with CC protocol discriminator and an arbitrary undefined message type, returns a STATUS message with cause value #97 to the peer CC entity without changing the state of the active call (this is verified by use of the status enquiry procedure).

26.5.3.1.3 Method of test**Initial conditions**

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a mobile terminating call in CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active".

Test Procedure

The SS sends a message to the MS the PD of which refers to call control, the TI of which refers to the active call, and the message type of which is undefined in the call control protocol (however bit 7 of the message type is "0"). The SS then checks that the MS responds with a STATUS message specifying cause value #97. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause value #30 and call state U10, "active".

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS -> MS | see comments | PD = "call control; call related SS messages" TI is that of the active call Message type is undefined for call control, bit 7 of the message type is "0" Cause IE indicates cause value #97. |
| 2 | MS -> SS | STATUS | |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 4 | MS -> SS | STATUS | |

Specific message contents

None.

26.5.3.2 Undefined or unexpected message type / undefined message type / MM**26.5.3.2.1 Conformance requirements**

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

References

GSM 04.08, section 8.4.

26.5.3.2.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a mobile terminating call in CC-state U10, "active", on receipt of a message with MM protocol discriminator and message type undefined for the mobility management protocol, returns an MM STATUS message with reject cause value #97 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the CC TI has value 0 (so that it has the same encoding as the skip indicator when sent from the SS) and where the message type has the same encoding as DISCONNECT in CC.

26.5.3.2.3 Method of test

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a mobile terminating call in CC-state U10, "active". The TI of that mobile terminating call has value 0.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS has a mobile terminating call in CC-state U10, "active".

Test Procedure

The SS sends a message to the MS the PD of which refers to mobility management, the skip indicator of which is "0000", and the message type of which is "0010 0101". The SS then checks that the MS responds with an MM STATUS message specifying reject cause value #97. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause #30 and call state U10, "active".

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS -> MS | see comments | PD = "mobility management messages" Skip indicator = "0000" Message type = "0010 0101" rest of the message is H'02 H'E0 H'90 Reject cause IE indicates reject cause value #97. |
| 2 | MS -> SS | MM STATUS | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |

Specific message contents

None.

26.5.3.3 Undefined or unexpected message type / undefined message type / RR

26.5.3.3.1 Conformance requirements

If the Mobile Station receives a message with message type not defined for the PD, it shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #97 "message type non-existent or not implemented".

Reference(s)

GSM 04.08, section 8.4.

26.5.3.3.2 Test purpose

To verify that an MS in RR connected mode on receipt of a message with RR protocol discriminator and message type undefined for the RR protocol, returns an RR STATUS message with reject cause value #97 without changing its state (this is checked by observing that the MS does not send L3 messages.)

26.5.3.3.3 Method of test

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has been paged and an RR connection has been established.

Related PICS/PIXIT statement(s)

- At least one circuit switched basic service supported(p = Y/N)

Foreseen Final State of the MS

The MS is in "idle updated" state.

Test Procedure

The SS sends a message to the MS the PD of which refers to radio resources management, the skip indicator of which is "0000", and the message type of which is "0010 1010". The SS then checks that the MS responds with an RR STATUS message specifying reject cause value #97. The SS then verifies during 5 seconds that the MS does not send a L3 message on the main signalling link but continues sending L2 fill frames on the main signalling link. Then the SS sends a SETUP message to the MS. This message specifies a BC that is supported by the MS, if there exists any; if the MS does not support any BC, the SETUP message specifies an arbitrary BC. The SS then verifies that the MS responds with a CALL CONFIRMED message if the SETUP had specified a BC supported by the MS, and that the MMS responds with a RELEASE COMPLETE message otherwise. Then the SS sends a CHANNEL RELEASE to the MS and waits for the disconnection of the main signalling link.

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS->MS | see comments | PD = "radio resources management messages" Skip indicator = "0000" Message type = "0010 0101" rest of the message is H'02 H'E0 H'90 RR cause IE indicates RR cause value #97. During 5 seconds the SS verifies that the MS does not send a L3 message on the main signalling link but still continues to send L2 fill frames on the main signalling link. |
| 2 | MS->SS | RR STATUS | |
| 3 | SS | | |
| 4 | SS->MS | SETUP | If the MS supports at least one BC (p = Y), the SETUP specifies a bearer capability supported by the MS. Otherwise (p = N) the SETUP message specifies any bearer capability. |
| A5 | MS->SS | CALL CONFIRMED | This message shall be sent by the MS if p = Y. |
| B5 | MS->SS | RELEASE COMPLETE | This message shall be sent by the MS if p = N. |
| 6 | SS->MS | CHANNEL RELEASE | The SS waits for disconnection of the main signalling link. |

Specific message contents

None.

26.5.3.4 Undefined or unexpected message type / unexpected message type / CC**26.5.3.4.1 Conformance requirements**

If the Mobile Station receives a message not consistent with the protocol state, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #98 "Message type not compatible with protocol state".

References

GSM 04.08, section 8.4.

26.5.3.4.2 Test purpose

To verify that a MS supporting the call control protocol for at least one BC, having a call in CC-state U10, "active", on receipt of an inopportune CC message, returns a STATUS message with reject cause value #98 without changing the state of the active call (this is verified by use of the status enquiry procedure.) This is tested in the special case where the inopportune CC message is a CALL PROCEEDING message relating to the active call.

26.5.3.4.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a call in CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS has a call in CC-state U10, "active".

Test Procedure

The SS sends a CALL PROCEEDING message to the MS. The SS then checks that the MS responds with a STATUS message specifying reject cause value #98. The SS then sends a STATUS ENQUIRY message to the MS and verifies that the MS responds with a STATUS message specifying cause #30 and call state U10, "active".

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | SS -> MS | CALL PROCEEDING | Cause IE indicates cause value #98. |
| 2 | MS -> SS | STATUS | |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 4 | MS -> SS | STATUS | |

Specific message contents

None.

26.5.4 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unforeseen information elements in the non-imperative message part

26.5.4.1 Unforeseen information elements in the non-imperative message part / duplicated information elements

26.5.4.1.1 Conformance requirements

If an information element with format T, TV, or TLV is repeated in a message in which repetition of the information element is not specified, only the contents of the information element appearing first shall be handled and all subsequent repetitions of the information element shall be ignored.

References

GSM 04.08, section 8.6.3.

26.5.4.1.2 Test purpose

To verify that the MS ignores an unforeseen second occurrence of an information element with format T, TV, or TLV in the special case of the mobile identity IE which has format TLV in the LOCATION UPDATING ACCEPT message.

26.5.4.1.3 Method of test

Initial conditions

System Simulator:

2 cells A and B belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode, listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode, listening to the BCCH/CCCH of cell B. It does not have a valid TMSI.

Test Procedure

The RF level of cell A is lowered until the MS selects cell B (according to the cell-reselection procedures of GSM 05.08). The MS shall establish an RR connection and initiate the normal location updating procedure (using TMSI). The SS responds to the location update request with the LOCATION UPDATING ACCEPT message containing the mobile identity IE specifying the IMSI of the MS followed by an additional mobile identity IE specifying the TMSI that was assigned to the MS in the initial conditions (i.e. duplication of information element).

The SS then pages the MS using the PAGING REQUEST TYPE 1 message including the TMSI which was previously used in the LOCATION UPDATE ACCEPT message. The SS then verifies during 5 seconds that the MS does not answer to paging. The SS then pages the MS with its IMSI. The SS verifies that the MS responds on cell B by initiating the immediate assignment procedure using the CHANNEL REQUEST message.

Maximum duration of test

20 s.

Expected sequence

During 3 seconds the SS verifies that the MS does not send any message on the RACH.

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | Mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | (see below) |
| 6 | SS -> MS | CHANNEL RELEASE | |
| 7 | SS | | The SS waits at least 5 s to give the MS time to become pageable |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity 1 IE specifies the TMSI of the MS. Mobile identity 2 is omitted. |
| 9 | SS | | The SS waits at least 5 seconds During that period the SS verifies that the MS does not send any message on the RACH. |
| 10 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity 1 IE specifies the IMSI of the MS. Mobile identity 2 is omitted. |
| 11 | MS -> SS | CHANNEL REQUEST | Establishment cause = answer to paging. |
| 12 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents**LOCATION UPDATING ACCEPT**

| Information element | value/remark |
|-------------------------------|---|
| location area identification | LAI of cell B |
| Mobile identity | coded TLV, specifies the IMSI of the MS |
| Type of identity | IMSI |
| Odd/even indication | corresponding to IMSI |
| Identity digit 1 etc. | corresponding to IMSI |
| Mobile identity (duplication) | coded TLV |
| Type of identity | TMSI of the MS |
| Odd/even indication | corresponding to TMSI |
| Identity digit 1 etc. | corresponding to TMSI |

26.5.5 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / non-semantical mandatory IE errors**26.5.5.1 Non-semantical mandatory IE errors / RR****26.5.5.1.1 Non-semantical mandatory IE errors / RR / missing mandatory IE error****26.5.5.1.1.1 Non-semantical mandatory IE errors / RR / missing mandatory IE error / special case**

The MS shall accept a CHANNEL RELEASE message whether it contains an RR cause or not. This allows for the shortening of the message in the future.

26.5.5.1.1.1.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed the MS shall proceed as follows: If the message is a CHANNEL RELEASE message, the actions taken shall be the same as specified for a normal RR-connection release.

References

GSM 04.08, section 8.5.

26.5.5.1.1.1.2 Test purpose

To verify that the MS in RR connected mode releases the connection upon receipt of a CHANNEL RELEASE message with missing RR cause (which is "mandatory" in that message).

26.5.5.1.1.1.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Test Procedure

A mobile terminating RR connection is established. Then the SS sends a CHANNEL RELEASE message in which the RR cause IE is missing. It is verified that the MS releases the main signalling link by sending a L2 DISC frame. The main signalling link release is then completed.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The mandatory RR cause IE is missing (the message consists only of protocol discriminator, skip indicator, and message type). The main signalling link is released (this is observed by a L2 DISC frame sent from the MS to the SS). |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | |
| 6 | MS -> SS | | |

Specific message contents

None.

26.5.5.1.1.2 Non-semantic mandatory IE errors / RR / missing mandatory IE error / general case

In the general case, the MS has to report an RR message with missing mandatory IE by the use of an RR STATUS message, but otherwise to ignore it. This is a recovery mechanism for unforeseen states.

26.5.5.1.1.2.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed the MS shall proceed as follows: If the message is not one of the messages listed in sections 8.5.1, 8.5.2, and 8.5.3 of GSM 04.08, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a status message (STATUS, RR STATUS or MM STATUS depending on the protocol discriminator) with cause value #96 "invalid mandatory information".

References

GSM 04.08, section 8.5.

26.5.5.1.1.2.2 Test purpose

To verify that the MS in RR connected mode ignores a ciphering mode command message in which the ciphering mode setting IE and cipher response IE are missing except for the fact that it returns a RR STATUS message.

26.5.5.1.1.2.3 Method of test

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the MM-state "idle, updated" and in RR-idle mode. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in RR-connected mode.

Test Procedure

A mobile terminating RR connection is established. Then the SS sends a ciphering mode command message in which the ciphering mode setting IE and cipher response IE are missing. The SS verifies that the MS does not start ciphering and returns a RR STATUS message.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The mandatory ciphering mode setting IE and cipher response IE are missing. RR cause IE specifies RR cause value #96. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | RR STATUS | |

Specific message contents

None.

26.5.5.1.2 Non-semantical mandatory IE errors / RR / comprehension required**26.5.5.1.2.1 Conformance requirements**

When an RR message containing an IE unknown in the message, but encoded as "comprehension required" (see subclause 10.5 / GSM 04.08) is received, the MS shall proceed as follows: When the message is not one of the messages listed in GSM 04.08 sections 8.5.1, 8.5.2, and 8.5.3, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a RR STATUS message with cause value #96 "invalid mandatory information".

References

GSM 04.08, section 8.5.

26.5.5.1.2.2 Test purpose

To verify that the MS having an RR-connection established ignores a HANDOVER COMMAND message containing in the non-imperative part an IE encoded as comprehension required except for the fact that it returns a RR STATUS message with cause # 96 "invalid mandatory information".

26.5.5.1.2.3 Method of test**Initial conditions**

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has an MT call in state U10, "active"; or alternatively, the MS has been paged and an RR-connection has been established.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

As in the initial conditions.

Test Procedure

The SS sends a HANDOVER command message containing in the non-imperative part an IE encoded as comprehension required. The SS verifies that the MS returns a RR STATUS message with cause value #96 without changing the dedicated channel.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | HANDOVER COMMAND | See below. |
| 2 | MS -> SS | RR STATUS | Sent on the old channel. RR cause IE specifies RR cause value #96. |

Specific message contents**HANDOVER COMMAND**

| Information element | value/remark |
|----------------------------|--------------|
| cell description | as required |
| channel description | as required |
| handover reference | as required |
| power command | as required |
| comprehension required IEI | 0000 0000 |
| length | 0000 0001 |
| unrecognized IE contents | xxxx xxxx |

26.5.5.2 Non-semantic mandatory IE errors / MM

The MS shall ignore MM messages with syntactically incorrect mandatory IE. This allows to use reserved values in later phases.

26.5.5.2.1 Non-semantic mandatory IE errors / MM / syntactically incorrect mandatory IE

Test 26.5.5.2.1 is only applicable for an MS supporting at least one BC, whereas test 26.5.5.2.2 is applicable to all types of MS.

26.5.5.2.1.1 Conformance requirements

When an MM message containing a syntactically incorrect mandatory IE is received, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a MM STATUS message with cause value #96 "invalid mandatory information".

References

GSM 04.08, section 8.5.

26.5.5.2.1.2 Test purpose

To verify that an MS supporting at least one BC, having a CC entity in state U10, "active", ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity; that the MS otherwise ignores the message is checked by means of the status enquiry procedure.

26.5.5.2.1.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a mobile terminating call in the CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS has a mobile terminating call in the CC-state U10, "active".

Test Procedure

The SS sends an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity. The SS verifies that the MS returns an MM STATUS message specifying cause value #96 but does not change its state (this is verified by use of the status enquiry procedure).

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS -> MS | IDENTITY REQUEST | The identity type IE is encoded as "1111" (so that the type of identity contains the reserved value "111"). |
| 2 | MS -> SS | MM STATUS | Reject cause IE indicates reject cause value #96. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the active call. |
| 4 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10. |

Specific message contents

None.

26.5.5.2.2 Non-semantic mandatory IE errors / MM / syntactically incorrect mandatory IE

Test 26.5.5.2.1 is only applicable for an MS supporting at least one BC, whereas this test (26.5.5.2.2) is applicable to all types of MS.

26.5.5.2.2.1 Conformance requirement(s)

When an MM message containing a syntactically incorrect mandatory IE is received, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns an MM STATUS message with cause value #96 "invalid mandatory information".

Reference(s)

GSM 04.08, section 8.5.

26.5.5.2.2.2 Test purpose

To verify that an MS having been paged and having an RR connection established ignores an MM message with syntactically incorrect IE except for the fact that it sends an MM STATUS message with reject cause #96. This is tested in the special case of an IDENTITY REQUEST message in which the (mandatory) *identity type* IE specifies a reserved value for the type of identity; the fact that the MS otherwise ignores the message is checked by testing that it answers as usual to an incoming SETUP message.

26.5.5.2.2.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has been paged; an RR connection has been established.
The MS has a valid TMSI.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(p=Y/N).

Foreseen final state of the MS

The MS is in the MM-state "idle updated" listening to the BCCH/CCCH of the cell. It has a valid TMSI.

Test Procedure

The SS sends an IDENTITY REQUEST message in which the (mandatory) identity type IE specifies a reserved value for the type of identity. The SS verifies that the MS returns an MM STATUS message specifying cause value #96 but does not change its state; this is verified as follows:

The SS sends a SETUP message to the MS. This message specifies a BC that is supported by the MS, if there exists any; if the MS does not support any BC, the SETUP message specifies an arbitrary BC. The SS then verifies that the MS responds with a CALL CONFIRMED message if the SETUP had specified a BC supported by the MS, and that the MS responds with a RELEASE COMPLETE message otherwise.

Then the SS sends a CHANNEL RELEASE to the MS and waits for the disconnection of the main signalling link.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS -> MS | IDENTITY REQUEST | The identity type IE is encoded as "1111" (so that the type of identity contains the reserved value "111"). |
| 2 | MS -> SS | MM STATUS | Reject cause IE indicates reject cause value #96. |
| 3 | SS -> MS | SETUP | If the MS supports at least one BC (p = Y), the SETUP specifies a bearer capability supported by the MS. Otherwise (p = N) the SETUP message specifies any bearer capability. |
| A4 | MS -> SS | CALL CONFIRMED | This message shall be sent by the MS if p = Y. |
| B4 | MS -> SS | RELEASE COMPLETE | This message shall be sent by the MS if p = N. |
| 5 | SS -> MS | CHANNEL RELEASE | The SS waits for disconnection of the main signalling link. |

Specific message contents

None.

26.5.5.2.3 Non-semantical mandatory IE errors / MM / comprehension required

The "comprehension required" mechanism allows for the introduction of essential new information elements into messages, such that a message is ignored and a report is sent if the new information element is not understood.

26.5.5.2.3.1 Conformance requirements

When an MM message containing an IE unknown in the message, but encoded as "comprehension required" (see subclause 10.5 / GSM 04.08) is received, the MS shall ignore the message except for the fact that, if an RR-connection exists, it returns an MM STATUS message with cause value #96 "invalid mandatory information".

References

GSM 04.08, section 8.5.

26.5.5.2.3.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message, but encoded as "comprehension required" ignores the message except for the fact that it returns an MM STATUS message with cause value #96 "invalid mandatory information"; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

26.5.5.2.3.3 Method of test**Initial conditions**

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

Test Procedure

The Rf level of cell A is lowered until the MS selects cell B. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element coded as "comprehension required". The SS verifies that the MS returns the MM STATUS message with cause #96 in response to the LOCATION UPDATING ACCEPT. The SS then waits for the MS to abort the RR-connection. The SS verifies that the MS establishes a new RR connection and starts a new location updating procedure.

On receipt of the new LOCATION UPDATING REQUEST, the SS sends a correctly coded LOCATION UPDATING ACCEPT allocating a new TMSI.

The SS verifies that the MS sends a TMSI REALLOCATION COMPLETE message. The SS then initiates the RR connection release.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | See below. |
| 6 | MS -> SS | MM STATUS | Reject cause IE specifies reject cause value #96. |
| 7 | MS | | The MS aborts the RR connection (it initiates release of L2 on SAPI 0) using the L2 DISC / UA exchange. |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the IMSI of the MS. |
| 11 | SS -> MS | LOCATION UPDATING ACCEPT | see below |
| 12 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 13 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

Specific message contents**LOCATION UPDATING ACCEPT - first occurrence**

| Information element | value/remark |
|------------------------------|-----------------------------|
| Location area identification | LAI of cell B |
| Comprehension required IEI | 0000 0000 |
| length | 1 |
| unrecognized IE contents | xxxx xxxx (arbitrary octet) |

LOCATION UPDATING ACCEPT - second occurrence

| Information element | value/remark |
|------------------------------|-------------------------|
| Location area identification | specifies LAI of cell B |
| Mobile Identity | specifies a TMSI |

26.5.5.3 Non-semantical mandatory IE errors / CC**26.5.5.3.1 Non-semantical mandatory IE errors / CC / missing mandatory IE****26.5.5.3.1.1 Non-semantical mandatory IE errors / CC / missing mandatory IE / disconnect message****26.5.5.3.1.1.1 Conformance requirements**

When on receipt of a message a "missing mandatory IE" error is diagnosed, the MS shall proceed as follows:
If the message is a DISCONNECT message, a RELEASE message shall be returned with cause value # 96 "invalid mandatory information" and normal call clearing applies.

References

GSM 04.08, section 8.5.

26.5.5.3.1.1.2 Test purpose

To verify that the MS having an MT call in state U10, "active", on receipt of a DISCONNECT message in which the mandatory cause IE is missing shall return a RELEASE message with cause value #96 "invalid mandatory information".

26.5.5.3.1.1.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has an MT call in the CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a DISCONNECT message in which the (mandatory) cause IE is missing. The SS verifies that the MS returns a RELEASE message specifying cause value #96. The SS then sends a RELEASE COMPLETE message and performs the RR connection release.

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | DISCONNECT | The mandatory cause IE is missing. |
| 2 | MS -> SS | RELEASE | The cause IE indicates cause value #96 |
| 3 | SS -> MS | RELEASE COMPLETE | |
| 4 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

Specific message contents

None.

26.5.5.3.1.2 Non-semantical mandatory IE errors / CC / missing mandatory IE / general case

26.5.5.3.1.2.1 Conformance requirements

When on receipt of a message a "missing mandatory IE" error is diagnosed, the MS shall proceed as follows: If the message is not a SETUP, RELEASE, DISCONNECT, RELEASE COMPLETE, HOLD REJECT or RETRIEVE REJECT message, it shall ignore the message except for the fact that it returns a STATUS message specifying cause value #96.

References

GSM 04.08, section 8.5.

26.5.5.3.1.2.2 Test purpose

To verify that the MS having an MT call in state U10, "active", on receipt of a STATUS message in which the mandatory cause IE and call state IE are missing shall ignore the message except for the fact that it return a STATUS message with cause value #96 "invalid mandatory information" (that the MS does not change state is checked by use of the status enquiry procedure).

26.5.5.3.1.2.3 Method of test

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has an MT call in the CC-state U10, "active".

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS has an MT call in the CC-state U10, "active".

Test Procedure

The SS sends a STATUS message in which the mandatory cause IE and call state IE are missing. The SS verifies that the MS returns a STATUS message with cause value #96 "invalid mandatory information". Then the SS sends a STATUS ENQUIRY message and checks that the MS returns a STATUS message indicating cause value #30 and call state U10, "active".

Maximum duration of test

15 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS -> MS | STATUS | The mandatory cause IE and call state IE are missing. The cause IE indicates cause value #96 TI refers to the active call. TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U10 |
| 2 | MS -> SS | STATUS | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

Specific message contents

None.

26.5.5.3.2 Non-semantical mandatory IE errors / CC / comprehension required

This test is applicable to all MS which support at least one MO circuit switched basic service.

26.5.5.3.2.1 Conformance requirements

When a CC message containing an IE unknown in the message, but encoded as "comprehension required" (see GSM 04.08, section 10.5) is received, the MS shall proceed as follows: When the message is not one of the messages listed in GSM 04.08 sections 8.5.1, 8.5.2, and 8.5.3, the Mobile Station shall ignore the message except for the fact that, if an RR-connection exists, it returns a STATUS message with cause value #96 "invalid mandatory information".

References

GSM 04.08, sections 8.5 and 10.5.

26.5.5.3.2.2 Test purpose

To verify that an MS supporting the call control protocol for at least one BC having a call control entity in state U3 ignores a CONNECT message containing in the non-imperative part an IE encoded as comprehension required except for the fact that it returns a STATUS message with cause value #96 "invalid mandatory information".

26.5.5.3.2.3 Method of test

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a call control entity in CC state U3.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

The MS supports MO calls.

Foreseen Final State of the MS

The MS has a call control entity in CC state U3.

Test Procedure

The SS sends a CONNECT message containing an optional information element coded as "comprehension required". The SS verifies that the MS returns a STATUS message specifying cause value #96 "invalid mandatory information". The SS checks by use of the status enquiry procedure that the MS did not change the state.

Maximum duration of test

5 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS -> MS | CONNECT | See below. |
| 2 | MS -> SS | STATUS | TI refers to the call in progress; cause IE indicates cause value #96. |
| 3 | SS -> MS | STATUS ENQUIRY | TI refers to the call in progress. |
| 4 | MS -> SS | STATUS | TI refers to the call in progress; Cause IE indicates cause value #30. Call state IE indicates state U3. |

Specific message contents**CONNECT**

| Information element | value/remark |
|---------------------|-----------------------------|
| Unknown IEI | 0000 0000 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

26.5.6 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / unknown IE, comprehension not required

26.5.6.1 Unknown information elements in the non-imperative message part / MM

26.5.6.1.1 Unknown IE, comprehension not required / MM / IE unknown in the protocol

26.5.6.1.1.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, sections 8.6.1, 8.6.2 and 10.5.

26.5.6.1.1.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message and unknown in the MM protocol which is not encoded as "comprehension required" ignores that IE; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

26.5.6.1.1.3 Method of test**Initial conditions**

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Test Procedure

The RF level of cell B is lowered until the MS selects cell A. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element not coded as "comprehension required" the IE of which is unknown in the MM protocol. The LOCATION UPDATING ACCEPT message contains a new TMSI in the mobile identity IE which is placed after the unknown IE. The MS shall send the TMSI REALLOCATION COMPLETE message.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | SS | | The RF level of cell B is lowered until the MS selects cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | See below. |
| 6 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 7 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific message contents**LOCATION UPDATING ACCEPT**

| Information element | value/remark |
|------------------------------|----------------------------------|
| Location area identification | LAI of cell A |
| Unknown IEI | 1010 xxx0 (where x is arbitrary) |
| Mobile Identity IEI | |
| length | 5 |
| Type of identity | TMSI |
| Identity | 4 octets of "new" TMSI |

26.5.6.1.2 Unknown IE, comprehension not required / MM / IE unknown in the message**26.5.6.1.2.1 Conformance requirements**

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, sections 8.6.1, 8.6.2 and 10.5.

26.5.6.1.2.2 Test purpose

To verify that the MS on receipt of an MM message containing an IE unknown in the message, but known in the MM protocol, which is not encoded as "comprehension required" ignores that IE; this in the special case of the MM message being a LOCATION UPDATING ACCEPT responding to a LOCATION UPDATING REQUEST from the MS.

26.5.6.1.2.3 Method of test**Initial conditions**

System Simulator:

The SS simulates two cells, A and B, belonging to different location areas, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell B. It has a valid TMSI.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" listening to the BCCH/CCCH of cell A. It has a valid TMSI.

Test Procedure

The RF level of cell B is lowered until the MS selects cell A. The SS verifies that the MS establishes an RR connection and performs the normal location updating procedure using its TMSI. The SS responds to the location updating request with the LOCATION UPDATING ACCEPT message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message but is used as the location area identification IEI in other messages of the MM protocol. The LOCATION UPDATING ACCEPT message contains a new TMSI in the mobile identity IE which is placed after the unknown IE. The MS shall send the TMSI REALLOCATION COMPLETE message.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | SS | | The RF level of cell B is lowered until the MS selects cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | The mobile identity IE specifies the TMSI of the MS. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | MS -> SS | TMSI REALLOCATION COMPLETE | See below. |
| 7 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific message contents**LOCATION UPDATING ACCEPT**

| Information element | value/remark |
|------------------------------|--|
| Location area identification | LAI of cell A |
| Unknown IEI | 0001 0011 |
| length | 2 |
| unknown IE contents | xxxx xxxx xxxx xxxx (2 arbitrary octets) |
| Mobile Identity IEI | |
| length | 5 |
| Type of identity | TMSI |
| Identity | 4 octets of "new" TMSI |

26.5.6.2 Unknown information elements in the non-imperative message part / CC**26.5.6.2.1 Unknown information elements in the non-imperative message part / CC / Call establishment**

This test is applicable to all MS which support at least one MO circuit switched basic service.

26.5.6.2.1.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, section 8.6.1.

26.5.6.2.1.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of the CC message being a CALL PROCEEDING message received by the MS in state U1.

26.5.6.2.1.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a call control entity in CC state U1.

Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

Foreseen Final State of the MS

The MS has a call control entity in CC state U3.

Test Procedure

The SS sends a CALL PROCEEDING message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a called party BCD number IE in other messages of the protocol. The SS verifies by use of the status enquiry procedure that the MS did not change the state.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---|
| 1 | SS -> MS | CALL PROCEEDING | See below. |
| 2 | SS -> MS | STATUS ENQUIRY | TI refers to the call in progress. |
| 3 | MS -> SS | STATUS | TI refers to the active call; Cause IE indicates cause value #30. Call state IE indicates state U3. |

Specific message contents**CALL PROCEEDING**

| Information element | value/remark |
|---------------------|-----------------------------|
| Unknown IEI | 0101 1110 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

26.5.6.2.2 Unknown information elements in the non-imperative message part / CC / disconnect

26.5.6.2.2.1 Conformance requirements

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, section 8.6.1.

26.5.6.2.2.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a DISCONNECT message received by the MS in state U10.

26.5.6.2.2.3 Method of test**Initial conditions**

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS has a call control entity in CC state U10.

Related PICS/PIXIT statements

At least one circuit switched basic service supported (Y/N).

Foreseen Final State of the MS

The MS has a call control entity in CC state U19.

Test Procedure

The SS sends a DISCONNECT message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a connected number IE in other messages of the protocol. The SS verifies that the MS responds with a RELEASE message; the SS verifies by use of the status enquiry procedure that the MS has entered state U19.

Maximum duration of test

5 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS -> MS | DISCONNECT | See below. Cause IE indicates cause value #30. Call state IE indicates state U19. |
| 2 | MS -> SS | RELEASE | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

Specific message contents**DISCONNECT**

| Information element | value/remark |
|---------------------|-----------------------------|
| Unknown IEI | 0100 1100 |
| length | 1 |
| unknown IE contents | xxxx xxxx (arbitrary octet) |

26.5.6.2.3 Unknown information elements in the non-imperative message part / CC / release**26.5.6.2.3.1 Conformance requirements**

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, section 8.6.1.

26.5.6.2.3.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a RELEASE message received by the MS having sent in state U10 a DISCONNECT message.

26.5.6.2.3.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a call control entity in CC state U10.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The MS is made to send a DISCONNECT message. The SS responds with a RELEASE message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for a high layer compatibility IE in other messages of the protocol. The SS verifies that the MS responds with a RELEASE COMPLETE message; the SS then releases the RR connection.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | MS | | The MS is made to initiate call clearing. |
| 2 | MS -> SS | DISCONNECT | |
| 3 | SS -> MS | RELEASE | See below. |
| 4 | MS -> SS | RELEASE COMPLETE | |
| 5 | SS -> MS | CHANNEL RELEASE | The RR connection is released. |

Specific message contents**RELEASE**

| Information element | value/remark |
|---------------------|-------------------|
| Unknown IEI | 0111 1101 |
| length | 1 |
| unknown IE contents | 1 arbitrary octet |

26.5.6.2.4 Unknown information elements in the non-imperative message part / CC / release complete**26.5.6.2.4.1 Conformance requirements**

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, section 8.6.1.

26.5.6.2.4.2 Test purpose

To verify that an MS supporting the CC protocol for at least one BC receiving a CC message containing an IE unknown in the message which is not encoded as "comprehension required" ignores that IE; this in the special case of a RELEASE COMPLETE message received by the MS in state U19.

26.5.6.2.4.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a call control entity in CC state U10.

Related PICS/PIXIT statements

At least one circuit switched basic service supported(Y/N).

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a DISCONNECT message. The SS verifies that the MS responds with a RELEASE message. The SS answers with a RELEASE COMPLETE message containing an optional information element not coded as "comprehension required" the IEI of which is unknown in the message, but used for an auxiliary states IE in other messages of the protocol. The SS verifies that the MS releases the link after some time.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | DISCONNECT | See below. The MS aborts the RR connection (it initiates release of L2 on SAPI 0) |
| 2 | MS -> SS | RELEASE | |
| 3 | SS -> MS | RELEASE COMPLETE | |
| 4 | MS | | |

Specific message contents**RELEASE COMPLETE**

| Information element | value/remark |
|---------------------|-------------------|
| Unknown IE | 0010 0100 |
| length | 1 |
| unknown IE contents | 1 arbitrary octet |

26.5.6.3 Unknown IE in the non-imperative message part, comprehension not required / RR**26.5.6.3.1 Conformance requirements**

The MS shall ignore all IEs unknown in a message which are not encoded as "comprehension required".

References

GSM 04.08, sections 8.6.1, 8.6.2 and 10.5.

26.5.6.3.2 Test purpose

To verify that the MS ignores an IE which is unknown in a message for Radio Resource Management in the special cases of CIPHERING MODE COMMAND, ASSIGNMENT COMMAND and CHANNEL RELEASE.

26.5.6.3.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the MM-state "idle, updated" and in the RR-idle mode. It has a valid TMSI.

Related PICS/PIXIT statements

Supported frequency bands, PGSM or EGSM or DCS 1 800.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in the RR-idle mode. It has a valid TMSI.

Test Procedure

In the normal call establishment the CIPHERING MODE COMMAND and ASSIGNMENT COMMAND contain additional IEs unknown in the message which are not encoded as "comprehension required", and therefore should be ignored by the MS. After sending an ASSIGNMENT COMPLETE, the subsequent CHANNEL RELEASE received by the MS also contains an IE unknown in a message which is not encoded as "comprehension required". The MS should ignore this IE.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | See specific message contents |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | See specific message contents On the dedicated channel See specific message contents The SS checks the release of the main signalling link at layer 2 level. |
| 7 | SS -> MS | ASSIGNMENT COMMAND | |
| 8 | MS -> SS | ASSIGNMENT COMPLETE | |
| 9 | SS -> MS | CHANNEL RELEASE | |
| 10 | SS | | |

Specific message contents

None.

Step 5: CIPHERING MODE COMMAND

| | |
|---|--|
| Cipher mode setting - algorithm identifier - SC | cipher with A5/1 start ciphering IMEI shall not be included 1001 0010 |
| Cipher Response Unknown IE (type 2) | |

Step 7: ASSIGNMENT COMMAND

| | |
|--|---|
| Channel Description Channel Type Timeslot number Training sequence code Hopping MAIO HSN | TCH/F + ACCHs arbitrarily selected, but not zero arbitrarily selected RF hopping channel 0 0 |
| Power Command First Unknown IE (Type 2) Cell Channel Description | |
| Second Unknown IE (Type 4) - IEI - length - contents | 0110 1001 2 xxxx xxxx xxxx xxxx, where x is arbitrarily coded. |
| Mobile Allocation | For PGSM and EGSM mobiles, indicates ARFCN 50, only. For DCS 1 800 mobiles, indicates ARFCN 750, only. |

Step 9: CHANNEL RELEASE

| | |
|--|--|
| RR Cause Unknown IE (type 4) - IEI - length - contents | normal event 0110 0010 5 xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx xxxx, where x is arbitrarily coded. |
|--|--|

26.5.7 Handling of unknown, unforeseen, and erroneous protocol data, and of parallel transactions / spare bits**26.5.7.1 Spare bits / RR****26.5.7.1.1 Spare bits / RR / paging channel****26.5.7.1.1.1 Conformance requirements**

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

26.5.7.1.1.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case of the spare bits occurring in the P1 Rest Octets IE of a PAGING REQUEST TYPE 1 message. That the spare bits are ignored is checked by addressing the MS in that PAGING REQUEST message and verifying that the MS responds to that paging.

26.5.7.1.1.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message containing at least one octet in the P1 rest octets IE that is different from 0010 1011.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|------------|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | See below. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents**PAGING REQUEST TYPE 1**

| Information element | Value/remark |
|-------------------------------------|--|
| L2 pseudo length | k+3 where k is the sum of the length of the mobile identity 1 IE |
| Page Mode | Normal paging |
| Channels needed for Mobiles 1 and 2 | |
| Channel (first) | Any channel |
| Channel (second) | (spare) |
| Mobile identity 1 | IMSI or TMSI of MS under test |
| Mobile identity 2 | Omitted |
| P1 rest octets | not all octets are "0010 1011" |

26.5.7.1.2 Spare bits / RR / BCCH**26.5.7.1.2.1 Conformance requirements**

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

26.5.7.1.2.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case where these spare bits are contained in the SI3 and SI4 messages. That the MS ignores the value of the spare bits is checked by changing the LAI in those message and observing the MS initiating a location update though the spare bits do not all have the default value.

26.5.7.1.2.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS simulates a BCCH where continuously for at least 30 seconds at least one octet of the SI3 Rest Octets IE in all SYSTEM INFORMATION TYPE 3 messages and at least one octet of the SI4 Rest Octets IE in all SYSTEM INFORMATION TYPE 4 messages is different from 0010 1011 and the location area identification IE denotes a location area different from the current location area held by the MS. The SS verifies that the MS sends a CHANNEL REQUEST message on the RACH including the establishment cause "location updating". The SS responds with an IMMEDIATE ASSIGNMENT REJECT message.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | SS -> MS | | The SS starts sending modified SYSTEM INFORMATION TYPE 3 and SYSTEM INFORMATION TYPE 4 messages (as defined below) continuously for at least 30 seconds on the BCCH. Establishment cause = "location updating (SDCCH needed). This message may be received during the 30 seconds. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific message contents

SYSTEM INFORMATION TYPE 3

| Information element | value/remark |
|------------------------------|--|
| L2 pseudo length | 18 |
| cell identity | as required |
| location area identification | denoting a new location area |
| control channel description | as required, but with the spare bits arbitrarily selected and at least one spare bit set to 1. |
| cell options | as required, but with (spare) bit 8 set to 1 |
| cell selection parameters | as required |
| RACH control parameters | as required |
| SI3 rest octets | at least one octet is different from "0010 1011" |

SYSTEM INFORMATION TYPE 4

| Information element | value/remark |
|------------------------------|--|
| L2 pseudo length | 12 |
| location area identification | denoting a new location area |
| cell selection parameters | as required |
| RACH control parameters | as required |
| SI4 rest octets | at least one octet is different from "0010 1011" |

26.5.7.1.3 Spare bits / RR / AGCH

26.5.7.1.3.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

26.5.7.1.3.2 Test purpose

To verify that the MS in the MM-state "idle, updated" and in RR-idle mode ignores the value of spare bits in the special case of the spare bits occurring in the Page Mode IE, the Spare Half Octet IE, the Channel Description IE, the Timing Advance IE, the IA Rest Octet IE, and in the IAR Rest Octet IE.

26.5.7.1.3.3 Method of test**Initial conditions**

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT message containing arbitrary spare bits in the Page Mode IE, in the Spare Half Octet IE, in the Channel Description IE, in the Timing Advance IE, and in the IA Rest Octet IE.

It is checked that the MS answers on the dedicated channel with a PAGING RESPONSE message and releases the main signalling link after a CHANNEL RELEASE message.

After a new paging of the MS an IMMEDIATE ASSIGNMENT REJECT is sent to test the spare bits in the IAR Rest Octet IE.

The MS is then paged again to check the idle state.

Maximum duration of test

20 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | see below |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | |
| 6 | SS | | The SS checks that the MS releases the main signalling link and waits 10 seconds for a cell reselection of the MS |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | normal, waiting time = 0, except the IAR Rest Octet IE (see below) |
| 10 | SS | | The SS waits six seconds |
| 11 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 12 | MS -> SS | CHANNEL REQUEST | To check that the MS has reached the idle state after the IMMEDIATE ASSIGNMENT REJECT |

Specific message contents**IMMEDIATE ASSIGNMENT**

| Information element | Value/remark |
|------------------------|--|
| L2 pseudo length | sum of the length of all IE except L2 pseudo length and IA Rest Octets |
| Protocol Discriminator | RR |
| Skip Indicator | 0000 |
| Message Type | Immediate Assignment |
| Page mode | xx00 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| Spare half octet | xxxx (where "xxxx" is arbitrary, with at least 1 bit set to 1) |
| Channel description | normal, no hopping, the two spare bits before ARFCN are chosen arbitrarily with at least one bit set to 1. |
| Request reference | normal (derived from the CHANNEL REQUEST) |
| Timing advance | xx00 0000 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| Mobile allocation | chosen so that, together with the channel description |
| Length | 0 |
| IA rest octets | |
| first octet | 00xx xxxx (where "xx xxxx" is arbitrary but different to 10 1011) |
| other octets | xxxx xxxx (where "xxxx xxxx" is arbitrary but different to 0010 1011) |

IMMEDIATE ASSIGNMENT REJECT

| Information element | Value/remark |
|---------------------|---|
| L2 pseudo length | 19 |
| Page mode | normal |
| Spare half octet | xxxx (where "xxxx" is arbitrary, with at least 1 bit is set to 1) |
| Request reference 1 | addressing the MS under test |
| Wait indication 1 | 0 seconds |
| ... | Other Request References and Wait Indications arbitrary |
| IAR rest octets | |
| Octet 1 to 3 | xxxx xxxx (where "xxxx xxxx" is arbitrary but different to 0010 1011) |

26.5.7.1.4 Spare bits / RR / Connected Mode**26.5.7.1.4.1 Conformance requirements**

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

26.5.7.1.4.2 Test purpose

To verify that the MS in the MM-state "MM-Connection active" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Cell Channel Description IE and in the Power Command IE.

26.5.7.1.4.3 Method of test**Initial conditions**

System Simulator:

- 1 cell, default parameters, except:
 - PGSM and EGSM mobiles are assigned to ARFCN 124 in step 10.
 - DCS 1 800 mobiles are assigned to ARFCN 801 in step 10.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

Mobile's frequency capabilities, PGSM or EGSM or DCS 1 800.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

In the procedure of a normal call establishment the ASSIGNMENT COMMAND will be modified to test the spare bits in the Cell Channel Description IE and in the Power Command IE.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | SS -> MS | SETUP | |
| 8 | MS -> SS | CALL CONFIRMED | |
| A9 | MS -> SS | ALERTING | |
| B9 | MS -> SS | CONNECT | |
| 10 | SS -> MS | ASSIGNMENT COMMAND | see below on the dedicated channel |
| 11 | MS -> SS | ASSIGNMENT COMPLETE | |
| 12 | SS -> MS | CHANNEL RELEASE | |
| 13 | SS | | |
| | | | The SS checks that the MS release the main signalling link |

Specific message contents**ASSIGNMENT COMMAND****For PGSM and EGSM mobiles**

| Information element | Value/remark |
|-------------------------------------|--|
| Channel Description | normal, hopping HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description octet 2 | 00xx 1000 (where "xx" is arbitrary, with at least 1 bit set to 1) |
| octet 3 to 17 (inclusive) | all bits set to zero |
| Mobile Allocation | indicates ARFCN 124 only |

For DCS 1 800 mobiles

| Information element | Value/remark |
|-------------------------------------|--|
| Channel Description | normal, hopping, HSN=63, MAIO=0 |
| Power Command | xxx0 0111 (where "xxx" is arbitrary, with at least 1 bit set to 1) |
| Cell Channel Description octet 2 | 10xx 111? (where "xx" is arbitrary, with at least 1 bit set to 1). Bit 1 of octet 2 and all of octets 3 to 17 (inclusive) indicate ARFCN 801 only (using the variable bit map format). |
| Mobile Allocation | indicates ARFCN 801 only |

26.5.7.2 Spare bits / MM**26.5.7.2.1 Conformance requirements**

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

26.5.7.2.2 Test purpose

To verify that the MS in the MM-state "wait net cmd" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Cipher Key Seq. Number IE or in the Identity Type IE.

26.5.7.2.3 Method of test**Initial conditions**

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

None.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

After the establishment of the RR-connection, in the AUTHENTICATION REQUEST message the spare bits of the Ciphering Key Sequence Number and of the Spare Half Octet IE will be randomly chosen. The spare bits of the Identity Type IE and the Spare Half Octet IE in the IDENTITY REQUEST message will also be chosen arbitrarily.

Maximum duration of test

10 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Addressing the MS under test |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | see below |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | |
| 7 | SS -> MS | IDENTITY REQUEST | see below with the right TMSI |
| 8 | MS -> SS | IDENTITY RESPONSE | |
| 9 | SS -> MS | CHANNEL RELEASE | The SS checks that the MS release the main signalling link |
| 10 | SS | | |

26.5.7.3 Spare bits / CC

This test is applicable to all MS supporting at least one MT circuit switched basic service.

26.5.7.3.1 Conformance requirements

The MS shall ignore the value of spare bits.

References

GSM 04.08, section 10.5.

26.5.7.3.2 Test purpose

To verify that the MS in the MM-state "connection established" and in RR-Connected mode ignores the value of spare bits in the special case of the spare bits occurring in the Calling Party BCD Number IE, Calling Party Subaddress IE, Called Party Subaddress IE, Cause IE and Progress Indicator IEs.

26.5.7.3.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the MM-state "idle, updated" and in RR-idle mode.

Related PICS/PIXIT statements

At least one circuit switched basic service supported.

MT calls supported.

Foreseen Final State of the MS

The MS is in the MM-state "idle, updated" and in RR-idle mode.

Test Procedure

After the establishment of the MM-connection, in the SETUP message the spare bits of the Calling Party BCD Number, Calling Party Subaddress and Called Party Subaddress will be arbitrarily chosen and also in the DISCONNECT message the spare bits of the Progress Indicator IE and of the Cause IE will be arbitrarily chosen.

Maximum duration of test

10 s.

Expected sequence

STATUS ENQUIRY (SS -> MS)

| Information element | Value/remark |
|------------------------|-----------------------------|
| Transaction identifier | relating to the active call |

26.6 Test of the elementary procedures for radio resource management

NOTE: For SS implementor: if tests are concatenated, it is important that unused fields in IMMEDIATE ASSIGNMENT REJECT messages do not use Request References that relate to CHANNEL REQUEST messages recently transmitted by the MS.

26.6.1 Immediate assignment

The immediate assignment procedure is used by the network to establish a dedicated control channel for the MS and network to communicate the detail of the service requested. If the Mobile Station does not implement the procedure correctly, radio resources can be wasted as the Mobile Station might use the wrong channels.

26.6.1.1 Immediate assignment / SDCCH or TCH assignment

26.6.1.1.1 Conformance requirement

1. Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on the SDCCH/8 described in the IMMEDIATE ASSIGNMENT message.
2. Following a PAGING REQUEST message, the MS shall correctly set up an RR connection on the TCH/FACCH described in the IMMEDIATE ASSIGNMENT message.

Reference(s)

GSM 04.08 section 3.3.1.1.2

26.6.1.1.2 Test purpose

To verify that the MS can correctly set up a dedicated SDCCH control channel and that the MS can correctly set up a dedicated TCH/FACCH control channel.

26.6.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, except that CCCH_CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs".

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statement(s)

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Support rate(s) of TCH: TCH/F and/or TCH/H.

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST message the SS assigns an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

If TCH/F is supported by the MS, the test is repeated with the SS assigning a TCH/F.

If TCH/H is supported by the MS, the test is repeated with the SS assigning a TCH/H.

Maximum Duration of Test

6 seconds per value of the execution timer.

Expected Sequence

This sequence is performed for execution counter, K = 1, 2, 3 (unless the TCH is not supported).

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Channel Type: see below Shall be sent on the correct channel |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents**IMMEDIATE ASSIGNMENT**

K=1, SDCCH test: Channel Type = SDCCH/8

K=2, TCH/F test: Channel Type = Bm + ACCHs

K=3, TCH/H test: Channel Type = Lm + ACCHs, subchannel arbitrarily chosen

26.6.1.2 Immediate assignment / extended assignment

NOTE 2: In these tests the SS must send the immediate assignment messages in due time to allow for the MS to receive them and send a PAGING RESPONSE rather than another random access. This applies to the whole of section 26.

26.6.1.2.1 Conformance requirements

1. The MS shall go to the allocated SDCCH/4 and send a PAGING RESPONSE message containing its identity and its classmark.
2. The MS shall go to the allocated SDCCH/8 and send a PAGING RESPONSE message containing its identity and its classmark.
3. The MS shall correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message.
4. The MS shall only react to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS.

References

GSM 04.08 section 3.3.

26.6.1.2.2 Test purpose

To verify that the MS goes to the allocated SDCCH/4 and sends a PAGING RESPONSE message containing its identity and its classmark.

To verify that the MS goes to the allocated SDCCH/8 and sends a PAGING RESPONSE message containing its identity and its classmark.

To verify that the MS can correctly identify its own assignment in either the Request Reference 1 or the Request Reference 2 information element in an extended assignment message.

To verify that the MS only reacts to an Immediate Assignment which references one of the last 3 CHANNEL REQUEST messages from the MS.

26.6.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-retrans is set to 7.

Mobile Station:

The MS is in the "idle, updated" state. with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with a TMSI allocated.

Test Procedure

In the first part of the test, the SS pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the n-th CHANNEL REQUEST message (n being arbitrarily chosen by the SS from the set {1, 2 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message, which references one of the last 3 CHANNEL REQUEST messages from the MS. The MS shall then go to the correct channel and send a PAGING RESPONSE message. The SS will then release the channel.

In the second part of the test, the SS again pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the k-th CHANNEL REQUEST message (k being arbitrarily chosen by the SS from the set {4, 5 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message which, instead of referencing one of the last 3 CHANNEL REQUEST messages from the MS, references an earlier CHANNEL REQUEST message. The MS shall then ignore the IMMEDIATE ASSIGNMENT EXTENDED message and continue to send CHANNEL REQUEST messages until the Max-Retrans value has been reached. Then a period of 7 seconds shall elapse in order to allow the MS to perform cell reselection (this allows for the time between the last CHANNEL REQUEST message and the beginning of cell reselection).

In the third part of the test, the CCCH_CONF of the SS is set to non-combined and the SS pages the MS, which shall react by sending CHANNEL REQUEST messages. Immediately after reception of the r-th CHANNEL REQUEST message (r being arbitrarily chosen by the SS from the set {4, 5 ... 8}) the SS sends an IMMEDIATE ASSIGNMENT EXTENDED message which, in the second request reference, references one of the last 3 CHANNEL REQUEST messages from the MS. The associated Channel Description allocates SDCCH(S) (S being arbitrarily chosen by the SS from the set {0,1 ... 7}). The MS shall then go to the correct channel and send a PAGING RESPONSE message. The SS will then release the channel.

