## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

---

## Foreword

This European Standard (Telecommunications series) has been produced by ETSI Technical Committee Transmission and Multiplexing (TM).

The present document has already been published as an ETSI Technical Specification, under TS 101 785.

This V1.2.1 contains full formal revision, in term of definitions of spectral efficiency, now referenced to other existing ENs for conventional PDH/SDH application in the same frequency bands.

The former title of the present document V1.1.1 was "Fixed Radio Systems; Point-to-point equipment; Parameters for packet data radio systems for transmission of digital signals operating in the frequency range 23, 26, 28 or 38 GHz".

<b>National transposition dates</b>	
Date of adoption of this EN:	8 February 2002
Date of latest announcement of this EN (doa):	31 May 2002
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	30 November 2002
Date of withdrawal of any conflicting National Standard (dow):	30 November 2002

---

## 1 Scope

The present document specifies the minimum performance parameters for terrestrial fixed service radio communications equipment operating at 7, 8, 13, 15, 18, 23, 26, 28, 32, 38, 52 to 55 GHz provided with a combination Packet data interfaces or of Packet Data interfaces and PDH/SDH interfaces. Such digital systems are intended for use for point-to-point connections in local and regional networks.

For regulatory purpose, reference shall be made to existing PDH/SDH standards to be used to assess the efficient use of radio spectrum.

---

## 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication and/or edition number or version number) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.

NOTE: In the case of non-specific references, the time frame of application and new certification procedures for new releases of these normative references after the date of the first public enquiry of the present document or the first certification of the equipment shall be agreed between the supplier and the regulatory authority. These new certification procedures will cover in any case only the parameters subject to changes from the on going release during the previous certification.

## 3 Definitions, symbols and abbreviations

### 3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

**Radio Interface Capacity (RIC):** maximum user capacity, defined at reference point X/X', that can be transmitted over the radio interface, defined at reference point C'

**Network Interface Capacity (NIC):** sum of the maximum bit rates of the implemented base band interfaces at reference point X/X'

### 3.2 Symbols

For the purposes of the present document, the following symbols apply:

GHz	GigaHertz
Mbit/s	Megabits per second
MHz	MegaHertz

### 3.3 Abbreviations

For the purposes of the present document, the following abbreviations apply:

BER	Bit Error Ratio
DRRS	Digital Radio Relay Systems
FER	Frame Error Ratio
RIC	Radio Interface Capacity
NIC	Network Interface Capacity

---

## 4 General characteristics

### 4.1 Channel arrangements

The equipments shall operate on channels in accordance with the referenced radio standard selected from clause 5.1.

### 4.2 Channel spacing

The channel spacings and the equipment classes for the referenced standards and the required Radio Interface Capacities are defined in clause 5.1.

### 4.3 Baseband interface parameters

All of the following specified data interface parameters refer to point X and X' of figure 1.

#### 4.3.1 Ethernet data interface

10 Mbit/s, 100 Mbit/s and 1 000 Mbit/s interfaces shall comply with the OSI physical layer requirements of ISO/IEC 8802-3 [4] and IEEE 802.3 [5] respectively. 10 Mbit/s, 100 Mbit/s and 1 000 Mbit/s interfaces shall comply with the maximum packet sizes defined in IEEE 802.1Q [6].

### 4.3.2 Plesiochronous interfaces

Plesiochronous interfaces at 2 Mbit/s, 8 Mbit/s and 34 Mbit/s shall comply with ITU-T Recommendation G.703 [19]. Parameters for service channels and wayside traffic channels are outside the scope of the present document.

### 4.3.3 ISDN interface (primary rate)

The transmission of 2 Mbit/s signals using the structure and functions of ISDN primary multiplex signals is to be in accordance with ITU-T Recommendations G.703 [19], G.704 [20], I.412 [21] and ETS 300 233 [22].

