| 6.2 Execution requirements for a TTCN-3 test system .....               | 24 |
| 7 TTCN-3 control interface and operations.....                          | 24 |
| 7.1 Overview of the TCI.....                                            | 24 |
| 7.1.0 TCI role in a TTCN-3 test system.....                             | 24 |
| 7.1.1 Correlation between TTCN-3 and TCI operation invocations .....    | 25 |
| 7.1.1.0 Mapping of TTCN-3 operations to TCI operations.....             | 25 |
| 7.1.1.1 TTCN-3 operations with TCI operation equivalent .....           | 25 |
| 7.1.1.2 TTCN-3 operations with TCI operation pair equivalent .....      | 26 |
| 7.1.1.3 TTCN-3 operations without direct TCI operation equivalent ..... | 27 |
| 7.1.1.3.0 Mapping of TTCN-3 operations to series of TCI operations..... | 27 |
| 7.1.1.3.1 Test case stop operation.....                                 | 27 |
| 7.2 TCI data.....                                                       | 27 |
| 7.2.0 Abstract data types.....                                          | 27 |
| 7.2.1 General abstract data types .....                                 | 27 |
| 7.2.1.0 Use of general abstract data types .....                        | 27 |
| 7.2.1.1 Management.....                                                 | 27 |
| 7.2.1.2 Communication .....                                             | 28 |
| 7.2.2 Abstract TTCN-3 data types and values .....                       | 29 |
| 7.2.2.0 Definition and scope of use .....                               | 29 |
| 7.2.2.1 Abstract TTCN-3 data types .....                                | 29 |
| 7.2.2.2 Abstract TTCN-3 values .....                                    | 31 |
| 7.2.2.2.0 Basic rules .....                                             | 31 |
| 7.2.2.2.1 The abstract data type Value .....                            | 32 |
| 7.2.2.2.2 The abstract data type IntegerValue .....                     | 35 |
| 7.2.2.2.3 The abstract data type FloatValue .....                       | 35 |
| 7.2.2.2.4 The abstract data type BooleanValue .....                     | 35 |
| 7.2.2.2.5 The abstract data type CharstringValue .....                  | 35 |
| 7.2.2.2.6 The abstract data type UniversalCharstringValue.....          | 36 |

|            |                                                 |    |
|------------|-------------------------------------------------|----|
| 7.2.2.2.7  | The abstract data type BitstringValue.....      | 36 |
| 7.2.2.2.8  | The abstract data type OctetstringValue.....    | 37 |
| 7.2.2.2.9  | The abstract data type HexstringValue.....      | 38 |
| 7.2.2.2.10 | The abstract data type RecordValue.....         | 39 |
| 7.2.2.2.11 | The abstract data type RecordOfValue.....       | 39 |
| 7.2.2.2.12 | The abstract data type UnionValue.....          | 41 |
| 7.2.2.2.13 | The abstract data type EnumeratedValue.....     | 41 |
| 7.2.2.2.14 | The abstract data type VerdictValue.....        | 41 |
| 7.2.2.2.15 | The abstract data type AddressValue.....        | 42 |
| 7.2.2.3    | Abstract TTCN-3 matching mechanisms.....        | 42 |
| 7.2.2.3.1  | The abstract data type MatchingMechanism.....   | 42 |
| 7.2.2.3.2  | The abstract data type MatchingList.....        | 42 |
| 7.2.2.3.3  | The abstract data type ValueRange.....          | 43 |
| 7.2.2.3.4  | The abstract data type CharacterPattern.....    | 43 |
| 7.2.2.3.5  | The abstract data type MatchDecodedContent..... | 44 |
| 7.2.2.4    | Data types for complex TTCN-3 properties.....   | 44 |
| 7.2.2.4.0  | Scope of use of TTCN-3 properties.....          | 44 |
| 7.2.2.4.1  | The abstract data type LengthRestriction.....   | 44 |
| 7.2.2.4.2  | The abstract data type Permutation.....         | 44 |
| 7.2.2.4.3  | The abstract data type RangeBoundary.....       | 45 |
| 7.2.3      | Abstract logging types.....                     | 45 |
| 7.2.3.1    | The abstract data type TciValueTemplate.....    | 45 |
| 7.2.3.2    | The abstract data type TciNonValueTemplate..... | 45 |
| 7.2.3.3    | The Value List and Mismatch Types.....          | 46 |
| 7.2.3.4    | The Status Types.....                           | 46 |
| 7.3        | TCI operations.....                             | 47 |
| 7.3.0      | The TCI interfaces.....                         | 47 |
| 7.3.1      | The TCI-TM interface.....                       | 48 |
| 7.3.1.0    | Scope of use.....                               | 48 |
| 7.3.1.1    | TCI-TM required.....                            | 48 |
| 7.3.1.1.0  | Scope of use.....                               | 48 |
| 7.3.1.1.1  | tcRootModule.....                               | 48 |
| 7.3.1.1.2  | tcGetImportedModules.....                       | 49 |
| 7.3.1.1.3  | tcGetModuleParameters.....                      | 49 |
| 7.3.1.1.4  | tcGetTestCases.....                             | 49 |
| 7.3.1.1.5  | tcGetTestCaseParameters.....                    | 49 |
| 7.3.1.1.6  | tcGetTestCaseTSI.....                           | 49 |
| 7.3.1.1.7  | tcStartTestCase.....                            | 50 |
| 7.3.1.1.8  | tcStopTestCase.....                             | 50 |
| 7.3.1.1.9  | tcStartControl.....                             | 50 |
| 7.3.1.1.10 | tcStopControl.....                              | 50 |
| 7.3.1.2    | TCI-TM provided.....                            | 51 |
| 7.3.1.2.0  | Scope of use.....                               | 51 |
| 7.3.1.2.1  | tcTestCaseStarted.....                          | 51 |
| 7.3.1.2.2  | tcTestCaseTerminated.....                       | 51 |
| 7.3.1.2.3  | tcControlTerminated.....                        | 51 |

## **Annex A (normative): IDL Specification of TCI .....284**

## **Annex B (normative): XML Mapping for TCI TL Provided .....302**

|     |                                         |     |
|-----|-----------------------------------------|-----|
| B.0 | Introduction .....                      | 302 |
| B.1 | TCI-TL XML Schema for Simple Types..... | 302 |
| B.2 | TCI-TL XML Schema for Types .....       | 303 |
| B.3 | TCI-TL XML Schema for Values .....      | 305 |
| B.4 | TCI-TL XML Schema for Templates .....   | 309 |
| B.5 | TCI-TL XML Schema for Events .....      | 312 |
| B.6 | TCI-TL XML Schema for a Log.....        | 334 |

## **Annex C (informative): Use scenarios .....338**

|         |                                                      |     |
|---------|------------------------------------------------------|-----|
| C.0     | Introduction .....                                   | 338 |
| C.1     | Initialization, collecting information, logging..... | 338 |
| C.1.1   | Use scenario: initialization .....                   | 338 |
| C.1.1.0 | Scenario description.....                            | 338 |
| C.1.1.1 | Sequence diagram.....                                | 339 |
| C.1.1.2 | TTCN-3 fragment .....                                | 339 |

|         |                                                                              |     |
|---------|------------------------------------------------------------------------------|-----|
| C.1.2   | Use scenario: requesting module parameters .....                             | 339 |
| C.1.2.0 | Scenario description.....                                                    | 339 |
| C.1.2.1 | Sequence diagram.....                                                        | 340 |
| C.1.2.2 | TTCN-3 fragment .....                                                        | 340 |
| C.1.3   | Use scenario: logging .....                                                  | 340 |
| C.1.3.0 | Scenario description.....                                                    | 340 |
| C.1.3.1 | Sequence diagram.....                                                        | 341 |
| C.1.3.2 | TTCN-3 fragment .....                                                        | 341 |
| C.2     | Execution of test cases and control .....                                    | 341 |
| C.2.1   | Use scenario: execution of control .....                                     | 341 |
| C.2.1.0 | Scenario description.....                                                    | 341 |
| C.2.1.1 | Sequence diagram.....                                                        | 342 |
| C.2.1.2 | TTCN-3 fragment .....                                                        | 342 |
| C.2.2   | Use scenario: test case execution within control .....                       | 342 |
| C.2.2.0 | Scenario description.....                                                    | 342 |
| C.2.2.1 | Sequence diagram.....                                                        | 343 |
| C.2.2.2 | TTCN-3 fragment .....                                                        | 343 |
| C.2.3   | Use scenario: direct test case execution .....                               | 343 |
| C.2.3.0 | Scenario description.....                                                    | 343 |
| C.2.3.1 | Sequence diagram.....                                                        | 344 |
| C.2.3.2 | TTCN-3 fragment .....                                                        | 344 |
| C.2.4   | Use scenario: execute test case to TRI .....                                 | 344 |
| C.2.4.0 | Scenario description.....                                                    | 344 |
| C.2.4.1 | Sequence diagram.....                                                        | 345 |
| C.2.4.2 | TTCN-3 fragment .....                                                        | 345 |
| C.3     | Component handling .....                                                     | 345 |
| C.3.1   | Use scenario: local control component creation.....                          | 345 |
| C.3.1.0 | Scenario description.....                                                    | 345 |
| C.3.1.1 | Sequence diagram.....                                                        | 346 |
| C.3.1.2 | TTCN-3 fragment .....                                                        | 346 |
| C.3.2   | Use scenario: remote control component creation.....                         | 346 |
| C.3.2.0 | Scenario description.....                                                    | 346 |
| C.3.2.1 | Sequence diagram.....                                                        | 347 |
| C.3.2.2 | TTCN-3 fragment .....                                                        | 347 |
| C.3.3   | Use scenario: local MTC creation .....                                       | 347 |
| C.3.3.0 | Scenario description.....                                                    | 347 |
| C.3.3.1 | Sequence diagram.....                                                        | 348 |
| C.3.3.2 | TTCN-3 fragment .....                                                        | 348 |
| C.3.4   | Use scenario: remote MTC creation.....                                       | 348 |

## Intellectual Property Rights

### Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org/>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

### Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

---

## Foreword

This ETSI Standard (ES) has been produced by ETSI Technical Committee Methods for Testing and Specification (MTS).

The present document is part 6 of a multi-part deliverable. Full details of the entire series can be found in part 1 [1].

---

## Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

# 1 Scope

The present document specifies the control interfaces for TTCN-3 test system implementations. The TTCN-3 Control Interfaces provide a standardized adaptation for management, test component handling and encoding/decoding of a test system to a particular test platform. The present document defines the interfaces as a set of operations independent of a target language.

The interfaces are defined to be compatible with the TTCN-3 standard (see clause 2). The interface definition uses the CORBA Interface Definition Language (IDL) to specify the TCI completely. Clauses 8, 9, 10, 11 and 12 present language mappings for this abstract specification to the target languages Java™, ANSI C, C++, XML and C#. A summary of the IDL-based interface specification is provided in annex A.

NOTE: Java™ is the trade name of a programming language developed by Oracle Corporation. This information is given for the convenience of users of the present document and does not constitute an endorsement by ETSI of the programming language named. Equivalent programming languages may be used if they can be shown to lead to the same results.

# 2 References

## 2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <http://docbox.etsi.org/Reference>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

- [1] ETSI ES 201 873-1: "Methods for Testing and Specification (MTS); The Testing and Test Control Notation version 3; Part 1: TTCN-3 Core Language".
- [2] ETSI ES 201 873-4: "Methods for Testing and Specification (MTS); The Testing and Test Control Notation version 3; Part 4: TTCN-3 Operational Semantics".
- [3] ETSI ES 201 873-5: "Methods for Testing and Specification (MTS); The Testing and Test Control Notation version 3; Part 5: TTCN-3 Runtime Interface (TRI)".
- [4] Recommendation ITU-T X.290: "OSI conformance testing methodology and framework for protocol Recommendations for ITU-T applications - General concepts".

NOTE: The corresponding ISO/IEC standard is ISO/IEC 9646-1: "Information technology - Open Systems Interconnection - Conformance testing methodology and framework; Part 1: General concepts".

- [5] ISO/IEC 10646:2012 "Information technology -- Universal Coded Character Set (UCS)".
- [6] CORBA 3.0: "The Common Object Request Broker: Architecture and Specification", OMG Formal Document (specifies IDL).
- [7] Sun Microsystems: "Java™ Language Specification".

## 2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

Not applicable.

---

## 3 Definitions and abbreviations

### 3.1 Definitions

For the purposes of the present document, the terms and definitions given in Recommendation ITU-T X.290 [4] and the following apply:

**Abstract Test Suite (ATS):** test suite composed of abstract test cases, which are specified by TTCN-3 module(s)

**codec:** encoder/decoder entity used for encoding and decoding data to be transmitted and received, respectively

**Coding/Decoding (CD):** entity that administers the value and type handling including encoding and decoding in the TTCN-3 test system

**communication port:** abstract mechanism facilitating communication between test components

NOTE: A communication port is modelled as a FIFO queue in the receiving direction. Ports can be message-based, procedure-based or a mixture of the two.

**Component Handling (CH):** entity that administers the handling of test components in the TTCN-3 test system

**control component:** component that executes the behaviour of the control part of a TTCN-3 module

**Executable Test Suite (ETS):** Refer to Recommendation ITU-T X.290 [4].

**Implementation eXtra Information for Testing (IXIT):** Refer to Recommendation ITU-T X.290 [4].

**Platform Adaptor (PA):** entity that adapts the TTCN-3 Executable to a particular execution platform

NOTE: The Platform Adaptor creates a single notion of time for a TTCN-3 test system, and implements both, explicit and implicit, timers as well as external functions.

**real test system interface:** Refer to Recommendation ITU-T X.290 [4].

**SUT Adaptor (SA):** entity that adapts the TTCN-3 communication operations with the SUT based on an abstract test system interface

NOTE: It implements the real test system interface.

**System Under Test (SUT):** Refer to Recommendation ITU-T X.290 [4].

**test case:** Refer to Recommendation ITU-T X.290 [4].

**test event:** either sent or received test data (message or procedure call) on a communication port that is part of the test system interface as well as timeout events of timers

**Test Logging (TL):** entity which provides logging information about test execution (including also the information provided by the TTCN-3 log statement)

**Test Management (TM):** entity which provides a user interface to as well as the administration of the TTCN-3 test system

**Test Management and Control (TMC):** set of entities providing test management and control; consists of the Test Management (TM), the Component Handling (CH), the Test Logging (TL) and the Coding/Decoding (CD)

NOTE: The TMC is an implementation of TCI.

**test system:** Refer to Recommendation ITU-T X.290 [4].

**Test System Interface (TSI):** test component that provides a mapping of the ports available in the (abstract) TTCN-3 test system to those offered by a real test system

**Testing and Test Control Notation (TTCN-3):** Refer to Recommendation ITU-T X.290 [4].

**TTCN-3 Control Interfaces (TCI):** four interfaces that define the interaction of the TTCN-3 Executable with the test management, the coding and decoding, the test component handling and the logging in a test system

**TTCN-3 Executable (TE):** part of a test system that deals with interpretation or execution of a TTCN-3 ETS

**TTCN-3 Runtime Interface (TRI):** two interfaces that define the interaction of the TTCN-3 Executable between the SUT and the Platform Adaptor (PA) and the System Adaptor (SA) in a test system

## 3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

|       |                                                    |
|-------|----------------------------------------------------|

## 4 Introduction

The present document consists of two distinct parts, the first part describing the structure of a TTCN-3 test system implementation and the second part presenting the TTCN-3 Control Interfaces specification.

The first part introduces the decomposition of a TTCN-3 test system into four main entities:

- Test Management and Control (TMC).
- TTCN-3 Executable (TE).
- SUT Adaptor (SA).
- Platform Adaptor (PA).

The TMC consists itself of three entities: Test Management (TM), Coder/Decoder (CD), and Test Component Handler (CH). In addition, the interaction between these entities, i.e. the corresponding interfaces, is defined.

The second part of the present document specifies the TTCN-3 Control Interfaces (TCI). The interfaces are defined in terms of operations implemented as part of one entity and called by other test system entities. For each operation, the interface specification defines associated data structures, the intended effect on the test system and any constraints on the usage of the operation. Note that these interface specifications only define interactions between the TE and TM, TE and CD, and TE and CH. For interactions between the TE and SA and the TE and PA please refer to the TTCN-3 Runtime Interface specification (ETSI ES 201 873-5 [3]).

---

## 5 Compliance

The minimum required for a TCI compliant TTCN-3 test system is to adhere to the interface specification stated in the present document. The TTCN-3 semantics in the test system shall adhere to the operational semantics defined in ETSI ES 201 873-4 [2]. In addition, one language mapping shall be supported. For example, if a vendor supports Java™, the TCI operation calls and implementations, which are part of the TTCN-3 executable, shall comply with the IDL to Java™ mapping specified in the present document. For the logging interface, the XML mapping can be used instead of the Java™ or the C mapping.

---

## 6 General structure of a TTCN-3 test system

### 6.1 Entities in a TTCN-3 test system

#### 6.1.0 Types of entities

A TTCN-3 test system can be thought of conceptually as a set of interacting entities. Each entity implements specific test system functionality. These entities:

- manage test execution;
- interpret or execute compiled TTCN-3 code;

- realize proper communication with the SUT;
- administer types, values and test components;
- implement external functions; and
- handle timer operations.

The structure of a TTCN-3 test system implementation is illustrated in figure 1.

**Figure 1: General structure of a TTCN-3 test system**

As shown in figure 1, the TTCN-3 Executable (TE), also referred to as the Executable Test Suite (ETS), interprets and executes TTCN-3 modules. Various TE structural elements can be identified: control, behaviour, components, types, values and queues. The structural elements within the TE represent functionality that is defined within a TTCN-3 module or by the TTCN-3 standard (ETSI ES 201 873-1 [1]) itself. For example, the structural element "Control" represents the control part within a TTCN-3 module, while the structural element "Queues" represents the requirement on a TTCN-3 Executable that each port of a test component maintains its own port queue. While the first is specified within a TTCN-3 module, the latter is required by the TTCN-3 specification.

Refinement of the TE, as shown in figure 1, is provided as an aid in defining the TTCN-3 Control Interfaces. The TE would typically correspond in a test system implementation either to the executable code produced by a TTCN-3 compiler or by a TTCN-3 interpreter.

The TE may be executed in a centralized or in a distributed manner. That is, on a single test device or across several test devices respectively. Although the structural entities of the TE implement a complete TTCN-3 module, single structural entities might be distributed over several test devices.

The TE implements a TTCN-3 module on an abstract level. The other entities of a TTCN-3 test system make these abstract concepts concrete. For example, the abstract concept of sending a message or receiving a timeout cannot be implemented within the TE. The remaining part of the test system implements the encoding of the message and its sending over concrete physical means or measuring the time and determining when a timer has expired, respectively.

The SA and PA and their interaction with the TE are defined in ETSI ES 201 873-5 [3]. The TCI specification defines the interaction between the TE and the TMC.

The logging interface provides logging capabilities to all elements of the test system architecture, i.e. the TE, the TM, the CH, the CD, the SA and the PA are able to log information on the test execution via TL. Figure 2 represents a more detailed view on TL.

Figure 2: Detailed View on TL

## 6.1.1 Test Management and Control (TMC)

### 6.1.1.0 Test Management and Control Entities

The TMC entity includes functionality related to management of:

- test execution;
- components;
- encoding and decoding; and
- logging.

#### 6.1.1.1 Test Management (TM)

The TM entity is responsible for the overall management of a test system. After the test system has been initialized, test execution starts within the TM entity. The entity is responsible for the proper invocation of TTCN-3 modules, i.e. propagating module parameters such as IXIT information to the TE if necessary. Typically, this entity would also implement a test system user interface.

#### 6.1.1.2 Coding and Decoding (CD)

The CD entity is responsible for the external encoding and decoding of TTCN-3 values into bitstrings suitable to be sent to the System Under Tests (SUT). Whenever external codecs are used, the TE determines which codecs shall be used. It passes the TTCN-3 data to the appropriate encoder to obtain the encoded data. Received data is decoded in the CD entity by using the appropriate decoder, which translates the received data into TTCN-3 values.

### 6.1.1.3 Component Handling (CH)

The TE can be distributed among several test devices. The CH implements communication between distributed test system entities. The CH entity provides the means to synchronize test system entities which might be distributed onto several nodes.

NOTE 1: Nodes and test devices are used as synonyms.

The general structure of a test system distributed among several nodes is depicted in figure 3.

**Figure 3: General structure of a distributed TTCN-3 test system**

Each node within a test system includes the TE, SA, PA, CD and TL entities. The entities CH and TM mediate the test management and test component handling between the TEs on each node. The TE which starts a test case is a special TE. It shall calculate the final test case verdict. Besides this, all TEs are handled the same.

NOTE 2: As stated in ETSI ES 201 873-4 [2], a test system executes at most one test case at a given point in time, i.e. a TTCN-3 module cannot execute multiple test cases at the same time.

The creation of the MTC, PTCs and the control component in TEs is controlled by CH. Please note the special role of the system component, which exists only conceptually and not as a running test component in a TE. System ports, i.e. the ports of the system component, may be distributed among several nodes. Further, test components on different nodes may have access to the same physical port of the SUT, i.e. they may be mapped to the same port of the test system interface.

EXAMPLE: Access to remote real SUT ports can be realized by TEs via local proxies.

Communication between TTCN-3 components is either message or procedure based. Therefore, the CH adapts message and procedure based communication of TTCN-3 components to the particular execution platform of the test system. It is aware of connections between TTCN-3 test component communication ports. It propagates send request operations from one TTCN-3 component to another TTCN-3 component. The receiving component may reside in a different instance of the same TE located on a different node. It then notifies the TE of any received test events by enqueueing them in the port queues of the TE.

Procedure based communication operations between TTCN-3 components are also visible at the CH. The CH shall distinguish between the different kinds of procedure-based communication, i.e. call, reply, and exception, and shall propagate them in the appropriate manner to the TE where the target component resides. TTCN-3 procedure based communication semantics, i.e. the effect of such operation on TTCN-3 test component execution, are to be handled in the TE.

Additional communication is needed to implement the distribution of test components onto several nodes. Component management communication includes the indication of the creation of test components, the starting of execution of a test component, verdict distribution, as well as component termination indication. The CH does not implement the TTCN-3 component behaviour. Rather, it implements the communication between several components implemented by a TE.

#### 6.1.1.4 Test Logging (TL)

The TL entity performs test event logging and presentation to the test system user. It provides the logging of information about the test execution such as which test components have been created, started and terminated, which data is sent to the SUT, received from the SUT and matched to TTCN-3 templates, which timers have been started, stopped or timed out, etc.

#### 6.1.2 TTCN-3 Executable (TE)

The TE entity executes or interprets a TTCN-3 module. Conceptually, the TE can be decomposed into six interacting entities: a Control, Behaviour, Component, Type, Value and Queue entity. This structural decomposition of the TE is defined in ETSI ES 201 873-5 [3]. The terminology for TE defined in ETSI ES 201 873-5 [3] is used within the present document.

#### 6.1.3 SUT Adaptor (SA)

The SA is the implementation of the System under Test Adaptor (SA) as defined in ETSI ES 201 873-5 [3]. The terminology for SA defined in ETSI ES 201 873-5 [3] is used within the present document.

#### 6.1.4 Platform Adaptor (PA)

The PA is the implementation of the Platform Adaptor (PA) as defined in ETSI ES 201 873-5 [3]. The terminology for PA defined in ETSI ES 201 873-5 [3] is used within the present document.

### 6.2 Execution requirements for a TTCN-3 test system

Each TCI operation call shall be treated as an atomic operation in the calling entity. The called entity, which implements a TCI operation, shall return control to the calling entity as soon as its intended effect has been accomplished or if the operation cannot be completed successfully. The called entity shall not block in the implementation of procedure-based communication.

As stated before, no assumption is made as to whether the TTCN-3 test system or individual entities are implemented in a single executable or process or whether they are distributed among different processes or even test devices.

A TCI implementation shall fulfil the above mentioned requirements.

---

## 7 TTCN-3 control interface and operations

### 7.1 Overview of the TCI

#### 7.1.0 TCI role in a TTCN-3 test system

The clause 7 defines a set of abstract data types used to represent data communicated between the TE and the TMC. In addition, it defines TCI operations in terms of their signatures, when they are to be used and what their effects on the TTCN-3 test system are.

This definition also includes a more detailed description of the input parameters required for each TCI operation call and its return value.

The TCI defines the interaction between the TTCN-3 Executable (TE), Component Handling (CH), the Test Management (TM), the Coding/Decoding (CD), the Test Logging (TL) entities within a TTCN-3 test system. It provides means for the TE to:

- manage test execution;
- distribute execution of test components among different test devices;
- encode and decode test data; and
- logging of information about test execution.

The TCI consists of four sub-interfaces:

- **TCI Test Management Interface (TCI-TM):** This interface includes all operations needed to manage test execution, provide module parameters and external constants and provide test event logging.
- **TCI Component Handling Interface (TCI-CH):** This interface consists of operations needed to implement the management of, and communication between TTCN-3 test components in a centralized or distributed test system. It includes operations to create, start and stop test components, establish connection between TTCN-3 components, manage test components and their verdicts, and handle message and procedure based communication between TTCN-3 components.
- **TCI Coding/Decoding Interface (TCI-CD):** This interface includes all operations needed to retrieve and access codecs, i.e. encoders or decoders, for encoding data to be sent, defined using the TTCN-3 encode attribute, and to decode received data.
- **TCI Test Logging Interface (TCI-TL):** This interface includes all operations needed to retrieve information about test execution and to control the level of detail of this information.

All interfaces are bi-directional so that calling and called parts reside in the TE and in the TMC of the test system. The provided interfaces (those operations which an interface offers to the TE) and the required operations (those operation which an interface needs to use from the TE) are combined into the respective provided and required subinterface for each interface, i.e. TCI-TM Provided/ TCI-TM Required, TCI-CH Provided/ TCI-CH Required, TCI-CD Provided/ TCI-CD Required, and TCI-TL Provided/TCI-TL Required.

## 7.1.1 Correlation between TTCN-3 and TCI operation invocations

### 7.1.1.0 Mapping of TTCN-3 operations to TCI operations

For some TTCN-3 operation invocations, there is a direct correlation to a TCI operation invocation, which is shown in table 1. Some of the TTCN-3 operations correlate to a pair of TCI operation request and TCI operation to implement the propagation of TTCN-3 operations through the test system. For the other TCI operation invocations there is an indirect correlation - they are needed to implement the TTCN-3 semantics of underlying concepts.

#### 7.1.1.1 TTCN-3 operations with TCI operation equivalent

The correlation shown for TTCN-3 communication operations (i.e. send, call, reply, and raise) only holds if these operations are invoked on a test component port connected to another test component port. The correlation for communication operations that are invoked on test component ports that are mapped to test system interface ports is defined in ETSI ES 201 873-5 [3].

**Table 1: Correlation between TTCN-3 communication operations and TCI operation invocations**

| TTCN-3 Operation Name | TCI Operation Name              | TCI Interface Name |
|-----------------------|---------------------------------|--------------------|
| send                  | tcISendConnected (see note 1)   | TCI-CH Provided    |
|                       | tcISendConnectedBC (see note 2) |                    |
|                       | tcISendConnectedMC (see note 3) |                    |
|                       | tcIEnqueueMsgConnected          | TCI-CH Required    |
| call                  | tcICallConnected (see note 1)   | TCI-CH Provided    |
|                       | tcICallConnectedBC (see note 2) |                    |
|                       | tcICallConnectedMC (see note 3) |                    |

| TTCN-3 Operation Name                | TCI Operation Name               | TCI Interface Name |
|--------------------------------------|----------------------------------|--------------------|
|                                      | tciEnqueueCallConnected          | TCI-CH Required    |
| reply                                | tciReplyConnected (see note 1)   | TCI-CH Provided    |
|                                      | tciReplyConnectedBC (see note 2) |                    |
|                                      | tciReplyConnectedMC (see note 3) |                    |
|                                      | tciEnqueueReplyConnected         | TCI-CH Required    |
| raise                                | tciRaiseConnected (see note 1)   | TCI-CH Provided    |
|                                      | tciRaiseConnectedBC (see note 2) |                    |
|                                      | tciRaiseConnectedMC (see note 3) |                    |
|                                      | tciEnqueueRaiseConnected         | TCI-CH Required    |
| log                                  | tliLog                           | TCI-TL Provided    |
| NOTE 1: For unicast communication.   |                                  |                    |
| NOTE 2: For broadcast communication. |                                  |                    |
| NOTE 3: For multicast communication. |                                  |                    |

### 7.1.1.2 TTCN-3 operations with TCI operation pair equivalent

The correlation for TTCN-3 test case, test component and port operations is shown below. The initiating TE issues a TCI request operation to the TCI-CH, which propagates the respective TCI operation on the TE(s) which has (have) to perform it.

**Table 2: Correlation between TTCN-3 test case, test component and port operations and TCI operation invocations**

| TTCN-3 Operation Name                                  | TCI Operation Name            | TCI Interface Name |
|--------------------------------------------------------|-------------------------------|--------------------|
| create                                                 | tciCreateTestComponentReq     | TCI-CH Provided    |
|                                                        | tciCreateTestComponent        | TCI-CH Required    |
| start (a component)                                    | tciStartTestComponentReq      | TCI-CH Provided    |
|                                                        | tciStartTestComponent         | TCI-CH Required    |
| stop (a component)                                     | tciStopTestComponentReq       | TCI-CH Provided    |
|                                                        | tciStopTestComponent          | TCI-CH Required    |
| kill                                                   | tciKillTestComponentReq       | TCI-CH Provided    |
|                                                        | tciKillTestComponent          | TCI-CH Required    |
| connect                                                | tciConnectReq                 | TCI-CH Provided    |
|                                                        | tciConnect                    | TCI-CH Required    |
| disconnect                                             | tciDisconnectReq              | TCI-CH Provided    |
|                                                        | tciDisconnect                 | TCI-CH Required    |
| map                                                    | tciMapReq (see note 1)        | TCI-CH Provided    |
|                                                        | tciMapParamReq (see note 2)   |                    |
|                                                        | tciMap (see note 1)           | TCI-CH Required    |
|                                                        | tciMapParam (see note 2)      |                    |
| unmap                                                  | tciUnmapReq (see note 1)      | TCI-CH Provided    |
|                                                        | tciUnmapParamReq (see note 2) |                    |
|                                                        | tciUnmap (see note 1)         | TCI-CH Required    |
|                                                        | tciUnmapParam (see note 2)    |                    |
| running                                                | tciTestComponentRunningReq    | TCI-CH Provided    |
|                                                        | tciTestComponentRunning       | TCI-CH Required    |
| alive                                                  | tciTestComponentAliveReq      | TCI-CH Provided    |
|                                                        | tciTestComponentAlive         | TCI-CH Required    |
| done                                                   | tciTestComponentDoneReq       | TCI-CH Provided    |
|                                                        | tciTestComponentDone          | TCI-CH Required    |
| killed                                                 | tciTestComponentKilledReq     | TCI-CH Provided    |
|                                                        | tciTestComponentKilled        | TCI-CH Required    |
| mtc                                                    | tciGetMTCReq                  | TCI-CH Provided    |
|                                                        | tciGetMTC                     | TCI-CH Required    |
| execute                                                | tciTestCaseExecuteReq         | TCI-CH Provided    |
|                                                        | tciTestCaseExecute            | TCI-CH Required    |
| NOTE 1: For statement without configuration parameter. |                               |                    |
| NOTE 2: For statement with configuration parameter.    |                               |                    |

### 7.1.1.3 TTCN-3 operations without direct TCI operation equivalent

#### 7.1.1.3.0 Mapping of TTCN-3 operations to series of TCI operations

For some TTCN-3 operation invocations, there is no direct correlation to TCI operation invocations as the ones shown in table 1. These TTCN-3 operation invocations are realized by a series of TCI operation invocations as described in this clause.

#### 7.1.1.3.1 Test case stop operation

When the testcase.stop operation is invoked from the TE, the following actions need to be taken by the TE:

- the overall verdict should be set to `USER_ERROR` with the message given to the invocation of the testcase.stop operation as the verdict reason by invoking `tcSetVerdict()`;
- a reference to the mtc should be obtained by invoking `triGetMtcReq()` in the CH interface; and
- via TLI, testcase.stop shall be logged with `tliTcTerminated()` with verdict `USER_ERROR`;
- the mtc should be stopped by invoking `triStopTestComponentReq()` in the CH with the obtained reference to the mtc.

## 7.2 TCI data

### 7.2.0 Abstract data types

The TCI specification defines a set of abstract data types. These describe, at a very high level, which kind of data shall be passed from a calling to a called entity. The abstract data types are used to determine:

- how TTCN-3 data is passed from a TE to an encoder, to encode TTCN-3 value representations into a bitstring; and in the reverse case;
- how data passed from a decoder to the TE shall be decoded from a bitstring into its TTCN-3 value representation.

For these abstract data types a set of operations is defined to process the data by the coder/decoder.

The concrete representation of these abstract data types as well as the definition of basic data types like `string` and `boolean` are defined in the respective language mappings in clauses 8, 9, 10, 11 and 12.

Notice that the values for any identifier data type shall be unique in the test system implementation where uniqueness is defined as being globally distinct at any point in time. This guarantees that different objects, e.g. two timers, are identified by different identifiers and identifiers are not reused.

### 7.2.1 General abstract data types

#### 7.2.1.0 Use of general abstract data types

The following abstract data types are defined and used for the definition of TCI operations.

#### 7.2.1.1 Management

|                                       |                                                                                                                                                                                               |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TciModuleIdType</code>          | A value of <code>TciModuleIdType</code> is the name of a TTCN-3 module as specified in the TTCN-3 ATS. This abstract type is used for module handling.                                        |
| <code>TciModuleParameterIdType</code> | A value of <code>TciModuleParameterIdType</code> is the qualified name of a TTCN-3 module parameter as specified in the TTCN-3 ATS. This abstract type is used for module parameter handling. |

|                                          |                                                                                                                                                                                                                                                                                           |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TciTestCaseIdType</code>           | A value of <code>TciTestCaseIdType</code> is the qualified name of a TTCN-3 testcase as specified in the TTCN-3 ATS. This abstract type is used for testcase handling.                                                                                                                    |
| <code>TciTestCaseIdListType</code>       | A value of <code>TciTestCaseIdListType</code> is a list of <code>TciTestCaseIdType</code> . This abstract type is used when retrieving the list of test cases in a TTCN-3 module.                                                                                                         |
| <code>TciModuleIdListType</code>         | A value of type <code>TciModuleIdListType</code> is a list of <code>TciModuleIdType</code> . This abstract type is used when retrieving the list of modules which are imported by a TTCN-3 module.                                                                                        |
| <code>TciModuleParameterType</code>      | A value of type <code>TciModuleParameterType</code> is a structure of <code>TciModuleParameterIdType</code> and <code>Value</code> . This abstract type is used to represent the parameter name and the default value of a module parameter.                                              |
| <code>TciModuleParameterListType</code>  | A value of type <code>TciModuleParameterListType</code> is a list of <code>TciModuleParameterType</code> . This abstract type is used when retrieving the module parameters of a TTCN-3 module.                                                                                           |
| <code>TciParameterType</code>            | A value of type <code>TciParameterType</code> includes a TTCN-3 <code>Value</code> , which can be absent, and a value of <code>TciParameterPassingModeType</code> to represent the name, the value and parameter passing mode specified for the parameter in the TTCN-3 ATS.              |
| <code>TciParameterPassingModeType</code> | A value of type <code>TciParameterPassingModeType</code> is either <code>IN</code> , <code>INOUT</code> , or <code>OUT</code> . This abstract type is used when starting a test case or when the termination of a test case is indicated.                                                 |
| <code>TciParameterListType</code>        | A value of type <code>TciParameterListType</code> is a list of <code>TciParameterType</code> . This abstract type is used when starting a test case or when the termination of a test case is indicated.                                                                                  |
| <code>TciParameterTypeType</code>        | A value of type <code>TciParameterTypeType</code> is a structure of <code>Type</code> and <code>TciParameterPassingModeType</code> . This abstract type is used to represent the type, the name and the parameter passing mode of a test case parameter.                                  |
| <code>TciParameterTypeListType</code>    | A value of type <code>TciParameterTypeListType</code> is a list of <code>TciParameterTypeType</code> . This abstract type is used to represent the list of parameters of a test case.                                                                                                     |
| <code>TciTestComponentKindType</code>    | A value of type <code>TciTestComponentKindType</code> is a literal of the set of kinds of TTCN-3 test components, i.e. <code>CONTROL</code> , <code>MTC</code> , <code>PTC</code> , <code>SYSTEM</code> , and <code>PTC_ALIVE</code> . This abstract type is used for component handling. |
| <code>TciTypeClassType</code>            | A value of type <code>TciTypeClassType</code> is a literal of the set of type classes in TTCN-3 such as <code>boolean</code> , <code>float</code> , <code>record</code> , etc. This abstract type is used for value handling.                                                             |
| <code>TciMatchingTypeType</code>         | A value of type <code>TciMatchingTypeType</code> is a literal of the set of matching mechanism types in TTCN-3 such as <code>template list</code> , <code>range</code> , <code>AnyValue</code> etc. This abstract type is used for template handling.                                     |

### 7.2.1.2 Communication

|                                 |                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------|
| <code>TciBehaviourIdType</code> | A value of type <code>TciBehaviourIdType</code> identifies a TTCN-3 behaviour functions. |
|---------------------------------|------------------------------------------------------------------------------------------|

Additional abstract data types with the prefix `Tri` are taken from ETSI ES 201 873-5 [3]: `TriPortIdType`, `TriPortIdListType`, `TriComponentIdType`, `TriComponentIdListType`, `TriAddressType`, `TriAddressListType`, `TriTimerIdType` and `TriMessageType`.