Maximum Duration of Test

90 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | n CHANNEL REQUESTs (n being arbitrarily chosen from {1... 8}) are sent, all with Establ. Cause = "Answer to paging". |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | MS -> SS | CHANNEL REQUEST | see note 3. |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | |
| 5 | MS -> SS | PAGING RESPONSE | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 6 | SS -> MS | CHANNEL RELEASE | |
| 7 | ----- | ----- | k CHANNEL REQUESTs (k being arbitrarily chosen from the set {4, 5, 8}) are sent all with Establ. Cause = "Answer to paging". |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 9 | MS -> SS | CHANNEL REQUEST | see note 4. |
| 10 | MS -> SS | CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | 8-k CHANNEL REQUESTs are sent, all with Establ. Cause = "Answer to paging". |
| 12 | MS -> SS | CHANNEL REQUEST | |
| 13 | MS -> SS | CHANNEL REQUEST | The SS verifies that the MS does not transmit any Layer 2 frames for at least 3 seconds. The SS sets CCCH_CONF to non-combined. The SS waits 40 seconds to allow the MS to perform cell reselection and to read the BCCH information. |
| 14 | SS | | |
| 15 | SS | | |
| 16 | SS | | |
| 17 | SS -> MS | PAGING REQUEST TYPE 1 | r CHANNEL REQUESTs (r being arbitrarily chosen from {4, 5... 8}) are sent, all with Establ. Cause = "Answer to paging". |
| 18 | MS -> SS | CHANNEL REQUEST | |
| 19 | MS -> SS | CHANNEL REQUEST | see note 5. |
| 20 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | |
| 21 | MS -> SS | PAGING RESPONSE | |
| 22 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

NOTE 3: The first Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {max (1,n-2) ... n}, its value being arbitrarily chosen by the SS. The second Request Reference shall be different from any Request Reference the MS has generated in this test.

NOTE 4: The first Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {1 ... k-3}, its value being arbitrarily chosen by the SS. The second Request Reference shall be different from any Request Reference the MS has generated in this test.

NOTE 5: The second Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer in the set {r-2, r-1, r}, its value being arbitrarily chosen by the SS. The first Request Reference shall be different from any Request Reference the MS has generated in this test.

26.6.1.3 Immediate assignment / assignment rejection

26.6.1.3.1 Conformance requirements

1. The MS shall respond to the Paging Request message by sending a Channel Request message with establishment cause set to "Answer to Paging". After the reception of IMMEDIATE ASSIGNMENT REJECT, the MS shall not transmit during the time indicated in the "Wait Indication" field of the IMMEDIATE ASSIGNMENT REJECT message, and then it shall answer to the new paging requests.
2. After an assignment rejection, the MS shall perform a cell reselection (idle mode operation) and the MS shall not transmit unless a different cell is selected.

References

GSM 04.08, section 3.3.1.1.3 and GSM 04.13 section 5.2.2.

26.6.1.3.2 Test purpose

To verify that the MS can accept an IMMEDIATE ASSIGNMENT REJECT.

To verify that the MS can respond to paging after an IMMEDIATE ASSIGNMENT REJECT is received on a different cell.

26.6.1.3.3 Method of test

Initial Conditions

System Simulator:

2 cells with the same LAI, Max-Retrans is 7.

Mobile Station:

The MS is camped on cell A and is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

The MS is camped on cell B and is in the "idle, updated" state, with a TMSI allocated.

Test Procedure

The SS pages the MS, which shall react by sending CHANNEL REQUESTs. Immediately after reception of the n-th CHANNEL REQUEST (n being an integer from the set {1, 2 ... 8}, arbitrarily chosen by the SS) the SS sends an IMMEDIATE ASSIGNMENT REJECT message, which references one of the last 3 CHANNEL REQUESTs from the MS, and with the Wait Indication set to x seconds (x being an integer from the set {5, 6 ... 255}, arbitrarily chosen by the SS). The SS continues to send paging messages for that mobile station in every block of the mobile station's paging subgroup for x+2 seconds. The MS shall not answer to the PAGING REQUEST TYPE 1 messages sent before x seconds have elapsed. The MS may respond to any one of the PAGING REQUEST TYPE 1 messages sent after x seconds have elapsed, but at the latest it shall respond to the first PAGING REQUEST TYPE 1 sent after x+1 seconds have elapsed.

The SS responds to this CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message with the Wait Indication set to 255 seconds.

Immediately afterwards the SS changes the power levels so the MS selects cell B. After 20 seconds have elapsed the SS pages the MS in cell B and the MS shall answer to this page. In order to avoid another cell reselection the SS then sends another IMMEDIATE ASSIGNMENT REJECT.

Maximum Duration of Test

5 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|

NOTE 6: The Request Reference is the one which pertains to the i-th CHANNEL REQUEST sent by the MS, where i is an integer from the set {max(1,n-2) ... n}, its value being arbitrarily chosen by the SS.

NOTE 7: the value of k is not important in this test.

Specific Message Contents

None.

26.6.1.4 Immediate assignment / ignore assignment**26.6.1.4.1 Conformance requirements**

1. An MS waiting for a response from the network, following the sending of a CHANNEL REQUEST, shall ignore an IMMEDIATE ASSIGNMENT message with a request reference containing a wrong frame number.
2. An MS is waiting for an assignment of its own, shall ignore an IMMEDIATE ASSIGNMENT message with a request reference containing a wrong random access information.

References

GSM 04.08 section 3.3.1.1.2

26.6.1.4.2 Test purpose

To verify that the MS ignores an assignment for another MS while it is waiting for an assignment of its own.

26.6.1.4.3 Method of test

Initial Conditions

System Simulator:
1 cell.

Mobile Station:
The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS, which reacts with CHANNEL REQUESTs. The SS responds to the first CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT containing a wrong Request Reference (in the first run of the test the frame number is wrong, in the repetition it is the random access info that is wrong). It is verified for 2 seconds that the MS does not start signalling on the SDCCH. The MS shall ignore the assignment and send another CHANNEL REQUEST message. In order to avoid cell reselection the SS now answers with a correct IMMEDIATE ASSIGNMENT REJECT and repeats the test once.

Maximum Duration of Test

12 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Establ. Cause = "Answer to paging". Frame number in Request Reference is 2 too high. The MS shall not start signalling on the assigned SDCCH. This is verified for a period of 2 seconds. Establ. Cause = "Answer to paging". |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CHANNEL REQUEST | SS waits for 6 seconds. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 6 | SS | | |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | Establ. Cause = "Answer to paging". Random access info in Request Reference is wrong. The MS shall not start signalling on the assigned SDCCH. This is verified for a period of 2 seconds. Establ. Cause = "Answer to paging". |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

26.6.1.5 Immediate assignment after immediate assignment reject**26.6.1.5.1 Conformance requirement**

Following an IMMEDIATE ASSIGNMENT REJECT message, the MS shall listen for IMMEDIATE ASSIGNMENTS until T3126 expires.

Reference

GSM 04.08 section 3.3.1.1.3

26.6.1.5.2 Test purpose

To verify that the MS correctly responds to an IMMEDIATE ASSIGNMENT message sent after an IMMEDIATE ASSIGNMENT REJECT message.

26.6.1.5.3 Method of test**Initial conditions**

System Simulator:

- 1 cell;
- CCCH_CONF is set to "1 basic physical channel used for CCCH not combined with SDCCHs";
- Max retrans is set to 7;
- TX-integer is set to 7;

Mobile Station:

The MS is in "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen final state of the MS

"idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS, which shall react by sending CHANNEL REQUESTs. Immediately after reception of the third CHANNEL REQUEST the SS sends an IMMEDIATE ASSIGNMENT REJECT message which references the first CHANNEL REQUEST from the MS and has the Wait Indication IE set to 6 seconds.

Between 0,75 seconds and 1,25 seconds after sending the IMMEDIATE ASSIGNMENT REJECT message the SS sends an IMMEDIATE ASSIGNMENT message referencing the second CHANNEL REQUEST message, and assigning an SDCCH. The MS shall go to the correct channel and send a PAGING RESPONSE message. Then the SS initiates RR-release by sending a CHANNEL RELEASE message.

Maximum duration of test

10 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 2 | MS -> SS | CHANNEL REQUEST | first request. |
| 3 | MS -> SS | CHANNEL REQUEST | second request. |
| 4 | MS -> SS | CHANNEL REQUEST | third request. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJ | references the first request from MS, Wait Indication IE set to 6 seconds. |
| 6 | SS -> MS | IMMEDIATE ASSIGNMENT | references the second request from the MS Channel type set to SDCCH/8 message sent between 0,75 s and 1,25 s after the completion of step 5. |
| 7 | MS -> SS | PAGING RESPONSE | shall be sent on the correct channel. |
| 8 | SS -> MS | CHANNEL RELEASE | |

26.6.2 Test of paging

The Paging procedure is used by the network to cause the Mobile Station to establish a radio connection. Normally the Mobile Station listens to its paging subchannel, but this can be modified by the use of different page modes. The correct implementation of the paging procedure in the Mobile Station is essential for the basic establishment of a connection.

26.6.2.1 Normal paging**26.6.2.1.1 Paging / normal / type 1****26.6.2.1.1.1 Conformance requirements**

1. The MS shall respond correctly to various PAGING REQUEST TYPE 1 messages, when the page mode is set to normal paging, in the following cases:
 - 1.1 The MS is addressed with its IMSI in the first Mobile Identity field. The optional Mobile Identity field is not present.
 - 1.2. The MS is addressed with its TMSI in the first Mobile Identity field. The optional Mobile Identity field specifies an IMSI different from that of the MS.
 - 1.3. The first Mobile Identity field specifies a TMSI different from that of the MS. The optional Mobile Identity field addresses the MS by its IMSI.

- 1.4 The first Mobile Identity field specifies a TMSI different from that of the MS. The optional Mobile Identity field contains the correct TMSI of the MS.
2. An MS shall ignore PAGING REQUEST TYPE 1 messages with incorrect information, when the page mode is set to normal paging, in the following case:
 - 2.1 The MS is addressed with its TMSI in the first Mobile Identity field, but the type of identity in this field is set to "No Identity". The optional Mobile Identity field is not present.

26.6.2.1.1.2 Test purpose

To test that the MS is able to determine its CCCH group and paging group correctly and that the MS responds correctly to various PAGING REQUEST TYPE 1 messages when the page mode is set to normal paging. All valid ways of addressing the MS are tested. It is tested that the MS responds with the same type of identity that is used in the PAGING REQUEST TYPE 1 message. It is tested that the MS ignores fill paging.

26.6.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS 5 times with different PAGING REQUEST TYPE 1 messages on the paging subchannel which corresponds to the MS's IMSI.

In the first 4 cases, where the MS is addressed by its IMSI or its TMSI, the MS shall answer to the paging by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST by assigning a channel, and the MS shall then send a correct PAGING RESPONSE. The SS then releases the channel.

In the last case, it is tested that the MS does not answer to paging that does not address it.

Maximum Duration of Test

2 min.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains IMSI of MS, 2nd Mobile Ident not present. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 3 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 3. |
| 5 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 6 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains TMSI of MS, 2nd Mobile Ident contains IMSI of another MS. |
| 8 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 9 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 9. |
| 11 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 12 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 13 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains TMSI of another MS, 2 nd Mobile Ident contains IMSI of MS. |
| 14 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 15 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 15. |
| 17 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 18 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 19 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains TMSI of another MS, 2 nd Mobile Ident contains TMSI of MS. |
| 20 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 21 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". |
| 22 | SS -> MS | IMMEDIATE ASSIGNMENT | Request Reference = pertaining to the message received in step 21. |
| 23 | MS -> SS | PAGING RESPONSE | Mobile Ident: TMSI. |
| 24 | SS -> MS | CHANNEL RELEASE | |
| | ----- | ----- | The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 25 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains TMSI of MS but with type of identity set to "no identity", second Mobile Ident not present. |
| 26 | ----- | ----- | During 1 second, the SS checks that the MS does not produce any Layer 3 messages. |

Specific Message Contents

None.

26.6.2.1.2 Paging / normal / type 2**26.6.2.1.2.1 Conformance requirements**

1. The MS shall respond correctly (by sending CHANNEL REQUEST messages with an Establishment Cause set to "Answer to Paging") to various PAGING REQUEST TYPE 2 messages, when the page mode is set to normal paging, in the following cases:
 - 1.1 The MS is addressed in the first TMSI field.
 - 1.2 The MS is addressed in the second TMSI field.
 - 1.3 The MS is addressed in the optional Mobile Identity field with its TMSI.
 - 1.4 The MS is addressed in the optional Mobile Identity field with its IMSI.
2. The MS shall ignore PAGING REQUEST TYPE 2 messages with incorrect information, when the page mode is set to normal paging, in the following case:
 - 2.1 The MS is addressed in the optional Mobile Identity field with its TMSI, but the type of identity in this field is set to "No Identity".

26.6.2.2 Paging / extended**26.6.2.2.1 Conformance requirements**

1. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 1 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.
2. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 2 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.
3. The MS shall operate in the extended page mode when this is ordered by the network in a PAGING REQUEST TYPE 3 message not addressing the MS but on the paging subchannel which corresponds to the MS's identity.

4. The MS shall operate in the extended page mode when this is ordered by the network in an IMMEDIATE ASSIGNMENT message on the paging subchannel which corresponds to the MS's identity.
5. The MS shall operate in the extended page mode when this is ordered by the network in an IMMEDIATE ASSIGNMENT EXTENDED message on the paging subchannel which corresponds to the MS's identity.

References

GSM 04.08 section 3.3.2.1; GSM 05.02, section 6.5.

26.6.2.2.2 Test purpose

To test that the MS is operating in the extended page mode when this is ordered by the SS in either a PAGING REQUEST message or an IMMEDIATE ASSIGNMENT message.

26.6.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends a PAGING REQUEST TYPE 1 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends an IMMEDIATE ASSIGNMENT on the paging subchannel which corresponds to the MS's identity. The random reference is different to those used by the Mobile Station in the last two CHANNEL REQUEST messages. (Phase 2 requires a Mobile Station to react on an IMMEDIATE ASSIGNMENT after a rejection.) The page mode is again set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 2 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond with CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends an IMMEDIATE ASSIGNMENT EXTENDED on the paging subchannel which corresponds to the MS's identity. The random references are different to those used by the Mobile Station in the last three CHANNEL REQUEST messages. The page mode is again set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 3 message specifying an arbitrarily chosen page mode and addressing the MS by its TMSI. The MS shall respond with CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends a PAGING REQUEST TYPE 3 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 2 message specifying an arbitrarily chosen page mode and addressing the MS by its IMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

The SS then sends a PAGING REQUEST TYPE 2 message not addressing the MS under test but on the paging subchannel which corresponds to the MS's identity. The page mode is set to "extended paging". In the next but one paging subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying an arbitrarily chosen page mode and addressing the MS by its IMSI. The MS shall respond to the last page by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT message.

Maximum Duration of Test

10 sec.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile Ident: IMSI of another MS, page mode = "extended paging". Sent in the next but one paging subblock. Page mode is arbitrarily chosen Mobile Ident: TMSI of the MS. |
| 2 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 3 | MS -> SS | CHANNEL REQUEST | Wait indication = 5 seconds. page mode = normal. |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 6 | SS | -- | SS waits for 5 seconds. |
| | SS -> MS | IMMEDIATE ASSIGNMENT | Sent in the paging subblock of MS under test. Page mode = "extended paging", Request reference chosen arbitrarily by the SS, but different from all references used earlier in this test sequence. |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: TMSI of the MS. |
| 9 | MS -> SS | CHANNEL REQUEST | Wait indication = 5 seconds. page mode = normal. |
| 10 | MS -> SS | CHANNEL REQUEST | |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 12 | SS | -- | SS waits for 5 seconds. |
| 13 | SS -> MS | IMMEDIATE ASSIGNMENT EXT | Sent in the paging subblock of MS under test. Page mode = "extended paging", Request references chosen arbitrarily by the SS, but different from all references used earlier in this test sequence. |
| 14 | SS -> MS | PAGING REQUEST TYPE 3 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: TMSI of the MS. |
| 15 | MS -> SS | CHANNEL REQUEST | Wait indication = 5 seconds page mode = normal. |
| 16 | MS -> SS | CHANNEL REQUEST | |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 18 | SS | -- | SS waits for 5 seconds. |
| 19 | SS -> MS | PAGING REQUEST TYPE 3 | Sent in the paging subblock of MS under test. Page mode = "extended paging". |
| 20 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: IMSI of the MS. |
| 21 | MS -> SS | CHANNEL REQUEST | Wait indication = 5 seconds page mode = normal. |
| 22 | MS -> SS | CHANNEL REQUEST | |
| 23 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 24 | SS | -- | SS waits for 5 seconds |
| 25 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in the paging subblock of MS under test. Page mode = "extended paging". |
| 26 | SS -> MS | PAGING REQUEST TYPE 1 | Sent in the next but one paging subblock. Page mode is arbitrarily chosen. Mobile Ident: IMSI of the MS. |
| 27 | MS -> SS | CHANNEL REQUEST | Wait indication = 5 seconds. |
| 28 | MS -> SS | CHANNEL REQUEST | |
| 29 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

26.6.2.3 Paging / reorganization**26.6.2.3.1 Paging / reorganization / procedure 1****26.6.2.3.1.1 Conformance requirements**

1. An MS, after reception of a message with page mode set to "paging reorganization", shall answer to paging messages (with page mode set to "normal paging") sent on its old CCCH in paging blocks which do not belong to the MS's paging sub-channel.
2. When the network changes the paging group of the MS by modifying BCCH parameters (to CCCH_CONF set to "1 basic physical channel used for CCCH combined with SDCCH", and BS_AG_BLK_RES set to "2 blocks reserved for access grant"), the MS shall calculate its new paging group and answer to paging messages on its new paging subchannel.
3. When the network changes the paging group of the MS by modifying BCCH parameters (to CCCH_CONF set to "2 basic physical channels used for CCCH, not combined with SDCCHs" and BS_AG_BLK_RES set to "2 blocks reserved for access grant"), the MS shall calculate its new paging group and answer to paging messages on its new paging subchannel.

References

GSM 04.08 section 3.3.2.1; GSM 05.02, section 6.5.

26.6.2.3.1.2 Test purpose

To test that the MS correctly determines its new paging subchannel when the CCCH structure is changed from non-combined to combined and when the number of CCCHs is changed.

26.6.2.3.1.3 Method of test**Initial Conditions**

System Simulator:

1 cell, Max-Retrans = 2, CCCH_CONF set to "1 basic physical channel used for CCCH, not combined with SDCCHs", a legal combination of BS_AG_BLK_RES and BS_PA_MFRMS is chosen arbitrarily by the SS, with the exception that BS_PA_MFRMS shall not be set to 9.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated. The IMSI of the MS is from a defined/default range that ensures its paging channel changes when the broadcast parameters are changed.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT EXTENDED message on the MS's paging subchannel, with the page mode element set to "paging reorganization" and Request References that do not pertain to the MS. Before the MS's original paging subchannel re-occurs, the SS pages it on the CCCH corresponding to the Mobile Station's IMSI with a PAGING REQUEST TYPE 2 message (page mode = normal paging) containing the MS's TMSI in some paging block which does not belong to the Mobile Station's paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection) on an arbitrarily selected paging subchannel.

Then the SS starts sending messages (PAGING REQUEST TYPE 1 or PAGING REQUEST TYPE 2 or PAGING REQUEST TYPE 3 or IMMEDIATE ASSIGNMENT or IMMEDIATE ASSIGNMENT EXTENDED or IMMEDIATE ASSIGNMENT REJECT) with page mode set to "paging reorganization" on all paging subchannels.

After 5 seconds (to ensure T3126 expires) the SS pages the MS with its TMSI on an arbitrarily selected paging subchannel (on the CCCH corresponding to the Mobile Station's IMSI). The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

The SS changes the paging parameters.

Then the SS sets the page mode to "normal paging".

The SS then waits for the duration of five 51-TDMA multiframes (4 to allow the MS to read all the system information type 1, 2, 3, and 4 messages on the BCCH, and one to calculate the new paging group). Not before 5 seconds after the last IMMEDIATE ASSIGNMENT REJECT message addressing the MS (to ensure T3126 expires), the MS is paged with a PAGING REQUEST TYPE 1 on its new paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection) and then waits 5 seconds (to ensure T3126 expires).

Then the MS is paged with a PAGING REQUEST TYPE 2 on its new paging subchannel. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

Maximum Duration of Test

60 sec.

Expected Sequence

This sequence is performed for execution counter, K =1, 2.

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | Sent on the MS's paging channel. Page mode set to "paging reorganization". Request Reference not pertaining to the MS. Sent before the MS's original paging subchannel re-occurs, but later than the next paging block of that CCCH. |
| 2 | SS -> MS | PAGING REQUEST TYPE 2 | |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | Wait indication = 0 seconds. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 6 | ----- | ----- | |
| 7 | SS -> MS | PAGING REQUEST TYPE 2 | All L3 messages sent on any paging subchannel are paging fill frames specify "paging reorganization". Sent on an arbitrarily selected paging subchannel Page mode "paging reorganization" Not sent before 5 seconds after step 5. |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Wait indication = 0 seconds. |
| 11 | | | |
| 12 | | | |
| 13 | ----- | ----- | Change of paging parameters in SYS INFO 3 as described below for K=1, 2. The SS waits until it has sent all system information messages (page mode is still paging reorganization). All L3 messages sent on any paging subchannel specify "normal paging". Wait 3 seconds. |
| 14 | ----- | ----- | |
| 15 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 16 | MS -> SS | CHANNEL REQUEST | Sent on the new paging subchannel of the MS. Not sent before 5 seconds after step 10. |
| 17 | MS -> SS | CHANNEL REQUEST | |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |
| 19 | SS -> MS | PAGING REQUEST TYPE 2 | Wait indication = 0 seconds. Sent on the new paging subchannel of the MS. Not sent before 5 seconds after step 18. |
| 20 | MS -> SS | CHANNEL REQUEST | |
| 21 | MS -> SS | CHANNEL REQUEST | |
| 22 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

For execution counter K:

K=1:

SYSTEM INFORMATION TYPE 3 shall have the Control Channel Description IE changed to:

| | |
|----------------|--|
| CCCH_CONF | "1 basic physical channel used for CCCH, combined with SDCCHs" |
| BS_AG_BLKs_RES | 2 |
| BS_PA_MFRMS | 9 |

K=2:

SYSTEM INFORMATION TYPE 3 shall have the Control Channel Description IE changed to:

| | |
|---------------|--|
| CCCH_CONF | "2 basic physical channel used for CCCH, not combined with SDCCHs" |
| BS_AG_BLK_RES | 2 |
| BS_PA_MFRMS | 9 |

26.6.2.3.2 Paging / reorganization / procedure 2

26.6.2.3.2.1 Conformance requirement

An MS, after reception of a message with page mode set to "paging reorganization", shall answer to paging messages (with page mode set to "normal paging") sent in a former Access Grant block.

References

GSM 04.08 section 3.3.2.1.

26.6.2.3.2.2 Test purpose

To test that the MS is operating in the "paging reorganization" page mode when this is ordered by the SS and the MS is paged in its former access grant channel.

26.6.2.3.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, Max-Retrans = 1, with the constraint that BS_AG_BLK_RES > 0, a legal combination of CCCH_CONF, BS_AG_BLK_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated. The IMSI of the MS is from a defined/default range that ensures its paging channel changes when the broadcast parameters are changed.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT EXTENDED on the MS's paging subchannel, with the page mode element set to "paging reorganization". The MS is then paged immediately in a former Access Grant block with a PAGING REQUEST TYPE 2 message. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

Maximum Duration of Test

5 sec.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|--|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT EXTENDED | Page mode set to "paging reorganization" |
| 2 | SS -> MS | PAGING REQUEST TYPE 2 | Sent in a former access grant block. |
| 3 | MS -> SS | CHANNEL REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

26.6.2.4 Paging / same as before**26.6.2.4.1 Conformance requirements**

An MS, after first receiving a message on its paging subchannel with page mode set to "extended paging" and then the next message on its paging subchannel with page mode set to "same as before", shall remember the page mode from the previous message and answer to paging messages in the next but one paging sub block.

References

GSM 04.08 section 3.3.2.1; GSM 05.02, section 6.5.

26.6.2.4.2 Test purpose

To test that the MS remembers the page mode from the previous paging request message.

26.6.2.4.3 Method of test**Initial Conditions**

System Simulator:

1 cell, Max-Retrans = 2, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS sends an IMMEDIATE ASSIGNMENT REJECT on the MS's paging subchannel, with the page mode element set to "extended paging". In the next but one subblock on the same CCCH, nothing addresses the MS. When the MS's specific paging subchannel reoccurs, a PAGING REQUEST TYPE 3 is sent, not addressing the MS under test and with page mode set to "same as before". In the next but one subblock on the same CCCH the SS sends a PAGING REQUEST TYPE 1 message specifying paging reorganization and addressing the MS. The MS shall respond by sending CHANNEL REQUESTs. The SS responds to the second CHANNEL REQUEST with an IMMEDIATE ASSIGNMENT REJECT (in order to avoid a cell reselection).

Maximum Duration of Test

10 sec.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|--------------------------------|---|
| 1 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | Page mode set to "extended paging". In the next but one subblock nothing addresses the MS. This is sent in the next paging subblock on the MS's specific paging subchannel. The page mode is set to "same as before", and the MS under test is not addressed. The MS is addressed in this "next but one subblock". Page mode set to "paging reorganization". |
| 2 | SS -> MS | XXXX | |
| 3 | SS -> MS | PAGING REQUEST TYPE 3 | |
| 4 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 5 | MS -> SS | CHANNEL REQUEST | |
| 6 | MS -> SS | CHANNEL REQUEST | |
| 7 | SS -> MS | IMMEDIATE ASSIGNMENT REJECT | |

Specific Message Contents

None.

26.6.2.5 Paging / multislot CCCH**26.6.2.5.1 Conformance requirements**

The MS shall respond correctly to a PAGING REQUEST TYPE 1 message, when the page mode is set to normal paging, when a multislot CCCH is used and the MS is addressed with its IMSI in the first Mobile Identity field, the optional Mobile Identity field being not present.

References

GSM 04.08 section 3.3.2, GSM 05.02 section 6.5.

26.6.2.5.2 Test purpose

- 1) To test that the MS is able to determine its CCCH group and paging group correctly in the case of a CCCH configuration on more than one timeslot when it is paged on a timeslot other than 0. The MS is addressed with a PAGING REQUEST TYPE 1 message when the page mode is set to normal paging. The MS is paged with its IMSI in the 1st Mobile Identity field, the optional Mobile Identity field being not present, is the only way of addressing tested.
- 2) To test that in such conditions the MS answers to the paging message on the timeslot on which the paging message was sent.

26.6.2.5.3 Method of test**Initial Conditions**

System Simulator:

1 cell, a legal combination of CCCH_CONF, BS_AG_BLKES_RES and BS_PA_MFRMS is chosen arbitrarily under the following constraint:

CCCH_CONF is in the set:

- 2 basic physical channels used for CCCH, not combined with SDCCHs
- 3 basic physical channels used for CCCH, not combined with SDCCHs
- 4 basic physical channels used for CCCH, not combined with SDCCHs

Mobile Station:

The IMSI last 3 digits are so that the CCCH_GROUP of the MS under test is other than 0. According to section 6.5.2 of recommendation GSM 05.02, this means that:

$(\text{IMSI} \bmod 1000) \bmod (\text{BS_CC_CHANS} \times N)$ is greater or equal to N , where $N = \text{BS_PA_MFRMS} \times (9 - \text{BS_AG_BLKS_RES})$.

The MS is in the "idle, updated" state.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle updated".

Test Procedure

The SS pages the MS once with a PAGING REQUEST TYPE 1 message on the timeslot and paging subchannel which correspond to the MS's IMSI.

The MS shall send the CHANNEL REQUEST on the same timeslot as the paging message.

The SS sends an IMMEDIATE ASSIGNMENT on the same timeslot as the paging message.

Maximum Duration of Test

10 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | 1st Mobile Ident contains IMSI of MS, 2nd Mobile Ident not present. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Answer to paging". on the same timeslot as the paging message. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | on the same timeslot as the paging message. |
| 4 | MS -> SS | PAGING RESPONSE | Mobile Ident: IMSI. |
| 5 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

None.

26.6.3 Test of measurement report

When an RR-connection exists, the MS shall send measurement reports. These reports contain reception characteristics from serving and neighbouring cells. The measurement report procedure is described in section 3.4.1.2 of GSM 04.08.

NOTE 8: The capability to calculate RxLev and RxQual is tested in sections 15 and 16. In this test only the signalling aspect is verified.

26.6.3.1 Measurement / no neighbours

This test applies to both GSM 900 and DCS 1 800 mobile stations.

26.6.3.1.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH block and the measurement valid indication shall be set to valid (0) within the second block at the latest.

References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

26.6.3.1.2 Test purpose

To test that, when the SS gives absolutely no information about neighbouring cells, the MS does not report on neighbouring cells.

26.6.3.1.3 Method of test

Initial Conditions

System Simulator:

8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|---------------|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 026 | 762 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 032 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. The BA is indicated as empty. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that no measurement results have been obtained.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, $k = 1, 2$.

Since when $k = 1$, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when $k = 2$ an additional SYSTEM INFORMATION TYPE 5bis is included) are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

Specific Message Contents

NOTE 1: The actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

26.6.3.2 Measurement / all neighbours present

This test applies to both GSM 900 and DCS 1 800 mobile stations.

26.6.3.2.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MEASUREMENT REPORT message shall contain measurement results for the 6 strongest BCCH carriers with known and allowed NCC part of BSIC.

References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

26.6.3.2.2 Test purpose

To test that, when the SS gives information about neighbouring cells, the MS reports appropriate results.

26.6.3.2.3 Method of test**Initial Conditions**

System Simulator:

8 cells with the following settings:

| Transmitter | Level | NCC | BSCC | ARFCN (GSM900) | ARFCN (DCS1800) | Cell identity |
|---------------|-------|-----|------|-------------------|--------------------|---------------|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 0002H |

DCS 1 800 end:

NOTE 1: These actual values are not checked.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

26.6.3.3 Measurement / barred cells and non-permitted NCCs

This test applies to both GSM 900 and DCS 1 800 mobile stations.

26.6.3.3.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORTs on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 seconds the messages shall contain measurement results only for the 4 BCCH carriers on which the MS is allowed to report.

References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

26.6.3.3.2 Test purpose

To test that, when a combination of normal neighbours, barred cells and non-permitted NCCs is "on air", the MS reports only on normal neighbours.

26.6.3.3.3 Method of test

Initial Conditions

System Simulator:
8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | Cell identity |
|---------------|-------|-----|-----|-------------------|--------------------|---------------|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 0003H |
| Neighbour, N3 | -75 | 2 | 1 | 020 | 665 | 0004H |
| Neighbour, N4 | -55 | 3 | 3 | 026 | 762 | 0005H |
| Neighbour, N5 | -50 | 4 | 5 | 032 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

NOTE 1: The BA sent in SYSTEM INFORMATION TYPE 5 does not include N1, N4 and N5. N1 may be the case of a barred cell, N3 simulates the case where another operator is transmitting on the same frequency (e.g. in border areas), N4 & N5 simulate the case where other operators are transmitting on other frequencies.

Mobile Station:

The MS is in the active state of a call (U10).

Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.
Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed twice.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH. 5 of the 8 BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 4 strongest permitted carriers have been obtained (one of the carriers in the BA belongs to a non-permitted NCC).

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, $k = 1, 2$.

Since when $k = 1$ SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when $k = 2$ an additional SYSTEM INFORMATION TYPE 5bis is included) messages are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

DCS 1 800 end:

NOTE 2: These actual values are not checked.

NOTE 3: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

26.6.3.4 Measurement / DTX

This test applies to both GSM 900 and DCS 1 800 mobile stations.

26.6.3.4.1 Conformance requirements

After the sending of the HANDOVER COMPLETE, the MS shall continuously send measurement reports in every SACCH blocks, the measurement valid indication shall be set to valid (0) within the second block at the latest. After 20 seconds the order of values in the MEASUREMENT REPORT message shall contain measurement results for the 6 strongest BCCH carriers among those monitored by the MS. Further, in a quiet environment, the DTX_USED field shall be set by the MS to "DTX used".

References

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

26.6.3.4.2 Test purpose

To test that, in the case of the MS using DTX and the SS indicating that power control is in use, the MS reports appropriate results.

26.6.3.4.3 Method of test**Initial Conditions**

System Simulator:

8 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | Cell identity |
|---------------|-------|-----|-----|-------------------|--------------------|---------------|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 026 | 762 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 032 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 0008H |

In the serving cell, the DTX indicator is set to "MS shall use discontinuous transmission".

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

The MS has just completed a handover into the serving cell, S1.

Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Support for transparent data services only: yes/no.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed twice.

With the MS having a call in progress on an arbitrary cell, the MS is handed over to cell S1. On cell S1, the SS sends SYSTEM INFORMATION TYPE 5 & 6 (on the second iteration of the test the SS also sends SYSTEM INFORMATION TYPE 5bis) on the SACCH with all 8 of the BCCHs "on air" indicated in the BA. Cell S1 also indicates that DTX shall be used. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that measurement results for the 6 strongest carriers have been obtained and that DTX has been used. (The MS is positioned in an environment free from acoustic noise.)

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed twice for execution counter, $k = 1, 2$.

Since when $k = 1$, SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT (and when $k = 2$ an additional SYSTEM INFORMATION TYPE 5bis is included) messages are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

GSM 04.08 section 3.4.1.2, GSM 05.08 section 8.4.

26.6.3.5.2 Test Purpose

To test that, when the SS gives information about neighbouring cells, the MS reports appropriate results.

26.6.3.5.3 Method of test

Initial Conditions

System Simulator:

2 cells with the following settings:

| Transmitter | Level | NCC | BCC | ARFCN (GSM900) | ARFCN (DCS1800) | Cell Identity |
|---------------|-------|-----|-----|-------------------|--------------------|---------------|
| Serving, S1 | -60 | 1 | 3 | 002 | 715 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 815 | 0002H |

With the exception of the Cell Allocation, the rest of the parameters for both cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1 to 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.
Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed three times.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5bis & 6 on the SACCH. Both of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated in these that no measurement results have been obtained.

For each iteration of the test the frequency format of the BA list contained in the System Information 5 and 5bis message shall change according to the specific message contents.

Maximum Duration Of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, K = 1, 2, 3.

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION 5bis, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

NOTE 2: The Measurement Valid Indication shall be set to valid within the second SACCH block at the latest.

26.6.3.6 Measurement / multiband environment

This test applies to both GSM 900 and DCS 1 800 mobile stations.

26.6.3.6.1 Conformance requirements

The MS shall continuously send MEASUREMENT REPORT messages on every SACCH blocks and the measurement valid indication shall be set to valid (0) within the second block at the latest. The MEASUREMENT REPORT message shall contain measurement results for up to the 6 strongest BCCH carriers among those with known and allowed NCC part of BSIC on which the mobile is asked to report.

26.6.3.6.2 Test purpose

To test that, when the SS gives information about neighbouring cells using SYSTEM INFORMATION TYPE 2ter/5ter, the MS reports appropriate results.

26.6.3.6.3 Method of test**Initial Conditions**

System Simulator:

8 cells with the following settings:

| Transmitter | Level | NCC | BSCC | ARFCN (GSM900) | ARFCN (DCS1800) | Cell identity |
|---------------|-------|-----|------|-------------------|--------------------|---------------|
| Serving, S1 | -60 | 1 | 3 | 002 | 514 | 0001H |
| Neighbour, N1 | -85 | 1 | 5 | 008 | 530 | 0002H |
| Neighbour, N2 | -80 | 1 | 7 | 014 | 602 | 0003H |
| Neighbour, N3 | -75 | 1 | 1 | 020 | 665 | 0004H |
| Neighbour, N4 | -55 | 1 | 3 | 026 | 762 | 0005H |
| Neighbour, N5 | -50 | 1 | 5 | 032 | 686 | 0006H |
| Neighbour, N6 | -45 | 1 | 7 | 038 | 549 | 0007H |
| Neighbour, N7 | -40 | 1 | 1 | 044 | 810 | 0008H |

With the exception of the Cell Allocation, the rest of the parameters for all eight cells are the same as the default settings and default SYSTEM INFORMATION TYPE 1, 2 and 4 message contents for cell A. The Cell Allocation for the serving cell is the same as the default setting for cell A. The Cell Allocations for the neighbour cells need have only one entry, consisting of the ARFCN of that cell's BCCH.

Mobile Station:

The MS is in the active state of a call (U10).

Related PICS/PIXIT Statements

Support for state U10 of the Call Control protocol.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

Active state of a call (U10).

Test Procedure

This test procedure is performed once.

With the MS having a call in progress, the SS sends SYSTEM INFORMATION TYPE 5, 5ter & 6 on the SACCH. All 8 of the BCCHs "on air" are indicated in the BA. The MS shall send MEASUREMENT REPORTs back to the SS, and it shall be indicated within 20 seconds in these that measurement results for the 6 strongest carriers, on which the mobile is asked to report, have been obtained.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

Since SYSTEM INFORMATION TYPE 5, SYSTEM INFORMATION TYPE 5ter, SYSTEM INFORMATION TYPE 6 and MEASUREMENT REPORT are sent continuously, a table is not applicable in this test. The

interval between 2 successive Layer 2 frames containing MEASUREMENT REPORTs shall not exceed one Layer 2 frame.

DCS 1 800 end:

26.6.4 Test of the channel assignment procedure

An intracell change of channel can be requested by upper layers in order to change the channel type, or it may be initiated by the RR-sublayer, e.g. for an intra cell handover. This change is performed using the channel assignment procedure. If the procedure is incorrectly implemented in the MS, the establishment and maintenance of connections is endangered. This applies for the successful case and for the assignment failure: the MS's correct return to the old channel after assignment failure is a necessary part of the GSM system design.

26.6.4.1 Dedicated assignment / successful case

This test is only applicable to an MS supporting a TCH.

26.6.4.1.1 Conformance requirements

1. Upon receipt of the ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channels and initiates the establishment of lower layer connections (this includes the activation of the channels, their connection and the establishment of the main signalling links).
2. MM-messages and CM-messages using SAPI=0 sent from the mobile station to the network can be duplicated by the data link layer in the following case:

a channel change of dedicated channels is required (assignment or handover procedure) and the last layer 2 frame has not been acknowledged by the peer data link layer before the mobile station leaves the old channel.

In this case, the mobile station does not know whether the network has received the message correctly. Therefore, the mobile station has to send the message again after the new dedicated channel is established.

3. An ASSIGNMENT COMMAND message may indicate a frequency change in progress, with a starting time and possibly alternative channel descriptions.

In the case of the reception of an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.

4. The MS shall establish the link with the power level specified in the ASSIGNMENT COMMAND message.

The MS shall confirm the power control level that it is currently employing in the uplink SACCH L1 header. The indicated value shall be the power control level actually used by the mobile for the last burst of the previous SACCH period.

5. The MS shall apply the hopping frequencies specified in ASSIGNMENT COMMAND message in the Mobile Allocation IE or the Frequency List IE at the time of accessing the new channel using the last received Cell Allocation.
6. After receipt of the ASSIGNMENT COMMAND the MS shall perform the assignment and return an ASSIGNMENT COMPLETE without undue delay.

References

- 1, 3, 5. GSM 04.08, subclause 3.4.3.
2. GSM 04.08, subclause 3.1.4.3.
4. GSM 04.08, subclause 3.4.3; GSM 05.08, subclause 4.2.
6. GSM 04.13, subclause 5.2.4.

26.6.4.1.2 Test purpose

1. To verify that upon receipt of an ASSIGNMENT COMMAND, the MS switches to the channel defined in the ASSIGNMENT COMMAND, establishes the link and sends an ASSIGNMENT COMPLETE message. This is tested for an MS supporting TCH in the special cases of a transition.
 - 1.1 from non-hopping SDCCH to hopping TCH/F using a different timeslot;
 - 1.2 from hopping TCH/F to non-hopping TCH/F using a different timeslot;
 - 1.3 from non-hopping TCH/F to non-hopping TCH/F using a different timeslot;
 - 1.4 from non-hopping TCH/F to hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;
 - 1.5 from hopping TCH/H to non-hopping TCH/H using a different timeslot; this test purpose is only applicable if the MS supports TCH/H;
 - 1.6 from non-hopping TCH/H to hopping TCH/F using a different timeslot; this test purpose is only applicable if the MS supports TCH/H.

2. To verify that an MS supporting TCH, having sent an MM- or CM message which was not acknowledged on L2 before the channel assignment procedure was initiated and before the MS has left the old channel, repeats that message after completion of the assignment procedure without incrementing N(SD). This is tested in the special case of MM message AUTHENTICATION RESPONSE.
3. To verify that, if an MS supporting TCH has received an ASSIGNMENT COMMAND message which contains only the description of a channel to be used after the starting time, and if the starting time has not already elapsed, the mobile station shall wait up to the starting time before accessing the channel.
4. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, having sent an SABM frame to establish the main signalling link on the assigned channel, reports the power level specified in the ASSIGNMENT COMMAND message, in the uplink SACCH L1 header of the SACCH message sent in the SACCH period following the transmission of the SABM frame.
5. To verify that an MS supporting TCH, having received an ASSIGNMENT COMMAND, is able in the case of frequency hopping to decode the Mobile Allocation and Frequency List IEs correctly and applies the specified frequencies using the correct Cell Allocation.
6. To verify that after receipt of the ASSIGNMENT COMMAND the MS returns an ASSIGNMENT COMPLETE without undue delay.

26.6.4.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters except:

GSM 900:

BCCH ARFCN =20.

Throughout the test, the CA broadcast in System Information 1 is (10, 17, 20, 26, 34, 42, 45, 46, 52, 59).

Note that the actual CA of the cell contains other frequencies.

DCS 1 800:

BCCH ARFCN =747.

Throughout the test, the CA broadcast in System Information 1 is (734, 741, 747, 754, 759, 766, 773, 775, 779, 782).

Note that the actual CA of the cell contains other frequencies.

Mobile Station:

The MS is in the "idle, updated" state with a TMSI allocated.

Related PICS/PIXIT Statements

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- The supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The SS pages the MS and allocates an SDCCH. Then 2 different channels are assigned with ASSIGNMENT COMMANDs. Each time the MS shall switch to the assigned channel, establish the link and send an ASSIGNMENT COMPLETE message.

Then the SS sends a AUTHENTICATION REQUEST message. The MS shall answer with an AUTHENTICATION RESPONSE message, which is not acknowledged on L2 by the SS. Immediately after the AUTHENTICATION RESPONSE message is received, the SS sends an ASSIGNMENT COMMAND. The MS shall switch to the assigned channel, establish the link with the commanded power level and send as ASSIGNMENT COMPLETE message. Then MS shall repeat the AUTHENTICATION RESPONSE message, with the same N(SD) value.

Then the SS sends an ASSIGNMENT COMMAND, which includes a Starting Time IE. The MS shall react as specified above, but this shall be done at the time specified in Starting Time IE.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the channel assignment procedure is performed another three times, with half rate channels involved, and again it is checked that the MS correctly completes the procedures, before the SS initiates the channel release procedure.

Maximum Duration of Test

30 s.

Expected Sequence

NOTE: TS GSM 04.08 appears to be unclear as to whether timer T3240 shall or shall not be started as a result of the AUTHENTICATION REQUEST message sent in step 10. To allow a variety of test equipment implementations, the IDENTITY REQUEST message is included in order to avoid an unexpected expiry of timer T3240 prior to the end of the expected sequence.

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | See specific message contents. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | ASSIGNMENT COMMAND | |
| 6 | MS -> SS | ASSIGNMENT COMPLETE | |
| 7 | SS | | The SS checks that the MS reports the requested power level in the layer 1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM. |
| 8 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| 9 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 8. |
| 10 | SS -> MS | AUTHENTICATION REQUEST | This message is not L2 acknowledged by the SS. |
| 11 | MS -> SS | AUTHENTICATION RESPONSE | |
| 12 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| 13 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 12. |
| 14 | MS -> SS | AUTHENTICATION RESPONSE | N(SD) shall be the same as in step 10. |
| 15 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| 16 | SS | | The SS checks that there is no radio transmission on the new channel before the starting time. |
| 17 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. |
| A | | | This test part is performed if the MS does not support TCH/H (see PICS/PIXIT). |
| A18 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| B | | | This test part is performed if the MS supports TCH/H (see PICS/PIXIT). |
| B18 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| B19 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 19. |
| B20 | SS -> MS | IDENTITY REQUEST | |
| B21 | MS -> SS | IDENTITY RESPONSE | See specific message contents. |
| B22 | SS -> MS | ASSIGNMENT COMMAND | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 22. |
| B23 | MS -> SS | ASSIGNMENT COMPLETE | |
| B24 | SS -> MS | ASSIGNMENT COMMAND | See specific message contents. |
| B25 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the correct channel after establishment of the main signalling link. This message shall be ready to be transmitted before 600 ms after the completion of step 24. |
| B26 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

| - Training Sequence Code | Single RF Channel |
| - Hopping | the ARFCN of the BCCH carrier |
| - ARFCN | |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Frequency list IE | Not included |
| Cell Channel Description | Bit map zero encodes (45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12**ASSIGNMENT COMMAND:**

| | |
|--------------------------------|---|
| Channel Description | TCH/F |
| - Channel Type and TDMA offset | (N+4) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | RF hopping channel |
| - Hopping | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO | Chosen arbitrarily from the set (1 to 63) |
| - HSN | |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies (45, 46, 73, 74, 75, 76, 108, 114) |
| Starting Time | Not included |

Step 15**ASSIGNMENT COMMAND:**

| | |
|--------------------------------|--|
| Channel Description | TCH/F |
| - Channel Type and TDMA offset | (N+5) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | Single RF Channel |
| - Hopping | 10 |
| - ARFCN | |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | indicates (current frame number + 100 frames) mod 42 432 |

Step 19**ASSIGNMENT COMMAND:**

| | |
|--------------------------|--|
| Channel Description | TCH/H |
| - Channel Type | Chosen arbitrarily |
| TDMA offset | (N+6) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | RF hopping channel |
| - Hopping | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - MAIO | 0 |
| - HSN | |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Channel Mode | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| Cell Channel Description | Not included |
| Frequency list IE | Uses bit map 0 to indicate (10, 34, 52, 73, 108, 114). |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21**ASSIGNMENT COMMAND:**

| | |
|--------------------------|--|
| Channel Description | TCH/H |
| - Channel Type | Chosen arbitrarily |
| TDMA offset | (N+7) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | Single RF Channel |
| - Hopping | Chosen arbitrarily, but not the BCCH carrier |
| - ARFCN | |
| Power Command | |

Step 23**ASSIGNMENT COMMAND:**

| | |
|--------------------------------|---|
| Channel Description | TCH/F |
| - Channel Type and TDMA offset | (N+1) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | RF hopping channel |
| - Hopping | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO | Chosen arbitrarily from the set (1 to 63) |
| - HSN | |
| Power Command | |
| - Power level | Chosen arbitrarily but with a changed value. |
| Cell Channel Description | Uses bit map 0 to indicate (17, 20) |
| Frequency list IE | Not included |
| Mobile Allocation | Indicates ARFCN 17 only |
| Starting Time | Not included |

GSM 900 end:**DCS 1 800 begin:****Step 3****IMMEDIATE ASSIGNMENT:**

| | |
|------------------------------------|-------------------------------|
| As default message contents except | |
| Channel Description | |
| - Channel Type | SDCCH/8 |
| TDMA offset | Chosen arbitrarily |
| - Timeslot Number | N, chosen arbitrarily |
| - Training Sequence Code | Chosen arbitrarily |
| - Hopping | Single RF Channel |
| - ARFCN | the ARFCN of the BCCH carrier |

Step 5**ASSIGNMENT COMMAND:**

| | |
|--------------------------------|---|
| Channel Description | TCH/F |
| - Channel Type and TDMA offset | (N+1) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | RF hopping channel |
| - Hopping | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO | Chosen arbitrarily from the set (1 to 63) |
| - HSN | |
| Power Command | Chosen arbitrarily but with a changed value. |
| - Power level | Not included |
| Frequency list IE | |
| Channel Mode | Signalling |
| - Mode | Indicates all of the CA (broadcast on the BCCH) except for the BCCH carrier. |
| Mobile Allocation | |
| Starting Time | Not included |

Step 8**ASSIGNMENT COMMAND:**

| | |
|--------------------------------|--|
| Channel Description | TCH/F |
| - Channel Type and TDMA offset | (N+3) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | Single RF Channel |
| - Hopping | the ARFCN of the BCCH carrier |
| - ARFCN | |
| Power Command | Chosen arbitrarily but with a changed value. |
| - Power level | A non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| Channel Mode | Not Included |
| Frequency list IE | Not Included |
| Cell Channel Description | Use Range 128 to encode (773, 775, 779, 782, 791, 798, 829, 832, 844) |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 12**ASSIGNMENT COMMAND:**

| | |
|--------------------------------|---|
| Channel Description | TCH/F |
| - Channel Type and TDMA offset | (N+4) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | RF hopping channel |
| - Hopping | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO | Chosen arbitrarily from the set (1 to 63) |
| - HSN | |
| Power Command | Chosen arbitrarily but with a changed value. |
| - Power level | |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included (thus the CA from step 8 is used to decode the MA) |
| Mobile Allocation | Indicates frequencies (773, 775, 779, 829, 832, 844) |
| Starting Time | Not included |

Step 15**ASSIGNMENT COMMAND:**

| | |
|--------------------------------|--|
| Channel Description | TCH/F |
| - Channel Type and TDMA offset | (N+5) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | Single RF Channel |
| - Hopping | 734 |
| - ARFCN | |
| Power Command | Chosen arbitrarily but with a changed value. |
| - Power level | |
| Channel Mode | signalling |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | indicates (current frame number + 100 frames) mod 42 432 |

Step 19**ASSIGNMENT COMMAND:**

| | |
|--------------------------|--|
| Channel Description | TCH/H |
| - Channel Type | Chosen arbitrarily |
| TDMA offset | (N+6) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | RF hopping channel |
| - Hopping | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Frequency List IE. |
| - MAIO | 0 |
| - HSN | Chosen arbitrarily but with a changed value. |
| Power Command | A non-signalling mode arbitrarily selected from the half rate capabilities declared for the MS |
| - Power level | Not included |
| Channel Mode | Uses Range 1024 to indicate (734, 741, 759, 766, 773, 832, 844) |
| Cell Channel Description | Not included |
| Frequency list IE | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 21**ASSIGNMENT COMMAND:**

| | |
|--------------------------|--|
| Channel Description | TCH/H |
| - Channel Type | Chosen arbitrarily |
| TDMA offset | (N+7) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | Single RF Channel |
| - Hopping | Chosen arbitrarily, but not the BCCH carrier |
| - ARFCN | Chosen arbitrarily but with a changed value. |
| Power Command | Not included |
| - Power level | Not included |
| Channel Mode | Not included |
| Frequency list IE | Not included |
| Cell Channel Description | Not included |
| Mobile Allocation | Not included |
| Starting Time | Not included |

Step 23**ASSIGNMENT COMMAND:**

| | |
|--------------------------------|---|
| Channel Description | TCH/F |
| - Channel Type and TDMA offset | (N+1) mod 8 |
| - Timeslot Number | Chosen arbitrarily |
| - Training Sequence Code | RF hopping channel |
| - Hopping | Chosen arbitrarily from the set (0, 1 to N-1) where N is the number of frequencies in the Mobile Allocation IE. |
| - MAIO | Chosen arbitrarily from the set (1 to 63 |
| - HSN | Chosen arbitrarily but with a changed value. |
| Power Command | Uses Variable Range Format to indicate (741, 747) |
| - Power level | Not included |
| Cell Channel Description | Not included |
| Frequency list IE | Indicates ARFCN 741 only |
| Mobile Allocation | Not included |
| Starting Time | |

DCS 1 800 end:**26.6.4.2 Dedicated assignment / failure****26.6.4.2.1 Dedicated assignment / failure / failure during active state**

This test is only applicable to an MS supporting the call control protocol.