### 4.3.4 SDH baseband interface

SDH baseband interfaces shall comply with ITU-T Recommendations G.703 [19], G.707 [23], G.783 [24], G.784 [25] and G.957 [26] and ITU-R Recommendation F.750 [27].

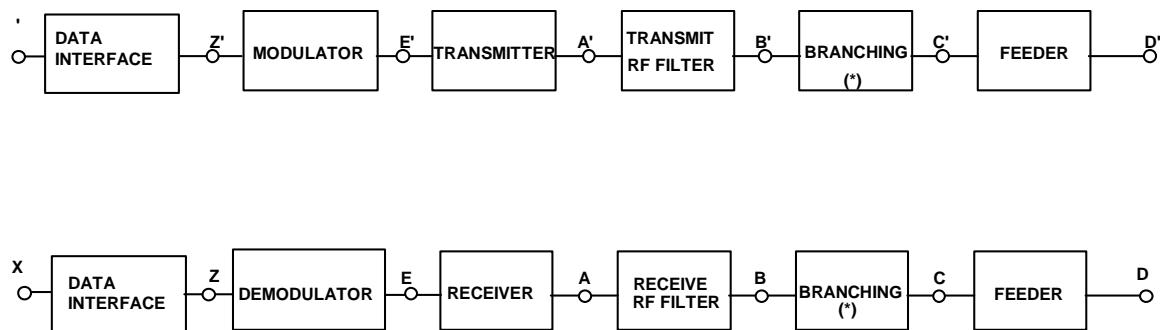

The use of reserved bytes contained in the SOH, and their termination shall be in accordance with ITU-R Recommendation F.750 [27]. Further details on the possible use of the SOH bytes reserved for future international standardization are given in TR 101 035 [3].

## 4.4 Performance and availability requirements

Digital equipment shall be designed in order to meet network performance requirements in the standard selected according to clause 5.1 and those defined in ISO/IEC 8802-3 [4] for 10 Mbit/s Medium Attachment Units and IEEE 802.3 [5] for 100 Mbit/s and 1 000 Mbit/s Physical Layer Devices. The implication of the link design on the performance is recognized and the general design criteria reported in ITU-R Recommendations P.530-9 [2] and F.1102 [1] shall be applied. Performance requirements for public networks are under study by the ITU-T.

All performance measurements shall be done with 64 octet frames.

## 4.5 System block diagram

NOTE 1: For the purpose of defining the measurement points, the branching network does not include a hybrid.

NOTE 2: The points shown above are reference points only; points C and C', D and D' in general coincide.

NOTE 3: Points B and C, B' and C' may coincide when simple duplexer is used.

**Figure 1: System block diagram**

## 4.6 Other general characteristics

All general characteristics of the equipment, apart from those detailed above, shall be in accordance with the referenced radio standard selected from clause 5.1.

## 5 System parameters

### 5.1 Selection of specification

All radio requirements shall be taken from an appropriate PDH or SDH specification. This clause describes how to select an appropriate PDH/SDH specification to be applied to a radio system with packet data interfaces. System type codes shall be taken from the selected PDH/SDH specification.

The manufacturer shall declare the Radio Interface Capacity (RIC). The Radio Interface Capacity (RIC) must exceed the minimum RIC given in table 2 to allow application of a specific PDH/SDH standard.

The Network Interface Capacity (NIC) must be equal to or exceed the Radio Interface Capacity (RIC) to allow application of a specific PDH/SDH standard from table 2.

For declaration of conformity according to annex III of the R&TTE directive [28], the version of the PDH/SDH standard shall be the one referred to in EN 301 751 [17]. The essential requirements are those listed in EN 301 751 [17] and repeated for convenience in table 1.