## 7.2.2 Abstract TTCN-3 data types and values

### 7.2.2.0 Definition and scope of use

The clause 7.2.2 defines the set of abstract data types that build up the TTCN-3 type, value and template representation. Functionality of each data type is defined by an accompanying set of operations. Operations on or using this abstract data type return either a value of this abstract type or a basic type like `boolean`.

All operations have been defined using the Interface Description Language (IDL). Concrete language mappings for the operations on the abstract data types are given in clauses 8, 9, 10, 11 and 12. In certain languages, the application of an operation on an abstract data type is represented by passing (either by-value or by-reference, depending on the mapping) the concrete value as a parameter to the operation. Other languages might choose other referencing method to the concrete value, e.g. by considering the value as an object on which a method corresponding to the operation is invoked. To indicate the inability to perform a certain task or to indicate the absence of an optional parameter in the following, the distinct value `null` is used. It can be considered as being a reserved value indicating a special value. The language mappings will define a concrete representation of this distinct value `null`.

The abstract TTCN-3 type, value and template representation consists of the following parts:

- an abstract data type `Type` that represents all TTCN-3 types in a TTCN-3 module;
- different abstract data types that represent TTCN-3 values, i.e. TTCN-3 values of a given TTCN-3 type. This can be either values of TTCN-3 predefined types or of TTCN-3 user-defined types;
- different abstract data types that represent matching mechanisms that can occur in TTCN-3 templates;
- other abstract data types that represent complex value properties such a permutations or length restrictions.

For accessing, evaluating, and coding the TTCN-3 data the test system uses the abstract data type `Type` and the different abstract value data types. Therefore, these abstract data types define the abstraction level between the TTCN-3 Executable (TE) and the remaining test system using the TCI interfaces.

### 7.2.2.1 Abstract TTCN-3 data types

According to the present document TTCN-3 types, either predefined or user-defined, will be represented at the TCI interfaces using the abstract data type `Type`.

For the abstract data type `Type` a set of operations is defined to:

- reference predefined and user-defined TTCN-3 data types; and
- create and maintain TTCN-3 values and templates.

The following operations are defined for the abstract data type `Type`:

|                                                  |                                                                                                                                                                                                                             |
|--------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TciModuleIdType getDefiningModule()</code> | Returns the module identifier of the module in which type is defined.<br>Returns the distinct value <code>null</code> if type is a TTCN-3 base type, e.g. <code>boolean</code> , <code>integer</code> , etc.).              |
| <code>TString getName()</code>                   | Returns the name of the type as defined in the TTCN-3 module. If the type is a nested type without explicit name, the TE has to create an additional unique identifier for this type which is consistently used in TRI/TCI. |

NOTE 1: The creation of identifiers for nested types is tool dependent.

NOTE 2: The naming for a nested type without explicit name can follow the rules defined in clauses 6.2.1.1 and 6.2.3.2 of ETSI ES 201 873-1 [1], e.g. `TypeIdOrExpression.ElementId` and `TypeId[-]`, respectively.

NOTE 3: There might be several instances of the abstract data type `Type` representing the same TTCN-3 type, e.g. in a situation when the type has different attributes in different context.

|                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TciTypeClassType getTypeClass()</code>                                            | Returns the type class of the respective type. A value of <code>TciTypeClassType</code> can have one of the following constants: <code>ADDRESS</code> , <code>ANYTYPE</code> , <code>ARRAY</code> , <code>BITSTRING</code> , <code>BOOLEAN</code> , <code>CHARSTRING</code> , <code>COMPONENT</code> , <code>ENUMERATED</code> , <code>FLOAT</code> , <code>HEXSTRING</code> , <code>INTEGER</code> , <code>OCTETSTRING</code> , <code>RECORD</code> , <code>RECORD_OF</code> , <code>SET</code> , <code>SET_OF</code> , <code>UNION</code> , <code>UNIVERSAL_CHARSTRING</code> , <code>VERDICT</code> , <code>DEFAULT</code> , <code>PORT</code> , <code>TIMER</code> .                                                                                                                                                      |
| <code>Value newInstance()</code>                                                        | Returns a freshly created value of the given type. This initial value of the created value is undefined.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| NOTE 4: Newly created instances of empty record types are considered to be initialized. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <code>TString getTypeEncoding()</code>                                                  | Returns the current type encode attribute as defined in the TTCN-3 module and possibly dynamically restricted by the <code>setencode</code> operation or <code>dynamic_encoding</code> parameter of codec operations. If no encode attribute is defined, the distinct value <code>null</code> is returned. If the type has more than one encode attributes associated with it, all encode attributes are concatenated to a single string using LF (line feed char(0, 0, 0, 10) ), CR (carriage return char(0, 0, 0, 13) ) or their combination as a separator.                                                                                                                                                                                                                                                                |
| <code>TString getTypeEncodingVariant()</code>                                           | This operation returns the current value encoding variant attribute as defined in the TTCN-3 module and possibly dynamically restricted by the <code>setencode</code> operation or <code>dynamic_encoding</code> parameter of codec operations, if any. If no encoding variant attribute is defined, the distinct value <code>null</code> is returned. If the type has more than one variant attributes associated with it, all variant attributes are concatenated to a single string using LF (line feed char(0, 0, 0, 10) ), CR (carriage return char(0, 0, 0, 13) ) or their combination as a separator. In case the type supports multiple encodings, the function returns variants for all encodings. Each variant is prefixed with the associated encode attribute and followed by a full stop character in this case. |
| <code>TStringSeq getEncodingAttributes()</code>                                         | Returns all current encode attributes of the type as defined in the TTCN-3 module. If no encode attribute is defined the distinct value <code>null</code> is returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <code>TStringSeq getVariantAttributes(in TString encoding)</code>                       | This operation returns all variant attributes of the type as defined in the TTCN-3 module and possibly dynamically restricted by the <code>setencode</code> operation or <code>dynamic_encoding</code> parameter of codec operations. If no variant attribute is defined, the distinct value <code>null</code> is returned. The parameter is used to specify encoding the variant attributes are related to. It is required when the type has multiple encodings associated with it. If the type uses a single encoding, the parameter can be set to the special value <code>null</code> . The operation returns the special value <code>null</code> , if the parameter specifies a non-existent encoding or if it contains <code>null</code> and the type contains multiple encodings.                                       |
| <code>TStringSeq getTypeExtension()</code>                                              | Returns the type extension attribute as defined in the TTCN-3 module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <code>Value parseValue(in TString val)</code>                                           | This operation creates a new value of the given type from a string provided in the parameter. The input string shall use valid TTCN-3 syntax for values or templates of this type. The only references allowed in the input string are type references. If the input string contains an error, the distinct value <code>null</code> is returned. The operation is an optional part of the TCI and tool vendors are not required to support value parsing. If not supported, <code>parseValue</code> will always return the distinct value <code>null</code> .                                                                                                                                                                                                                                                                 |

NOTE 5: The `parseValue` operation can be used for defining matching symbols to enable the representation of templates in TCI.

`MatchingMechanism newTemplate(TciMatchingType matchingType)`

Returns a freshly created matching mechanism of this type. The `matchingType` parameter determines what kind of matching mechanism will be created (see clause 7.2.2.3.1 for more details). If the created matching mechanism contains additional data properties, these properties are uninitialized in the created matching mechanism.

`RangeBoundary getLowerTypeBoundary()`

Returns the lower range boundary of the type if it has a range-restriction attached to it. Otherwise, the distinct value `null` is returned.

`RangeBoundary getUpperTypeBoundary()`

Returns the lower range boundary of the type if it has a range-restriction attached to it. Otherwise, the distinct value `null` is returned.

`LengthRestriction getTypeLengthRestriction()`

Returns the length restriction of the type if it has a length restriction attached to it. Otherwise, the distinct value `null` is returned.

`MatchingMechanism getTypeMatchingMechanism()`

Returns the matching mechanism of the type if it is restricted by a matching mechanism. Otherwise, the distinct value `null` is returned.

## 7.2.2.2 Abstract TTCN-3 values

### 7.2.2.2.0 Basic rules

According to the present document, TTCN-3 values are represented at the TCI interfaces via numerous abstract data types.

Figure 4 presents the hierarchy between the abstract data types for TTCN-3 values (short: abstract values).

**Figure 4: Hierarchy of abstract values**

As shown in figure 4, all TTCN-3 abstract values share the same base abstract data type **Value**. All operations defined on this common base data type are implicitly defined also for the abstract value types derived from it.

In addition, **Value** can be used to represent matching mechanisms, which are used instead or inside values e.g. in template parameters or for template variables. Two additional operations: `isMatchingSymbol` (returns true for matching symbols) and `valueToString` (for printing value content in the same way as the `any2unistr` predefined function; can be used for displaying value content) are defined. These operations are not mandatory - it is up to a tool vendor to support them or not.

Values using `@lazy` and `@fuzzy` modifiers are represented by the **Value** data type too. However, it is not possible to use the **Value** data type to perform evaluation of these values; evaluation can be performed by the TE only. If a `@lazy` or `@fuzzy` value has been assigned, but it does not contain result of the evaluation, any data access operations shall result in an error.

#### 7.2.2.2.1 The abstract data type **Value**

The following operations are defined on the base abstract data type **Value**. The concrete representations of these operations are defined in the respective language mapping sections:

Type `getType()` Returns the type of the specified value.

TBoolean `notPresent()` Returns `true` if the specified value is `omit`, `false` otherwise.

|                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TString getValueEncoding()</code>                                                                                                                                                                                                                                                                                                                                | Returns the current value encode attribute as defined in the TTCN-3 module and possibly dynamically restricted by the <code>setencode</code> operation or <code>dynamic_encoding</code> parameter of codec operations, if any. If no encoding attribute is defined, the distinct value <code>null</code> is returned. If the value has more than one encode attributes associated with it, all encode attributes are concatenated to a single string using LF (line feed char(0, 0, 0, 10) ), CR (carriage return char(0, 0, 0, 13) ) or their combination as a separator.                                                                                                                                                                                                                                            |
| <code>TString getValueEncodingVariant()</code>                                                                                                                                                                                                                                                                                                                         | Returns the current value encoding variant attribute as defined in the TTCN-3 module and possibly dynamically restricted by the <code>setencode</code> operation or <code>dynamic_encoding</code> parameter of codec operations, if any. If no encoding variant attribute is defined, the distinct value <code>null</code> is returned. If the value has more than one variant attributes associated with it, all variant attributes are concatenated to a single string using LF (line feed char(0, 0, 0, 10) ), CR (carriage return char(0, 0, 0, 13) ) or their combination as a separator. In case the value supports multiple encodings, the function returns variants for all encodings. Each variant will be prefixed with the associated encode attribute and followed by a full stop character in this case. |
| <code>TStringSeq getEncodingAttributes()</code>                                                                                                                                                                                                                                                                                                                        | Returns all current encode attributes of the value as defined in the TTCN-3 module and possibly dynamically restricted by the <code>setencode</code> operation or <code>dynamic_encoding</code> parameter of codec operations. If no encode attribute is defined, the distinct value <code>null</code> is returned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <code>TStringSeq getVariantAttributes(in TString encoding)</code>                                                                                                                                                                                                                                                                                                      | This operation returns all current variant attributes of the value as defined in the TTCN-3 module and possibly dynamically restricted by the <code>setencode</code> operation or <code>dynamic_encoding</code> parameter of codec operations. If no variant attribute is defined, the distinct value <code>null</code> is returned. The parameter is used to specify encoding the variant attributes are related to. It is required when the value has multiple encodings associated with it. If the type uses a single encoding , the parameter can be set to the special value <code>null</code> . The operation returns the distinct value <code>null</code> , if the parameter specifies a non-existent encoding or if it contains <code>null</code> and the value contains multiple encodings.                  |
| <code>TBoolean isMatchingSymbol()</code>                                                                                                                                                                                                                                                                                                                               | Returns <code>true</code> if the instance is of the <code>MatchingMechanism</code> abstract data type (or any other abstract data type derived from the <code>MatchingMechanism</code> data type) and <code>false</code> in all other cases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>NOTE: This method can be used for detecting the exact abstract data type of the instance. If the method returns <code>false</code>, it is safe to assume that the instance is one of the abstract value data types defined in clause 7.2.2.2. If the method returns <code>true</code>, the instance is one of the matching mechanism defined in clause 7.2.2.3.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TBoolean isEvaluated ()</code>                                  | Returns <code>true</code> if the value has been evaluated and its data content is available, <code>false</code> otherwise. In case of uninitialized values, <code>false</code> is always returned. The method is typically used for <code>@lazy</code> values, and it returns <code>false</code> for values that have been assigned, but not evaluated yet and <code>true</code> if the value contains the evaluation result. The method returns <code>false</code> for <code>@fuzzy</code> values, as the result of evaluation is never stored by the TE. For all other values, the method returns <code>true</code> . |
| <code>LengthRestriction getLengthRestriction()</code>                 | Returns a length restriction matching attribute (specified in clause B.1.4.1 of ETSI ES 201 873-1 [1]) in case it is attached to the value or the distinct value <code>null</code> if no such matching attribute is present.                                                                                                                                                                                                                                                                                                                                                                                            |
| <code>void setLengthRestriction(LengthRestriction restriction)</code> | Adds a length restriction matching attribute (specified in clause B.1.4.1 of ETSI ES 201 873-1 [1]) to the value or modifies an existing one. The distinct value <code>null</code> can be used as a parameter to disable an existing length restriction.                                                                                                                                                                                                                                                                                                                                                                |
| <code>TBoolean isIfPresentEnabled()</code>                            | Returns <code>true</code> if the <code>ifpresent</code> indicator (specified in clause B.1.4.2 of ETSI ES 201 873-1 [1]) is attached to the value and <code>false</code> otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>void setIfPresentEnabled(TBoolean enabled)</code>               | Sets the whether the <code>ifpresent</code> indicator (specified in clause B.1.4.2 of ETSI ES 201 873-1 [1]) is attached to the value or not.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <code>RangeBoundary getLowerTypeBoundary()</code>                     | Returns the lower range boundary of the value's type if it has a range-restriction attached to it. Otherwise, the distinct value <code>null</code> is returned. This is only applicable for values with types of typeclass <code>INTEGER</code> and <code>FLOAT</code> .                                                                                                                                                                                                                                                                                                                                                |
| <code>RangeBoundary getUpperTypeBoundary()</code>                     | Returns the upper range boundary of the value's type if it has a range-restriction attached to it. Otherwise, the distinct value <code>null</code> is returned. This is only applicable for values with types of typeclass <code>INTEGER</code> or <code>FLOAT</code> .                                                                                                                                                                                                                                                                                                                                                 |
| <code>LengthRestriction getTypeLengthRestriction()</code>             | Returns a length restriction matching attribute (specified in clause B.1.4.1 of ETSI ES 201 873-1 [1]) in case it is attached to the value's type or the distinct value <code>null</code> if no such matching attribute is present.<br>This is only applicable for values with types of typeclass <code>CHARSTRING</code> , <code>UNIVERSAL_CHARSTRING</code> , <code>BITSTRING</code> , <code>HEXSTRING</code> , <code>OCTETSTRING</code> , <code>RECORD_OF</code> , <code>SET_OF</code> or <code>ARRAY</code> .                                                                                                       |
| <code>MatchingMechanism getTypeMatchingMechanism()</code>             | Returns the matching mechanism (see clause 7.2.2.3.1) of the value's type if it is restricted by a subtype specification attribute (specified in clauses 6.1.2 and 6.2.13 of ETSI ES 201 873-1 [1]). Otherwise, the distinct value <code>null</code> is returned.                                                                                                                                                                                                                                                                                                                                                       |
| <code>TBoolean isOptional()</code>                                    | Returns <code>true</code> if and only if the value is either an optional field or a template without value or present template restriction.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

When working with length restriction data using the `getLengthRestriction` and `setLengthRestriction`, methods, no assumption shall be made on how the data are stored in a value. An internal implementation might choose to use a reference to the data or copy the data. It is safe to assume that the data are copied. Therefore, it should be assumed that subsequent modifications of the length restriction data will not be considered in the value object.

#### 7.2.2.2.2 The abstract data type IntegerValue

The abstract data type `IntegerValue` is based on the abstract data type `Value`. It represents TTCN-3 integer values.

The following operations are defined on the abstract data type `IntegerValue`:

|                                             |                                                             |
|---------------------------------------------|-------------------------------------------------------------|
| <code>TInteger getInt()</code>              | Returns the integer value of this TTCN-3 integer.           |
| <code>void setInt(in TInteger value)</code> | Sets this <code>IntegerValue</code> to <code>value</code> . |

#### 7.2.2.2.3 The abstract data type FloatValue

The abstract data type `FloatValue` is based on the abstract data type `Value`. It represents TTCN-3 float values.

The following operations are defined on the abstract data type `FloatValue`:

|                                             |                                                           |
|---------------------------------------------|-----------------------------------------------------------|
| <code>TFloat getFloat()</code>              | Returns the float value of this TTCN-3 float.             |
| <code>void setFloat(in TFloat value)</code> | Sets this <code>FloatValue</code> to <code>value</code> . |

#### 7.2.2.2.4 The abstract data type BooleanValue

The abstract data type `BooleanValue` is based on the abstract data type `Value`. It represents TTCN-3 boolean values.

The following operations are defined on the abstract data type `BooleanValue`:

|                                                 |                                                  |
|-------------------------------------------------|--------------------------------------------------|
| <code>TBoolean getBoolean ()</code>             | Returns the boolean value of the TTCN-3 boolean. |
| <code>void setBoolean(in TBoolean value)</code> | Sets this boolean value to <code>value</code> .  |

#### 7.2.2.2.5 The abstract data type CharstringValue

The abstract data type `CharstringValue` is based on the abstract data type `Value`. It represents TTCN-3 `charstring` values. `TChar` is a character within a `charstring` value.

The following operations are defined on the abstract data type `CharstringValue`:

|                                                                 |                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TString getString()</code>                                | Returns the string value of the TTCN-3 <code>charstring</code> . The textual representation of the empty TTCN-3 <code>charstring</code> is "", while its length is zero.                                                                         |
| <code>void setString(in TString value)</code>                   | Sets this <code>CharstringValue</code> to <code>value</code> .                                                                                                                                                                                   |
| <code>TChar getChar(in TInteger position)</code>                | Returns the char value of the TTCN-3 <code>charstring</code> at <code>position</code> . Position 0 denotes the first char of the TTCN-3 <code>charstring</code> . Valid values for <code>position</code> are from 0 to <code>length - 1</code> . |
| <code>void setChar(in TInteger position, in TChar value)</code> | Set the character at <code>position</code> to <code>value</code> . Valid values for <code>position</code> are from 0 to <code>length - 1</code> .                                                                                                |
| <code>TInteger getLength()</code>                               | Returns the length of this <code>CharstringValue</code> in chars, zero if the value of this <code>CharstringValue</code> is omit.                                                                                                                |
| <code>void setLength(in TInteger len)</code>                    | <code>setLength</code> first resets this <code>CharstringValue</code> to its initial value and afterwards sets the length of this <code>CharstringValue</code> in chars to <code>len</code> .                                                    |

#### 7.2.2.2.6 The abstract data type UniversalCharstringValue

The abstract data type `UniversalCharstringValue` is based on the abstract data type `Value`. It represents TTCN-3 universal charstring values. `TUniversalChar` is a character within a universal charstring value.

The following operations are defined on the abstract data type `UniversalCharstringValue`:

|                                                                          |                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TString getString()</code>                                         | Returns the textual representation of this <code>UniversalCharstringValue</code> , as defined in TTCN-3.                                                                                                                                                     |
| <code>void setString(in TString value)</code>                            | Sets the value of this <code>UniversalCharstringValue</code> according to the textual representation as defined by <code>value</code> .                                                                                                                      |
| <code>TUniversalChar getChar(in TInteger position)</code>                | Returns the universal char value of the TTCN-3 universal charstring at position. Position 0 denotes the first <code>TUniversalChar</code> of the TTCN-3 universal charstring. Valid values for <code>position</code> are from 0 to <code>length - 1</code> . |
| <code>void setChar(in TInteger position, in TUniversalChar value)</code> | Sets the universal char at position to value. Valid values for <code>position</code> are from 0 to <code>length - 1</code> .                                                                                                                                 |
| <code>TInteger getLength()</code>                                        | Returns the length of this universal charstring value in universal chars, zero if the value of this universal charstring value is omit.                                                                                                                      |
| <code>void setLength(in TInteger len)</code>                             | <code>setLength</code> first resets this <code>UniversalCharstringValue</code> to its initial value and afterwards sets the length of this <code>UniversalCharstringValue</code> in universal chars to <code>len</code> .                                    |

#### 7.2.2.2.7 The abstract data type BitstringValue

The abstract data type `BitstringValue` is based on the abstract data type `Value`. It represents TTCN-3 bitstring values. This abstract data type uses a parameter `position` in some of its operations for addressing individual bits or embedded matching mechanisms. The following rules are valid in this case:

- Position 0 denotes the first bit or matching mechanism of the TTCN-3 bitstring
- Valid values for `position` are from 0 to `length - 1`, where `length` is the total number of bits and individual matching mechanisms in the value

Each individual matching mechanism takes exactly one position regardless of how many bits it can match.

The following operations are defined on the abstract data type `BitstringValue`.

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TString getString()</code>                                  | Returns the textual representation of this <code>BitstringValue</code> , as defined in TTCN-3. E.g. the textual representation of 0101 is '0101'B. The textual representation of the empty TTCN-3 bitstring is ''B, while its length is zero.                                                                                                                                   |
| <code>void setString(in TString value)</code>                     | Sets the value of this <code>BitstringValue</code> according to the textual representation as defined by <code>value</code> . E.g. the value of this <code>BitstringValue</code> is 0101 if the textual representation in <code>value</code> is '0101'B. The parameter may contain allowed matching symbols such as <code>AnyElement</code> or <code>AnyElementsOrNone</code> . |
| <code>TChar getBit(in TInteger position)</code>                   | Returns the value (0   1) at position of this TTCN-3 bitstring as a character. An error will occur when the specified position contains a matching mechanism.                                                                                                                                                                                                                   |
| <code>void setBit(in TInteger position, in TInteger value)</code> | Sets the bit at position to the value (0   1).                                                                                                                                                                                                                                                                                                                                  |

|                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TInteger getLength()</code>                                                  | Returns the length of this <code>BitstringValue</code> . The length is equal to the total number of bits and individual matching mechanisms in the value. If the value of this <code>BitstringValue</code> is <code>omit</code> , the length is equal to 0. Each individual matching mechanism is considered to have the length of one bit regardless of how many bits it can match. |
| <code>void setLength(in TInteger len)</code>                                       | <code>setLength</code> first resets this <code>BitstringValue</code> to its initial value and afterwards sets the length of this <code>BitstringValue</code> in bits to <code>len</code> .                                                                                                                                                                                           |
| <code>TBoolean isMatchingAt(in TInteger position)</code>                           | Returns <code>true</code> if the item at <code>position</code> of this TTCN-3 bitstring is a matching mechanism inside a value ( <code>AnyElement</code> , <code>AnyElementsOrNone</code> ) and <code>false</code> otherwise.                                                                                                                                                        |
| <code>MatchingMechanism getMatchingAt(in TInteger position)</code>                 | If the <code>position</code> of this TTCN-3 bitstring contains a matching mechanism inside a value ( <code>AnyElement</code> , <code>AnyElementsOrNone</code> ), the method returns it. Otherwise the distinct value <code>null</code> is returned.                                                                                                                                  |
| <code>void setMatching(in TInteger position, in MatchingMechanism template)</code> | Sets a matching mechanism at <code>position</code> . Only two matching mechanisms are allowed: <code>AnyElement</code> and <code>AnyElementsOrNone</code> .                                                                                                                                                                                                                          |

#### 7.2.2.2.8 The abstract data type `OctetstringValue`

The abstract data type `OctetstringValue` is based on the abstract data type `Value`. It represents TTCN-3 `octetstring` values. This abstract data type uses a parameter `position` in some of its operations for addressing individual octets or embedded matching mechanisms. The following rules are valid in this case:

- Position 0 denotes the first octet or matching mechanism of the TTCN-3 `octetstring`
- Valid values for position are from 0 to `length - 1`, where `length` is the total number of octets and individual matching mechanisms in the value
- Each individual matching mechanism takes exactly one position regardless of how many octets it can match

The following operations are defined on the abstract data type `OctetstringValue`:

|                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TString getString()</code>                                    | Returns the textual representation of this <code>OctetstringValue</code> , as defined in TTCN-3. E.g. the textual representation of <code>0xCAFFEE</code> is <code>'CAFFEE'0</code> . The textual representation of the empty TTCN-3 <code>octetstring</code> is <code>''0</code> , while its length is zero.                                                                                                        |
| <code>void setString(in TString value)</code>                       | Sets the value of this <code>OctetstringValue</code> according to the textual representation as defined by <code>value</code> . E.g. The value of this <code>OctetstringValue</code> is <code>0xCAFFEE</code> if the textual representation in <code>value</code> is <code>'CAFFEE'0</code> . The parameter may contain allowed matching symbols such as <code>AnyElement</code> or <code>AnyElementsOrNone</code> . |
| <code>TChar getOctet(in TInteger position)</code>                   | Returns the value (0..255) at <code>position</code> of this TTCN-3 <code>octetstring</code> . An error will occur when the specified position contains a matching mechanism.                                                                                                                                                                                                                                         |
| <code>void setOctet(in TInteger position, in TInteger value)</code> | Sets the octet at <code>position</code> to value (0..255).                                                                                                                                                                                                                                                                                                                                                           |
| <code>TInteger getLength()</code>                                   | Returns the length of this <code>OctetstringValue</code> . The length is equal to the total number of octets and individual matching mechanisms in the value. If the value of this <code>OctetstringValue</code> is <code>omit</code> , the length is equal to 0. Each individual matching mechanism is considered to have the length of one octet regardless of how many octets it can match.                       |

|                                                                                    |                                                                                                                                                                                                                                                       |
|------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>void setLength(in TInteger len)</code>                                       | <code>setLength</code> first resets this <code>OctetstringValue</code> to its initial value and afterwards sets the length of this <code>OctetstringValue</code> in octets to <code>len</code> .                                                      |
| <code>TBoolean isMatchingAt(in TInteger position)</code>                           | Returns <code>true</code> if the item at <code>position</code> of this TTCN-3 octetstring is a matching mechanism inside a value ( <code>AnyElement</code> , <code>AnyElementsOrNone</code> ) and <code>false</code> otherwise.                       |
| <code>MatchingMechanism getMatchingAt(in TInteger position)</code>                 | If the <code>position</code> of this TTCN-3 octetstring contains a matching mechanism inside a value ( <code>AnyElement</code> , <code>AnyElementsOrNone</code> ), the method returns it. Otherwise the distinct value <code>null</code> is returned. |
| <code>void setMatching(in TInteger position, in MatchingMechanism template)</code> | Sets a matching mechanism at <code>position</code> . Only two matching mechanisms are allowed: <code>AnyElement</code> and <code>AnyElementsOrNone</code> .                                                                                           |

#### 7.2.2.2.9 The abstract data type `HexstringValue`

The abstract data type `HexstringValue` is based on the abstract data type `Value`. It represents TTCN-3 `hexstring` values. This abstract data type uses a parameter `position` in some of its operations for addressing individual hex digits or embedded matching mechanisms. The following rules are valid in this case:

- Position 0 denotes the first hex digit or matching mechanism of the TTCN-3 `hexstring`
- Valid values for position are from 0 to `length - 1`, where `length` is the total number of hex digits and individual matching mechanisms in the value

Each individual matching mechanism takes exactly one position regardless of how many hex digits it can match.

The following operations are defined on the abstract data type `HexstringValue`:

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TString getString()</code>                                  | Returns the textual representation of this <code>HexstringValue</code> , as defined in TTCN-3. E.g. the textual representation of <code>0xAFFEE</code> is <code>'AFFEE'H</code> . The textual representation of the empty TTCN-3 <code>hexstring</code> is <code>'H</code> , while its length is zero.                                                                                                         |
| <code>void setString(in TString value)</code>                     | Sets the value of this <code>HexstringValue</code> according to the textual representation as defined by <code>value</code> . E.g. The value of this <code>HexstringValue</code> is <code>0xAFFEE</code> if the textual representation in <code>value</code> is <code>'AFFEE'H</code> . The parameter may contain allowed matching symbols such as <code>AnyElement</code> or <code>AnyElementsOrNone</code> . |
| <code>TChar getHex(in TInteger position)</code>                   | Returns the value (0..15) at <code>position</code> of this TTCN-3 <code>hexstring</code> . An error will occur when the specified position contains a matching mechanism.                                                                                                                                                                                                                                      |
| <code>void setHex(in TInteger position, in TInteger value)</code> | Sets the hex digit at position to value (0..15).                                                                                                                                                                                                                                                                                                                                                               |
| <code>TInteger getLength()</code>                                 | Returns the length of this <code>HexstringValue</code> . The length is equal to the total number of hex digits and individual matching mechanisms in the value. If the value of this <code>HexstringValue</code> is <code>omit</code> , the length is equal to 0. Each individual matching mechanism is considered to have the length of one hex digit regardless of how many hex digits it can match.         |
| <code>void setLength(in TInteger len)</code>                      | <code>setLength</code> first resets this <code>HexstringValue</code> to its initial value and afterwards sets the length of this <code>HexstringValue</code> in hex digits to <code>len</code> .                                                                                                                                                                                                               |
| <code>TBoolean isMatchingAt(in TInteger position)</code>          | Returns <code>true</code> if the item at <code>position</code> of this TTCN-3 <code>hexstring</code> is a matching mechanism inside a value ( <code>AnyElement</code> , <code>AnyElementsOrNone</code> ) and <code>false</code> otherwise.                                                                                                                                                                     |

MatchingMechanism getMatchingAt(in TInteger position)

If the `position` of this TTCN-3 hexstring contains a matching mechanism inside a value (AnyElement, AnyElementsOrNone) the method returns it. Otherwise the distinct value `null` is returned.

void setMatching(in TInteger position, in MatchingMechanism template)

Sets a matching mechanism at `position`. Only two matching mechanisms are allowed: AnyElement and AnyElementsOrNone.

#### 7.2.2.2.10 The abstract data type RecordValue

The abstract data type `RecordValue` is based on the abstract data type `Value`. It specifies how to get and set the TTCN-3 record type.

NOTE: Newly created instances of empty record types are considered to be initialized.

The same abstract data type applies for values whose type class is `SET`. The distinction between `record` and `set` is only relevant at matching time.

The following operations are defined on the abstract data type `RecordValue`:

Value getField(in TString fieldName)

Returns the value of the field named `fieldName`. The return value is the common abstract base type `Value`, as a record field can have any type defined in TTCN-3. If the field cannot be obtained from the record the distinct value `null` is returned.

void setField(in TString fieldName, in Value value)

Sets the field named `fieldName` of the record to `value`. No assumption shall be made on how a field is stored in a record. An internal implementation might choose to store a reference to this value or to copy the value. It is safe to assume that the value is copied. Therefore it should be assumed that subsequent modifications of `value` will not be considered in the record. Using a `MatchingMechanism` of the `OMIT_TEMPLATE` type as the `value` parameter has the same effect as calling the `setFieldOmitted` with the `fieldName` as a parameter.

TStringSeq getFieldNames()

Returns a sequence of string of field names, the empty sequence, if the record has no fields.

void setFieldOmitted(in TString fieldName)

Mark the referenced field of the record as being omitted.

#### 7.2.2.2.11 The abstract data type RecordOfValue

The abstract data type `RecordOfValue` is based on the abstract data type `Value`. It specifies how to get and set elements in TTCN-3 `record of` types. The same abstract data type applies for value whose type class is `ARRAY` or `SET_OF`. The distinction between `record of`, `set of`, and `array` is only relevant at matching time.

This abstract data type uses a parameter `position` in some of its operations for addressing individual elements or embedded matching mechanisms. The following rules are valid in this case:

- Position 0 denotes the first element or matching mechanism of the record of, set of or array value.
- Valid values for position are from 0 to `length - 1`, where `length` is the total number of elements and individual matching mechanisms in the record of, set of and or array value.
- In case of array, element indices start from 0, independent of the lower index bound.
- Each individual matching mechanism with exception permutations takes exactly one position regardless of how many elements it can match.

- Permutation takes exactly as many positions as many items it contains: each value or matching mechanism inside it takes exactly one position.

When working with instances received from the get methods (`getField`, `getPermutation`), and passed to the set methods (`setField`, `appendField`, `setPermutation`), no assumption shall be made on how the data are stored in a `record of`. An internal implementation might choose to use a reference to the data or to copy the data. It is safe to assume that the data are copied. Therefore, it should be assumed that subsequent modifications of the field or permutation data will not be considered in the `record of`.

The following operations are defined on the abstract data type `RecordOfValue`:

|                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>Value getField(in TInteger position)</code>                | Returns the value of the <code>record of</code> at <code>position</code> if <code>position</code> is between zero and <code>length - 1</code> , the distinct value <code>null</code> otherwise. The return value is the common abstract base type <code>Value</code> , as a <code>record of</code> can have fields of any type defined in TTCN-3.                                                                                                                                                                                                                                                   |
| <code>void setField(in TInteger position, in Value value)</code> | Sets the field at <code>position</code> to <code>value</code> . If <code>position</code> is greater than <code>(length - 1)</code> the <code>record of</code> is extended to have the length <code>(position + 1)</code> . The <code>record of</code> elements between the original position at <code>length</code> and <code>position - 1</code> is set to <code>omit</code> .                                                                                                                                                                                                                     |
| <code>void appendField(in Value value)</code>                    | Appends the value at the end of the <code>record of</code> , i.e. at position <code>length</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <code>Type getElementType()</code>                               | Returns the <code>Type</code> of the elements of this <code>record of</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>TInteger getLength()</code>                                | Returns the actual length of the <code>record of</code> value, zero if the <code>record of</code> value is <code>omit</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <code>void setLength(in TInteger len)</code>                     | Sets the length of the <code>record of</code> to <code>len</code> . If <code>len</code> is greater than the original length, newly created elements have the value <code>omit</code> . If <code>len</code> is less or equal than the original length this operation is ignored.                                                                                                                                                                                                                                                                                                                     |
| <code>TInteger getOffset()</code>                                | Returns the lowest possible index. For a <code>record of</code> or <code>set of</code> value this is always 0. For an <code>array</code> value, this is the lower index bound used in the type definition.                                                                                                                                                                                                                                                                                                                                                                                          |
| <code>TInteger getPermutationCount()</code>                      | Returns the number of permutations in the <code>record of</code> or <code>array</code> value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <code>Permutation getPermutation(TInteger index)</code>          | Returns the permutation at the specified index. The allowed index range is from 0 to <code>(getPermutationCount() - 1)</code> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <code>void definePermutation(Permutation permutation)</code>     | Creates permutation from existing elements of a <code>record of</code> value. The <code>permutation</code> parameter shall not include a direct or indirect reference to elements that are already a part of other existing permutations attached to the same <code>record of</code> . In particular, no element with and index greater or equal to <code>permutation.getStartPostion()</code> and less than <code>permutation.getStartPosition() + permutation.getLength()</code> may be a part of a different permutation. No elements are added to the <code>record of</code> by this operation. |
| <code>void removePermutation(TInteger index)</code>              | Removes the permutation at the specified index. The allowed index range is from 0 to <code>(getPermutationCount() - 1)</code> . No elements are removed from the <code>record of</code> by this operation. When the operation completes, the existing elements at positions specified by the removed permutation do not belong to any permutation.                                                                                                                                                                                                                                                  |
| <code>void clearPermutations()</code>                            | Removes all permutations from the value. The elements that belonged to the removed permutation are not removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### 7.2.2.2.12 The abstract data type UnionValue

The abstract data type `UnionValue` is based on the abstract data type `Value`. It specifies how to get and set variants in a TTCN-3 union type. The TTCN-3 anytype is represented by a `UnionValue` where the type class of the type obtained by `getType()` is `ANYTYPE`. For details on type classes see clause 7.2.2.1.