26.6.4.2.1.1 Conformance requirements

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

GSM 05.05 section 4.1.1.

26.6.4.2.1.2 Test purpose

To test that, when the MS fails to seize the new channel, the MS reactivates the old channel, reporting use of the last power level used on the old channel.

This is tested in the special cases of a transition:

- from TCH/F to hopping TCH/F in state U10 if the MS supports TCH/F and call control;
- from TCH/H to hopping TCH/H in state U10 if the MS supports TCH/H and call control.

26.6.4.2.1.3 Method of test**Initial Conditions**

System Simulator:

1 cell, default parameters. The SS orders the MS to use a power level P. Where P is a power level within the range supported by the Type of MS.

Mobile Station:

The MS is in the active state (U10) of a mobile terminated call.

Related PICS/PIXIT Statements

- Support for TCH/F.
- Support for TCH/H.
- Support for state U10 of the Call Control protocol.
- Type of MS (P-GSM 900 or EGSM or DCS 1 800).
- Power Class of MS.

Foreseen Final State of the MS

The active state (U10) of a mobile terminated call.

Test Procedure

The MS is in the active state (U10) of a mobile terminated call. The SS sends an ASSIGNMENT COMMAND allocating a new TCH/F, but does not activate the new channel. It is checked that the MS triggers the establishment of the main signalling link on the old channel and then sends an ASSIGNMENT FAILURE.

Maximum Duration of Test

30 s.

Expected Sequence

The test is repeated for execution counter k = 1, 2 if the MS supports TCH/H.

| Step | Direction | Message | Comments |
|------|-----------|--------------------|---|
| 1 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/F, if k = 1, Channel Type = TCH/H, if k = 2. Power level specified in power command is different to P, again where P is a power level within the range supported by the Type of MS. The MS attempts (and fails) to establish a signalling link on the new channel. The MS re-establishes the signalling link on the old channel. RR cause value = "protocol error unspecified". The SS checks that the MS reports power level P in the L1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM. |
| 2 | | | |
| 3 | MS -> SS | ASSIGNMENT FAILURE | |
| 4 | SS | | |

Specific Message Contents

None.

26.6.4.2.2 Dedicated assignment / failure / general case**26.6.4.2.2.1 Conformance requirements**

On the mobile station side, if a lower layer failure happens on the new channel before the ASSIGNMENT COMPLETE message has been sent, the mobile station deactivates the new channels, reactivates the old channels, reconnects the TCHs if any and triggers the establishment of the main signalling link. It then sends a ASSIGNMENT FAILURE message, cause "protocol error unspecified" on the main DCCH and resumes the normal operation, as if no assignment attempt had occurred. The operational parameters (e.g. ciphering mode) when returning on the old channel are those applied before the procedure.

GSM 04.08 section 3.4.3.3.

26.6.4.2.2.2 Test purpose

To test that, when the MS fails to seize the new channel, the MS reactivates the old channel.

This is tested in the special cases of a transition:

- from SDCCH to hopping TCH/F; this test part is only applicable if the MS supports TCH/F.
- from non-hopping SDCCH to hopping TCH/H; this test part is only applicable if the MS supports TCH/H.
- from hopping TCH/F to hopping TCH/H; this test part is only applicable if the MS supports TCH/H.

NOTE: 26.6.8.4 contains the case of an assignment failure SDCCH -> SDCCH.

26.6.4.2.2.3 Method of test**Initial Conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is "idle updated".

Related PICS/PIXIT Statements

- Support for TCH/F.
- Support for TCH/H.
- Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

The MS is "idle updated".

Test Procedure

A mobile terminated RR connection is established on an SDCCH. The SS sends an ASSIGNMENT COMMAND message allocating a hopping TCH/F, but does not activate the assigned channels. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE.

For an MS not supporting TCH/H, the SS initiates the channel release procedure and the test ends here. For an MS supporting TCH/H, the test sequence is repeated another two times, with half rate channels involved, and again it is checked that the MS correctly returns to the old channels, before the SS initiates the channel release procedure.

Maximum Duration of Test

30 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Channel Type: SDCCH. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | ASSIGNMENT COMMAND | |
| 6 | | | Channel Type = TCH/F, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| 7 | MS -> SS | ASSIGNMENT FAILURE | The MS re-establishes the signalling link on the old channel. RR cause value = "protocol error unspecified". |
| A | | | This test part is performed if the MS does not support TCH/H. |
| A8 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |
| B | | | This test part is performed if the MS supports TCH/H. |
| B8 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/H, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| B9 | | | The MS re-establishes the signalling link on the old channel. |
| B10 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = "protocol error unspecified". |
| B11 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/F, hopping. |
| B12 | MS -> SS | ASSIGNMENT COMPLETE | Sent on the assigned channel after establishment of the main signalling link. |
| B13 | SS -> MS | ASSIGNMENT COMMAND | Channel Type = TCH/H, hopping. The MS attempts (and fails) to establish a signalling link on the new channel. |
| B14 | | | The MS re-establishes the signalling link on the old channel. |
| B15 | MS -> SS | ASSIGNMENT FAILURE | RR cause value = "protocol error unspecified". |
| B16 | SS -> MS | CHANNEL RELEASE | The main signalling link is released. |

Specific Message Contents

None.

26.6.5 Test of handover

With the Handover procedure, it is possible to completely alter the channels allocated to a MS. This makes it possible in particular to switch a call in progress from one cell to another. The procedure is always initiated by the network and with the MS in a dedicated mode.

Sections 26.6.5.1 - 26.6.5.4 contain generic test procedures to be used for executing successful Handover tests. Table 26.6-1 contains a summary of the different combinations of parameters which have to be tested, together with a reference to the appropriate generic test procedure. If a test uses a channel rate which the MS under test does not support, the test shall be skipped.

Table 26.6-1

| From | To | Timing Adv. | Start Time | Syn ? | State of call | Section | Exec Counter |
|----------------|----------------|-------------------|------------|-------|---------------|----------|--------------|
| TCH/F, no FH | TCH/F, no FH | 20 | none | no | U10 | 26.6.5.1 | 1 |
| TCH/F, no FH | TCH/F, FH | arbitrary | none | no | U10 | 26.6.5.1 | 2 |

Table 26.6-2

| | TCH/FS | TCH/HS | SDCCH |
|---|--------|--------|-------|
| n | 10-20 | 5-10 | 2-5 |

In addition to the successful case of Handover, 2 unsuccessful cases shall be tested. These tests are described in 26.6.5.8 and 26.6.5.9.

26.6.5.1 Handover / successful / active call / non-synchronized

26.6.5.1.1 Conformance requirements

The MS shall correctly apply the handover procedure in the non-synchronized case when a call is in progress and when handover is performed from a TCH/F without frequency hopping towards a TCH/F without frequency hopping.

The MS shall correctly apply the handover procedure in the non-synchronized case when a call is in progress and when handover is performed from a TCH/H without frequency hopping to a TCH/H with frequency hopping. This does not apply to MSs not supporting TCH/H.

References

GSM 04.08 sections 3.4.4 and 9.1.15.

GSM 04.13 section 5.2.6.2.

26.6.5.1.2 Test purpose

To test that when the MS is ordered to make a non-synchronized handover it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly handles the values of any Starting Time IE in the HANDOVER COMMAND message in the case when none of the information elements referring to before the starting time are present. To test that the MS correctly handles the Timing Advance IE in the PHYSICAL INFORMATION message. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay.

26.6.5.1.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B with same LAI, default parameters except:

GSM 900:

Cell A has:

BCCH ARFCN = 20

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114)

Cell B has:

BCCH ARFCN = 40

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114)

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844)

Cell B has:

BCCH ARFCN = 764

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844)

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The frame numbers of cells A and B shall be different by 100.

The timebase of cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

Mobile Station:

The MS is in the active state (U10) of a call on cell A.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Support for state U10 of the Call Control protocol.

Support for speech: yes/no.

supported radio interface rates: 12kbps, 6kbps, 3,6kbps.

Type of Mobile Station (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

The active state (U10) of a call on cell A.

Test Procedure

This procedure is repeated for execution counter M = 1 to 8. (See table 26.6-1.)

The MS is in the active state (U10) of a call. The SS sends a HANDOVER COMMAND on the main DCCH. The MS shall (at the time defined by the Starting Time information element, if included in the message) begin to send access bursts on the new DCCH of the target cell. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of section 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.6-1 of section 26.6.5. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message, before "x" MS after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in GSM 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for an execution counter M = 1, 2, 3 for an MS which only supports TCH/F.
This sequence is performed for an execution counter M = 1, 2.. 8 for an MS which supports TCH/F and H

| Step | Direction | Message | Comments |
|------|-----------|----------------------|--|
| 0 | MS -> SS | | The MS and SS are in the active state of a call on the channel described below. |
| 1 | SS -> MS | HANDOVER COMMAND | See Specific message contents. |
| 2 | MS -> SS | HANDOVER ACCESS | Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND. If the HANDOVER COMMAND includes a starting time IE then the first HANDOVER ACCESS message shall be transmitted in the indicated frame (unless the indicated frame is not used by that channel, in which case the next frame used by that channel shall be used). |
| 3 | SS -> MS | PHYSICAL INFORMATION | Sent after reception of n HANDOVER ACCESS messages. See specific message contents. |
| 4 | MS -> SS | SABM | Sent without information field. |
| 5 | SS -> MS | UA | |
| 6 | MS -> SS | HANDOVER COMPLETE | The message shall be ready to be transmitted before "x" ms after the completion of step 3. |
| 7 | MS -> SS | | The MS and SS are in the active state of a call on the channel described below. |

Step 7: The MS and SS are using a full rate TCH in non-hopping mode on cell A.

Specific Message Contents For Mobiles not Supporting Speech

If the mobile station supports half rate, then the 12 kbps radio interface rate is not used for this test. With this restriction, the radio interface rate is selected arbitrarily from those support.

The message contents shall be the same for the declared type of Mobile Station (either P-GSM 900 or DCS 1 800) supporting speech , except for:

M = 3 and 7:

HANDOVER COMMAND

| Information Element | value/remarks |
|-----------------------|---|
| Mode of first channel | Data, with the full rate radio interface rate that is in use. |

26.6.5.2 Handover / successful / call under establishment / non-synchronized

This test is applicable to all MS which support at least one MO circuit switched basic service.

26.6.5.2.1 Conformance requirements

The MS shall correctly apply the handover procedure from SDCCH/8, TCH/F or TCH/H with or without frequency hopping to SDCCH/8, TCH/F or TCH/H with or without frequency hopping in the non-synchronized case during call establishment. The mobile shall correctly apply the handover procedures from non frequency hopping SDCCH/4 to SDCCH/8, TCH/F or TCH/H with or without frequency hopping. If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

References

GSM 04.08, sections 3.1.4.2, 3.4.4 and 9.1.15.

GSM 04.13, section 5.2.6.2.

26.6.5.2.2 Test purpose

To test that when the MS is ordered to make a non-synchronized handover, it continuously sends access bursts on the main DCCH until it receives a PHYSICAL INFORMATION message from the SS. To test that the MS correctly takes the values of the Timing Advance information element in the PHYSICAL INFORMATION message into account. To test that the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay. To test that the MS correctly retransmits Layer 3 MM or CC messages, that were not acknowledged by Layer 2 before the Handover, after completion of the Handover.

26.6.5.2.3 Method of test

Initial Conditions

System Simulator:

2 cells A and B with same LAI, default parameters, except:

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN_PERM = 00001010.

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using bit map 0 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = as defaults.

BS colour code, BCC = as defaults.

PLMN_PERM = 00001010.

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

PLMN colour code, NCC = 3.

BS colour code, BCC = 0.

Both cells send SYSTEM INFORMATION TYPE 1 messages containing the complete Cell Allocation of the cell, using Range 512 format.

The timebase of Cells A and B shall be such that the edges of their timeslots are not coincident at the antenna connector.

For execution counter M = 1, 2 and 3 a combined CCH/SDCCH is used.

For execution counter M = 4 to 10 a non combined SDCCH is used.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Support for MO calls.

Supported speech and data rates.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

Test Procedure

This procedure is repeated for execution counter M = 1, 2 .. 10 (See table 26.6-1.)

A Mobile Originating Call is initiated on Cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then begin to send access bursts on the new DCCH to cell B. The SS observes the access bursts and after receiving n (n being arbitrarily chosen between values according to table 26.6-2 of section 26.6.5) access bursts, the SS sends one PHYSICAL INFORMATION message with a Timing Advance as specified in table 26.6-1 of section 26.6.5. The MS shall activate the channel in sending and receiving mode. The MS shall establish a signalling link. The MS shall be ready to transmit a HANDOVER COMPLETE message before x ms after the end of the PHYSICAL INFORMATION message, but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is defined in GSM 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

The sequence is performed for execution counter M = 1, 2..10 (unless a particular TCH is not supported).

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | ----- | ----- | A MO call is initiated on cell A. Establ. Cause = "Originating call, NECI not set to 1 See specific message contents. CM Service Type = Mobile Origina- ting Call Establishment. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | Last L2 frame not acknowledged by the SS. See specific message contents. Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | MS -> SS | SETUP | |
| 8 | SS -> MS | HANDOVER COMMAND | |
| 9 | MS -> SS | HANDOVER ACCESS | Sent after reception of n HANDOVER ACCESS message. Timing Advance as specified in table 26.6-1 of section 26.6.5. Sent without information field. |
| 10 | SS -> MS | PHYSICAL INFORMATION | |
| 11 | MS -> SS | SABM | |
| 12 | SS -> MS | UA | |
| 13 | MS -> SS | HANDOVER COMPLETE | This message shall be ready to be transmitted before "x" ms after the completion of step 10. Same N(SD) as in step 7. |
| 14 | MS -> SS | SETUP | |
| 15 | SS -> MS | CHANNEL RELEASE | |

| Mode of first channel | Arbitrary from those supported (6, 3,6 kbps). |

26.6.5.3 Handover / successful / active call / finely synchronized

26.6.5.3.1 Conformance requirements

The MS shall correctly apply the handover procedure from TCH/F with frequency hopping to TCH/F without frequency hopping in the finely synchronized case when a call is in progress.

The MS shall correctly apply the handover procedure from TCH/H with frequency hopping to TCH/H without frequency hopping in the finely synchronized case when a call is in progress. This requirement does not apply to MSs not supporting TCH/H.

References

GSM 05.10, section 6.6.

26.6.5.3.2 Test purpose

To test that when the MS is ordered to make a finely synchronized handover to a synchronized cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element, power command and correctly calculating the timing advance to use. To test the MS activates the new channel correctly and transmits the HANDOVER COMPLETE message without undue delay.

26.6.5.3.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters, except:

The BCCH of cell A is sent k bit periods before the BCCH of cell B. The timing advance in cell A sent to the MS is y bit periods. k and y are selected such that $0 < (2k+y) \bmod 256 < 60$.

P-GSM 900:

Cell B has BCCH ARFCN = 40.

DCS 1 800:

Cell B has BCCH ARFCN = 764.

Mobile Station:

The MS is in the active state (U10) of a call (on cell A). The MS is using a power level P. Where P is a power level within the supported range of that type of MS.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Support for state U10 of the Call Control protocol.

Supported speech and data rates.

Type of Mobile Station (P-GSM 900 or EGSM or DCS 1 800).

Power class of Mobile Station.

Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B).

Test Procedure

This procedure is repeated for execution counter M = 1 to 2. (See table 26.6-1.)

The MS is in the active state (U10) of a call on cell A. The SS sends a HANDOVER COMMAND on the main DCCH. The MS shall (at the time specified in the Starting Time information element, if included) send 4 access bursts, in 4 successive slots on the new DCCH to cell B. Then the MS shall establish a signalling link indicating the correct Timing Advance and power level and send a HANDOVER COMPLETE message.

The MS shall be "ready to transmit" a HANDOVER COMPLETE message before "x" ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in GSM 04.13. The value of "x" depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter M = 1 for an MS which only supports TCH/F.
This sequence is performed for execution counter M = 1 to 2 for an MS which supports TCH/F and H.

| Step | Direction | Message | Comments |
|------|-----------|-------------------|--|
| 0 | MS -> SS | | M = 1, The MS and SS are using a full rate TCH in hopping mode on cell A. M = 2, The MS and SS are using a half rate TCH in hopping mode on cell A. |
| 1 | SS -> MS | HANDOVER COMMAND | See Specific Message Contents. |
| 2 | MS -> SS | HANDOVER ACCESS | See specific message contents. Four messages. |
| 3 | MS -> SS | HANDOVER ACCESS | are transmitted to Cell B in 4 successive slots. |
| 4 | MS -> SS | HANDOVER ACCESS | on the new DCCH. |
| 5 | MS -> SS | HANDOVER ACCESS | |
| 6 | MS -> SS | SABM | Sent without information field. |
| 7 | SS -> MS | UA | |
| 8 | MS -> SS | HANDOVER COMPLETE | This message shall be ready to be transmitted before "x" ms after the completion of step 1. See specific message contents. |
| 9 | SS | | The header of the next uplink SACCH is examined and the Timing Advance and Power Level indications are examined. The correct timing advance shall be indicated. A tolerance of +/- 2 bit periods is allowed. The power level indication shall indicate the power level used in the handover command. |

26.6.5.4 Handover / successful / call under establishment / finely synchronized

This test is applicable to all MS which support at least one MO circuit switched basic service.

26.6.5.4.1 Conformance requirements

The MS shall correctly apply the handover procedure from SDCCH/8 or TCH/F with or without frequency hopping to SDCCH4, SDCCH/8 or TCH/F with or without frequency hopping in the finely synchronized case, during call establishment.

If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.

References

GSM 05.10, section 6.6.

GSM 04.08, section 3.1.4.2.
GSM 04.13, section 5.2.6.

26.6.5.4.2 Test purpose

To test that when the MS is ordered to make a finely synchronized handover to a synchronized cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly, taking into account the value of any Starting Time information element, power command and correctly calculating the timing advance to use. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. To verify the MS transmits the HANDOVER COMPLETE message without undue delay.

26.6.5.4.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters, except:

The BCCH of cell A is sent k bit periods before the BCCH of cell B. The timing advance in cell A sent to the MS is y bit periods. k and y are selected such that $0 < (2k + y) \bmod 256 < 60$.

The frame numbers of cells A and B shall be different by 100.

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (734, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A. The MS is using a power level P , where P is a power level within the supported range of that type of MS.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state MO calls.

Supported speech and data rates.

Type of Mobile Station (P-GSM 900 or EGSM or DCS 1 800).

Power class of Mobile Station.

Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

Test Procedure

This procedure is repeated for execution counter M = 1, 2, 3, 4 (See table 26.6-1.)

A Mobile Originating Call is initiated on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANDOVER COMMAND message, ordering the MS to switch to cell B. The MS shall then (at the time specified in the Starting Time information element, if included) send 4 access bursts, in successive slots on the new DCCH to cell B. Then the MS shall establish a signalling link indicating the correct timing advance and power level and send a HANDOVER COMPLETE message. The MS shall be "ready to transmit" the HANDOVER COMPLETE message before "x" ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS. The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

The term "ready to transmit" is defined in GSM 04.13. The value "x" depends upon the target channel and is specified in the specific message contents section.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This procedure is repeated for execution counter M = 1, 2, 3, 4 (unless a particular TCH is not supported).

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | ----- | ----- | A MO call is initiated. |
| 2 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Originating call, NECI not set to 1" |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | See Specific Message contents. |
| 4 | MS -> SS | CM SERVICE REQUEST | CM Service Type = Mobile Origina- ting Call Establishment. |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | |
| 7 | MS -> SS | SETUP | Last L2 frame not acknowledged by the SS. |
| 8 | SS -> MS | HANDOVER COMMAND | See Specific Message Contents. |
| 9 | MS -> SS | HANDOVER ACCESS | |
| 10 | MS -> SS | HANDOVER ACCESS | |
| 11 | MS -> SS | HANDOVER ACCESS | See Specific message contents. Four. |
| 12 | MS -> SS | HANDOVER ACCESS | Messages are transmitted to cell B in 4 successive slots on the new DCCH. If the HANDOVER COMMAND message includes a starting time IE then the first HANDOVER ACCESS message shall be transmitted in the indicated frame (unless the starting time has elapsed). |
| 13 | MS -> SS | SABM | Sent without information field. |
| 14 | SS -> MS | UA | |
| 15 | MS -> SS | HANDOVER COMPLETE | The message shall be ready to be transmitted before "x" ms after the completion of step 8. |
| 16 | SS | | The header of the next uplink SACCH is examined and the Timing Advance and Power Level indications are examined. The correct timing advance shall be indicated. A tolerance of +/- 2 bit periods is allowed. The power level indication shall indicate the power level used in the handover command. |
| 17 | MS -> SS | SETUP | Same N(SD) as in step 7. |
| 18 | SS -> MS | CHANNEL RELEASE | |

26.6.5.5 Pre-synchronized handovers

26.6.5.5.1 Handover / successful / active call / pre-synchronized / Timing Advance IE not included

If an MS does not implement the pre-synchronized handover procedure correctly then calls may fail.

26.6.5.5.1.1 Conformance requirements

- 1 The MS shall correctly apply the handover procedure from TCH/F without frequency hopping to TCH/F without frequency hopping in the pre-synchronized case when a call is active.
- 2 When the Timing Advance information element is not included in the HANDOVER COMMAND, the MS shall access the new cell with the default timing advance of 1 bit period.
- 3 The MS shall be ready to transmit the HANDOVER COMPLETE message within 650 ms of the end of the HANDOVER COMMAND message.

References

Conformance requirement 1: GSM 04.08 section 3.4.4.

Conformance requirement 2: GSM 05.10, section 6.6.

Conformance requirement 3: GSM 04.13, section 5.2.6.1.

26.6.5.5.1.2 Test purpose

To verify that when the MS is ordered to make a pre-synchronized handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit.

26.6.5.5.1.3 Method of test**Initial Conditions**

System Simulator:

2 cells, A and B, with same LAI, default parameters.

The BCCH of cell A is sent k bit periods before the BCCH of cell B. k is arbitrarily selected.

Mobile Station:

The MS is in the active state (U10) of a call (on cell A) using a full rate TCH in non-hopping mode.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B) using a full rate TCH in non-hopping mode.

Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANDOVER COMMAND for a pre-synchronized handover without the Timing Advance IE on the main DCCH. The MS shall send 4 access bursts, at the commanded power level, in 4 successive slots of the new DCCH to cell B with a Timing Advance of zero. Then the MS shall establish a signalling link using a Timing Advance of one and send a HANDOVER COMPLETE message. The MS shall be ready to transmit the HANDOVER COMPLETE message before 650 ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in GSM 04.13.

Maximum Duration of Test

5 seconds.

26.6.5.5.2 Handover / successful / call being established / pre-synchronized / timing advance IE is included / reporting of observed time difference requested

This test is applicable to all MS which support at least one MO circuit switched basic service.

If an MS does not implement the pre-synchronized handover procedure correctly then calls may fail.

If an MS does not report the observed time difference between cells correctly then pseudo synchronized handovers might not be possible for any MS.

26.6.5.5.2.1 Conformance requirements

- 1 The MS shall correctly apply the handover procedure from an SDCCH/4 to a TCH/F without frequency hopping in the pre-synchronized case while a call is being established.
- 2 If during call establishment a Layer 3 MM or CC message just sent by the MS is not Layer 2 acknowledged before the channel change caused by the HANDOVER COMMAND message, the MS shall send the Layer 3 message to the new cell, using the same value in the N(SD) field, after the handover procedure.
- 3 When the Timing Advance information element is included in the HANDOVER COMMAND, the MS shall access the new cell with the timing advance included in the Timing Advance IE.
- 4 The MS shall be ready to transmit the HANDOVER COMPLETE message within 650 ms of the end of the HANDOVER COMMAND message.
- 5 When requested to do so in the HANDOVER COMMAND message, the MS shall return the Mobile Time Difference IE in the HANDOVER COMPLETE message indicating the sum of the observed time difference between the cells and the timing advance used on the old cell.

Conformance requirement 5: GSM 04.08, section 10.5.2.39.

26.6.5.5.2.2 Test purpose

To test that when the MS is ordered to make a pre-synchronized handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly retransmits Layer 3 MM or CC messages that were not acknowledged by Layer 2 before the Handover, after completion of the Handover. To test that the MS correctly reports on the time difference between the cells.

26.6.5.5.2.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters.

The BCCH of cell A is sent k bit periods before the BCCH of cell B.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and camped on cell A.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state MO calls.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated" with TMSI allocated and camped on cell B.

Test Procedure

A Mobile Originating Call is initiated. The SS sends an IMMEDIATE ASSIGNMENT message allocating an SDCCH/4. The MS is commanded to use a timing advance of y bit periods on cell A. After the MS has sent the SETUP message (and before the last L2 frame carrying the SETUP message is acknowledged by the SS) the SS sends a HANDOVER COMMAND, ordering the MS to switch to cell B. The MS shall then send 4 access bursts, at the commanded power level, in 4 successive slots of the new DCCH to cell B. Then the MS shall establish a signalling link using the correct timing advance and send a HANDOVER COMPLETE message. The MS shall be ready to transmit the HANDOVER COMPLETE message before 650 ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in GSM 04.13.

The MS shall then again send the SETUP message to the SS, using the same value in the N(SD) field. Finally the SS sends a CHANNEL RELEASE to end the test.

Maximum Duration of Test

20 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1 | ----- | ----- | A MO call is initiated. |
| 2 | MS -> SS | CHANNEL REQUEST | to an SDCCH/4. |

26.6.5.6 Handover / successful / active call / pseudo synchronized

This test only applies to MSs that claim to support the pseudo synchronized handover procedure. If MSs that claim to support this procedure do not correctly implement it, then calls may fail.

26.6.5.6.1 Conformance requirements

- 1 The MS shall correctly apply the handover procedure from TCH/F without frequency hopping to TCH/F without frequency hopping in the pseudo synchronized case when a call is in progress.
- 2 The MS shall access the new cell with the correct timing advance.
- 3 The MS shall be ready to transmit the HANDOVER COMPLETE message within 650 ms of the end of the HANDOVER COMMAND message.
- 4 When requested to do so in the HANDOVER COMMAND message, the MS shall return the Mobile Time Difference IE in the HANDOVER COMPLETE message indicating the sum of the observed time difference between the cells and the timing advance used on the old cell.

26.6.5.6.2 Test purpose

To test that when the MS is ordered to make a pseudo synchronized handover to another cell, it sends 4 access bursts on the main DCCH and then activates the channel correctly and correctly calculates the time to transmit. To test that the MS correctly reports the time difference between the cells.

26.6.5.6.3 Method of test

Initial Conditions

System Simulator:

2 cells, A and B, with same LAI, default parameters.

The BCCH of cell A is sent k bit periods before the BCCH of cell B. k is arbitrarily selected.

The MS is being commanded to use a timing advance of y bit periods on cell A, where y is arbitrarily selected from the set {11, 12, ..., 62}.

Mobile Station:

The MS is in the active state (U10) of a call (on cell A) using a full rate TCH in non-hopping mode.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Support for pseudo synchronization.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B) using a full rate TCH in non-hopping mode.

Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANDOVER COMMAND for a pseudo-synchronized handover with the Real Time Difference IE included. The Time Difference value is set to $(2k+10)$ modulo 256. The MS shall send 4 access bursts, at the commanded power level, in 4 successive slots of the new DCCH to cell B with a Timing Advance of zero. Then the MS shall establish a signalling link using a Timing Advance of $(y-10)$ bit periods and send a HANDOVER COMPLETE message. The MS shall be ready to transmit the HANDOVER COMPLETE message before 650 ms after the end of the HANDOVER COMMAND message, but not before a UA frame has been sent by the SS.

The term "ready to transmit" is defined in GSM 04.13.

Maximum Duration of Test

5 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------|--|
| 1 | SS -> MS | HANDOVER COMMAND | See specific message contents below. Handover Reference as included in the HANDOVER COMMAND. |
| 2 | MS -> SS | HANDOVER ACCESS | |

Conformance requirement 1: GSM 04.08, section 3.4.4.

Conformance requirement 2: GSM 04.08, section 10.5.2.39.

26.6.5.7.2 Test purpose

To verify that when the MS is ordered to make a non-synchronized handover to another cell and is ordered to report on the time difference between the cells, that it does so correctly.

26.6.5.7.3 Method of test**Initial Conditions****System Simulator:**

2 cells, A and B with default parameters except the LAI of cell B has MNC = 02 decimal, MCC = 315 decimal, and LAC = 5344 H.

The BCCH of cell A is sent k bit periods before the BCCH of cell B.

The MS is commanded to use a timing advance of y bit periods on cell A.

Mobile Station:

The MS is in the active state (U10) of a call (on cell A) using a full rate TCH in non-hopping mode.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell B) using a full rate TCH in non-hopping mode.

Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANDOVER COMMAND on the main DCCH. The HANDOVER COMMAND includes a Synchronization Indication IE that instructs the MS to supply the observed time difference between the cells. The MS shall begin to send access bursts on the new DCCH to cell B and the SS sends one PHYSICAL INFORMATION message. The MS shall activate the channel in sending and receiving mode and establish a signalling link using the correct timing advance. The MS shall transmit a HANDOVER COMPLETE message containing the Mobile Time Difference IE with a correct value.

Maximum Duration of Test

5 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------|---|
| 1 | SS -> MS | HANDOVER COMMAND | See specific message contents below. Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. Handover Reference as included in the HANDOVER COMMAND. |
| 2 | MS -> SS | HANDOVER ACCESS | |
| 3 | SS -> MS | PHYSICAL INFORMATION | Sent without information field. |
| 4 | MS -> SS | SABM | |
| 5 | SS -> MS | UA | Shall include the Mobile Time Difference IE with value $(2k+y) \bmod 2,097,152$ half bit periods. A tolerance of ± 2 half bit periods is allowed. |
| 6 | MS -> SS | HANDOVER COMPLETE | |

Specific Message Contents**HANDOVER COMMAND**

|--|-----------------------------------|

26.6.5.8 Handover / layer 3 failure**26.6.5.8.1 Conformance requirements**

The MS shall return to the old channel in the case of an handover failure caused by the non reception of the PHYSICAL INFORMATION message. On the old channel the MS shall use the Power Level that it was previously using on that channel.

References

GSM 04.08 section 3.4.4.

26.6.5.8.2 Test purpose

To verify the function of timer T3124 and the contents in the message HANDOVER FAILURE and in the layer 1 header on the SACCH.

26.6.5.8.3 Method of test**Initial Conditions**

System Simulator:
2 cells with same LAI, default parameters.

Mobile Station:
The MS is in the active state (U10) of a call (on cell A). Used power level is the maximum supported by the MS.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.
Support for state U10 of the Call Control protocol.
Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell A). Used power level is the maximum supported by the MS.

Test Procedure

The MS is in the active state (U10) of a call on cell A. The SS sends a HANDOVER COMMAND with Power Command set to 8 on the main DCCH. The MS shall begin to send access bursts at the commanded power level on the new DCCH to cell B. The SS activates the SACCH, but does not send PHYSICAL INFORMATION (thus causing a time-out of T3124). The MS shall re-establish the old link on cell A and send a HANDOVER FAILURE within 3 seconds from the transmission of HANDOVER COMMAND, using the old power level.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 0 | SS | - | The SS records the power level in the layer 1 header of the last SACCH message sent by the MS before step 1. |
| 1 | SS -> MS | HANDOVER COMMAND | Channel description: non-hopping, full rate Power Command: 8. Synchronization Indication: non synchronized. |
| 2 | MS -> SS | HANDOVER ACCESS | Several messages are sent, all with correct Handover References. |
| 3 | MS -> SS | HANDOVER FAILURE | Sent on old channel, RR cause value = "Abnormal release, unspecified", "Abnormal release, channel unacceptable", "Abnormal release, timer expired", "Abnormal release, no activity on the radio path" or "Protocol error unspecified". Shall be sent within 3 seconds from the transmission of HANDOVER COMMAND. |
| 4 | SS | - | The SS checks that the power level reported in the layer 1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM is the same as in step 0. |

Specific Message Contents

None.

26.6.5.9 Handover / layer 1 failure**26.6.5.9.1 Conformance requirements**

The MS shall return to the old channel in the case of an handover failure caused by a layer 1 failure on the target cell. On the old channel the MS shall use the Power Level that it was previously using on that channel.

References

GSM 04.08 section 3.4.4.

26.6.5.9.2 Test purpose

To verify the function of timer T3124 and the contents in the message HANDOVER FAILURE and in the layer 1 header on the SACCH.

26.6.5.9.3 Method of test**Initial Conditions**

System Simulator:
2 cells with same LAI, default parameters.

Mobile Station:
The MS is in the active state (U10) of a call (on cell A). Used power level is the maximum supported by the MS.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F.

Support for state U10 of the Call Control protocol.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

The active state (U10) of a mobile call (on cell A). Used power level is the maximum supported by the MS.

Test Procedure

The MS is in the active state (u10) of a call on cell A. The SS sends a HANDOVER COMMAND on the main DCCH. The MS shall begin to send access bursts at the commanded power level on the new DCCH to cell B. With the exception of normal BCCH signalling, the SS does not transmit anything on cell B (thus causing a time-out of T3124). The MS shall re-establish the old link on cell A and send a HANDOVER FAILURE within 3 seconds from the transmission of HANDOVER COMMAND, using the old power level.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 0 | SS | - | The SS records the power level in the layer 1 header of the last SACCH message sent by the MS before step 1. |
| 1 | SS -> MS | HANDOVER COMMAND | Channel description: non-hopping, full rate. |
| 2 | MS -> SS | HANDOVER ACCESS | Synchronization Indication: non synchronized. |
| 3 | MS -> SS | HANDOVER FAILURE | Several messages are sent, all with correct Handover References. |
| 4 | SS | - | Sent on old channel, RR cause value = "Abnormal release, unspecified", "Abnormal release, channel unacceptable", "Abnormal release, timer expired", "Abnormal release, no activity on the radio path" or "Protocol error unspecified". Shall be sent within 3 seconds from the transmission of HANDOVER COMMAND. |
| | | | The SS checks that the power level reported in the layer 1 header of the SACCH message that is sent in the first SACCH multiframe following the SABM is the same as in step 0. |

Specific Message Contents

None.

26.6.6 Test of frequency redefinition

The Frequency Redefinition procedure is used by the network to change the frequencies and hopping sequences of the allocated channels.

26.6.6.1 Frequency redefinition

26.6.6.1.1 Conformance requirements

An MS, after receiving a FREQUENCY REDEFINITION message, shall start using the new frequencies and hopping sequence in the correct time slot when the MS is allocated a dedicated channel.

The behaviour described in the test purpose is applied for each combination of the value T(k) (k = 1,2,3) and for each supported dedicated channel type.

References

GSM 04.08 sections 3.4.5, 9.1.13 and 10.5.2.13.

26.6.6.1.2 Test purpose

To verify that the MS, after receiving a Frequency Redefinition message, starts using the new frequencies and hopping sequence at the time indicated in the message.

26.6.6.1.3 Method of test**Initial Conditions**

System Simulator:

1 cell, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs. The cell allocation is set to CA_{PGSM}(1) or CA_{DCS}(1), depending on the band of operation of the Mobile Station (See PICS/PIXIT), before each execution of this test.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Supported rate(s) of TCH: TCH/F and/or TCH/H.

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

Test parameters:

P-GSM 900:

ca_{PGSM}(1) is set to 64.

An arbitrary subset CA_{PGSM}(1) of the set {1,...,124} containing ca_{PGSM}(1) elements is drawn.

An element B of the set CA_{PGSM}(1) is arbitrarily chosen.

An arbitrary value ca_{PGSM}(2) in the range 20,...,63 is chosen.

An arbitrary subset CA_{PGSM}(2) of the set {1,...,124} with ca_{PGSM}(2) elements and containing B is chosen.

An arbitrary value ca_{PGSM}(3) in the range 4,...,19 is chosen.

An arbitrary subset CA_{PGSM}(3) of the set {1,...,124} with ca_{PGSM}(3) elements and containing B is chosen.

For j = 1,2,3, values ma_{PGSM}(j) in the range j,...,ca_{PGSM}(j)-1 and values MAIO_{PGSM}(j) in the range 0,...,ma_{PGSM}(j)-1 are arbitrarily chosen.

Subsets MA_{PGSM}(j) of CA_{PGSM}(j) not containing B and having ma(j) elements are arbitrarily chosen.

DCS 1 800:

ca_{DCS}(1) is set to 64.

An arbitrary subset CA_{DCS}(1) of the set {700,...,812} containing ca_{DCS}(1) elements is chosen.

An element B of the set CA_{DCS}(1) is arbitrarily chosen. CA_{DCS}(1) is then coded using the Variable Bit Map coding scheme.

An arbitrary value $ca_{DCS}(2)$ in the range 17,...,63 is chosen.

An arbitrary subset $CA_{DCS}(2)$ of the set {700,...,812} with $ca_{DCS}(2)$ elements and containing B is chosen. $CA_{DCS}(2)$ is then coded using the Variable Bit Map coding scheme.

An arbitrary value $ca_{DCS}(3)$ in the range 4,...,16 is chosen.

An arbitrary subset $CA_{DCS}(3)$ of the set {700,...,812} with $ca_{DCS}(3)$ elements and containing B is chosen. $CA_{DCS}(3)$ is then coded according to the specific message contents.

For $j = 1, 2, 3$, values $ma_{DCS}(j)$ in the range $j, \dots, ca_{DCS}(j)-1$ and values $MAIO_{DCS}(j)$ in the range $0, \dots, ma_{DCS}(j)-1$ are arbitrarily chosen.

Subsets $MA_{DCS}(j)$ of $CA_{DCS}(j)$ not containing B and having $ma_{DCS}(j)$ elements are arbitrarily chosen.

DCS 1 800 and GSM 900

Let $T(1) = 91$, $T(2) = 42\ 000$.

An arbitrary value $T(3)$ in the range 92,...,29999 is chosen.

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a dedicated channel (TCH/F, TCH/H or SDCCH, as defined by the execution counter R). Then the SS sends a FREQUENCY REDEFINITION message, which modifies the frequencies/hopping sequence to be used by the MS. The MS shall then, at the TDMA frame defined by the contents of the "Starting Time" information element, use the new frequencies/hopping sequence. (The value of $T(2)$ ensures that the MS believes the Starting Time has passed and so the MS shall start transmitting immediately. Immediately being in the scope of this test no later than 73 Frames for SDCCH/8 or TCH/F and 90 Frames for TCH/H after the SS sends the last burst of the first L2 frame containing the beginning of the FREQUENCY REDEFINITION message. The range for $T(3)$ ensures that the MS has to wait until the designated frame before starting transmission on the new frequencies.)

The verification is performed at the RF burst level. The MS transmits the standard test signal C1 (annex 5), and for the TCH case, the SS checks the received pattern with the expected pattern. For the SDCCH case the MS transmits fill frames, and the SS checks for each burst whether the burst is transmitted at the right frequency.

Maximum Duration of Test

$3 * (\text{number of supported channels} * T(3) + 7)$

Expected Sequence

This sequence is performed for every combination of execution counters $K = 1, 2, 3$ and $R = 1, 2, 3$:

| Step | Direction | Message | Comments |

26.6.7 Test of the channel mode modify procedure

The channel mode modify procedure allows the network to request the MS to change the channel mode for one channel. If the mobile station does not correctly respond to the CHANNEL MODE MODIFY message (with a positive acknowledgement if the new channel mode is supported, with a negative acknowledgement if the new channel mode is not supported), the network may try to repeat the procedure, release the connection, or continue to wait for the acknowledgement (the maximum time resulting from layer two re-transmissions and MS reaction time being around 5 seconds).

26.6.7.1 Test of the channel mode modify procedure / full rate

This test is only applicable to an MS supporting TCH/F.

26.6.7.1.1 Conformance requirement

When the MS has received the CHANNEL MODE MODIFY message, the mobile station changes the mode for the indicated channel and then replies by a CHANNEL MODE MODIFY ACKNOWLEDGE message indicating the new channel mode.

If the mobile station does not support the indicated mode, it shall retain the old mode and return the associated channel mode information in the CHANNEL MODE MODIFY ACKNOWLEDGE message.

References

GSM 04.08, subclauses 3.4.6.1.2 and 3.4.6.1.3

26.6.7.1.2 Test purpose

To verify that the MS, in an RR connected state, acknowledges a CHANNEL MODE MODIFY message by sending a CHANNEL MODE MODIFY ACKNOWLEDGEMENT message specifying and switching to the correct mode.

- the new mode if that mode is supported.
- the old mode if the new mode is not supported.

This shall be verified for the channel modes

- signalling only.
- speech full rate version 1.
- data 9,6 Kb/s.
- data 4,8 Kb/s full rate.
- data 2,4 Kb/s full rate.

26.6.7.1.3 Method of test

Initial Conditions

System Simulator:

1 cells, default parameters.

Mobile Station:

The MS is "idle updated", with TMSI allocated.

Related PICS/PIXIT Statements

- Type of MS (P-GSM 900 or EGSM or DCS 1 800).
- The MS supports TCH/F (Y/N).
- Bearer Capabilities supported by the MS.
- Channel modes supported by the MS:
 - * MS supports speech full rate version 1 (p1 = Y/N);
 - * MS supports data 9,6 Kb/s (p2 = Y/N);
 - * MS supports data 4,8 Kb/s full rate (p3 = Y/N);
 - * MS supports data 2,4 Kb/s full rate (p4 = Y/N).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test procedure

A Mobile Terminated call is initiated , however following the Channel Request received from the Mobile Station, the SS sends an Immediate Assignment to the MS commanding it to go to a TCH/F. This sets the Channel Mode automatically to "Signalling Only".

The SS then sends a series of CHANNEL MODE MODIFY messages to the MS. Each time it is checked that the MS responds with a CHANNEL MODE MODIFY ACKNOWLEDGE message specifying:

- the channel mode that has been specified in the CHANNEL MODE MODIFY message, if the MS supports that mode (this mode then becomes the "channel mode in use");
- the channel mode that was in use when the CHANNEL MODE MODIFY message has been received, if the MS does not support the channel mode specified in the CHANNEL MODE MODIFY message.

Maximum Duration of Test

30 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------------------|---|
| 1 | SS->MS | PAGING REQUEST TYPE 1 | Sent on correct paging subchannel. Establishment cause indicates "answer to paging". Assignment to a non hopping TCH/F. |
| 2 | MS->SS | CHANNEL REQUEST | |
| 3 | SS->MS | IMMEDIATE ASSIGNMENT | |
| 4 | SS->MS | CHANNEL MODE MODIFY | |

26.6.8 Test of ciphering mode setting

The Ciphering Mode Setting Procedure can be used by the network to trigger the start and stop of stream ciphering.

The SS shall start and synchronize ciphering and deciphering according to GSM 03.20. The bitstream shall be generated by algorithm A5 (A5/1 or A5/2 as defined by the test case) using the encryption key Kc.

26.6.8.1 Ciphering mode / start ciphering

26.6.8.1.1 Conformance requirements

1. When the MS receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "start ciphering", the MS starts ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field:
 - the MS responds with a CIPHERING MODE COMPLETE message in ciphered mode;
 - the ciphering uses the cipher key determined during the authentication procedure.
2. The MS responds to the AUTHENTICATION REQUEST message with an AUTHENTICATION RESPONSE message and continues to use the ciphering key obtained from the previous authentication procedure.

References

GSM 04.08 section 3.4.7.

26.6.8.1.2 Test purpose

To verify that the MS starts ciphering when it receives a CIPHERING MODE COMMAND message with Cipher Mode Setting = "Start Ciphering". To verify that it continues to use the old cipher key after it receives an AUTHENTICATION REQUEST whilst in ciphered mode.

26.6.8.1.3 Method of test

Initial Conditions

System Simulator:

1 cells, Radio_Link_Timeout set to 64.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Support for state U10 of the Call Control protocol.

Supported encryption algorithms: A5/1 and/or A5/2.

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is made to originate a call. It shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a CM SERVICE REQUEST. The SS sends an AUTHENTICATION REQUEST and the MS shall answer with AUTHENTICATION RESPONSE. Then the SS sends a CIPHERING MODE COMMAND, ordering the MS to start ciphering with an algorithm supported by the MS. After transmission of this command the SS starts deciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in ciphered mode using the cipher key determined during the authentication procedure, and continue to establish the call with a SETUP message. After reception of the CIPHERING MODE COMPLETE the SS starts enciphering.

The SS then sends another AUTHENTICATION REQUEST and the MS shall respond with an AUTHENTICATION RESPONSE. The MS shall continue to use the old cipher key.

Finally the SS sends a CHANNEL RELEASE to end the test.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

This sequence is performed for execution counter, K=1, 2.

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Originating Call" NECI not set to 1 |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 3 | MS -> SS | CM SERVICE REQUEST | |
| 4 | SS -> MS | AUTHENTICATION REQUEST | |
| 5 | MS -> SS | AUTHENTICATION RESPONSE | |
| 6 | SS -> MS | CIPHERING MODE COMMAND | Cipher Mode Setting = "Start Ciphering; cipher with algorithm A5/K". The SS starts deciphering. Sent in ciphered mode using the cipher key determined in between steps 4&5. The SS start enciphering. |
| 7 | MS -> SS | CIPHERING MODE COMPLETE | |
| 8 | MS -> SS | SETUP | Determines a new cipher key. Sent in ciphered mode using the cipher key determined in between steps 4&5. |
| 9 | SS -> MS | AUTHENTICATION REQUEST | |
| 10 | MS -> SS | AUTHENTICATION RESPONSE | |
| 11 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

| For | k = 1, A5/k = A5/1 |
| For | k = 2, A5/k = A5/2 |

26.6.8.2 Ciphering mode / no ciphering

26.6.8.2.1 Conformance requirements

When the MS receives a CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "no ciphering" the MS shall respond in non ciphered mode with a CIPHERING MODE COMPLETE message.

When the CIPHERING MODE COMMAND with Ciphering Mode Setting information element set to "no ciphering" is received as a response to a CM SERVICE REQUEST, the MS shall continue the establishment of the CM service.

References

GSM 04.08 section 3.4.7.

26.6.8.2.2 Test purpose

To verify that the MS does not start ciphering when it receives a CIPHERING MODE COMMAND message with Cipher Mode Setting = "No Ciphering".

26.6.8.2.3 Method of test**Initial Conditions**

System Simulator:

1 cells, Radio_Link_Timeout set to 64.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Support for state U10 of the Call Control protocol.

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is made to originate a call. It shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a CM SERVICE REQUEST. The SS sends an AUTHENTICATION REQUEST and the MS shall answer with an AUTHENTICATION RESPONSE. Then the SS sends a CIPHERING MODE COMMAND, ordering the MS not to start ciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in non-ciphered mode and continue to establish the call with a SETUP message.

Finally the SS sends a CHANNEL RELEASE to end the test.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Originating call; NECI not equal to 1. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | |

26.6.8.3 Ciphering mode / old cipher key

26.6.8.3.1 Conformance requirements

When the MS receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "start ciphering", the MS starts ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field. Also;

- the MS responds with a CIPHERING MODE COMPLETE message in the correct ciphered mode;
- the ciphering shall use the previously stored cipher key;
- in the case of a mobile originating speech call, the MS shall send a SETUP message after the completion of the ciphering procedure.

