1 Scope

The present document specifies the technical characteristics to be provided by TErrestrial Trunked Radio (TETRA) terminal equipment, which uses the TETRA technology. It applies to terminal equipment operating within the frequency ranges, which are expected to be allocated to TETRA when member states have implemented ERC Decision ERC/DEC/(96)/4 [26].

The objective of the present document is to ensure that no disturbance occurs to the public telecommunications network, and to ensure proper inter-working of TETRA terminals with TETRA networks so that communication can be routed successfully through the applicable network(s).

The Harmonized Standard does not contain requirements on Direct Mode operation (DMO) (which means direct interworking between two mobiles without control or intervention by a network) unless control mechanisms to avoid interference are found.

In addition to the present document, other Harmonized Standards may apply.

Requirements apply to the network interface and the Radio Frequency (RF) Air Interface of the equipment.

TETRA terminal equipment consists of several elements. The present document is structured to enable the approval of the individual elements as separate items. Because of the need for effective use of the radio spectrum, the essential air interface characteristics will always apply. For each essential requirement a test is given including measurement methods.

In the present document there are no Electromagnetic Compatibility (EMC) requirements in terms of the Terminal Directive 98/13/EC [23], article 5c.

NOTE: Technical requirements for EMC performance are covered by the relevant standards applicable to the EMC Directive 89/336/EEC [25] which also lays down the conformity assessment procedure.

The present document is based on the radio and protocol provisions of ETS 300 392 [27] and ETS 300 394 [28].

5 Test specification

5.1 Introduction

Subclause 5.1 provides the test references for the requirements of the present document used to determine the compliance of an IUT to the present document.

The tests referenced in this subclause are defined in corresponding TETRA conformance testing specifications:

- a) radio conformance testing specification, ETS 300 394-1 [7];
- b) protocol conformance testing specifications:
 - Test Suite Structure (TSS) and Test Purposes (TPs), ETS 300 394-2-1 [8];
 - ATS for NWK layer, ETS 300 394-2-2 [9];
 - ATS for LLC layer, ETS 300 394-2-3 [10];
 - ATS for MAC layer, ETS 300 394-2-4 [11].

NOTE: The ATSs for protocol testing are written in TTCN according to ISO/IEC 9646-3 [24]. For detailed information on conventions used for TPs refer to ETS 300 394-2-1 [8], clause 5. For detailed information on ATS conventions refer to ETS 300 394-2-2 [9], clause 5 for NWK layer; ETS 300 394-2-3 [10], clause 5 for LLC layer; and ETS 300 394-2-4 [11], clause 5 for upper MAC layer.

Not all the tests defined for the conformance testing are relevant for type approval testing and the tests referenced in this clause are the ones corresponding to the justified requirements in clause 4 in the present document.

To allow test case selection for the purposes of the present document, the test case index and test case selection expression definitions are specified for the physical layer.

For protocol layers the TSS, test case index, test case selection expression definitions, and test suite parameter definitions are redefined and those tables are included for each ATS in this clause. The ATS conventions for the protocol conformance testing have been followed in the present document to allow one to one mapping with the test cases in the conformance test suites and the redefined structural parts in the present document.

All the tables for testing in this clause follow the TTCN format in ISO/IEC 9646-3 [24].

5.2 Environmental conditions

Radio type approval testing shall be performed at normal and (where required) extreme test conditions as specified in ETS 300 394-1 [7].

Protocol type approval testing shall be performed within the intended environmental conditions of the IUT.

5.3 Test configuration

The test configurations given or referenced in the present document do not imply a specific realization of test equipment or arrangement or use of specific test devices for type approval testing. However, any test configuration and equipment used shall provide the test conditions specified in the tests to enable testing according to the present document.

Detailed test equipment accuracy, specification tolerance of the test devices, or test equipment conformity with the requirements set by the type approval tests are not subjects of the present document. Where such details are provided, they are considered as being an informative addition to the test specifications.