The following operations are defined on the abstract data type `UnionValue`:

|                                                                      |                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>Value getVariant(in TString variantName)</code>                | Returns the value of the TTCN-3 union <code>variantName</code> , if <code>variantName</code> equals the result of <code>getPresentVariantName</code> , the distinct value <code>null</code> otherwise. <code>variantName</code> denotes the name of the union variant as defined in the TTCN-3 module.                                 |
| <code>void setVariant(in TString variantName, in Value value)</code> | Sets <code>variantName</code> of the union to <code>value</code> . If <code>variantName</code> is not defined for this union this operation is ignored. If another variant was selected the new variant is selected instead.                                                                                                           |
| <code>TString getPresentVariantName()</code>                         | Returns a <code>String</code> representing the currently selected variant name in the given TTCN-3 union. The distinct value <code>null</code> is returned if no variant is selected.                                                                                                                                                  |
| <code>TStringSeq getVariantNames()</code>                            | Returns a sequence of string of variant names, the distinct value <code>null</code> , if the union has no fields. If the <code>UnionValue</code> represents the TTCN-3 anytype, i.e. the type class of the type obtained by <code>getType()</code> is <code>ANYTYPE</code> , all predefined and user-defined TTCN-3 types is returned. |

### 7.2.2.2.13 The abstract data type EnumeratedValue

The abstract data type `EnumeratedValue` is based on the abstract data type `Value`. It specifies how TTCN-3 `enumerated` can be set and get.

The following operations are defined on the abstract data type `EnumeratedValue`:

|                                                 |                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TString getEnum()</code>                  | Returns the string identifier of this <code>EnumeratedValue</code> . This identifier equals the identifier in the TTCN-3 specification.                                                                                                                                                          |
| <code>void setEnum(in TString enumValue)</code> | Sets the enum to <code>enumValue</code> . If <code>enumValue</code> is not an allowed value for this enumeration the operation is ignored.                                                                                                                                                       |
| <code>TInteger getInt()</code>                  | Returns the integer value of this <code>EnumeratedValue</code> . This integer equals the user-assigned integer value in the TTCN-3 specification or the automatically assigned integer value.                                                                                                    |
| <code>setInt(in TInteger intValue)</code>       | Sets the integer value of this <code>EnumeratedValue</code> . This integer should equal the user-assigned integer value in the TTCN-3 specification or the automatically assigned integer value. If <code>intValue</code> is not an allowed value for this enumeration the operation is ignored. |

### 7.2.2.2.14 The abstract data type VerdictValue

The abstract data type `VerdictValue` is based on the abstract data type `Value`. It specifies how TTCN-3 `verdict` can be set and get.

The following operations are defined on the abstract data type `VerdictValue`:

|                                    |                                                                                                                                                                                                                                                |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TInteger getVerdict()</code> | Returns the integer value for this <code>VerdictValue</code> . The integer is one of the following constants: <code>ERROR</code> , <code>FAIL</code> , <code>INCONC</code> , <code>NONE</code> , <code>PASS</code> , <code>USER_ERROR</code> . |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

```
void setVerdict(in TInteger verdict)
```

Sets this `VerdictValue` to `verdict`. Note that a `VerdictValue` can be set to any of the above mentioned verdicts at any time. The `VerdictValue` does not perform any verdict calculations as defined in TTCN-3. For example, it is legal to set the `VerdictValue` first to `INCONC` and then to `PASS`.

#### 7.2.2.2.15 The abstract data type `AddressValue`

The following operations are defined on the base abstract data type `AddressValue`. The concrete representations of these operations are defined in the respective language mapping sections:

```
Value getAddress() Returns the address value, which will no longer be of type class ADDRESS
but rather of the actual type used for address.
```

```
void setAddress(in Value value) Sets this address value to value.
```

### 7.2.2.3 Abstract TTCN-3 matching mechanisms

#### 7.2.2.3.1 The abstract data type `MatchingMechanism`

In case a template can occur in a TCI operation in the same place as a value (e.g. in a function call).

TTCN-3 matching mechanisms are represented at the TCI interfaces via numerous abstract data types. All matching mechanisms share the same abstract data type `MatchingMechanism`. This data type is based on the abstract data type `Value` and inherits all its operations. While simpler matching mechanisms that do not have any additional properties are represented by the `MatchingMechanism` data type, more complex ones have their own dedicated data types. These data types are derived from the `MatchingMechanism` data type implicitly inherit all its operations.

The abstract data type `MatchingMechanism` defines operations that are common for all TCI matching mechanisms. It is also used to represent simple matching mechanisms with no additional properties, in particular: `AnyValue`, `AnyValueOrNone`, `AnyElement`, `AnyElementsOrNone`, `omit`.

The following operations are defined on the base abstract data type `MatchingMechanism`. The concrete representations of these operations are defined in the respective language mapping sections:

```
TciMatchingTypeType getMatchingType() Returns the matching mechanism type. A value of
TciMatchingTypeType can have one of the following constants:
TEMPLATE_LIST, COMPLEMENTED_LIST, ANY_VALUE,
ANY_VALUE_OR_NONE, VALUE_RANGE, SUBSET, SUPERSET,
ANY_ELEMENT, ANY_ELEMENTS_OR_NONE, PATTERN,
MATCH_DECODED_CONTENT, OMIT_TEMPLATE.
```

NOTE: `OMIT_TEMPLATE` is used to represent an omit matching symbol assigned to a top-level template. Omitted fields of record templates are represented in a different way (see clause 7.2.2.2.10 for more details).

#### 7.2.2.3.2 The abstract data type `MatchingList`

The abstract data type `MatchingList` is used to represent matching mechanisms that contain a list of items of the same type: template list, complemented template list, `SubSet` and `SuperSet`.

This abstract data type uses a parameter `position` in some of its operations for addressing individual values or templates inside this matching mechanism. The following rules are valid in this case:

- Position 0 denotes the first value or template in the TTCN-3 matching mechanism
- Valid values for position are from 0 to (`size()` - 1)

When working with instances received from the `get` method and passed to the set methods (`add`, `insert`), no assumption shall be made on how the data are stored in a matching mechanism. An internal implementation might choose to use a reference to the data or to copy the data. It is safe to assume that the data are copied. Therefore, it should be assumed that subsequent modifications of the data will not be considered in the matching mechanism.

The following operations are defined on the base abstract data type `MatchingList`:

|                                             |                                                                                                     |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>TInteger size()</code>                | Returns the number of items in the matching mechanism.                                              |
| <code>Value get(TInteger position)</code>   | Returns the value or template at the specified <code>position</code> inside the matching mechanism. |
| <code>void add(Value item)</code>           | Adds a new <code>item</code> to the end of the matching list, increasing its size.                  |
| <code>void remove(TInteger position)</code> | Removes the value or template at the specified <code>position</code> inside the matching mechanism. |
| <code>void clear()</code>                   | Removes all values and templates from the matching mechanism.                                       |

### 7.2.2.3.3 The abstract data type `ValueRange`

The abstract data type `ValueRange` is used to represent the value range matching mechanism.

When working with instances received from the `get` methods (`getLowerBoundary`, `getUpperBoundary`) and passed to the set methods (`setLowerBoundary`, `setUpperBoundary`), no assumption shall be made on how the data are stored in a matching mechanism. An internal implementation might choose to use a reference to the data or to copy the data. It is safe to assume that the data are copied. Therefore, it should be assumed that subsequent modifications of the data will not be considered in the `ValueRange` instance.

The following operations are defined on the base abstract data type `ValueRange`:

|                                                                 |                                          |
|-----------------------------------------------------------------|------------------------------------------|
| <code>RangeBoundary getLowerBoundary()</code>                   | Returns the lower boundary of the range. |
| <code>RangeBoundary getUpperBoundary()</code>                   | Returns the upper boundary of the range. |
| <code>void setLowerBoundary(RangeBoundary lowerBoundary)</code> | Sets the lower boundary of the range.    |
| <code>void setUpperBoundary(RangeBoundary upperBoundary)</code> | Sets the upper boundary of the range.    |

### 7.2.2.3.4 The abstract data type `CharacterPattern`

The abstract data type `CharacterPattern` is used to represent the character pattern matching mechanism.

When working with instances received from the `getPatternString` method and passed to the `setPatternString` method, no assumption shall be made on how the data are stored in a matching mechanism. An internal implementation might choose to use a reference to the data or to copy the data. It is safe to assume that the data are copied. Therefore, it should be assumed that subsequent modifications of the data will not be considered in the `CharacterPattern` instance.

The following operations are defined on the base abstract data type `CharacterPattern`:

|                                                            |                                                                                                                                                                                                   |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>Value getPatternString ()</code>                     | Returns the character pattern definition of this pattern (either a <code>CharstringValue</code> or <code>UniversalCharstringValue</code> ).                                                       |
| <code>void setPatternString(Value characterPattern)</code> | Sets the character pattern definition of this pattern. The <code>characterPattern</code> parameter shall contain either a <code>CharstringValue</code> or <code>UniversalCharstringValue</code> . |

### 7.2.2.3.5 The abstract data type MatchDecodedContent

The abstract data type `MatchDecodedContent` is used to represent the `decmatch` matching mechanism.

When working with instances received from the `getContent` method and passed to the `setContent` method, no assumption shall be made on how the data are stored in a matching mechanism. An internal implementation might choose to use a reference to the data or to copy the data. It is safe to assume that the data are copied. Therefore, it should be assumed that subsequent modifications of the data will not be considered in the `DecodedMatch` instance.

The following operations are defined on the base abstract data type `DecodedMatch`:

|                                             |                                                                                                                   |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>Value getContent()</code>             | Returns the value or matching mechanism used as an argument of the <code>decmatch</code> matching mechanism.      |
| <code>void setContent(Value content)</code> | Sets the value or matching mechanism that is used as an argument of the <code>decmatch</code> matching mechanism. |

### 7.2.2.4 Data types for complex TTCN-3 properties

#### 7.2.2.4.0 Scope of use of TTCN-3 properties

The abstract data types described in the clause 7.2.2.4 are used to describe complex properties of TTCN-3 values and matching mechanisms.

#### 7.2.2.4.1 The abstract data type LengthRestriction

The abstract data type `LengthRestriction` is used to represent the length restriction matching attribute.

The following operations are defined on the base abstract data type `LengthRestriction`:

|                                                       |                                                                                                     |
|-------------------------------------------------------|-----------------------------------------------------------------------------------------------------|
| <code>TInteger getLowerBoundary()</code>              | Returns the lower boundary of the length restriction.                                               |
| <code>TInteger getUpperBoundary()</code>              | Returns the upper boundary of the length restriction.                                               |
| <code>void setLowerBoundary(TInteger boundary)</code> | Sets the lower boundary value.                                                                      |
| <code>void setUpperBoundary(TInteger boundary)</code> | Sets the upper boundary value.                                                                      |
| <code>TBoolean isUpperBoundaryInfinity()</code>       | Returns <code>true</code> if the upper boundary contains infinity and <code>false</code> otherwise. |
| <code>void setInfiniteUpperBoundary()</code>          | Sets the upper boundary to infinity.                                                                |

#### 7.2.2.4.2 The abstract data type Permutation

The abstract data type `Permutation` is used to describe properties of a permutation matching mechanism embedded in a `RecordOfValue` instance.

The following operations are defined on the base abstract data type `Permutation`:

|                                                  |                                                                                                                               |
|--------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| <code>TInteger getStartPosition()</code>         | Returns the position of the first item of the permutation in the <code>RecordOfValue</code> .                                 |
| <code>setStartPosition(TInteger position)</code> | Sets the position of the first item of the permutation in the <code>RecordOfValue</code> .                                    |
| <code>TInteger getLength()</code>                | Returns the number of elements or matching mechanisms of the <code>RecordOfValue</code> that are included in the permutation. |

`void setLength(TInteger length)`      Sets the number of elements or matching mechanisms of the `RecordOfValue` that are included in the permutation.

#### 7.2.2.4.3 The abstract data type `RangeBoundary`

The abstract data type `RangeBoundary` is used to describe properties of lower and upper bound of `ValueRange` instances.

The following operations are defined on the base abstract data type `RangeBoundary`:

|                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>Value getBoundary()</code>                                  | Returns the boundary value. Dependent on the type of the value range, the return value can be either an <code>IntegerValue</code> , <code>FloatValue</code> , <code>CharstringValue</code> or <code>UniversalCharstringValue</code> . If the boundary is undefined or it cannot be represented by a <code>Value</code> instance (infinity in case of integer values), the distinct value <code>null</code> is returned. |
| <code>TBoolean isInclusive()</code>                               | Returns <code>true</code> if the boundary value is a part of the allowed range and <code>false</code> otherwise.                                                                                                                                                                                                                                                                                                        |
| <code>void setBoundary(Value boundary, TBoolean inclusive)</code> | Sets the boundary value. Dependent on the type of the value range, the boundary parameter can contain either an <code>IntegerValue</code> , <code>FloatValue</code> , <code>UniversalCharstringValue</code> or <code>CharstringValue</code> . The inclusive parameter determines whether the boundary value is a part of the range ( <code>true</code> ) or not ( <code>false</code> ).                                 |
| <code>TBoolean isInfinity()</code>                                | Returns <code>true</code> if the boundary is equal to infinity or -infinity and <code>false</code> otherwise. The infinity setting is context-dependent. If the <code>RangeBoundary</code> instance is used as a lower boundary, it will be interpreted as -infinity and if it is used as an upper boundary, it will be interpreted as infinity.                                                                        |
| <code>void setToInfinity()</code>                                 | Sets the boundary to infinity.                                                                                                                                                                                                                                                                                                                                                                                          |

### 7.2.3 Abstract logging types

#### 7.2.3.1 The abstract data type `TciValueTemplate`

The following operations are defined on the abstract data type `TciValueTemplate`. The concrete representations of these operations are defined in the respective language mapping sections:

|                                       |                                                                       |
|---------------------------------------|-----------------------------------------------------------------------|
| <code>TBoolean isOmit()</code>        | Returns <code>true</code> if the template is an omit template.        |
| <code>TBoolean isAny()</code>         | Returns <code>true</code> if the template is an any template.         |
| <code>TBoolean isAnyOrOmit()</code>   | Returns <code>true</code> if the template is an any or omit template. |
| <code>TString getTemplateDef()</code> | Returns the definition of that template.                              |

#### 7.2.3.2 The abstract data type `TciNonValueTemplate`

The following operations are defined on the abstract data type `TciNonValueTemplate`. The concrete representations of these operations are defined in the respective language mapping sections:

|                                       |                                                               |
|---------------------------------------|---------------------------------------------------------------|
| <code>TBoolean isAny()</code>         | Returns <code>true</code> if the template is an any template. |
| <code>TBoolean isAll()</code>         | Returns <code>true</code> if the template is an all template. |
| <code>TString getTemplateDef()</code> | Returns the definition of that template.                      |

### 7.2.3.3 The Value List and Mismatch Types

The following abstract data types are defined and used for the logging of differences between values and templates:

|                                     |                                                                                                                                                |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>TciValueList</code>           | A value of <code>TciValueList</code> is a list of values.                                                                                      |
| <code>TciValueDifference</code>     | A value of <code>TciValueDifference</code> is a structure containing a value, a template, and a description for the reason of this difference. |
| <code>TciValueDifferenceList</code> | A value of <code>TciValueDifferenceList</code> is a sequence of value differences.                                                             |

The following operations are defined on the abstract data type `TciValueList`. The concrete representations of these operations are defined in the respective language mapping sections:

|                                           |                                                            |
|-------------------------------------------|------------------------------------------------------------|
| <code>TInteger size()</code>              | Returns the number of values in this list.                 |
| <code>TBoolean isEmpty()</code>           | Returns <code>true</code> if this list contains no values. |
| <code>Value get(in TInteger index)</code> | Returns the value at the specified position.               |

The following operations are defined on the abstract data type `TciValueDifference`. The concrete representations of these operations are defined in the respective language mapping sections:

|                                                     |                                                               |
|-----------------------------------------------------|---------------------------------------------------------------|
| <code>Value getValue()</code>                       | Returns the value of the <code>TciValueDifference</code> .    |
| <code>TciValueTemplate getTciValueTemplate()</code> | Returns the template of the <code>TciValueDifference</code> . |
| <code>String getDescription()</code>                | Returns the description of the mismatch.                      |

The following operations are defined on the abstract data type `TciValueDifferenceList`. The concrete representations of these operations are defined in the respective language mapping sections:

|                                                        |                                                                        |
|--------------------------------------------------------|------------------------------------------------------------------------|
| <code>TInteger size()</code>                           | Returns the number of values in the list.                              |
| <code>TBoolean isEmpty()</code>                        | Returns <code>true</code> if the list contains no values.              |
| <code>TciValueDifference get(in TInteger index)</code> | Returns the <code>TciValueDifference</code> at the specified position. |

### 7.2.3.4 The Status Types

The following abstract data types are defined and used for the logging of component and timer status:

|                                  |                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <code>ComponentStatusType</code> | A value of <code>ComponentStatusType</code> is either "inactiveC", "runningC", "stoppedC", "killedC", or "nullC". |
| <code>TimerStatusType</code>     | A value of <code>TimerStatusType</code> is either "runningT", "inactiveT", "expiredT", or "nullC".                |
| <code>PortStatusType</code>      | A value of <code>PortStatusType</code> is either "startedP", "haltedP", or "stoppedP".                            |

## 7.3 TCI operations

### 7.3.0 The TCI interfaces

The clause 7.3 specifies the operations that a TTCN-3 Executable shall provide to a test system (*required operations*) and which functionality shall be provided by the test system to the TTCN-3 Executable (*provided operations*).

The terms "required" and "provided" reflect the fact that the present document defines the requirements on a TTCN-3 Executable from a user's point of view. The user "requires" from a TTCN-3 Executable certain functionality to build a complete TTCN-3-based test system. To fulfil its task the TTCN-3 Executable has to inform the user on certain events where the user has to "provide" this possibility to the TTCN-3 Executable.

All operation definitions in this clause are defined using the Interface Definition Language (IDL). Concrete language mappings are defined in clauses 8, 9, 10, 11 and 12. Annex B provides for the logging interface an alternative mapping to XML.

For every TCI operation call all *in*, *inout*, and *out* parameters listed in the particular operation definition are mandatory. The value of an *in* parameter is specified by the calling entity. Calling entity refers to the direction of the call. For operations on a *required* interface the calling entity is the test system while the called entity is the TTCN-3 Executable. For operations on a *provided* interface the calling entity is the TTCN-3 Executable while the test system is the called entity.

Similarly, the value of an *out* parameter is specified by the called entity. In the case of an *inout* parameter, a value is first specified by the calling entity but may be replaced with a new value by the called entity. Note that although TTCN-3 also uses *in*, *inout*, and *out* for signature definitions the denotations used in TCI IDL specification are not related to those in a TTCN-3 specification.

Operation calls should use a reserved value to indicate the absence of parameters. The reserved values for these types are defined in each language mapping and will be subsequently referred to as the `null` value.

In addition, the `null` value will also be used to indicate the inability to perform a certain task.

As this clause specifies interfaces only and does not suggest concrete implementations on how to perform the specified functionality the term entity will be used to identify the part of the test system implementation that implements this interface and performs the requested functionality. For example, the calling entity in the `tcISendConnected` operation is the TE, i.e. the part of test system implementation that provides the TE functionality.

All functions in the interface are described using the following template. Descriptions that are not applicable for certain operations are removed.

|                         |                                                                                                                                                               |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signature</b>        | IDL Signature                                                                                                                                                 |
| <b>In Parameters</b>    | Description of data passed as parameters to the operation from the calling entity to the called entity.                                                       |
| <b>Out Parameters</b>   | Description of data passed as parameters to the operation from the called entity to the calling entity.                                                       |
| <b>InOut Parameters</b> | Description of data passed as parameters to the operation from the calling entity to the called entity and from the called entity back to the calling entity. |
| <b>Return Value</b>     | Description of data returned from the operation to the calling entity.                                                                                        |
| <b>Constraint</b>       | Description of any constraints when the operation can be called.                                                                                              |
| <b>Effect</b>           | Behaviour required of the called entity before the operation may return.                                                                                      |

## 7.3.1 The TCI-TM interface

### 7.3.1.0 Scope of use

The TCI Test Management Interface (TCI-TM) describes the operations a TTCN-3 Executable is required to implement and the operations a test management implementation shall provide to the TE (figure 5).

Figure 5: The TCI-TM interface

A test management implementation provides overall test management to the test system user. It requires from the TE the presence of operations to start and stop test execution of a TTCN-3 module or of certain test cases in a TTCN-3 module. In turn it provides operations to the TE for resolving module parameter at runtime and the indication of execution termination.

Annex C illustrates the usage and sequential ordering of operation calls by either the TE or the test management.

### 7.3.1.1 TCI-TM required

#### 7.3.1.1.0 Scope of use

Clause 7.3.1.1 specifies the operations the TM requires from the TE. In addition to the operations specified in this clause, a test management requires the operations as required at the TCI-CD interface.

#### 7.3.1.1.1 tciRootModule

|                      |                                                                                                                                                                                             |                                                                                |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|
| <b>Signature</b>     | void tciRootModule (in TciModuleIdType moduleName)                                                                                                                                          |                                                                                |
| <b>In Parameters</b> | moduleName                                                                                                                                                                                  | The moduleName denotes the module identifiers as defined in the TTCN-3 module. |
| <b>Return Value</b>  | void                                                                                                                                                                                        |                                                                                |
| <b>Constraint</b>    | Shall be used only if neither the control part nor a test case is currently being executed.                                                                                                 |                                                                                |
| <b>Effect</b>        | tciRootModule selects the indicated module for execution through a subsequent call using tciStartTestCase or tciStartControl. A tciError will be issued by the TE if no such module exists. |                                                                                |

## 7.3.1.1.2 tciGetImportedModules

|                     |                                                                                                                                                                                                                              |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signature</b>    | TciModuleIdListType tciGetImportedModules()                                                                                                                                                                                  |
| <b>Return Value</b> | A list of all imported modules of the root module. The modules are ordered as they appear in the TTCN-3 module. If no imported modules exist, an empty module list is returned.                                              |
| <b>Constraint</b>   | Shall be used only if a root module has been set before.                                                                                                                                                                     |
| <b>Effect</b>       | The TE provides to the management a list of imported modules of the root module. If no imported module exists, an empty module list is returned. If the TE cannot provide a list, the distinct null value shall be returned. |

## 7.3.1.1.3 tciGetModuleParameters

|                      |                                                                                                                                                                                                                                                |                                                                                                    |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| <b>Signature</b>     | TciModuleParameterListType tciGetModuleParameters (in TciModuleIdType moduleName)                                                                                                                                                              |                                                                                                    |
| <b>In Parameters</b> | moduleName                                                                                                                                                                                                                                     | The moduleName denotes the module identifiers for which the module parameters should be retrieved. |
| <b>Return Value</b>  | A list of all module parameters of the identified module. The parameters are ordered as they appear in the TTCN-3 module. If no parameters exist, an empty module parameter list is returned.                                                  |                                                                                                    |
| <b>Constraint</b>    | Shall be used only if a root module has been set before.                                                                                                                                                                                       |                                                                                                    |
| <b>Effect</b>        | The TE provides to the management a list of module parameters of the identified module. If no module parameters exist, an empty module parameter list is returned. If the TE cannot provide a list, the distinct null value shall be returned. |                                                                                                    |

## 7.3.1.1.4 tciGetTestCases

|                     |                                                                                                                                                                                                  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signature</b>    | TciTestCaseIdListType tciGetTestCases ()                                                                                                                                                         |
| <b>Return Value</b> | A list of all test cases that are either defined in or imported into the root module.                                                                                                            |
| <b>Constraint</b>   | Shall be used only if a root module has been set before.                                                                                                                                         |
| <b>Effect</b>       | The TE provides to the management a list of test cases. If no test cases exist, an empty test case list is returned. If the TE cannot provide a list, the distinct null value shall be returned. |

## 7.3.1.1.5 tciGetTestCaseParameters

The parameters in parameterList are ordered as they appear in the TTCN-3 signature of the test case. If no parameters have to be passed either the null value or an empty parameterList, i.e. a list of length zero shall be passed. |
| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Constraint</b>    | Shall be called only if a module has been selected before. Only testCaseIds for test cases that are declared in the currently selected TTCN-3 module shall be passed. Test cases that are imported in a referenced module cannot be started. To start imported test cases the referenced (imported) module shall be selected first using the tciRootModule operation.                                                 |                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Effect</b>        | tciStartTestCase starts a test case in the currently selected module with the given parameters. A tciError will be issued by the TE if no such test case exists.<br>All <i>in</i> and <i>inout</i> test case parameters in parameterList contain Value. All <i>out</i> test case parameters in parameterList shall contain the distinct value of null since they are only of relevance when the test case terminates. |                                                                                                                                                                                                                                                                                                                                                                   |

## 7.3.1.1.8 tciStopTestCase

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Signature</b>    | void tciStopTestCase()                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |
| <b>Return Value</b> | void                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |  |
| <b>Constraint</b>   | Shall be called only if a module has been selected before.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |  |
| <b>Effect</b>       | tciStopTestCase stops the test case currently being executed. If the TE is not executing a test case, the operation will be ignored. If the control part is being executed, tciStopTestCase will stop execution of the currently executed test case, i.e. the execution of the test case that has recently been indicated using the <i>provided</i> operation tciTestCaseStarted. A possible executing control part will continue execution as if the test case has stopped normally and returned with verdict ERROR. |  |

## 7.3.1.1.9 tciStartControl

|                     |                                                                                                                                                                                                                                                                                                                                                                                                                                      |  |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Signature</b>    | TriComponentId tciStartControl()                                                                                                                                                                                                                                                                                                                                                                                                     |  |
| <b>Return Value</b> | A TriComponentId that represents the test component the module control part is executed on. If the TE cannot start control part of the selected module the distinct value null will be returned.                                                                                                                                                                                                                                     |  |
| <b>Constraint</b>   | Shall be called only if a module has been selected before.                                                                                                                                                                                                                                                                                                                                                                           |  |
| <b>Effect</b>       | Starts the control part of the selected module. The control part will start TTCN-3 test cases as described in TTCN-3. While executing the control part the TE will call the <i>provided</i> operation tciTestCaseStarted and tciTestCaseTerminated for every test case that has been started and that has terminated. After termination of the control part the TE will call the <i>provided</i> operation tciControlPartTerminated. |  |

## 7.3.1.1.10 tciStopControl

|                     |                                                                                                                                                                                                                                                                     |  |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| <b>Signature</b>    | void tciStopControl()                                                                                                                                                                                                                                               |  |
| <b>Return Value</b> | void                                                                                                                                                                                                                                                                |  |
| <b>Constraint</b>   | Shall only be called if a module has been selected before.                                                                                                                                                                                                          |  |
| <b>Effect</b>       | tciStopControl stops execution of the control part. If no control part is currently being executed the operation will be ignored. If a test case has been started directly this will stop execution of the current test case as if tciStopTestCase has been called. |  |

### 7.3.1.2 TCI-TM provided

#### 7.3.1.2.0 Scope of use

The clause 7.3.1.2 specifies the operations the TM has to provide to the TE.

#### 7.3.1.2.1 tciTestCaseStarted

|                      |                                                                                                                                                                                                                                                                               |                                                                                                                                                            |

| <b>Signature</b>     | void tciTestCaseTerminated(in VerdictValue verdict,<br>in TciParameterListType parameterList)                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                            |
| <b>In Parameters</b> | verdict                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | The final verdict of the test case.                                                                                                                        |
|                      | parameterList                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | A list of values that are part of the test case signature. The parameters in parameterList are ordered as they appear in the TTCN-3 test case declaration. |
| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                            |
| <b>Constraint</b>    | Shall only be called after either the control part of the module or a test case has been started using the <i>required</i> operations tciStartControl or tciStartTestCase.                                                                                                                                                                                                                                                                                                           |                                                                                                                                                            |
| <b>Effect</b>        | This operation will be called by the TE to indicate the test management that the test case that has been currently executed on the MTC has terminated and that the final verdict was verdict. On the invocation of a tciTestCaseTerminated operation all <i>out</i> and <i>inout</i> test case parameters contain Values. All in test case parameters contain the distinct value of null because they are only of relevance to the test case start but not in the reply to the call. |                                                                                                                                                            |

#### 7.3.1.2.3 tciControlTerminated

|                     |                                                                                                                                                     |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signature</b>    | void tciControlTerminated ()                                                                                                                        |
| <b>Return Value</b> | void                                                                                                                                                |
| <b>Constraint</b>   | Shall only be called when the module execution has been started using the tciStartControl operation.                                                |
| <b>Effect</b>       | This operation will be called by the TE to indicate the test management that the control part of the selected module has just terminated execution. |

## 7.3.1.2.4 tciGetModulePar

|                      |                                                                                                                                                                                                                                                                                                                                                                              |                                                                         |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| <b>Signature</b>     | Value tciGetModulePar (in TciModuleParameterIdType parameterId)                                                                                                                                                                                                                                                                                                              |                                                                         |
| <b>In Parameters</b> | parameterId                                                                                                                                                                                                                                                                                                                                                                  | The identifier of the module parameter as defined in the TTCN-3 module. |
| <b>Return Value</b>  | A value.                                                                                                                                                                                                                                                                                                                                                                     |                                                                         |
| <b>Constraint</b>    | This operation shall be called whenever the TE needs to access the value of a module parameter. Every accessed module parameter will be resolved only once between a tciStartTestCase and tciTestCaseTerminated pair if a test case has been started explicitly or between a tciStartControl and tciControlTerminated pair if the control part of a module has been started. |                                                                         |
| <b>Effect</b>        | The management provides to the TE a Value for the indicated parameterId. Every call of tciGetModulePar ( ) will return the same value throughout the execution of an explicitly started test case or throughout the execution of a control part. If the management cannot provide a TTCN-3 value, the distinct null value shall be returned.                                 |                                                                         |

|                      |                                                                                                                                           |                                                    |
|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------|
| <b>Signature</b>     | void tciLog (in TriComponentIdType testComponentId,<br>in TString message)                                                                |                                                    |
| <b>In Parameters</b> | testComponentId                                                                                                                           | Identifier of the component that logs the message. |
|                      | message                                                                                                                                   | A string value, i.e. the message to be logged.     |
| <b>Return Value</b>  | void                                                                                                                                      |                                                    |
| <b>Constraint</b>    | Shall be called by the TE when the TTCN-3 statement log will be executed, either in the control part of a module or within the test case. |                                                    |
| <b>Effect</b>        | The TM presents testComponentId and message to the user, how this done is not within the scope of the present document.                   |                                                    |

## 7.3.1.2.6 tciError

|                      |                                                                                                                                                                                                                                                                                                                                                        |                                         |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|
| <b>Signature</b>     | void tciError(in TString message)                                                                                                                                                                                                                                                                                                                      |                                         |
| <b>In Parameters</b> | message                                                                                                                                                                                                                                                                                                                                                | A string value, i.e. the error message. |
| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                   |                                         |
| <b>Constraint</b>    | Can be called at any time by the TE to indicate an unrecoverable error situation. This error situation could either be indicated by the CH or the CD or could occur within the TE.                                                                                                                                                                     |                                         |
| <b>Effect</b>        | The TE indicates the occurrence of an unrecoverable error situation. message contains a reason phrase that might be communicated to the test system user. It is up to the test management to terminate execution of test cases or control parts if running. The test management has to take explicit measures to terminate test execution immediately. |                                         |

## 7.3.2 The TCI-CD interface

## 7.3.2.0 Scope of use

The TCI Codec Interface (TCI-CD) describes the operations a TTCN-3 Executable is required to implement and the operations a codec implementation for a certain encoding scheme shall provide to the TE (see figure 6).

Figure 6: The TCI-CD interface

A codec implementation encodes TTCN-3 values according to the encoding attribute into a bitstring and decodes a bitstring according to decoding hypothesis. To be able to decode a bitstring into a TTCN-3 value the CD requires certain functionality from the TE. In turn the CD provides encoding and decoding functionality to the TTCN-3 Executable.

Annex C illustrates the usage and sequential ordering of operation calls by either the TE or the CD.

### 7.3.2.1 TCI-CD required

#### 7.3.2.1.0 Scope of use

The clause 7.3.2.1 specifies the operations the CD requires from the TE. All operations specified in this clause are also required at the TCI-TM and TCI-CH interfaces.

#### 7.3.2.1.1 getTypeForName

| Signature     | Type getTypeForName(in TString typeName)       |                                                                                                                                                                                                                                                                                      |
|---------------|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| In Parameters | typeName                                       | The TTCN-3 name of the type as defined in the TTCN-3 module. The following are reserved type names and will return a predefined type:<br>"integer"<br>"float"<br>"bitstring"<br>"hexstring"<br>"octetstring"<br>"charstring"<br>"universal charstring"<br>"boolean"<br>"verdicttype" |
|               |                                                | typeName has to be the fully qualified type name, i.e. module.typeName                                                                                                                                                                                                               |
| Return Value  | A type representing the requested TTCN-3 type. |                                                                                                                                                                                                                                                                                      |
| Constraint    | ---                                            |                                                                                                                                                                                                                                                                                      |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Effect</b> | Returns a type representing a TTCN-3 type. Predefined TTCN-3 types can be retrieved from the TE by using the TTCN-3 keywords for the predefined types. In this case typeName denotes to the basic TTCN-3 type like "charstring", "bitstring", etc.<br>Returns the distinct value null if the requested type cannot be returned. Note that the anytype and address cannot be obtained with module set to null. Although they are predefined types they might be distinct between modules. For example, address can either be the unmodified predefined type, or a user-defined type in a module. Other predefined types cannot be redefined. |
|---------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

#### 7.3.2.1.2 getInteger

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <b>Signature</b>    | Type getInteger()                                       |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 integer type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 integer type.     |

#### 7.3.2.1.3 getFloat

|                     |                                                       |
|---------------------|-------------------------------------------------------|
| <b>Signature</b>    | Type getFloat()                                       |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 float type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 float type.     |

#### 7.3.2.1.4 getBoolean

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <b>Signature</b>    | Type getBoolean()                                       |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 boolean type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 boolean type.     |

#### 7.3.2.1.5 Void

#### 7.3.2.1.6 getCharstring

|                     |                                                            |
|---------------------|------------------------------------------------------------|
| <b>Signature</b>    | Type getCharstring ()                                      |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 charstring type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 charstringtype.      |

#### 7.3.2.1.7 getUniversalCharstring

|                     |                                                                      |
|---------------------|----------------------------------------------------------------------|
| <b>Signature</b>    | Type getUniversalCharstring ()                                       |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 universal charstring type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 universal charstring type.     |

#### 7.3.2.1.8 getHexstring

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| <b>Signature</b>    | Type getHexstring ()                                      |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 hexstring type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 hexstring type.     |

#### 7.3.2.1.9 getBitstring

|                     |                                                           |
|---------------------|-----------------------------------------------------------|
| <b>Signature</b>    | Type getBitstring()                                       |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 bitstring type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 bitstring type.     |

## 7.3.2.1.10 getOctetstring

|                     |                                                             |
|---------------------|-------------------------------------------------------------|
| <b>Signature</b>    | Type getOctetstring ()                                      |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 octetstring type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 octetstring type.     |

## 7.3.2.1.11 getVerdict

|                     |                                                         |
|---------------------|---------------------------------------------------------|
| <b>Signature</b>    | Type getVerdict()                                       |
| <b>Return Value</b> | An instance of Type representing a TTCN-3 verdict type. |
| <b>Effect</b>       | Constructs and returns a basic TTCN-3 verdict type.     |

## 7.3.2.1.12 tciErrorReq

|                      |                                                                                                                                       |                                                               |

|                      | decodingHypothesis                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | The hypothesis the decoding can be based on. |
| <b>Return Value</b>  | Returns the decoded value, if the value is of a compatible type as the decodingHypothesis, else the distinct value null.                                                                                                                                                                                                                                                                                                                                                                                                                             |                                              |
| <b>Constraint</b>    | This operation shall be called whenever the TE has to implicitly decode an encoded value (e.g. when performing a port operation such as receive, trigger, getcall, getreply, catch, check or calling an external function). The TE might decode immediately after reception of an encoded value, or might for performance considerations postpone the decoding until the actual access of the encoded value.                                                                                                                                         |                                              |
| <b>Effect</b>        | This operation decodes message according to the encoding rules and returns a TTCN-3 value. The decodingHypothesis shall be used to determine whether the encoded value can be decoded. If an encoding rule is not self-sufficient, i.e. if the encoded message does not inherently contain its type decodingHypothesis shall be used. If the encoded value can be decoded without the decoding hypothesis, the distinct null value shall be returned if the type determined from the encoded message is not compatible with the decoding hypothesis. |                                              |

## 7.3.2.2.2 encode

|                      |                                                                                                                                                                                              |                          |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>Signature</b>     | TriMessageType encode(in Value value)                                                                                                                                                        |                          |
| <b>In Parameters</b> | value                                                                                                                                                                                        | The value to be encoded. |
| <b>Return Value</b>  | Returns an encoded TriMessage for the specified encoding rule.                                                                                                                               |                          |
| <b>Constraint</b>    | This operation shall be called whenever the TE has to implicitly encode a value (e.g. when performing a port operation such as send, call, reply and raise or calling an external function). |                          |
| <b>Effect</b>        | Returns an encoded TriMessage according to the encoding rules.                                                                                                                               |                          |

### 7.3.2.2.3 decodeValue

|                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                  |

| <b>Out Parameters</b> | decodedValue                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | The decoded value, if the value is of a compatible type as the decodingHypothesis, else the distinct value null. |
| <b>Return Value</b>   | An integer value indicating success of the operation: 0 in case of success, 1 in case of an unspecified decoding error and 2 if decoding could not be completed because encodedValue did not contain enough bits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                  |
| <b>Constraint</b>     | This operation shall be called whenever the TE invokes the predefined functions decvalue or decvalue_unichar.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                  |
| <b>Effect</b>         | This operation decodes message according to the encoding rules and returns the result of the decoding operation. The decodingHypothesis shall be used to determine whether the encoded value can be decoded. If an encoding rule is not self-sufficient, i.e. if the encoded message does not inherently contain its type decodingHypothesis shall be used. In case of success, the used bits are removed from the encodedValue parameter and the decoded TTCN-3 value is passed to the caller in the decodedValue parameter. In case of a failure, the TE shall ignore the content of the encodedValue and decodedValue parameter and shall act as if the former one were unchanged and the latter one contained the distinct value null. |                                                                                                                  |

|----------------------|---------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Signature</b>     | TriMessageType encode(in Value value, in TString encodingInfo)                                                |                              |
| <b>In Parameters</b> | value                                                                                                         | The value to be encoded.     |
|                      | encodingInfo                                                                                                  | Dynamic encoding parameters. |
| <b>Return Value</b>  | Returns an encoded TriMessage for the specified encoding rule.                                                |                              |
| <b>Constraint</b>    | This operation shall be called whenever the TE invokes the predefined functions encvalue or encvalue_unichar. |                              |
| <b>Effect</b>        | Returns an encoded TriMessage according to the encoding rules.                                                |                              |

## 7.3.3 The TCI-CH interface

### 7.3.3.0 Scope of use

The TCI Component Handling Interface (TCI-CH) describes the operations a TTCN-3 Executable is required to implement and the operations a component handling implementation shall provide to the TE (figure 7).