References

GSM 04.08 section 3.4.7.

26.6.8.3.2 Test purpose

To verify that the MS uses the stored cipher key when it receives a CIPHERING MODE COMMAND without a preceding authentication procedure.

26.6.8.3.3 Method of test

Initial Conditions

System Simulator:

1 cells, Radio_Link_Timeout = 64.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and a known cipher key stored.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Support for state U10 of the Call Control protocol.

Supported encryption algorithms: A5/1 and/or A5/2.

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is made to originate a call. It shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a CM SERVICE REQUEST. The SS sends a CIPHERING MODE COMMAND, ordering the MS to start ciphering with a supported algorithm. After transmission of this command the SS starts deciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in the commanded ciphered mode using the stored cipher key and continue to establish the call with a SETUP message. After reception of the CIPHERING MODE COMPLETE the SS starts enciphering.

Finally the SS sends a CHANNEL RELEASE to end the test.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Originating Call: NECI not equal to 1. |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 3 | MS -> SS | CM SERVICE REQUEST | Cipher Mode Setting = "Start Ciphering", algorithm arbitrarily selected from those supported by the MS. The SS starts deciphering. Sent in commanded ciphered mode with the stored cipher key. The SS starts enciphering. |
| 4 | SS -> MS | CIPHERING MODE COMMAND | |
| 5 | MS -> SS | CIPHERING MODE COMPLETE | |
| 6 | MS -> SS | SETUP | |

26.6.8.4 Ciphering mode / change of mode, algorithm and key

Networks can be implemented that do not have the same ciphering algorithms on all base stations. In such networks changes of algorithms and ciphering mode may occur and calls will fail if MSs incorrectly handle commands or use an incorrect cipher key.

26.6.8.4.1 Conformance requirements

- 1 When the MS in the "not ciphered" mode, receives a CIPHERING MODE COMMAND message with the Ciphering Mode Setting information element set to "start ciphering", the MS shall load the cipher key stored in the SIM into the ME, use this key to start ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field and, respond with a CIPHERING MODE COMPLETE message.
- 2 If the last timeslot of the message block containing a CIPHERING MODE COMMAND message occurs at time T, then the MS shall be ready to transmit the CIPHERING MODE COMPLETE message before T+500 ms.
- 3 When the MS receives an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the assignment, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key.
- 4 When the MS receives a HANDOVER COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the handover, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key.
- 5 When the MS in the "ciphered" mode receives a CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no ciphering", the MS shall load the cipher key stored in the SIM into the ME, load the cipher key stored in the SIM into the ME, stop ciphering and deciphering and, respond with a CIPHERING MODE COMPLETE message.
- 6 When the MS receives an AUTHENTICATION REQUEST message, it shall process the challenge information and send back an AUTHENTICATION RESPONSE message to the network. The new ciphering key calculated from the challenge information shall overwrite the previous one and be stored on the SIM before the AUTHENTICATION RESPONSE message is transmitted. The ciphering key stored in the SIM shall be loaded in to the ME when any valid CIPHERING MODE COMMAND is received.

- 7 When the MS in the not ciphered mode receives a CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no ciphering", the MS shall load the cipher key stored in the SIM into the ME, stop ciphering and deciphering and, respond with a CIPHERING MODE COMPLETE message.
- 8 If a handover fails then the operational parameters used when returning to the old channel are those applied before the HANDOVER COMMAND message was received.
- 9 If an assignment fails then the operational parameters used when returning to the old channel are those applied before the ASSIGNMENT COMMAND message was received.

26.6.8.4.2 Test purpose

- 1 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "start ciphering", the MS uses the cipher key stored in the SIM to start ciphering and deciphering with the algorithm indicated by the "algorithm identifier" field and that the MS responds with a CIPHERING MODE COMPLETE message.
- 2 To verify that the MS is ready to transmit the CIPHERING MODE COMPLETE message before 500 ms after the end of the CIPHERING MODE COMMAND message.
- 3 To verify that when the MS receives an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the assignment, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key.
- 4 To verify that when the MS receives a HANDOVER COMMAND message containing a Cipher Mode Setting IE after receipt of a CIPHERING MODE COMMAND message, the MS shall perform the handover, use the commanded mode and/or algorithm on the new channel, and not change the ciphering key
- 5 To verify that when the MS is in the "ciphered" mode and receives the CIPHERING MODE COMMAND message with Cipher Mode Setting IE set to "no ciphering", the MS loads the cipher key stored in the SIM into the ME, stops ciphering and deciphering and, responds with a CIPHERING MODE COMPLETE message.
- 6 To verify that the MS responds to an AUTHENTICATION REQUEST message with an AUTHENTICATION RESPONSE message and continues to use the cipher key obtained from the previous authentication procedure.
- 7 To verify that when the MS is in the "not ciphered" mode and receives the CIPHERING MODE COMMAND message with Ciphering Mode Setting information element set to "no ciphering", the does not start ciphering or deciphering, but does respond with a CIPHERING MODE COMPLETE message.
- 8 To verify that when the MS receives a HANDOVER COMMAND message and the handover fails, the MS sends a HANDOVER FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.

- 9 To verify that when the MS receives an ASSIGNMENT COMMAND message and the assignment fails, the MS sends an ASSIGNMENT FAILURE message on the old channel using the old ciphering mode and (if ciphered) the old algorithm and old key.

26.6.8.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, with a legal combination of CCCH_CONF with SDCCH/4s or SDCCH/8s is chosen arbitrarily by the SS.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and a known cipher key, K, stored in the SIM.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Supported ciphering algorithms: A5/1 and/or A5/2.

Power class of mobile station.

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is paged. The MS shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a PAGING RESPONSE message.

The SS sends a CIPHERING MODE COMMAND, ordering the MS to start ciphering with a supported algorithm. After transmission of this command the SS starts deciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in the commanded ciphered mode using the cipher key K. After reception of the CIPHERING MODE COMPLETE the SS starts enciphering. The MS shall be ready to transmit the CIPHERING MODE COMPLETE message before 500 ms after the end of the CIPHERING MODE COMMAND message.

The term "ready to transmit" is defined in GSM 04.13.

The SS sends an AUTHENTICATION REQUEST message to the MS. Cipher key L is calculated. The MS shall send an AUTHENTICATION RESPONSE message to the SS.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "no ciphering". The MS shall transmit the HANDOVER COMPLETE on the commanded channel in non ciphered mode.

The SS sends an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE set to "start ciphering". The MS shall start transmitting on the commanded channel using the commanded algorithm and cipher key K. The MS shall transmit the ASSIGNMENT COMPLETE message.

The SS sends a CIPHERING MODE COMMAND, ordering the MS to stop ciphering. After transmission of this command the SS stops deciphering. The MS shall respond with a CIPHERING MODE COMPLETE message in non ciphered mode. After reception of the CIPHERING MODE COMPLETE the SS stops enciphering.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "start ciphering". The MS shall transmit the HANDOVER COMPLETE on the commanded channel in ciphered mode using cipher key L and command algorithm.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "start ciphering" and the algorithm identifier indicating the algorithm currently in use. The MS shall transmit the HANDOVER COMPLETE on the commanded channel in ciphered mode using the same algorithm as before the handover.

The SS sends an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE set to "no ciphering". The MS shall start transmitting on the commanded channel in non-ciphered mode. The MS shall transmit the ASSIGNMENT COMPLETE message.

The SS sends a CIPHERING MODE COMMAND, containing a Cipher Mode Setting IE set to "no ciphering". The MS shall respond with a CIPHERING MODE COMPLETE message.

The SS sends an AUTHENTICATION REQUEST message to the MS. Cipher key M is calculated. The MS shall send an AUTHENTICATION RESPONSE message to the SS.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "start ciphering". The MS shall transmit the HANDOVER COMPLETE on the commanded channel using the commanded algorithm and cipher key L.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) with the Cipher Mode Setting IE set to "no ciphering". The SS does not activate the commanded channel. The MS's transmissions on the new channel need not be monitored. The MS shall transmit the HANDOVER FAILURE message on the "old" channel using the "old" algorithm and cipher key L and commanded algorithm.

The SS sends an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE set to "start ciphering". The SS does not activate the commanded channel. The MS's transmissions on the new channel need not be monitored. The MS shall transmit the ASSIGNMENT FAILURE message on the "old" channel using the "old" algorithm and cipher key L.

If the MS only supports one ciphering algorithm then the SS sends a CHANNEL RELEASE message.

If the MS supports more than one ciphering algorithm then the following steps are performed:

The SS sends an ASSIGNMENT COMMAND message containing a Cipher Mode Setting IE set to "start ciphering" and the Algorithm Identifier indicating a different supported algorithm to the one in use. The MS shall start transmitting on the commanded channel using the commanded algorithm. The MS shall transmit the ASSIGNMENT COMPLETE message.

The SS sends a HANDOVER COMMAND (for a finely synchronized intra-BTS handover) containing a Cipher Mode Setting IE set to "start ciphering" and the Algorithm Identifier indicating a different supported algorithm to the one in use. The MS shall transmit the HANDOVER COMPLETE on the commanded channel using the commanded algorithm.

The SS sends a CHANNEL RELEASE to end the test.

Maximum Duration of Test

3 minutes.

Expected Sequence

For MSs that only support one ciphering algorithm, the SS shall use step 61A. For MSs that support more than one ciphering algorithm, the SS shall use step 61B and the subsequent steps.

NOTE: TS GSM 04.08 appears to be unclear as to whether timer T3240 shall or shall not be started as a result of the AUTHENTICATION REQUEST messages sent in steps 8 and 44. To allow a variety of test equipment implementations, the IDENTITY REQUEST messages are included in order to avoid an unexpected expiry of timer T3240 prior to the end of the expected sequence.

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | To either SDCCH4 or SDCCH8 depending upon CCH_CONF arbitrarily chosen. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | Cipher Mode Setting = "Start Ciphering", algorithm arbitrarily selected from those supported by the MS. The SS starts deciphering with the selected algorithm. |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | Sent in ciphered mode using key "K", the stored cipher key, and the commanded algorithm. This message shall be ready to be transmitted before 500 ms after the completion of step 5. |
| 7 | SS | AUTHENTICATION REQUEST | - The SS starts enciphering using key "K". Contains a new Ciphering Key Sequence Number which is associated with the new cipher key, "L". |
| 8 | SS -> MS | | |
| 9 | MS -> SS | AUTHENTICATION RESPONSE | Includes Cipher Mode Setting IE set to "No Ciphering". |
| 10 | SS -> MS | HANDOVER COMMAND | |
| 11 | SS | - | The SS activates the new channel without ciphering. |
| 12 | MS -> SS | HANDOVER ACCESS | These four HANDOVER ACCESS messages are sent on the new channel in non ciphered mode. |
| 13 | MS -> SS | HANDOVER ACCESS | |
| 14 | MS -> SS | HANDOVER ACCESS | |
| 15 | MS -> SS | HANDOVER ACCESS | |
| 16 | MS -> SS | HANDOVER COMPLETE | Sent in non ciphered mode on the new channel. Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm arbitrarily selected from those supported by the MS. |
| 17 | SS -> MS | ASSIGNMENT COMMAND | |
| 18 | SS | ASSIGNMENT COMPLETE | The SS activates the new channel with enciphering and deciphering enabled and using cipher key "K". |
| 19 | MS -> SS | | |
| 20 | SS -> MS | CIPHERING MODE COMMAND | Sent on the new channel in ciphered mode using key "K" and the commanded algorithm. Cipher Mode Setting = "No Ciphering". The SS starts receiving in non ciphered mode. |
| 21 | MS -> SS | CIPHERING MODE COMPLETE | Sent in non ciphered mode. This message shall be ready to be transmitted before 500 ms after the completion of step 20. |
| 22 | SS | HANDOVER COMMAND | The SS starts transmitting in non ciphered mode. Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm "X" arbitrarily selected from those supported by the MS. |
| 23 | SS -> MS | | |
| 24 | SS | HANDOVER COMPLETE | The SS activates the new channel with enciphering and deciphering enabled and using cipher key "L". These four HANDOVER ACCESS messages are sent on the new channel in the non ciphered mode. |
| 25 | MS -> SS | | |
| 26 | MS -> SS | | |
| 27 | MS -> SS | | |
| 28 | MS -> SS | HANDOVER COMPLETE | Sent on the new channel in ciphered mode using key "L" and algorithm "X". |
| 29 | MS -> SS | | |
| 30 | SS -> MS | IDENTITY REQUEST | |
| 31 | MS -> SS | IDENTITY RESPONSE | |
| 32 | SS -> MS | HANDOVER COMMAND | Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm identifier set to "X". |
| 33 | SS | HANDOVER ACCESS | The SS activates the new channel with enciphering and deciphering enabled. |
| 34 | MS -> SS | | |
| 35 | MS -> SS | HANDOVER ACCESS | These four HANDOVER ACCESS messages are sent on the new channel in the non ciphered |

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 36 | MS -> SS | HANDOVER ACCESS | mode. |
| 37 | MS -> SS | HANDOVER ACCESS | |
| 38 | MS -> SS | HANDOVER COMPLETE | Sent on the new channel in ciphered mode using algorithm "X". |
| 39 | SS -> MS | ASSIGNMENT COMMAND | Includes Cipher Mode Setting IE set to "No Ciphering". |
| 40 | SS | | The SS activates the new channel without ciphering. |
| 41 | MS -> SS | ASSIGNMENT COMPLETE | Sent in non-ciphered mode on the new channel. |
| 42 | SS -> MS | CIPHERING MODE COMMAND | Cipher Mode Setting = "No Ciphering". |
| 43 | MS -> SS | CIPHERING MODE COMPLETE | Sent in non ciphered mode. This message shall be ready to be transmitted before 500 ms after the completion of step 42. |
| 44 | SS -> MS | AUTHENTICATION REQUEST | Contains a new Ciphering Key Sequence Number which is associated with the new cipher key, "M". |
| 45 | MS -> SS | AUTHENTICATION RESPONSE | |
| 46 | SS -> MS | HANDOVER COMMAND | Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm "Y" arbitrarily selected from those supported by the MS. |
| 47 | SS | | The SS activates the new channel with enciphering and deciphering enabled and using cipher key "L". |
| 48 | MS -> SS | HANDOVER ACCESS | These four HANDOVER ACCESS messages are sent on the new channel in the non ciphered mode. |
| 49 | MS -> SS | HANDOVER ACCESS | |
| 50 | MS -> SS | HANDOVER ACCESS | |
| 51 | MS -> SS | HANDOVER ACCESS | |
| 52 | MS -> SS | HANDOVER COMPLETE | Sent on the new channel in ciphered mode using key "L" |
| 53 | SS -> MS | HANDOVER COMMAND | Includes Cipher Mode Setting IE set to "No Ciphering". |
| 54 | SS, MS | | The SS does not activate the new channel The MS's transmissions on the new channel need not be monitored. |
| 55 | MS -> SS | HANDOVER FAILURE | sent on old channel using algorithm "Y" and key "L". |
| 56 | SS -> MS | IDENTITY REQUEST | |
| 57 | MS -> SS | IDENTITY RESPONSE | |
| 58 | SS -> MS | ASSIGNMENT COMMAND | Includes Cipher Mode Setting IE set to "No Ciphering". |
| 59 | SS, MS | | The SS does not activate the new channel The MS's transmissions on the new channel need not be monitored. |
| 60 | MS -> SS | ASSIGNMENT FAILURE | sent on old channel using algorithm "Y" and key "L". |
| 61A | SS -> MS | CHANNEL RELEASE | |
| 61B | SS -> MS | ASSIGNMENT COMMAND | Includes Cipher Mode Setting IE set to "Start Ciphering", with algorithm "Z" arbitrarily selected from those supported by the MS but different to algorithm "Y". |
| 62B | SS | | The SS activates the new channel with enciphering and deciphering enabled. |
| 63B | MS -> SS | ASSIGNMENT COMPLETE | Sent on the new channel in ciphered mode using key "L" and algorithm "Z". |
| 64B | SS -> MS | HANDOVER COMMAND | Includes Cipher Mode Setting IE set to "Start Ciphering" and the algorithm identifier set to "Y". |
| 65B | SS | | The SS activates the new channel with enciphering and deciphering enabled. |

| Step | Direction | Message | Comments |
|------|-----------|-------------------|---|
| 66B | MS -> SS | HANDOVER ACCESS | These four HANDOVER ACCESS messages are sent on the new channel in the non ciphered mode. |
| 67B | MS -> SS | HANDOVER ACCESS | |
| 68B | MS -> SS | HANDOVER ACCESS | |
| 69B | MS -> SS | HANDOVER ACCESS | |
| 70B | MS -> SS | HANDOVER COMPLETE | Sent on the new channel in ciphered mode using key "L" and algorithm "Y". |
| 71B | SS -> MS | CHANNEL RELEASE | |

26.6.8.5 Ciphering mode / IMEISV request

If the MS does not supply the IMEISV when requested, the network will not know whether or not the MS is type approved, i.e. whether or not it has passed any tests.

If the MS supplies its IMEISV when not requested, this may cause calls to systematically fail.

26.6.8.5.1 Conformance requirements

1. When the MS receives the CIPHERING MODE COMMAND message with Cipher Response bit set to "IMEISV shall be included", the MS shall include the IMEISV in the Mobile Identity IE in the CIPHERING MODE COMPLETE message.
2. When the MS receives the CIPHERING MODE COMMAND message with Cipher Response bit set to "IMEISV shall not be included", the MS shall not include the Mobile Identity IE in the CIPHERING MODE COMPLETE message.

References

Conformance requirement 1: GSM 04.08 sections 3.4.7.2 and 9.1.10.1.

Conformance requirement 2: GSM 04.08 section 9.1.10.1.

26.6.8.5.2 Test purpose

To verify that the MS supplies its IMEISV in the CIPHERING MODE COMPLETE message when it receives a CIPHERING MODE COMMAND message with a Cipher Response bit set to "IMEISV shall be included".

To verify that the MS does not supply any Mobile Identity IE in the CIPHERING MODE COMPLETE message when it receives a CIPHERING MODE COMMAND message with a Cipher Response bit set to "IMEISV shall not be included".

26.6.8.5.3 Method of test**Initial Conditions**

System Simulator:
1 cell.

Mobile Station:
The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

IMEISV of the MS.
Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is paged. It shall send at least one CHANNEL REQUEST message. The SS sends an IMMEDIATE ASSIGNMENT and the MS shall answer with a PAGING RESPONSE. Then the SS sends a CIPHERING MODE COMMAND indicating "No ciphering" and with the Cipher Response bit set to "IMEISV shall not be included". The MS shall respond with a CIPHERING MODE COMPLETE message that does not include the Mobile Identity IE.

Then the SS sends a CIPHERING MODE COMMAND indicating "No ciphering" and with the Cipher Response bit set to "IMEISV shall be included". The MS shall respond with a CIPHERING MODE COMPLETE message that carries the IMEISV in the Mobile Identity IE.

Finally the SS sends a CHANNEL RELEASE to end the test.

Maximum Duration of Test

10 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Cipher Mode Setting = "No Ciphering". Cipher Response = "IMEISV shall not be included". Shall not include Mobile Identity IE. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | Cipher Mode Setting = "No Ciphering". Cipher Response = "IMEISV shall be included". Shall include one Mobile Identity IE carrying the MS's IMEISV. |
| 7 | SS -> MS | CIPHERING MODE COMMAND | |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | |
| 9 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

None.

26.6.9 Test of additional assignment

The Additional Assignment procedure is used to change an MS's channel configuration from Lm + ACCH to Lm + Lm + ACCH. It is therefore only relevant to those mobiles which perform such an operation.

No tests are specified at the moment.

26.6.10 Test of partial release

The Partial Release procedure is used to change an MS's channel configuration from Lm + Lm + ACCH to Lm + ACCH. It is therefore only relevant to those mobiles which perform such an operation.

No tests are specified at the moment.

26.6.11 Test of classmark

26.6.11.1 Classmark change

This procedure allows the MS to indicate to the network that a change in the classmark (e.g. due to addition of power amplification) has taken place.

26.6.11.1.1 Conformance requirements

If the RF power capability of the MS is changed during a call, this change shall be signalled to the network.

If the RF power capability of the MS is changed in idle mode, the up to date RF power capability shall be signalled to the network during RR connection establishment.

References

GSM 04.08 section 3.4.10.

26.6.11.1.2 Test purpose

To verify that if the RF power capability or any other capability indicated in a Classmark IE of the MS is changed during a call, the change is communicated on the DCCH to the network.

To verify that if the RF power capability or any other capability indicated in a Classmark IE of the MS is changed in idle mode, the out of date capabilities are not communicated to the network during RR connection establishment.

26.6.11.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated and with no additional power amplification applied.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).
Support for more than one RF power class: yes/no.
Support for state U10 of the Call Control protocol.
Full rate channel modes supported by the MS

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated and with no additional power amplification applied.

Test Procedure

With the MS in idle mode, the RF power capability shall be changed by the addition of power amplification, after which the MS is made to originate a call. The new RF power capability shall be included in the CM SERVICE REQUEST message. After the call has reached the Call Control state U10, the RF power capability of the MS is changed by removal of the additional power amplification. The MS shall send a CLASSMARK CHANGE message indicating the new RF power capability. The RF power capability is then changed by adding the power amplification. The MS shall again send a CLASSMARK CHANGE message indicating the new RF power capability. The call is then released by the SS.

With the MS in idle mode, the power amplification is removed. The SS then pages the MS, which in the PAGING RESPONSE message shall indicate the correct RF power capability.

Finally the SS transmits a CHANNEL RELEASE to end the test.

Maximum Duration of Test

5 minutes, including 1 minute for any necessary operator actions.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | ----- | ----- | Add power amplification. |
| 2 | ----- | ----- | The MS shall be made to originate a call. |
| 3 | MS -> SS | CHANNEL REQUEST | Establ. Cause = "Originating call" NECI not equal to one. |
| 4 | SS -> MS | IMMEDIATE ASSIGNMENT | The "Mobile Station Classmark 2" IE shall indicate the new RF power capability. |
| 5 | MS -> SS | CM SERVICE REQUEST | |
| 6 | SS -> MS | CM SERVICE ACCEPT | |
| 7 | MS -> SS | SETUP | |
| 8 | SS -> MS | CALL PROCEEDING | The Channel Mode is a non-signalling mode arbitrarily selected from the full rate capabilities declared for the MS |
| 9 | SS -> MS | ALERTING | |
| 10 | SS -> MS | ASSIGNMENT COMMAND | |
| 11 | MS -> SS | ASSIGNMENT COMPLETE | |
| 12 | SS -> MS | CONNECT | Remove the power amplification. The "Mobile Station Classmark 2" IE shall indicate the new power capability. |
| 13 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 14 | ----- | ----- | |
| 15 | MS -> SS | CLASSMARK CHANGE | |
| 16 | ----- | ----- | Add power amplification. |
| 17 | MS -> SS | CLASSMARK CHANGE | The "Mobile Station Classmark 2" IE shall indicate the new power capability. |
| 18 | SS -> MS | CHANNEL RELEASE | Remove the power amplification. The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 19 | ----- | ----- | |
| 20 | SS -> MS | PAGING REQUEST TYPE 1 | Establ. Cause = "Answer to paging". |
| 21 | MS -> SS | CHANNEL REQUEST | |
| 22 | SS -> MS | IMMEDIATE ASSIGNMENT | The "Mobile Station Classmark 2" IE shall indicate the new power capability. |
| 23 | MS -> SS | PAGING RESPONSE | |
| 24 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

None.

26.6.11.2 Classmark interrogation

This procedure allows the network to request the MS to supply all its classmark information to the network.

Networks may systematically use this procedure (e.g. during location updating) and, if it is incorrectly implemented in the MS, the basic connection establishment procedure may systematically fail.

26.6.11.2.1 Conformance requirements

On receipt of a CLASSMARK ENQUIRY message, the MS sends a CLASSMARK CHANGE message to the network containing the Mobile Station Classmark 2 information element and depending upon the contents of this information element, possibly the Mobile Station Classmark 3 information element.

References

GSM 04.08 sections 3.4.11 and 9.1.11.1.

GSM 04.13 section 5.2.9.

26.6.11.2.2 Test purpose

To verify that if the network requests the MS to supply all its classmark information then this information is communicated on the DCCH to the network.

26.6.11.2.3 Method of test

Initial Conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
"Idle, updated", with TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Contents of Mobile Station Classmark 2 information element.

Existence of Mobile Station Classmark 3 information element: yes/no.

Contents of Mobile Station Classmark 3 information element.

Switch off button: yes/no.

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is switched off (or has its power removed).

The SS then sets the IMSI attach-detach flag in the SYSTEM INFORMATION messages so that the MS shall perform a location update when switched on.

The MS is switched on (or its power is re-applied). The MS then initiates a location update attempt. After the mobile has sent the LOCATION UPDATING REQUEST message, the SS transmits a CLASSMARK ENQUIRY message. The MS shall be ready to transmit the CLASSMARK CHANGE message before 300 ms after the end of the CLASSMARK ENQUIRY message.

The term "ready to transmit" is defined in GSM 04.13.

Then the SS transmits a LOCATION UPDATING ACCEPT message that does not contain a Mobile Identity IE.

Maximum Duration of Test

2 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | MS | | The MS is switched off (or has its power removed). IMSI attach-detach flag changed. The MS is switched on (or its power is re-applied). |
| 2 | SS | | |
| 3 | MS | | |
| 4 | MS -> SS | CHANNEL REQUEST | Contents as defined for default message. This message shall be ready to be transmitted before 300 ms after the completion of step 7. |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS -> SS | LOCATION UPDATING REQUEST | |
| 7 | SS -> MS | CLASSMARK ENQUIRY | |
| 8 | MS -> SS | CLASSMARK CHANGE | |
| 9 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 10 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

None.

Default Message Contents

Contents of LOCATION UPDATING ACCEPT message:

| | |
|------------------------------|-------------|
| Protocol Discriminator | MM message |
| Skip Indicator | 0000 |
| Message Type | 00000010 |
| Location Area Identification | |

| - Mobile Network Code | 01 decimal |
| - Location Area Code | 0001H |
| Mobile Identity | Not present |
| Follow on proceed | Not present |

26.6.12 Test of channel release

The purpose of this procedure is to deactivate the dedicated channels in use. When the channels are released, the MS returns to the CCCH configuration, idle mode.

26.6.12.1 Channel release / SDCCH

26.6.12.1.1 Conformance requirements

After the acknowledgement of the Layer 2 disconnection by the network, the MS shall not produce any further RF-transmission.

References

GSM 04.08 section 3.4.13.1

26.6.12.1.2 Test purpose

To verify that the MS is able to correctly release an SDCCH after having received a CHANNEL RELEASE message.

26.6.12.1.3 Method of test

Initial Conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is paged and allocated a dedicated channel and the Layer 2 signalling link is established. The SS then sends a CHANNEL RELEASE message, after which the MS shall initiate a Layer 2 disconnection process on the main signalling link. After the acknowledgement of the Layer 2 disconnection by the SS, the MS shall stop transmission of Layer 2 messages. This is verified for 3 seconds. The MS shall return to the idle state, which is verified through the paging procedure to which the MS shall respond.

Maximum Duration of Test

20 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Establ. Cause = "Answer to paging". Channel Type = SDCCH/8 With a valid RR cause value. The MS may send the DISC message without performing a layer 2 acknowledgement of the CHANNEL RELEASE message. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | |
| 6 | MS -> SS | DISC | |
| 7 | SS -> MS | UA | The SS verifies for 3 seconds that the MS does not produce any Layer 2 messages. The SS waits 12 seconds to allow the MS to perform cell reselection. |
| | ----- | ----- | |
| | ----- | ----- | |

26.6.12.2 Channel release / SDCCH - no L2 ACK**26.6.12.2.1 Conformance requirements**

After the expiry of timer T3110 the MS shall not produce any further RF-transmission.

References

GSM 04.08 section 3.4.13.1

26.6.12.2.2 Test purpose

To verify that the MS is able to correctly release a SDCCH after having received a CHANNEL RELEASE message, even if the SS does not L2 acknowledge the L2 DISC frame.

26.6.12.2.3 Method of test**Initial Conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is paged and allocated a dedicated channel and the Layer 2 signalling link is established. The SS then sends a CHANNEL RELEASE message, after which the MS shall send at least 2 L2 DISC frames. The SS does not acknowledge any of the L2 DISC frames. After 2 seconds, the SS verifies for 3 seconds that the MS has stopped transmission of Layer 2 messages. The MS shall return to the idle state, which is verified through the paging procedure to which the MS shall respond.

Maximum Duration of Test

25 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Establ. Cause = "Answer to paging". Channel Type = SDCCH/8. With a valid RR cause value. The MS may send the DISC message without performing a layer 2 acknowledgement of the CHANNEL RELEASE message. The MS shall send at least 2 L2 DISC frames, to which the SS does not respond. After a period of 2 seconds, the SS verifies for 3 seconds that the MS does not produce any further Layer 2 messages. The SS waits 12 seconds to allow the MS to perform cell reselection. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | |
| 6 | MS -> SS | DISC | |
| | ----- | ----- | |
| 7 | SS -> MS | PAGING REQUEST TYPE 1 | Establ. Cause = "Answer to paging". |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | PAGING RESPONSE | |
| 11 | SS -> MS | CHANNEL RELEASE | |

Specific Message Contents

None.

26.6.12.3 Channel release / TCH-F**26.6.12.3.1 Conformance requirements**

After the acknowledgement of the Layer 2 disconnection by the network the MS shall not produce any further RF-transmission.

References

GSM 04.08 section 3.4.13.1

26.6.12.3.2 Test purpose

To verify that the MS is able to correctly release a full-rate TCH after having received a CHANNEL RELEASE message.

26.6.12.3.3 Method of test**Initial Conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT Statements

Type of MS (P-GSM 900 or EGSM or DCS 1 800).

Supported rate of TCH: TCH/F.

Foreseen Final State of the MS

"Idle, updated", with TMSI allocated.

Test Procedure

The MS is paged and allocated a dedicated channel and the Layer 2 signalling link is established. The SS then sends a CHANNEL RELEASE message, after which the MS shall initiate a Layer 2 disconnection process on the main signalling link. After the acknowledgement of the Layer 2 disconnection by the SS, the MS shall stop transmission of Layer 2 messages. This is verified for 3 seconds. The MS shall return to the idle state, which is verified through the paging procedure to which the MS shall respond.

Maximum Duration of Test

20 seconds.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Establ. Cause = "Answer to paging". Channel Type = "Bm + ACCHs" |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CHANNEL RELEASE | |
| 6 | MS -> SS | DISC | |
| 7 | SS -> MS | UA | With a valid RR cause value. The MS may send the DISC message without performing a layer 2 acknowledgement of the CHANNEL RELEASE message. The SS verifies for 3 seconds that the MS does not produce any Layer 2 messages. The SS waits 12 seconds to allow the MS to perform cell reselection. |
| | ----- | ----- | |
| | ----- | ----- | |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Establ. Cause = "Answer to paging". |

26.6.13 Test of starting time

The Assignment, Handover and immediate assignment procedures can include a delayed change of frequency list, MAIO and HSN. This series of tests checks the behaviour of the Mobile Station when receiving channel allocation messages with a starting time and channel description for both before and after the starting time. Tests checking the phase 1 usage of the starting time (that is without a channel description for before the time) are included in the series related to immediate assignment, dedicated assignment and handover.

Throughout section 26.6.13 the defaults in section 26.6.14 for GSM 900 and 26.6.15 for DCS 1 800 are used with the following exceptions:

Contents of IMMEDIATE ASSIGNMENT message, unless otherwise defined in the individual test cases:

| | |
|--------------------------------|---|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the IA rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 11. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111111 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Channel Description | |
| - Channel Type and TDMA offset | Chosen arbitrarily (see initial conditions). |
| - Timeslot Number | Chosen arbitrarily by the test house; |
| - Training Sequence Code | Chosen arbitrarily by the test house |
| - Hopping | Yes. |
| - Hopping parameters | Chosen arbitrarily. |
| Request Reference | Pertaining to last Channel Request sent by the MS. |
| Timing Advance | |
| - Timing advance value | 30 bit periods. |
| Mobile Allocation | Chosen arbitrarily, at least one frequency. In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |
| Starting Time | Not present. |
| IA rest octets | Not used (all bits set to spare). |

GSM 900:

Cell A has:

BCCH ARFCN = 20.

Cell Allocation = (10, 17, 20, 26, 34, 42, 45, 46, 52, 59, 66, 73, 74, 75, 76, 108, 114).

Cell B has:

BCCH ARFCN = 40.

Cell Allocation = (14, 18, 22, 24, 30, 31, 38, 40, 60, 66, 73, 74, 75, 76, 108, 114).

Base station Colour Code = different to Cell A

The Cell Allocation of both Cell A and Cell B shall be coded using bit map 0 format.

(The BCCH ARFCNs are already included in the default BA-List.)

DCS 1 800:

Cell A has:

BCCH ARFCN = 747.

Cell Allocation = (737, 741, 747, 754, 759, 762, 766, 767, 773, 775, 779, 782, 791, 798, 829, 832, 844).

Base station Colour Code = different to Cell A

Cell B has:

BCCH ARFCN = 764.

Cell Allocation = (739, 743, 746, 749, 756, 758, 761, 764, 771, 779, 782, 791, 798, 829, 832, 844).

The Cell Allocation of both Cell A and Cell B shall be coded using range 256 format.

The BCCH ARFCNs shall be added to the default BA-List.

26.6.13.1 Dedicated assignment with starting time / successful case / time not elapsed**26.6.13.1.1 Conformance requirement**

A Mobile Station receiving an ASSIGNMENT COMMAND message with a starting time and channel descriptions for both after and before the starting time, and ready to access before the indicated time has elapsed, shall perform the assignment on the channels as described for before the starting time and shall start using the new frequency parameters (frequencies and hopping sequence, or single frequency) in the correct time slot indicated by the starting time.

The Mobile Station shall accept the ASSIGNMENT COMMAND message for different message formatting, differing by the information elements used to describe frequency lists.

Reference(s)

GSM 04.08 sub-clauses 3.4.3.1, 9.1.2.

26.6.13.1.2 Test purpose

To verify that the MS, after receiving an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, and ready to access before the indicated time, performs correctly the assignment using the description for before the time, and eventually starts using the frequency parameters for after the time at the time indicated in the message.

26.6.13.1.3 Method of test**Initial condition(s)**

System Simulator:

1 cell, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

- TCH supported (Y/N)
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping SDCCH. Then the SS sends an ASSIGNMENT COMMAND message allocating a channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions (hopping case) for both before and after the starting time, as detailed in the "specific message contents" clause. The indicated time is such that the Mobile Station is ready to access before that time. The Mobile Station then accesses the channel as described for before the starting time. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the ASSIGNMENT COMMAND message, use the new frequency parameters. The verification is performed at the RF burst level.

Test parameters:

T1 is set to $T0+60$ and $T0+1000 \pmod{42\,432}$, where T0 is the frame number at which the first burst of the ASSIGNMENT COMMAND message is sent.

Maximum duration of test

45 sec.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Hopping channel. See specific message contents. Sent on the correct channel (before time parameters) after establishment of the main signalling link. The SS checks that the MS is transmitting now on the correct frequencies (after time parameters) and that the transmission started in the correct frame. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | ASSIGNMENT COMMAND | |
| 6 | MS -> SS | ASSIGNMENT COMPLETE | |
| 7 | ----- | Time T1 | |
| 8 | SS -> MS | CHANNEL RELEASE | |

Specific message contents**ASSIGNMENT COMMAND**

| Information element | Value/remark |
|--|---|
| Channel Description, after time Channel Type and TDMA offset | Chosen arbitrarily among that supported by the Mobile Station. |
| Timeslot Number | Chosen arbitrarily. |
| Training Sequence Code | Chosen arbitrarily. |
| Hopping | Yes. |
| Hopping parameters | Chosen arbitrarily. |
| Power Command | |
| Power level | Chosen arbitrarily. |
| Channel Mode | |
| Mode | Arbitrarily selected from capabilities declared for the MS for the chosen type of channel. |
| Mobile Allocation, after time | Chosen arbitrarily, at least one frequency. In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |
| Starting Time | T1 |
| Channel Description, before time Channel Type and TDMA offset | Same as after time. |
| Timeslot Number | Same as after time. |
| Training Sequence Code | Same as after time. |
| Hopping | Yes. |
| Hopping parameters | Chosen arbitrarily, different from "after time". |
| Mobile Allocation, before time | Chosen arbitrarily, at least one frequency and different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

26.6.13.2 Dedicated assignment with starting time / successful case / time elapsed**26.6.13.2.1 Conformance requirement**

A Mobile Station receiving an ASSIGNMENT COMMAND message with a starting time and channel descriptions for both after and before the starting time, and ready to access after the indicated time has elapsed, shall perform the assignment on the channels as described for after the starting time.

The Mobile Station shall accept the ASSIGNMENT COMMAND message for different message formattings, differing by the information elements used to describe frequency lists.

Reference(s):

GSM 04.08 sub-clauses 3.4.3.1, 9.1.2.

26.6.13.2.2 Test purpose

To verify that the MS, after receiving an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, performs correctly the assignment using the frequency parameters for after the time if the indicated time has already elapsed when the Mobile Station is ready to transmit.

26.6.13.2.3 Method of test**Initial condition(s)**

System Simulator:

1 cell, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

26.6.13.3 Dedicated assignment with starting time and frequency redefinition / failure case / time not elapsed**26.6.13.3.1 Conformance requirement**

An MS, after receiving a FREQUENCY REDEFINITION message, shall keep the provided information until the time is elapsed. The Mobile Station must accept an intervening dedicated assignment, and, in case of failure of this assignment resulting in a return to the old channel before the time indicated in the FREQUENCY REDEFINITION message, shall return on the old channel with the frequency parameters in use at the moment of the reception of the FREQUENCY REDEFINITION message, and shall eventually start using the new frequency parameters in the correct time slot indicated by the starting time of the FREQUENCY REDEFINITION message.

Reference(s):

GSM 04.08 sub-clauses 3.4.3 and 3.4.5.

26.6.13.3.2 Test purpose

To verify that the MS, after receiving a FREQUENCY REDEFINITION and then an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the assignment and returning on the old channel, and ready to access before the time indicated in the FREQUENCY REDEFINITION, resumes transmission on the channels used at the time of the reception of the FREQUENCY REDEFINITION message and eventually starts using the new frequency parameters at the time indicated in the FREQUENCY REDEFINITION message.

26.6.13.3.3 Method of test**Initial condition(s)**

System Simulator:

1 cell, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns allocating a hopping channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported). Then the SS sends a FREQUENCY REDEFINITION message (starting time T1), which modifies the frequency parameters to be used by the MS. Then the SS sends an ASSIGNMENT COMMAND message, with a starting time (T2) and channel descriptions for both before and after the starting time. The channels and hopping sequences so allocated are distinct from those used and from those described by the FREQUENCY REDEFINITION message. The System Simulator does not activate the channels defined in the ASSIGNMENT COMMAND. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE message. Time T1 is chosen so it is reached only after the sending of the ASSIGNMENT FAILURE message. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the FREQUENCY REDEFINITION message, use the new frequency parameters. The verification is performed at the RF burst level.

Test parameters:

T1 is set to $T0 + 5000 \pmod{42\,432}$, where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

T2 is set to $T0 + 4000 \pmod{42\,432}$, where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

Maximum duration of test

180 sec.

Expected sequence

26.6.13.4 Dedicated assignment with starting time and frequency redefinition / failure case / time elapsed**26.6.13.4.1 Conformance requirement**

An MS, after receiving a FREQUENCY REDEFINITION message, shall keep the provided information until the time is elapsed. The Mobile Station must accept an intervening dedicated assignment, and, in case of failure of this assignment resulting in a return to the old channel after the time indicated in the FREQUENCY REDEFINITION message, shall return on the old channel with the frequency parameters indicated in the FREQUENCY REDEFINITION message.

Reference(s):

GSM 04.08 sub-clauses 3.4.3 and 3.4.5.

26.6.13.4.2 Test purpose

To verify that the MS, after receiving a FREQUENCY REDEFINITION and then an ASSIGNMENT COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the assignment and returning on the old channel, and ready to access after the time indicated in the FREQUENCY REDEFINITION, resumes transmission using the new frequency parameters indicated in the FREQUENCY REDEFINITION message.

26.6.13.4.3 Method of test**Initial condition(s)**

System Simulator:

1 cell, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

- Supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns allocating a hopping channel (SDCCH). Then the SS sends a FREQUENCY REDEFINITION message (starting time T1), which modifies the frequency parameters to be used by the MS. Then the SS sends an ASSIGNMENT COMMAND message, with a starting time (T2) and channel descriptions for both before and after the starting time. Time T1 is chosen so it is reached after the sending of the ASSIGNMENT COMMAND message, but before the return on the old channel. The System Simulator does not activate the channels defined in the ASSIGNMENT COMMAND. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel with the new frequency parameters as indicated by the FREQUENCY REDEFINITION message, and trigger the establishment of the main signalling link on the old channel. Then the MS shall send an ASSIGNMENT FAILURE message. The verification is performed at the RF burst level.

Test parameters:

i.e. for SDCCH

T2 is set to $T0 + 5000 \pmod{42\,432}$, where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

T1 is set to $T0 + 214 \pmod{42\,432}$, where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

NOTE: $T0 + 214$ is calculated for a maximum execution time of:

| | | |
|--|-------------------|------------|
| FREQUENCY REDEFINITION | using 1 L2 frame | 51 frames |
| ASSIGNMENT COMMAND | using 2 L2 frames | 102 frames |
| + 120 ms maximum time for a channel change | | 25 frames |
| + some frames contention (here 36) | | |

Maximum duration of test

180 sec.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Hopping channel. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | FREQUENCY REDEFINITION | Hopping channel, type among possible, signalling mode. Sent on the correct channel (parameters from the FREQUENCY REDEFINITION message) after establishment of the main signalling link. |
| 6 | SS -> MS | ASSIGNMENT COMMAND | |

26.6.13.5 Handover with starting time / successful case / time not elapsed**26.6.13.5.1 Conformance requirement**

A Mobile Station receiving an HANDOVER COMMAND message with a starting time and channel descriptions for both after and before the starting time, and ready to access before the indicated time has elapsed, shall perform the handover on the channels as described for before the starting time and shall, if specified, use the parameters in the frequency list, MAIO and HSN, in the correct time slot indicated by the starting time.

The Mobile Station shall accept the HANDOVER COMMAND message for different message formatting, differing by the information elements used to describe frequency lists.

Reference(s):

GSM 04.08 sub-clauses 3.4.4.1 and 9.1.15.

26.6.13.5.2 Test purpose

To verify that the MS, after receiving a HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, and ready to access before the indicated time, performs correctly the handover using the description for before the time, and then starts using the frequency parameters for after the time at the time indicated in the message.

26.6.13.5.3 Method of test

Initial condition(s)

System Simulator:

2 cells, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated, and camped on cell B.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping SDCCH. After the SS has received measurements concerning cell B, the SS sends a HANDOVER COMMAND message allocating a channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions (hopping case) for both before and after the starting time, as detailed in the "specific message contents" clause. The indicated time is such that the Mobile Station is ready to access before that time. The Mobile Station then accesses the channel as described for before the starting time. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the HANDOVER COMMAND message, use the new frequency parameters. The verification is performed at the RF burst level.

Test parameters:

T1 is set to $T0 + 1000 \pmod{42432}$, where T0 is the frame number at which the first burst of the HANDOVER COMMAND message is sent.

Maximum duration of test

120 sec.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Hopping channel. See specific message contents. Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | HANDOVER COMMAND | |
| 6 | MS -> SS | HANDOVER ACCESS | |
| 7 | SS -> MS | PHYSICAL INFORMATION | Sent on the correct channel (before time parameters) after establishment of the main signalling link. The SS checks that the MS is transmitting now on the correct frequencies (after time parameters) and that the transmissions started in the correct frame. |
| 8 | MS -> SS | HANDOVER COMPLETE | |
| 9 | ----- | Time T1 | |
| 10 | SS -> MS | CHANNEL RELEASE | |

Specific message contents**HANDOVER COMMAND:**

26.6.13.6 Handover with starting time / successful case / time elapsed**26.6.13.6.1 Conformance requirement**

A Mobile Station receiving a HANDOVER COMMAND message with a starting time and channel descriptions for both after and before the starting time, and ready to access after the indicated time has elapsed, shall perform the handover on the channels as described for after the starting time.

The Mobile Station shall accept the HANDOVER COMMAND message for different message formattings, differing by the information elements used to describe frequency lists.

Reference(s):

GSM 04.08 sub-clauses 3.4.4.1 and 9.1.15.

26.6.13.6.2 Test purpose:

To verify that the MS, after receiving a HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, and ready to transmit after the indicated time, performs correctly the handover using the frequency parameters for after the time.

26.6.13.6.3 Method of test**Initial condition(s)**

System Simulator:

2 cells, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated, and camped on cell A

Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated, and camped on cell B.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping SDCCH. After the SS has received measurements concerning cell B, the SS sends a HANDOVER COMMAND message allocating a channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions (hopping case) for both before and after the starting time., as detailed in the "specific message contents" clause. The indicated time is such that the Mobile Station is ready to access only after that time. The Mobile Station then accesses the channel as described for after the starting time. The verification is performed at the RF burst level.

Test parameters:

T1 is set to T0+5 (mod 42 432), where T0 is the frame number at which the first burst of the HANDOVER COMMAND message is sent.

Maximum duration of test

120 sec.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Hopping channel. See specific message contents. Repeated on every burst of the uplink main DCCH until reception of PHYSICAL INFORMATION. |

26.6.13.7 Handover with starting time and frequency redefinition / failure case / time not elapsed**26.6.13.7.1 Conformance requirement**

An MS, after receiving a FREQUENCY REDEFINITION message, shall keep the provided information until the time is elapsed. The Mobile Station must accept an intervening handover, and, in case of failure of this handover resulting in a return to the old channel before the time indicated in the FREQUENCY REDEFINITION message, shall return on the old channel with the frequency parameters in use at the moment of the reception of the FREQUENCY REDEFINITION message, and shall eventually start using the new frequency parameters in the correct time slot indicated by the starting time of the FREQUENCY REDEFINITION message.

Reference(s):

GSM 04.08 sub-clauses 3.4.4 and 3.4.5.

26.6.13.7.2 Test purpose:

To verify that the MS, after receiving a FREQUENCY REDEFINITION and then a HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the handover, and ready to access on the old channel before the time indicated in the FREQUENCY REDEFINITION, resumes transmission on the channels used at the time of the reception of the FREQUENCY REDEFINITION message and eventually starts using the new frequency parameters at the time indicated in the FREQUENCY REDEFINITION message.

26.6.13.7.3 Method of test**Initial condition(s)**

System Simulator:

2 cells, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated, and camped on cell A.

Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated, and camped on cell A.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns allocating a hopping channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported). Then the SS sends a FREQUENCY REDEFINITION message (starting time T1), which modifies the frequency parameters to be used by the MS. Then the SS sends a HANDOVER COMMAND message, with a starting time (T2) and channel descriptions for both before and after the starting time. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel and trigger the establishment of the main signalling link on the old channel. The System Simulator does not activate the channels defined in the HANDOVER COMMAND. Then the MS shall send a HANDOVER FAILURE message. Time T1 is chosen so it is reached only after the sending of the HANDOVER FAILURE message. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the FREQUENCY REDEFINITION message, use the new frequency parameters. The verification is performed at the RF burst level.

Test parameters:

T1 is set to $T_0 + 5000 \pmod{42\,432}$, where T_0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

T2 is set to $T_0 + 4000 \pmod{42\,432}$, where T_0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

Maximum duration of test

180 sec.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Hopping channel. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | FREQUENCY REDEFINITION | Hopping channel, type among possible, signalling mode. Not checked. Sent on the correct channel (original parameters) after establishment of the main signalling link. The SS checks that the MS is transmitting now on the correct frequencies (parameters of the FREQUENCY REDEFINITION message) and that the transmissions started in the correct frame. |
| 6 | SS -> MS | HANDOVER COMMAND | |
| 7 | MS -> SS | HANDOVER ACCESS | |

26.6.13.8 Handover with starting time and frequency redefinition / failure case / time elapsed**26.6.13.8.1 Conformance requirement**

An MS, after receiving a FREQUENCY REDEFINITION message, shall keep the provided information until the time is elapsed. The Mobile Station must accept an intervening handover, and, in case of failure of this handover resulting in a return to the old channel after the time indicated in the FREQUENCY REDEFINITION message, shall return on the old channel with the frequency parameters indicated in the FREQUENCY REDEFINITION message.

Reference(s):

GSM 04.08 sub-clauses 3.4.4 and 3.4.5.

26.6.13.8.2 Test purpose:

To verify that the MS, after receiving a FREQUENCY REDEFINITION and then a HANDOVER COMMAND message with a starting time and channel descriptions both for before and after the starting time, failing the handover and returning on the old channel, and ready to access after the time indicated in the FREQUENCY REDEFINITION, resumes transmission using the new frequency parameters indicated in the FREQUENCY REDEFINITION message.

26.6.13.8.3 Method of test**Initial condition(s)**

System Simulator:

2 cells, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated, and camped on cell A.