**Table 1: List of essential requirements**

Clause in [17]	Requirements
4.5.1	Frequency error/stability
4.5.2	Transmitter power
4.5.3.1	Adjacent channel power - Spectrum mask and spectral lines at symbol rate
4.5.3.2	Adjacent channel power - Remote Transmit Power Control (RTPC)
4.5.4	Spurious emissions
4.5.5.1	Transient behaviour of the transmitter - Automatic Transmit Power Control (ATPC)
4.5.5.2	Transient behaviour of the transmitter - Remote Frequency Control (RFC)
4.7.1	BER as a function of receiver input signal level
4.7.2	Co-channel interference sensitivity
4.7.3	Adjacent channel interference sensitivity
4.7.4	Blocking or desensitization inc. duplex (CW Spurious Interference)
4.7.5	Spurious emissions

**Table 2: Applicable PDH/SDH specifications for packet data systems**

## 5.2 Translation of requirements

This clause describes how to translate the requirements from the PDH/SDH specification to verify compliance of the radio system with packet data interfaces.

The manufacturer shall describe how to load the system with the Radio Interface Capacity (RIC), possibly using multiple interfaces. The error rates specified in the PDH/SDH specification shall be met on all traffic loading the system. The traffic may contain both PDH, SDH and packet data. For Ethernet interfaces, the BER requirements in the PDH/SDH standard shall be converted to FER requirements using table 3 (based on 64 octet frames). For this type of equipment, the  $\text{BER}=10^{-3}$  requirement is not considered to be essential and is therefore omitted from table 3.

**Table 3: Conversion between Bit Error Rate (BER) and Frame Error Rate (FER)**

BER	FER
$10^{-6}$	$5 \times 10^{-4}$
$10^{-8}$	$5 \times 10^{-6}$
$10^{-10}$	$5 \times 10^{-8}$
$10^{-12}$	$5 \times 10^{-10}$

---

## Annex A (informative): FER/BER equivalence and FER measurement

### A.1 FER/BER equivalence

FER and BER can be translated as described herein. Ethernet frames can range from 64 octets up to 1 522 octets. In the example below 64 octet frames have been used.

An Ethernet frame is considered errored if at least one bit in the frame is errored. Assuming a normal distribution the probability of there being exactly one errored bit in a 64 octet frame is:

$$P = p \times (1 - p)^{64 \times 8 - 1} \times (64 \times 8) \quad \text{where } p = \text{BER}$$

The probability that a frame contains exactly two errors is:

$$P = p^2 \times (1 - p)^{64 \times 8 - 2} \times (64 \times 8)(64 \times 8 - 1)/2$$

The probability of there being at least one bit errored in the 64 octet frame is:

$$P = 1 - (1 - p)^{64 \times 8}$$

From these formulas we can determine the following probabilities and FER:

**Table A.1: FER/BER equivalence**

Channel BER	1 bit error in frame	2 bit errors in frame	FER
$1 \times 10^{-6}$	$5 \times 10^{-4}$	$1 \times 10^{-7}$	$5 \times 10^{-4}$
$1 \times 10^{-8}$	$5 \times 10^{-6}$	$1 \times 10^{-11}$	$5 \times 10^{-6}$
$1 \times 10^{-10}$	$5 \times 10^{-8}$	$1 \times 10^{-15}$	$5 \times 10^{-8}$
$1 \times 10^{-12}$	$5 \times 10^{-10}$	$1 \times 10^{-19}$	$5 \times 10^{-10}$

---

### A.2 FER equipment settings and measurement techniques (example)

Equipment used: IEEE 802.3 [5] compliant Ethernet frame test equipment.

The transmitting Ethernet port of the test equipment should be configured to the following settings:

- Mode: Single burst
- Count: 10 000 000 frames
- Length: Fixed, 64 bytes
- Interpacket Gap: 0,96 µs for 100 Mbit/s, 9,6 µs for 10 Mbit/s

FER can be calculated by the following formula after using the above measurements:

$\text{FER} = 1 - (\text{number of non-errored frames received})/(\text{number of frames transmitted})$ .

For example if 50 frames are lost or errored then the number of non-errored frames indicated by the test equipment will be 9,999,950.

The resulting  $\text{FER} = 1 - 9\,999\,950/10\,000\,000 = 5 \times 10^{-6}$ .