Figure 7: The TCI-CH interface

A component handling implementation distributes TTCN-3 configuration operations like create, connect and start and intercomponent communication like send on a connected port among one or more TTCN-3 Executables participating in a test session. Note that although multiple instances of a TE might participate in a test session this is not mandatory.

The basic principle is that TCI-CH is not *implementing* any kind of TTCN-3 functionality. Instead it will be informed by the TE that for example a test component shall be created. Based on Component Handling (CH) internal knowledge the request for creation of a test component will be transmitted to another (remote) participating TE. This second (remote) participating TE will create the TTCN-3 component and will provide a handle back to the requesting (local) TE. The requesting (local) TE can now operate on the created test component via this component handle.

Within the operation definitions the terms local TE and remote TE is used to highlight the fact that a test system implementation might be distributed over several test devices, each of them hosting a complete TE. The terms "local" and "remote" always refer to the interfaces currently being described. For convenience, the term "local" refers always to the TE being either the callee of an operation (for *required* operations) or the caller of an operation (for *provided* operations). While the TE is conceptually considered as being distributed, the CH is considered to be non-distributed. This can either be achieved using a centralized architecture or by using a middleware-platform that abstracts from distribution aspects. Although the TE might be distributed over different physical devices, there might be configurations where only one, non-distributed TE will participate in a test session. In this case the term "local" and "remote" refer to the same TE instance.

Annex C illustrates the usage and sequential ordering of operation calls by either the TE or the CH.

Although all TTCN-3 Executables participating in a test session are equal, there is a distinct TE\*. This TE\* is the TE where the explicit `tcStartTestCase()` or `tcStartControl()` has been processed. The reason for this distinction is, that TE\* shall calculate the global verdict. TE\* will notify the test management upon termination of test execution and shall provide then the global verdict of the test case.

### 7.3.3.1 TCI-CH required

#### 7.3.3.1.0 Scope of use

Clause 7.3.3.1 specifies the operations the CH requires from the TE. In addition to the operations specified in this clause, all *required* operations of the TCI-CD interface are also required.

## 7.3.3.1.1 tciEnqueueMsgConnected

| <b>Constraint</b>    | This operation shall be called by the CH at the local TE when at a remote TE a <i>provided</i> tciReplyConnected has been called. All <i>out</i> and <i>inout</i> procedure parameters and the return value contain values. All <i>in</i> procedure parameters shall contain the distinct value of null since they are only of relevance to the procedure call but not in the reply to the call. The parameterList contains procedure call parameters. These parameters are the parameters specified in the TTCN-3 signature template. If no return type has been defined for the procedure signature in the TTCN-3 ATS, the distinct value null shall be passed for the returnValue. |                                                                                                                                                                       |
| <b>Effect</b>        | The TE enqueues the reply at the local port queue of the indicated receiver component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                       |

| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                           |                                                  |
| <b>Constraint</b>    | This operation shall be called by the CH at the local TE when at a remote TE a <i>provided</i> tciTestComponentTerminatedReq has been called.                                                                                                                                                                                                                  |                                                  |
| <b>Effect</b>        | The local TE is notified of the termination of the indicated test component on a remote TE. Because the out values of <i>inout</i> and <i>out</i> parameters of a function being executed on a test component have no effect on that test component (ETSI ES 201 873-1 [1]), the tciTestComponentTerminated operation does not have a parameterList parameter. |                                                  |

## 7.3.3.1.15 tciTestComponentRunning

|                      |                                                                                                                                                                                                                                                                                                                                                                                   |                                                        |

|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signature</b>    | TriComponentIdType tciGetMTC()                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Return Value</b> | A TriComponentIdType value of the MTC if the MTC executes on the local TE, the distinct value null otherwise.                                                                                                                                                                                                                                                                                      |
| <b>Constraint</b>   | This operation can be called by the CH at the appropriate local TE when at a remote TE a <i>provided</i> tciGetMTCReq has been called.                                                                                                                                                                                                                                                             |
| <b>Effect</b>       | The local TE determines whether the MTC is executing on the local TE. If the MTC executes on the local TE the component id of the MTC is being returned. If the MTC is not executed on the local TE the distinct value null will be returned. The operation will have no effect on the execution of the MTC. After the operation returns, the CH will communicate the value back to the remote TE. |

#### 7.3.3.1.18 tciExecuteTestCase

|                      |                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The parameters in parameterList are ordered as they appear in the TTCN-3 signature declaration. |
| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                       |
| <b>Constraint</b>    | This operation shall be called by the TE when it executes a TTCN-3 unicast call operation on a component port, which has been connected to another component port. All <i>in</i> and <i>inout</i> procedure parameters contain values. All <i>out</i> procedure parameters shall contain the distinct value of null because they are only of relevance in a reply to the procedure call but not in the procedure call itself. The procedure parameters are the parameters specified in the TTCN-3 signature template.                                                                                                                                                                                                     |                                                                                                                                                                       |
| <b>Effect</b>        | On invocation of this operation the TE can initiate the procedure call corresponding to the signature identifier signature at the called component receiver. The tciCallConnected operation shall return without waiting for the return of the issued procedure call. Note that an optional timeout value, which can be specified in the TTCN-3 ATS for a call operation, is not included in the tciCallConnected operation signature. The TE is responsible to address this issue by starting a timer for the TTCN-3 call operation in the PA with a separate TRI operation call, i.e. triStartTimer. CH transmits the call to the remote TE on which receiver is being executed and enqueues the call in the remote TE. |                                                                                                                                                                       |

## 7.3.3.2.5 tciCallConnectedBC

|                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                       |

| <b>Constraint</b>    | This operation shall be called by the TE when it executes a TTCN-3 broadcast call operation on a component port, which has been connected to other component ports. All <i>in</i> and <i>inout</i> procedure parameters contain values. All <i>out</i> procedure parameters shall contain the distinct value of null because they are only of relevance in a reply to the procedure call but not in the procedure call itself. The procedure parameters are the parameters specified in the TTCN-3 signature template. |                                                                                                                                                                       |

|               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Effect</b> | On invocation of this operation the TE can initiate the procedure call corresponding to the signature identifier <code>signature</code> at the called component receiver. The <code>tcicallconnected</code> operation shall return without waiting for the return of the issued procedure call. Note that an optional timeout value, which can be specified in the TTCN-3 ATS for a call operation, is not included in the <code>tcicallconnected</code> operation signature. The TE is responsible to address this issue by starting a timer for the TTCN-3 call operation in the PA with a separate TRI operation call, i.e. <code>triStartTimer</code> . CH transmits the call to all remote TEs on which a receiver is being executed and enqueues the call in the remote TEs. |

| <b>Constraint</b>    | This operation shall be called by the TE when it executes a TTCN-3 multicast call operation on a component port, which has been connected to other component ports. All <i>in</i> and <i>inout</i> procedure parameters contain values. All <i>out</i> procedure parameters shall contain the distinct value of <code>null</code> because they are only of relevance in a reply to the procedure call but not in the procedure call itself. The procedure parameters are the parameters specified in the TTCN-3 signature template.                                                                                                                                                                                                                                                |                                                                                                                                                                                    |
| <b>Effect</b>        | On invocation of this operation the TE can initiate the procedure call corresponding to the signature identifier <code>signature</code> at the called component receiver. The <code>tcicallconnected</code> operation shall return without waiting for the return of the issued procedure call. Note that an optional timeout value, which can be specified in the TTCN-3 ATS for a call operation, is not included in the <code>tcicallconnected</code> operation signature. The TE is responsible to address this issue by starting a timer for the TTCN-3 call operation in the PA with a separate TRI operation call, i.e. <code>triStartTimer</code> . CH transmits the call to all remote TEs on which a receiver is being executed and enqueues the call in the remote TEs. |                                                                                                                                                                                    |

| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                      |
| <b>Constraint</b>    | This operation shall be called by the TE when it executes a TTCN-3 unicast reply operation on a component port which has been connected to another component port. All <i>out</i> and <i>inout</i> procedure parameters and the return value contain values. All <i>in</i> procedure parameters shall contain the distinct value of <code>null</code> since they are only of relevance to the procedure call but not in the reply to the call. The <code>parameterList</code> contains procedure call parameters. These parameters are the parameters specified in the TTCN-3 signature template. If no return type has been defined for the procedure signature in the TTCN-3 ATS, the distinct value <code>null</code> shall be passed for the return value. |                                                                                                                                                                                      |
| <b>Effect</b>        | On invocation of this operation the CH can issue the reply to a procedure call corresponding to the signature identifier <code>signature</code> and component identifier <code>receiver</code> . CH transmits the reply to the remote TE on which <code>receiver</code> is being executed and enqueues the reply in the remote TE.                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                      |

| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                         |
| <b>Constraint</b>    | This operation shall be called by the TE when it executes a TTCN-3 broadcast reply operation on a component port which has been connected to other component ports.<br>All <i>out</i> and <i>inout</i> procedure parameters and the return value contain values. All <i>in</i> procedure parameters shall contain the distinct value of null since they are only of relevance to the procedure call but not in the reply to the call. The parameterList contains procedure call parameters. These parameters are the parameters specified in the TTCN-3 signature template. If no return type has been defined for the procedure signature in the TTCN-3 ATS, the distinct value null shall be passed for the return value. |                                                                                                                                                                         |
| <b>Effect</b>        | On invocation of this operation the CH can issue the reply to a procedure call corresponding to the signature identifier signature and all components connected to sender. CH transmits the exception to all remote TEs on which receivers are being executed and enqueues the exception in the remote TEs.                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                         |

| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                         |
| <b>Constraint</b>    | This operation shall be called by the TE when it executes a TTCN-3 multicast reply operation on a component port which has been connected to other component ports.<br>All <i>out</i> and <i>inout</i> procedure parameters and the return value contain values. All <i>in</i> procedure parameters shall contain the distinct value of null since they are only of relevance to the procedure call but not in the reply to the call. The parameterList contains procedure call parameters. These parameters are the parameters specified in the TTCN-3 signature template. If no return type has been defined for the procedure signature in the TTCN-3 ATS, the distinct value null shall be passed for the return value. |                                                                                                                                                                         |
| <b>Effect</b>        | On invocation of this operation the CH can issue the reply to a procedure call corresponding to the signature identifier signature and one of the component identifier in receivers. CH transmits the reply to the remote TEs on which receivers are being executed and enqueues the reply in the remote TEs.                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                         |

|                      | verdict                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Verdict after termination of the component.      |
| <b>Return Value</b>  | void                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                  |
| <b>Constraint</b>    | This operation shall be called by the TE when a test component terminates execution, either explicitly with the TTCN-3 stop operation or implicitly, if it has reached the last statement.                                                                                                                                                                                                                                                                                                        |                                                  |
| <b>Effect</b>        | The CH is notified of the termination of the indicated test component. Because the out values of <i>inout</i> and <i>out</i> parameters of a function being executed on a test component have no effect on that test component (ETSI ES 201 873-1 [1]), the tciTestComponentTerminateReq operation does not have a parameterList parameter. CH communicates the termination of the indicated component to all participating TEs and to the special TE*, which keeps track of the overall verdict. |                                                  |

## 7.3.3.2.23 tciTestComponentRunningReq

|                      |                                                                                                                                                                                                                |                                                        |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>Signature</b>     | TBoolean tciTestComponentRunningReq (in TriComponentIdType component)                                                                                                                                          |                                                        |
| <b>In Parameters</b> | component                                                                                                                                                                                                      | Identifier of the component to be checked for running. |
| <b>Return Value</b>  | true if the indicated component is still executing a behaviour, false otherwise.                                                                                                                               |                                                        |
| <b>Constraint</b>    | This operation shall be called by the TE when it executes a TTCN-3 running operation.                                                                                                                          |                                                        |
| <b>Effect</b>        | CH transmits the running request to the remote TE having the test component to be checked, where it calls the tciTestComponentRunning operation to check the execution status of the indicated test component. |                                                        |

## 7.3.3.2.24 tciTestComponentDoneReq

|                       |                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                   |

| <b>Out Parameters</b> | verdict                                                                                                                                                                                        | If the component has completed executing its behaviour, the parameter will contain numeric representation of the final component verdict (one of the following constants: ERROR, FAIL, INCONC, NONE, PASS, USER_ERROR). Otherwise, the parameter will contain the ERROR constant. |
| <b>Return Value</b>   | true if the indicated component has completed executing its behaviour, false otherwise.                                                                                                        |                                                                                                                                                                                                                                                                                   |
| <b>Constraint</b>     | This operation shall be called by the TE when it executes a TTCN-3 done operation.                                                                                                             |                                                                                                                                                                                                                                                                                   |
| <b>Effect</b>         | CH transmits the done request to the remote TE having the test component to be checked, where it calls the tciTestComponentDone operation to check the status of the indicated test component. |                                                                                                                                                                                                                                                                                   |

## 7.3.3.2.25 tciGetMTCReq

|                     |                                                                                   |  |
|---------------------|-----------------------------------------------------------------------------------|--|
| <b>Signature</b>    | TriComponentIdType tciGetMTCReq()                                                 |  |
| <b>Return Value</b> | A TriComponentIdType value of the MTC.                                            |  |
| <b>Constraint</b>   | This operation shall be called by the TE when it executes a TTCN-3 mtc operation. |  |
| <b>Effect</b>       | The CH determines the component id of the MTC.                                    |  |

## 7.3.3.2.26 tciExecuteTestCaseReq

|                      |                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Signature</b>     | void tciExecuteTestCaseReq (in TciTestCaseIdType testCaseId,<br>in TriPortIdListType tsiPortList)                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>In Parameters</b> | testCaseId                                                                                                                                                                                                            | A test case identifier as defined in the TTCN-3 module.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                      | tsiPortList                                                                                                                                                                                                           | tsiPortList contains all ports that have been declared in the definition of the system component for the test case, i.e. the TSI ports. If a system component has not been explicitly defined for the test case, then the tsiPortList contains all communication ports of the MTC. The ports in tsiPortList are ordered as they appear in the respective TTCN-3 component type declaration.<br>If no ports have to be passed either the null value or an empty tsiPortList, i.e. a list of length zero shall be passed. |
| <b>Return Value</b>  | void                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Constraint</b>    | This operation can be called by the TE immediately before it starts the test case behaviour on the MTC (in course of a TTCN-3 execute operation).                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Effect</b>        | CH transmits the execute test case request to the remote TEs having system ports of the indicated test case. Static connections to the SUT and the initialization of communication means for TSI ports can be set up. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## 7.3.3.2.27 tciResetReq

|                     |                                                                              |  |
|---------------------|------------------------------------------------------------------------------|--|
| <b>Signature</b>    | void tciResetReq ()                                                          |  |
| <b>Return Value</b> | void                                                                         |  |
| <b>Constraint</b>   | This operation can be called by the TE at any time to reset the test system. |  |
| <b>Effect</b>       | CH transmits the reset request to all involved TEs.                          |  |

## 7.3.3.2.28 tciKillTestComponentReq

|                      |                                                                                                              |                                           |
|----------------------|--------------------------------------------------------------------------------------------------------------|-------------------------------------------|
| <b>Signature</b>     | void tciKillTestComponentReq(in TriComponentIdType comp)                                                     |                                           |
| <b>In Parameters</b> | comp                                                                                                         | Identifier of the component to be killed. |
| <b>Return Value</b>  | void                                                                                                         |                                           |
| <b>Constraint</b>    | This operation shall be called by the TE when it executes the TTCN-3 kill operation.                         |                                           |
| <b>Effect</b>        | CH transmits the kill component request to the remote TE and calls there the tciKillTestComponent operation. |                                           |

## 7.3.3.2.29 tciTestComponentAliveReq

|                      |                                                                                                                                                                                                |                                                            |
|----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| <b>Signature</b>     | TBoolean tciTestComponentAliveReq (in TriComponentIdType comp)                                                                                                                                 |                                                            |
| <b>In Parameters</b> | comp                                                                                                                                                                                           | Identifier of the component to be checked for being alive. |
| <b>Return Value</b>  | true if the indicated component is alive, false otherwise.                                                                                                                                     |                                                            |
| <b>Constraint</b>    | This operation shall be called by the TE when it executes the TTCN-3 alive operation.                                                                                                          |                                                            |
| <b>Effect</b>        | CH transmits the request to the remote TE that created the test component in question, where it calls the tciTestComponentAlive operation to check the status of the indicated test component. |                                                            |

## 7.3.4 The TCI-TL interface

### 7.3.4.0 Scope of use

The TCI Test Logging Interface (TCI-TL) describes the operations a TTCN-3 Executable is required to implement and the operations a test logging implementation shall provide to the TE (figure 8).

Figure 8: The TCI-TL interface

The logging provides for all TTCN-3 level operations an operation to log the respective event being performed by the TE, the SA, the PA, the CH or the CD to the user.

### 7.3.4.1 TCI-TL provided

#### 7.3.4.1.0 Scope of use

Clause 7.3.4.1.0 specifies the operations the TL shall provide to the TE.

**NOTE:** A logging event is timestamped. The timestamps are specific to the language mapping and to the tool used. For example, C# mapping uses System.DateTime objects and C++ mapping uses the timeval structure. Java™, C and XML use integer instead, so that a tool has to choose its timestamp handling. For example, for Java™ System.currentTimeMillis() could be used or for C time() could be used.

#### 7.3.4.1.1 tliTcExecute

| Signature     | void tliTcExecute(in TString am, in TInteger ts,<br>in TString src, in TInteger line, in TriComponentIdType c,<br>in TciTestCaseIdType tcId, in TciParameterListType tciPars,<br>in TriTimerDurationType dur) |                                                  |

|                      | val                                                                                                                                                             | The value returned by the random number generator.     |
|                      | seed                                                                                                                                                            | The value used by the random number generator as seed. |
| <b>Return Value</b>  | Void                                                                                                                                                            |                                                        |
| <b>Constraint</b>    | Shall be called by TE to log a call to the random number generator function rnd. This event occurs after the random number has been generated.                  |                                                        |
| <b>Effect</b>        | The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document. |                                                        |

## 7.3.4.1.121 tliEvaluate

|                      |                                                                                                                                                                       |                                                 |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------|
| <b>Signature</b>     | void tliEvaluate (in TString am, in TInteger ts, in TString src,<br>in TInteger line, in TriComponentIdType c,<br>in QualifiedName name, in Value evalResult)         |                                                 |
| <b>In Parameters</b> | am                                                                                                                                                                    | An additional message.                          |
|                      | ts                                                                                                                                                                    | The time when the event is produced.            |
|                      | src                                                                                                                                                                   | The source file of the test specification.      |
|                      | line                                                                                                                                                                  | The line number where the request is performed. |
|                      | c                                                                                                                                                                     | The component which produces this event.        |
|                      | name                                                                                                                                                                  | The name of the template or variable.           |
|                      | evalResult                                                                                                                                                            | The result of evaluation.                       |
| <b>Return Value</b>  | void                                                                                                                                                                  |                                                 |
| <b>Constraint</b>    | Shall be called by TE to log the result of evaluation of a @lazy or @fuzzy template or variable. This event occurs after the template or variable has been evaluated. |                                                 |
| <b>Effect</b>        | The TL presents all the information provided in the parameters of this operation to the user, how this is done is not within the scope of the present document.       |                                                 |

## 8 Java™ language mapping

### 8.1 Introduction

This clause introduces the TCI Java™ language mapping. For efficiency reasons a dedicated language mapping is introduced instead of using the OMG IDL [6] to Java™ language [7].

The Java™ language mapping for the TTCN-3 Control Interface defines how the IDL definitions described in clause 7 are mapped to the Java™ language. The language mapping is independent of the used Java™ version as only basic Java™ language constructs are used.

### 8.2 Names and scopes

#### 8.2.1 Names

Although there are no conflicts between identifiers used in the IDL definition and the Java™ language some naming translation rules are applied to the IDL identifiers.

Java™ interfaces or class identifiers are omitting the trailing **Type** used in the IDL definition.

EXAMPLE: The IDL type **TciTestCaseIdType** maps to `TciTestCaseId` in Java™.

The resulting mapping conforms to the standard Java™ coding conventions.

#### 8.2.2 Scopes

The IDL module **tciInterface** is mapped to the Java™ package `org.etsi.ttcn3.tci`. All IDL type declarations within this module are mapped to Java™ classes or interface declarations within this package.

### 8.3 Type mapping

#### 8.3.1 Basic type mapping

Table 3 gives an overview on how the native types **TBoolean**, **TFloat**, **TInteger**, **TString**, and **TStringSeq** are mapped to the Java™ types.

**Table 3: Basic type mappings**

| IDL Type          | Java™ Type                      |
|-------------------|---------------------------------|
| <b>Tboolean</b>   | <code>boolean</code>            |
| <b>Tfloat</b>     | <code>float</code>              |
| <b>Tinteger</b>   | <code>int</code>                |
| <b>Tstring</b>    | <code>java.lang.String</code>   |
| <b>TstringSeq</b> | <code>java.lang.String[]</code> |

`boolean`

The IDL **TBoolean** type is mapped to the java basic type `boolean`.

`float`

The IDL **TFloat** type is mapped to the java basic type `float`.

`char`

The IDL **TChar** type is mapped to the java basic type `char`.

`int`

The IDL **TInteger** type is mapped to the java basic type `int`.

`String`

The IDL **TString** type is mapped to the `java.lang.String` class without range checking or bounds for characters in the string. All possible strings defined in TTCN-3 can be converted to `java.lang.String`.

`String[]`

The IDL **TStringSeq** type is mapped to an array of the `java.lang.String` class.

`Universal Char`

The IDL **TUniversalChar** type is mapped to a java basic type `int`. The integer uses the canonical form as defined in ISO/IEC 10646 [5], clause 6.2.

## 8.3.2 Structured type mapping

### 8.3.2.0 General principles

The TCI IDL description defines user defined types as native types. In the Java™ language mapping these types are mapped to Java™ interfaces. The interfaces define methods and attributes being available for objects implementing this interface.

#### 8.3.2.1 TciParameterType

**TciParameterType** is mapped to the following interface:

```
// TCI IDL TciParameterType
package org.etsi.ttcn.tci;
public interface TciParameter {
    public String    getParameterName();
    public void      setParameterName(String name);
    public int       getParameterPassingMode();
    public void      setParameterPassingMode(TciParameterPassingMode mode);
    public Value     getParameter();
    public void      setParameter(Value parameter);
}
```

#### Methods:

- `getParameterName` Returns the parameter name as defined in the TTCN-3 specification.
- `setParameterName` Sets the name of this `TciParameter` parameter to `name`.
- `getParameterPassingMode` Returns the parameter passing mode of this parameter.
- `setParameterPassingMode` Sets the parameter mode of this `TriParameter` parameter to `mode`.
- `getParameter` Returns the `Value` parameter of this `TciParameter`, or the `null` object if the parameter contains the distinct value `null`.
- `setParameter` Sets the `Value` parameter of this `TciParameter` to `parameter`. If the distinct value `null` shall be set to indicate that this parameter holds no value, the Java `null` shall be passed as parameter.

### 8.3.2.2 TciParameterPassingModeType

**TciParameterPassingModeType** is mapped to the following interface:

```
// TCI IDL TciParameterPassingModeType
package org.etsi.ttcn.tci;
public interface TciParameterPassingMode {
    public final static int TCI_IN      = 0;
    public final static int TCI_INOUT   = 1;
    public final static int TCI_OUT     = 2;
}
```

#### Constants:

- **TCI\_IN** Will be used to indicate that a **TciParameter** is an **in** parameter.
- **TCI\_INOUT** Will be used to indicate that a **TciParameter** is an **inout** parameter.
- **TCI\_OUT** Will be used to indicate that a **TciParameter** is an **out** parameter.

### 8.3.2.3 TciParameterListType

**TciParameterListType** is mapped to the following interface:

```
// TCI IDL TciParameterListType
package org.etsi.ttcn.tci;
public interface TciParameterList {
    public int size() ;
    public boolean isEmpty() ;
    public java.util.Enumeration getParameters() ;
    public TciParameter get(int index) ;
    public void clear() ;
    public void add(TciParameter parameter) ;
    public void setParameters(TciParameter[] parameters) ;
}
```

#### Methods:

- **size** Returns the number of parameters in this list.
- **isEmpty** Returns **true** if this list contains no parameters.
- **getParameters** Returns an **Enumeration** over the parameters in the list. The enumeration provides the parameters in the same order as they appear in the list.
- **get** Returns the **TciParameter** at the specified position.
- **clear** Removes all parameters from this **TciParameterList**.
- **add** Adds **parameter** to the end of this **TciParameterList**.
- **setParameter** Fills this **TciParameterList** with **parameters**.

### 8.3.2.4 TciTypeClassType

**TciTypeClassType** is mapped to the following interface:

```
// TCI IDL TciTypeClassType
package org.etsi.ttcn.tci;
public interface TciTypeClass {
    public final static int ADDRESS      = 0 ;
    public final static int ANYTYPE     = 1 ;
    public final static int BITSTRING   = 2 ;
    public final static int BOOLEAN     = 3 ;
    public final static int CHARSTRING  = 5 ;
    public final static int COMPONENT   = 6 ;
    public final static int ENUMERATED  = 7 ;
    public final static int FLOAT       = 8 ;
    public final static int HEXSTRING   = 9 ;
}
```

```

public final static int INTEGER          = 10 ;
public final static int OCTETSTRING     = 12 ;
public final static int RECORD          = 13 ;
public final static int RECORD_OF       = 14 ;
public final static int ARRAY           = 15 ;
public final static int SET              = 16 ;
public final static int SET_OF          = 17 ;
public final static int UNION            = 18 ;
public final static int UNIVERSAL_CHARSTRING = 20 ;
public final static int VERDICT         = 21 ;
public final static int DEFAULT         = 22 ;
public final static int PORT             = 23 ;
public final static int TIMER            = 24 ;
}

```

### 8.3.2.5 TciTestComponentKindType

**TciTestComponentKindType** is mapped to the following interface:

```

// TCI IDL TciTestComponentKindType
public interface TciTestComponentKind {
    public final static int TCI_CTRL_COMP      = 0;
    public final static int TCI_MTC_COMP      = 1;
    public final static int TCI_PTC_COMP      = 2;
    public final static int TCI_SYSTEM_COMP = 3;
    public final static int TCI_ALIVE_COMP     = 4;
}

```

### 8.3.2.6 TciBehaviourIdType

**TciBehaviourIdType** is mapped to the following interface:

```

// TCI IDL TciBehaviourIdType
package org.etsi.ttcn.tci;
public interface TciBehaviourId extends QualifiedName {
}

```

### 8.3.2.7 TciTestCaseIdType

**TciTestCaseIdType** is mapped to the following interface:

```

// TCI IDL TciTestCaseIdType
package org.etsi.ttcn.tci;
public interface TciTestCaseId extends QualifiedName {
}

```

### 8.3.2.8 TciModuleIdType

**TciModuleIdType** is mapped to the following interface:

```

// TCI IDL TciModuleIdType
package org.etsi.ttcn.tci;
public interface TciModuleId extends QualifiedName {
}

```

### 8.3.2.9 TciModuleParameterIdType

**TciModuleParameterIdType** is mapped to the following interface:

```

// TCI IDL TciModuleParameterIdType
package org.etsi.ttcn.tci;
public interface TciModuleParameterId extends QualifiedName {
}

```

### 8.3.2.10 TciModuleParameterListType

**TciModuleParameterListType** is mapped to the following interface:

```
// TCI IDL TciModuleParameterListType
package org.etsi.ttcn.tci;
public interface TciModuleParameterList {
    public int size() ;
    public boolean isEmpty() ;
    public java.util.Enumeration getModuleParameters() ;
    public TciModuleParameter get(int index) ;
}
```

**Methods:**

- **size** Returns the number of module parameters in this list.
- **isEmpty** Returns **true** if this list contains no module parameters.
- **getModuleParameters** Returns an **Enumeration** over the module parameters in the list. The enumeration provides the module parameters in the same order as they appear in the list.
- **get** Returns the **TciModuleParameter** at the specified position.

### 8.3.2.11 TciModuleParameterType

**TciModuleParameterType** is mapped to the following interface:

```
// TCI IDL TciModuleParameterType
package org.etsi.ttcn.tci;
public interface TciModuleParameter {
    public TciModuleParameterId getModuleParameterName();
    public Value getDefaultValue();
}
```

**Methods:**

- **getModuleParameterName** Returns the module parameter name as defined in the TTCN-3 specification.
- **getDefaultValue** Returns the default **Value** module parameter of this **TciModuleParameter**, or the **null** object if the module parameter contains the distinct value **null**.

### 8.3.2.12 TciParameterTypeListType

**TciParameterTypeListType** is mapped to the following interface:

```
// TCI IDL TciParameterTypeListType
package org.etsi.ttcn.tci;
public interface TciParameterTypeList {
    public int size() ;
    public boolean isEmpty() ;
    public java.util.Enumeration getParameterTypes() ;
    public TciParameterType get(int index) ;
}
```

**Methods:**

- **size** Returns the number of parameter types in this list.
- **isEmpty** Returns **true** if this list contains no parameter types.
- **getParameterTypes** Returns an **Enumeration** over the parameter types in the list. The enumeration provides the parameter types in the same order as they appear in the list.
- **get** Returns the **TciParameterType** at the specified position.

### 8.3.2.13 TciParameterTypeType

**TciParameterTypeType** is mapped to the following interface:

```
// TCI IDL TciParameterTypeType
package org.etsi.ttcn.tci;
public interface TciParameterType {
    public String    getParameterName();
    public Type      getParameterType() ;
    public int       getParameterPassingMode();
}
```

#### Methods:

- `getParameterName`                Returns the parameter name as defined in the TTCN-3 specification.
- `getParameterType`               Returns the `Type` of the parameter.
- `getParameterPassingMode`       Returns the parameter passing mode of this parameter.

### 8.3.2.14 TciModuleIdListType

**TciModuleIdListType** is mapped to the following interface:

```
// TCI IDL TciModuleIdListType
package org.etsi.ttcn.tci;
public interface TciModuleIdList {
    public int          size() ;
    public boolean      isEmpty() ;
    public java.util.Enumeration tciGetImportedModules() ;
    public TciModuleId  get(int index) ;
}
```

#### Methods:

- `size`                               Returns the number of modules in this list.
- `isEmpty`                           Returns `true` if this list contains no modules.
- `tciGetImportedModules`           Returns an `Enumeration` over the modules in the list. The enumeration provides the modules in the same order as they appear in the list.
- `get`                                 Returns the `TciModuleId` at the specified position.

### 8.3.2.15 TciTestCaseIdListType

**TciTestCaseIdType** is mapped to the following interface:

```
// TCI IDL TciTestCaseIdListType
package org.etsi.ttcn.tci;
public interface TciTestCaseIdList {
    public int          size() ;
    public boolean      isEmpty() ;
    public java.util.Enumeration tciGetTestCases() ;
    public TciTestCaseId  get(int index) ;
}
```

#### Methods:

- `size`                               Returns the number of test cases in this list.
- `isEmpty`                           Returns `true` if this list contains no test cases.
- `tciGetTestCases`                 Returns an `Enumeration` over the test cases in the list. The enumeration provides the test cases in the same order as they appear in the list.
- `get`                                 Returns the `TciTestCaseId` at the specified position.

### 8.3.2.16 TciDecodingResult

**TciDecodingResult** is used as a return type of the `TciCDProvided.decodeValue` operation and it is defined as follows:

```
package org.etsi.ttcn.tci;
public interface TciDecodingResult {
    public int          getResult ();
    public Value        getDecodedValue ();
}
```

#### Methods:

- `getResult` Returns the numeric result of the `TciCDProvided.decodeValue` operation.
- `getDecodedValue` Returns the decoded value or the distinct value `null`.

### 8.3.2.17 TciMatchingTypeType

**TciMatchingTypeType** is mapped to the following interface:

```
// TCI IDL TciTypeClassType
package org.etsi.ttcn.tci;
public interface TciMatchingType {
    public final static int TEMPLATE_LIST          = 0 ;
    public final static int COMPLEMENTED_LIST      = 1 ;
    public final static int ANY_VALUE              = 2 ;
    public final static int ANY_VALUE_OR_NONE      = 3 ;
    public final static int VALUE_RANGE            = 4 ;
    public final static int SUBSET                  = 5 ;
    public final static int SUPERSET               = 6 ;
    public final static int ANY_ELEMENT            = 7 ;
    public final static int ANY_ELEMENTS_OR_NONE   = 8 ;
    public final static int PATTERN                = 9 ;
    public final static int MATCH_DECODED_CONTENT  = 10 ;
    public final static int OMIT_TEMPLATE          = 11 ;
}
```

### 8.3.2.18 LengthRestriction

**LengthRestriction** is mapped to the following interface:

```
// TCI IDL LengthRestriction
package org.etsi.ttcn.tci;
public interface LengthRestriction {
    public int getLowerBoundary ();
    public int getUpperBoundary ();
    public void setLowerBoundary (int boundary);
    public void setUpperBoundary (int boundary);
    public boolean isUpperBoundaryInfinity ();
    public void setInfiniteUpperBoundary ();
}
```

#### Methods:

- `getLowerBoundary` Returns the lower boundary of the length restriction.
- `getUpperBoundary` Returns the upper boundary of the length restriction.
- `setLowerBoundary` Sets the lower boundary value.
- `setUpperBoundary` Sets the upper boundary value.
- `isUpperBoundaryInfinity` Returns `true` if the upper boundary contains infinity and `false` otherwise.
- `setInfiniteUpperBoundary` Sets the upper boundary to infinity.

### 8.3.2.19 Permutation

**Permutation** is mapped to the following interface:

```
// TCI IDL Permutation
package org.etsi.ttcn.tci;
public interface Permutation {
    public int getStartPosition ();
    public void setStartPosition (int position);
    public int getLength ();
    public void setLength (int length);
}
```

**Methods:**

- **getStartPosition** Returns the position of the first item of the permutation in the **RecordOfValue**.
- **setStartPosition** Sets the position of the first item of the permutation in the **RecordOfValue**.
- **getLength** Returns the number of elements or matching mechanisms of the **RecordOfValue** that are included in the permutation.
- **setLength** Sets the number of elements or matching mechanisms of the **RecordOfValue** that are included in the permutation.