Related PICS/PIXIT statement(s)

- Supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated, and camped on cell A.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator assigns a hopping channel (SDCCH). Then the SS sends a FREQUENCY REDEFINITION message (starting time T1), which modifies the frequency parameters to be used by the MS. Then the SS sends a HANDOVER COMMAND message, with a starting time (T2) and channel descriptions for both before and after the starting time. Time T1 is chosen so it is reached after the sending of the HANDOVER COMMAND message, but before the return on the old channel. The System Simulator does not activate the channels defined in the HANDOVER COMMAND. The MS shall try to activate the new channel (this is not verified) and shall then reactivate the old channel with the new frequency parameters as indicated by the FREQUENCY REDEFINITION message, and trigger the establishment of the main signalling link on the old channel. Then the MS shall send a HANDOVER FAILURE message. The verification is performed at the RF burst level.

Test parameters:

i.e. for SDCCH

T2 is set to $T0 + 5000 \pmod{42\,432}$, where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

T1 is set to $T0 + 265 \pmod{42\,432}$, where T0 is the frame number at which the first burst of the FREQUENCY REDEFINITION message is sent.

NOTE: $T0 + 265$ is calculated for a maximum execution time of:

| | | |
|--|-------------------|------------|
| FREQUENCY REDEFINITION | using 1 L2 frame | 51 frames |
| HANDOVER COMMAND | using 3 L2 frames | 153 frames |
| + 120 ms maximum time for a channel change | | 25 frames |
| + some frames contention (here 36) | | |

Maximum duration of test

180 sec.

26.6.13.9 Immediate assignment with starting time / successful case / time not elapsed**26.6.13.9.1 Conformance requirement**

A Mobile Station receiving an IMMEDIATE ASSIGNMENT message with a starting time and channel descriptions for both after and before the starting time, and ready to access before the indicated time has elapsed, shall perform the assignment on the channels as described for before the starting time and shall start using the new frequencies and hopping sequence in the correct time slot when the MS is allocated a dedicated channel.

Reference(s):

GSM 04.08 sub-clauses 3.3.1.1.3.1 and 9.1.18.

26.6.13.9.2 Test purpose

To verify that the MS, after receiving an IMMEDIATE ASSIGNMENT message with a starting time and channel descriptions both for before and after the starting time, and ready to access before the indicated time, performs correctly the assignment using the description for before the time, and then starts using the frequency parameters for after the time at the time indicated in the message.

26.6.13.9.3 Method of test**Initial condition(s)**

System Simulator:

1 cell, CCCH_CONF set to 1 basic physical channel used for CCCH, not combined with SDCCHs.

Mobile Station:

The MS is in the "idle, updated" state, with a TMSI allocated.

Related PICS/PIXIT statement(s)

- TCH supported (Y/N).
- Supported rate(s) of TCH: (F/F+H).
- The supported channel mode(s) need to be declared.
- Supported frequencies (P-GSM, E-GSM, R-GSM or DCS 1 800).

Foreseen final state of the MS

"Idle, updated", with TMSI allocated.

Test procedure

The System Simulator pages the MS and after the MS has responded with a CHANNEL REQUEST, the simulator sends an IMMEDIATE ASSIGNMENT message allocating a hopping channel (TCH/F, TCH/H or SDCCH, arbitrarily chosen among the channels supported), with a starting time and channel descriptions for both before and after the starting time. The indicated time is such that the Mobile Station is ready to access before that time. The Mobile Station then accesses the channel as described for before the starting time. The MS shall eventually, at the TDMA frame defined by the contents of the "Starting Time" information element of the IMMEDIATE ASSIGNMENT message, use the new frequency parameters. The verification is performed at the RF burst level.

Test parameters:

T1 is chosen arbitrarily to be between T0+60 and T0+100 (mod 42 432), where T0 is the frame number at which the first burst of the IMMEDIATE ASSIGNMENT COMMAND message is sent.

Maximum duration of test

45 sec.

| MAIO | Chosen arbitrarily, different from "after time". |
| Mobile Allocation (before time) | Chosen arbitrarily, at least one frequency and different from "Mobile Allocation, after time". In case of an MA with just one frequency, the frequency should be different from the BCCH carrier. |

26.6.14 Default contents of GSM 900 layer 3 messages for RR tests

This section contains the default values of GSM 900 L3 messages, which unless indicated otherwise in section 26.6 shall be transmitted by the system simulator and which are required to be received from the GSM 900 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this section, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 5 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

Cell A**Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.**

| | |
|--------------------------------|---|
| (CBCH) Channel Description | Not present. |
| (CBCH) Mobile Allocation | Not present. |
| Cell Channel Description | |
| - Format identifier | bit map 0. |
| - Cell Allocation ARFCN | Channel Numbers 20, 30, 50 and 70. |
| Cell Identity | |
| - Cell Identity Value | 0001H |
| Cell Options | |
| - Power Control Indicator | Power Control Indicator is not set. |
| - DTX Indicator | MS shall not use DTX. |
| - Radio_Link_Timeout | 8 SACCH blocks. |
| Cell Selection Parameters | |
| - Cell_Reselect_Hysteresis | 12 dB. |
| - MX_TXPWR_MAX_CCH | Minimum level. |
| - ACS | No addition cell parameters are present in SYSTEM INFORMATION messages 7 and 8. |
| - NECI | New establishment causes not supported. |
| - RXLEV_ACCESS_MIN | Minimum level. |
| Control Channel Description | |
| - Attach-Detach allowed | No Attach/Detach. |
| - BS_AG_BLKES_RES | 0 blocks reserved for access grant. |
| - CCCH_CONF | 1 basic physical channel used for CCCH, combined with SDCCHs. |
| - BS_PA_MFRMS | 5 multiframe periods for transmission of paging messages. |
| - T3212 Time-out value | Infinite. |
| L2 pseudo length | |
| - System information 1 | 21 |
| - System information 2 | 22 |
| - System information 3 | 18 |
| - System information 4 | 12 |
| Location Area Identification | |
| - Mobile Country Code | 001 decimal |
| - Mobile Network Code | 01 decimal |
| - Location Area Code | 0001H |
| Message Type | |
| - System information 1 | 00011001 |
| - System information 2 | 00011010 |
| - System information 3 | 00011011 |
| - System information 4 | 00011100 |
| - System information 5 | 00011101 |
| - System information 6 | 00011110 |
| Neighbour Cells Description | |
| - Format identifier | bit map 0. |
| - BCCH Allocation Sequence | 0 |
| - BCCH Allocation ARFCN | Channels numbers 10, 20, 40, 80, 90, 100, 110 and 120. |
| - EXT-IND | This IE carries the complete BA. |
| NCC Permitted | 0000 0010 |
| RACH Control Parameters | |
| - Max Retrans | Max 1 retrans. |
| - Tx-integer | 5 slots used. |
| - Cell Barred for Access | Cell is not barred. |
| - Call Reestablishment Allowed | Not allowed. |
| - Access Control Class | Access is not barred. |
| - Emergency Call allowed | Yes. |
| SI 1 rest octets | Not used (all bits are set to spare). |
| SI 2 rest octets | Not used (all bits are set to spare). |
| SI 3 rest octets | Not used (all bits are set to spare). |
| SI 4 rest octets | Not used (all bits are set to spare). |

Default settings for cell A:

| | |
|--------------------------|--|
| Downlink input level | 63 dBmicroVolt emf. |
| Uplink output power | minimum supported by the MS's power class. |
| Propagation profile | static. |
| BCCH/CCCH carrier number | 20 |

Cell B

The contents of SYSTEM INFORMATION TYPE 1 to 6 messages for cell B are identical to those of cell A with the following exceptions:

| | |
|--|----------------------------------|
| Cell Channel Description - Format Identifier - Cell Allocation ARFCN | Bit map 0. Channel Number 10. |
|--|----------------------------------|

NOTE 2: This IE needs modification when used in handover tests which command the MS to go to a frequency hopping channel in cell B.

Cell Identity
- Cell Identity Value 0002H

Default settings for cell B:

| | |
|--------------------------|--|
| Downlink input level | 53 dBmicroVolt emf. |
| Uplink output power | minimum supported by the MS's power class. |
| Propagation profile | static. |
| BCCH/CCCH carrier number | 10 |

Contents of ALERTING message (SS to MS):

| | |
|--------------------------------|-------------------------------|
| Protocol Discriminator | Call Control. |
| Transaction Identifier | |
| TI value | As used in the SETUP message. |
| TI flag | 1 (destination side). |
| Message Type | 00000001 |
| All other information elements | Not present. |

Contents of ASSIGNMENT COMMAND message:

| | |
|--------------------------------|---------------------------------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00101110 |
| Channel Description | |
| - Channel Type and TDMA offset | Bm + ACCHs |
| - Timeslot Number | Chosen arbitrarily by the test house. |
| - Training Sequence Code | Chosen arbitrarily by the test house. |
| - Hopping | Single RF channel. |
| - ARFCN | Channel number 30. |
| Power Command | |
| - Power level | Chosen arbitrarily by the test house. |
| All other information elements | Not present. |

Contents of ASSIGNMENT COMPLETE message:

| | |
|------------------------|----------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00101001 |
| RR Cause | |
| - RR Cause Value | Normal event. |

Contents of ASSIGNMENT FAILURE message:

| | |
|------------------------|--------------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00101111 |
| RR Cause | |
| - RR Cause Value | Depending on test. |

Contents of AUTHENTICATION REQUEST message:

| | |
|-------------------------------|---|
| Protocol Discriminator | MM message. |
| Skip Indicator | 0000 |
| Message Type | 00010010 |
| Ciphering Key Sequence Number | |
| - Key Sequence | Chosen arbitrarily by the test house from the range 0 to 6. |
| Authentication Parameter RAND | |
| - RAND value | Chosen arbitrarily by the test house. |

Contents of AUTHENTICATION RESPONSE message:

| | |
|------------------------------|--------------|
| Protocol Discriminator | MM message. |
| Skip Indicator | 0000 |
| Message Type | 0X010100 |
| Other information element(s) | Not checked. |

Contents of CALL PROCEEDING message:

| | |
|--------------------------------|-------------------------------|
| Protocol Discriminator | Call Control. |
| Transaction Identifier | |
| TI value | As used in the SETUP message. |
| TI flag | 1 (destination side). |
| Message Type | 00000010 |
| All other information elements | Not present. |

Contents of CHANNEL MODE MODIFY message:

| | |
|--------------------------------|---------------------------------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00010000 |
| Channel Description | |
| - Channel Type and TDMA offset | Depending on test. |
| - Timeslot Number | Chosen arbitrarily by the test house. |
| - Training Sequence Code | Chosen arbitrarily by the test house. |
| - Hopping | Single RF channel. |
| - ARFCN | Channel number 30. |
| Channel Mode | |
| - Mode | Depending on test. |

Contents of CHANNEL MODE MODIFY ACKNOWLEDGE message:

| | |
|--------------------------------|---|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00010111 |
| Channel Description | |
| - Channel Type and TDMA offset | Depending on test. |
| - Timeslot Number | Same as in the CHANNEL MODE MODIFY message. |
| - Training Sequence Code | Same as in the CHANNEL MODE MODIFY message. |
| - Hopping | Single RF channel. |
| - Frequency Band | Band number 0. |
| - ARFCN | Channel number 30. |
| Channel Mode | |
| - Mode | Same as in the CHANNEL MODE MODIFY message. |

Contents of CHANNEL RELEASE message:

| | |
|------------------------|----------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00001101 |
| RR Cause | |
| - RR Cause Value | Normal event. |

Contents of CHANNEL REQUEST message

| | |
|---------------------|--------------|
| Establishment Cause | Not checked. |
| Random Reference | Not checked. |

Contents of CIPHERING MODE COMMAND message:

| | |
|------------------------|-----------------------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00110101 |
| Cipher Mode Setting | |
| - algorithm identifier | cipher with A5/1. |
| - SC | Start ciphering. |
| Cipher Response | IMEI shall not be included. |

Contents of CIPHERING MODE COMPLETE message:

| | |
|------------------------|----------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00110010 |
| Mobile Identity | Not present. |

Contents of the CLASSMARK CHANGE message:

| | |
|----------------------------|---|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 000100110 |
| Mobile Station Classmark 2 | See PICS/PIXIT. |
| Mobile Station Classmark 3 | For presence and contents see PICS/PIXIT. |

Contents of CM SERVICE ACCEPT message:

| | |
|------------------------|----------------------|
| Protocol Discriminator | Mobility Management. |
| Skip Indicator | 0000 |
| Message Type | 00100001 |

Contents of CM SERVICE REQUEST message

| | |
|----------------------------|----------------------|
| Protocol Discriminator | Mobility Management. |
| Skip Indicator | 0000 |
| Message Type | 0X100100 |
| Other information elements | Not checked. |

Contents of CONNECT message (SS to MS)

| | |
|--------------------------------|-------------------------------|
| Protocol Discriminator | Call Control. |
| Transaction Identifier | |
| TI value | As used in the SETUP message. |
| TI flag | 1 |
| Message Type | 00000111 |
| All other information elements | Not present. |

Contents of CONNECT ACKNOWLEDGE message (MS to SS)

| | |
|------------------------|-------------------------------|
| Protocol Discriminator | Call Control. |
| Transaction Identifier | |
| TI value | As used in the SETUP message. |
| TI flag | 0 |
| Message Type | 0X001111 |

Contents of HANDOVER ACCESS message:

| | |
|--------------------|--|
| Handover Reference | Equal to the value included in the Handover Command message. |
|--------------------|--|

Contents of HANDOVER COMMAND message:

| | |
|--------------------------------|---|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00101011 |
| Cell Description | |
| - Network Colour Code | 1 |
| - Base station Colour Code | Corresponding to target cell |
| - BCCH Carrier Number | Set to the BCCH carrier number of cell B. (one of 10, 20, 80, 90, 100, 110 or 120). |
| Channel Description | |
| - Channel Type and TDMA offset | Bm + ACCHs. |
| - Timeslot Number | Chosen arbitrarily by the test house. |
| - Training Sequence Code | Chosen arbitrarily by the test house. |
| - Hopping | Single RF channel. |
| - ARFCN | Chosen arbitrarily by the test house from those supported on the target cell. |
| Handover Reference | |
| - Handover Reference Value | Chosen arbitrarily by the test house. |
| Power Command | |
| - Power level | Chosen arbitrarily by the test house. |
| All other information elements | Not present. |

Contents of HANDOVER COMPLETE message:

| | |
|------------------------|----------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00101100 |
| RR cause | Normal event. |
| Time difference | Not present. |

Contents of HANDOVER FAILURE message:

| | |
|------------------------|------------------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00101000 |
| RR cause | Dependent on the test. |

IDENTITY REQUEST

| Information element | Value/remark |
|---------------------|--------------|
| Identity type | IMEI |
| Spare half octet | 0000 |

IDENTITY RESPONSE

| Information element | Value/remark |
|---------------------|--------------|
| Mobile identity | not checked |

Contents of IMMEDIATE ASSIGNMENT message:

| | |
|--------------------------------|---|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the IA rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 11. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111111 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Channel Description | |
| - Channel Type and TDMA offset | For non-combined CCCH/SDCCH (see initial conditions), SDCCH/8, with subchannel chosen arbitrarily by the test house For combined CCCH/SDCCH (default SS conditions), SDCCH/4, with subchannel chosen arbitrarily by the test house. |
| - Timeslot Number | For non-combined CCCH/SDCCH (see initial conditions), chosen arbitrarily by the test house; For combined CCCH/SDCCH (default SS conditions), SDCCH/4, timeslot zero. |
| - Training Sequence Code | For non-combined CCCH/SDCCH (see initial conditions), chosen arbitrarily by the test house; For combined CCCH/SDCCH (default SS conditions), SDCCH/4, TSC=5 (same as the BCC). |
| - Hopping | Single RF channel. |
| - ARFCN | For non-combined CCCH/SDCCH (see initial conditions), Channel number 30; For combined CCCH/SDCCH (default SS conditions), SDCCH/4, Channel number 20. |
| Request Reference | Pertaining to last Channel Request sent by the MS. |
| Timing Advance | |
| - Timing advance value | 30 bit periods. |
| Mobile Allocation | |
| - Length | 0 |
| Starting Time | Not present. |
| IA rest octets | Not used (all bits set to spare). |

Contents of IMMEDIATE ASSIGNMENT EXTENDED message:

| | |
|--------------------------------|---|
| L2 pseudo length | This is the sum of the lengths of all the information elements present in the message except for the IAX rest octets and L2 pseudo length IEs. For the default message the L2 pseudo length is 18. |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111001 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Channel Description 1 | |
| - Channel Type and TDMA offset | For non-combined CCCH/SDCCH (see test conditions), SDCCH/8, with subchannel chosen arbitrarily by the test house; For combined CCCH/SDCCH (default SS conditions), SDCCH/4, with subchannel chosen arbitrarily by the test house. |
| - Timeslot Number | For non-combined CCCH/SDCCH (see test conditions), chosen arbitrarily by the test house; For combined CCCH/SDCCH (default SS conditions), SDCCH/4, timeslot zero. |
| - Training Sequence Code | For non-combined CCCH/SDCCH (see initial conditions), chosen arbitrarily by the test house; For combined CCCH/SDCCH (default SS conditions), SDCCH/4, TSC=5 (same as the BCC). |
| - Hopping | Single RF channel. |
| - ARFCN | For non-combined CCCH/SDCCH (see initial conditions), Channel number 30; For combined CCCH/SDCCH (default SS conditions), SDCCH/4, Channel number 20. |
| Request Reference 1 | Pertaining to last Channel Request sent by the MS. |
| Timing Advance 1 | |
| - Timing advance value | Chosen arbitrarily by the test house. |
| Channel Description 2 | |
| - Channel Type and TDMA offset | Same channel type as in Channel Description 1, but different TDMA offset to that in Channel Description 1. |
| - Timeslot Number | equal to the value in Channel Description 1. |
| - Training Sequence Code | equal to the value in Channel Description 1. |
| - Hopping | Single RF channel. |
| - ARFCN | equal to the value in Channel Description 1. |
| Request Reference 2 | Not pertaining to any Channel Requests sent by the MS. |
| Timing Advance 2 | |
| - Timing advance value | Chosen arbitrarily by the test house. |
| Mobile Allocation | |
| - Length | 0 |
| Starting Time | Not present. |
| IAX rest octets | Not used (all bits set to spare). |

Contents of IMMEDIATE ASSIGNMENT REJECT message:

| | |
|------------------------|--|
| L2 pseudo length | 19 |
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00111010 |
| Page Mode | |
| - Page Mode | Normal Paging. |
| Request Reference | Pertaining to last Channel Request sent by the MS. |
| Wait Indication | 0 seconds. |
| Request Reference | Not pertaining to the MS under test. |
| Wait Indication | 0 seconds. |
| Request Reference | Not pertaining to the MS under test. |
| Wait Indication | 0 seconds. |
| Request Reference | Not pertaining to the MS under test. |
| Wait Indication | 0 seconds. |
| IAR rest octets | Not used (all bits set to spare). |

Contents of LOCATION UPDATING REQUEST message:

| | |
|----------------------------|--------------|
| Protocol Discriminator | MM message. |

| - second channel | any channel. |
| Mobile identity 1 | |
| - TMSI value | TMSI previously allocated to MS. |
| Mobile identity 2 | |
| - TMSI value | TMSI not allocated to MS. |
| Mobile identity 3 | |
| - TMSI value | TMSI not allocated to MS. |
| Mobile identity 4 | |
| - TMSI value | TMSI not allocated to MS. |
| P3 rest octets | Not used (all bits set to spare). |

Contents of PAGING RESPONSE message:

| | |
|-------------------------------|--|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00100111 |
| Ciphering Key Sequence Number | |
| - Key Sequence | Key sequence number previously allocated to MS, or "111" if no key is available. |
| Mobile Station Classmark 2 | |
| Mobile Identity | |
| - odd/even indication | Even |
| - Type of identity | TMSI |
| - Identity Digits | TMSI previously allocated to MS. |

Contents of PHYSICAL INFORMATION message:

| | |
|------------------------|-----------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00101101 |
| Timing advance | 20 bit periods. |

Contents of SETUP message; (MS to SS):

| | |
|----------------------------|-------------------------------------|
| Protocol Discriminator | Call Control. |
| Transaction Identifier | |
| TI value | any value from the set {0, ..., 6}. |
| TI flag | 0 |
| Message Type | 0X000101 |
| Other information elements | Not checked. |

26.6.15 Default contents of DCS 1 800 layer 3 messages for RR tests

This section contains the default values of DCS 1 800 L3 messages, which unless indicated otherwise in section 26.6 shall be transmitted by the system simulator and which are required to be received from the DCS 1 800 MS under test. These values are used in order to be consistent with the phase 2 version of 26.6.

The necessary L3 messages are listed in alphabetic order, with the exception of the SYSTEM INFORMATION messages, where it is the information elements which are listed in alphabetic order (this is because some information elements occur in several SYSTEM INFORMATION types).

In this section, decimal values are normally used. However, sometimes a hexadecimal value, indicated by an "H", or a binary value, indicated by a "B" is used.

Default SYSTEM INFORMATION:

NOTE 1: SYSTEM INFORMATION 2 bis, SYSTEM INFORMATION 7, and SYSTEM INFORMATION 8 messages are not used.

SYSTEM INFORMATION 5 bis is not sent as a default message. For those tests which require SYSTEM INFORMATION 5 bis see the specific message contents for that test.

Cell A**Contents of information elements in SYSTEM INFORMATION TYPE 1 to 6 messages for cell A.**

| | |
|--------------------------------|---|
| (CBCH) Channel Description | Not present. |
| (CBCH) Mobile Allocation | Not present. |
| Cell Channel Description | |
| - Format identifier | Range 512. |
| - Cell Allocation ARFCN | Channel Numbers, 590, 650, 750 and 850. |
| Cell Identity | |
| - Cell Identity Value | 0001H |
| Cell Options | |
| - Power Control Indicator | Power Control Indicator is not set, 0 |
| - DTX Indicator | MS shall not use DTX. |
| - Radio_Link_Timeout | 8 SACCH blocks. |
| Cell Selection Parameters | |
| - Cell_Reselect_Hysteresis | 12 dB |
| - MX_TXPWR_MAX_CCH | Minimum level. |
| - ACS | No addition cell parameters are present in SYSTEM INFORMATION messages 7 and 8. |
| - NECI | New establishment causes not supported. |
| - RXLEV_ACCESS_MIN | Minimum level. |
| Control Channel Description | |
| - Attach-Detach allowed | MS shall not apply. |
| - BS_AG_BLK_RES | 0 blocks reserved for access grant. |
| - CCCH_CONF | 1 basic physical channel used for CCCH, combined with SDCCHs. |
| - BS_PA_MFRMS | 5 multiframe periods for transmission of paging messages. |
| - T3212 Time-out value | Infinite. |
| L2 pseudo length | |
| - System information 1 | 21 |
| - System information 2 | 22 |
| - System information 3 | 18 |
| - System information 4 | 12 |
| Location Area Identification | |
| - Mobile Country Code | 001 decimal. |
| - Mobile Network Code | 01 decimal. |
| - Location Area Code | 0001H |
| Message Type | |
| - System information 1 | 00011001 |
| - System information 2 | 00011010 |
| - System information 3 | 00011011 |
| - System information 4 | 00011100 |
| - System information 5 | 00011101 |
| - System information 6 | 00011110 |
| Neighbour Cells Description | |
| - Format identifier | Range 512. |
| - BCCH Allocation Sequence | 0 |
| - BCCH Allocation ARFCN | Channels numbers, 520, 590, 600, 700, 747, 764, 780, 810, 870. |
| - EXT-IND | This IE carries the complete BA. EXT-IND is 0. |
| NCC Permitted | 0000 0010 |
| RACH Control Parameters | |
| - Max Retrans | Max 1 retrans. |
| - Tx-integer | 5 slots used. |
| - Cell Barred for Access | Cell is not barred. |
| - Call Reestablishment Allowed | Not Allowed. |
| - Access Control Class | Access is not barred. |
| - Emergency Call allowed | Yes. |
| SI 1 rest octets | Not used (all bits are set to spare). |
| SI 2 rest octets | Not used (all bits are set to spare). |
| SI 3 rest octets | Not used (all bits are set to spare). |
| SI 4 rest octets | Not used (all bits are set to spare). |

Default settings for cell A:

| | |
|--------------------------|---|
| Downlink input level | 63 dBmicroVolt emf(). |
| Uplink output power | minimum supported by the MS's power class |
| Propagation profile | static. |
| BCCH/CCCH carrier number | ARFN 590. |

Cell B

The contents of SYSTEM INFORMATION TYPE 1 to 6 messages for cell B are identical to those of cell A with the following exceptions:

| | |
|--------------------------|---------------------|
| Cell Channel Description | |
| - Format Identifier | Range 512. |
| - Cell Allocation ARFCN | Channel Number 520. |

NOTE 2: This IE needs modification when used in handover tests which command the MS to go to a frequency hopping channel in cell B.

| | |
|-----------------------|-------|
| Cell Identity | |
| - Cell Identity Value | 0002H |

Default settings for cell B:

| | |
|--------------------------|---|
| Downlink input level | 53 dBmicroVolt emf(). |
| Uplink output power | minimum supported by the MS's power class |
| Propagation profile | static. |
| BCCH/CCCH carrier number | 520 |

Contents of ALERTING message (SS to MS):

| | |
|--------------------------------|-------------------------------|
| Protocol Discriminator | Call Control. |
| Transaction Identifier | |
| TI value | As used in the SETUP message. |
| TI flag | 1 (destination side). |
| Message Type | 00000001 |
| All other information elements | Not present. |

Contents of ASSIGNMENT COMMAND message:

| | |
|--------------------------------|---------------------------------------|
| Protocol Discriminator | RR Management. |
| Skip Indicator | 0000 |
| Message Type | 00101110 |
| Channel Description | |
| - Channel Type and TDMA offset | Bm + ACCHs. |
| - Timeslot Number | Chosen arbitrarily by the test house. |
| - Training Sequence Code | Chosen arbitrarily by the test house. |
| - Hopping | Single RF channel. |
| - ARFCN | Channel number 650. |
| Power Command | |
| - Power level | Chosen arbitrarily by the test house. |
| All other information elements | Not present. |

Contents of ASSIGNMENT COMPLETE message:

| | |
|------------------------|----------------|

26.7 Elementary procedures of mobility management

The tests are based on GSM 04.08 and GSM 03.03.

In this section, when the expected sequence require that "a mobile originated CM connection is attempted", it shall be for a service other than emergency call.

In this section, a initial CM message is either a SETUP message, a REGISTER message or a CP-DATA message (in that case the acknowledged mode of operation on SAPI 3 will have be established and this message will be sent on SAPI 3).

26.7.1 TMSI reallocation

The intention of the TMSI Reallocation procedure is to assign a new temporary identity for the MS. If the message is not understood by the MS, the network could not establish a link to the MS. As this is a common MM procedure, it can be initiated at any time.

26.7.1.1 Conformance requirement

- 1) A Mobile Station shall acknowledge a new TMSI when explicitly allocated during a location updating procedure or an incoming call.
- 2) The TMSI shall be updated on the SIM when the Mobile Station is correctly deactivated in accordance with the manufacturer's instructions.
- 3) A Mobile Station shall answer paging with this TMSI and includes it in the Paging Response message.

Reference(s):

GSM 04.08 section 4.3.1, GSM 03.03 section 2, GSM 02.17 section 6.1.

26.7.1.2 Test purpose

To verify that the MS is able to receive and acknowledge a new TMSI by means of an explicit TMSI reallocation procedure.

To verify that the MS has stored the TMSI in a non-volatile memory.

The implicit reallocation procedure is tested in section 26.7.4.1.

26.7.1.3 Method of test

Initial conditions

System Simulator:

Two cells A and B, belonging to different location areas a and b, default parameters.

Mobile Station:

The MS has valid TMSI (= TMSI1), CKSN, Kc. It is "idle updated" on cell B.

Related PICS/PIXIT statement(s)

Switch off button Yes/No.

Way to bring the MS into service.

Foreseen final state of the MS

The MS has a valid TMSI (= TMSI1), CKSN, Kc. It is "idle updated" on cell A.

Test Procedure

The MS is paged in cell B and the ciphering mode is established. An explicit TMSI reallocation procedure is performed. The channel is released. The MS is switched off and then its power supply is interrupted for 10 seconds. The power supply is resumed and then the MS is switched on and allowed sufficient time to guarantee that the MS is in service (listening to its paging subchannel). The system simulator then checks, by paging, whether the MS has stored the received TMSI.

The MS is made to select cell A. A normal location updating procedure is performed in cell A. An explicit TMSI reallocation procedure is performed and then the location updating procedure is accepted by the SS. The system simulator checks, by paging, whether the MS has stored the allocated TMSI.

Maximum duration of test

2 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | The following messages are sent and shall be received on cell B. "Mobile identity" = TMSI1. Establishment Cause: Answer to paging. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | CIPHERING MODE COMMAND | The SS starts deciphering. |
| 6 | MS -> SS | CIPHERING MODE COMPLETE | The SS starts enciphering. |
| 7 | SS -> MS | TMSI REALLOCATION COMMAND | "Mobile identity" = new TMSI (TMSI2) different from TMSI 1. |
| 8 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 9 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. If possible (see PICS), the MS is switched off. The power supply is interrupted for 10 seconds. The MS is switched on. The SS waits an amount of time which is enough to guarantee that the MS is in service (listening to its paging subchannel). |
| 10 | MS | | |
| 10a | MS | | |
| 11 | MS | | |
| 12 | SS | | |
| 13 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile identity" = TMSI2. Establishment Cause: Answer to paging. |
| 14 | MS -> SS | CHANNEL REQUEST | |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 16 | MS -> SS | PAGING RESPONSE | |
| 17 | SS -> MS | CHANNEL RELEASE | "Mobile identity" = TMSI2. After the sending of this message, the SS waits for the disconnection of the main signalling link. The following messages are sent and shall be received on cell A The RF level of cell B is lowered until the MS selects cell A. The RF level of cell B is set sufficiently low to ensure that cell B is not suitable as defined in GSM 05.08 section 6.6.2. Establishment cause: Location updating. |
| 18 | SS | | |
| 19 | MS -> SS | CHANNEL REQUEST | |
| 20 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 21 | MS -> SS | LOCATION UPDATING REQUEST | |
| 22 | SS -> MS | TMSI REALLOCATION COMMAND | location updating type = normal, "ciphering key sequence number" = CKSN, LAI = b, "mobile identity" = TMSI2. TMSI = TMSI1. |
| 23 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 24 | SS -> MS | LOCATION UPDATING ACCEPT | This message does not contain the optional Mobile Identity field. After the sending of this message, the SS waits for the disconnection of the main signalling link. The SS waits an amount of time which is enough to guarantee that the MS is "idle updated" on cell A. |
| 25 | SS -> MS | CHANNEL RELEASE | |
| 26 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile identity" IE contains the new TMSI (= TMSI1). "Establishment cause": Answer to paging. |
| 27 | MS -> SS | CHANNEL REQUEST | |
| 28 | SS -> MS | IMMEDIATE ASSIGNMENT | "Mobile identity" IE contains the new TMSI (= TMSI1). |
| 29 | MS -> SS | PAGING RESPONSE | |
| 30 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents:

None.

26.7.2 Authentication

The purpose of this procedure is to verify the user identity. A correct response is essential to guarantee the establishment of the connection. If not, the connection will drop.

The SS shall be able to handle vectors of Kc, RAND, and SRES in a similar way as the MSC/BSS entities. The SS shall incorporate a test algorithm for generating SRES and Kc from RAND and Ki which operates as described in annex 4.

26.7.2.1 Authentication accepted**26.7.2.1.1 Conformance requirement**

- 1) A Mobile Station shall correctly respond to an Authentication Request message by sending an Authentication Response message with the SRES information field set to the same value as the one produced by the authentication algorithm in the network.
- 2) A Mobile Station shall indicate in a Paging Response message the ciphering key sequence number which was allocated to it through the authentication procedure.

Reference(s)

GSM 04.08 section 4.3.2, GSM 03.03 section 2.

26.7.2.1.2 Test purpose

- 1) To check that a Mobile Station correctly responds to an Authentication Request message by sending an Authentication Response message with the SRES information field set to the same value as the one produced by the authentication algorithm in the network.
- 2) To check that a Mobile Station indicates in a Paging Response message the ciphering key sequence number which was allocated to it through the authentication procedure.

26.7.2.1.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has valid TMSI, CKSN (CKSN1), Kc. It is "idle updated" on the cell.

Related PICS/PIXIT statement(s)

None.

Foreseen final state of the MS

The MS has valid TMSI, CKSN and Kc. It is "idle updated" on the cell.

Test Procedure

The MS is paged. After the MS has sent a PAGING RESPONSE message to the SS, the SS initiates an authentication procedure and checks the value SRES sent by the MS in the AUTHENTICATION RESPONSE message. The channel is released. The MS is paged and the SS checks the value of the ciphering key sequence number sent by the MS in the PAGING RESPONSE message.

Maximum duration of test

1 minute.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Establishment Cause: Answer to paging. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | CKSN = CKSN1 |
| 5 | SS -> MS | AUTHENTICATION REQUEST | The SS initiates authentication with CKSN2 different from CKSN1. |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | "Auth. parameter SRES" IE shall be bit exact with the value as produced by the authentication algorithm. |
| 7 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. The SS waits an amount of time which is enough to guarantee that the MS is in service. |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | Establishment Cause: Answer to paging. |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 11 | MS -> SS | PAGING RESPONSE | "Ciphering key sequence number" shall be the same as the value that was sent in the last AUTHENTICATION REQUEST message (= CKSN2). |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents:

None.

26.7.2.2 Authentication rejected**26.7.2.2.1 Conformance requirement**

- 1) After reception of an Authentication Reject message the Mobile Station shall:
 - 1.1 not perform normal location updating.
 - 1.2 not perform periodic location updating.
 - 1.3 not respond to paging with TMSI.
 - 1.4 reject any request from CM entity for MM connection except for emergency call.
 - 1.5 not perform IMSI detach if deactivated.
- 2) After reception of an Authentication Reject message the Mobile Station, if it supports speech, shall accept a request for an emergency call by sending a CHANNEL REQUEST message with the establishment cause set to "emergency call" and include an IMEI as mobile identity in the CM SERVICE REQUEST message.
- 3) After reception of an Authentication Reject message the Mobile Station shall delete the stored LAI, CKSN and TMSI.

Reference(s)

GSM 04.08 sections 4.3.2.5.

26.7.2.2.2 Test purpose

- 1) To check that ,after reception of an Authentication Reject message, the Mobile Station:
 - 1.1 does not perform normal location updating.
 - 1.2 does not perform periodic location updating.
 - 1.3 does not respond to paging with TMSI.
 - 1.4 rejects any request from CM entity for MM connection except for emergency call.
 - 1.5 does not perform IMSI detach if deactivated.
- 2) To check that, after reception of an Authentication Reject message the Mobile Station, if it supports speech, accepts a request for an emergency call by sending a CHANNEL REQUEST message with the establishment cause set to "emergency call" and includes an IMEI as mobile identity in the CM SERVICE REQUEST message.
- 3) To check that, after reception of an Authentication Reject message and after having been deactivated and reactivated, the MS performs location updating using its IMSI as mobile identity and indicates deleted LAI and CKSN.

26.7.2.2.3 Method of test**Initial conditions**

System Simulator:

- Two cells: A and B, belonging to different location areas a and b.
- IMSI attach/detach is allowed in both cells.
- The T3212 time-out value is 1/10 hour in both cells.

Mobile Station:

- The MS has valid TMSI, CKSN (CKSN2) and Kc. It is "idle updated" on cell B.

Related PICS/PIXIT statement(s)

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

Foreseen final state of the MS

The MS has valid TMSI, CKSN (CKSN1) and Kc. It is "idle updated" on cell A.

Test procedure

The SS rejects an authentication. The channel is released. The SS checks that the MS has entered the state MM IDLE substate NO IMSI, i.e. does not perform normal location updating, does not perform periodic updating, does not respond to paging, rejects any requests from CM entities except emergency calls and does not perform IMSI detach if SIM detachment is performed, switch off is performed, or the power is removed, depending on the MS (see PICS/PIXIT).

Maximum duration of test

10 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|--|-----------|-------------------------|---|
| The following messages are sent and shall be received on cell B | | | |
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Establishment Cause: Answer to paging. "Ciphering key sequence number" shall be the same as the value that was sent in the last AUTHENTICATION REQUEST message (= CKSN2). |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | AUTHENTICATION REQUEST | After the sending of this message, the SS waits for the disconnection of the main signalling link. The MS is paged in cell B. "Mobile identity" IE contains TMSI. The MS shall ignore this message. This is verified during 3 seconds. The SS waits for at least for 15 s. A MO CM connection is attempted. The MS shall not initiate an RR connection establishment on cell A or cell B. This is checked during 3 seconds. If the MS supports speech (see PICS), an emergency call is attempted. "Establishment cause": Emergency call. "CM service type": Emergency call establishment. "Mobile identity": type of identity is set to IMEI. "Cause" = unassigned number. After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | |
| 7 | SS -> MS | AUTHENTICATION REJECT | |
| 8 | SS -> MS | CHANNEL RELEASE | |
| 9 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 10 | MS | | |
| 11 | SS | | |
| 12 | MS | | |
| 13 | MS | | |
| 14 | MS | | |
| 15 | MS -> SS | CHANNEL REQUEST | "CM service type": Emergency call establishment. "Mobile identity": type of identity is set to IMEI. |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 17 | MS -> SS | CM SERVICE REQUEST | |
| 18 | SS -> MS | CM SERVICE ACCEPT | |
| 19 | MS -> SS | EMERGENCY SETUP | "Cause" = unassigned number. After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 20 | SS -> MS | RELEASE COMPLETE | |
| 21 | SS -> MS | CHANNEL RELEASE | |
| The following messages are sent and shall be received on cell A. | | | |
| 22 | SS | | The RF levels are changed to make the MS reselect the cell A. The MS performs cell reselection according to procedure as specified in GSM 05.08 (this however is not checked until step 29). The MS shall not initiate an RR connection establishment on cell A or on cell B. The SS waits at least 7 minutes for a possible periodic updating. The MS shall not initiate an RR connection establishment on cell A or on cell B. If possible (see PICS) SIM detachment is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. The MS shall not initiate an RR connection establishment on cell A or on cell B. This is checked during 3 seconds. Depending on what has been performed in step 26 the MS is brought back to operation. "Establishment cause": Location updating. |

Specific message contents

None.

26.7.3 Identification

The purpose of this procedure is to check that the MS gives its identity as requested by the network. If this procedure does not work, it will not be possible for the network to rely on the identity claimed by the MS.

26.7.3.1 General Identification

26.7.3.1.1 Conformance requirement

- 1) When requested by the network the Mobile Station shall send its IMSI.
- 2) When requested by the network the Mobile Station shall send the TMSI which it was previously allocated.
- 3) When requested by the network the Mobile Station shall send its IMEI as stored in the Mobile Equipment.
- 4) When requested by the network the Mobile Station shall send its IMEISV as stored in the Mobile Equipment.

Reference(s)

GSM 04.08 sections 4.3.3.

26.7.3.1.2 Test purpose

- 1) To verify that the MS sends identity information as requested by the system in the following cases: IMSI and TMSI are requested in non-ciphered mode, IMEI is requested in ciphered mode.
- 2) To verify that the MS sends its IMEI, when requested to do so, in non-ciphered mode.
- 3) To verify that the MS sends its IMEISV, when requested to do so, in non-ciphered mode.

26.7.3.1.3 Method of test**26.7.3.1.3.1 Identification / test 1****Initial conditions**

System Simulator:

1 cell, default values.

Mobile Station:

The MS has a valid TMSI. It is "idle updated" on the cell.

Related PICS/PIXIT statement(s)

IMEI of the ME.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on the cell.

Test Procedure

The SS requests identity information from the MS:

- IMSI in non ciphering mode,
- allocated TMSI in non ciphering mode,
- IMEI in ciphering mode.

Maximum duration of test

30 seconds.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Establishment Cause: Answer to paging. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | |
| 5 | SS -> MS | IDENTITY REQUEST | "Identity type" IE is IMSI. |
| 6 | MS -> SS | IDENTITY RESPONSE | "Mobile identity" IE specifies the IMSI of the MS. |
| 7 | SS -> MS | IDENTITY REQUEST | "Identity type" IE is TMSI. |
| 8 | MS -> SS | IDENTITY RESPONSE | "Mobile identity" IE specifies the allocated TMSI of the MS. |
| 9 | SS -> MS | CIPHERING MODE COMMAND | "Identity type" IE is IMEI. "Mobile identity" IE specifies the IMEI stored in the Mobile Equipment. |
| 10 | MS -> SS | CIPHERING MODE COMPLETE | |
| 11 | SS -> MS | IDENTITY REQUEST | |
| 12 | MS -> SS | IDENTITY RESPONSE | |
| 13 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents:

None.

26.7.3.1.3.2 Identification / test 2**Initial conditions**

System Simulator:

1 cell, default values.

Mobile Station:

The MS has a valid TMSI. It is in "idle updated".

Related PICS/PIXIT statement(s)

IMEI of the ME.

IMEISV of the ME.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

The SS requests identity information from the MS:

- IMEI in non ciphering mode;
- IMEISV in non ciphering mode.

Maximum duration of test

30 second;

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | Establishment Cause: Answer to paging. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | "Identity type" IE is IMEI. "Mobile identity" IE specifies the IMEI of the MS. "Identity type" IE is IMEIS. "Mobile identity" IE specifies the IMEISV of the MS. After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 5 | SS -> MS | IDENTITY REQUEST | |
| 6 | MS -> SS | IDENTITY RESPONSE | |
| 7 | SS -> MS | IDENTITY REQUEST | |
| 8 | MS -> SS | IDENTITY RESPONSE | |
| 9 | SS -> MS | CHANNEL RELEASE | |
| | | | |
| | | | |
| | | | |

Specific message contents:

None.

26.7.3.2 Handling of IMSI shorter than the maximum length**26.7.3.2.1 Conformance requirement**

The MS shall be capable of handling an IMSI that is not of the maximum length.

Reference(s)

GSM 04.08 clause 10.5.1.4.

26.7.3.2.2 Test purpose

To check that the MS behaves correctly when activated with an IMSI of length less than the maximum length.

In this condition, the MS shall:

- perform location updating;
- answer to paging with IMSI;
- give the correct IMSI when asked by an IDENTITY REQUEST;
- attempt CM connection establishment when requested to;
- attempt call re-establishment when needed;
- attempt IMSI detach when needed;
- erase its TMSI when the IMSI is sent by the network in a LOCATION UPDATING ACCEPT or a TMSI REALLOCATION COMMAND message.

26.7.3.2.3 Method of test

Initial conditions

System Simulator:

- 1 cell, default values.
- IMSI attach/detach bit set to "1".

Mobile Station:

- The MS has no valid TMSI.
- It is "idle updated".
- The IMSI has the value 001011234.

Related PICS/PIXIT statement(s)

On/Off switch - Yes/No.

Foreseen final state of MS

The MS has no valid TMSI. It is in "idle, updated".

Test Procedure

The MS is paged with its IMSI. The MS shall answer to paging and include the correct IMSI in the PAGING RESPONSE message. During call establishment, the SS asks for the IMSI of the MS. The MS shall answer by an IDENTITY RESPONSE message including the correct IMSI. During the active phase of the call, the SS stops sending valid SACCH frames. The MS performs call re-establishment. The MS shall include the correct IMSI in the CM RE-ESTABLISHMENT message. A TMSI REALLOCATION COMMAND including a TMSI is sent to the MS. The MS acknowledges this message. The call is release.

The MS is paged with its TMSI. The MS shall answer to paging and includes its TMSI in the PAGING RESPONSE message. During call establishment, the SS sends a TMSI REALLOCATION COMMAND including the IMSI to the MS. The MS shall acknowledge this message. The MS shall erase its TMSI. The call is released.

The MS is switched off or has its power source removed. The MS performs IMSI detach. The MS shall include the correct IMSI in the IMSI DETACH INDICATION message.

The MS is switched on or powered on. The MS performs IMSI attach. The MS shall include the correct IMSI in the LOCATION UPDATING REQUEST message. A TMSI is allocated to the MS.

The LAC of the cell is changed. The MS performs location updating. The SS includes the IMSI in the LOCATION UPDATING ACCEPT message.

A mobile originated CM connection is attempted. The MS shall include the correct IMSI in the CM SERVICE REQUEST message.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1 | SS -> MS | PAGING REQUEST TYPE 1 | "mobile identity 1" contains IMSI of MS. |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause: Answer to paging. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | PAGING RESPONSE | "mobile identity" contains the IMSI of the MS. |
| 5 | SS -> MS | IDENTITY REQUEST | "identity type" IE is IMSI. |
| 6 | MS -> SS | IDENTITY RESPONSE | "mobile identity" IE contains the IMSI of the MS. |
| 7 | | | The call is established using the sequence of the generic terminating call set-up procedure. |
| 8 | SS | | The SS stops sending valid SACCH frames. |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 11 | MS -> SS | CM REESTABLISHMENT REQUEST | "mobile identity" IE contains IMSI of the MS. |
| 12 | SS -> MS | TMSI REALLOCATION COMMAND | "mobile identity" contains a TMSI. |
| 13 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 14 | SS -> MS | CHANNEL RELEASE | After sending this message, the SS waits for the disconnection of the main signalling link. |
| 15 | SS -> MS | PAGING REQUEST TYPE 1 | "mobile identity 1" contains TMSI of MS. |
| 16 | MS -> SS | CHANNEL REQUEST | Establishment cause: Answer to paging. |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 18 | MS -> SS | PAGING RESPONSE | "mobile identity" contains the TMSI of the MS. |
| 19 | SS -> MS | AUTHENTICATION REQUEST | |
| 20 | MS -> SS | AUTHENTICATION RESPONSE | |
| 21 | SS -> MS | TMSI REALLOCATION COMMAND | "mobile identity" contains a IMSI of MS. |
| 22 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 23 | SS -> MS | CHANNEL RELEASE | |
| 24 | MS | | If possible (see PICS) the MS is switched off, otherwise the MS has its power source removed. |
| 25 | MS -> SS | CHANNEL REQUEST | If the MS was switched off it performs IMSI detach. |
| 26 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 27 | MS -> SS | IMSI DETACH INDICATION | "mobile identity" contains IMSI of MS. |
| 28 | SS -> MS | CHANNEL RELEASE | |
| 29 | MS | | The MS is switched on or has power restored. |
| 30 | MS -> SS | CHANNEL REQUEST | |
| 31 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 32 | MS -> SS | LOCATION UPDATING REQUEST | "mobile identity" contains IMSI of MS. |
| 33 | SS -> MS | LOCATION UPDATING ACCEPT | "mobile identity" contains a TMSI. |
| 34 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 35 | SS -> MS | CHANNEL RELEASE | |
| 36 | SS | | The SS changes the LAC of the cell. |
| 37 | MS -> SS | CHANNEL REQUEST | Shall be sent within 35s of the LAC being changed. |
| 38 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 39 | MS -> SS | LOCATION UPDATING REQUEST | "mobile identity" contains TMSI of the MS. |
| 40 | SS -> MS | LOCATION UPDATING ACCEPT | "mobile identity" contains IMSI of the MS. |
| 41 | SS -> MS | CHANNEL RELEASE | |
| 42 | MS | | a mobile originated CM connection is attempted. |
| 43 | MS -> SS | CHANNEL REQUEST | |
| 44 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 45 | MS -> SS | CM SERVICE REQUEST | "mobile identity" contains IMSI of the MS. |
| 46 | SS -> MS | CHANNEL RELEASE | |

Specific message contents

None.

26.7.4 Location updating

This procedure is used to register the MS in the network. If it is not performed correctly, no call can be established.

26.7.4.1 Location updating / accepted**26.7.4.1.1 Conformance requirement**

1.
 - 1.1 If the network accepts a location updating from the Mobile Station and reallocates a TMSI in the Location Updating Accept message the Mobile Station shall acknowledge the reception of the new TMSI.
 - 1.2 The Mobile Station shall answer to paging with this TMSI and include it in a Paging Response message.
- 2 If the network accepts a location updating from the Mobile Station and the Location Updating Accept message contains neither TMSI nor IMSI, the Mobile Station shall answer to paging when addressed with the last allocated TMSI and include it in the Paging Response message.
3.
 - 3.1 If the network accepts a location updating from the Mobile Station by use of a Location Updating Accept message containing the IMSI of the Mobile Station, the Mobile Station shall not answer paging with the last allocated TMSI.
 - 3.2 The Mobile Station shall still answer paging with IMSI.
4. A mobile station that supports either:
only the primary GSM band P-GSM 900 (cf. GSM 05.05), or
only the DCS 1800 band (cf. GSM 05.05)

may ignore SYSTEM INFORMATION TYPE 2ter messages ; if it does so it shall assume that the SYSTEM INFORMATION TYPE 2 carries the complete BA, for selection of the cell , where it performs the location updating procedure .

This SYSTEM INFORMATION TYPE 2ter message may be sent by the network with either a L2 pseudo length of 18 or some other value.

see 04.08, section 9.1.34, and 3.2.2.1.

Reference(s)

GSM 04.08 section 4.4.4.6.

26.7.4.1.2 Test purpose

1) To test the behaviour of the MS if the network accepts the location updating of the MS.

For the network response three different cases are identified:

- 1.1) TMSI is allocated,
- 1.2) Location updating accept contains neither TMSI nor IMSI,
- 1.3) Location updating accept contains IMSI.

2) To verify that the MS , that supports only the primary GSM900 band or only the DCS1800 band is not disturbed by SYSTEM INFORMATION 2ter messages , with different values of L2pseudolength.

26.7.4.1.3 Method of test**26.7.4.1.3.1 Location Updating/accepted/test1****Initial conditions:**

System Simulator:

Two cells, A and B, belonging to different location areas with location area identification a and b of the same PLMN.