In the case of a protocol test resulting in a fail verdict, the corresponding test case execution will be repeated at least once to ensure the result being caused by the requirements in the test case.

30

The manufacturer of the IUT shall provide an interface for connecting the IUT to the test system for type approval testing according to the present document. This interface may be located in the IUT or it may exist in an additional device dedicated for testing purposes. The interface may be based on a specific test connector protocol or it may use radio interface. Specification for the actual interface being used is outside the scope of the present document.

The IUT may need parameterization or special initialization for testing. Those actions shall be performed according to any specific instructions provided by the manufacturer and are outside the scope of the present document.

Detailed Comments

The references given in the PICS/PIXIT Ref. -column refer to the requirement tables in annex A and declarations in annex B in the present document.

5.5 Ud air interface test specification

Tests to be performed to verify compliance with the requirements at the Ud air interface will be added, when the control mechanism to avoid interference (Managed DMO) has been fully specified.

Annex A (normative): Requirements Tables (RT)

Notwithstanding the provisions of the copyright clause related to the text of the present document, ETSI grants that users of the present document may freely reproduce the RT proforma in this annex so that it can be used for its intended purposes and may further publish the completed RT.

A.1 Introduction

The RT indicates the status of the features tested according to the requirements in the present document, i.e. which features and procedures are mandatory, optional or conditional.

The test case selection in clause 5 is based on the values declared by the manufacturer in the "Support" column in this RT.

The following table headers are applicable to this RT:

Item: is an entry number in the table to be used for references. Multiple numbering levels may be used to

express major functions, and their supporting components;

Reference: references to specifications where the requirements and tests are declared;

Status: contains the status required for implementation conforming to the present document;

Support is the column for the manufacturer's statement of whether the particular item is supported by the

implementation;

Allowed values: specifies the allowed (range of) values for a parameter (only used when a declaration of supported

values is required for the purposes of testing);

Supported values: is the column for the manufacturer's statement of the implemented (range of) values for a

parameter (only to be filled in when allowed values are specified);

Transmission: specifies whether the support of sending a message, frame or information element is required;

Reception: specifies whether the support of receiving a message, frame or information element is required;

The interpretation of status columns in all tables is as follows:

m mandatory - the capability is required to be supported;

o optional - the capability may be supported or not;

o.i qualified optional - for mutually exclusive or selectable options from a set. "i" is an integer which

identifies an unique group of related optional items and the logic of their selection which is

defined immediately following the table;

ci conditional - the requirement on the capability ("m", "o", "x", "n" or "n/a") depends on the

support of other optional or conditional items. "i" is an integer identifying a unique conditional

status expression which is defined immediately following the table;

n Not a requirement. The entry is outside the scope of the present document and it is not a

requirement that the feature is supported;

n/a not applicable - in the given context, it is impossible to use the capability;

x prohibited (excluded) - there is a requirement not to use this capability in the given context.

If a procedure, message, frame, information element, timer, or constant is not explicitly listed in any of the following tables these shall be considered as "n".

A.2 Type of air interface

The supplier of the implementation shall state the support of the implementation for each type of air interface presented in table A.1.

A.4 Requirements tables for Ud air interface

Requirements at the Ud air interface are not covered by this edition of the Harmonized Standard. Requirements at the Ud air interface will be added, when the control mechanism to avoid interference (Managed DMO) has been fully specified.

Annex B (normative): Declarations on parameters supported

Notwithstanding the provisions of the copyright clause related to the text of the present document, ETSI grants that users of the present document may freely reproduce the RT proforma in this annex so that it can be used for its intended purposes and may further publish the completed RT.

B.1 Introduction

The following tables contain extracts from the PICS document ETS 300 392-14 [6]. These tables supplement the RT giving the required information to parameterize the test suites referred to in the present document.

For the notation used in the tables in this clause, refer to annex A, clause A.1.