### 8.3.2.20 RangeBoundary

**RangeBoundary** is mapped to the following interface:

```
// TCI IDL RangeBoundary
package org.etsi.ttcn.tci;
public interface RangeBoundary {
    public Value getBoundary ();
    public boolean isInclusive ();
    public void setBoundary (Value boundary, boolean isInclusive);
    public boolean isInfinity ();
    public void setToInfinity ();
}
```

**Methods:**

- **getBoundary** Returns the boundary value. Dependent on the type of the value range, the return value can be either an **IntegerValue**, **FloatValue**, **CharstringValue** or **UniversalCharstringValue**. If the boundary is undefined or it cannot be represented by a **Value** instance (infinity in case of integer values), the distinct value **null** is returned.
- **isInclusive** Returns **true** if the boundary value is a part of the allowed range and **false** otherwise.
- **setBoundary** Sets the boundary value. Dependent on the type of the value range, the boundary parameter can contain either an **IntegerValue**, **FloatValue**, **UniversalCharstringValue** or **CharstringValue**. The inclusive parameter determines whether the boundary value is a part of the range (**true**) or not (**false**).
- **isInfinity** Returns **true** if the boundary is equal to infinity and **false** otherwise.
- **setToInfinity** Sets the boundary to infinity (if the instance is used for the upper range boundary) or **-infinity** (if the instance is used for the lower range boundary).

### 8.3.3 Abstract type mapping

#### 8.3.3.0 General principles

The TTCN-3 data types are modelled in Java™ using the abstract type mapping as defined in the clause 8.3.3. The `Type` interface defines only operations used to retrieve in TTCN-3 defined types. No TTCN-3 types can be constructed using the `Type` interface. Types are modelled using the single interface `Type`, that provides methods to identify types and to retrieve values of a given type.

#### 8.3.3.1 Type

**Type** is mapped to the following interface:

```
// TCI IDL Type
package org.etsi.ttcn.tci;
public interface Type {
    public TciModuleId getDefiningModule ();
    public String getName ();
    public int getTypeClass ();
    public Value newInstance ();
    public String getTypeEncoding ();
    public String getTypeEncodingVariant();
    public String[] getEncodeAttributes();
    public String[] getVariantAttributes(String encoding);
    public String[] getTypeExtension();
    public Value parseValue (String val);
    public MatchingMechanism newTemplate (int matchingType);
    public RangeBoundary getLowerTypeBoundary();
    public RangeBoundary getUpperTypeBoundary();
    public LengthRestriction getTypeLengthRestriction();
    public MatchingMechanism getTypeMatchingMechanism();
}
```

#### Methods:

- `getDefiningModule` Returns the module identifier of the module the type has been defined in. If the type represents a TTCN-3 base type the distinct value `null` will be returned.
- `getName` Returns name of the type as defined in the TTCN-3 module.
- `getTypeClass` Returns the type class of the respective type. A value of `TciTypeClassType` can have one of the following constants: ADDRESS, ANYTYPE, BITSTRING, BOOLEAN, CHARSTRING, COMPONENT, ENUMERATED, FLOAT, HEXSTRING, INTEGER, OCTETSTRING, RECORD, RECORD\_OF, ARRAY, SET, SET\_OF, UNION, UNIVERSAL\_CHARSTRING, VERDICT, DEFAULT, PORT, TIMER.
- `newInstance` Returns a freshly created value of the given type. This initial value of the created value is undefined.
- `getTypeEncoding` Returns the type encoding attribute as defined in the TTCN-3 module.
- `getTypeEncodingVariant` This operation returns the value encoding variant attribute as defined in the TTCN-3 module, if any. If no encoding variant attribute has been defined the distinct value `null` will be returned.
- `getEncodeAttributes` Returns all encode attributes of the type.
- `getVariantAttributes` Returns all variant attributes of the type for the specified encoding.
- `getTypeExtension` Returns the type extension attribute as defined in the TTCN-3 module.
- `parseValue` Parses the value provided in the parameter and in case of successful parsing returns a `Value` object representing the parsed value. In case of an error or if value parsing is not supported by the tool, the method returns `null`.

- `newTemplate` Returns a freshly created matching mechanism of this type. The `matchingType` parameter determines what kind of matching mechanism will be created and it shall be one of the following constants: `TEMPLATE_LIST`, `COMPLEMENTED_LIST`, `ANY_VALUE`, `ANY_VALUE_OR_NONE`, `VALUE_RANGE`, `SUBSET`, `SUPERSET`, `ANY_ELEMENT`, `ANY_ELEMENTS_OR_NONE`, `PATTERN`, `DECODED_MATCH`. If the created matching mechanism contains additional data properties, these properties are uninitialized in the created matching mechanism.
- `getLowerTypeBoundary` Return the lower boundary of the type restriction or `null`.
- `getUpperTypeBoundary` Return the upper boundary of the type restriction or `null`.
- `getTypeLengthRestriction` Return the length restriction of the type or `null`.
- `getTypeMatchingMechanism` Return the matching mechanism restriction of the type or `null`.

## 8.3.4 Abstract value mapping

### 8.3.4.0 General principles

TTCN-3 values can be retrieved from the TE and constructed using the Value interface. The value mapping interface is constructed hierarchically with Value as the basic interface. Specialized interfaces for different types of values have been defined.

#### 8.3.4.1 Value

**Value** is mapped to the following interface:

```
// TCI IDL Value
package org.etsi.ttcn.tci;
public interface Value {
    public Type      getType();
    public boolean   notPresent();
    public String    getValueEncoding();
    public String    getValueEncodingVariant();
    public String[]  getEncodeAttributes();
    public String[]  getVariantAttributes(String encoding);
    public boolean   isMatchingSymbol();
    public String    valueToString ();
    public boolean   isLazy();
    public boolean   isFuzzy();
    public boolean   isEvaluated();
    public LengthRestriction getLengthRestriction ();
    public LengthRestriction newLengthRestriction ();
    public void setLengthRestriction (LengthRestriction restriction);
    public boolean   isIfPresentEnabled ();
    public void setIfPresentEnabled (boolean enabled);
    public RangeBoundary getLowerTypeBoundary();
    public RangeBoundary getUpperTypeBoundary();
    public LengthRestriction getTypeLengthRestriction();
    public MatchingMechanism getTypeMatchingMechanism();
    public boolean   isOptional();
}
public LengthRestriction getTypeLengthRestriction();
```

#### Methods:

- `getType` Returns the type of the specified value.
- `notPresent` Returns `true` if the specified value is `omit`, `false` otherwise.

- `getValueEncoding` This operation returns the value encoding attribute as defined in the TTCN-3 module, if any. If no encoding attribute has been defined the distinct value `null` will be returned.
- `getValueEncodingVariant` This operation returns the value encoding variant attribute as defined in TTCN-3, if any. If no encoding variant attribute has been defined the distinct value `null` will be returned.
- `getEncodeAttributes` Returns all encode attributes of the value.
- `getVariantAttributes` Returns all variant attributes of the value for the specified encoding.
- `isMatchingSymbol` Returns `true` if the specified value is a matching symbol (see clause 7.2.2.2.1 for more details), `false` otherwise.
- `valueToString` Returns the same string as produced by the `any2unistr` predefined function with the specified value as its parameter.
- `isLazy` Returns `true` if the specified value is `@lazy`, `false` otherwise.
- `isFuzzy` Returns `true` if the specified value is `@fuzzy`, `false` otherwise.
- `isEvaluated` Returns `true` if the specified value contains an evaluation result, `false` otherwise (see clause 7.2.2.2.1 for more details).
- `getLengthRestriction` Returns a length restriction matching attribute in case it is attached to the value or the distinct value `null` if no such matching attribute is present.
- `newLengthRestriction` Creates a new instance of the `LengthRestriction` interface.
- `setLengthRestriction` Adds a length restriction matching to the value or modifies an existing one. The distinct value `null` can be used as a parameter to disable an existing length restriction.
- `isIfPresentEnabled` Returns `true` if the `ifpresent` is attached to the value and `false` otherwise.
- `setIfPresentEnabled` Sets the whether the `ifpresent` indicator is attached to the value or not.
- `getLowerTypeBoundary` Return the lower boundary of the value's type restriction or `null`.
- `getUpperTypeBoundary` Return the upper boundary of the value's type restriction or `null`.
- `getTypeLengthRestriction` Return the value's type length restriction or `null`.
- `getTypeMatchingMechanism` Return the value's type restriction.
- `isOptional` Returns `true` if and only if the value is either an optional field or a template without value or present template restriction.

### 8.3.4.2 IntegerValue

**IntegerValue** type is mapped to the following interface:

```
// IntegerValue
package org.etsi.ttcn.tci;
public interface IntegerValue {
    public void    setInteger(int value);
    public int     getInteger();
}
```

**Methods:**

- `setInteger` Sets this IntegerValue to the int value `value`.
- `getInteger` Returns the int value represented by this IntegerValue.

**8.3.4.3 FloatValue**

**FloatValue** type is mapped to the following interface:

```
// FloatValue
package org.etsi.ttcn.tci;
public interface FloatValue {
    public void    setFloat(float value);
    public float   getFloat();
    public void    setDouble(double value);
    public double  getDouble();
    public void    setBigDecimal(java.math.BigDecimal value);
    public java.math.BigDecimal getBigDecimal();
}
```

**Methods:**

- `setFloat` Sets this FloatValue to the float value `value`.
- `getFloat` Returns the float value represented by this FloatValue.
- `setDouble` Sets this FloatValue to the float value with double precision.
- `getDouble` Returns the float value represented by this FloatValue with double precision.
- `setBigDecimal` Sets this FloatValue to the float value with user-defined precision. If loss of precision is probable when using float or double, this method should be used.
- `getBigDecimal` Returns the float value represented by this FloatValue with user-defined precision. If loss of precision is probable when using float or double, this method should be used.

**8.3.4.4 BooleanValue**

**BooleanValue** type is mapped to the following interface:

```
// BooleanValue
package org.etsi.ttcn.tci;
public interface BooleanValue {
    public void    setBoolean(boolean value);
    public boolean getBoolean();
}
```

**Methods:**

- `setBoolean` Sets this BooleanValue to the boolean value `value`.
- `getBoolean` Returns the boolean value represented by this BooleanValue.

**8.3.4.5 CharstringValue**

**CharstringValue** is mapped to the following interface:

```
// TCI IDL CharstringValue
package org.etsi.ttcn.tci;
public interface CharstringValue {
    String getString ();
    void    setString (String value);
    char    getChar (int position);
    void    setChar (int position, char value);
}
```

```

    int    getLength ();
    void    setLength (int len);
}

```

#### Methods:

- **getString** Returns the string of the TTCN-3 charstring. The textual representation of the empty TTCN-3 charstring is "", while its length is zero.
- **setString** Sets this CharstringValue to value.
- **getChar** Returns the char value of the TTCN-3 charstring at position. position 0 denotes the first char of the TTCN-3 charstring. Valid values for position are 0 to length - 1.
- **setChar** Set the char at position to value. Valid values for position are 0 to length - 1.
- **getLength** Returns the length of this CharstringValue in chars, zero if the value of this CharstringValue is omit.
- **setLength** Sets the length of this CharstringValue in chars to len.

### 8.3.4.6 BitstringValue

**BitstringValue** is mapped to the following interface:

```

// TCI IDL BitstringValue
package org.etsi.ttcn.tci;
public interface BitstringValue {
    String getString ();
    void    setString (String value);
    int     getBit (int position);
    void    setBit (int position, int value);
    int     getLength ();
    void    setLength (int len);
    boolean isMatchingAt (int position);
    MatchingMechanism getMatchingAt (int position);
    void    setMatchingAt (int position, MatchingMechanism template);
}

```

#### Methods:

- **getString** Returns the textual representation of this BitstringValue, as defined in TTCN-3. E.g. the textual representation of 0101 is '0101'B. The textual representation of the empty TTCN-3 bitstring is ' 'B, while its length is zero.
- **setString** Sets the value of this BitstringValue according to the textual representation as defined by value. E.g. The value of this BitstringValue will be 0101 if the textual representation in value is '0101'B.
- **getBit** Returns the value (0 | 1) at position of this TTCN-3 bitstring. position 0 denotes the first bit of the TTCN-3 bitstring. Valid values for position are 0 to length - 1.
- **setBit** Set the bit at position to value (0 | 1). position 0 denotes the first bit in this BitstringValue. Valid values for position are 0 to length - 1.
- **getLength** Returns the length of this BitstringValue in bits, zero if the value of this BitstringValue is omit.
- **setLength** Sets the length of this BitstringValue in bits to len.

- **isMatchingAt** Returns **true** if the item at **position** of this TTCN-3 bitstring is a matching mechanism inside a value (**AnyElement**, **AnyElementsOrNone**) and **false** otherwise.
- **getMatchingAt** If the **position** of this TTCN-3 bitstring contains a matching mechanism inside a value (**AnyElement**, **AnyElementsOrNone**), the method returns it. Otherwise the distinct value **null** is returned.
- **setMatching** Sets a matching mechanism at **position**. Only two matching mechanisms are allowed: **AnyElement** and **AnyElementsOrNone**.

### 8.3.4.7 OctetstringValue

**OctetstringValue** is mapped to the following interface:

```
// TCI IDL OctetstringValue
package org.etsi.ttcn.tci;
public interface OctetstringValue {
    String getString ();
    void setString (String value);
    int getOctet (int position);
    void setOctet (int position, int value);
    int getLength ();
    void setLength (int len);
    boolean isMatchingAt (int position);
    MatchingMechanism getMatchingAt (int position);
    void setMatchingAt (int position, MatchingMechanism template);
}
```

#### Methods:

- **getString** Returns the textual representation of this **OctetstringValue**, as defined in TTCN-3. E.g. the textual representation of **0xCAFFEE** is **'CAFFEE'0**. The textual representation of the empty TTCN-3 octetstring is **'0**, while its length is zero.
- **setString** Sets the value of this **OctetstringValue** according to the textual representation as defined by **value**. E.g. the value of this **OctetstringValue** will be **0xCAFFEE** if the textual representation in **value** is **'CAFFEE'0**.
- **getOctet** Returns the value (0..255) at **position** of this TTCN-3 octetstring. **position 0** denotes the first octet of the TTCN-3 octetstring. Valid values for **position** are **0** to **length - 1**.
- **setOctet** Set the octet at **position** to value (0..255). **position 0** denotes the first octet in the octetstring. Valid values for **position** are **0** to **length - 1**.
- **getLength** Returns the length of this **OctetstringValue** in octets, zero if the value of this **OctetstringValue** is **omit**.
- **setLength** Sets the length of this **OctetstringValue** in octets to **len**.
- **isMatchingAt** Returns **true** if the item at **position** of this TTCN-3 octetstring is a matching mechanism inside a value (**AnyElement**, **AnyElementsOrNone**) and **false** otherwise.
- **getMatchingAt** If the **position** of this TTCN-3 octetstring contains a matching mechanism inside a value (**AnyElement**, **AnyElementsOrNone**), the method returns it. Otherwise the distinct value **null** is returned.
- **setMatching** Sets a matching mechanism at **position**. Only two matching mechanisms are allowed: **AnyElement** and **AnyElementsOrNone**.

### 8.3.4.8 UniversalCharstringValue

**UniversalCharstringValue** is mapped to the following interface:

```
// TCI IDL UniversalCharstringValue
package org.etsi.ttcn.tci;
public interface UniversalCharstringValue {
    String getString ();
    void    setString (String value);
    int     getChar (int position);
    void    setChar (int position, int value);
    int     getLength ();
    void    setLength (int len);
}
```

#### Methods:

- **getString** Returns the textual representation of this **UniversalCharstringValue**, as defined in TTCN-3.
- **setString** Sets the value of this **UniversalCharstringValue** according to the textual representation as defined by **value**.
- **getChar** Returns the **UniversalChar** value of the TTCN-3 universal charstring at position. position 0 denotes the first **UniversalChar** of the TTCN-3 universal charstring. Valid values for position are 0 to length - 1.
- **setChar** Set the **UniversalChar** at position to value. Valid values for position are 0 to length - 1.
- **getLength** Returns the length of this **UniversalCharstringValue** in **UniversalChars**, zero if the value of this **UniversalCharstringValue** is omit.
- **setLength** Sets the length of this **UniversalCharstringValue** in **UniversalChars** to len.

### 8.3.4.9 HexstringValue

**HexstringValue** is mapped to the following interface:

```
// TCI IDL HexstringValue
package org.etsi.ttcn.tci;
public interface HexstringValue {
    String getString ();
    void    setString (String value);
    int     getHex (int position);
    void    setHex (int position, int value);
    int     getLength ();
    void    setLength (int len);
    boolean isMatchingAt (int position);
    MatchingMechanism getMatchingAt (int position);
    void    setMatchingAt (int position, MatchingMechanism template);
}
```

#### Methods:

- **getString** Returns the textual representation of this **HexstringValue**, as defined in TTCN-3. E.g. the textual representation of 0xAFFEE is 'AFFEE'H. The textual representation of the empty TTCN-3 hexstring is 'H', while its length is zero.
- **setString** Sets the value of this **HexstringValue** according to the textual representation as defined by **value**. E.g. the value of this **HexstringValue** will be 0xAFFEE if the textual representation in **value** is 'AFFEE'H.

- **getHex** Returns the value (0...15) at **position** of this TTCN-3 hexstring. **position** 0 denotes the first hex digits of the TTCN-3 hexstring. Valid values for **position** are 0 to **length** - 1.
- **setHex** Set the hex digit at **position** to value (0...16). **position** 0 denotes the first octet in the **hexstring**. Valid values for **position** are 0 to **length** - 1.
- **getLength** Returns the length of this **HexstringValue** in octets, zero if the value of this **HexstringValue** is **omit**.
- **setLength** Sets the length of this **HexstringValue** in hex digits to **len**.
- **isMatchingAt** Returns **true** if the item at **position** of this TTCN-3 hexstring is a matching mechanism inside a value (**AnyElement**, **AnyElementsOrNone**) and **false** otherwise.
- **getMatchingAt** If the **position** of this TTCN-3 hexstring contains a matching mechanism inside a value (**AnyElement**, **AnyElementsOrNone**), the method returns it. Otherwise the distinct value **null** is returned.
- **setMatching** Sets a matching mechanism at **position**. Only two matching mechanisms are allowed: **AnyElement** and **AnyElementsOrNone**.

#### 8.3.4.10 RecordValue

**RecordValue** is mapped to the following interface:

```
// TCI IDL RecordValue
package org.etsi.ttcn.tci;
public interface RecordValue {
    public Value    getField(String fieldName) ;
    public void     setField(String fieldName, Value value) ;
    public String[] getFieldNames() ;
    public void     setFieldOmitted(String fieldName);
}
```

##### Methods:

- **getField** Returns the value of the field named **fieldName**. The return value is the common abstract base type **Value**, as a record field can have any type defined in TTCN-3. If the field cannot be obtained from the record the distinct value **null** will be returned.
- **setField** Set the field named **fieldName** of the record to **value**. No assumption shall be made on how a field is stored in a record. An internal implementation might choose to store a reference to this value or to copy the value. It is safe to assume that the value will be copied. Therefore it should be assumed that subsequent modifications of **value** will not be considered in the record.
- **getFieldNames** Returns an array of **String** of field names, the empty sequence, if the record has no fields.
- **setFieldOmitted** Set the field named **fieldName** of the record to **omit**.

#### 8.3.4.11 RecordOfValue

**RecordOfValue** is mapped to the following interface:

```
// TCI IDL RecordOfValue
package org.etsi.ttcn.tci;
public interface RecordOfValue {
    public Value    getField(String fieldName) ;
    public void     setField(int position, Value value) ;
    public void     appendField(Value value) ;
    public Type     getElementType() ;
}
```

```

    public int      getLength() ;
    public void     setLength(int len) ;
    public int      getOffset() ;
    public int      getPermutationCount ();
    public Permutation getPermutation (int index);
    public Permutation newPermutation ();
    public void     definePermutation (Permutation permutation);
    public void     removePermutation (int index);
    public void     clearPermutations ();
}

```

### Methods:

- **getField** Returns the value of the **record of** at **position** if **position** is between **zero** and **length - 1**, the distinct value **null** otherwise. The return value is the common abstract base type **Value**, as a **record of** can have fields of any type defined in TTCN-3.
- **setField** Sets the field at **position** to **value**. If **position** is greater than **(length - 1)** the **record of** will be extended to have the length **(position + 1)**. The **record of** elements between the original position at **length** and **position - 1** will be set to **OMIT**. No assumption shall be made on how a field is stored in a **record of**. An internal implementation might choose to store a reference to this value or to copy the value. It is safe to assume that the value will be copied. Therefore it should be assumed that subsequent modifications of **value** will not be considered in the **record of**.
- **appendField** Appends the value at the end of the **record of**, i.e. at position **length**. No assumption shall be made on how a field is stored in a **record of**. An internal implementation might choose to store a reference to this value or to copy the value. It is safe to assume that the value will be copied. Therefore it should be assumed that subsequent modifications of **value** will not be considered in the **record of**.
- **getElementType** This operation will return the **Type** of the elements of this **record of**.
- **getLength** Returns the actual length of the **record of** value, zero if the **record of** value is **OMIT**.
- **setLength** Set the length of the **record of** to **len**. If **len** is greater than the original length, newly created elements have the value **OMIT**. If **len** is less or equal than the original length this operation will be ignored.
- **getOffset** Returns the lowest possible index. For a **record of** or **set of** value this is always **0**. For an **array** value, this is the lower index bound used in the type definition.
- **getPermutationCount** Returns the number of permutations in the **record of** or **array** value.
- **getPermutation** Returns the permutation at the specified index. The allowed index range is from **0** to **(getPermutationCount() - 1)**.
- **newPermutation** Creates a new instance of the **Permutation** interface.
- **definePermutation** Creates permutation from existing elements of a **record of** value. The **permutation** parameter shall not include elements that are already a part of other existing permutations attached to the same **record of**. No elements are added to the **record of** by this operation.
- **removePermutation** Removes the permutation at the specified index. The allowed index range is from **0** to **(getPermutationCount() - 1)**. No elements are removed from the **record of** by this operation. When the operation completes, the existing elements at positions specified by the removed permutation do not belong to any permutation.

- `clearPermutations` Removes all permutations from the value. The elements that belonged to the removed permutation are not removed.

### 8.3.4.12 UnionValue

**UnionValue** is mapped to the following interface:

```
// TCI IDL UnionValue
package org.etsi.ttcn.tci;
public interface UnionValue {
    Value      getVariant (String variantName);
    void       setVariant (String variantName, Value value);
    String     getPresentVariantName ();
    String[]   getVariantNames ();
}
```

#### Methods:

- `getVariant` Returns the value of the TTCN-3 union `variantName`, if `variantName` equals the result of `getPresentVariantName`, the distinct value `null` otherwise. `variantName` denotes the name of the union variant as defined in the TTCN-3 module.
- `setVariant` Sets `variantName` of the union to `value`. If `variantName` is not defined for this union this operation will be ignored. If another variant was selected the new variant will be selected instead.
- `getPresentVariantName` Returns the variant name that has a value in this union set as a `String`. The distinct value `null` will be returned if no variant is selected.
- `getVariantNames` Returns an array of `String` of variant names, the empty sequence, if the union has no fields. If the `UnionValue` represents the TTCN-3 anytype, i.e. the type class of the type obtained by `getType()` is `ANYTYPE`, all predefined and user-defined TTCN-3 types will be returned.

### 8.3.4.13 EnumeratedValue

**EnumeratedValue** is mapped to the following interface:

```
// TCI IDL EnumeratedValue
package org.etsi.ttcn.tci;
public interface EnumeratedValue {
    String  getEnum ();
    void    setEnum (String enumValue);
    int     getInt();
    void    setInt(int intValue);
}
```

#### Methods:

- `getEnum` Returns the string identifier of this `EnumeratedValue`. This identifier equals the identifier in the TTCN-3 specification.
- `setEnum` Set the enum to `enumValue`. If `enumValue` is not an allowed value for this enumeration the operation will be ignored.
- `getInt` Returns the integer value of this `EnumeratedValue`. This integer equals the user-assigned integer value in the TTCN-3 specification or the automatically assigned integer value.
- `setInt` Sets the integer value of this `EnumeratedValue`. This integer should equal the user-assigned integer value in the TTCN-3 specification or the automatically assigned integer value. If `intValue` is not an allowed value for this enumeration the operation is ignored.

### 8.3.4.14 VerdictValue

**VerdictValue** is mapped to the following interface:

```
// TCI IDL VerdictValue
package org.etsi.ttcn.tci;
public interface VerdictValue {
    public static final int NONE      = 0;
    public static final int PASS      = 1;
    public static final int INCONC    = 2;
    public static final int FAIL      = 3;
    public static final int ERROR     = 4;

    public int      getVerdict() ;
    public void     setVerdict(int verdict) ;
}
```

**Methods:**

- **getVerdict** Returns the integer value for this VerdictValue. The integer is one of the following constants: ERROR, FAIL, INCONC, NONE, PASS, USER\_ERROR.
- **setVerdict** Sets this VerdictValue to verdict. Note that a VerdictValue can be set to any of the above mentioned verdicts at any time. The VerdictValue does not perform any verdict calculations as defined in TTCN-3. For example, it is legal to set the VerdictValue first to INCONC and then to PASS.

### 8.3.4.15 AddressValue

**AddressValue** is mapped to the following interface:

```
// TCI IDL Address_Value
package org.etsi.ttcn.tci;
public interface AddressValue {
    public int getAddress() ;
    public void setAddress(Value value) ;
}
```

**Methods:**

- **getAddress** Returns the value represented by this AddressValue.
- **setAddress** Sets this AddressValue to the value value.

## 8.3.5 Abstract template mapping

### 8.3.5.0 General principles

TTCN-3 matching mechanisms can be retrieved from the TE and constructed using the MatchingMechanism interface. The template mapping interface is constructed hierarchically with MatchingMechanism as the basic interface. Specialized interfaces for different types of matching mechanisms have been defined.

### 8.3.5.1 MatchingMechanism

**MatchingMechanism** is mapped to the following interface:

```
// TCI IDL MatchingMechanism
package org.etsi.ttcn.tci;
public interface MatchingMechanism {
    public int getMatchingType ();
}
```

**Methods:**

- **getMatchingType** Returns the matching mechanism type.

### 8.3.5.2 MatchingList

**MatchingList** is mapped to the following interface:

```
// TCI IDL MatchingList
package org.etsi.ttcn.tci;
public interface MatchingList {
    public int      size ();
    public Value    get (int position);
    public void     add (Value item);
    public void     remove (int position);
    public void     clear ();
}
```

**Methods:**

- `size` Returns the number of items in the matching mechanism.
- `get` Returns a value or template at the specified position.
- `add` Adds a value or template to the matching mechanism.
- `remove` Removes a value or template from the specified position.
- `clear` Removes all values and templates from the matching mechanism.

### 8.3.5.3 ValueRange

**ValueRange** is mapped to the following interface:

```
// TCI IDL ValueRange
package org.etsi.ttcn.tci;
public interface ValueRange {
    public RangeBoundary getLowerBoundary ();
    public RangeBoundary getUpperBoundary ();
    public void setLowerBoundary (RangeBoundary boundary);
    public void setUpperBoundary (RangeBoundary boundary);
}
```

**Methods:**

- `getLowerBoundary` Returns the lower boundary of the range.
- `getUpperBoundary` Returns the upper boundary of the range.
- `setLowerBoundary` Sets the lower boundary of the range.
- `setUpperBoundary` Sets the upper boundary of the range.

### 8.3.5.4 CharacterPattern

**CharacterPattern** is mapped to the following interface:

```
// TCI IDL CharacterPattern
package org.etsi.ttcn.tci;
public interface CharacterPattern {
    public Value getPatternString ();
    public void setPatternString (Value pattern);
}
```

**Methods:**

- `getPatternString` Returns the character pattern definition of this pattern (either a `CharstringValue` or `UniversalCharstringValue`).
- `setPatternString` Sets the character pattern definition of this pattern. The `CharacterPattern` parameter shall contain either a `CharstringValue` or `UniversalCharstringValue`.

### 8.3.5.5 MatchDecodedContent

**MatchDecodedContent** is mapped to the following interface:

```
// TCI IDL MatchDecodedContent
package org.etsi.ttcn.tci;
public interface MatchDecodedContent {
    public Value getContent ();
    public void setContent (Value pattern);
}
```

**Methods:**

- `getContent` Returns the value or matching mechanism used as an argument of the `decmatch` matching mechanism.
- `setContent` Sets the value or matching mechanism that is used as an argument of the `decmatch` matching mechanism.

## 8.3.6 Abstract logging types mapping

### 8.3.6.0 General principles

Additional types are defined to ease the logging of matches between values and templates.

#### 8.3.6.1 TciValueTemplate

**TciValueTemplate** is mapped to the following interface:

```
// TCI IDL TciValueTemplate
package org.etsi.ttcn.tci;
public interface TciValueTemplate {
    public boolean isOmit();
    public boolean isAny();
    public boolean isAnyOrOmit();
    public String getTemplateDef();
}
```

**Methods:**

- `isOmit` Returns `true` if the template is `omit`, `false` otherwise.
- `isAny` Returns `true` if the template is `any`, `false` otherwise.
- `isAnyOrOmit` Returns `true` if the template is `anyoromit`, `false` otherwise.
- `getTemplateDef` This operation returns the template definition.

#### 8.3.6.2 TciNonValueTemplate

**TciNonValueTemplate** is mapped to the following interface:

```
// TCI IDL TciNonValueTemplate
package org.etsi.ttcn.tci;
public interface TciNonValueTemplate {
    public boolean isAny();
    public boolean isAll();
    public String getTemplateDef();
}
```

**Methods:**

- `isAny` Returns `true` if the template is `any`, `false` otherwise.
- `isAll` Returns `true` if the template is `all`, `false` otherwise.

- `getTemplateDef` This operation returns the template definition.

### 8.3.6.3 TciValueList

**TciValueList** is mapped to the following interface:

```
// TCI IDL TciValueList
package org.etsi.ttcn.tci;
public interface TciValueList{
    public int          size() ;
    public boolean      isEmpty() ;
    public Value        get(int index) ;
}
```

**Methods:**

- `size` Returns the number of values in this list.
- `isEmpty` Returns `true` if this list contains no values.
- `get` Returns the `Value` at the specified position.

### 8.3.6.4 TciValueDifference

**TciValueDifference** is mapped to the following interface:

```
// TCI IDL TciValueDifference
package org.etsi.ttcn.tci;
public interface TciValueDifference {
    public Value    getValue();
    public TciValueTemplate getTciValueTemplate();
    public String   getDescription();
}
```

**Methods:**

- `getValue` Returns the value of this `TciValueDifference`.
- `getTciValueTemplate` Returns the template of this `TciValueDifference`.
- `getDescription` Returns the description of the mismatch.

### 8.3.6.5 TciValueDifferenceList

**TciValueDifferenceList** is mapped to the following interface:

```
// TCI IDL TciValueDifferenceList
package org.etsi.ttcn.tci;
public interface TciValueDifferenceList{
    public int          size() ;
    public boolean      isEmpty() ;
    public TciValueDifference get(int index) ;
}
```

**Methods:**

- `size` Returns the number of differences in this list.
- `isEmpty` Returns `true` if this list contains no differences.
- `get` Returns the `TciValueDifference` at the specified position.

### 8.3.6.6 ComponentStatus

**ComponentStatus** is mapped to the following interface:

```
// TCI IDL ComponentStatus
package org.etsi.ttcn.tci;
public interface ComponentStatus {
    public static final int INACTIVE_C = 0;
    public static final int RUNNING_C = 1;
    public static final int STOPPED_C = 2;
    public static final int KILLED_C = 3;
    public static final int NULL_C = 4;

    public int      getComponentStatus() ;
    public void     setComponentStatus (int componentStatus) ;
}
```

### 8.3.6.7 TimerStatus

**TimerStatus** is mapped to the following interface:

```
// TCI IDL TimerStatus
package org.etsi.ttcn.tci;
public interface TimerStatus {
    public static final int RUNNING_T = 0;
    public static final int INACTIVE_T = 1;
    public static final int EXPIRED_T = 2;
    public static final int NULL_T = 3;

    public int      getTimerStatus() ;
    public void     setTimerStatus (int timerStatus) ;
}
```

### 8.3.6.8 TciStatus

**TciStatus** is mapped to the following interface:

```
// TCI IDL TciStatus
package org.etsi.ttcn.tci;
public interface TciStatus {
    public static final int TCI_OK = 0;
    public static final int TCI_ERROR = -1;

    public int      getTciStatus() ;
    public void     setTciStatus (int tciStatus) ;
}
```

## 8.4 Constants

Within this Java™ language mapping constants have been specified. All constants are defined `public final static` and are accessible from every object from every package. The constants defined within this clause are not defined with the IDL clause. Instead they result from the specification of the TCI IDL types marked as native.

The following constants can be used to determine the parameter passing mode of TTCN-3 parameters (see also clause 8.3.2.3).

- `org.etsi.ttcn.tci.TciParameterPassingMode.TCI_IN;`
- `org.etsi.ttcn.tci.TciParameterPassingMode.TCI_INOUT;`
- `org.etsi.ttcn.tri.TciParameterPassingMode.TCI_OUT.`

For the distinct parameter value `null`, the encoded parameter value shall be set to Java `null`.

The following constants shall be used for value handling (see also clause 8.3.2.4).

- `org.etsi.ttcn.tci.TciTypeClass.ADDRESS;`
- `org.etsi.ttcn.tci.TciTypeClass.ANYTYPE;`

- `org.etsi.ttcn.tci.TciTypeClass.BITSTRING;`
- `org.etsi.ttcn.tci.TciTypeClass.BOOLEAN;`
- `org.etsi.ttcn.tci.TciTypeClass.CHARSTRING;`
- `org.etsi.ttcn.tci.TciTypeClass.COMPONENT;`
- `org.etsi.ttcn.tci.TciTypeClass.ENUMERATED;`
- `org.etsi.ttcn.tci.TciTypeClass.FLOAT;`
- `org.etsi.ttcn.tci.TciTypeClass.HEXSTRING;`
- `org.etsi.ttcn.tci.TciTypeClass.INTEGER;`
- `org.etsi.ttcn.tci.TciTypeClass.OCTETSTRING;`
- `org.etsi.ttcn.tci.TciTypeClass.RECORD;`
- `org.etsi.ttcn.tci.TciTypeClass.RECORD_OF;`
- `org.etsi.ttcn.tci.TciTypeClass.SET;`
- `org.etsi.ttcn.tci.TciTypeClass.SET_OF;`
- `org.etsi.ttcn.tci.TciTypeClass.ARRAY;`
- `org.etsi.ttcn.tci.TciTypeClass.UNION;`
- `org.etsi.ttcn.tci.TciTypeClass.UNIVERSAL_CHARSTRING;`
- `org.etsi.ttcn.tci.TciTypeClass.VERDICT.`

The following constants shall be used for component handling (see also clause 8.3.2.5).

- `org.etsi.ttcn.tci.TciTestComponentKind.TCI_CTRL_COMP;`
- `org.etsi.ttcn.tci.TciTestComponentKind.TCI_MTC_COMP;`
- `org.etsi.ttcn.tci.TciTestComponentKind.TCI_PTC_COMP;`
- `org.etsi.ttcn.tci.TciTestComponentKind.TCI_SYSTEM_COMP;`
- `org.etsi.ttcn.tci.TciTestComponentKind.TCI_ALIVE_COMP.`

The following constants shall be used for component status (see also clause 8.3.6.6).

- `org.etsi.ttcn.tci.ComponentStatus.INACTIVE_C;`
- `org.etsi.ttcn.tci.ComponentStatus.RUNNING_C;`
- `org.etsi.ttcn.tci.ComponentStatus.STOPPED_C;`
- `org.etsi.ttcn.tci.ComponentStatus.KILLED_C;`
- `org.etsi.ttcn.tci.ComponentStatus.NULL_C.`

The following constants shall be used for timer status (see also clause 8.3.6.7).

- `org.etsi.ttcn.tci.TimerStatus.RUNNING_T;`
- `org.etsi.ttcn.tci.TimerStatus.INACTIVE_T;`
- `org.etsi.ttcn.tci.TimerStatus.EXPIRED_T;`
- `org.etsi.ttcn.tci.TimerStatus.NULL_T.`

The following constants shall be used for TCI status (see also clause 8.3.6.8).

- `org.etsi.ttcn.tci.TciStatus.TCI_OK;`

- `org.etsi.ttcn.tci.TciStatus.TCI_ERROR`.