IMSI attach/detach is allowed in both cells.

The T3212 time-out value is 1/10 hour in both cells.

Mobile Station:

The MS has a valid TMSI (=TMSI1) and CKSN (=CKSN1). It is "idle updated" on cell A.

Related PICS/PIXIT statement(s)

None.

Foreseen final state of the MS

The MS has no valid TMSI. It has valid CKSN and Kc. It is "idle, updated" on cell B.

Test Procedure

The MS is made to select cell B. A normal location updating with TMSI reallocation is performed in cell B. The channel is released. The SS checks, by paging, that the MS has stored the newly allocated TMSI. The channel is released. The MS is made to select cell A. A normal location updating is performed in cell A. The LOCATION UPDATING ACCEPT message contains neither IMSI nor TMSI. The SS checks, by paging, that the MS has kept the old TMSI. The channel is released. The MS is made to select cell B. A normal location updating is performed in cell B. The LOCATION UPDATING ACCEPT message contains an IMSI. The SS checks, by paging, that the MS has deleted its TMSI and responds to paging with IMSI.

Maximum duration of test

4 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. "location updating type" = normal, "CKSN" = CKSN1, "location area identification" = a, "mobile station classmark 1" as given by the PICS and "mobile identity" = TMSI1. "Mobile identity" = new TMSI (=TMSI2), LAI = b. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | MS -> SS | TMSI REALLOCATION COMPLETE | After the sending of this message, the SS waits for the disconnection of the main signalling link. The SS waits an amount of time which is enough to guarantee that the MS is in service. |
| 7 | SS -> MS | CHANNEL RELEASE | |
| 8 | SS -> MS | PAGING REQUEST TYPE 1 | |
| 9 | MS -> SS | CHANNEL REQUEST | |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | "Mobile identity" IE contains the new TMSI (= TMSI2). "Mobile identity" IE contains the new TMSI (= TMSI2). After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 11 | MS -> SS | PAGING RESPONSE | |
| 12 | SS -> MS | CHANNEL RELEASE | |
| 13 | SS | | |
| 14 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating "location updating type" = normal, "CKSN" = CKSN1, "location area identification" = b, "mobile station classmark 1" as given by the PICS and "mobile identity" = TMSI2. "Mobile identity" IE not included. |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT | |

26.7.4.2 Location updating / rejected**26.7.4.2.1 Location updating / rejected / IMSI invalid****26.7.4.2.1.1 Conformance requirement**

- 1) If the network rejects a location updating from the Mobile Station with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the Mobile Station shall:
 - 1.1 not perform normal location updating;
 - 1.2 not perform periodic location updating;
 - 1.3 not respond to paging with IMSI;
 - 1.4 not respond to paging with TMSI;
 - 1.5 reject any request from CM entity for MM connection other than for emergency call;
 - 1.6 not perform IMSI detach if it is switched off or has its power source removed.
- 2) If the network rejects a location updating from the Mobile Station with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the Mobile Station, if it supports speech, shall accept a request for an emergency call by sending a Channel Request message with the establishment cause set to "emergency call" and include an IMEI as mobile identity in the CM SERVICE REQUEST message.
- 3) If the network rejects a location updating from the Mobile Station with the cause "IMSI unknown in HLR", "Illegal MS" or "Illegal ME" the Mobile Station shall delete the stored LAI, CKSN and TMSI.

Reference(s)

GSM 04.08 sections 4.4.4.7.

26.7.4.2.1.2 Test purpose

To test the behaviour of the MS if the network rejects the location updating of the MS with the cause "IMSI unknown in HLR", "illegal MS" or "Illegal ME".

26.7.4.2.1.3 Method of test**Initial conditions**

System Simulator:

Two cells: A and B, belonging to different location areas of the same PLMN.
IMSI attach/detach is allowed in both cells.
The T3212 time-out value is 1/10 hour in both cells.

Mobile Station:

The MS has valid TMSI, CKSN and Kc. It is "idle updated" on cell A.

Related PICS/PIXIT statement(s)

SIM removal possible while the MS is powered Yes/No.
Switch off on button Yes/No.
Support for speech Yes/No.

Foreseen final state of the MS

The MS has valid TMSI, CKSN and Kc. It is "idle updated" on cell A.

Test Procedure

The SS rejects a normal location updating with the cause value "IMSI unknown in HLR". The channel is released. The SS checks that the MS has entered the state MM IDLE and the substate NO IMSI, i.e. does not perform normal location updating when a new cell of the same or another PLMN is entered, does not perform periodic updating, does not respond to paging, rejects any requests from CM entities except emergency calls and does not perform IMSI detach if it is switched off or has its power source removed.

The test is repeated with cause value "Illegal MS" and with cause value "Illegal ME".

Maximum duration of test

35 minutes.

Expected sequence

The sequence is executed for execution counter k = 1, 2, 3.

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | SS | | <p>The following messages are sent and shall be received on cell B.</p> <p>The RF level of cell A is lowered until the MS selects cell B.</p> <p>"Establishment cause": Location updating.</p> <p>"Reject cause" IE is "IMSI unknown in HLR" for k = 1, "Illegal MS" for k = 2, "Illegal ME" for k = 3.</p> <p>After the sending of this message, the SS waits for the disconnection of the main signalling link.</p> |

26.7.4.2.2 Location updating / rejected / PLMN not allowed**26.7.4.2.2.1 Conformance requirement**

- 1) If the network reject a location updating from the Mobile Station with the cause "PLMN not allowed" the Mobile Station shall:
 - 1.1 not perform periodic updating;
 - 1.2 not perform IMSI detach when switched off;
 - 1.3 not perform IMSI attach when switched on in the same location area;
 - 1.4 not perform normal location updating when in the same PLMN and when that PLMN is not selected manually;
 - 1.5 reject any request from CM entity for MM connection other than for emergency call.
- 2) If the network rejects a location updating from the Mobile Station with the cause "PLMN not allowed" the Mobile Station shall:
 - 2.1 perform normal location updating when a new PLMN is entered;
 - 2.2 accept a request for an emergency call, if it supports speech, by sending a Channel Request message with the establishment cause set to "emergency call".
- 3) If the network rejects a location updating from the Mobile Station with the cause "PLMN not allowed" and if after that the PLMN from which this rejection was received, is manually selected, the Mobile Station shall perform a normal location updating procedure.

Reference(s)

GSM 04.08 section 4.4.4.7.

26.7.4.2.2.2 Test purpose

To test the behaviour of the MS if the network rejects the location updating of the MS with the cause "PLMN not allowed".

26.7.4.2.2.3 Method of test**26.7.4.2.2.3.1 Location updating / rejected / PLMN not allowed / test 1****Initial conditions**

System Simulator:

One cell: C, belonging to PLMN1.

Two cells: A and B, belonging to different location areas a and b and belonging to PLMN2. PLMN2 is different from HPLMN and from PLMN1.

IMSI attach/detach is allowed in cells A and B but not in cell C.

The T3212 time-out value is 1/10 hour in cells A and B.

Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell C.

The MS is in manual mode for PLMN selection.

Related PICS/PIXIT statement(s)

SIM removal possible while the MS is powered Yes/No.

Switch off on button Yes/No.

The MS is automatically in automatic mode after switch on Yes/No.

Support for speech Yes/No.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on cell C. The MS is in automatic mode for PLMN selection.

Test Procedure

The SS rejects a normal location updating with the cause value "PLMN not allowed". The channel is released. The SS checks that the MS does not perform periodic updating, does not perform IMSI detach, does not perform IMSI attach if activated in the same location area, rejects any request for CM connection establishment other than emergency call, accepts a request for an emergency call and performs normal location updating only when a new PLMN is entered.

Maximum duration of test

12 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|--|--|--|---|
| 1 2 | MS SS | | The following messages are sent and shall be received on cell B. The MS is switched off (or power is removed). The SS activates cells A and B and deactivates cell C. Cell B has a level higher by at least 5 dB than cell A. |
| 3 | MS | | The MS is switched on. (or power is reapplied) If necessary the MS is put in manual selection mode. The MS shall offer the new PLMN as available to the user. The PLMN is manually selected. |
| 4 5 6 | MS -> SS SS -> MS MS -> SS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT LOCATION UPDATING REQUEST | "Establishment cause": Location updating. |

26.7.4.2.2.3.2 Location updating / rejected / PLMN not allowed / test 2**Initial conditions**

System Simulator:

One cell C, belonging to PLMN1.

Two cells A and B, belonging to different location areas a and b and belonging to PLMN2. PLMN2 is different from HPLMN.

IMSI attach/detach is allowed in cells A and B but not in cell C.

The T3212 time-out value is 1/10 hour in cells A and B.

Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell C.

Related PICS/PIXIT statement(s)

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

The MS is automatically in automatic mode after switch on Yes/No.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle, updated" on cell C.

The MS is in automatic mode for PLMN selection.

Test Procedure

The SS rejects a normal location updating with the cause value "PLMN not allowed". The channel is released. Then the PLMN from which this rejection was received is manually selected and the SS checks that a normal location updating is performed.

Maximum duration of test

5 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | MS | | The following messages are sent and shall be received on cell B. |
| 2 | SS | | The MS is switched off (or power is removed). The SS activates cells A and B and deactivates cell C. Cell B has a level higher by at least 5 dB than cell A. |
| 3 | MS | | The MS is switched on (or power is reapplied). |
| 3a | MS | | If the MS is in manual mode, it shall offer the new PLMN as available to the user. In this case the PLMN is manually selected. |
| 4 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |

| 14 | MS | | The MS is switched off. |
| 15 | SS | | The SS activates cell C and deactivates cells A and B. |
| 16 | MS | | The MS is switched on. If necessary, the MS is put into the automatic mode. |
| 17 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 19 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = normal, "CKSN" = no key available, "LAI" = deleted LAI (the MCC and MNC hold the values of PLMN1, the LAC is coded FFFE) "mobile identity" = IMSI. |
| 20 | SS -> MS | LOCATION UPDATING ACCEPT | "Mobile identity" = TMSI. |
| 21 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 22 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents:

None.

26.7.4.2.3 Location updating / rejected / location area not allowed**26.7.4.2.3.1 Conformance requirement**

- 1) If the network rejects a location updating from the Mobile Station with the cause "Location Area not allowed" the Mobile Station shall:
 - 1.1 not perform periodic updating;

- 1.2 not respond to paging with TMSI;
 - 1.3 reject any request from CM entity for MM connection other than for emergency call;
 - 1.4 not perform IMSI detach.
- 2) If the network rejects a location updating from the Mobile Station with the cause "Location Area not allowed" the Mobile Station shall:
- 2.1 perform normal location updating when a new location area is entered;
 - 2.2 accept a request for an emergency call, if it supports speech, by sending a Channel Request message with the establishment cause set to "emergency call";
 - 2.3 delete the list of forbidden LAs after switch off (power off).

Reference(s)

GSM 04.08 sections 4.4.4.7.

26.7.4.2.3.2 Test purpose

To test the behaviour of the MS if the network rejects the location updating of the MS with the cause "Location Area not allowed".

To test that the MS deletes the list of forbidden LAs after switch off (power off).

26.7.4.2.3.3 Method of test**Initial conditions**

System Simulator:

- Two cells: A and B, belonging to different location areas a and b.
- IMSI attach/detach is allowed in both cells.
- The T3212 time-out value is 1/10 hour in both cells.

Mobile Station:

- The MS has a valid TMSI. It is "idle updated" on cell A.

Related PICS/PIXIT statement(s)

- Switch off on button Yes/No.
- Support for speech Yes/No.
- Method to clear the list of forbidden location areas periodically.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on cell A.

Test Procedure

The SS rejects a normal location updating with the cause value "Location Area not allowed". The channel is released. The SS checks that the MS does not perform periodic updating, does not respond to paging with TMSI, rejects any requests from CM entities for MM-connections except emergency calls, does not perform IMSI detach, performs normal location updating when a new location area is entered and deletes the list of forbidden LAs when switched off.

Different types of MS may use different methods to periodically clear the list of forbidden location areas (e.g. every day at 12am). If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

12 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell B. The RF level of cell A is lowered so that cell B is selected, while keeping the C1 and C2 of cell A greater than 10. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING REJECT | |
| 6 | SS -> MS | CHANNEL RELEASE | "Reject cause" = "Location Area not allowed". |
| 7 | SS | | After the sending of this message, the SS waits for the disconnection of the mainsignalling link. The SS waits for a possible location updating for 7 minutes. |
| 8 | MS | | The MS shall not initiate an RR-connection establishment either on cell A or cell B. |
| 9 | SS -> MS | PAGING REQUEST TYPE 1 | The MS is paged in cell B. "Mobile identity" = TMSI. |
| 10 | MS | | The MS shall ignore this message. This is checked during 3 seconds. |
| 11 | MS | | A MO CM connection is attempted. |
| 12 | MS | | The MS shall not initiate an RR connection establishment on cell A or cell B. This is checked during 3 seconds. |
| 13 | MS | | If the MS supports speech (see PICS), it is made to perform an emergency call. |
| 14 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Emergency call. |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT | "CM service type": Emergency call establishment. |
| 16 | MS -> SS | CM SERVICE REQUEST | |
| 17 | SS -> MS | CM SERVICE ACCEPT | |
| 18 | MS -> SS | EMERGENCY SETUP | |
| 19 | SS -> MS | RELEASE COMPLETE | Cause: "unassigned number". |
| 20 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 21 | MS | | If possible (see PICS) switch off is performed. |
| 22 | MS | | Otherwise the power is removed. |
| 23 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B (check for IMSI detach) This is checked during 3 seconds. |
| 24 | MS -> SS | CHANNEL REQUEST | Depending on what has been performed in step 21 the MS is brought back to operation. |
| 25 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": Location updating. |
| 26 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = normal, "CKSN" = no key available, "LAI" = deleted LAI, "mobile identity" = IMSI (This checks the deletion of the forbidden lists) |
| 27 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" = "Location Area not allowed". |
| 28 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. The following messages are sent and shall be received on cell A. |
| 29 | SS | | The RF level of cell B is lowered until the MS selects cell A. |
| 30 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 31 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 32 | MS -> SS | LOCATION UPDATING REQUEST | |
| 33 | SS -> MS | AUTHENTICATION REQUEST | |

| | | | |
|----|----------|----------------------------|--|
| 34 | MS -> SS | AUTHENTICATION RESPONSE | Mobile identity = TMSI. |
| 35 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 36 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 37 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents:

None.

26.7.4.2.4 Location updating / rejected / roaming not allowed in this location area**26.7.4.2.4.1 Conformance requirement**

- 1) If the network rejects a location updating from the Mobile Station with the cause "Roaming not allowed in this area" the Mobile Station shall:
 - 1.1 not perform periodic updating;
 - 1.2 not respond to paging with TMSI;
 - 1.3 reject any request from CM entity for MM connection other than for emergency call;
 - 1.4 not perform IMSI detach.
- 2) If the network rejects a location updating from the Mobile Station with the cause "Roaming not allowed in this area" the Mobile Station shall:
 - 2.1 perform normal location updating when a new location area is entered;
 - 2.2 accept a request for an emergency call, if it supports speech, by sending a Channel Request message with the establishment cause set to "emergency call";
 - 2.3 periodically search for its HPLMN.
- 3) The mobile station shall reset the list of "Forbidden location areas for roaming" when it is switched off or has its power source removed or when the SIM is removed.
- 4) The MS shall be capable of storing at least 6 entries in the list of "Forbidden location areas for roaming".

Reference(s)

GSM 04.08 section 4.4.4.7.

26.7.4.2.4.2 Test purposes**Test purpose 1**

To test that on receipt of a rejection using the Roaming cause code, the MS ceases trying to update on that cell, that this situation continues for at least one periodic location interval period, and that the corresponding list is re-set by switching off the MS or removing its power source.

Test purpose 2

To test that if no cell is available, the MS does not answer to paging with TMSI, rejects a request from CM entity other than for emergency calls.

Test purpose 3

To test that at least 6 entries can be held in the list of "forbidden location areas for roaming" (the requirement in GSM 04.08 is to store at least 10 entries. This is not fully tested by the third procedure).

Test purpose 4

To test that if a cell of the Home PLMN is available then the MS returns to it in preference to any other available cell.

Test purpose 5

To test that if the SIM is removed the list of "forbidden location areas for roaming" is cleared.

26.7.4.2.4.3 Method of test**Initial conditions**

The initial conditions shall be met before each of the different procedures.

System Simulator:

For procedures 1, 2, 3 and 5: Two cells A and B, belonging to different location areas of the same PLMN with LAI a and b. The MCC of that PLMN is the same as that of the HPLMN. The MNC of that PLMN is different from that of the HPLMN.

For procedure 4: three cells A, B, C of the same PLMN which is not the HPLMN with 3 different location area codes. Cells should differ in signal strength by 10 dB with cell A being the strongest and cell C the weakest. There should be a 20 dB range between A and C. A should be set to a level of - 40 dBm.

IMSI attach/detach is allowed in every cell.

The T3212 time-out value is 1/10 hour in every cell.

Mobile Station:

Procedures 1, 2, 3 and 5: The MS has valid TMSI, CKSN and Kc. It is "idle updated" on cell B.

Procedure 4: The MS has valid TMSI, CKSN and Kc. It is "idle updated" on cell A.

The list of "forbidden location areas for roaming" shall be empty (this may be achieved by either removing the SIM or switching the MS OFF then ON or removing the MS power source depending on PICS).

Related PICS/PIXIT statement(s)

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

Method to clear the list of location areas for roaming periodically.

The MS is automatically in automatic mode after switch on Yes/No.

Foreseen final state of the MS

Procedures 1 and 5: The MS has no valid TMSI and no CKSN. It is "idle updated" on cell A.

Procedure 2 and 3: The MS has no valid TMSI and no CKSN. It is in the "limited service" state on cell A.

Procedure 4: The MS has no valid TMSI and no CKSN. It is "idle updated" on cell C.

Test Procedures

Procedure 1:

The SS rejects a normal location updating with the cause value "Roaming not allowed in this area". The channel is released. The SS checks that the MS does not perform periodic location updating procedure. The MS is turned off and then on. The SS checks that the MS performs location updating on the cell on which its location update request had been rejected (this checks that the LA is not the forbidden list after switch on). This procedure is performed another time but the deletion of the list is checked while removing the SIM (instead of turning off the MS).

Procedure 2:

The SS rejects a normal location updating with the cause value "Roaming not allowed in this area". The channel is released. The SS checks that the MS does not answer to a paging message with TMSI, rejects a request from CM entity but supports an emergency call.

Procedure 3:

The SS rejects a normal location updating with the cause value "Roaming not allowed in this area". This is done for 6 different location areas. Then the SS checks that the MS does not attempt to begin a location updating procedure on the non-allowed location areas.

Procedure 4:

The SS accepts a periodic location updating on a cell not belonging to the HPLMN. Then when the MS attempts to perform a periodic location updating to this cell, the SS rejects this location updating with the cause value "Roaming not allowed in this area". Two cells are then available, one belonging to the HPLMN but with the weakest level. It is checked that the MS returns to its HPLMN.

Procedure 5: If SIM removal is possible while MS is powered:

The SS rejects a normal location updating with the cause value "Roaming not allowed in this area". The channel is released. The SS checks that the MS does not perform periodic location updating procedure. The SIM is removed and inserted in the MS. The SS checks that the MS performs location updating on the cell on which its location update request had been rejected (this checks that the LA is not the forbidden list after switch on).

Different types of MS may use different methods to periodically clear the list of forbidden areas (e.g. every day at 12am) for roaming. If the list is cleared while the test is being run, it may be necessary to re-run the test.

Maximum duration of test

Procedures 1 and 5: 12 minutes each.

Procedure 2: 6 minutes.

Procedure 3: 17 minutes.

Procedure 4: 16 minutes.

Expected sequence

The following procedure is used during the test:

Change_LAI (x):

- The purpose of this procedure is to change the value of Location Area Identifier of cell x.
- The Location Area Identifier of cell x shall be changed. The code shall be chosen arbitrarily but shall be different from any previously used in this procedure. The code shall have the same MCC as the Home PLMN and shall not have the same MNC as the Home PLMN.

Procedure 1

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. The RF level of cell B is lowered until cell B is no more suitable and the MS selects cell A. "Establishment cause": Location updating. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 6 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 7 | SS | | The SS waits at least 7 minutes for a possible location updating. |
| 8 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B. |
| 9 | MS | | If possible (see PICS) the MS is switched off. Otherwise if possible the power is removed. |
| 10 | MS | | Depending on what has been performed in step 9 the MS is brought back to operation and placed in a automatic mode. |
| 11 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 12 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 13 | MS -> SS | LOCATION UPDATING REQUEST | Location Updating Type = normal. |
| 14 | SS -> MS | LOCATION UPDATING ACCEPT | IE Mobile Identity not present. |
| 15 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Procedure 2

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | The RF level of cell B is lowered until the MS selects cell A. The level of cell B shall be such that cell B is suitable for cell selection. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": Location updating This message is sent on cell A. |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 6 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 7 | MS -> SS | CHANNEL REQUEST | The following messages are sent and shall be received on cell B. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": Location updating. |
| 9 | MS -> SS | LOCATION UPDATING REQUEST | |
| 10 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 11 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 12 | SS | | The SS waits for a possible location updating procedure on both cells A and B for 2 minutes. |
| 13 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B within 2 minutes after the end of step 11. |
| 14 | SS -> MS | PAGING REQUEST TYPE 1 | "Mobile identity" = TMSI. This message is sent on cell A and on cell B. |
| 15 | MS | | The MS shall not initiate an RR connection on cell A or on cell B. This is checked during 3 seconds. |
| 16 | MS | | A MO CM connection is attempted. |
| 17 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B. This is checked during 3 seconds. |
| 18 | MS | | The following messages are sent and shall be received on cell A Steps 20 to 27 are performed if the MS supports speech. |
| 19 | MS -> SS | CHANNEL REQUEST | An emergency call is attempted. |
| 20 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": |
| 21 | MS -> SS | CM SERVICE REQUEST | "CM service type": Emergency call establishment. |
| 22 | SS -> MS | CM SERVICE ACCEPT | |
| 23 | MS -> SS | EMERGENCY SETUP | |
| 24 | SS -> MS | RELEASE COMPLETE | "Cause" = unassigned number. |
| 25 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Procedure 3

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A The RF level of cell B is lowered until the MS selects cell A. The level of cell B shall be such that cell B is suitable for cell selection. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 6 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 9 | MS -> SS | CHANNEL REQUEST | The following messages are sent and shall be received on cell B. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": Location updating. |
| 11 | MS -> SS | LOCATION UPDATING REQUEST | |
| 12 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 13 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 14 | SS | | Change_LAI (A) within 5 seconds after step 12. |
| 17 | MS -> SS | CHANNEL REQUEST | The following messages are sent and shall be received on cell A. |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": Location updating. |
| 19 | MS -> SS | LOCATION UPDATING REQUEST | |
| 20 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 21 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 22 | SS | | Change_LAI (B) within 5 seconds after step 20. |
| 25 | MS -> SS | CHANNEL REQUEST | The following messages are sent and shall be received on cell B. |
| 26 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": Location updating. |
| 27 | MS -> SS | LOCATION UPDATING REQUEST | |
| 28 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 29 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 30 | SS | | Change_LAI (A) within 5 seconds after step 28. |
| 33 | MS -> SS | CHANNEL REQUEST | The following messages are sent and shall be received on cell A. |
| 34 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": Location updating. |
| 35 | MS -> SS | LOCATION UPDATING REQUEST | |
| 36 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 37 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 38 | SS | | Change_LAI (B) within 5 seconds after step 36. |

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 41 | MS -> SS | CHANNEL REQUEST | The following messages are sent and shall be received on cell B. "Establishment cause": Location updating. |
| 42 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 43 | MS -> SS | LOCATION UPDATING REQUEST | |
| 44 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 45 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 46 | SS | | The SS waits for a possible location updating procedure on both cells A and B for 7 minutes. |
| 47 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B within 7 minutes after the end of step 45. |

Procedure 4

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. The SS waits for a periodic location updating procedure on cell A for 7 minutes after the initial conditions have been established. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | Location Updating Type = periodic. |
| 6 | SS -> MS | CHANNEL RELEASE | IE Mobile Identity not present. |
| 7 | SS | | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 8 | SS | | The location area identity of cell C shall be changed to that of a location area in the Home PLMN. |
| 9 | MS -> SS | CHANNEL REQUEST | The SS waits for a periodic location updating procedure on cell A for 7 minutes. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | "Establishment cause": Location updating This message is sent on cell A within 7 minutes after the end of step 6. |
| 11 | MS -> SS | LOCATION UPDATING REQUEST | "Location updating type" = periodic. |
| 12 | SS -> MS | LOCATION UPDATING REJECT | "Reject cause" IE is "Roaming not allowed in this location area". |
| 13 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 16 | MS -> SS | CHANNEL REQUEST | The following messages are sent and shall be received on cell C. "Establishment cause": Location updating. |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 18 | MS -> SS | LOCATION UPDATING REQUEST | |
| 19 | SS -> MS | LOCATION UPDATING ACCEPT | IE Mobile Identity not present. |
| 20 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Procedure 5

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS | | The following messages are sent and shall be received on cell A. The RF level of cell B is lowered until cell B is no longer suitable and the MS selects cell A. "Establishment cause": Location updating. "Reject cause" IE is "Roaming not allowed in this location area". After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING REJECT | |
| 6 | SS -> MS | CHANNEL RELEASE | |
| 7 | SS | | The SS waits at least 7 minutes for a possible location updating. The MS shall not initiate an RR connection establishment on cell A or on cell B. |
| 8 | MS | | |
| 9 | MS | | The SIM is removed. The SIM is inserted into the ME. "Establishment cause": Location updating. Location Updating Type = normal. IE Mobile Identity not present. After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 10 | MS | | |
| 11 | MS -> SS | CHANNEL REQUEST | |
| 12 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 13 | MS -> SS | LOCATION UPDATING REQUEST | |
| 14 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 15 | SS -> MS | CHANNEL RELEASE | |

Specific message contents:

None.

26.7.4.3 Location updating / abnormal cases**26.7.4.3.1 Location updating / abnormal cases / random access fails****26.7.4.3.1.1 Conformance requirement**

If during the RR connection establishment phase of a normal location updating procedure, channel requests are not answered by the network, the Mobile Station shall:

1. send (Max-Retrans+1) Channel Request messages;
2. not try to establish a connection during a period of T3213;
3. then perform a normal location updating procedure as it is still necessary;
4. not repeat the complete procedure if the original cause of the location updating procedure has disappeared.

Reference(s):

GSM 04.08 section 4.4.4.9 and GSM 05.08 section 6.6.2.

26.7.4.3.1.2 Test purpose

To verify that when during the RR connection establishment phase of a location updating procedure, channel requests are not answered by the network, after expiry of T3213 (= 4s in Phase 2) and when the cell reselection procedure is finished the complete procedure is repeated if still necessary.

26.7.4.3.1.3 Method of test**Initial conditions**

System Simulator:

Two cells: A and B of the same PLMN, belonging to different location areas with LAI a and b.

The RF power level of cell B is higher than the one of cell A.

IMSI attach/detach is not allowed in both cells.

The T3212 time-out value is set to infinite in both cells.

Mobile Station:

The MS has a valid TMSI, CKSN and Kc. It is "Idle updated" on cell B.

Related PICS/PIXIT statement(s)

None.

Foreseen final state of the MS

The MS is "Idle updated" on cell A.

Test Procedure

The SS causes a random access failure in the MS during a normal location updating procedure. After the expiry of T3213 and when the cell reselection procedure is finished the MS will try to restart the normal location updating procedure.

The test is repeated but the original cause of the location updating procedure has disappeared. The SS then checks that the MS will not restart the location updating procedure.

Maximum duration of test

1 minute.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | MS | | The following messages are sent and shall be received on cell A. |
| 2 | MS -> SS | CHANNEL REQUEST | The RF level of cell B is lowered until the MS selects cell A. The RF level of cell B is set sufficiently low to ensure that cell B is not suitable as defined in GSM 05.08 section 6.6.2.. |
| 3 | SS | | Establishment cause: Location updating. This message is sent by the MS (Max_Retrans + 1) times. |
| 4 | MS | | The SS waits for 4 seconds. |
| 5 | MS -> SS | CHANNEL REQUEST | The MS shall not send any layer 3 message during this time. |
| 6 | SS -> MS | IMMEDIATE ASSIGNMENT | Establishment cause: Location updating. The time difference between this message and the last CHANNEL REQUEST sent in step 2 shall be in the range 4 s - 9 s. |
| 7 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = b, mobile station classmark 1 and mobile identity = TMSI. |
| 8 | SS -> MS | LOCATION UPDATING ACCEPT | Optional IE Mobile Identity not included |
| 9 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 10 | SS | | The RF level of cell B is set to the same value as for cell A. |
| 11 | SS | | The RF level of cell A is lowered until the MS selects cell B. The RF level of cell A is kept sufficiently high to ensure that cell A is still suitable as defined in GSM 05.08 section 6.6.2. |
| 12 | MS -> SS | CHANNEL REQUEST | The following messages are sent and shall be received on cell B. |
| 13 | SS | | Establishment cause: Location updating. This message is sent by the MS (Max_Retrans + 1) times. |
| 14 | MS | | Immediately after the end of step 12 the RF level of cell A is set to the same value as for cell B. |
| | | | The MS shall not initiate an RR connection establishment on cell A or on cell B. This is checked during 15 s. |

Specific message contents:

None.

26.7.4.3.2 Location updating / abnormal cases / attempt counter less or equal to 4, LAI different**26.7.4.3.2.1 Conformance requirement**

- 1) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during a normal location updating procedure, if the attempt counter is smaller than 4 and after expiry of T3211, the Mobile Station shall resend its Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type set to "normal location updating".

- 2) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during a normal location updating procedure the Mobile Station shall:
 - 2.1 not answer to paging with the previously allocated TMSI;
 - 2.2 not perform the IMSI detach procedure, when switched off.
- 3) When a failure such as case e) of section 4.4.4.9 of GSM 04.08 has occurred during a normal location updating procedure and when an emergency call establishment is requested by the user the Mobile Station, if it supports speech, shall send a CM Service Request message with CM Service Type IE set to "emergency call establishment", CKSN IE set to "no key available" and Mobile Identity IE set to its IMSI and after acceptance by the network it shall send an Emergency Setup message.
- 4) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during a normal location updating procedure the Mobile Station shall use a request from CM entity other than emergency call as a trigger for a normal location updating procedure and shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".
- 5) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during a normal location updating procedure the Mobile Station shall answer to paging with IMSI and shall send a Paging Response message with CKSN IE set to "no key available" and Mobile Identity IE set to its IMSI.
- 6) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during a normal location updating procedure the Mobile Station shall perform a normal location updating procedure as soon as it enters a new cell.

References

GSM 04.08 section 4.4.4.2 and 4.4.4.9 and GSM 05.08 section 6.6.2.

26.7.4.3.2.2 Test purpose

To verify that the MS performs normal location updating procedures when its attempt counter is smaller than 4.

To check that the MS does not perform the IMSI detach procedure when "idle not updated".

To verify that when "idle not updated" the MS can perform an emergency call.

To verify that when "idle not updated" the MS uses requests from CM layer other than emergency call as triggering of a normal location updating procedure.

To verify that the MS performs a normal location updating procedure if it enters a new cell while being "idle not updated".

26.7.4.3.2.3 Method of test

Initial conditions

System Simulator:

Two cells: A and B of the same PLMN, belonging to different location areas with LAI a and b.
ATT flag shall be set to IMSI attach/detach allowed.

Mobile Station:

The MS is "idle updated" on cell A. A valid CKSN value is stored in the SIM and is noted "initial CKSN".
A TMSI is allocated.

Related PICS/PIXIT statements

SIM removal possible while MS is powered Yes/No.
Switch off on button Yes/No.
Support for speech Yes/No.

Foreseen final state of the MS

The MS is "Idle updated" on cell A with a valid CKSN and a TMSI.

Test Procedure

The MS is made to perform a normal location updating procedure. Four types of failure cases are triggered:

- sending of a Location Updating Reject with cause randomly chosen between all defined cause values except 2, 3, 6, 11, 12 and 13 (which trigger a different action) (case g of GSM 04.08 section 4.4.4.9);
- RR-connection failure (case d);
- sending of a CHANNEL RELEASE message before the normal end of the procedure (case f);
- T3210 time-out (case e).

As there is no stored LAI or the stored LAI is different from the broadcast LAI, and the attempt counter in the MS shall be lower than 4, the MS enters the state MM IDLE and substate ATTEMPTING TO UPDATE and waits for T3211 seconds before trying again a location updating procedure.

Then the behaviour of the MS in the MM IDLE ATTEMPTING TO UPDATE SERVICE state is checked, that is:

- not answer to paging with TMSI;
- not perform an IMSI detach procedure;
- support request for emergency call;
- use requests from CM layer other than emergency call as triggering of a normal location updating procedure;
- perform normal location updating procedure when a new cell is entered.

Maximum duration of test

9 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|--|-----------|----------------------------|--|
| The following messages are sent and shall be received on cell B. | | | |
| 1 | MS | | The RF level of cell A is lowered until the MS selects cell B. The RF level of cell A is set sufficiently low to ensure that cell A is not suitable as defined in GSM 05.08 section 6.6.2. |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = a, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 5 | SS -> MS | LOCATION UPDATING REJECT | IE Reject cause is set to a value arbitrarily chosen: * in table 10.66 of GSM 04.08, causes #2, #3, #6, #11, #12 and #13 being excluded. |
| 6 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 7 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 8 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 11 | SS | | The SS deactivates the SACCH on the dedicated channel. The SS waits until there are no more SACCH frames in the uplink direction. This release connection is done within 8 SACCH frames. |
| 12 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B within T3211 + RadioLinkTimeout after the SS deactivates the SACCH. |
| 13 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 14 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 15 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 16 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 17 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 18 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 19 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 20 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 21 | SS -> MS | AUTHENTICATION REQUEST | CKSN = initial CKSN. |
| 22 | MS -> SS | AUTHENTICATION RESPONSE | |
| 23 | SS -> MS | LOCATION UPDATING ACCEPT | IE mobile Identity = new TMSI. |
| 24 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 25 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. MS is now "idle updated" in cell B. |

| Step | Direction | Message | Comments |
|--|-----------|----------------------------|---|
| The following messages are sent and shall be received on cell A. | | | |
| 26 | MS | | The RF level of cell B is lowered until the MS selects cell A. The RF level of cell B is set sufficiently low to ensure that cell B is not suitable as defined in GSM 05.08 section 6.6.2. |
| 27 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 28 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 29 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 30 | SS | | performs step 5 with reject cause #100 and step 6. |
| 31 | SS -> MS | PAGING REQUEST TYPE 1 | Mobile identity = old TMSI of the MS. This message is sent continuously to the MS during 8 seconds. |
| 32 | SS | | The SS checks that there is no answer from the MS during 12 seconds. |
| 33 | SS | | If during steps 31 and 32 the MS attempts to perform a location updating procedure the SS will perform step 30 and then continue the procedure. |
| 34 | MS | | If possible (see PICS) SIM detachment is performed. Otherwise if possible (see PICS) mobile switch off is performed. Otherwise the power is removed. |
| 35 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B. This is checked during 30 seconds. |
| 36 | MS | | Depending on what has been performed in step 34 the MS is brought back to operation. |
| 37 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 38 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 39 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 40 | SS -> MS | AUTHENTICATION REQUEST | CKSN = initial CKSN. |
| 41 | MS -> SS | AUTHENTICATION RESPONSE | |
| 42 | SS -> MS | LOCATION UPDATING ACCEPT | IE mobile Identity = new TMSI. |
| 43 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 44 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. MS is now "idle updated" in cell A. |
| 45 | MS | | The RF level of cell A is lowered until the MS selects cell B. The RF level of cell A is set sufficiently low to ensure that cell A is not suitable as defined in GSM 05.08 section 6.6.2. |
| 46 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 47 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 48 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = a, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 49 | SS -> MS | AUTHENTICATION REQUEST | |
| 50 | MS->SS | AUTHENTICATION RESPONSE | steps 49 and 50 are performed N times. N shall be chosen in such a way that T3210 expires. Depending on when T3210 expires in the MS, it is possible that on the Nth occurrence of step 50 the MS may send a L2 DISC rather than the AUTHENTICATION RESPONSE message. |

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 51 | SS | | The SS checks that there is no more activity from the MS on the channel after the DISC/UA exchange has been completed. |
| 52 | MS | | If the MS supports speech it is made to perform an emergency call. |
| 53 | MS -> SS | CHANNEL REQUEST | Establishment cause: Emergency call. |
| 54 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 55 | MS -> SS | CM SERVICE REQUEST | CM service type = Emergency call establishment; CKSN = no key available; Mobile Identity = IMSI. |
| 56 | SS -> MS | CM SERVICE ACCEPT | |
| 57 | MS -> SS | EMERGENCY SETUP | |
| 58 | SS -> MS | RELEASE COMPLETE | Cause = unassigned number. |
| 59 | SS -> MS | CHANNEL RELEASE | |
| 60 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating The SS will wait at most 15 seconds for this message. |
| 61 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 62 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 63 | SS -> MS | AUTHENTICATION REQUEST | CKSN = initial CKSN. |
| 64 | MS -> SS | AUTHENTICATION RESPONSE | |
| 65 | SS -> MS | LOCATION UPDATING ACCEPT | IE mobile Identity = new TMSI. |
| 66 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 67 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. MS is now "idle updated" in cell B. |
| 68 | MS | | The RF level of cell B is lowered until the MS selects cell A. The RF level of cell B is set sufficiently low to ensure that cell B is not suitable as defined in GSM 05.08 section 6.6.2. |
| 69 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 70 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 71 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 72 | SS | | performs step 11. |
| 73 | MS | | A MO CM connection is attempted before T3211 expiry. |
| 74 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 75 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 76 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 77 | SS -> MS | LOCATION UPDATING ACCEPT | IE mobile Identity = new TMSI. |
| 78 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 79 | SS -> MS | CHANNEL RELEASE | Steps 80 to 83 are optional as the MS may have memorized the request for CM connection attempt Wait 10 s to decide whether to go directly to step 84. |
| 80 | MS -> SS | CHANNEL REQUEST | Establishment cause: Not checked. |
| 81 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 82 | MS -> SS | CM SERVICE REQUEST | CKSN = no key available, Mobile identity = TMSI. |

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 83 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. MS is now "idle updated" in cell A. The RF level of cell A is lowered until the MS selects cell B. The RF level of cell A is set sufficiently low to ensure that cell A is not suitable as defined in GSM 05.08 section 6.6.2. Establishment cause: Location updating. |
| 84 | MS | | |
| 85 | MS -> SS | CHANNEL REQUEST | location updating type = normal, CKSN = no key available LAI = a, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. performs step 16. |
| 86 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 87 | MS -> SS | LOCATION UPDATING REQUEST | The RF level of cell B is lowered until the MS selects cell A. The RF level of cell B is set sufficiently low to ensure that cell B is not suitable as defined in GSM 05.08 section 6.6.2. Establishment cause: Location updating. The time interval between Cell B being set sufficiently low to ensure that Cell B is not suitable and this message shall be less than 20s. |
| 88 | SS | | |
| 89 | MS | | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), mobile station classmark 1 as given by the PICS and mobile identity = IMSI. CKSN = initial CKSN. |
| 90 | MS -> SS | CHANNEL REQUEST | |
| 91 | SS -> MS | IMMEDIATE ASSIGNMENT | Mobile identity = TMSI. |
| 92 | MS -> SS | LOCATION UPDATING REQUEST | |
| 93 | SS -> MS | AUTHENTICATION REQUEST | |
| 94 | MS -> SS | AUTHENTICATION RESPONSE | |
| 95 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 96 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 97 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. MS is now "Idle, updated" in cell A. |

Specific message contents

None.

26.7.4.3.3 Location updating / abnormal cases / attempt counter equal to 4

26.7.4.3.3.1 Conformance requirement

- 1) When four failures such as cases d) to g) of section 4.4.4.9 of GSM 04.08 have occurred during a normal location updating procedure the Mobile Station shall:
 - 1.1 perform location updating after T3212 expiry by sending a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type set to "normal updating".
 - 1.2 if the T3212 initiated location updating was unsuccessful, then after T3211 expiry the Mobile Station shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".

- 2) When four failures such as cases d), f), g) of section 4.4.4.9 of GSM 04.08 have occurred during a normal location updating procedure the Mobile Station, if it supports speech, shall be able to perform an emergency call i.e. the Mobile Station is able to send a CM Service Request message with the CM Service Type IE set to "emergency call establishment", CKSN IE set to "no key is available" and Mobile Identity IE set to its IMSI and then send an Emergency Setup message.
- 3) When four failures such as cases d), f), g) of section 4.4.4.9 of GSM 04.08 have occurred during a normal location updating procedure:
 - 3.1 the Mobile Station shall use a request from CM entity for MM connection for a service other than emergency call as a trigger for a normal location updating procedure and shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".
 - 3.2 after a location updating triggered by a request from the CM layer which was unsuccessful, after T3211 expiry the Mobile Station shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".
- 4) When four failures such as cases d), f), g) of section 4.4.4.9 of GSM 04.08 have occurred during a normal location updating procedure:
 - 4.1 the Mobile Station shall perform a normal location updating procedure if it enters a new cell.
 - 4.2 if this location updating is unsuccessful, after T3211 expiry the Mobile Station shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type IE set to "normal location updating".

References

GSM 04.08 section 4.4.4.9 and GSM 05.08 section 6.6.2.

26.7.4.3.3.2 Test purpose

To verify that the MS performs normal location updating procedures after T3212 expiry, when its attempt counter has reached value 4 and that the MS reset its attempt counter after a timer T3212 expiry.

To verify that the MS still follows the MM IDLE ATTEMPTING TO UPDATE state requirements after its attempt counter has reached value 4.

To verify that the attempt counter is reset in the cases where it has to be done.

26.7.4.3.3.3 Method of test

Initial conditions

System Simulator:

- Two cells: A and B, belonging to different location areas a and b.
- IMSI attach/detach is allowed in both cells.
- T3212 is set to 6 minutes.

Mobile Station:

- The MS is "Idle updated" on cell B with a valid CKSN and a TMSI.

Related PICS/PIXIT statements

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

Foreseen final state of the MS

The MS is "Idle updated" on cell A with a valid CKSN and a TMSI.

Test Procedure

The MS is made to perform a normal location updating. The SS triggers a failure in this procedure. After T3211 expiry the MS will try again the location updating procedure. The SS triggers again a failure. This is done again 2 times. At this point the attempt counter shall be equal to 4. It is then checked that T3212 has been started and that at its expiry the MS will try a normal location updating procedure. It is verified that the MS has reset its attempt counter after timer T3212 expiry.

Then it is checked that, when the attempt counter has reached the value of 4, the MS is in the MM IDLE state and ATTEMPTING TO UPDATE substate, that is:

- not perform an IMSI detach procedure;
- support request for emergency call;
- use requests from CM layer other than emergency call as triggering of a normal location updating procedure;
- perform normal location updating procedure when a new cell is entered.

Maximum duration of test

20 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | MS | | The following messages are sent and shall be received on cell A. The RF level of cell B is lowered until the MS selects cell A. The RF level of cell B is set sufficiently low to ensure that cell B is not suitable as defined in GSM 05.08 section 6.6.2. |
| 2 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 5 | SS -> MS | LOCATION UPDATING REJECT | IE Reject cause is set to #22 * in table 10.66 of GSM 04.08, causes #2, #3, #6, #11, #12 and #13 being excluded. |
| 6 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 7 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B within T3211. |
| 8 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 11 | SS | | The SS deactivates the SACCH on the dedicated channel and waits until there are no more SACCH frames in the uplink. This is done within 8 SACCH frames. |
| 12 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B with T3211 + RadioLinkTimeout after the SS deactivates the SACCH. |
| 13 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 14 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 15 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 16 | SS -> MS | AUTHENTICATION REQUEST | |
| 17 | MS -> SS | AUTHENTICATION RESPONSE | these steps (16 and 17) are performed N times. N shall be chosen in such a way that T3210 expires. Depending on when T3210 expires in the MS, it is possible that on the Nth occurrence of step 50 the MS may send a L2 DISC rather than the AUTHENTICATION RESPONSE message. |
| 18 | MS | | The MS shall cease transmission (after the DISC/UA exchange has been completed) and then shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the expiry of T3210. |
| 19 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 20 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 21 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 22 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 23 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3212 (tolerance -15s; 45s) at least after the channel release. |
| 24 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 25 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 26 | MS -> SS | LOCATION UPDATING REQUEST | location updating type: "normal location update" CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE) mobile station classmark 1 as given by the PICS and mobile identity = IMSI. |
| 27 | SS -> MS | LOCATION UPDATING REJECT | IE Reject cause = #17 "network failure". |
| 28 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 29 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 30 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 31 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 32 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE) mobile station classmark 1 as given by the PICS and mobile identity = IMSI. |
| 33 | SS -> MS | AUTHENTICATION REQUEST | CKSN = initial CKSN. |
| 34 | MS -> SS | AUTHENTICATION RESPONSE | |
| 35 | SS -> MS | LOCATION UPDATING ACCEPT | IE mobile Identity = new TMSI. |
| 36 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 37 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. MS is now "idle, updated" in cell A. |
| 38 | MS | | The RF level of cell A is lowered until the MS selects cell B. The RF level of cell A is set sufficiently low to ensure that cell A is not suitable as defined in GSM 05.08 section 6.6.2. |
| 39 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 40 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 41 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = a, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 42 | SS -> MS | LOCATION UPDATING REJECT | IE Reject cause is set to #42 * in table 10.66 of GSM 04.08, causes #2, #3, #6, #11, #12 and #13 being excluded. |
| 43 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 44 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 45 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 46 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 47 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 48 | SS | | The SS deactivates the SACCH on the dedicated channel and waits until there is no more SACCH frames in the uplink. This is done within 8 SACCH frames. |
| 48a | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B within T3211 + RadioLinkTimeOut after the SS deactivates the SACCH. |
| 49 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 50 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 51 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 52 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 53 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 54 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 55 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 56 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE) mobile station classmark 1 as given by the PICS and mobile identity = IMSI. |
| 57 | SS | | performs step 42 with cause #38 and step 43. |
| 58 | MS | | If the MS supports speech, it is made to perform an emergency call. |
| 59 | MS -> SS | CHANNEL REQUEST | Establishment cause: Emergency call. |
| 60 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 61 | MS -> SS | CM SERVICE REQUEST | CM service type = Emergency call establishment; CKSN = no key available; Mobile Identity = IMSI. |
| 62 | SS -> MS | CM SERVICE ACCEPT | |
| 63 | MS -> SS | EMERGENCY SETUP | |
| 64 | SS -> MS | RELEASE COMPLETE | Cause = unassigned number. |
| 65 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 66 | MS | | If possible (see PICS) SIM detachment is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 67 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B. This is checked during 3 seconds. |
| 68 | MS | | Depending on what has been performed in step 66 the MS is brought back to operation. |
| 69 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 70 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 71 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 72 | SS -> MS | AUTHENTICATION REQUEST | CKSN = initial CKSN. |
| 73 | MS -> SS | AUTHENTICATION RESPONSE | |
| 74 | SS -> MS | LOCATION UPDATING ACCEPT | IE mobile Identity = new TMSI. |
| 75 | MS -> SS | TMSI REALLOCATION COMPLETE | |

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 76 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. MS is now "idle, updated" in cell B. |
| 77 | MS | | The RF level of cell B is lowered until the MS selects cell A. The RF level of cell B is set sufficiently low to ensure that cell B is not suitable as defined in GSM 05.08 section 6.6.2. |
| 78 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 79 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 80 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 81 | SS -> MS | LOCATION UPDATING REJECT | IE Reject cause is set to #38 * in table 10.66 of GSM 04.08, causes #2, #3, #6, #11, #12, and #13 being excluded. |
| 82 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 83 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 84 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 85 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 86 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 87 | SS | | The SS deactivates the SACCH on the dedicated channel and waits until there is no more SACCH frames in the uplink. This is done within 8 SACCH frames. |
| 88 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B within T3211 + RadioLinkTimeout seconds after the SS deactivates the SACCH. |
| 89 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 90 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 91 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 92 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 93 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 94 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 95 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 96 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE) mobile station classmark 1 as given by the PICS and mobile identity = IMSI. |
| 97 | SS | | performs step 48. |
| 98 | MS | | A MO CM connection is attempted. |
| 99 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 100 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 101 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 102 | SS | | performs step 52. |

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 103 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 104 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 105 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 106 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFEE), Mobile Identity = IMSI. |
| 107 | SS -> MS | AUTHENTICATION REQUEST | CKSN = initial CKSN. |
| 108 | MS -> SS | AUTHENTICATION RESPONSE | |
| 109 | SS -> MS | LOCATION UPDATING ACCEPT | IE mobile Identity = new TMSI. |
| 110 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 111 | SS -> MS | CHANNEL RELEASE | MS is now "idle, updated" in cell A The MS may or may not have memorized the request for CM connection. The steps 112 to 116 are therefore optional for the MS. The SS waits 10 second whether to decide to go directly to step 117. |
| 112 | MS -> SS | CHANNEL REQUEST | |
| 113 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 114 | MS -> SS | CM SERVICE REQUEST | CKSN = initial value, Mobile identity = TMSI. |
| 115 | SS -> MS | CM SERVICE REJECT | cause #17 (network failure). |
| 116 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 117 | MS | | The RF level of cell A is lowered until the MS selects cell B. The RF level of cell A is set sufficiently low to ensure that cell A is not suitable as defined in GSM 05.08 section 6.6.2. |
| 118 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 119 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 120 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = initial value, LAI = a, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 121 | SS -> MS | LOCATION UPDATING REJECT | IE Reject cause is set to #38 * in table 10.66 of GSM 04.08, causes #2, #3, #6, #11, #12 and #13 being excluded. |
| 122 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link |
| 123 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 124 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 125 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 126 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFEE), Mobile Identity = IMSI. |
| 127 | SS | | The SS stops any RF transmission on the dedicated channel and waits until there is no more SACCH in the uplink. |
| 128 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B within T3211 + RadioLinkTimeOut seconds after the SS stops RF transmission. |
| 129 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 130 | SS -> MS | IMMEDIATE ASSIGNMENT | |

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 131 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 132 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. |
| 133 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B during T3211 seconds at least after the channel release. |
| 134 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 135 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 136 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE) mobile station classmark 1 as given by the PICS and mobile identity = IMSI. |
| 137 | SS | | performs steps 42 and 43. |
| 138 | MS | | The RF level of cell B is lowered until the MS selects cell A. The RF level of cell B is set sufficiently low to ensure that cell B is not suitable as defined in GSM 05.08 section 6.6.2. |
| 139 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 140 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 141 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE) mobile station classmark 1 as given by the PICS and mobile identity = IMSI. |
| 142 | SS | | performs the step 48. |
| 143 | MS | | The MS shall not initiate an RR connection establishment on cell A or on cell B until T3211 + RadioLinkTimeout after the SS deactivates the SACCH. |
| 144 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 145 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 146 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = normal, CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE), Mobile Identity = IMSI. |
| 147 | SS -> MS | AUTHENTICATION REQUEST | CKSN = initial CKSN. |
| 148 | MS -> SS | AUTHENTICATION RESPONSE | |
| 149 | SS -> MS | LOCATION UPDATING ACCEPT | IE mobile Identity = new TMSI. |
| 150 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 151 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. MS is now "idle, updated" in cell A. |

Specific message contents

None.