## 8.5 Mapping of interfaces

### 8.5.0 Calling rules

The TCI IDL definition defines four interfaces, the **TCI-TM**, the **TCI-CH**, the **TCI-CD**, and the **TCI-TL** interface. The operations are defined for different directions within this interface, i.e. some operations can only be called by the TTCN-3 Executable (TE), the System Adaptor (SA) or the Platform Adaptor (PA) on the Test Management and Control (TMC) while others can only be called by the TMC on the TE. This is reflected by dividing the TCI IDL interfaces in two sub interfaces, each suffixed by **Required** or **Provided**.

**Table 4: Sub interfaces**

| Calling/Called | TE                                   | TM                 | CD                 | CH                 | SA                                   | PA                                   | TL                 |
|----------------|--------------------------------------|--------------------|--------------------|--------------------|--------------------------------------|--------------------------------------|--------------------|
| <b>TE</b>      | -                                    | TCI-TM<br>Provided | TCI-CD<br>Provided | TCI-CH<br>Provided | See ETSI<br>ETSI ES 201<br>873-5 [3] | See ETSI<br>ETSI ES 201<br>873-5 [3] | TCI-TL<br>Provided |
| <b>TM</b>      | TCI-TM<br>Required                   | -                  | -                  | -                  | -                                    | -                                    | TCI-TL<br>Provided |
| <b>CD</b>      | TCI-CD<br>Required                   | -                  | -                  | -                  | -                                    | -                                    | TCI-TL<br>Provided |
| <b>CH</b>      | TCI-CH<br>Required                   | -                  | -                  | -                  | -                                    | -                                    | TCI-TL<br>Provided |
| <b>SA</b>      | See ETSI<br>ETSI ES 201<br>873-5 [3] | -                  | -                  | -                  | -                                    | -                                    | TCI-TL<br>Provided |
| <b>PA</b>      | See ETSI<br>ETSI ES 201<br>873-5 [3] | -                  | -                  | -                  | -                                    | -                                    | TCI-TL<br>Provided |
| <b>TL</b>      | -                                    | -                  | -                  | -                  | -                                    | -                                    | -                  |

All methods defined in these interfaces should behave as defined in clause 7.

### 8.5.1 The TCI-TM interface

#### 8.5.1.1 TCI-TM provided

The **TCI-TM Provided** interface is mapped to the following interface:

```
// TCI-TM
// TE -> TM
package org.etsi.ttcn.tci;
public interface TciTMPProvided {
    public void tciTestCaseStarted (TciTestCaseId testCaseId, TciParameterList parameterList, Float
timer);
    public void tciTestCaseTerminated (VerdictValue verdict, TciParameterList parameterList);
    public void tciControlTerminated ();
    public Value tciGetModulePar (TciModuleParameterId parameterId);
    public void tciLog (TriComponentId testComponentId, String message);
    public void tciError (String message);
}
```

### 8.5.1.2 TCI-TM required

The TCI-TM Required interface is mapped to the following interface:

```
// TCI-TM
// TM -> TE
package org.etsi.ttcn.tci;
public interface TciTMRequired {
    public void tciRootModule (TciModuleId moduleName);
    public TciModuleIdList tciGetImportedModules ();
    public TciModuleParameterList tciGetModuleParameters (TciModuleId moduleId);
    public TciTestCaseIdList tciGetTestCases ();
    public TciParameterTypeList tciGetTestCaseParameters (TciTestCaseId testCaseId);
    public TriPortIdList tciGetTestCaseTSI (TciTestCaseId testCaseId);
    public void tciStartTestCase (String testCaseId, TciParameterList parameterList );
    public void tciStopTestCase ();
    public TriComponentId tciStartControl ();
    public void tciStopControl ();
}
```

## 8.5.2 The TCI-CD interface

### 8.5.2.1 TCI-CD provided

The TCI-CD Provided interface is mapped to the following interface:

```
// TCI-CD
// TE -> CD
package org.etsi.ttcn.tci;
public interface TciCDProvided {
    public Value decode (TriMessage message, Type decodingHypothesis );
    public TriMessage encode (Value value);
    public TciDecodingResult decodeValue (TriMessage message, Type decodingHypothesis,
        String decodingInfo );
    public TriMessage encodeValue (Value value, String encodingInfo);
}
```

### 8.5.2.2 TCI-CD required

The TCI-CD Required interface is mapped to the following interface:

```
// TCI-CD
// CD -> TE
package org.etsi.ttcn.tci;
public interface TciCDRequired {
    public Type getTypeForName (String typeName);
    public Type getInteger ();
    public Type getFloat ();
    public Type getBoolean ();
    public Type getCharstring ();
    public Type getUniversalCharstring ();
    public Type getHexstring ();
    public Type getBitstring ();
    public Type getOctetstring ();
    public Type getVerdict ();
    public void tciErrorReq (String message);
}
```

## 8.5.3 The TCI-CH interface

### 8.5.3.1 TCI-CH provided

The TCI-CH Provided interface is mapped to the following interface:

```
// TciCHProvided
// TE -> CH
package org.etsi.ttcn.tci;
public interface TciCHProvided {
```

```

}

```

## 8.6 Optional parameters

Clause 7.2.2 defines that a reserved value shall be used to indicate the absence of an optional parameter. For the Java™ language mapping the Java null value shall be used to indicate the absence of an optional value. For example, if in the `tciReplyConnected` operation the value parameter shall be omitted the operation invocation shall be `tciReplyConnected (sender, receiver, signature, parameterList, null)`.

## 8.7 TCI initialization

All methods are non-static, i.e. operations can only be called on objects. As the present document does not define concrete implementation strategies of TE, TM, CD and CH the mechanism how the TE, the TM, the CD or the CH get to know the handles on the respective objects is out of scope of the present document.

Tool vendors shall provide methods to the developers of TM, CD and CH to register the TE, TM, CD and CH to their respective communication partner.

## 8.8 Error handling

All operations called from the TM, CH or CD that return have succeeded. If an erroneous situation has been identified by the TE a test case error will be communicated to the user using the procedures as defined in clause 7.3.1.2.6 (`tciError`). If an operation called by the TE in the TM, CH, CD, or TL produces an error, this erroneous situation should be communicated to the TE using the procedures as defined in clause 7.3.2.1.12 (`tciErrorReq`).

Beside this error handling no additional error handling is defined with this Java™ language mapping. In particular, no exception handling mechanisms are defined.

## 9 ANSI C language mapping

### 9.1 Introduction

This clause defines the TCI ANSI-C [8] language mapping for the TCI data specified in clause 7.2 and for the TCI operations specified in clause 7.3.

### 9.2 Value interfaces

**Table 5**

| TCI IDL Interface                                      | ANSI C representation                                                              | Notes and comments                                                                                        |
|--------------------------------------------------------|------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>Type</b>                                            |                                                                                    |                                                                                                           |
| TciModuleIdType<br>getDefiningModule()                 | TciModuleIdType<br>tciGetDefiningModule(Type inst)                                 |                                                                                                           |
| TString getName()                                      | String tciGetName(Type inst)                                                       | String type reused from IDL (OMG recommendation)                                                          |
| TciTypeClassType<br>getTypeClass()                     | TciTypeClassType tciGetTypeClass<br>(Type inst)                                    |                                                                                                           |
| Value newInstance()                                    | Value tciNewInstance(Type inst)                                                    |                                                                                                           |
| Value newTemplate<br>(TciMatchingType<br>matchingType) | Value tciNewTemplate(Type inst, TciMatchingTypeType<br>matchingType)               |                                                                                                           |

## 9.4 Operation interfaces

### 9.4.1 The TCI-TM interface

#### 9.4.1.1 TCI-TM provided

The TCI - TM Provided interface is mapped to the following interface:

```
void tciTestCaseStarted
    (TciTestCaseIdType testCaseId, TciParameterListType parameterList, double timer)
void tciTestCaseTerminated (VerdictValue verdict, TciParameterListType parameterlist)
void tciControlTerminated()
Value tciGetModulePar (TciModuleParameterIdType parameterId)
void tciLog(String message)
void tciError(String message)
```

#### 9.4.1.2 TCI-TM required

The TCI - TM Required interface is mapped to the following interface:

```
void tciRootModule(String moduleId)
TciModuleIdListType tciGetImportedModules()
TciModuleParameterListType tciGetModuleParameters(TciModuleIdType moduleName)
TciTestCaseIdListType tciGetTestCases()
TciParameterTypeListType tciGetTestCaseParameters (TciTestCaseIdType testCaseId)
TriPortIdList tciGetTestCaseTSI (TciTestCaseIdType testCaseId)
void tciStartTestCase (TciTestCaseIdType testCaseId, TciParameterListType parameterlist)
void tciStopTestCase()
TriComponentId tciStartControl()
void tciStopControl()
```

### 9.4.2 The TCI-CD interface

#### 9.4.2.1 TCI-CD provided

The TCI - CD Provided interface is mapped to the following interface:

```
Value tciDecode (BinaryString message, Type decHypothesis)
BinaryString tciEncode(Value value)
int tciDecodeValue (BinaryString * message, Type decHypothesis, String decodingInfo, Value *
    decodedValue)
BinaryString tciEncodeValue(Value value, string encodingInfo)
```

NOTE: BinaryString type reused from TRI.

### 9.4.2.2 TCI-CD required

The TCI-CD Required interface is mapped to the following interface:

```
Type tciGetTypeForName(String typeName)
Type tciGetIntegerType()
Type tciGetFloatType()
Type tciGetBooleanType()
Type tciGetCharType()
Type tciGetUniversalCharType()
Type tciGetTciCharstringType()
Type tciGetUniversalCharstringType()
Type tciGetHexstringType()
Type tciGetBitstringType()
Type tciGetOctetstringType()
Type tciGetVerdictType()
void tciErrorReq(String message)
```

## 9.4.3 The TCI-CH interface

### 9.4.3.1 TCI-CH provided

The TCI-CH Provided interface is mapped to the following interface:

```
void tciSendConnected(TriPortId sender, TriComponentId receiver, Value sendMessage)
void tciSendConnectedBC(TriPortId sender, Value sendMessage)
void tciSendConnectedMC
    (TriPortId sender, TriComponentIdList receivers, Value sendMessage)
void tciCallConnected
    (TriPortId sender, TriComponentId receiver, TriSignatureId signature,
    TciParameterListType parameterList)
void tciCallConnectedBC
    (TriPortId sender, TriSignatureId signature, TciParameterListType parameterList)
void tciCallConnectedMC
    (TriPortId sender, TriComponentIdList receivers, TriSignatureId signature,
    TciParameterListType parameterList)
void tciReplyConnected
    (TriPortId sender, TriComponentId receiver, TriSignatureId signature,
    TciParameterListType parameterList, Value returnValue)
void tciReplyConnectedBC
    (TriPortId sender, TriSignatureId signature, TciParameterListType parameterList,
    Value returnValue)
void tciReplyConnectedMC
    (TriPortId sender, TriComponentIdList receivers, TriSignatureId signature,
    TciParameterListType parameterList, Value returnValue)
void tciRaiseConnected
    (TriPortId sender, TriComponentId receiver, TriSignatureId signature, Value exception)
void tciRaiseConnectedBC
    (TriPortId sender, TriSignatureId signature, Value exception)
void tciRaiseConnectedMC
    (TriPortId sender, TriComponentIdList receivers, TriSignatureId signature, Value exception)
TriComponentId tciCreateTestComponentReq
    (TciTestComponentKindType kind, Type componentType, String name, Value hostId)
void tciStartTestComponentReq
    (TriComponentId component, TciBehaviourIdType behaviour, TciParameterListType parameterList)
void tciStopTestComponentReq (TriComponentId component)
void tciConnectReq(TriPortId fromPort, TriPortId toPort)
void tciDisconnectReq(TriPortId fromPort, TriPortId toPort)
void tciMapReq(TriPortId fromPort, TriPortId toPort)
void tciMapParamReq
    (TriPortId fromPort, TriPortId toPort, TciParameterListType parameterList)
void tciUnmapReq(TriPortId fromPort, TriPortId toPort)
void tciUnmapParamReq
    (TriPortId fromPort, TriPortId toPort, TciParameterListType parameterList)
void tciTestComponentTerminatedReq(TriComponentId component, VerdictValue verdict)
Boolean tciTestComponentRunningReq(TriComponentId component)
Boolean tciTestComponentDoneReq(TriComponentId component, int * verdict)
TriComponentId tciGetMTCReq()
void tciExecuteTestCaseReq(TciTestCaseIdType testCaseId, TriPortIdList tsiPortList)
void tciResetReq()
void tciKillTestComponentReq(TriComponentId component)
Boolean tciTestComponentAliveReq (TriComponentId component)
Boolean tciTestComponentKilledReq (TriComponentId component, int * verdict)
```

### 9.4.3.2 TCI-CH required

The TCI-CH Required interface is mapped to the following interface:

```

void          tciEnqueueMsgConnected
(TriPortId sender, TriComponentId receiver, Value rcvdMessage)
void          tciEnqueueCallConnected
(TriPortId sender, TriComponentId receiver, TriSignatureId signature,
TciParameterListType parameterList)
void          tciEnqueueReplyConnected
(TriPortId sender, TriComponentId receiver, TriSignatureId signature,
TciParameterListType parameterList, Value returnValue)
void          tciEnqueueRaiseConnected
(TriPortId sender, TriComponentId receiver, TriSignatureId signature, Value exception)
TriComponentId tciCreateTestComponent
(TciTestComponentKindType kind, Type componentType, String name)
void          tciStartTestComponent
(TriComponentId component, TciBehaviourIdType behaviour, TciParameterListType parameterList)
void          tciStopTestComponent(TriComponentId component)
void          tciConnect(TriPortId fromPort, TriPortId toPort)
void          tciDisconnect(TriPortId fromPort, TriPortId toPort)
void          tciMap (TriPortId fromPort, TriPortId toPort)
void          tciMapParam
(TriPortId fromPort, TriPortId toPort, TciParameterListType parameterList)
void          tciUnmap(TriPortId fromPort, TriPortId toPort)
void          tciUnmapParam
(TriPortId fromPort, TriPortId toPort, TciParameterListType parameterList)
void          tciTestComponentTerminated(TriComponentId component, VerdictValue verdict)
Boolean       tciTestComponentRunning(TriComponentId component)
Boolean       tciTestComponentDone(TriComponentId component, int * verdict)
TriComponentId tciGetMTC()
void          tciExecuteTestCase(TciTestCaseIdType testCaseId, TriPortIdList tsiPortList)
void          tciReset()
void          tciKillTestComponent(TriComponentId component)
Boolean       tciTestComponentAlive(TriComponentId component)
Boolean       tciTestComponentKilled(TriComponentId component, int * verdict)

```

## 9.4.4 The TCI-TL interface

### 9.4.4.1 TCI-TL provided

The TCI-TL Provided interface is mapped to the following interface:

```

void tliTcExecute
(String am, int ts, String src, int line, TriComponentId c, TciTestCaseIdType tcId,
TciParameterListType tciPars, TriTimerDuration dur)
void tliTcStart
(String am, int ts, String src, int line, TriComponentId c, TciTestCaseIdType tcId,
TciParameterListType tciPars, TriTimerDuration dur)
void tliTcStop
(String am, int ts, String src, int line, TriComponentId c, String reason)
void tliTcStarted
(String am, int ts, String src, int line, TriComponentId c, TciTestCaseIdType tcId,
TciParameterListType tciPars, TriTimerDuration dur)
void tliTcTerminated
(String am, int ts, String src, int line, TriComponentId c, TciTestCaseIdType tcId,
TciParameterListType tciPars, VerdictValue verdict, String reason)

void tliCtrlStart(String am, int ts, String src, int line, TriComponentId c)
void tliCtrlStop(String am, int ts, String src, int line, TriComponentId c)
void tliCtrlTerminated(String am, int ts, String src, int line, TriComponentId c)

void tliMSend_m
(String am, int ts, String src, int line, TriComponentId c, TriPortId at, TriPortId to,
Value msgValue, Value addrValue, TciStatus encoderFailure, TriMessage msg,
TriAddress address, TriStatus transmissionFailure)
void tliMSend_m_BC
(String am, int ts, String src, int line, TriComponentId c, TriPortId at, TriPortId to,
Value msgValue, TciStatus encoderFailure, TriMessage msg, TriStatus transmissionFailure)
void tliMSend_m_MC
(String am, int ts, String src, int line, TriComponentId c, TriPortId at, TriPortId to,
Value msgValue, TciValueList addrValues, TciStatus encoderFailure, TriMessage msg,
TriAddressList addresses, TriStatus transmissionFailure)
void tliMSend_c

```

```

    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, TriPortId to,
     Value msgValue, TriStatus transmissionFailure)
void tliMSend_c_BC
    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, TriPortIdList to,
     Value msgValue, TriStatus transmissionFailure)
void tliMSend_c_MC
    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, TriPortIdList to,
     Value msgValue, TriStatus transmissionFailure)
void tliMDetected_m
    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, TriPortId from,
     TriMessage msg, TriAddress address)
void tliMDetected_c
    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, TriPortId from,
     Value msgValue)
void tliMMismatch_m
    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, Value msgValue,
     TciValueTemplate msgTmpl, TciValueDifferenceList diffs, Value addrValue,
     TciValueTemplate addressTmpl)
void tliMMismatch_c
    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, Value msgValue,
     TciValueTemplate msgTmpl, TciValueDifferenceList diffs, TriComponentId from,
     TciNonValueTemplate fromTmpl)
void tliMReceive_m
    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, Value msgValue,
     TciValueTemplate msgTmpl, Value addrValue, TciValueTemplate addressTmpl)
void tliMReceive_c
    (String am, int ts, String src, int line, TriComponentId c, TriPortId at, Value msgValue,

## 9.7 Optional parameters

Clause 7.2.2 defines that a reserved value shall be used to indicate the absence of an optional parameter. For the C language mapping an explicit null shall be used. The function `tciSetNull` can be used to set a value to null and `tciIsNull` can be used to check whether a value represents null. `tciIsNull` returns true if the value is null, false otherwise.

For example, if in the `tcReplyConnected` operation the value parameter shall be omitted, then a value `reply` shall be created and set to null; the operation invocation shall be:

```
tcSetNull(reply);
tcReplyConnected (sender, receiver, signature, parameterList, reply).
```

---

## 10 C++ language mapping

### 10.1 Introduction

This clause introduces the TCI C++ language [9] mapping for the definitions given in clause 7.

### 10.2 Names and scopes

The namespace `ORG_ETSI_TTCN3_TCI` has been defined for the TCI C++ mapping, in order to avoid conflicts with the different names used, for example, in the C mapping.

C++ class identifiers are omitting the trailing "Type" at the end of the abstract definitions, e.g. the type `TciModuleIdType` is mapped to `TciModuleId` in C++.

### 10.3 Memory management

A general policy for memory management is not defined in this mapping. However, parameters are passed as pointers (or references) where possible, and a clone method has been added to the definition of every interface. The clone method can be used by the receiving entity to make a local copy where needed.

### 10.4 Error handling

No additional error handling has been defined for this mapping.

### 10.5 Type mapping

#### 10.5.0 Basic concepts

This clause introduces the TRI C++ language mapping for the abstract types defined in clause 7.2. The following concepts have been used:

- Pure virtual classes have been used following the concept of an interface.
- C++ types have been encapsulated under abstract definitions like `Tfloat` or `Tinteger`.

#### 10.5.1 Encapsulated C++ types

The following types have been defined in order to keep the definitions of data types and operations as general as possible:

|                                   |                                                    |
|-----------------------------------|----------------------------------------------------|
| Boolean type definition:          | <code>typedef bool Tboolean</code>                 |
| Integer type definition:          | <code>typedef long int Tinteger</code>             |
| Size type definition:             | <code>typedef unsigned long int Tsize</code>       |
| Index type definition:            | <code>typedef unsigned long int Tindex</code>      |
| Float type definition:            | <code>typedef double Tfloat</code>                 |
| String type definition:           | <code>typedef std::string Tstring</code>           |
| Universal string type definition: | <code>typedef std::wstring TuniversalString</code> |
| Bit type definition:              | <code>typedef unsigned char Tbit</code>            |
| Char type definition:             | <code>typedef unsigned char Tchar</code>           |

## 10.5.2 General abstract data types

### 10.5.2.1 TciBehaviourId

Identifies a TTCN-3 behaviour functions. It is mapped to the following pure virtual class:

```
class TciBehaviourId: public ORG_ETSI_TTCN3_TRI::QualifiedName {
public:
    virtual ~TciBehaviourId ();
    virtual Tboolean operator== (const TciBehaviourId &bid) const =0;
    virtual TciBehaviourId * clone () const =0;
    virtual Tboolean operator< (const TciBehaviourId &bid) const =0;
}
```

#### Methods:

|                 |                                        |
|-----------------|----------------------------------------|
| ~TciBehaviourId | Destructor                             |
| operator==      | Returns true if both objects are equal |
| clone           | Return a copy of the TciBehaviourId    |
| operator<       | Operator < overload                    |

### 10.5.2.2 TciModuleId

A value of TciModuleId specifies the name of a TTCN-3 module. It is mapped to the following pure virtual class:

```
class TciModuleId {
public:
    virtual ~TciModuleId ()
    virtual const Tstring & getObjectname() const = 0;
    virtual void setObjectName (const Tstring &p_name)=0;
    virtual Tboolean operator== (const TciModuleId &mid) const =0;
    virtual TciModuleId * clone () const =0;
    virtual Tboolean operator< (const TciModuleId &mid) const =0;
}
```

#### Methods:

|               |                                        |
|---------------|----------------------------------------|
| ~TciModuleId  | Destructor                             |
| getObjectname | Get the moduleId name                  |
| setObjectName | Set the moduleId name                  |
| operator==    | Returns true if both objects are equal |
| clone         | Return a copy of the TciModuleId       |
| operator<     | Operator < overload                    |

### 10.5.2.3 TciModuleParameterId

A value of TciModuleParameterId specifies the name of a TTCN-3 module parameter as defined in the TTCN-3 module. It is mapped to the following pure virtual class:

```
class TciModuleParameterId : public ORG_ETSI_TTCN3_TRI::QualifiedName {
public:
    virtual ~TciModuleParameterId ();
    virtual Tboolean operator== (const TciModuleParameterId &mparId) const =0;
    virtual TciModuleParameterId * clone () const =0;
    virtual Tboolean operator< (const TciModuleParameterId &mparId) const =0;
}
```

**Methods:**

~TciModuleParameterId  
Destructor

operator==  
Returns true if both objects are equal

clone  
Return a copy of the TciModuleParameterId

operator<  
Operator < overload

**10.5.2.4 TciTestCaseId**

A value of TciModuleParameterId specifies the name of a TTCN-3 testcase as defined in the TTCN-3 module. It is mapped to the following pure virtual class:

```
class TciTestCaseId : public TciBehaviourId {
public:
    virtual ~TciTestCaseId();
    virtual Tboolean operator== (const TciTestCaseId &tcid) const =0;
    virtual TciTestCaseId * clone () const =0;
    virtual Tboolean operator< (const TciTestCaseId &tcid) const =0;
}
```

**Methods:**

~TciTestCaseId  
Destructor

operator==  
Returns true if both objects are equal

clone  
Return a copy of the TciTestCaseId

operator<  
Operator < overload

**10.5.2.5 TciModuleIdList**

A value of TciModuleIdList defines a list of TciModuleId elements. It is mapped to the following pure virtual class:

```
class TciModuleIdList {
public:
    virtual ~TciModuleIdList();
    virtual Tsize size () const =0;
    virtual Tboolean empty () const =0;
    virtual const TciModuleId *get (Tsize p_index) const =0;
    virtual void clear ()=0;
    virtual void push_back (const TciModuleId &comp)=0;
    virtual Tboolean operator== (const TciModuleIdList &midList) const =0;
    virtual TciModuleIdList * clone () const =0;
    virtual Tboolean operator< (const TciModuleIdList &midList) const =0;
}
```

**Methods:**

~TciModuleIdList  
Destructor

size  
Return the size of the list

empty  
Return true if the list is empty

get  
Return the requested element

clear  
Remove all the components from this list

push\_back  
Add a component to the end of this list

operator==  
Returns true if both objects are equal

clone  
Return a copy of the TciModuleId

```
operator<
    Operator < overload
```

### 10.5.2.6 TciModuleParameter

This abstract type is used to represent the parameter name and the default value of a module parameter. It is mapped to the following pure virtual class:

```
class TciModuleParameter {
public:
    virtual ~TciModuleParameter ();
    virtual const TciValue & getDefaultValue () const =0;
    virtual const Tstring & getModuleParameterName () const =0;
    virtual const TciModuleParameterId & getTciModuleParameterId () const =0;
    virtual Tboolean operator== (const TciModuleParameter &mpar) const =0;
    virtual TciModuleParameter * clone () const =0;
    virtual Tboolean operator< (const TciModuleParameter &mpar) const =0;
}
```

#### Methods:

```
~TciModuleParameter
    Destructor
getDefaultValue
    Return default value of the parameter
getModuleParameterName
    Return parameter name
getTciModuleParameterId
    Get the name of the module parameter as defined in the TTCN-3 module
operator==
    Returns true if both objects are equal
clone
    Return a copy of the TciModuleParameter
operator<
    Operator < overload
```

### 10.5.2.7 TciModuleParameterList

A value of TciModuleParameterList is a list of TciModuleParameter elements. It is mapped to the following pure virtual class:

```
class TciModuleParameterList {
public:
    virtual ~TciModuleParameterList ();
    virtual Tsize size () const =0;
    virtual Tboolean empty () const =0;
    virtual const TciModuleParameter *get (Tindex p_index) const =0;
    virtual void clear ()=0;
    virtual void push_back (const TciModuleParameter &comp)=0;
    virtual Tboolean operator== (const TciModuleParameterList &mparList) const =0;
    virtual TciModuleParameterList * clone () const =0;
    virtual Tboolean operator< (const TciModuleParameterList &mparList) const =0;
}
```

#### Methods:

```
~TciModuleParameterList
    Destructor
size
    Return the size of the list
empty
    Return true if the list is empty
get
    Retrieve the specified element
clear
    Remove all components from this list
push_back
    Add a component to the end of this list
operator==
    Returns true if both objects are equal
```

```
clone
    Return a copy of the TciModuleParameterList
operator<
    Operator < overload
```

### 10.5.2.8 TciParameterPassingMode

Defines the parameter passing mode. It is mapped to an enumeration:

```
typedef enum
{
    IN = 0,
    OUT = 1,
    INOUT = 2
} TciParameterPassingMode;
```

### 10.5.2.9 TciParameter

Includes a TTCN-3 Value and a TciParameterPassingMode. It is mapped to the following pure virtual class:

```
class TciParameter {
public:
    virtual ~TciParameter ();
    virtual TciValue & getValue ()=0;
    virtual void setValue (TciValue &value)=0;
    virtual const TciParameterPassingMode &getParameterPassingMode () const =0;
    virtual void setParameterPassingMode (const TciParameterPassingMode &mode)=0;
    virtual const TString & getParameterName () const =0;
    virtual void setParameterName (const TString &name)=0;
    virtual Tboolean operator== (const TciParameter &param) const =0;
    virtual TciParameter * clone () const =0;
    virtual Tboolean operator< (const TciParameter &param) const =0;
}
```

#### Methods:

```
~TciParameter
    Destructor
getValue
    Retrieve the TTCN-3 value
setValue
    Set the TTCN-3 value
getParameterPassingMode
    Return the parameter passing mode
setParameterPassingMode
    Set the parameter passing mode
getParameterName
    Return the name of the parameter
setParameterName
    Set the name of the parameter
operator==
    Returns true if both objects are equal
clone
    Return a copy of the TciParameter
operator<
    Operator < overload
```

### 10.5.2.10 TciParameterList

Defines a list of TciParameter elements. It is mapped to the following pure virtual class:

```
class TciParameterList {
public:
    virtual ~TciParameterList ();
    virtual Tsize size () const =0;
    virtual Tboolean empty () const =0;
    virtual TciParameter *get (Tindex p_index) =0;
    virtual void clear ()=0;
    virtual void push_back (const TciParameter &comp)=0;
    virtual Tboolean operator== (const TciParameterList &param) const =0;
    virtual TciParameterList * clone () const =0;
```

```
    virtual Tboolean operator< (const TciParameterList &param) const =0;
}
```

#### Methods:

```
~TciParameterList    Destructor
size                Return the size of the list
empty              Return true if the list is empty
get                Get the specified element
clear              Remove all the components from this list
push_back          Add a component to the end of this list
operator==         Returns true if both objects are equal
clone              Return a copy of the TciParameterList
operator<          Operator < overload
```

### 10.5.2.11 TciParameterType

Includes a TTCN-3 type, parameter name and a TciParameterPassingMode. It is mapped to the following pure virtual class:

```
class TciParameterType {
public:
    virtual ~TciParameterType ();
    virtual const Tstring & getParameterName () const =0;
    virtual const TciType & getType () const =0;
    virtual const TciParameterPassingMode & getParameterPassingMode () const =0;
    virtual Tboolean operator== (const TciParameterType &parType) const =0;
    virtual TciParameterType * clone () const =0;
    virtual Tboolean operator< (const TciParameterType &parType) const =0;
}
```

#### Methods:

```
~TciParameterType    Destructor
getType              Return the TTCN-3 Type
getParameterName     Return the name of the parameter
getParameterPassingMode Get the parameter passing mode
operator==           Returns true if both objects are equal
clone                Return a copy of the TciParameterType
operator<            Operator < overload
```

### 10.5.2.12 TciParameterTypeList

Specifies a list of TciParameterType elements. It is mapped to the following pure virtual class:

```
class TciParameterTypeList {
public:
    virtual ~TciParameterTypeList ();
    virtual Tsize size () const =0;
    virtual Tboolean empty () const =0;
    virtual const TciParameterType *get (Tindex p_position) const =0;
    virtual void clear ()=0;
    virtual void push_back (const TciParameterType &comp)=0;
    virtual Tboolean operator== (const TciParameterTypeList &ptypeList) const =0;
```

```

    virtual TciParameterTypeList * clone () const =0;
    virtual Tboolean operator< (const TciParameterTypeList &ptypeList) const =0;
}

```

#### Methods:

```

~TciParameterTypeList
    Destructor
size
    Return the size of the list
empty
    Returns true if the list is empty
get
    Return the requested element
clear
    Remove all the components from this list
push_back
    Add a component to the end of this list
operator==
    Returns true if both objects are equal
clone ()
    Returns a copy of the TciParameterTypeList
operator< (const TciParameterTypeList &ptypeList)
    Operator < overload

```

### 10.5.2.13 TciTestComponentKind

Defines the test component kind. It is mapped to an enumeration:

```

typedef enum
{
    SYSTEM_COMP = 0,
    PTC_COMP = 1,
    PTC_ALIVE_COMP = 2,
    MTC_COMP = 3,
    CTRL_COMP = 4
} TciTestComponentKind;

```

### 10.5.2.14 TciTypeClass

Defines the type class. It is mapped to an enumeration:

```

typedef enum
{
    TCI_ADDRESS = 0,
    TCI_ANYTYPE = 1,
    TCI_BITSTRING = 2,
    TCI_BOOLEAN = 3,
    TCI_CHARSTRING = 5,
    TCI_COMPONENT = 6,
    TCI_ENUMERATED = 7,
    TCI_FLOAT = 8,
    TCI_HEXSTRING = 9,
    TCI_INTEGER = 10,
    TCI_OCTETSTRING = 12,
    TCI_RECORD = 13,
    TCI_RECORD_OF = 14,
    TCI_ARRAY = 15,
    TCI_SET = 16,
    TCI_SET_OF = 17,
    TCI_UNION = 18,
    TCI_UNIVERSAL_CHARSTRING = 20,
    TCI_VERDICT = 21,
    TCI_DEFAULT = 22,
    TCI_PORT = 23,
    TCI_TIMER = 24
} TciTypeClass;

```

### 10.5.2.15 TciTestCaseIdList

Specifies a list of TciTestCaseId elements. It is mapped to the following pure virtual class:

```
class TciTestCaseIdList {
public:
    virtual ~TciTestCaseIdList ();
    virtual Tsize size () const =0;
    virtual Tboolean empty () const =0;
    virtual const TciTestCaseId *get (Tindex p_position) const =0;
    virtual void clear ()=0;
    virtual void push_back (const TciTestCaseId &comp)=0;
    virtual Tboolean operator== (const TciTestCaseIdList &ptypeList) const =0;
    virtual TciTestCaseIdList * clone () const =0;
    virtual Tboolean operator< (const TciTestCaseIdList &ptypeList) const =0;
}
```

#### Methods:

|                                                |                                          |
|------------------------------------------------|------------------------------------------|
| ~TciTestCaseIdList                             | Destructor                               |
| size                                           | Return the size of the list              |
| empty                                          | Returns true if the list is empty        |
| get                                            | Return the requested element             |
| clear                                          | Remove all the components from this list |
| push_back                                      | Add a component to the end of this list  |
| operator==                                     | Returns true if both objects are equal   |
| clone ()                                       | Returns a copy of the TciTestCaseIdList  |
| operator< (const TciTestCaseIdList &ptypeList) | Operator < overload                      |

### 10.5.2.16 TciMatchingTypeType

Defines the matching template type. It is mapped to an enumeration:

```
typedef enum
{
    TCI_TEMPLATE_LIST = 0,
    TCI_COMPLEMENTED_LIST = 1,
    TCI_ANY_VALUE = 2,
    TCI_ANY_VALUE_OR_NONE = 3,
    TCI_VALUE_RANGE = 4,
    TCI_SUBSET = 5,
    TCI_SUPERSET = 6,
    TCI_ANY_ELEMENT = 7,
    TCI_ANY_ELEMENTS_OR_NONE = 8,
    TCI_PATTERN = 9,
    TCI_MATCH_DECODED_CONTENT = 10,
    TCI_OMIT_TEMPLATE = 11
} TciMatchingType;
```

### 10.5.2.17 LengthRestriction

Specifies a length restriction. It is mapped to the following pure virtual class:

```
class LengthRestriction {
public:
    virtual ~LengthRestriction ();
    virtual Tinteger getLowerBoundary () const =0;
    virtual Tinteger getUpperBoundary () const =0;
    virtual void setLowerBoundary (Tinteger p_boundary) =0;
    virtual void setUpperBoundary (Tinteger p_boundary) =0;
    virtual Tboolean isUpperBoundaryInfinity () const =0;
    virtual void setInfiniteUpperBoundary () =0;
    virtual Tboolean operator== (const LengthRestriction &p_lenRestriction) const =0;
```

```

    virtual LengthRestriction * clone () const =0;
    virtual Tboolean operator< (const LengthRestriction &p_lenRestriction) const =0;
}

```

**Methods:**

```

~LengthRestriction
    Destructor
getLowerBoundary
    Returns the lower boundary of the length restriction
getUpperBoundary
    Returns the upper boundary of the length restriction
setLowerBoundary
    Sets the lower boundary value
setUpperBoundary
    Sets the upper boundary value
isUpperBoundaryInfinity
    Returns true if the upper boundary contains infinity and false otherwise
setInfiniteUpperBoundary
    Sets the upper boundary to infinity
operator==
    Returns true if both objects are equal
clone ()
    Returns a copy of the LengthRestriction
operator<
    Operator < overload

```

**10.5.2.18 Permutation**

Specifies a permutation. It is mapped to the following pure virtual class:

```

class Permutation {
public:
    virtual ~Permutation ();
    virtual Tindex getStartPosition () const =0;
    virtual void setStartPosition (Tindex p_position) =0;
    virtual Tsize getLength () const =0;
    virtual void setLength (Tsize p_length) =0;
    virtual Tboolean operator== (const Permutation &p_permutation) const =0;
    virtual Permutation * clone () const =0;
    virtual Tboolean operator< (const Permutation &p_permutation) const =0;
}

```

**Methods:**

```

~Permutation
    Destructor
getStartPosition
    Returns the position of the first item of the permutation in the RecordOfValue
setStartPosition
    Sets the position of the first item of the permutation in the RecordOfValue
getLength
    Returns the number of elements or matching mechanisms of the RecordOfValue that are included in the
    permutation
setLength
    Sets the number of elements or matching mechanisms of the RecordOfValue that are included in the permutation
operator==
    Returns true if both objects are equal
clone ()
    Returns a copy of the Permutation
operator<
    Operator < overload

```

### 10.5.2.19 RangeBoundary

Specifies a lower or upper boundary of a `ValueRange`. It is mapped to the following pure virtual class:

```
class RangeBoundary {
public:
    virtual ~RangeBoundary ();
    virtual TciValue& getBoundary () const =0;
    virtual Tboolean isInclusive () const =0;
    virtual void setBoundary (TciValue &p_value, Tboolean p_isInclusive) =0;
    virtual Tboolean isInfinity () const =0;
    virtual void setToInfinity () =0;
    virtual Tboolean operator== (const RangeBoundary &p_boundary) const =0;
    virtual RangeBoundary * clone () const =0;
    virtual Tboolean operator< (const RangeBoundary &p_boundary) const =0;
}
```

#### Methods:

```
~RangeBoundary      Destructor
getBoundary          Returns the boundary value
isInclusive          Returns true if the boundary value is a part of the allowed range and false otherwise
setBoundary          Sets the boundary value
isInfinity           Returns true if the boundary is equal to infinity or -infinity and false otherwise
setToInfinity        Sets the boundary to infinity
operator==           Returns true if both objects are equal
clone ()             Returns a copy of the LengthRestriction
operator<            Operator < overload
```

## 10.5.3 Abstract TTCN-3 data types and values

### 10.5.3.1 TciType

A value of `TciType` represents one of the TTCN-3 types in a TTCN-3 module. It is mapped to the following pure virtual class:

```
class TciType {
public:
    virtual ~TciType ();
    virtual const TciModuleId & getDefiningModule () const =0;
    virtual const Tstring & getName () const =0;
    virtual const TciTypeClass & getTypeClass () const =0;
    virtual const Tstring & getTypeEncoding () const =0;
    virtual const Tstring & getTypeEncodingVariant () const =0;
    virtual const std::vector<Tstring*> & getEncodeAttributes () const =0;
    virtual const std::vector<Tstring*> & getVariantAttributes (const Tstring * encoding) const =0;
    virtual const std::vector<Tstring*> & getTypeExtension() const =0;
    virtual TciValue * newInstance () const =0;
    virtual MatchingMechanism * newTemplate (TciMatchingType matchingType) const =0;
    virtual TciValue * parseValue (const Tstring & val) const =0;
    virtual const RangeBoundary * getLowerTypeBoundary() const = 0;
    virtual const RangeBoundary * getUpperTypeBoundary() const = 0;
    virtual const LengthRestriction * getTypeLengthRestriction() const = 0;
    virtual const MatchingMechanism * getTypeMatchingMechanism() const = 0;
    virtual Tboolean operator== (const TciType &typ) const =0;
    virtual TciType * clone () const =0;
    virtual Tboolean operator< (const TciType &typ) const =0;
}
```

**Methods:**

`~TciType`  
     Destructor  
`getDefiningModule`  
     Returns the defining module as defined in the TTCN-3 module  
`getName`  
     Returns type name as defined in the TTCN-3 module  
`getTypeClass`  
     Returns this type class  
`getTypeEncoding`  
     Returns type encoding as defined in the TTCN-3 module  
`getTypeEncodingVariant`  
     Returns encoding variant as defined in the TTCN-3 module  
`getEncodeAttributes`  
     Returns all encode attributes of the type as defined in the TTCN-3 module. The distinct value `null` is mapped to an empty vector.  
`getVariantAttributes`  
     Returns all variant attributes of the type as defined in the TTCN-3 module. The distinct value `null` is mapped to an empty vector.  
`getTypeExtension`  
     Returns type extension as defined in the TTCN-3 module  
`newInstance`  
     Returns a new Value instance of this type  
`newTemplate`  
     Returns a freshly created matching mechanism of this type. The `matchingType` parameter determines what kind of matching mechanism will be created. If the created matching mechanism contains additional data properties, these properties are uninitialized in the created matching mechanism.  
`parseValue`  
     Returns a new `TciValue` instance in case of successful parsing or null pointer in case of parsing error or if value parsing is not supported by the tool  
`getLowerTypeBoundary`  
     Returns the lower boundary of the type restriction or `null`.  
`getUpperTypeBoundary`  
     Returns the upper boundary of the type restriction or `null`.  
`getTypeLengthRestriction`  
     Returns the type length restriction or `null`.  
`getTypeMatchingMechanism`  
     Returns the matching mechanism restriction of the type or `null`.  
`operator==`  
     Returns true if the types are equal  
`clone`  
     Returns a copy of the `TciType`  
`operator<`  
     Operator < overload

**10.5.3.2 TciValue**

A value of `TciValue` represents TTCN-3 values for a given type. It is mapped to the following pure virtual class:

```

class TciValue {
public:
    virtual ~TciValue ();
    virtual const TciType & getType () const =0;
    virtual const TString & getValueEncoding () const =0;
    virtual const TString & getValueEncodingVariant () const =0;
    virtual const std::vector<TString*> & getEncodeAttributes () const =0;
    virtual const std::vector<TString*> & getVariantAttributes (const TString * encoding) const =0;
    virtual Tboolean notPresent () const =0;
    virtual Tboolean isMatchingSymbol () const =0;
    virtual const TString & valueToString () const =0;
    virtual Tboolean isLazy () const =0;
    virtual Tboolean isFuzzy () const =0;
    virtual Tboolean isEvaluated () const =0;
    virtual LengthRestriction * getLengthRestriction () const = 0;
    virtual LengthRestriction * newLengthRestriction () const = 0;
    virtual void setLengthRestriction (const LengthRestriction * p_restriction) =0;
    virtual Tboolean isIfPresentEnabled () const =0;
    virtual void setIfPresentEnabled (Tboolean p_enabled) =0;
    virtual Tboolean isOptional () const =0;

```

```

virtual RangeBoundary * getLowerTypeBoundary() const = 0;
virtual RangeBoundary * getUpperTypeBoundary() const = 0;
virtual LengthRestriction * getTypeLengthRestriction() const = 0;
virtual MatchingMechanism * getTypeMatchingMechanism() const = 0;
virtual Tboolean operator== (const TciValue &p_val) const =0;
virtual TciValue * clone () const =0;
virtual Tboolean operator< (const TciValue &p_val) const =0;
}

```

### Methods:

**~TciValue**  
Destructor

**getType**  
Returns the type of the specified value

**getValueEncoding**  
Returns the value encoding attribute as defined in the TTCN-3 module

**getValueEncodingVariant**  
Returns the value encoding variant attribute as defined in the TTCN-3 module

**getEncodeAttributes**  
Returns all encode attributes of the value as defined in the TTCN-3 module. The distinct value `null` is mapped to an empty vector.

**getVariantAttributes**  
Returns all variant attributes of the value as defined in the TTCN-3 module. The distinct value `null` is mapped to an empty vector.

**notPresent**  
Returns true if the specified value is omit

**isMatchingSymbol**  
Returns true if the specified value is a matching symbol (see clause 7.2.2.2.1 for more details), false otherwise

**valueToString**  
Returns the same string as produced by the `any2unistr` predefined function

**isLazy**  
Returns true if the specified value is `@lazy`, false otherwise

**isFuzzy**  
Returns true if the specified value is `@fuzzy`, false otherwise

**isEvaluated**  
Returns true if the specified value contains an evaluation result, false otherwise (see clause 7.2.2.2.1 for more details)

**getLengthRestriction**  
Returns a length restriction matching attribute or `null` if no restriction is present

**newLengthRestriction**  
Creates a new instance of the `LengthRestriction` class

**setLengthRestriction**  
Adds a length restriction matching to the value or modifies an existing one. `Null` pointer can be used to remove an existing length restriction

**isIfPresentEnabled**  
Returns true if the `ifpresent` matching attribute is attached to the value and false otherwise

**setIfPresentEnabled**  
Sets the whether the `ifpresent` matching attribute is attached to the value or not

**isOptional**  
Returns whether the value is an optional field or a template without the present or value restriction.

**getLowerTypeBoundary**  
Returns the lower boundary of the value's type restriction or `null`.

**getUpperTypeBoundary**  
Returns the upper boundary of the value's type restriction or `null`.

**getTypeLengthRestriction**  
Returns the value's type length restriction or `null`.

**getTypeMatchingMechanism**  
Returns the matching mechanism type restriction of the value's type or `null`.

**operator==**  
Returns true if both objects are equal

**clone**  
Return a copy of the `TciValue`

**operator<**  
Operator < overload

### 10.5.3.3 IntegerValue

TTCN-3 integer value support. It is mapped to the following pure virtual class:

```
class IntegerValue : public virtual TciValue {
public:
    virtual ~IntegerValue ();
    virtual Tinteger getInt () const =0;
    virtual void setInt (Tinteger p_value)=0;
    virtual Tboolean operator== (const IntegerValue &p_intVal) const =0;
    virtual IntegerValue * clone () const =0;
    virtual Tboolean operator< (const IntegerValue & p_intVal) const =0;
}
```

#### Methods:

```
~IntegerValue      Destructor
getInt             Return integer value
setInt             Set integer value
operator==         Returns true if both objects are equal
clone              Return a copy of the IntegerValue
operator<          Operator < overload
```

### 10.5.3.4 FloatValue

TTCN-3 float value support. It is mapped to the following pure virtual class:

```
class FloatValue : public virtual TciValue {
public:
    virtual ~FloatValue ();
    virtual Tfloat getFloat () const =0;
    virtual void setFloat (Tfloat p_floatValue)=0;
    virtual Tboolean operator== (const FloatValue & p_floatVal) const =0;
    virtual FloatValue * clone () const =0;
    virtual Tboolean operator< (const FloatValue & p_floatVal) const =0;
}
```

#### Methods:

```
~FloatValue      Destructor
getFloat          Return the float value
setFloat          Set float value
operator==        Returns true if both objects are equal
clone              Return a copy of the FloatValue
operator<         Operator < overload
```

### 10.5.3.5 BooleanValue

TTCN-3 boolean values support. It is mapped to the following pure virtual class:

```
class BooleanValue : public virtual TciValue {
public:
    virtual ~BooleanValue ();
    virtual Tboolean getBoolean () const =0;
    virtual void setBoolean (Tboolean p_booleanValue)=0;
    virtual Tboolean operator== (const BooleanValue & p_booleanVal) const =0;
    virtual BooleanValue * clone () const =0;
    virtual Tboolean operator< (const BooleanValue & p_booleanVal) const =0;
}
```

**Methods:**

~BooleanValue  
     Destructor  
 getBoolean  
     Return the boolean value  
 setBoolean  
     Set the variable to booleanValue  
 operator==  
     Returns true if both objects are equal  
 clone  
     Return a copy of the BooleanValue  
 operator<  
     Operator < overload

**10.5.3.6 CharstringValue**

TTCN-3 charstring value support. It is mapped to the following pure virtual class:

```

class CharstringValue : public virtual TciValue {
public:
    virtual ~CharstringValue ();
    virtual char getChar (Tindex p_position) const =0;
    virtual Tsize getLength () const =0;
    virtual const Tstring & getString () const =0;
    virtual void setChar (Tsize p_position, char p_char)=0;
    virtual void setLength (Tsize p_length)=0;
    virtual void setString (const Tstring &p_charValue)=0;
    virtual Tboolean operator== (const CharstringValue & p_charStr) const =0;
    virtual CharstringValue * clone () const =0;
    virtual Tboolean operator< (const CharstringValue & p_charStr) const =0;
}
  
```

**Methods:**

~CharstringValue  
     Destructor  
 getChar  
     Return the char at the specified position  
 getLength  
     Return length of the string  
 getString  
     Return the value of the string  
 setChar  
     Set the char at the specified position  
 setLength  
     Set length of the string  
 setString  
     Set the value of the string  
 operator==  
     Returns true if both objects are equal  
 clone  
     Return a copy of the CharstringValue  
 operator<  
     Operator < overload

**10.5.3.7 UniversalCharstringValue**

TTCN-3 universal charstring value support. It is mapped to the following pure virtual class:

```

class UniversalCharstringValue : public virtual TciValue {
public:
    virtual ~UniversalCharstringValue ();
    virtual wchar_t getChar (Tindex p_position) const =0;
    virtual Tsize getLength () const =0;
    virtual const TuniversalString & getString () const =0;
    virtual void setChar (Tindex p_position, const wchar_t p_ucValue)=0;
    virtual void setLength (Tsize p_length)=0;
    virtual void setString (const TuniversalString &p_ucsValue)=0;
    virtual Tboolean operator== (const UniversalCharstringValue & p_uniCharstr) const =0;
}
  
```

```

    virtual UniversalCharstringValue * clone () const =0;
    virtual Tboolean operator< (const UniversalCharstringValue & p_uniCharstr) const =0;
}

```

**Methods:**

```

~UniversalCharstringValue
    Destructor
getChar
    Return the requested element
getLength
    Return the length of the universal charstring
getString
    Return the textual representation of the string
setChar
    Set the char at the specified position
setLength
    Set the length of the string
setString
    Set the value of the string
operator==
    Returns true if both objects are equal
clone
    Return a copy of the UniversalCharstringValue
operator<
    Operator < overload

```

**10.5.3.8 BitstringValue**

TTCN-3 bitstring value support. It is mapped to the following pure virtual class:

```

class BitstringValue : public virtual TciValue {
public:
    virtual ~BitstringValue ();
    virtual Tbit getBit (Tindex p_position) const =0;
    virtual Tsize getLength () const =0;
    virtual const Tstring & getString () const =0;
    virtual void setBit (Tindex p_position, Tbit p_bsValue)=0;
    virtual void setLength (Tindex p_new_length)=0;
    virtual void setString (const Tstring &p_bsValue)=0;
    virtual Tboolean isMatchingAt (Tindex p_position) const =0;
    virtual MatchingMechanism & getMatchingAt (Tindex p_position) const =0;
    virtual void setMatchingAt (Tindex p_position, MatchingMechanism &p_template) = 0;
    virtual Tboolean operator== (const BitstringValue &p_bitStr) const =0;
    virtual BitstringValue * clone () const =0;
    virtual Tboolean operator< (const BitstringValue &p_bitStr) const =0;
}

```

**Methods:**

```

~BitstringValue
    Destructor
getBit
    Returns the bit at the specified position
getLength
    Returns the length of the string
getString
    Set the value of the string
setBit
    Set the bit value at the specified position
setLength
    Set the length of the string
setString
    Set the string value
isMatchingAt
    Returns true if the item at the specified position is a matching mechanism inside a value
getMatchingAt
    Returns a matching mechanism at the specified position
setMatchingAt
    Sets the matching mechanism at the specified position

```

operator==  
Returns true if both objects are equal  
clone  
Return a copy of the BitstringValue  
operator<  
Operator < overload

### 10.5.3.9 OctetstringValue

TTCN-3 octetstring value support. It is mapped to the following pure virtual class:

```
class OctetstringValue : public virtual TciValue {
public:
    virtual ~OctetstringValue ();
    virtual Tsize getLength () const =0;
    virtual const Tchar getOctet (Tindex p_position) const =0;
    virtual const Tstring & getString () const =0;
    virtual void setLength (Tsize p_length)=0;
    virtual void setOctet (Tindex p_position, Tchar p_ochar)=0;
    virtual void setString (const Tstring &p_osValue)=0;
    virtual Tboolean isMatchingAt (Tindex p_position) const =0;
    virtual MatchingMechanism & getMatchingAt (Tindex p_position) const =0;
    virtual void setMatchingAt (Tindex p_position, MatchingMechanism &p_template) = 0;
    virtual Tboolean operator== (const OctetstringValue & p_octStr) const =0;
    virtual OctetstringValue * clone () const =0;
    virtual Tboolean operator< (const OctetstringValue & p_octStr) const =0;
}
```

#### Methods:

~OctetstringValue  
Destructor  
getLength  
Return the length of the string  
getOctet  
Return the textual representation of the octetchar at the specified position  
getString  
Set the string value  
setLength  
Set the length of the string  
setOctet  
Set the char at specified position  
setString  
Set the value of the string  
isMatchingAt  
Returns true if the item at the specified position is a matching mechanism inside a value  
getMatchingAt  
Returns a matching mechanism at the specified position  
setMatchingAt  
Sets the matching mechanism at the specified position  
operator==  
Returns true if both objects are equal  
clone  
Return a copy of the OctetstringValue  
operator<  
Operator < overload

### 10.5.3.10 HexstringValue

TTCN-3 hexstring value support. It is mapped to the following pure virtual class:

```
class HexstringValue : public virtual TciValue {
public:
    virtual ~HexstringValue ();
    virtual Tchar getHex (Tindex p_position) const =0;
    virtual Tsize getLength () const =0;
    virtual const Tstring & getString () const =0;
    virtual void setHex (Tindex p_position, Tchar p_hcValue)=0;
    virtual void setLength (Tsize p_length)=0;
    virtual void setString (const Tstring &p_hsValue)=0;
    virtual Tboolean isMatchingAt (Tindex p_position) const =0;
```

```

    virtual MatchingMechanism & getMatchingAt (Tindex p_position) const =0;
    virtual void setMatchingAt (Tindex p_position, MatchingMechanism &p_template) = 0;
    virtual Tboolean operator== (const HexstringValue & p_hexStr) const =0;
    virtual HexstringValue * clone () const =0;
    virtual Tboolean operator< (const HexstringValue & p_hexStr) const =0;
}

```

**Methods:**

```

~HexstringValue
    Destructor
getHex
    Return the element at the specified position
getLength
    Return the length of the string
getString
    Return the string value
setHex
    Set the hex value at the specified position
setLength
    Set the length of the string
setString
    Set the value of the string
isMatchingAt
    Returns true if the item at the specified position is a matching mechanism inside a value
getMatchingAt
    Returns a matching mechanism at the specified position
setMatchingAt
    Sets the matching mechanism at the specified position
operator==
    Returns true if both objects are equal
clone
    Return a copy of the HexstringValue
operator<
    Operator < overload

```

**10.5.3.11 RecordValue**

TTCN-3 record value support. It is mapped to the following pure virtual class:

```

class RecordValue : public virtual Tcivalue {
public:
    virtual ~RecordValue ();
    virtual Tcivalue &getField (const Tstring &p_field_name) =0;
    virtual void setField (const Tstring &p_field_name,const Tcivalue &p_new_value)=0;
    virtual const std::vector< Tstring *> & getFieldNames () const =0;
    virtual void setFieldOmitted (const Tstring & p_fieldName)=0;
    virtual Tboolean operator== (const RecordValue & p_rec) const =0;
    virtual RecordValue * clone () const =0;
    virtual Tboolean operator< (const RecordValue & p_rec) const =0;
}

```

**Methods:**

```

~RecordValue
    Destructor
getField
    Return a reference to the field name
setField
    Set the value of a field
getFieldNames
    Return a list which containing the names of all the fields
setFieldOmitted
    Set omit in one field
operator==
    Returns true if both objects are equal
clone
    Return a copy of the RecordValue
operator<
    Operator < overload

```

### 10.5.3.12 RecordOfValue

TTCN-3 record of value support. It is mapped to the following pure virtual class:

```
class RecordOfValue : public virtual TciValue {
public:
    virtual ~RecordOfValue ();
    virtual TciValue & getField (Tindex p_position)=0;
    virtual void setField (Tindex p_position, const TciValue &p_value)=0;
    virtual void appendField (const TciValue &p_value)=0;
    virtual const TciType & getElementType () const =0;
    virtual Tsize getLength () const =0;
    virtual void setLength (Tsize p_length)=0;
    virtual Tindex getOffset() const =0;
    virtual Tsize getPermutationCount () const =0;
    virtual Permutation & getPermutation (Tindex p_position) const =0;
    virtual Permutation * newPermutation () =0;
    virtual void definePermutation (const Permutation & permutation) =0;
    virtual void removePermutation (Tindex p_position) =0;
    virtual void clearPermutations () =0;
    virtual Tboolean operator== (const RecordOfValue &p_recOf) const =0;
    virtual RecordOfValue * clone () const =0;
    virtual Tboolean operator< (const RecordOfValue &p_recOf) const =0;
}
```

#### Methods:

~RecordOfValue  
Destructor

getField  
Return the field at the specified position

setField  
Set the value at the specified position

appendField  
Add a value at the end of the record of

getElementType  
Return the type of the elements of this record of

getLength  
Return the length of the object

setLength  
Set length of the record of

getOffset  
For arrays, return the lower index bound used in the type definition of arrays. Return 0 for record of and set of

getPermutationCount  
Returns the number of permutations in the record of or array value

getPermutation  
Returns the permutation at the specified index

definePermutation  
Creates a new Permutation class instance

removePermutation  
Creates permutation from existing elements of a record of value

clearPermutations  
Removes the permutation at the specified index

operator==  
Removes all permutaions from the value

clone  
Returns true if both objects are equal

operator<  
Return a copy of the RecordOfValue

Operator < overload

### 10.5.3.13 UnionValue

TTCN-3 union value support. It is mapped to the following pure virtual class:

```
class UnionValue : public virtual TciValue {
public:
    virtual ~UnionValue ()
    virtual void setVariant (const Tstring &p_variantName, const TciValue &p_value)=0;
    virtual TciValue & getVariant (const Tstring &p_variantName) =0;
    virtual const Tstring & getPresentVariantName () const =0;
    virtual const std::set< Tstring *> & getVariantNames () const =0;
    virtual Tboolean operator== (const UnionValue & p_unionVal) const =0;
    virtual UnionValue * clone () const =0;
    virtual Tboolean operator< (const UnionValue & p_unionVal) const =0;
}
```

#### Methods:

```
~UnionValue          Destructor
setVariant           Set the variant name to a value
getVariant           Return the value of the variant if exists
getPresentVariantName Return the name of the current variant value. null if no initialized
getVariantNames      Return a list which contains the variant names as defined in the TTCN-3 module
operator==           Returns true if both objects are equal
clone                Return a copy of the UnionValue
operator<            Operator < overload
```

### 10.5.3.14 EnumeratedValue

TTCN-3 enumerated value support. It is mapped to the following pure virtual class:

```
class EnumeratedValue : public virtual TciValue {
public:
    virtual ~EnumeratedValue ();
    virtual const Tstring & getEnum () const =0;
    virtual void setEnum (const Tstring &p_value)=0;
    virtual Tinteger getInt() const =0;
    virtual void setInt(Tinteger p_int);
    virtual Tboolean operator== (const EnumeratedValue & p_enumVal) const =0;
    virtual EnumeratedValue * clone () const =0;
    virtual Tboolean operator< (const EnumeratedValue & p_enumVal) const =0;
}
```

#### Methods:

```
~EnumeratedValue    Destructor
getEnum             Return current value
setEnum             Set the enumeration value
getInt              Return current integer value
setInt              Set the integer value
operator==          Returns true if both objects are equal
clone               Return a copy of the EnumeratedValue
operator<           Operator < overload
```

### 10.5.3.15 VerdictValue

TTCN-3 verdict value support. It is mapped to the following pure virtual class:

```
class VerdictValue : public virtual TciValue {
public:
    virtual ~VerdictValue ();
    virtual const VerdictValueEnum & getVerdict () const =0;
    virtual void setVerdict (const VerdictValueEnum & p_enum)=0;
    virtual Tboolean operator== (const VerdictValue & p_verdictVal) const =0;
    virtual VerdictValue * clone () const =0;
    virtual Tboolean operator< (const VerdictValue & p_verdictVal) const =0;
}
```

#### Methods:

```
~VerdictValue      Destructor
getVerdict         Return the value of the verdict
setVerdict         Set the value of the verdict
operator==         Returns true if both objects are equal
clone              Return a copy of the VerdictValue
operator<          Operator < overload
```

### 10.5.3.16 VerdictValueEnum

Defines verdict values as an enumeration:

```
typedef enum
{
    NONE = 0,
    PASS = 1,
    FAIL = 2,
    INCONC = 3,
    ERROR = 4,
    USER_ERROR = 5
} VerdictValueEnum;
```

### 10.5.3.17 AddressValue

TTCN-3 address value support. It is mapped to the following pure virtual class:

```
class AddressValue {
public:
    virtual ~AddressValue ();
    virtual TciValue & getAddress ()=0;
    virtual void setAddress ( const TciValue& T)=0;
    virtual Tboolean operator== (const AddressValue & p_addr) const =0;
    virtual AddressValue * cloneAddressValue () const =0;
    virtual Tboolean operator< (const AddressValue & p_addr) const =0;
}
```

#### Methods:

```
~AddressValue      Destructor
getAddress         Return the value of the address
setAddress         Set the value of the address
operator==         Returns true if both objects are equal
clone              Return a copy of the AddressValue
operator<          Operator < overload
```

### 10.5.3.18 MatchingMechanism

Represents a TTCN-3 matching mechanism. It is mapped to the following pure virtual class:

```
class MatchingMechanism : public virtual TciValue {
public:
    virtual ~MatchingMechanism ();
    virtual TciMatchingType getMatchingType () const =0;
    virtual Tboolean operator== (const MatchingMechanism &p_template) const =0;
    virtual MatchingMechanism * clone () const =0;
    virtual Tboolean operator< (const MatchingMechanism &p_template) const =0;
}
```

#### Methods:

```
~MatchingMechanism    Destructor
getMatchingType        Returns the matching mechanism type
operator==             Returns true if both objects are equal
clone                 Return a copy of the MatchingMechanism
operator<              Operator < overload
```

### 10.5.3.19 MatchingList

Represents the following TTCN-3 matching mechanisms: template list, complemented template list, subset, superset. It is mapped to the following pure virtual class:

```
class MatchingList : public virtual MatchingMechanism {
public:
    virtual ~MatchingList ();
    virtual Tsize size () const =0;
    virtual TciValue& get (Tindex p_position) const =0;
    virtual void add (TciValue& p_val) =0;
    virtual void remove (Tindex p_position) =0;
    virtual void clear () =0;
    virtual Tboolean operator== (const MatchingList &p_list) const =0;
    virtual MatchingList * clone () const =0;
    virtual Tboolean operator< (const MatchingList &p_list) const =0;
}
```

#### Methods:

```
~MatchingList    Destructor
size             Returns the number of items in the matching list
get             Returns the value or template at the specified position inside the matching list
add            Adds a new item to the end of the matching list, increasing its size
remove        Removes the value or template at the specified position inside the matching list
clear         Removes all values and templates from the matching list
operator==    Returns true if both objects are equal
clone        Return a copy of the MatchingList
operator<    Operator < overload
```

### 10.5.3.20 ValueRange

TTCN-3 value range support. It is mapped to the following pure virtual class:

```
class ValueRange : public virtual MatchingMechanism {
public:
    virtual ~ValueRange ();
    virtual RangeBoundary & getLowerBoundary () =0;
    virtual RangeBoundary & getUpperBoundary () =0;
    virtual void setLowerBoundary (const RangeBoundary & p_boundary) =0;
    virtual void setUpperBoundary (const RangeBoundary & p_boundary) =0;
    virtual Tboolean operator== (const ValueRange &p_range) const =0;
    virtual ValueRange * clone () const =0;
    virtual Tboolean operator< (const ValueRange &p_range) const =0;
}
```

#### Methods:

```
~ValueRange          Destructor
getLowerBoundary      Returns the lower boundary of the range
getUpperBoundary      Returns the upper boundary of the range
setLowerBoundary      Sets the lower boundary of the range
setUpperBoundary      Sets the upper boundary of the range
operator==            Returns true if both objects are equal
clone                 Return a copy of the ValueRange
operator<             Operator < overload
```

### 10.5.3.21 CharacterPattern

TTCN-3 pattern support. It is mapped to the following pure virtual class:

```
class CharacterPattern : public virtual MatchingMechanism {
public:
    virtual ~CharacterPattern ();
    virtual TciValue & getPatternString () =0;
    virtual void setPatternString (const TciValue & p_string) =0;
    virtual Tboolean operator== (const CharacterPattern &p_pattern) const =0;
    virtual CharacterPattern * clone () const =0;
    virtual Tboolean operator< (const CharacterPattern &p_pattern) const =0;
}
```

#### Methods:

```
~CharacterPattern      Destructor
getPatternString        Returns the character pattern definition of this pattern
setPatternString        Sets the character pattern definition of this pattern
operator==              Returns true if both objects are equal
clone                   Return a copy of the CharacterPattern
operator<               Operator < overload
```

### 10.5.3.22 MatchDecodedContent

TTCN-3 MatchDecodedContent support. It is mapped to the following pure virtual class:

```
class MatchDecodedContent : public virtual MatchingMechanism {
public:
    virtual ~MatchDecodedContent ();
    virtual TciValue & getContent () =0;
    virtual void setContent (const TciValue & p_content) =0;
    virtual Tboolean operator== (const MatchDecodedContent &p_content) const =0;
    virtual MatchDecodedContent * clone () const =0;
    virtual Tboolean operator< (const MatchDecodedContent &p_content) const =0;
}
```

#### Methods:

```
~MatchDecodedContent    Destructor
getContent              Returns the value or matching mechanism used as an argument of the decmatch matching mechanism
setContent              Sets the value or matching mechanism used as an argument of the decmatch matching mechanism
operator==              Returns true if both objects are equal
clone                   Return a copy of the MatchDecodedContent template
operator<               Operator < overload
```

## 10.5.4 Abstract logging types

### 10.5.4.1 TciValueTemplate

Interface that defines the concrete operations of the TTCN-3 template. It is mapped to the following pure virtual class:

```
class TciValueTemplate {
public:
    virtual ~TciValueTemplate ();
    virtual Tboolean isOmit () const =0;
    virtual Tboolean isAny () const =0;
    virtual Tboolean isAnyOrOmit () const =0;
    virtual const Tstring & getTemplateDef () const =0;
    virtual Tboolean operator== (const TciValueTemplate &vtempl) const =0;
    virtual TciValueTemplate * clone () const =0;
    virtual Tboolean operator< (const TciValueTemplate &vtempl) const =0;
}
```

#### Methods:

```
~TciValueTemplate ()    Destructor
isOmit ()               Return true if value of template is omit
isAny ()                Return true if value of template is any
isAnyOrOmit ()          Return true value of template if any or omit
getTemplateDef ()        Return the template definition as defined in the TTCN-3 module
operator== (const TciValueTemplate &vtempl) Returns true if both objects are equal
clone ()                Return a copy of the TciValueTemplate
operator< (const TciValueTemplate &vtempl) Operator < overload
```

### 10.5.4.2 TciNonValueTemplate

Support *all* and *any* matching mechanisms over TTCN-3 components and timers. It is mapped to the following pure virtual class:

```
class TciNonValueTemplate {
public:
    virtual ~TciNonValueTemplate ();
    virtual Tboolean isAny () const =0;
    virtual Tboolean isAll () const =0;
    virtual const Tstring & getTemplateDef () const =0;
    virtual Tboolean operator== (const TciNonValueTemplate &nvtempl) const =0;
    virtual TciNonValueTemplate * clone () const =0;
    virtual Tboolean operator< (const TciNonValueTemplate &nvtempl) const =0;
}
```

#### Methods:

```
~TciNonValueTemplate ()
    Destructor
isAny ()
    Return true if value is any
isAll ()
    Return true if is value all
getTemplateDef ()
    Return template definition as defined in the TTCN-3 module
operator== (const TciNonValueTemplate &nvtempl)
    Returns true if both objects are equal
clone ()
    Return a copy of the TciNonValueTemplate
operator< (const TciNonValueTemplate &nvtempl)
    Operator < overload
```

### 10.5.4.3 TciValueList

A list of TciValues. It is mapped to the following pure virtual class:

```
class TciValueList {
public:
    virtual ~TciValueList (void);
    virtual Tsize size () const =0;
    virtual Tboolean empty () const =0;
    virtual const TciValue *get (Tindex index) const =0;
    virtual void clear ()=0;
    virtual void add (const TciValue &comp)=0;
    virtual Tboolean operator== (const TciValueList &vallist) const =0;
    virtual TciValueList * clone () const =0;
    virtual Tboolean operator< (const TciValueList &vallist) const =0;
}
```

#### Methods:

```
~TciValueList ()
    Destructor
size ()
    Return the size of the list
empty ()
    Return true if the list is empty
get (Tindex index)
    Return the value at the specified position
clear ()
    Remove all the elements from this list
add (const TciValue &comp)
    Add an element to the end of this list
operator== (const TciValueList &vallist)
    Returns true if both objects are equal
clone ()
    Return a copy of the TciValueList
operator< (const TciValueList &vallist)
    Operator < overload
```

#### 10.5.4.4 TciValueDifference

Represents the differences during a match operation. It is mapped to the following pure virtual class:

```
class TciValueDifference {
public:
    virtual ~TciValueDifference ();
    virtual const TciValue & getValue () const =0;
    virtual void setValue (TciValue &val)=0;
    virtual const TciValueTemplate & getTciValueTemplate () const =0;
    virtual void setTciValueTemplate (TciValueTemplate &valT)=0;
    virtual const Tstring & getDescription () const =0;
    virtual void setDescription (const Tstring &descr)=0;
    virtual Tboolean operator== (const TciValueDifference &vdiff) const =0;
    virtual TciValueDifference * clone () const =0;
    virtual Tboolean operator< (const TciValueDifference &vdiff) const =0;
}
```

##### Methods:

```
~TciValueDifference ()
    Destructor
getValue ()
    Return the value definition
setValue (TciValue &val)
    Set the value definition
getTciValueTemplate ()
    Return the template definition
setTciValueTemplate (TciValueTemplate &valT)
    Set the template definition
getDescription ()
    Return a string which describes the difference
setDescription (const Tstring &descr)
    Set description
operator== (const TciValueDifference &vdiff)
    Returns true if both objects are equal
clone ()
    Return a copy of the TciValueDifference
operator< (const TciValueDifference &vdiff)
    Operator < overload
```

#### 10.5.4.5 TciValueDifferenceList

Collection of TciValueDifferences. It is mapped to the following pure virtual class:

```
class TciValueDifferenceList {
public:
    virtual ~TciValueDifferenceList ();
    virtual Tsize size () const =0;
    virtual Tboolean empty () const =0;
    virtual const TciValueDifference *get (Tindex p_position) const =0;
    virtual void clear ()=0;
    virtual void add (const TciValueDifference &comp)=0;
    virtual Tboolean operator== (const TciValueDifferenceList &vdList) const =0;
    virtual TciValueDifferenceList * clone () const =0;
    virtual Tboolean operator< (const TciValueDifferenceList &vdList) const =0;
}
```

##### Methods:

```
~TciValueDifferenceList ()
    Destructor
size ()
    Return the size of the list
empty ()
    Return true if this list contains no elements
get (Tindex p_position)
    Return the requested difference
clear ()
    Remove all the components from this list
```

```

add (const TciValueDifference &comp)
    Add a component to the end of the list
operator== (const TciValueDifferenceList &vdList)
    Returns true if both objects are equal
clone ()
    Return a copy of the TciValueDifferenceList
operator< (const TciValueDifferenceList &vdList)
    Operator < overload

```

#### 10.5.4.6 ComponentStatus

Defines component status as an enumeration:

```

typedef enum
{
    INACTIVE_C = 0,
    RUNNING_C = 1,
    STOPPED_C = 2,
    KILLED_C = 3,
    NULL_C = 4
} ComponentStatus;

```

#### 10.5.4.7 TimerStatus

Defines timer status as an enumeration:

```

typedef enum
{
    RUNNING_T = 0,
    INACTIVE_T = 1,
    EXPIRED_T = 2,
    NULL_T = 3
} TimerStatus;

```

#### 10.5.4.8 TciStatus

Defines TCI status as an enumeration:

```

typedef enum
{
    TCI_OK = 0,
    TCI_ERROR = -1
} TciStatus;

```

### 10.6 Operations mapping

#### 10.6.1 TCI-TM

##### 10.6.1.1 TciTmRequired

Specifies the operations the TM requires from TE. It is mapped to the following interface:

```

//Destructor
virtual ~TciTmRequired ();

//Selects the indicated module for execution
virtual void tciRootModule (const TciModuleId *moduleName)=0;

//The TE provides to the management a list of imported modules of the root module
virtual const TciModuleIdList * getImportedModules () const =0;

//The TE provides to the management a list of module parameters of the identified module
virtual const TciModuleParameterList * tciGetModuleParameters (const TciModuleId *moduleName)=0;

//The TE provides to the management a list of test cases
virtual const TciTestCaseIdList * tciGetTestCases () const =0;

```

```

//The TE provides to the management a list of parameter types of the given test case
virtual const TciParameterTypeList * tciGetTestCaseParameters (const TciTestCaseId *testCaseId)
const =0;

//The TE provides to the management a list of system ports of the given test case
virtual const TriPortIdList * tciGetTestCaseTSI (const TciTestCaseId &testCaseId) const =0;

//Starts a testcase in the currently selected module with the given parameters
virtual void tciStartTestCase (const TciTestCaseId *testCaseId, const TciParameterList
*parameterList)=0;

//Stops the testcase currently being executed
virtual void tciStopTestCase ()=0;

//Starts the control part of the selected module
virtual const TriComponentId * tciStartControl ()=0;

//Stops execution of the control part
virtual void tciStopControl ()=0;

```

### 10.6.1.2 TciTmProvided

Specifies the operation the TM has to provide to the TE. It is mapped to the following interface:

```

//Destructor
virtual ~TciTmProvided ();

//Indicates to the TM that a test case with testCaseId has been started
virtual void tciTestCaseStarted (const TciTestCaseId &testCaseId, const TciParameterList
&parameterList, const Tfloat &timer)=0;