26.7.4.3.4 Location updating / abnormal cases / attempt counter less or equal to 4, stored LAI equal to broadcast LAI

26.7.4.3.4.1 Conformance requirement

- 1) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during a periodic location updating procedure (the broadcast LAI is equal to the stored LAI):

- 1.1 the Mobile Station shall be able to establish an MM connection i.e. send a Channel Request and then a CM Service Request message, CKSN and LAI set to those which have been allocated to the Mobile Station, Mobile Identity IE set to the TMSI which has been allocated to the Mobile Station;
 - 1.2 then the Mobile Station shall not attempt a location updating procedure.
- 2) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during an IMSI attach procedure (the broadcast LAI is equal to the stored LAI):
 - 2.1 the Mobile Station shall be able to establish an MM connection i.e. send a Channel Request and then a CM Service Request message, CKSN and LAI set to those which have been allocated to the Mobile Station, Mobile Identity IE set to the TMSI which has been allocated to the Mobile Station;
 - 2.2 then the Mobile Station shall not attempt a location updating procedure.
- 3) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during a periodic location updating procedure and the attempt counter is smaller than 4 the Mobile Station shall send, after T3211 expiry, a Location Updating Request message with the Mobile Identity IE set to the TMSI which has been allocated to the Mobile Station, CKSN IE and LAI set to those which have been allocated to the Mobile Station and the Location Updating type set to "periodic updating".

When the Mobile Station's attempt counter reaches the value 4 (four failures such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 have occurred during a periodic location updating procedure) after T3212 expiry it shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type set to "normal".
- 4) When the Mobile Station's attempt counter reaches the value 4 (four failures such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 have occurred during a periodic location updating procedure) it shall use a request for a CM connection other than emergency call as a trigger for a location updating procedure.
- 5) When a failure such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 has occurred during an IMSI attach procedure and the attempt counter is smaller than 4 the Mobile Station shall send, after T3211 expiry, a Location Updating Request message with the Mobile Identity IE set to the TMSI which has been allocated to the Mobile Station, CKSN IE and LAI set to those which have been allocated to the Mobile Station and the Location Updating type set to "IMSI attach".

When the Mobile Station's attempt counter reaches the value 4 (four failures such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 have occurred during an IMSI attach procedure) after T3212 expiry it shall send a Location Updating Request message with the Mobile Identity IE set to its IMSI, CKSN IE set to "no key is available" and the Location Updating type set to "normal".
- 6) When the Mobile Station's attempt counter reaches the value 4 (four failures such as cases d), f) and g) of section 4.4.4.9 of GSM 04.08 have occurred during an IMSI attach procedure) it shall use a request for a CM connection other than emergency call as a trigger for a location updating procedure.

References

GSM 04.08 section 4.4.4.9.

26.7.4.3.4.2 Test purpose

To verify that in the case when the attempt counter is smaller than 4 and the broadcast LAI is equal to the stored LAI, the MS is in the MM IDLE state and NORMAL SERVICE substate. To verify that timer T3211 is stopped after a MM connection establishment.

To verify that the MS uses the T3211 timer, and that it enters the MM IDLE state and NORMAL SERVICE substate when its attempt counter reaches value 4 even in the case where the stored LAI is equal to the broadcast LAI.

26.7.4.3.4.3 Method of test

Initial conditions

System Simulator:

- One cell: B, belonging to location area b.
- IMSI attach/detach is allowed.
- T3212 is set to 6 minutes.

Mobile Station:

- The MS is "Idle updated" on cell B with a valid CKSN and a TMSI.

Related PICS/PIXIT statements

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Foreseen final state of the MS

The MS is "idle updated" on cell B with a valid CKSN and a TMSI.

Test Procedure

A failure during the periodic location updating is triggered: as the broadcast LAI is equal to the stored LAI, the MS is still in the MM IDLE state and NORMAL SERVICE substate and timer T3211 is started. A CM connection other than for emergency call is attempted. It is checked that this is possible and that T3211 is stopped. Same test is performed with a failure during an IMSI attach procedure.

Then failures are triggered during the periodic location updating to let the attempt counter to reach the value of 4. The MS shall enter the MM IDLE LIMITED SERVICE state and delete any TMSI, stored LAI, ciphering key sequence number and ciphering key. When the attempt counter reaches the value of 4, timer T3212 shall be started. At timer T3212 expiry a location updating procedure is started. A request for CM connection other for than emergency call shall trigger a location updating procedure.

Same tests are performed when the failures are triggered during an IMSI attach procedure.

Maximum duration of test

40 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | SS | | The SS shall wait at most T3212 + 45 seconds. Establishment cause: Location updating. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS | | location updating type = periodic, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. performs step 5, of 26.7.4.3.2 with cause #17 and step 6 of 26.7.4.3.2. A MO CM connection is attempted. |
| 6 | MS | | |
| 7 | MS -> SS | CHANNEL REQUEST | |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 9 | MS -> SS | CM SERVICE REQUEST | CKSN = initial CKSN, Mobile Identity = TMSI. |
| 10 | SS -> MS | CM SERVICE ACCEPT | |
| 11 | MS -> SS | An initial CM message | |
| 12 | SS -> MS | CHANNEL RELEASE | |
| 13 | SS | | The SS waits for the disconnection of the main signalling link. The MS shall not initiate an RR connection establishment. This is checked during 2*T3211. |
| 14 | MS | | If possible (see PICS) SIM detachment is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 15 | MS -> SS | CHANNEL REQUEST | Steps 15 to 19 are optional. |
| 16 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 17 | MS -> SS | IMSI DETACH INDICATION | |
| 18 | SS -> MS | CHANNEL RELEASE | |
| 19 | MS | | Depending on what has been performed in step 14 the MS is brought back to operation. Establishment cause: Location updating. |
| 20 | MS -> SS | CHANNEL REQUEST | |
| 21 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 22 | MS -> SS | LOCATION UPDATING REQUEST | |
| 23 | SS | | location updating type = IMSI attach, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. performs step 11 of 26.7.4.3.2. A MO CM connection is attempted. |
| 24 | MS | | |
| 25 | MS -> SS | CHANNEL REQUEST | |
| 26 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 27 | MS -> SS | CM SERVICE REQUEST | CKSN = initial CKSN, Mobile Identity = TMSI. |
| 28 | SS -> MS | CIPHERING MODE COMMAND | |
| 29 | MS -> SS | CIPHERING MODE COMPLETE | |
| 30 | MS -> SS | An initial CM message | |
| 31 | SS -> MS | CHANNEL RELEASE | The SS waits for the disconnection of the main signalling link. The MS shall not initiate an RR connection establishment. This is checked during 2*T3211 MS is "idle, updated" in cell B. |
| 32 | SS | | |
| 32/1 | MS | | If possible (see PICS) SIM detachment is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. |
| 32/2 | MS -> SS | CHANNEL REQUEST | Steps 32/2 to 32/5 are optional. |
| 32/3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 32/4 | MS -> SS | IMSI DETACH INDICATION | |
| 32/5 | SS -> MS | CHANNEL RELEASE | |
| 32/6 | MS | | Depending on what has been performed in step 32/1, the MS is brought back to operation. |
| 32/7 | MS -> SS | CHANNEL REQUEST | |
| | | | Establishment cause: Location updating. |

| Step | Direction | Message | Comments |
|-------|-----------|----------------------------|--|
| 32/8 | SS -> MS | IMMEDIATE ASSIGNMENT | location updating type = IMSI attach, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 32/9 | MS -> SS | LOCATION UPDATING REQUEST | |
| 32/10 | SS -> MS | LOCATION UPDATING ACCEPT | without mobile identity |
| 32/11 | SS -> MS | CHANNEL RELEASE | The SS shall wait at most T3212 + 15 seconds. Establishment cause: Location updating. |
| 33 | SS | | |
| 34 | MS -> SS | CHANNEL REQUEST | location updating type = periodic, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 35 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 36 | MS -> SS | LOCATION UPDATING REQUEST | performs step 16 of 26.7.4.3.2. |
| 37 | SS | | The MS shall not initiate an RR connection establishment during T3211 at least after the channel release. |
| 38 | MS | | |
| 39 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 40 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 41 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = periodic, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 42 | SS | | |
| 43 | MS | | performs step 5 of 26.7.4.3.2 with cause #17 and step 6 of 26.7.4.3.2. |
| 44 | MS -> SS | CHANNEL REQUEST | The MS shall not initiate an RR connection establishment during T3211 at least after the channel release. |
| 45 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 46 | MS -> SS | LOCATION UPDATING REQUEST | Establishment cause: Location updating. |
| 47 | SS | | |
| 48 | MS | | location updating type = periodic, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 49 | MS -> SS | CHANNEL REQUEST | performs step 11 of 26.7.4.3.2. |
| 50 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 51 | MS -> SS | LOCATION UPDATING REQUEST | The MS shall not initiate an RR connection establishment within T3211 + RadioLinkTimeout after the SS deactivates the SACCH. |
| 52 | SS | | Establishment cause: Location updating. |
| 53 | MS | | |
| 54 | MS -> SS | CHANNEL REQUEST | location updating type = periodic, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 55 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 56 | MS -> SS | LOCATION UPDATING REQUEST | performs step 16 of 26.7.4.3.2. |
| 57 | SS -> MS | AUTHENTICATION REQUEST | The MS shall not initiate an RR connection establishment during T3212 - 15 seconds at least after the channel release. |
| 58 | MS -> SS | AUTHENTICATION RESPONSE | |
| 59a | SS -> MS | LOCATION UPDATING ACCEPT | Establishment cause: Location updating. |
| 59b | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 60 | SS -> MS | CHANNEL RELEASE | location updating type = periodic or normal (see Note 1), CKSN = no key available, LAI = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE) mobile station classmark 1 as given by the PICS and mobile identity = IMSI. |
| | | | IE mobile Identity = TMSI. |
| | | | The SS waits for the disconnection of the main signalling link. |

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|---|
| 61 | MS | | The MS shall not initiate an RR connection establishment earlier than T3212 - 15 seconds after the transmission of the CHANNEL RELEASE in step 60. |
| 62 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |
| 63 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 64 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = periodic, CKSN = initial value, LAI = b, mobile station classmark 1 as given by the PICS and mobile identity = TMSI. |
| 65 | SS | | performs step 5 of 26.7.4.3.2 with cause #17 and step 6 of 26.7.4.3.2. |
| 66 | MS | | The MS shall not initiate an RR connection establishment during T3211 at least after the channel release. |
| 67 | MS -> SS | CHANNEL REQUEST | Establishment cause: Location updating. |

|------|-----------|----------------------------|---|
| 157 | MS -> SS | AUTHENTICATION RESPONSE | IE mobile Identity = TMSI. |
| 158 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 159 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 160 | SS -> MS | CHANNEL RELEASE | |
| 161 | MS | | Steps 161 to 166 are optional. An MO CM connection is attempted. |
| 162 | MS -> SS | CHANNEL REQUEST | |
| 163 | SS -> MS | IMMEDIATE ASSIGNMENT | CKSN = initial value, Mobile identity = TMSI. cause #17 (network failure). |
| 164 | MS -> SS | CM SERVICE REQUEST | |
| 165 | SS -> MS | CM SERVICE REJECT | |
| 166 | SS -> MS | CHANNEL RELEASE | |

NOTE 1: the MS can include both types of Location updating. As T3212 expires it can be a periodic location updating procedure and as there is no stored LAI it can be a normal one.

NOTE 2: same problem as in note 1. Three types of location updating procedures should be allowed.

Specific message contents

None.

26.7.4.4 Location updating / release / expiry of T3240

26.7.4.4.1 Conformance requirement

The mobile station receiving a LOCATION UPDATING REJECT message shall start T3240: it shall abort the RR connection at the expiry of timer T3240.

References

GSM 04.08 section 4.4.4.8, 11.2.

26.7.4.4.2 Test purpose

To verify that the MS aborts the RR-connection at the expiry of timer T3240.

26.7.4.4.3 Method of test

Initial conditions

System Simulator:

Two cells: A and B, belonging to different location areas a and b.

Mobile Station:

The MS has a valid TMSI. It is "idle updated" on cell A.

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS is "idle updated" on cell B.

Test Procedure

A normal location updating procedure is performed. The RR-connection is not released by the SS within the timer T3240. It is checked that the MS aborts the RR-connection.

Maximum duration of test

1 minute.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | SS | | The RF level of cell A is lowered until the MS selects cell B. "Establishment cause": Location updating. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | The SS waits T3240 expiry. The MS shall abort the RR connection (disconnection of layer 2). |
| 6 | SS | | |
| 7 | MS | | |

Specific message contents

None.

26.7.4.5 Location updating / periodic

26.7.4.5.1 Location updating / periodic spread

26.7.4.5.1.1 Conformance requirement

- 1) The Mobile Stations shall perform spreading of the time before performing a periodic location updating when the location updating timer value is reduced.
- 2) The Mobile Station shall reset timer T3212 when the Mobile Station is deactivated, and shall start with a value between zero and the broadcasted value when reactivated in the same cell, IMSI attach being forbidden.
- 3) When activated the Mobile Station shall start timer T3212 with a value randomly drawn in the allowed range.

NOTE: This conformance requirement is not covered by a test purpose. It is intended to be covered by a manufacturer declaration.

References

GSM 04.08 section 4.4.2.

26.7.4.5.1.2 Test purpose

- 1) To check that when the location updating timer is reduced, the timer running in the MS is started with a value depending on the current timer value and the new broadcasted T3212 value.
- 2) To verify that when the MS is reactivated in the same cell (as the one in which it was deactivated), IMSI attach being forbidden, the MS starts the timer T3212 with a value between zero and the broadcasted value.

NOTE: It is not tested that the value is random.

26.7.4.5.1.3 Method of test**Initial conditions**

System Simulator:

One cell, T3212 is set to 30 minutes.
IMSI attach is allowed in the cell.

Mobile Station:

The MS is deactivated. The stored MCC, MNC and LAC correspond to the broadcasted values. The stored update status is "updated".

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test procedure

The MS is activated. It performs IMSI attach. 3 minutes after the end of the IMSI attach procedure, the value of T3212 is set to 6 minutes. The MS shall perform periodic location updating 6 minutes after the end of the IMSI attach procedure.

Then, the IMSI attach/detach is forbidden. T3212 is still set to 6 minutes.

The MS is deactivated. The MS is reactivated. It is checked that the MS performs a periodic location updating during the 6 minutes following activation.

Maximum duration of test

20 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | MS | | The MS is activated. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type": IMSI attach. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 7 | SS | | 3 minutes after step 6 the value of T3212 is set to 6 minutes. |
| 8 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating This message shall be sent by the MS between 5minutes 45s and 6minutes 15s after step 6. |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type": periodic updating. |
| 11 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 13 | SS | | IMSI attach/detach is not allowed. |
| 14 | MS | | The MS is deactivated. |
| 15 | MS | | The MS is activated. |
| 16 | SS | | The SS waits until the periodic location updating. |
| 17 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating This message shall arrive during the 7 minutes following the MS activation. |
| 18 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 19 | MS -> SS | LOCATION UPDATING REQUEST | "Location updating type" = periodic. |
| 20 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 21 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.4.5.2 Location updating / periodic normal / test 1**26.7.4.5.2.1 Conformance requirement**

- 1 The Mobile Station shall stop and reset the timer T3212 of the periodic location updating procedure when the first MM message is received or ciphering mode setting is completed in the case of MM connection establishment.
- 2 The Mobile Station shall stop and reset the timer T3212 of the periodic location updating procedure when the Mobile Station has responded to paging and thereafter has received the first correct L3 message that is not an RR message.

References

GSM 04.08 section 4.4.2.

26.7.4.5.2.2 Test purpose

To verify that the MS stops and resets the timer T3212 of the periodic location updating procedure when:

- the first MM-message is received in the case of MM-connection establishment, ciphering mode being not set;
- the MS has responded to paging and the first correct L3 message that is not an RR message is received.

NOTE: T3212 is stopped when the MM-idle state is left and restarted when the MM sublayer returns to that state, substate NORMAL SERVICE or ATTEMPTING TO UPDATE. As a consequence, the exact time when T3212 is reset between those two events cannot be tested.

26.7.4.5.2.3 Method of test

Initial conditions

System Simulator:

1 cell, default parameters.

IMSI attach/detach is not allowed.

The T3212 time-out value is 2/10 hour.

Mobile Station:

The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test procedure

An MS originated MM connection is established and cleared. The channel is released. It is checked that the MS performs a periodic location updating 12 minutes after the release of the channel.

One minute after the periodic location updating, the MS is paged, it sends a CHANNEL REQUEST message and the SS responds with an IMMEDIATE ASSIGNMENT message, a call is established and then cleared. It is checked that the MS performs a periodic location updating 12 minutes after the release of the link.

Maximum duration of test

30 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | MS | | <p>A MO CM connection is attempted.</p> <p>cause #17 (network failure).</p> <p>After the sending of this message, the SS waits for the disconnection of the main signalling link.</p> <p>The SS waits until the periodic location updating.</p> <p>"Establishment cause": Location updating This message shall arrive between 11 minutes 45 s and 12 minutes 15 s after the last release of the RR connection by the SS.</p> <p>"Location updating type" = periodic.</p> <p>After the sending of this message, the SS waits for the disconnection of the main signalling link.</p> |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | |
| 5 | SS -> MS | CM SERVICE REJECT | |
| 6 | SS -> MS | CHANNEL RELEASE | |
| 7 | SS | | |
| 8 | MS -> SS | CHANNEL REQUEST | |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | LOCATION UPDATING REQUEST | |
| 11 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 12 | SS -> MS | CHANNEL RELEASE | |
| 13 | SS | | <p>The SS waits 1 minute.</p> <p>"Mobile identity" = IMSI.</p> <p>"Establishment cause": Answer to paging.</p> <p>After the sending of this message, the SS waits for the disconnection of the main signalling link.</p> <p>The SS waits until the periodic location updating.</p> <p>"Establishment cause": Location updating This message shall arrive between 11 minutes 45 s and 12 minutes 15 s after the last release of the RR connection by the SS.</p> <p>"Location updating type" = periodic.</p> <p>After the sending of this message, the SS waits for the disconnection of the main signalling link.</p> |

| 25 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 26 | SS -> MS | CHANNEL RELEASE | |

Specific message contents

None.

26.7.4.5.3 Location updating / periodic normal / test 2**26.7.4.5.3.1 Conformance requirement**

When a LOCATION UPDATING ACCEPT or a LOCATION UPDATING REJECT message is received, the timer T3212 is stopped and reset and the Mobile Station shall perform a periodic location updating after T3212 expiry.

References

GSM 04.08 section 4.4.2.

26.7.4.5.3.2 Test purpose

To verify that the MS stops and resets the timer T3212 of the periodic location updating procedure when a LOCATION UPDATING ACCEPT message is received.

NOTE: T3212 is stopped when the MM-idle state is left and restarted when the MM sublayer returns to that state, substate NORMAL SERVICE or ATTEMPTING TO UPDATE. As a consequence, the exact time when T3212 is reset between those two events cannot be tested.

26.7.4.5.3.3 Method of test**Initial conditions**

System Simulator:
2 cells, IMSI attach/detach is allowed in both cells.
T3212 is set to 6 minutes.

Mobile Station:
The MS has a valid TMSI. It is "idle updated" on cell A.

Related PICS/PIXIT statements

SIM removal possible while MS is powered Yes/No

Switch off on button yes/No

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on cell B.

Test procedure

A normal location updating is performed. The channel is released. One minute later, the MS is deactivated, then reactivated in the same cell. It is checked that the MS performs an IMSI attach and a periodic location updating 6 minutes after the IMSI attach.

Maximum duration of test

20 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | SS | | The following messages are sent and shall be received on cell B. The RF level of cell A is lowered until the MS selects cell B. |
| 2 | MS -> SS | CHANNEL REQUEST | "establishment cause": Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = normal. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 7 | SS | | The SS waits until the periodic location updating. |
| 8 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating This message shall arrive between 5 minutes 45s and 6 minutes 15 s after the last release of the RR connection by the SS. |
| 9 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 10 | MS -> SS | LOCATION UPDATING REQUEST | "Location updating type" = periodic. |
| 11 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 12 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 13 | MS | | If possible (see PICS) SIM removal is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. steps 14 to 17 may be performed or not depending on the action made in step 13. |
| 14 | MS -> SS | CHANNEL REQUEST | |
| 15 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 16 | MS -> SS | IMSI DETACH INDICATION | |
| 17 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 18 | MS | | Depending on what has been performed in step 13 the MS is brought back to operation. |
| 19 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 20 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 21 | MS -> SS | LOCATION UPDATING REQUEST | "Location updating type" = IMSI attach. |
| 22 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 23 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 24 | SS | | The SS waits until the periodic location updating. |
| 25 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating This message shall arrive between 5 minutes 45 s and 6 minutes 15s after the last release of the RR connection by the SS. |
| 26 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 27 | MS -> SS | LOCATION UPDATING REQUEST | "Location updating type" = periodic. |
| 28 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 29 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.4.5.4 Location updating / periodic HPLMN search**26.7.4.5.4.1 Location updating / periodic HPLMN search / MS waits time T****26.7.4.5.4.1.1 Conformance requirement**

When in automatic mode and roaming in the home country, the MS shall make an attempt to access the HPLMN, if the MS is on the VPLMN at time T after since the last attempt.

NOTE: This test is not intended to test every value in the range 6 minutes to 8 hours or the default of 30 minutes, but is intended to check that the mobile is capable of using the value stored on the SIM.

References

GSM 02.11 section 3.2.2.5.2.

GSM 03.22 section 4.4.3.3.

26.7.4.5.4.1.2 Test purpose

To verify that when a cell of the HPLMN becomes available, following the successful location request on the VPLMN of the home country and after the first search the mobile has failed to find its HPLMN, that the MS shall perform a location update request on the HPLMN after time T. Where T is the HPLMN Search Period stored in the SIM.

26.7.4.5.4.1.3 Method of test**Initial conditions**

System Simulator:

Two cells A and B, belonging to different location areas with location identification a and b. Cell A shall be a cell of the HPLMN and Cell B shall be a cell of the VPLMN with a Country Code the same as that of Cell A. Initially Cell A shall not be broadcasting. IMSI attach/detach is not allowed on either cell.

Mobile Station:

The MS is switched off. The HPLMN Search Period on the SIM shall be set to 6 minutes. The location area information on the SIM is "deleted".

Related PICS/PIXIT statements

Switch on/off button Yes/No.

Foreseen final state of the MS

The MS is "idle updated" on Cell A.

Test Procedure

Only Cell B shall be broadcasting. The MS shall be switched on either by using the Power Switch or by applying power. A normal location updating is performed on Cell B. Cell A shall be made available after 8 minutes, thus ensuring the MS fails to find the HPLMN during its first attempt. It is verified that the MS performs a location update request on Cell A, within 6 minutes after broadcasting of Cell A.

Maximum duration of test

17 minutes.

Expected sequence

| Step | Direction | Message | Contents |
|------|-----------|---------------------------|--|
| 1 | MS | | The following messages shall be sent and received on Cell B. The MS is switched on by either using the Power Switch or by applying power. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | "Location Update Type": Normal. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | SS -> MS | CHANNEL RELEASE | After sending this message the SS waits for the disconnection of the main signalling link. The SS waits a period of 8 minutes, this allowing the MS to make its first periodic search. |
| 8 | SS | | Cell A is made available. Within 8 minutes after step 8 the following messages shall be sent and received on Cell A. |
| 9 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 11 | MS -> SS | LOCATION UPDATING REQUEST | "Location Update Type": normal. |
| 12 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 13 | SS -> MS | CHANNEL RELEASE | After sending this message the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.4.5.4.2 Location updating / periodic HPLMN search / MS in manual mode**26.7.4.5.4.2.1 Conformance requirement**

The periodic attempts shall only be performed if in automatic mode when the MS is roaming in its home country.

References

GSM 02.11 section 3.2.2.5.2.

GSM 03.22 section 4.4.3.3.

26.7.4.5.4.2.2 Test purpose

To verify that no HPLMN Search is performed when the MS is not in automatic mode.

26.7.4.5.4.2.3 Method of test**Initial conditions**

System Simulator:

Two cells A and B, belonging to different location areas with location identification a and b. Cell A shall be a cell of the HPLMN and Cell B shall be a cell of the VPLMN with a Country Code the same as that of Cell A. Initially Cell A shall not be broadcasting. IMSI attach/detach is not allowed on either cell.

Mobile Station:

The MS is switched off. The HPLMN Search Period on the SIM shall be set to 6 minutes. The location area information on the SIM is "deleted".

Related PICS/PIXIT statements

Switch on/off button Yes/No.

Foreseen final state of the MS

The MS is "idle updated" on Cell B.

Test Procedure

Only Cell B shall be broadcasting. The MS shall be switched on either by using the Power Switch or by applying power. A normal location updating is performed on Cell B. The MS is forced into manual selection mode. Cell A is made available. It is verified that the MS does not attempt to perform a location update on Cell A.

Maximum duration of test

7 minutes.

Expected sequence

| Step | Direction | Message | Contents |
|------|-----------|---------------------------|--|
| 1 | MS | | The following messages shall be sent and received on Cell B. The MS is switched on by either using the Power Switch or by applying power. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | "Location Update Type": Normal. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | SS -> MS | CHANNEL RELEASE | After sending this message the SS waits for the disconnection of the main signalling link. |
| 8 | MS | | The MS is forced into manual selection mode. |
| 9 | SS | | Cell A is made available. |
| 10 | SS | | The SS waits a period of 7 minutes. During this time no messages shall be received on Cell A. |

Specific message contents

None.

26.7.4.5.4.3 Location updating / periodic HPLMN search / MS waits at least two minutes and at most T minutes**26.7.4.5.4.3.1 Conformance requirement**

After switch on, the MS waits at least 2 minutes and at most T minutes before the first HPLMN Search is attempted.

References

GSM 02.11 section 3.2.2.5.2.

GSM 03.22 section 4.4.3.3.

26.7.4.5.4.3.2 Test purpose

To verify that the MS waits at least 2 minutes and at most T minutes before attempting its first HPLMN Search.

26.7.4.5.4.3.3 Method of test**Initial Conditions**

System Simulator:

Two cells A and B, belonging to different location areas with location identification a and b. Cell A shall be a cell of the HPLMN and Cell B shall be a cell of the VPLMN with a Country Code the same as that of Cell A. Initially Cell A shall not be broadcasting. IMSI attach/detach is not allowed on either cell.

Mobile Station:

The MS is switched off. The HPLMN Search Period on the SIM shall be set to 6 minutes. The location area information on the SIM is "deleted".

Related PICS/PIXIT statements

Switch on/off button Yes/No.

Foreseen final state of the MS

The MS is "idle updated" on Cell A.

Test Procedure

Only Cell B shall be broadcasting. The MS shall be switched on either by using the Power Switch or by applying power. A normal location updating is performed on Cell B. Cell A is made available. It is verified that the MS attempts to perform a location update on Cell A, after at least 2 minutes and at most T minutes have passed following power on.

Maximum duration of test

8 minutes.

Expected sequence

| Step | Direction | Message | Contents |
|------|-----------|---------------------------|--|
| 1 | MS | | The following messages shall be sent and received on Cell B. The MS is switched on by either using the Power Switch or by applying power. |
| 2 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | "Location Update Type": Normal. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | SS -> MS | CHANNEL RELEASE | After sending this message the SS waits for the disconnection of the main signalling link. |
| 8 | SS | | Cell A is made available. |
| 9 | SS | | The SS waits a period of 2 minutes after the MS is switched on. During this time no messages shall be received on Cell A. The following messages shall be sent and received on cell A. Within T minutes after the MS is switched on the following messages shall be sent and received on cell A. |
| 10 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating This message shall be sent between 2 and 7 minutes after step 1 |
| 11 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 12 | MS -> SS | LOCATION UPDATING REQUEST | "Location Update Type": normal. |
| 13 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 14 | SS -> MS | CHANNEL RELEASE | After sending this message the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.4.6 Location updating / interworking of attach and periodic**26.7.4.6.1 Conformance requirement**

- 1) If the Mobile Station is in service state NO CELL AVAILABLE, LIMITED SERVICE, PLMN SEARCH or PLMN SEARCH-NORMAL SERVICE when the timer expires the location updating procedure is delayed until this service state is left.
- 2) The T3212 time-out value shall not be changed in the NO CELL AVAILABLE, LIMITED SERVICE, PLMN SEARCH and PLMN SEARCH-NORMAL SERVICE states.
- 3) If the selected cell is in the location area where the mobile station is registered and IMSI ATTACH is not required and timer T3212 has not expired, then the state is NORMAL SERVICE.

References

- 1 GSM 04.08 section 4.4.2.

- 3 GSM 04.08 section 4.2.1.1

26.7.4.6.2 Test purpose

- 1) To check that if the PLU timer expires while the MS is out of coverage, the MS informs the network of its return to coverage.
- 2) To check that the PLU timer is not disturbed by cells of forbidden PLMNs.
- 3) To check that if the PLU timer does not expire while out of coverage and if the mobile returns to the LA where it is updated, the mobile does not inform the network of its return to coverage.

26.7.4.6.3 Method of test**Initial conditions**

System Simulator:

Two cells, a and b, of different PLMNs.
T3212 is set to 12 minutes on cell a.
T3212 is set to 6 minutes on cell b.
IMSI attach is allowed in both cells.

Mobile Station:

The MS is deactivated. The PLMN of cell b is entered in the SIM's forbidden PLMN list.

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS is "idle updated". The PLMN of cell b is entered in the SIM's forbidden PLMN list.

Test procedure

The MS is activated and placed in automatic network selection mode. It performs IMSI attach. 1 minute after the end of the IMSI attach procedure, cell a is switched off. The MS shall not location update on cell b. 8 minutes after the end of the IMSI attach procedure, cell a is switched on. The MS shall not location update on cell a before 11,75 minutes after the end of the IMSI attach procedure. The MS shall perform a periodic location update on cell a between 11,75 minutes and 12,25 minutes after the end of the IMSI attach procedure.

3 minutes after the end of the periodic location updating procedure, cell a is switched off. The MS shall not location update on cell b. 14 minutes after the end of the periodic location updating procedure, cell a is switched on and cell b is switched off. The MS shall perform a location update on cell a before 17 minutes after the end of the periodic location updating procedure.

Maximum duration of test

35 minutes.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | MS | | The MS is activated in automatic network selection mode. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type": IMSI attach. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 7 | SS | | 1 minute after step 6, cell a is switched off. |
| 8 | SS | | 8 minutes after step 6, cell a is switched on. |
| 9 | MS -> SS | CHANNEL REQUEST | This message shall be sent by the MS between 11 minutes 45s and 12 minutes 15s after step 6. |
| 10 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 11 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type": periodic updating. |
| 12 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 13 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 14 | SS | | 3 minutes after step 13, cell a is switched off. |
| 15 | SS | | 14 minutes after step 13, cell a is switched on and cell b is switched off. |
| 16 | MS -> SS | CHANNEL REQUEST | This message shall be sent by the MS before 17 minutes after step 13. |
| 17 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 18 | MS -> SS | LOCATION UPDATING REQUEST | "Location updating type" = periodic. |
| 19 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 22 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

26.7.5 MM connection**26.7.5.1 Introduction**

[tbd]

26.7.5.2 MM connection / establishment with cipher**26.7.5.2.1 Conformance requirement**

- 1) The Mobile Station shall be able to correctly set up an MM connection in a Mobile Originating CM connection attempt and send a CM Service Request message with CKSN information element as stored in the SIM and Mobile Identity information element set to the TMSI.
- 2) The Mobile Station shall be able to interpret cipher mode setting as acceptance of its CM service request i.e. send a CM message.

References

GSM 04.08 sections 4.5.1.1.

26.7.5.2.2 Test purpose

To verify that the MS can correctly set up an MM connection in an origination and interpret cipher mode setting as acceptance of its CM service request.

26.7.5.2.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS has valid TMSI, CKSN. It is "idle updated".

Test Procedure

A mobile originating CM connection is initiated. After the MS has sent the CM SERVICE REQUEST message to the SS, an authentication procedure and a ciphering mode setting procedure are performed. Then, the MS sends a CM message and the SS clears the call and releases the channel.

Maximum duration of test

One minute.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------------|--|
| 1 | MS | | A MO CM connection is attempted. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | |
| 5 | SS -> MS | AUTHENTICATION REQUEST | |
| 6 | MS -> SS | AUTHENTICATION RESPONSE | |
| 7 | SS -> MS | CIPHERING MODE COMMAND | The SS starts deciphering. |
| 8 | MS -> SS | CIPHERING MODE COMPLETE | The SS starts enciphering. |
| A9 | MS -> SS | SETUP | "Cause" IE: "unassigned number". |
| A10 | SS -> MS | RELEASE COMPLETE | |
| B9 | MS -> SS | REGISTER | |
| B10 | SS -> MS | RELEASE COMPLETE | |
| C9 | MS -> SS | CP-DATA | |
| C10 | SS -> MS | CP-ACK | |
| C11 | SS -> MS | CP-DATA | |
| C12 | MS -> SS | CP-ACK | |
| 13 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.5.3 MM connection / establishment without cipher**26.7.5.3.1 Conformance requirement**

Upon reception of the CM SERVICE ACCEPT message, the MS shall send a CM message.

References

GSM 04.08 sections 4.5.1.1.

26.7.5.3.2 Test purpose

To verify that the MS can correctly set up an MM connection in an originating CM connection establishment when ciphering mode setting is not required.

26.7.5.3.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

A mobile originating CM connection is attempted. The MM-connection is established without invoking the ciphering mode setting procedure.

Then, the MS sends a CM message and the SS releases the channel.

Maximum duration of test

one minute.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------|--|
| 1 | MS | | A MO CM connection is attempted. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | |
| 5 | SS -> MS | CM SERVICE ACCEPT | |
| A6 | MS -> SS | SETUP | |
| B6 | MS -> SS | REGISTER | |
| C6 | MS -> SS | CP-DATA | |
| C7 | SS -> MS | CP-ACK | |
| C8 | SS -> MS | CP-DATA | |
| C9 | MS -> SS | CP-ACK | |
| 10 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.5.4 MM connection / establishment rejected**26.7.5.4.1 Conformance requirement**

Upon reception of a CM SERVICE REJECT message, the MS shall not send any layer 3 message, start timer T3240 and enter the "wait for network command" state.

References

GSM 04.08 sections 4.5.1.1.

26.7.5.4.2 Test purpose

To verify that the MS does not send a layer 3 message when the service request is rejected by the SS.

26.7.5.4.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS has a valid TMSI; It is "idle updated".

Test Procedure

A mobile originating CM connection is attempted. After the MS has sent the CM SERVICE REQUEST message to the SS, the SS responds with a CM SERVICE REJECT message with reject cause "requested service option not subscribed". It is checked that the MS does not send a layer 3 message.

Maximum duration of test

1 minute.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------|---|
| 1 | MS | | A MO CM connection is attempted |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | |
| 5 | SS -> MS | CM SERVICE REJECT | |
| 6 | SS | | "Reject cause" IE: "requested service option not subscribed". The MS shall not send a layer 3 message. This is checked during 5 seconds. |
| 7 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.5.5 MM connection / establishment rejected cause 4**26.7.5.5.1 Conformance requirement**

- 1) The Mobile Station shall be able to correctly set up an MM connection in a Mobile Originating CM connection attempt and send a CM Service Request message with CKSN information element as stored in the SIM and Mobile Identity information element set to the TMSI.
- 2) The Mobile Station, when receiving a CM SERVICE REJECT message with reject cause "IMSI unknown in VLR" shall wait for the network to release the RR connection.
- 3) The Mobile Station shall then be able to perform a location updating procedure.

References

GSM 04.08 sections 4.5.1.1.

26.7.5.5.2 Test purpose

To verify that the MS can correctly accept a CM SERVICE REJECT message with reject cause "IMSI unknown in VLR".

26.7.5.5.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS has valid TMSI, CKSN. It is "idle updated".

Test Procedure

A mobile originating CM connection is attempted. After the MS has sent the CM SERVICE REQUEST message to the SS, the SS responds with a CM SERVICE REJECT message with reject cause "IMSI unknown in VLR". On receipt of this message, the MS shall delete any TMSI, LAI, cipher key and cipher key sequence number. The channel is released. It is checked that the MS performs a normal location updating procedure.

Maximum duration of test

One minute.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 1 | MS | | A MO CM connection is attempted. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | |
| 5 | SS -> MS | CM SERVICE REJECT | "Reject cause" = "IMSI unknown in VLR". |
| 6 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 7 | MS -> SS | CHANNEL REQUEST | "Establishment cause": Location updating. |
| 8 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 9 | MS -> SS | LOCATION UPDATING REQUEST | "Ciphering key sequence number" = "No key is available". "Mobile identity" = IMSI. "Location area identification" = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE). |
| 10 | SS -> MS | AUTHENTICATION REQUEST | |
| 11 | MS -> SS | AUTHENTICATION RESPONSE | |
| 12 | SS -> MS | LOCATION UPDATING ACCEPT | "Mobile identity" = new TMSI. |
| 13 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 14 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.5.6 MM connection / expiry T3230

26.7.5.6.1 Conformance requirement

At T3230 expiry (i.e. no response is given but an RR connection is available) the MM connection establishment shall be aborted.

References

GSM 04.08 sections 4.5.1.2 and 11.2.

26.7.5.6.2 Test purpose

To verify that at T3230 expiry, the MS aborts the MM-connection establishment.

26.7.5.6.3 Method of test**Initial conditions**

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS has a valid TMSI. It is "idle updated".

Related PICS/PIXIT statements

None.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test Procedure

A mobile originating CM connection is attempted. After the MS has sent the CM SERVICE REQUEST message to the SS, the SS waits for expiry of timer T3230. It is checked that the MS does not send a layer 3 message but waits for the release of the RR-connection.

Maximum duration of test

1 minute.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------|--|
| 1 | MS | | A MO CM connection is attempted. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | CM SERVICE REQUEST | |
| 5 | SS | | The SS waits for expiry of timer T3230. |
| 6 | SS -> MS | CM SERVICE ACCEPT | |
| 7 | MS -> SS | MM STATUS | "Reject cause " IE is "message not compatible with the call state or not implemented". After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 8 | SS -> MS | CHANNEL RELEASE | |

Specific message contents

None.

26.7.5.7 MM connection / abortion by the network**26.7.5.7.1 MM connection / abortion by the network / cause #6****26.7.5.7.1.1 Conformance requirement**

- 1) Upon reception of an ABORT message, the MS shall release any ongoing MM connection and enter the "wait for network command" state.
- 2) If the cause in the ABORT message was cause #6, the Mobile Station shall:
 - 2.1 not perform normal location updating;
 - 2.2 not perform periodic location updating;
 - 2.3 not respond to paging with TMSI;
 - 2.4 reject any request for Mobile Originating call establishment except Emergency call;
 - 2.5 not perform IMSI detach if deactivated.

- 3) After reception of an ABORT message with cause #6, the Mobile Station, if it supports speech, shall accept a request for an emergency call by sending a Channel Request message with the establishment cause set to "emergency call".
- 4) After reception of an ABORT message with cause #6, the Mobile Station shall delete the stored LAI, CKSN and TMSI.

Reference(s)

GSM 04.08 section 4.3.5.

26.7.5.7.1.2 Test purpose

To check that upon reception of an ABORT message with cause #6 during call establishment:

- the MS does not send any layer 3 message;
- after reception of an ABORT message and after having been deactivated and reactivated, the MS performs location updating using its IMSI as mobile identity and indicates deleted LAI and CKSN;
- the MS does not perform location updating, does not answer to paging with TMSI, rejects any request for mobile originating call except emergency call, does not perform IMSI detach;
- the MS accepts a request for emergency call.

26.7.5.7.1.3 Method of test**Initial Conditions**

System Simulator:
2 cells, default parameters.

Mobile Station:
The MS has a valid TMSI, CKSN and Kc. It is "idle updated" on cell B.

Related PICS/PIXIT Statement(s)

SIM removal possible while MS is powered Yes/No.

Switch off on button Yes/No.

Support of speech Yes/No.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated" on cell A.

Test procedure

A mobile originating CM connection is attempted. Upon reception of the AUTHENTICATION RESPONSE message, the SS sends an ABORT message with cause #6. The SS waits for 5 seconds. The MS shall not send any layer 3 message. The SS releases the RR connection.

The SS checks that the MS has entered the state MM IDLE substate NO IMSI, i.e. does not perform normal location updating, does not perform periodic updating, does not respond to paging, rejects any requests from CM entities except emergency calls and does not perform IMSI detach if deactivated.

Maximum Duration Of Test

10 minutes.

Expected Sequence

| Step | Direction | Message | Comments |
|--|-----------|--|--|
| The following messages are sent and shall be received on cell B | | | |
| 1 | MS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT CM SERVICE REQUEST AUTHENTICATION REQUEST AUTHENTICATION RESPONSE ABORT CHANNEL RELEASE | A mobile originating CM connection is attempted. |
| 2 | MS -> SS | | |
| 3 | SS -> MS | | |

| 25 | SS -> MS | | |
| 26 | SS -> MS | | |
| 27 | MS | | |
| 28 | MS | | "CM service type": Emergency call establishment. |
| 29 | MS | | "Cause" = unassigned number. |
| 30 | MS -> SS | CHANNEL REQUEST IMMEDIATE ASSIGNMENT | After the sending of this message, the SS waits for the disconnection of the main signalling link. |
| 31 | SS -> MS | | If possible (see PICS) SIM detachment is performed. Otherwise if possible (see PICS) switch off is performed. Otherwise the power is removed. The MS shall not initiate an RR connection establishment on cell A or on cell B. This is checked during 3 seconds. |
| 32 | MS | | Depending on what has been performed in step 29 the MS is brought back to operation. |
| 33 | MS -> SS | | "Establishment cause": Location updating. |

| Step | Direction | Message | Comments |
|------|-----------|----------------------------|--|
| 32 | MS -> SS | LOCATION UPDATING REQUEST | "location updating type" = normal, "CKSN" = no key available, "Mobile Identity" = IMSI, "LAI" = deleted LAI (the MCC and MNC hold the previous values, the LAC is coded FFFE). |
| 33 | SS -> MS | AUTHENTICATION REQUEST | |
| 34 | MS -> SS | AUTHENTICATION RESPONSE | "CKSN" = CKSN1. |
| 35 | SS -> MS | LOCATION UPDATING ACCEPT | "Mobile Identity" = TMSI. |
| 36 | MS -> SS | TMSI REALLOCATION COMPLETE | |
| 37 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.5.7.2 MM connection / abortion by the network / cause not equal to #6

26.7.5.7.2.1 Conformance requirement

Upon reception of an ABORT message, the MS shall release any ongoing MM connection and enter the "wait for network command" state.

Reference(s)

GSM 04.08 section 4.3.5.

26.7.5.7.2.2 Test purpose

To check that when multiple MM connections are established, the MS releases all MM connections upon reception of an ABORT message, in the case when the two MM connections are established for a mobile terminating call and a non call related supplementary service operation.

26.7.5.7.2.3 Method of test

Initial Conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in state U10 of a mobile terminating call.

Related PICS/PIXIT Statement(s)

The MS supports a non call related supplementary service operation during an active call Yes/No.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test procedure

A non call related supplementary service operation is attempted at the MS. Upon reception of the REGISTER message, the SS sends an ABORT message with cause # 17. The SS sends a DISCONNECT using the TI of the mobile terminating call. The MS shall send a RELEASE COMPLETE message with the PD and TI of the DISCONNECT message and with cause #81. The SS releases the RR connection.

Maximum Duration Of Test

15 seconds.

Expected Sequence

This procedure is performed if the MS supports non call related supplementary service operation.

| Step | Direction | Message | Comments |
|------|-----------|--------------------|--|
| 1 | MS | | A non call related supplementary service operation is attempted at the MS. |
| 2 | MS -> SS | CM SERVICE REQUEST | |
| 3 | SS -> MS | CM SERVICE ACCEPT | |
| 4 | MS -> SS | REGISTER | |
| 5 | SS -> MS | ABORT | "reject cause" = #17. |
| 6 | SS -> MS | DISCONNECT | with the TI of the mobile terminating call. |
| 7 | MS -> SS | RELEASE COMPLETE | "cause" = #81. Same PD and TI as the DISCONNECT message. |
| 8 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.5.8 MM connection / follow-on request pending**26.7.5.8.1 MM connection / follow-on request pending / test 1****26.7.5.8.1.1 Conformance requirement**

The MS shall not attempt to establish a new MM connection after location updating on the same RR connection if not allowed by the network.

Reference(s)

GSM 04.08 section 4.4.4.6.

26.7.5.8.1.2 Test purpose

To check that when the network does not include the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that has a CM application request pending does not attempt to establish a new MM connection on that RR connection.

26.7.5.8.1.3 Method of test**Initial Conditions**

System Simulator:

1 cell, ATT flag is set to "MSs in the cell shall apply IMSI attach and detach procedure".

Mobile Station:

The MS has a valid TMSI and is deactivated.

Related PICS/PIXIT Statement(s)

None.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test procedure

The MS is activated and a CM connection is attempted during the location updating procedure. The SS does not include the follow on proceed information element in the LOCATION UPDATING ACCEPT message. The SS waits for at least 8 seconds. The MS shall not send any layer 3 message for 8 seconds.

Maximum Duration of Test

60 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | MS | | The MS is activated. |
| 2 | MS -> SS | CHANNEL REQUEST | |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | location updating type = IMSI attach. Then the SS waits for 15 s. During this delay a CM connection is attempted. |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | follow on proceed IE not included. |
| 6 | SS | | The SS wait for at least 8 seconds. |
| 7 | MS | | The MS shall not send any layer 3 message for 8 seconds after reception of the LOCATION UPDATING ACCEPT message. |
| 8 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.5.8.2 MM connection / follow-on request pending / test 2**26.7.5.8.2.1 Conformance requirement**

A MS supporting the follow-on request procedure and having a CM connection request pending shall correctly establish an MM connection following a location update when allowed by the network.

Reference(s)

GSM 04.08 section 4.4.4.6.

26.7.5.8.2.2 Test purpose

To check that when the network includes the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that supports the follow on request procedure and that has a CM application request pending establishes successfully a new MM connection on that RR connection.

26.7.5.8.2.3 Method of test**Initial Conditions**

System Simulator:

1 cell, ATT flag is set to "MSs in the cell shall apply IMSI attach and detach procedure".

Mobile Station:

The MS has a valid TMSI and is deactivated.

Related PICS/PIXIT Statement(s)

MS supports the follow on request procedure Yes/No.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test procedure

The MS is activated and a CM connection is attempted during the location updating procedure. The SS includes the follow on proceed information element in the LOCATION UPDATING ACCEPT message. The SS waits for at least 8 seconds.

If the MS supports the follow on request procedure:

The MS shall send a CM SERVICE REQUEST. Upon reception of that message, the SS sends a CM SERVICE ACCEPT message. The MS shall send an initial CM message. Upon reception of that message, the SS releases the RR connection.

If the MS does not support the follow on request procedure:

The MS shall not send any layer 3 message for 8 seconds.

Maximum Duration of Test

60 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|---|
| 1 | MS | | The MS is activated. |
| 2 | MS -> SS | CHANNEL REQUEST | Location updating type = IMSI attach. Then the SS waits for 15 s. During this delay a CM connection is attempted. follow on proceed IE included. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| | | | If the MS supports the follow on request procedure (see PICS) steps A6 to A8 are performed, otherwise steps B6 to B7 are performed. |
| A6 | MS -> SS | CM SERVICE REQUEST | |
| A7 | SS -> MS | CM SERVICE ACCEPT | |
| A8 | MS -> SS | An initial CM message | |
| B6 | SS | | The SS wait for at least 8 seconds. The MS shall not send any layer 3 message for 8 seconds after reception of the LOCATION UPDATING ACCEPT message. |
| B7 | MS | | |
| 9 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.5.8.3 MM connection / follow-on request pending / test 3**26.7.5.8.3.1 Conformance requirement**

- 1) The MS shall not set the follow on request bit in a LOCATION UPDATING REQUEST message if no MM connection request is pending.
- 2) When the network includes the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that has no CM application request pending shall not attempt to establish a new MM connection on that RR connection.
- 3) The MS shall correctly handle a CM connection established by the network on the RR connection that was used for the location updating procedure.

Reference(s)

GSM 04.08 section 4.4.4.6.

26.7.5.8.3.2 Test purpose

- 1) To check that a MS that has no CM application request pending sets the Follow-On-Request bit to No follow-on request pending in a LOCATION UPDATING REQUEST message.
- 2) To check that when the network includes the follow on proceed IE in a LOCATION UPDATING ACCEPT message, a MS that has no CM application request pending does not attempt to establish a new MM connection on that RR connection.
- 3) To check that the MS accepts establishment by the network of a new MM connection on the existing RR connection.

26.7.5.8.3.3 Method of test**Initial Conditions**

System Simulator:

1 cell, ATT flag is set to "MSs in the cell shall apply IMSI attach and detach procedure".

Mobile Station:

The MS has a valid TMSI and is deactivated.

Related PICS/PIXIT Statement(s)

Supported services on TCH.

Foreseen final state of the MS

The MS has a valid TMSI. It is "idle updated".

Test procedure

The MS is activated. The MS performs location updating. The MS shall set the FOR bit to No follow-on request pending in the LOCATION UPDATING REQUEST message. The SS includes the follow on proceed information element in the LOCATION UPDATING ACCEPT message. The SS waits for 5 seconds. The MS shall not send any layer 3 message for 5 seconds. The SS sends a SETUP message to the MS requesting a basic service supported by the MS. The MS shall send either a CALL CONFIRMED message if it supports a service on TCH or a RELEASE COMPLETE with cause #88.

Maximum Duration of Test

20 s.

Expected Sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------------|--|
| 1 | MS | | The MS is activated. |
| 2 | MS -> SS | CHANNEL REQUEST | "Location updating type" = IMSI attach. The FOR bit is set to No follow-on request pending. follow on proceed IE is included. |
| 3 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 4 | MS -> SS | LOCATION UPDATING REQUEST | |
| 5 | SS -> MS | LOCATION UPDATING ACCEPT | |
| 6 | SS | | The SS wait for 5 seconds. The MS shall not send any layer 3 message for 5 seconds after reception of the LOCATION UPDATING ACCEPT message. |
| 7 | MS | | |
| 8 | SS -> MS | SETUP | |
| A9 | MS -> SS | CALL CONFIRMED | If the MS supports a basic service on TCH. |
| B9 | MS -> SS | RELEASE COMPLETE | If the MS does not support any basic service on TCH. cause #88. |
| 10 | SS -> MS | CHANNEL RELEASE | After the sending of this message, the SS waits for the disconnection of the main signalling link. |

Specific message contents

None.

26.7.6 Default contents of messages**Default contents SYSTEM INFORMATION messages and default settings**

For cell A and B For GSM use 26.6.14.
 For DCS use 26.6.15.

Cell C

The contents of SYSTEM INFORMATION TYPE 1 to 6 messages for cell C are identical to those of cell A with the following exceptions:

| | |
|--|--|
| Cell Channel Description - Format Identifier - Cell Allocation ARFCN | Bit map 0 for GSM Range 512 for DCS. Channel Number 30 for GSM, Channel Number 700 for DCS. |
| Cell Identity - Cell Identity Value | 0003H |

Default settings for cell C:

| | |
|--|---|
| Downlink input level Uplink output power Propagation profile BCCH/CCCH carrier number | 53 dBmicroVolt emf minimum supported by the MS's power class static. 30 for GSM 700 for DCS. |
|--|---|

ABORT

| Information element | Value/remark |

26.8 Tests related to circuit switched call control

26.8.1 Circuit switched Call Control (CC) state machine verification

26.8.1.1 General on CC state machine verification

The principle of checking the call control functions consists in the validation of each call control identified state.

State U0 as an initial state is not verified in the tests of 26.8.1.2 (establishment of an outgoing call).

State U0.1 is never verified.

The steps to be followed within each performed test are:

- bring the MS into the required state;
- trigger the tested event;
- check the MS response and new state.

In sections 26.8.1.2 and 26.8.1.3 different tables are defined to bring the MS into the required initial state. The exact table to be chosen is specified individually in section "Initial conditions" of "Method of test" for each test case.

For each test, unless otherwise specified, a circuit switched basic service among those supported by the MS but excluding the emergency call teleservice shall be chosen arbitrarily, and the test shall be performed according to that basic service. If the only circuit switched basic service supported by the mobile is emergency call, then the incoming call tests shall not be performed and the other call control tests shall be performed with the EMERGENCY SETUP message replacing the SETUP message.

The initial states are to be checked through STATUS ENQUIRY messages sent by the SS, when feasible. This is not explicitly stated in the tables of expected sequences of signalling messages. The checking of final states are explicitly included into the expected sequences of signalling messages.

The following postamble may be used by the SS to bring MS back to idle mode in those test cases, in which it is not already included into expected sequence of signalling messages:

Table 26.8.1.1/1: A postamble to bring the MS back to idle mode.

| Step | Direction | Message | Comments |
|----------|----------------|-----------------|---|
| n n+1 | SS -> MS MS | CHANNEL RELEASE | the MS shall release the main signalling link (DISC/UA) |

The postamble has not been included into the all of the tests in order to leave an option to concatenate the procedures in the future by using a final state of a test case as an initial state to another one.

For the special case of U0, the state is checked by sending STATUS ENQUIRY message with all possible values of transaction identifier (seven values) as U0 is the only state in which for every TI the MS will answer with release complete with cause #81. If U0 is to be verified when no RR connection exists, first a mobile terminating radio connection must be established.

The MS responses are either call management messages received by the SS or lower layers functions activated within the MS or MMI actions (e.g. the buzzing of an alerting tone).

A time-out within the MS is triggered by the SS when it does not answer back an MS expected response.

The test sequences may be split in 3 main groups:

- establishment and release of an outgoing call;
- establishment and release of an incoming call;
- in-call functions.

Remark on verification of transient states:

Some call control states of the mobile station may be transient, depending on implementation, configuration of the MS and previous messages (see annex 3, subclause 3.1.6).

If a test starts in a transient state, then the test is executed without verification of the starting state.

26.8.1.2 Establishment of an outgoing call**Initial conditions**

As a minimum requirement the MS is updated and has been given a TMSI, a ciphering key and cipher key sequence number, and the layer 2, RR and MM functionalities have been verified.

There are as many CM initial conditions as states to be checked.

The tables below describe message exchanges which bring the MS in the requested initial states.

A state may be taken as initial only when all the states which lead to this initial states have been validated. The order followed in the test procedure will be U0, U0.1, U1, U3, U4, U10, U12, U19, U11 as seen in the table underneath.

The MS is brought again in the initial state starting with U0 at each new test performed.

Table 26.8.1.2/1: Establishment of an outgoing call, procedure 1 (late assignment)

| Step | Direction | Message | Comments/actions/next state |
|------|-----------|----------------------------|---|

26.8.1.2.1 Outgoing call / U0 null state

26.8.1.2.1.1 Outgoing call / U0 null state / MM connection requested

26.8.1.2.1.1.1 Definition and applicability

The call control entity of the Mobile Station requests the MM-sublayer to establish a mobile originating MM-connection. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.1.1.2 Conformance requirement

- 1) Upon initiation of an outgoing basic call by user the MS shall initiate establishment of an MM connection, using as first MM message a CM SERVICE REQUEST message with CM service type "Mobile originating call establishment or packet mode connection establishment".

References

GSM 04.08 section 5.2.1.1, GSM 04.08 section 4.5.1.1, GSM 04.08 section 3.3.1.1

26.8.1.2.1.1.3 Test purpose

To verify that upon initiation of an outgoing basic call by user the MS initiates establishment of an MM connection, using as first MM message a CM SERVICE REQUEST message with CM service type "Mobile originating call establishment or packet mode connection establishment".

26.8.1.2.1.1.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Foreseen final state of the MS

U0, null.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. When the SS receives CM SERVICE REQUEST, the contents of it shall be checked.

Maximum duration of test

30 s.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------|--|
| 1 | MS -> SS | CHANNEL REQUEST | initiate outgoing call |
| 2 | SS -> MS | IMMEDIATE ASSIGNMENT | TCH |
| 3 | MS -> SS | CM SERVICE REQUEST | verify the type of call which is asked for "basic" or "emergency by the MS |
| 4 | SS -> MS | CHANNEL RELEASE | the MS shall release the main signalling link (DISC/UA) |
| 5 | MS | | |

Specific message contents:

None.

26.8.1.2.2 Outgoing call / U0.1 MM connection pending**26.8.1.2.2.1 Outgoing call / U0.1 MM connection pending / CM service rejected****26.8.1.2.2.1.1 Definition and applicability**

A request for MM connection is rejected by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.2.1.2 Conformance requirement

Upon receiving indication of an MM-connection establishment being rejected, CC entity should inform upper layer of this rejection.

References

GSM 04.08, section 4.5.1.1 , GSM 04.07, section 6.2.2.

26.8.1.2.2.1.3 Test purpose

To verify that a CC entity of the MS in CC-state U0.1, "MM-connection pending", upon the MS receiving a CM SERVICE REJECT message, returns to CC state U0, "Null".

26.8.1.2.2.1.4 Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U0.1 by using table 26.8.1.2/1.

Foreseen final state of the MS

U0, null.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. When the SS receives CM SERVICE REQUEST, the contents of it shall be checked. The SS rejects it by CM SERVICE REJECT. Then the SS will check the state of the MS by using STATUS ENQUIRY with all the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------|--|
| 1 | SS -> MS | CM SERVICE REJECT | cause shall be 81# (invalid TI value) repeat steps 2-3 to cover all the transaction identifiers from 000 ...110 |
| 2 | SS -> MS | STATUS ENQUIRY | |
| 3 | MS -> SS | RELEASE COMPLETE | |
| 4 | SS | | |
| 5 | SS -> MS | CHANNEL RELEASE | the MS shall release the main signalling link (DISC/UA) |
| 6 | MS | | |

Specific message contents:

None.

26.8.1.2.2.2 Outgoing call / U0.1 MM connection pending / CM service accepted**26.8.1.2.2.2.1 Definition and applicability**

A CM request is accepted for the MM-connection by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.2.2.2 Conformance requirement

A CC entity of the MS in CC-state U0.1, "MM-connection pending", upon the MS receiving a CM SERVICE ACCEPT message, shall send a SETUP message specifying the Called party BCD number that was entered into the MS and then enter CC state U1, "Call initiated".

References

GSM 04.08, section 4.5.1.1, GSM 04.08, section 5.2.1.1.

26.8.1.2.2.2.3 Test purpose

To verify that a CC entity of the MS in CC-state U0.1, "MM-connection pending", upon the MS receiving a CM SERVICE ACCEPT message, sends a SETUP message specifying the Called party BCD number that was entered into the MS and then enters CC state U1, "Call initiated".

26.8.1.2.2.2.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U0.1 by using table 26.8.1.2/1.

Foreseen final state of the MS

U1, call initiated.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. When the MS is requesting a MM-connection, the SS will indicate acceptance by sending a CM SERVICE ACCEPT message. The MS shall respond with SETUP. Then the SS will check the state of the call control entity by STATUS ENQUIRY with the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-------------------|---|
| 1 | SS -> MS | CM SERVICE ACCEPT | with called party BCD number. cause shall be 30# (response to enq.) and state U1 call initiated. |
| 2 | MS -> SS | SETUP | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.2.3 Outgoing call / U0.1 MM connection pending / lower layer failure**26.8.1.2.2.3.1 Definition and applicability**

The call control entity of the MS being in the state, U0.1, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.2.3.2 Conformance requirement

- 1) Upon a lower layer failure the MS releases the MM connection in progress and returns to idle mode. In that state no call exists, and the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

References

GSM 04.08, section 4.5.1.2, GSM 04.08, section 5.2.1.1., GSM 04.08 section 5.5.3.2. and GSM 04.08 section 8.3.

26.8.1.2.2.3.3 Test purpose

To verify that after the MS with a CC entity in state U0.1, "MM-connection pending", has detected a lower layer failure and has returned to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

26.8.1.2.2.3.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U0.1 by using table 26.8.1.2/1.

Foreseen final state of the MS

U0, null.

Maximum duration of test

1 min.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. When the MS has sent a CM SERVICE REQUEST message, the SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------|--|
| 1 | SS | | SS generates lower layer failure. |
| 2 | SS | | SS waits 20 s for the MS to return to listening to paging. |
| 3 | SS -> MS | PAGING REQUEST | |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS -> SS | PAGING RESPONSE | |
| 7 | SS -> MS | STATUS ENQUIRY | |
| 8 | MS -> SS | RELEASE COMPLETE | cause shall be 81# (invalid TI value). |
| 9 | SS | | repeat steps 7-8 to cover all the transaction identifiers from 000 ...110. |
| 10 | SS -> MS | CHANNEL RELEASE | the main signalling link shall be released by the MS (L2: DISC/UA). |

Specific message contents:

None.

26.8.1.2.3 Outgoing call / U1 call initiated

26.8.1.2.3.1 Outgoing call / U1 call initiated / receiving CALL PROCEEDING

26.8.1.2.3.1.1 Definition and applicability

The call control entity of the MS being in the state, U1, a CALL PROCEEDING message is sent by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.1.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a CALL PROCEEDING message, shall enter CC state U3, "Mobile originating call proceeding".

References

GSM 04.08, sections 5.2.1.1, 5.2.1.2 and 5.2.1.3.

26.8.1.2.3.1.3 Test purpose

To verify that a CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a CALL PROCEEDING message, enters CC state U3, "Mobile originating call proceeding".

26.8.1.2.3.1.4 Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/2.

Foreseen final state of the MS

U3, Mobile originating call proceeding.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. The SS sends a CALL PROCEEDING message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U3.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|--|
| 1 | SS -> MS | CALL PROCEEDING | tone generation not mandatory cause 30#, state U3 |
| 2 | SS -> MS | STATUS ENQUIRY | |
| 3 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.3.2 Outgoing call / U1 call initiated / rejecting with RELEASE COMPLETE**26.8.1.2.3.2.1 Definition and applicability**

The call control entity of the MS being in the state, U1, the call is rejected by a RELEASE COMPLETE message sent by the SS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.2.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a RELEASE COMPLETE message with valid cause value, shall enter CC state U0, "Null".
- 2) On returning to idle mode, the CC entities relating to the seven mobile originating transaction identifiers shall be in state U0, "Null".
- 3) On releasing the MM-connection, the MS shall wait for MM layer release initiated by the network.

26.8.1.2.3.2.3 Test purpose

- 1) To verify that a CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a RELEASE COMPLETE message with valid cause value, enters CC state U0, "Null".
- 2) To verify that in returning to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".
- 3) To verify that in releasing the MM-connection, the MS shall wait for MM layer release initiated by SS.

26.8.1.2.3.2.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/2.

Foreseen final state of the MS

U0, null.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. The SS sends a RELEASE COMPLETE message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|--|
| 1 | SS -> MS | RELEASE COMPLETE | See specific message content below. cause 81# (invalid TI value) repeat steps 2-3 to cover all the transaction identifiers from 000...110 the main signalling link shall be released by the MS (L2: DISC/UA). |
| 2 | SS -> MS | STATUS ENQUIRY | |
| 3 | MS -> SS | RELEASE COMPLETE | |
| 4 | SS | | |
| 5 | SS -> MS | CHANNEL RELEASE | |

Specific message contents:**RELEASE COMPLETE**

1) With a valid cause value among:

related to numbering,
#1 unallocated number
#3 no route to destination
#22 number changed
#28 invalid number format

related to bearer capabilities,
#8 operator determined barring
#57 bearer capability not authorized
#58 bearer capability not presently available
#63 service or option not available
#65 bearer service not implemented
#34 no circuit/channel available (call queuing).

26.8.1.2.3.3 Outgoing call / U1 call initiated / T303 expiry**26.8.1.2.3.3.1 Definition and applicability**

The call control entity of the MS being in the state, U1, if no response is then received from the SS, timer T303 expires at the MS side. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.3.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U1, "Call initiated", upon expiry of T303 shall send a DISCONNECT message to its peer entity and enter state U11, "Disconnect request".

References

GSM 04.08, section 5.2.1.1, GSM 04.08, section 5.4.

26.8.1.2.3.3.3 Test purpose

- 1) To verify that a CC entity of the MS in CC-state U1, "Call initiated", upon expiry of T303 (accuracy +/-20 % between reception of CM SERVICE REQUEST and DISCONNECT by SS) sends a DISCONNECT message to its peer entity and enters state U11, "Disconnect request".

26.8.1.2.3.3.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U1 by using table 26.8.1.2/2.

Foreseen final state of the MS

U11, disconnect request.

Maximum duration of test

1 minute.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. When T303 expires at the MS, the MS shall send DISCONNECT. The SS checks by using the status enquiry procedure that the CC entity has entered the state U11, disconnect request.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS | | SS waits for T303 expiry. |
| 2 | MS -> SS | DISCONNECT | Shall be transmitted between 24 s and 36 s after the CM SERVICE REQUEST. |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | cause 30#, status U11 |

Specific message contents:

None.

26.8.1.2.3.4 Outgoing call / U1 call initiated / lower layer failure**26.8.1.2.3.4.1 Definition and applicability**

The call control entity of the MS being in the state, U1, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.4.2 Conformance requirement

Upon a lower layer failure MM informs the relevant CM entities that the MM connection has been interrupted. As call re-establishment is not allowed, the CC entity must perform a local release. The MS returns to idle mode. In that state no call exists, and the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/4.

Foreseen final state of the MS

U4, call delivered.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. The SS sends an ALERTING message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U4, call delivered.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---------------------|
| 1 | SS -> MS | ALERTING | cause 30#, state U4 |
| 2 | SS -> MS | STATUS ENQUIRY | |
| 3 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.3.6 Outgoing call / U1 call initiated / entering state U10**26.8.1.2.3.6.1 Definition and applicability**

The call control entity of the MS being in the state, U1, a CONNECT message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.6.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a CONNECT message, shall send a CONNECT ACKNOWLEDGE message to its peer entity and enter CC state U10, "Active".

References

GSM 04.08, section 5.2.1.1, GSM 04.08, section 5.2.1.6.

26.8.1.2.3.6.3 Test purpose

To verify that a CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a CONNECT message, sends a CONNECT ACKNOWLEDGE message to its peer entity and enters CC state U10, "Active".

26.8.1.2.3.6.4 Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/4.

Foreseen final state of the MS

U10, call active.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. The SS sends a CONNECT message to the MS. The MS shall respond by sending a CONNECT ACKNOWLEDGE message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U10, active.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------|----------------------|
| 1 | SS -> MS | CONNECT | cause 30#, state U10 |
| 2 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.3.7 Outgoing call / U1 call initiated / unknown message received

26.8.1.2.3.7.1 Definition and applicability

The call control entity of the MS being in the state, U1, an unknown message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.3.7.2 Conformance requirement

- 1) A CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a message with message type not defined for the protocol discriminator from its peer entity shall return a STATUS message.

References

GSM 04.08 section 8.4.

26.8.1.2.3.7.3 Test purpose

To verify that a CC entity of the MS in CC-state U1, "Call initiated", upon receipt of a message with message type not defined for the protocol discriminator unknown message from its peer entity returns a STATUS message.

26.8.1.2.3.7.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U1 by using table 26.8.1.2/1.

Foreseen final state of the MS

U1, call initiated.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U1. The SS sends a message with message type not defined for the protocol discriminator to the MS. The MS shall respond with a STATUS message, and finally the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---------------------------------|
| 1 | SS -> MS | unknown message | message type not defined for PD |
| 2 | MS -> SS | STATUS | cause 97#, state U1 |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | cause 30#, state U1 |

Specific message contents:

None.

26.8.1.2.4 Outgoing call / U3 MS originating call proceeding**26.8.1.2.4.1 Outgoing call / U3 MS originating call proceeding / ALERTING received****26.8.1.2.4.1.1 Definition and applicability**

The call control entity of the MS being in the state, U3, an ALERTING message is sent to the MS as a indication that a call is being alerted at a called end. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.1.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a ALERTING message shall enter CC-state U4, "Call Delivered".

References

GSM 04.08 section 5.2.1.5.

26.8.1.2.4.1.3 Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a ALERTING message enters CC-state U4, "Call Delivered".

26.8.1.2.4.1.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/2.

Foreseen final state of the MS

U4, call delivered.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends an ALERTING message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U4, call delivered.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---------------------|
| 1 | SS -> MS | ALERTING | cause 30#, state U4 |
| 2 | SS -> MS | STATUS ENQUIRY | |
| 3 | MS -> SS | STATUS | |

26.8.1.2.4.2 Outgoing call / U3 MS originating call proceeding / CONNECT received**26.8.1.2.4.2.1 Definition and applicability**

The call control entity of the MS being in the state, U3, a CONNECT message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.2.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a CONNECT message shall return a "CONNECT ACKNOWLEDGE" message to its peer entity and enter the CC state U10, "Active".
- 2) The MS shall then stop any locally generated indication.

References

Conformance requirement 1: GSM 04.08 section 5.2.1.6.

Conformance requirement 2: GSM 04.08 section 5.2.1.6.

26.8.1.2.4.2.3 Test purpose

- 1) To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a CONNECT message returns a "CONNECT ACKNOWLEDGE" message to its peer entity and enters the CC state U10, "Active".
- 2) To verify that the MS stops locally generated indication, if any.

26.8.1.2.4.2.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/2.

Foreseen final state of the MS

U10, active.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends a CONNECT message to the MS. The MS shall respond by sending a CONNECT ACKNOWLEDGE message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U10, active.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------|---|
| 1 | SS -> MS | CONNECT | the MS shall stop tone generation, if any cause 30#, state U10 |
| 2 | MS -> SS | CONNECT ACKNOWLEDGE | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.4.3 Outgoing call / U3 MS originating call proceeding / PROGRESS received without in band information**26.8.1.2.4.3.1 Definition and applicability**

The call control entity of the MS being in the state, U3, a PROGRESS message is received by the MS. The PROGRESS message does not contain indication of in-band information availability. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.3.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a PROGRESS message with valid cause values shall stay in CC-state U3.
- 2) After receipt of the PROGRESS message timer T310 shall be stopped.

References

Conformance requirement 1: GSM 04.08 section 5.2.1.4.

Conformance requirement 2: GSM 04.08 section 11.3.

26.8.1.2.4.3.3 Test purpose

- 1) To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a PROGRESS message with valid cause values stays in CC-state U3.
- 2) To verify that after receipt of the PROGRESS message timer T310 is stopped.

26.8.1.2.4.3.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/2.

Foreseen final state of the MS

U3, mobile originating call proceeding.

Maximum duration of test

1 min.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends a PROGRESS message not containing indication of in-band information availability to the MS. The SS checks that the MS has stopped T310, i.e. at T310 time-out no DISCONNECT message is sent by the MS. Then the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS -> MS | PROGRESS | (note) cause 30#, state U3 SS waits at least 45 seconds and checks no DISCONNECT is sent by the MS |
| 2 | SS -> MS | STATUS ENQUIRY | |
| 3 | MS -> SS | STATUS | |
| 4 | SS | | |
| 5 | SS -> MS | STATUS ENQUIRY | cause 30#, state U3 |
| 6 | MS -> SS | STATUS | |

NOTE: Tested with a valid cause value among:

#4 call has returned to PLMN/ISDN
#32 call is end-to-end PLMN/ISDN or
any value in the set #(21-127)

Specific message contents:

None.

26.8.1.2.4.4 **Outgoing call / U3 MS originating call proceeding / PROGRESS with in band information**

26.8.1.2.4.4.1 **Definition and applicability**

The call control entity of the MS being in the state, U3, a PROGRESS message indicating availability of in band information is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.4.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a PROGRESS message indicating in-band announcement shall through-connect the traffic channel for speech, if TCH is in a speech mode. If TCH is not in speech mode, the MS shall not through-connect the TCH.
- 2) After receipt of the PROGRESS message, T310 shall be stopped.

References

1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U3 by using table 26.8.1.2/2.

Foreseen final state of the MS

U3, mobile originating call proceeding.

Maximum duration of test

1 minute.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends a PROGRESS message containing indication of in-band information availability to the MS. The SS checks that if channel mode is speech, the TCH shall be through connected. If channel mode is not speech, the TCH shall not be through connected. Also the SS checks that the MS has stopped T310, i.e. at T310 time-out no DISCONNECT message is sent by the MS. Then the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS -> MS | PROGRESS 1) | the MS shall stop all the CC timers (note), if channel mode is speech, the TCH shall be through connected. If channel mode is not speech, the TCH shall not be through connected. |
| 2 | SS -> MS | STATUS ENQUIRY | |
| 3 | MS -> SS | STATUS | |
| 4 | SS | | |
| 5 | SS -> MS | STATUS ENQUIRY | cause 30#, state U3 SS waits at least 45 seconds and checks no DISCONNECT is sent by the MS. |
| 6 | MS -> SS | STATUS | |
| 7 | SS | | |

Specific message contents:

NOTE: Tested with a valid cause value among:

- #1 call is not end to end PLMN/ISDN
- #2 destination address is non PLMN/ISDN
- #3 originating address is non PLMN/ISDN
- #8 in band information or appropriate pattern now available or any value in the set #(6-20).

26.8.1.2.4.5 Outgoing call / U3 MS originating call proceeding / DISCONNECT with in band tones

26.8.1.2.4.5.1 Definition and applicability

The call control entity of the MS being in the state, U3, a DISCONNECT message indicating availability of in band information is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.5.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a DISCONNECT with progress indicator #8, shall through-connect the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS shall send a RELEASE message.

References

GSM 04.08 section 5.2.1.4., GSM 04.08 section 5.4.4.

26.8.1.2.4.5.3 Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding", upon receipt of a DISCONNECT with progress indicator #8 through-connects the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS sends a RELEASE message.

26.8.1.2.4.5.4 Method of test

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends an ASSIGNMENT COMMAND for traffic channel to the MS. The MS shall establish layer 2 link on the newly allocated channel and respond with an ASSIGNMENT COMPLETE message. The SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------|--|
| 1 | SS -> MS | ASSIGNMENT COMMAND | (TCH) the MS shall perform L2 establishment on the FACCH |
| 2 | MS -> SS | ASSIGNMENT COMPLETE | |
| 3 | SS -> MS | STATUS ENQUIRY | cause 30#, state U3 |
| 4 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.4.10 Outgoing call / U3 MS originating call proceeding / timer T310 time-out**26.8.1.2.4.10.1 Definition and applicability**

The call control entity of the MS being in the state, U3, if no response is then received from the SS, timer T310 expires at the MS side. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.10.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" shall, upon expiry of timer T310, and not before, initiate call release by sending DISCONNECT and enter the CC-state U11, "Disconnect Request".

References

GSM 04.08 section 5.2.1.3./Abnormal case, GSM 04.08 section 5.4.3, GSM 04.08 section 11.3.

26.8.1.2.4.10.3 Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" will, upon expiry of timer T310 (accuracy minus 2 %, plus 50 %), initiate call release by sending DISCONNECT and enter the CC-state U11, "Disconnect Request".

26.8.1.2.4.10.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/3.

Foreseen final state of the MS

U11, disconnect request.

Maximum duration of test

1 min.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The T310 expires at the MS and the MS shall send DISCONNECT. The SS checks timer T310 accuracy and that the CC entity has entered the state U11, disconnect request.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | SS | | the SS waits for T310 time-out |
| 2 | MS -> SS | DISCONNECT | check the timer T310 accuracy (minus 2 % to plus 50 %) |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | cause 30#, state U11 |

Specific message contents:

None.

26.8.1.2.4.11 Outgoing call / U3 MS originating call proceeding / lower layer failure**26.8.1.2.4.11.1 Definition and applicability**

The call control entity of the MS being in the state, U3, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.11.2 Conformance requirement

- 1) If a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" has detected a lower layer failure and has returned to idle mode, the CC entities relating to the seven mobile originating transaction identifiers shall be in state U0, "Null".

References

GSM 04.08 section 4.5.2.3., GSM 04.08 section 4.5.3., GSM 04.08 section 5.5.3.2., GSM 04.08 section 3.4.13.2.1

26.8.1.2.4.11.3 Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" having detected a lower layer failure and having returned to idle mode, the CC entities relating to the seven mobile originating transaction identifiers are in state U0, "Null".

26.8.1.2.4.11.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U3 by using table 26.8.1.2/4.

Foreseen final state of the MS

U0, null.

Maximum duration of test

1 min 30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The MS is brought to the state U3. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------|---|
| 1 | SS | | SS generates lower layer failure SS waits 20 s for the MS to return to listening to paging |
| 2 | SS | | |
| 3 | SS -> MS | PAGING REQUEST | cause 81# (invalid TI value) repeat steps 18-19 to cover all the transaction identifiers from 000...110 the main signalling link shall be released by the MS (L2: DISC/UA). |
| 4 | MS -> SS | CHANNEL REQUEST | |
| 5 | SS -> MS | IMMEDIATE ASSIGNMENT | |
| 6 | MS -> SS | PAGING RESPONSE | |
| 7 | SS -> MS | STATUS ENQUIRY | |
| 8 | MS -> SS | RELEASE COMPLETE | |
| 9 | SS | | |
| 10 | SS -> MS | CHANNEL RELEASE | |

Specific message contents:

None.

26.8.1.2.4.12 Outgoing call / U3 MS originating call proceeding / unknown message received**26.8.1.2.4.12.1 Definition and applicability**

The call control entity of the MS being in the state, U3, an unknown message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.4.12.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" having received an unknown message from its peer entity shall return a STATUS message.

References

GSM 04.08 section 8.5.

26.8.1.2.4.12.3 Test purpose

To verify that a CC-entity of the MS in CC-state U3, "Mobile Originating Call Proceeding" having received an unknown message from its peer entity returns a STATUS message.

26.8.1.2.4.12.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U3 by using table 26.8.1.2/1.

Foreseen final state of the MS

U3, mobile originating call proceeding.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U3. The SS sends a message with message type not defined for the protocol discriminator to the MS. The MS shall respond with a STATUS message, and finally the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---------------------------------|
| 1 | SS -> MS | unknown message | message type not defined for PD |
| 2 | MS -> SS | STATUS | cause 97#, state U3 |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | cause 30#, state U3 |

Specific message contents:

None.

26.8.1.2.4.13 Outgoing call / U3 MS originating call proceeding / Internal alerting indication**26.8.1.2.4.13.1 Definition and applicability**

The call control entity of the MS being in the state, U3, an ALERTING message is sent to the MS when the user connection is not attached to the radio path. This test is applicable for any equipment supporting mobile originated circuit switched basic service for telephony.

26.8.1.2.4.13.2 Conformance requirement

- 1) When the call control entity of the MS in the "mobile originating call proceeding" state receives an ALERTING message then it shall enter "call delivered" state and, for speech calls, if the user connection is not attached to the radio path, the MS shall internally generate an alerting indication.

References

GSM 04.08 section 5.2.1.5.

26.8.1.2.4.13.3 Test purpose

When the call control entity of the MS in the "mobile originating call proceeding" state receives an ALERTING message then it enters "call delivered" state and, for speech calls, if the user connection is not attached to the radio path, the MS generates internally an alerting indication.

26.8.1.2.4.13.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.
- way to give internally generated alerting indication for outgoing calls

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U3 by using table 26.8.1.2/1.

Foreseen final state of the MS

U4, call delivered.

Maximum duration of test

30 s.

Test procedure

The SS sends an ALERTING message to the MS. The SS checks by using the status enquiry procedure that the CC entity has entered the state U4, call delivered. Also it is checked that the MS generates internally alerting indication to the user in the way described in the PICX/PIXIT statements.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS -> MS | ALERTING | the MS shall generate an alerting indication to the user in the way described in the PICS/PIXIT statements cause 30#, state U4 |
| 2 | SS -> MS | STATUS ENQUIRY | |
| 3 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.5 Outgoing call / U4 call delivered**26.8.1.2.5.1 Outgoing call / U4 call delivered / CONNECT received****26.8.1.2.5.1.1 Definition and applicability**

The call control entity of the MS being in the state, U4, a CONNECT message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.1.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U4, "Call Delivered", upon receipt of the CONNECT message shall return a CONNECT ACKNOWLEDGE to its peer entity and enter the CC-state U10, "Active".

References

GSM 04.08 section 5.2.1.6.

26.8.1.2.5.1.3 Test purpose

To verify that a CC-entity of the MS in CC-state U4, "Call Delivered", upon receipt of the CONNECT message returns a CONNECT ACKNOWLEDGE to its peer entity and enters the CC-state U10, "Active".

26.8.1.2.5.1.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U4 by using table 26.8.1.2/3.

Foreseen final state of the MS

U10, active.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends a CONNECT message to the MS. The MS shall respond by sending a CONNECT ACKNOWLEDGE message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U10, active.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------|----------------------------------|
| 1 | SS -> MS | CONNECT | |
| 2 | MS -> SS | CONNECT ACKNOWLEDGE | MS stops alerting, if applicable |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | cause 30#, state U10 |

Specific message contents:

None.

26.8.1.2.5.2 Outgoing call / U4 call delivered / termination requested by the user**26.8.1.2.5.2.1 Definition and applicability**

The call control entity of the MS being in the state, U4, the user requests to terminate the call. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.2.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U4, "Call Delivered", upon request by the user to terminate shall send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

References

GSM 04.07 section 6.2.2., GSM 04.08 section 5.4.3.

26.8.1.2.5.2.3 Test purpose

To verify that a CC-entity of the MS in CC-state U4, "Call Delivered", upon request by the user to terminate will send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

26.8.1.2.5.2.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U4 by using table 26.8.1.2/3.

Foreseen final state of the MS

U11, disconnect request.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The user requests termination of the call. The MS shall send a DISCONNECT message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U11, disconnect request.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|--|
| 1 | | | MMI action, terminate call cause 30#, state U11 |
| 2 | MS -> SS | DISCONNECT | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.5.3 Outgoing call / U4 call delivered / DISCONNECT with in band tones**26.8.1.2.5.3.1 Definition and applicability**

The call control entity of the MS being in the state, U4, a DISCONNECT message indicating availability of in band information is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.3.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U4, "Call Delivered" shall, upon receipt of a DISCONNECT with a progress indicator indicating in-band information, shall through-connect the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS shall send a RELEASE message.

References

GSM 04.08 section 3.4.3, GSM 04.08 section 5.4.4.1., GSM 04.08 section 5.5.1., GSM 04.08 section 5.2.1.9.

26.8.1.2.5.3.3 Test purpose

To verify that a CC-entity of the MS in CC-state U4, "Call Delivered", upon receipt of a DISCONNECT with a progress indicator indicating in-band information, through-connects the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS shall send a RELEASE message.

26.8.1.2.5.3.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U4 by using table 26.8.1.2/2.

Foreseen final state of the MS

U12, disconnect indication.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends a DISCONNECT message containing indication of in-band information availability to the MS. The SS checks that if channel mode is MO telephony, the TCH shall be through connected and the MS enters state U12, disconnect indication. If channel mode is not speech, the TCH shall not be through connected and the MS shall enter state U19, release request.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS -> MS | DISCONNECT | (note) |
| A2 | SS | | TCH in speech mode: the SS will check that the audio path for in band tones is attached. |
| A3 | SS -> MS | STATUS ENQUIRY | |
| A4 | MS -> SS | STATUS | cause 30#, state U12 |
| B2 | MS -> SS | RELEASE | TCH is not in speech mode: |
| B3 | SS -> MS | STATUS ENQUIRY | |
| B4 | MS -> SS | STATUS | cause 30#, state U19 |

Specific message contents:

NOTE: the Progress Indicator, Progress Description:

#8 in band information or appropriate pattern now available.

26.8.1.2.5.4 Outgoing call / U4 call delivered / DISCONNECT without in band tones**26.8.1.2.5.4.1 Definition and applicability**

The call control entity of the MS being in the state, U4, a DISCONNECT message is received by the MS. The DISCONNECT message does not contain indication of in-band information availability. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.4.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U4, "Call Delivered", upon receipt of a DISCONNECT without progress indicator, shall return a RELEASE message and enter the CC-state U19, "Release Request".

References

GSM 04.08 section 5.4.4.

26.8.1.2.5.4.3 Test purpose

To verify that a CC-entity of the MS in CC-state U4, "Call Delivered", upon receipt of a DISCONNECT without progress indicator, returns a RELEASE message and enters the CC-state U19, "Release Request".

26.8.1.2.5.4.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U4 by using table 26.8.1.2/2.

Foreseen final state of the MS

U19, release request.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends a DISCONNECT message not containing indication of in-band information availability to the MS. The MS shall respond with a RELEASE message. The SS checks by using the status enquiry procedure that the CC entity of the MS has entered the state U19, release request.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|----------------------|
| 1 | SS -> MS | DISCONNECT | cause 30#, state U19 |
| 2 | MS -> SS | RELEASE | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

Specific message contents:

None.

26.8.1.2.5.5 Outgoing call / U4 call delivered / RELEASE received**26.8.1.2.5.5.1 Definition and applicability**

The call control entity of the MS being in the state, U4, a RELEASE message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.5.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U4, "Call Delivered", upon receipt of the RELEASE message shall respond with the RELEASE COMPLETE message and enter the CC-state U0, "Null".
- 2) The MS on returning to idle mode shall release the MM-connection and the CC-entities relating to the seven mobile originating transaction identifiers shall be in CC-state U0, "Null".

References

Conformance requirement 1: GSM 04.08 section 5.4.2., GSM 04.08 section 5.4.4.
 Conformance requirement 2: GSM 04.08 section 4.5.3., GSM 04.08 section 5.5.3.2.

26.8.1.2.5.5.3 Test purpose

- 1) To verify that a CC-entity of the MS in CC-state U4, "Call Delivered", upon receipt of the RELEASE message will respond with the RELEASE COMPLETE message and enter the CC-state U0, "Null".
- 2) To verify that the MS on returning the idle mode releases the MM-connection and that the CC-entities relating to the seven mobile originating transaction identifiers are in CC-state U0, "Null".

26.8.1.2.5.5.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U4 by using table 26.8.1.2/2.

Foreseen final state of the MS

U0, null.

Maximum duration of test

1 min 30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends a RELEASE message to the MS. The MS shall respond with a RELEASE COMPLETE message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS -> MS | RELEASE | with cause "Normal, unspecified" |
| 2 | MS -> SS | RELEASE COMPLETE | |
| 3 | SS -> MS | STATUS ENQUIRY | cause 81# (invalid TI value) repeat steps 19-20 to cover all the transaction identifiers from 000...110 the main signalling link shall be released by the MS (L2: DISC/UA). |
| 4 | MS -> SS | RELEASE COMPLETE | |
| 5 | SS | | |
| 6 | SS -> MS | CHANNEL RELEASE | |

Specific message contents:

None.

26.8.1.2.5.6 Outgoing call / U4 call delivered / lower layer failure**26.8.1.2.5.6.1 Definition and applicability**

The call control entity of the MS being in the state, U4, a lower layer failure is accomplished at the MS and consequently, communication at layer 3 level with the peer entity is terminated. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.6.2 Conformance requirement

- 1) When CC-entity of the MS in CC-state U4, "Call Delivered" has detected a lower layer failure and has returned to idle mode, the CC-entities relating to the seven mobile originating transaction identifiers shall be in CC-state U0, "Null".

References

GSM 04.08 section 4.5.2.3., GSM 04.08 section 4.5.3., GSM 04.08 section 5.5.3.2., GSM 04.08 section 3.4.13.2.1

26.8.1.2.5.6.3 Test purpose

To verify that a CC-entity of the MS in CC-state U4, "Call Delivered" having detected a lower layer failure and has returned to idle mode, the CC-entities relating to the seven mobile originating transaction identifiers are in CC-state U0, "Null".

26.8.1.2.5.6.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U4 by using table 26.8.1.2/2.

Foreseen final state of the MS

U0, null.

Maximum duration of test

1 min 30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The MS is brought to the state U4. The SS generates a lower layer failure at the MS. The SS waits long enough to enable the MS to return to idle state listening to paging, and then pages MS to create RR-connection. Finally, the SS will check the state of the MS by using STATUS ENQUIRY with the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------------|---|
| 1 | SS | | SS generates lower layer failure SS waits 20 s for the MS to return to listening to paging |
| 2 | SS | | |
| 3 | SS -> MS | PAGING REQUEST | cause 81# (invalid TI value) repeat steps 7-8 to cover all the transaction identifiers from 000...110 the main signalling link shall be released by the MS (L2: DISC/UA). |

Specific message contents:

None.

26.8.1.2.5.7 Outgoing call / U4 call delivered / traffic channel allocation**26.8.1.2.5.7.1 Definition and applicability**

The call control entity of the MS being in the state, U4, a traffic channel assignment procedure is performed. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.7.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U4, "Call Delivered", when allocated a traffic channel by the network performing the assignment procedure, shall perform a layer 2 establishment on the FACCH without changing the state of the call in progress.

References

GSM 04.08 section 3.4.3., GSM 04.08 section 5.2.1.9.

26.8.1.2.5.7.3 Test purpose

To verify that a CC-entity of the MS in CC-state U4, "Call Delivered", when allocated a traffic channel by the network performing the assignment procedure, shall perform a layer 2 establishment on the FACCH without changing the state of the call in progress.

26.8.1.2.5.7.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U4 by using table 26.8.1.2/1.

Foreseen final state of the MS

U4, call delivered.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends an ASSIGNMENT COMMAND for traffic channel to the MS. The MS shall establish layer 2 link on the newly allocated channel and respond with an ASSIGNMENT COMPLETE message. The SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|---------------------|--|
| 1 | SS -> MS | ASSIGNMENT COMMAND | TCH, the MS shall perform L2 establishment on the FACCH cause 30#, state U4 |
| 2 | MS -> SS | ASSIGNMENT COMPLETE | |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | |

None.

26.8.1.2.5.8 Outgoing call / U4 call delivered / unknown message received**26.8.1.2.5.8.1 Definition and applicability**

The call control entity of the MS being in the state, U4, an unknown message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.5.8.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U4, "Call Delivered", having received an unknown message from its peer entity shall return a STATUS message.

References

GSM 04.08 section 8.4.

26.8.1.2.5.8.3 Test purpose

To verify that a CC-entity of the MS in CC-state U4, "Call Delivered", having received an unknown message from its peer entity returns a STATUS message.

26.8.1.2.5.8.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
The MS is brought into the state U4 by using table 26.8.1.2/4.

Foreseen final state of the MS

U4, call delivered.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U4. The SS sends a message with message type not defined for the protocol discriminator to the MS. The MS shall respond with a STATUS message, and finally the SS checks by using the status enquiry procedure that the state of the CC entity has remained unchanged.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|-----------------|---------------------------------|
| 1 | SS -> MS | unknown message | message type not defined for PD |
| 2 | MS -> SS | STATUS | cause 97#, state U4 |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | cause 30#, state U4 |

Specific message contents:

None.

26.8.1.2.6 U10 call active

26.8.1.2.6.1 U10 call active / termination requested by the user

26.8.1.2.6.1.1 Definition and applicability

The call control entity of the MS being in the state, U10, the user requests to terminate the call. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.6.1.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U10, "Call Active", upon request by the user to terminate shall send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

References

GSM 04.07 section 6.2.2., GSM 04.08 section 5.4.3.

26.8.1.2.6.1.3 Test purpose

To verify that the a CC-entity of the MS in CC-state U10, "Call Active", upon request by the user to terminate will send a DISCONNECT message and enter the CC-state U11, "Disconnect Request".

26.8.1.2.6.1.4 Method of test

Related PICS/PIXIT statements

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/1.

Foreseen final state of the MS

U11, disconnect request.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U10. The user requests termination of the call. The MS shall send a DISCONNECT message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U11, disconnect request.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|----------------------------|
| 1 | | | MMI action, terminate call |
| 2 | MS -> SS | DISCONNECT | U11 |
| 3 | SS -> MS | STATUS ENQUIRY | |
| 4 | MS -> SS | STATUS | cause 30#, state U11 |

Specific message contents:

None.

26.8.1.2.6.2 U10 call active / RELEASE received**26.8.1.2.6.2.1 Definition and applicability**

The call control entity of the MS being in the state, U10, a RELEASE message is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.6.2.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U10, "Call Active", upon receipt of the RELEASE shall respond with the RELEASE COMPLETE message and enter the CC-state U0, "Null"
- 2) When the MS returns to the idle mode it shall release the MM-connection and the CC-entities relating to the seven mobile originating transaction identifiers shall be in CC-state U0, "Null"

References

Conformance requirement 1: GSM 04.08 section 5.4.2., GSM 04.08 section 5.4.4.
Conformance requirement 2: GSM 04.08 section 4.5.3., GSM 04.08 section 5.5.3.2.

26.8.1.2.6.2.3 Test purpose

- 1) To verify that the a CC-entity of the MS in CC-state U10, "Call Active", upon receive of the RELEASE will respond with the RELEASE COMPLETE message and enter the CC-state U0, "Null"
- 2) To verify that the MS on returning to the idle mode releases the MM-connection and that the CC-entities relating to the seven mobile originating transaction identifiers are in CC-state U0, "Null"

26.8.1.2.6.2.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/1.

Foreseen final state of the MS

U0, null.

Maximum duration of test

1 min 30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U10. The SS sends a RELEASE message to the MS. The MS shall respond with a RELEASE COMPLETE message. The SS checks by using the status enquiry procedure that the CC entity has entered the state U0 with all the relevant transaction identifiers.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|------------------|---|
| 1 | SS -> MS | RELEASE | with cause "Normal, unspecified" the MS starts T3240 |
| 2 | MS -> SS | RELEASE COMPLETE | |
| 3 | SS -> MS | STATUS ENQUIRY | cause 81# (invalid TI value) repeat steps 3-4 to cover all the transaction identifiers from 000...110 |
| 4 | MS -> SS | RELEASE COMPLETE | |
| 5 | SS | | |
| 6 | SS -> MS | CHANNEL RELEASE | the main signalling link shall be released by the MS (L2: DISC/UA) |

Specific message contents:

None.

26.8.1.2.6.3 U10 call active / DISCONNECT with in band tones**26.8.1.2.6.3.1 Definition and applicability**

The call control entity of the MS being in the state, U10, a DISCONNECT message indicating availability of in band information is received by the MS. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.6.3.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U10, "Call Active", upon receipt of a DISCONNECT message with a Progress Indicator indicating in-band information, shall through-connect the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS shall send a RELEASE message.

References

GSM 04.08 section 5.4.4.1., GSM 04.08 section 5.5.1.

26.8.1.2.6.3.3 Test purpose

To verify that a CC-entity of the MS in CC-state U10, "Call Active", upon receipt of a DISCONNECT message with a Progress Indicator indicating in-band information, through-connects the speech channel to make in-band announcements available, if traffic channel is in speech mode. If TCH is not in speech mode, the MS sends a RELEASE message.

26.8.1.2.6.3.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:

1 cell, default parameters.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/2.

Foreseen final state of the MS

U12, disconnect indication.

Maximum duration of test

30 s.

Test procedure

An MO circuit switched basic service is selected that is supported by the MS; if the MS supports MO telephony, the selected basic service is telephony. If necessary, the MS is configured for that basic service. Then, the MS is made to initiate a call. The CC entity of the MS is brought to the state U10. The SS sends a DISCONNECT message containing indication of in-band information availability to the MS. The SS checks that if channel mode is speech, the TCH shall be through connected and the MS enters state U12, disconnect indication. If channel mode is not speech, the TCH shall not be through connected and the MS enters state U19, release request.

Expected sequence

| Step | Direction | Message | Comments |
|------|-----------|----------------|---|
| 1 | SS -> MS | DISCONNECT | (note) |
| A2 | SS | | TCH in speech mode: the SS will check that the audio path for in band tones is attached. |
| A3 | SS -> MS | STATUS ENQUIRY | |
| A4 | MS -> SS | STATUS | cause 30#, state U12 |
| B2 | MS -> SS | RELEASE | TCH is not in speech mode: |
| B3 | SS -> MS | STATUS ENQUIRY | |
| B4 | MS -> SS | STATUS | cause 30#, state U19 |

Specific message contents:

NOTE: the Progress Indicator, Progress Description:

#8 in band information or appropriate pattern now available.

26.8.1.2.6.4 U10 call active / DISCONNECT without in band tones**26.8.1.2.6.4.1 Definition and applicability**

The call control entity of the MS being in the state, U10, a DISCONNECT message is received by the MS. The DISCONNECT message does not contain indication of in-band information availability. This test is applicable for any equipment supporting at least one mobile originated circuit switched basic service.

26.8.1.2.6.4.2 Conformance requirement

- 1) A CC-entity of the MS in CC-state U10, "Call Active", upon receipt of a DISCONNECT message without progress indicator, shall return a RELEASE message and enter the CC-state U19, "Release Request".

References

GSM 04.08 section 5.4.4.

26.8.1.2.6.4.3 Test purpose

To verify that the a CC-entity of the MS in CC-state U10, "Call Active", upon receipt of a DISCONNECT message without progress indicator, returns a RELEASE message and enters the CC-state U19, "Release Request".

26.8.1.2.6.4.4 Method of test**Related PICS/PIXIT statements**

- supported MO circuit switched basic services.

Initial conditions

System Simulator:
1 cell, default parameters.

Mobile Station:
The MS is in MM-state "idle, updated" with valid TMSI and CKSN.