//Called to indicate that the test case has terminated execution
virtual void tciTestCaseTerminated (const VerdictValue &verdict, const TciParameterList
&parameterList)=0;

//Called to indicate that the control part of the selected module has just terminated execution
virtual void tciControlTerminated ()=0;

//The management provides to the TE a Value for the indicated parameterId
virtual TciValue * tciGetModulePar (const TciModuleParameterId &parameterId)=0;

//Indicates the occurrence of an unrecoverable error situation
virtual void tciError (const Tstring &message)=0;

//The TE indicates a message of a test component
virtual void tciLog (const TriComponentId &testComponentId, const Tstring &message)=0;

```

## 10.6.2 TCI-CD

### 10.6.2.1 TciCdRequired

This class defines the TCI\_CD required interface. It is mapped to the following interface:

```

//Destructor
virtual ~TciCdRequired ();

//Returns a type representing a ttcn type
virtual const TciType * getTypeForName (const Tstring typeName) const =0;

//Constructs and returns a basic TTCN-3 integer type
virtual const TciType & getInteger () const =0;

//Constructs and returns a basic TTCN-3 float type
virtual const TciType & getFloat () const =0;

//Constructs and returns a basic TTCN-3 boolean type
virtual const TciType & getBoolean () const =0;

//Constructs and returns a basic TTCN-3 charstring type
virtual const TciType & getCharstring () const =0;

//Constructs and returns a basic TTCN-3 universal charstring type
virtual const TciType & getUniversalCharstring () const =0;

```

```
//Constructs and returns a basic TTCN-3 hexstring type
virtual const TciType & getHexstring () const =0;

//Constructs and returns a basic TTCN-3 bitstring type
virtual const TciType & getBitstring () const =0;

//Constructs and returns a basic TTCN-3 octetstring type
virtual const TciType & getOctetstring () const =0;

//Constructs and returns a basic TTCN-3 verdict type
virtual const TciType & getVerdict () const =0;

//The TE will be notified about an unrecoverable error situation within the CD
virtual void tciErrorReq (const Tstring message)=0;
```

### 10.6.2.2 TciCdProvided

This class defines the TCI\_CD provided interface. It is mapped to the following interface:

```
//Destructor
virtual ~TciCdProvided ();

//This operation is called whenever the TE has to implicitly decode a value
virtual TciValue * decode (const TriMessage *p_message, const TciType *p_decodingHypothesis)=0;

//This operation is called whenever the TE has to implicitly encode a value
virtual TriMessage * encode (const TciValue *p_value)=0;

//This operation is called whenever the TE invokes decvalue
virtual Tinteger decodeValue (TriMessage *p_message, const TciType *p_decodingHypothesis,
                             const TuniversalString & decodingInfo, TciValue ** decodedValue )=0;

//This operation is called whenever the TE invokes encvalue
virtual TriMessage * encodeValue (const TciValue *p_value, const TuniversalString & encodingInfo)=0;
```

## 10.6.3 TCI-CH

### 10.6.3.1 TciChRequired

This class defines the TCI\_CH required interface. It is mapped to the following interface:

```
//Default destructor
virtual ~TciChRequired ();

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciSendConnected has been called
virtual void tciEnqueueMsgConnected (const TriPortId *sender, const TriComponentId *receiver,
                                     const TciValue *rcvdMessage)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciCallConnected has been called
virtual void tciEnqueueCallConnected (const TriPortId *sender, const TriComponentId *receiver,
                                     const TriSignatureId *signature, const TciParameterList *parameterList)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciReplyConnected has been called
virtual void tciEnqueueReplyConnected (const TriPortId *sender, const TriComponentId *receiver,
                                       const TriSignatureId *signature, const TciParameterList *parameterList,
                                       const TciValue *returnValue)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciRaiseConnected has been called
virtual void tciEnqueueRaiseConnected (const TriPortId *sender, const TriComponentId *receiver,
                                       const TriSignatureId *signature, const TciValue *exception)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciCreateTestComponentReq has been called
virtual const TriComponentId * tciCreateTestComponent (const TciTestComponentKind *kind,
                                                       const TciType *componentType, const Tstring *name)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciStartTestComponentReq has been called
virtual void tciStartTestComponent (const TriComponentId *component,
                                    const TciBehaviourId *behaviour, const TciParameterList *parameterList)=0;
```

```

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciStopTestComponentReq has been called
virtual void tciStopTestComponent (const TriComponentId *component)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided tciConnect
//has been called
virtual void tciConnect (const TriPortId *fromPort, const TriPortId *toPort)

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciDisconnect has been called
virtual void tciDisconnect (const TriPortId *fromPort, const TriPortId *toPort)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided tciMapReq
//has been called
virtual void tciMap (const TriPortId *fromPort, const TriPortId *toPort)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciMapParamReq has been called
virtual void tciMapParam (const TriPortId *fromPort, const TriPortId *toPort,
    const TciParameterList *parameterList)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided tciUnmapReq
//has been called
virtual void tciUnmap (const TriPortId *fromPort, const TriPortId *toPort)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciUnmapParamReq has been called
virtual void tciUnmapParam (const TriPortId *fromPort, const TriPortId *toPort,
    const TciParameterList *parameterList)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided tciUnmapReq
//has been called
virtual void tciTestComponentTerminated (const TriComponentId *component,
    const VerdictValue *verdict) const =0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciTestComponentRunningReq has been called
virtual Tboolean tciTestComponentRunning (const TriComponentId *component) const =0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciTestComponentDoneReq has been called
virtual Tboolean tciTestComponentDone (const TriComponentId *comp, VerdictValueEnum * verdict)
    const =0;

//This operation can be called by the CH at the appropriate local TE when at a remote TE a
//provided tciGetMTCReq has been called
virtual const TriComponentId * tciGetMTC () const =0;

//This operation is called by the CH at the appropriate local TE when at a remote TE a provided
//tciExecuteTestCaseReq has been called
virtual void tciExecuteTestCase (const TciTestCaseId *testCaseId,
    const TriPortIdList *tsiPortList)=0;

//This operation is called by the CH at appropriate local TEs when at a remote TE a provided
//tciResetReq has been called
virtual void tciReset ()=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciKillTestComponentReq has been called
virtual void tciKillTestComponent (const TriComponentId *comp, VerdictValueEnum * verdict)=0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciTestComponentAliveReq has been called
virtual Tboolean tciTestComponentAlive (const TriComponentId *comp) const =0;

//This operation is called by the CH at the local TE when at a remote TE a provided
//tciTestComponentKilledReq has been called
virtual Tboolean tciTestComponentKilled (const TriComponentId *comp) const =0;

```

### 10.6.3.2 TciChProvided

This class defines the TCI\_CH provided interface. It is mapped to the following interface:

```

//Destructor
virtual ~TciChProvided ();

```

```

//Called by the TE when it executes a TTCN-3 unicast send operation on a component port
virtual void tciSendConnected (const TriPortId *sender, const TriComponentId *receiver,
    const TciValue *sendMessage)=0;

//Called by the TE when it executes a TTCN-3 broadcast send operation on a component port
virtual void tciSendConnectedBC (const TriPortId *sender, const TciValue *sendMessage)=0;

//Called by the TE when it executes a TTCN-3 multicast send operation on a component port
virtual void tciSendConnectedMC (const TriPortId *sender, const TriComponentIdList *receivers,
    const TciValue *sendMessage)=0;

//Called by the TE when it executes a TTCN-3 unicast call operation on a component port
virtual void tciCallConnected (const TriPortId *sender, const TriComponentId *receiver,
    const TriSignatureId *signature, const TciParameterList *parameterList)=0;

//Called by the TE when it executes a TTCN-3 broadcast call operation on a component port
virtual void tciCallConnectedBC (const TriPortId *sender, const TriSignatureId *signature,
    const TciParameterList *parameterList)=0;

//Called by the TE when it executes a TTCN-3 multicast call operation on a component port
virtual void tciCallConnectedMC (const TriPortId *sender, const TriComponentIdList *receivers,
    const TriSignatureId *signature, const TciParameterList *parameterList)=0;

//Called by the TE when it executes a TTCN-3 unicast reply operation on a component port
virtual void tciReplyConnected (const TriPortId *sender, const TriComponentId *receiver,
    const TriSignatureId *signature, const TciParameterList *parameterList,
    const TciValue *returnValue)=0;

//Called by the TE when it executes a TTCN-3 broadcast reply operation on a component port
virtual void tciReplyConnectedBC (const TriPortId *sender, const TriSignatureId *signature,
    const TciParameterList *parameterList, const TciValue *returnValue)=0;

//Called by the TE when it executes a TTCN-3 multicast reply operation on a component
virtual void tciReplyConnectedMC (const TriPortId *sender, const TriComponentIdList *receivers,
    const TriSignatureId *signature, const TciParameterList *parameterList,
    const TciValue *returnValue)=0;

//Called by the TE when it executes a TTCN-3 unicast raise operation on a component port
virtual void tciRaiseConnected (const TriPortId *sender, const TriComponentId *receiver,
    const TriSignatureId *signature, const TciValue *exception)=0;

//Called by the TE when it executes a TTCN-3 broadcast raise operation on a component port
virtual void tciRaiseConnectedBC (const TriPortId *sender, const TriSignatureId *signature,
    const TciValue *exception)=0;

//Called by the TE when it executes a TTCN-3 multicast raise operation on a component
virtual void tciRaiseConnectedMC (const TriPortId *sender, const TriComponentIdList *receiver,
    const TriSignatureId *signature, const TciValue *exception)=0;

//Called from the TE when a component has to be created
virtual const TriComponentId * tciCreateTestComponentReq (const TciTestComponentKind *kind,
    const QualifiedName *componentType, const Tstring &name, const TciValue *hostId)=0;

//Called by the TE when it executes the TTCN-3 start operation
virtual void tciStartTestComponentReq (const TriComponentId *component,
    const TciBehaviourId *behaviour, const TciParameterList *parameterList)=0;

//Called by the TE when it executes the TTCN-3 stop operation
virtual void tciStopTestComponentReq (const TriComponentId *component)=0;

//Called by the TE when it executes a TTCN-3 connect operation
virtual void tciConnectReq (const TriPortId *fromPort, const TriPortId *toPort)=0;

//Called by the TE when it executes a TTCN-3 disconnect operation
virtual void tciDisconnectReq (const TriPortId *fromPort, const TriPortId *toPort)=0;

//Called by the TE when it executes a TTCN-3 map operation
virtual void tciMapReq (const TriPortId *fromPort, const TriPortId *toPort)=0;

//Called by the TE when it executes a TTCN-3 map operation including parameters
virtual void tciMapParamReq (const TriPortId *fromPort, const TriPortId *toPort,
    const TciParameterList *parameterList)=0;

//Called by the TE when it executes a TTCN-3 unmap operation
virtual void tciUnmapReq (const TriPortId *fromPort, const TriPortId *toPort)=0;

```

```

//Called by the TE when it executes a TTCN-3 unmap operation including parameters
virtual void tciUnmapParamReq (const TriPortId *fromPort, const TriPortId *toPort,
    const TciParameterList *parameterList)=0;

//Called by the TE when a test component terminates execution
virtual void tciTestComponentTerminatedReq (const TriComponentId *component,
    const VerdictValue *verdict)=0;

//Called by the TE when it executes a TTCN-3 running operation
virtual Tboolean tciTestComponentRunningReq (const TriComponentId *component) const =0;

//Called by the TE when it executes a TTCN-3 done operation
virtual Tboolean tciTestComponentDoneReq (const TriComponentId *comp, VerdictValueEnum * verdict)
    const =0;

//Called by the TE when it executes a TTCN-3 mtc operation
virtual const TriComponentId * tciGetMTCReq () const =0;

//Called by the TE immediately before it starts the test case behaviour on the MTC
virtual void tciExecuteTestCaseReq (const TciTestCaseId *testCaseId,
    const TriPortIdList *tsiPortList)=0;

//Called by the TE at any time to reset the test system
virtual void tciResetReq ()=0;

//Called by the TE when it executes the TTCN-3 kill operation
virtual void tciKillTestComponentReq (const TriComponentId *comp)=0;

//Called by the TE when it executes the TTCN-3 alive operation
virtual Tboolean tciTestComponentAliveReq (const TriComponentId *comp) const =0;

//Called by the TE when it executes the TTCN-3 killed operation
virtual Tboolean tciTestComponentKilledReq (const TriComponentId *comp, VerdictValueEnum * verdict)
    const =0;

```

## 10.6.4 TCI-TL

### 10.6.4.1 TciTlProvided

This class defines the TCI\_TL provided Tinterface:

```

//Default constructor
TciTlProvided ();

// Destructor
virtual ~TciTlProvided ();

//Called by TE to log the execute test case request
virtual void tliTcExecute (const Tstring &am, const timeval ts, const Tstring src, const Tinteger
    line, const TriComponentId *c, const TciTestCaseId *tcId, const TciParameterList *tciPars, const
    TriTimerDuration *dur)=0;

//Called by TE to log the start of a testcase. This event occurs before the testcase is started
virtual void tliTcStart (const Tstring &am, const timeval ts, const Tstring &src, const Tinteger
    line, const TriComponentId *c, const TciTestCaseId *tcId, const TciParameterList *tciPars, const
    TriTimerDuration *dur)=0;

//Called by TE to log the stop of a testcase
virtual void tliTcStop (const Tstring &am, const timeval ts, const Tstring &src, const Tinteger
    line, const TriComponentId *c, const Tstring &reason)=0;

//Called by TE to log the start of a testcase
virtual void tliTcStarted (const Tstring &am, const timeval ts, const Tstring &src, const Tinteger
    line, const TriComponentId *c, const TciTestCaseId *tcId, const TciParameterList *tciPars, const
    TriTimerDuration *dur)=0;

//Called by TE to log the termination of a testcase
virtual void tliTcTerminated (const Tstring &am, const timeval ts, const Tstring &src, const
    Tinteger line, const TriComponentId *c, const TciTestCaseId *tcId, const TciParameterList *tciPars,
    const VerdictValue *verdict, const Tstring &reason)=0;

//Called by TE to log the start of the control part
virtual void tliCtrlStart (const Tstring &am, const timeval ts, const Tstring &src, const Tinteger
    line, const TriComponentId *c)=0;

```

```

//Called by TE to log the stop of the control part. This event occurs after the control has
//stopped. If the control is not represented by TRI component, c is null
virtual void tliCtrlStop (const Tstring &am, const timeval ts, const Tstring &src, const Tinteger
line, const TriComponentId *c)=0;

//Called by TE to log the termination of the control part
virtual void tliCtrlTerminated (const Tstring &am, const timeval ts, const Tstring &src, const
Tinteger line, const TriComponentId *c)=0;

//Called by TE to log a unicast send operation
virtual void tliMSend_m (const Tstring &am, const timeval ts, const Tstring &src, const Tinteger
line, const TriComponentId *c, const TriPortId *at, const TriPortId *to, const TciValue *msgValue,
const TriAddress *address, const TciStatus *encoderFailure, const TriMessage *msg, const TriStatus
*transmissionFailure)=0;

//Called by TE to log a broadcast send operation
virtual void tliMSend_m_BC (const Tstring &am, const timeval ts, const Tstring &src, const Tinteger
line, const TriComponentId *c, const TriPortId *at, const TriPortId *to, const TciValue *msgValue,

line, const TriComponentId *c, const QualifiedName &name, const TciValue *evalResult)=0;

```

---

## 11 W3C XML mapping

### 11.1 Introduction

This clause introduces the TCI XML mapping [10], [11] and [12] for the logging interface of TCI. The XML mapping for the logging interface defines how the IDL definitions for TCI-TL described in clause 7 are mapped to XML. The complete schema definitions for this mapping are given in annex B.

### 11.2 Scopes

The IDL module **tciInterface** is mapped to an XML schema with the name space [http://uri.etsi.org/ttcn-3/tci/TLI\\_v4\\_10\\_1.xsd](http://uri.etsi.org/ttcn-3/tci/TLI_v4_10_1.xsd).

This schema uses further schemas:

- [http://uri.etsi.org/ttcn-3/tci/SimpleTypes\\_v4\\_10\\_1.xsd](http://uri.etsi.org/ttcn-3/tci/SimpleTypes_v4_10_1.xsd)  
for the mapping of simple types to XML.
- [http://uri.etsi.org/ttcn-3/tci/Types\\_v4\\_10\\_1.xsd](http://uri.etsi.org/ttcn-3/tci/Types_v4_10_1.xsd)  
for the mapping of structured types to XML.

- [http://uri.etsi.org/ttcn-3/tci/Values\\_v4\\_10\\_1.xsd](http://uri.etsi.org/ttcn-3/tci/Values_v4_10_1.xsd)  
for the mapping of values to XML.
- [http://uri.etsi.org/ttcn-3/tci/Templates\\_v4\\_10\\_1.xsd](http://uri.etsi.org/ttcn-3/tci/Templates_v4_10_1.xsd)  
for the mapping of templates to XML.
- [http://uri.etsi.org/ttcn-3/tci/Events\\_v4\\_10\\_1.xsd](http://uri.etsi.org/ttcn-3/tci/Events_v4_10_1.xsd)  
for the mapping of logging events to XML.

## 11.3 Type mapping

### 11.3.1 Mapping of simple types

#### 11.3.1.1 TBoolean

The IDL **TBoolean** type is mapped to the xsd basic type `boolean`.

#### 11.3.1.2 TString

The IDL **TString** type is mapped to the xsd basic type `string`.

#### 11.3.1.3 TInteger

The IDL **TInteger** type is mapped to the xsd basic type `integer`.

#### 11.3.1.4 TriTimerDurationType

The IDL **TriTimerDurationType** type is mapped to the xsd basic type `float`.

#### 11.3.1.5 TciParameterPassingModeType

The IDL **TciParameterPassingModeType** type is mapped to the xsd basic type `string` with enumeration values `"in"`, `"out"` and `"inout"`.

#### 11.3.1.6 TriStatusType

The IDL **TriStatusType** type is mapped to the xsd basic type `string` with enumeration values `"TRI_Ok"` and `"TRI_Error"`.

#### 11.3.1.7 TciStatusType

The IDL **TriStatusType** type is mapped to the xsd basic type `string` with enumeration values `"TCI_Ok"` and `"TCI_Error"`.

#### 11.3.1.8 ComponentStatusType

The IDL **ComponentStatusType** type is mapped to the xsd basic type `string` with enumeration values `"inactiveC"`, `"runningC"`, `"stoppedC"`, `"killedC"` and `"nullC"`.

#### 11.3.1.9 TimerStatusType

The IDL **TimerStatusType** type is mapped to the xsd basic type `string` with enumeration values `"runningT"`, `"inactiveT"`, `"expiredT"`, and `"nullT"`.

### 11.3.1.10 PortStatusType

The IDL **PortStatusType** type is mapped to the xsd basic type `string` with enumeration values "startedP", "haltedP" and "stoppedP".

## 11.3.2 Complex type mapping

### 11.3.2.1 TriPortIdType

**TriPortIdType** is mapped to the following complex type:

```
<xsd:complexType name="TriPortIdType">
  <xsd:sequence>
    <xsd:element name="comp" type="Types:TriComponentIdType" />
    <xsd:element name="port" type="Types:Port"/>
  </xsd:sequence>
</xsd:complexType>
```

#### Elements:

- `comp` The TRI component identifier.
- `port` The identification of the port.

#### Attributes:

- none.

### 11.3.2.2 TriComponentIdType

**TriComponentIdType** is mapped to the following complex type:

```
<xsd:complexType name="TriComponentIdType">
  <xsd:sequence>
    <xsd:choice>
      <xsd:element name="null" type="Templates:null"/>
      <xsd:element name="id" type="Types:Id"/>
    </xsd:choice>
  </xsd:sequence>
</xsd:complexType>
```

#### Elements:

- `id` The identifier of the TRI component.
- `null` The `null` identifier. To be used if there is no TRI component identifier.

#### Attributes:

- none.

### 11.3.2.3 TriComponentIdListType

**TriComponentIdListType** is mapped to the following complex type:

```
<xsd:complexType name="TriComponentIdListType">
  <xsd:sequence>
    <xsd:element name="comp" type="Types:TriComponentIdType" minOccurs="0"
      maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

#### Elements:

- `comp` The identifiers of TRI components in that list.

**Attributes:**

- none.

**11.3.2.4 Port**

**Port** is mapped to the following complex type:

```
<xsd:complexType name="Port">
  <xsd:sequence>
    <xsd:element name="id" type="Types:Id"/>
    <xsd:element name="index" type="xsd:int"/>
  </xsd:sequence>
</xsd:complexType>
```

**Elements:**

- **id** The port identifier.
- **port** The port index.

**Attributes:**

- none.

**11.3.2.5 Id**

**Id** is used as identification for components, ports and timers and is mapped to the following complex type:

```
<xsd:complexType name="Id">
  <xsd:sequence>
    <xsd:element name="name" type="SimpleTypes:TString"/>
    <xsd:element name="id" type="SimpleTypes:TString" minOccurs="0"/>
    <xsd:element name="type" type="SimpleTypes:TString" minOccurs="0"/>
  </xsd:sequence>
</xsd:complexType>
```

**Elements:**

- **name** The name of the component, port or timer.
- **id** The internal representation of the component, port or timer.
- **type** The type of the component, port or timer.

**Attributes:**

- none.

**11.3.2.6 TriMessageType**

**TriMessageType** is mapped to the following complex type:

```
<xsd:complexType name="TriMessageType">
  <xsd:attribute name="val" type="xsd:hexBinary"/>
  <xsd:attribute name="paddingBits" type="xsd:integer" use="optional" default="0"/>
</xsd:complexType>
```

**NOTE:** paddingBits is optional with a default value of 0 and should only take values between 0 and 7.  
 The relation between paddingBits and numberOfBits is:  
 $\text{numberOfBits} == (\text{length}(\text{val-attribute})/2) * 8 - \text{paddingBits}$   
 In the byte-aligned case which is the typical one, the paddingBits attribute can be left out.

**Elements:**

- none.

**Attributes:**

- **val** The encoded message.
- **paddingBits** The padding bits of the encoded message.

**11.3.2.7 TriParameterType**

**TriParameterType** is mapped to the following complex type:

```
<xsd:complexType name="TriParameterType">
  <xsd:attribute name="val" type="xsd:hexBinary"/>
  <xsd:attribute name="paddingBits" type="xsd:integer" use="optional" default="0"/>
  <xsd:attribute name="name" type="SimpleTypes:TString"/>
  <xsd:attribute name="mode" type="SimpleTypes:TciParameterPassingModeType"/>
</xsd:complexType>
```

NOTE: paddingBits is optional with a default value of 0 and should only take values between 0 and 7.  
 The relation between paddingBits and numberOfBits is:  
 $\text{numberOfBits} == (\text{length}(\text{val-attribute})/2) * 8 - \text{paddingBits}$   
 In the byte-aligned case which is the typical one, the paddingBits attribute can be left out.

**Elements:**

- none.

**Attributes:**

- **val** The encoded parameter.
- **paddingBits** The padding bits of the encoded parameter.
- **name** The parameter name.
- **mode** The parameter passing mode.

**11.3.2.8 TriParameterListType**

**TriParameterListType** is mapped to the following complex type:

```
<xsd:complexType name="TriParameterListType">
  <xsd:sequence>
    <xsd:element name="par" type="Types:TriParameterType" minOccurs="0"
      maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

**Sequence of Elements:**

- **par** The parameters in that list.

**Attributes:**

- none.

**11.3.2.9 TriAddressType**

**TriAddressType** is mapped to the following complex type:

```
<xsd:complexType name="TriAddressType">
  <xsd:attribute name="val" type="xsd:hexBinary"/>
  <xsd:attribute name="paddingBits" type="xsd:integer" use="optional" default="0"/>
</xsd:complexType>
```

NOTE: paddingBits is optional with a default value of 0 and should only take values between 0 and 7.  
 The relation between paddingBits and numberOfBits is:  
 $\text{numberOfBits} == (\text{length}(\text{val-attribute})/2) * 8 - \text{paddingBits}$   
 In the byte-aligned case which is the typical one, the paddingBits attribute can be left out.

**Elements:**

- none.

**Attributes:**

- val                      The address value.
- paddingBits            The padding bits of the encoded address.

### 11.3.2.10 TriAddressListType

**TriAddressListType** is mapped to the following complex type:

```
<xsd:complexType name="TriAddressListType">
  <xsd:sequence>
    <xsd:element name="addr" type="Types:TriAddressType" minOccurs="0"
      maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

**Elements:**

- addr                    The addresses in that list.

**Attributes:**

- none.

### 11.3.2.11 TriExceptionType

**TriExceptionType** is mapped to the following complex type:

```
<xsd:complexType name="TriExceptionType">
  <xsd:attribute name="val" type="xsd:hexBinary"/>
  <xsd:attribute name="paddingBits" type="xsd:integer" use="optional" default="0"/>
</xsd:complexType>
```

NOTE: paddingBits is optional with a default value of 0 and should only take values between 0 and 7.  
 The relation between paddingBits and numberOfBits is:  
 $\text{numberOfBits} == (\text{length}(\text{val-attribute})/2) * 8 - \text{paddingBits}$   
 In the byte-aligned case which is the typical one, the paddingBits attribute can be left out.

**Elements:**

- val                      The exception.

**Attributes:**

- none.

### 11.3.2.12 TriSignatureIdType

**TriSignatureIdType** is mapped to the following complex type:

```
<xsd:complexType name="TriSignatureIdType">
  <xsd:attribute name="val" type="SimpleTypes:TString" use="required"/>
</xsd:complexType>
```

**Elements:**

- val                      The signature.

**Attributes:**

- none.

**11.3.2.13 TriTimerIdType**

**TriTimerIdType** is mapped to the following complex type:

```
<xsd:complexType name="TriTimerIdType">
  <xsd:sequence>
    <xsd:element name="id" type="Types:Id"/>
  </xsd:sequence>
</xsd:complexType>
```

**Elements:**

- **id** The identification of the timer.

**Attributes:**

- none.

**11.3.2.14 TriTimerDurationType**

**TriTimerDurationType** is mapped to the following simple type:

```
<xsd:simpleType name="TriTimerDurationType">
  <xsd:restriction base="xsd:float"/>
</xsd:simpleType>
```

**11.3.2.15 QualifiedName**

**QualifiedName** is used to fully qualify module parameters, variables, etc and is mapped to the following complex type:

```
<xsd:complexType name="QualifiedName">
  <xsd:attribute name="moduleName" type="SimpleTypes:TString" use="required"/>
  <xsd:attribute name="baseName" type="SimpleTypes:TString" use="required"/>
</xsd:complexType>
```

**Elements:**

- **moduleName** The module name of the TTCN-3 module.
- **baseName** The name of the object that is fully qualified.

**Attributes:**

- none.

**11.3.2.16 TciBehaviourIdType**

**TciBehaviourIdType** is mapped to the following complex type:

```
<xsd:complexType name="TciBehaviourIdType">
  <xsd:sequence>
    <xsd:element name="name" type="Types:QualifiedName"/>
  </xsd:sequence>
</xsd:complexType>
```

**Elements:**

- **name** The qualified name of the behaviour.

**Attributes:**

- none.

### 11.3.2.17 TciTestCaseIdType

**TciTestCaseIdType** is mapped to the following complex type:

```
<xsd:complexType name="TciTestCaseIdType">
  <xsd:sequence>
    <xsd:element name="name" type="Types:QualifiedName"/>
  </xsd:sequence>
</xsd:complexType>
```

**Elements:**

- name      The qualified name of the test case.

**Attributes:**

- none.

### 11.3.2.18 TciParameterType

**TciParameterType** is mapped to the following complex type:

```
<xsd:complexType name="TciParameterType">
  <xsd:sequence>
    <xsd:element name="val" type="Values:Value"/>
  </xsd:sequence>
  <xsd:attribute name="name" type="SimpleTypes:TString"/>
  <xsd:attribute name="mode" type="SimpleTypes:TciParameterPassingModeType"/>
</xsd:complexType>
```

**Elements:**

- val      The encoded parameter.

**Attributes:**

- name      The parameter name.
- mode      The parameter passing mode.

### 11.3.2.19 TciParameterListType

**TciParameterListType** is mapped to the following complex type:

```
<xsd:complexType name="TciParameterListType">
  <xsd:sequence>
    <xsd:element name="par" type="Types:TciParameterType"
      minOccurs="0" maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

**Sequence of Elements:**

- par      The parameters in that list.

**Attributes:**

- none.

### 11.3.2.20 TriPortIdListType

**TriPortIdListType** is mapped to the following complex type:

```
<xsd:complexType name="TriPortIdListType">
  <xsd:sequence>
    <xsd:element name="port" type="Types:TriPortIdType" minOccurs="0"
      maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

#### Elements:

- port The identifiers of TRI ports in that list.

#### Attributes:

- none.

## 11.3.3 Abstract value mapping

### 11.3.3.1 Value

**Value** is mapped to the following complex type:

```
<xsd:complexType name="Value" mixed="true">
  <xsd:group ref="Values:Value"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

<xsd:group name="Value">
  <xsd:choice>
    <xsd:element name="integer" type="Values:IntegerValue"/>
    <xsd:element name="float" type="Values:FloatValue"/>
    <xsd:element name="boolean" type="Values:BooleanValue"/>
    <xsd:element name="verdicttype" type="Values:VerdictValue"/>
    <xsd:element name="bitstring" type="Values:BitstringValue"/>
    <xsd:element name="hexstring" type="Values:HexstringValue"/>
    <xsd:element name="octetstring" type="Values:OctetstringValue"/>
    <xsd:element name="charstring" type="Values:CharstringValue"/>
    <xsd:element name="universal_charstring" type="Values:UniversalCharstringValue"/>
    <xsd:element name="record" type="Values:RecordValue"/>
    <xsd:element name="record_of" type="Values:RecordOfValue"/>
    <xsd:element name="set" type="Values:SetValue"/>
    <xsd:element name="set_of" type="Values:SetOfValue"/>
    <xsd:element name="enumerated" type="Values:EnumeratedValue"/>
    <xsd:element name="union" type="Values:UnionValue"/>
    <xsd:element name="anytype" type="Values:AnytypeValue"/>
    <xsd:element name="address" type="Values:AddressValue"/>
    <xsd:element name="component" type="Values:ComponentValue"/>
    <xsd:element name="port" type="Values:PortValue"/>
    <xsd:element name="default" type="Values:DefaultValue"/>
    <xsd:element name="timer" type="Values:TimerValue"/>
  </xsd:choice>
</xsd:group>

<xsd:simpleType name="ValueModifier">
  <xsd:restriction base="SimpleTypes:TString">
    <xsd:enumeration value="lazy"/>
    <xsd:enumeration value="fuzzy"/>
  </xsd:restriction>
</xsd:simpleType>

<xsd:attributeGroup name="ValueAtts">
  <xsd:attribute name="name" type="SimpleTypes:TString" use="optional"/>
  <xsd:attribute name="type" type="SimpleTypes:TString" use="optional"/>
  <xsd:attribute name="module" type="SimpleTypes:TString" use="optional"/>
  <xsd:attribute name="modifier" type="Values:ValueModifier" use="optional"/>
  <xsd:attribute name="annotation" type="SimpleTypes:TString" use="optional"/>
</xsd:attributeGroup>

<xsd:group name="BaseValue">
  <xsd:choice>
    <xsd:sequence>
```

```

        <xsd:choice>
            <xsd:element name="value" type="SimpleTypes:TString"/>
            <xsd:element name="matching_symbol" type="Templates:MatchingSymbol"/>
        </xsd:choice>
        <xsd:element name="ifpresent" type="SimpleTypes:TEEmpty" minOccurs="0"/>
        <xsd:element name="length" type="Values:LengthRestriction" minOccurs="0"/>
    </xsd:sequence>
    <xsd:element name="null" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="not_evaluated" type="SimpleTypes:TEEmpty"/>
</xsd:choice>
</xsd:group>

<xsd:complexType name="LengthRestriction">
    <xsd:sequence>
        <xsd:element name="lower" type="SimpleTypes:TInteger" />
        <xsd:element name="upper" type="SimpleTypes:TInteger" minOccurs="0" />
    </xsd:sequence>
</xsd:complexType>

```

### Value Group:

- integer                      An integer value.
- float                        A float value.
- boolean                     A boolean value.
- verdicttype                A verdicttype value.
- bitstring                  A bitstring value.
- hexstring                  A hexstring value.
- octetstring                An octetstring value.
- charstring                 A charstring value.
- universal\_charstring      A universal charstring value.
- record                     A record value.
- record\_of                 A record of value.
- array                      An array value.
- set                        A set value.
- set\_of                     A set of value.
- enumerated                An enumerated value.
- union                     A union value.
- anytype                    An anytype value.
- address                    An address value.
- component                A component value.
- port                      A port value.
- default                    A default value.
- timer                     A timer value.

**Attributes:**

- **name** The name of the value, if known.
- **type** The type of the value, if known.
- **module** The module of the value, if known.
- **modifier** The value modifier, if used: either lazy or fuzzy.
- **annotation** A helper attribute to provide additional matching/mismatching information, etc.

**BaseValue Group:**

- **value** A value in the string format.
- **matching\_symbol** A matching symbol when used instead of a value.
- **ifpresent** The ifpresent matching attribute.
- **length** The length matching attribute.
- **null** If no value is given.
- **omit** If the value is omitted.
- **not\_evaluated** Used if a @lazy or @fuzzy value contains not evaluated content.

**LengthRestriction Element:**

- **lower** The lower bound of the length matching attribute.
- **upper** The upper bound of the length matching attribute. Omitted when equal to infinity.

**11.3.3.2 IntegerValue**

**IntegerValue** is mapped to the following complex type:

```
<xsd:complexType name="IntegerValue">
  <xsd:group ref="Values:BaseValue"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- **BaseValue** Integer value content described in clause 11.3.3.1.
- **ValueAtts** Value attributes described in clause 11.3.3.1.

**11.3.3.3 FloatValue**

**FloatValue** is mapped to the following complex type:

```
<xsd:complexType name="FloatValue">
  <xsd:group ref="Values:BaseValue"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- **BaseValue** Float value content described in clause 11.3.3.1.
- **ValueAtts** Value attributes described in clause 11.3.3.1.

### 11.3.3.4 BooleanValue

**BooleanValue** is mapped to the following complex type:

```
<xsd:complexType name="BooleanValue">
  <xsd:group ref="Values:BaseValue"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- BaseValue Boolean value content described in clause 11.3.3.1.
- ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.5 Void

### 11.3.3.6 VerdictValue

**VerdictValue** is mapped to the following complex type:

```
<xsd:complexType name="VerdictValue">
  <xsd:group ref="Values:BaseValue"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- BaseValue Verdict value content described in clause 11.3.3.1.
- ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.7 BitstringValue

**BitstringValue** is mapped to the following complex type:

```
<xsd:complexType name="BitstringValue">
  <xsd:group ref="Values:BaseValue"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- BaseValue Bitstring value content described in clause 11.3.3.1.
- ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.8 HexstringValue

**HexstringValue** is mapped to the following complex type:

```
<xsd:complexType name="HexstringValue">
  <xsd:attributeGroup ref="Values:ValueAtts"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- BaseValue Hexstring value content described in clause 11.3.3.1.
- ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.9 OctetstringValue

**OctetstringValue** is mapped to the following complex type:

```
<xsd:complexType name="OctetstringValue">
  <xsd:attributeGroup ref="Values:ValueAtts"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- BaseValue Octetstring value content described in clause 11.3.3.1.
- ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.10 CharstringValue

**CharstringValue** is mapped to the following complex type:

```
<xsd:complexType name="CharstringValue">
  <xsd:attributeGroup ref="Values:ValueAtts"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- BaseValue Charstring value content described in clause 11.3.3.1.
- ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.11 UniversalCharstringValue

**UniversalCharstringValue** is mapped to the following complex type:

```
<xsd:complexType name="UniversalCharstringValue">
  <xsd:attributeGroup ref="Values:ValueAtts"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- BaseValue Universal charstring value content described in clause 11.3.3.1.
- ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.12 RecordValue

**RecordValue** is mapped to the following complex type:

```
<xsd:complexType name="RecordValue">
  <xsd:choice>
    <xsd:sequence>
      <xsd:choice>
        <xsd:group ref="Values:Value" minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="matching_symbol" type="Templates:MatchingSymbol"/>
      </xsd:choice>
      <xsd:element name="ifpresent" type="SimpleTypes:TEEmpty" minOccurs="0"/>
    </xsd:sequence>
    <xsd:element name="null" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="not_evaluated" type="SimpleTypes:TEEmpty"/>
  </xsd:choice>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Sequence of Elements:**

- **Value** The value group is specified in clause 11.3.3.1. It is used for describing individual elements of the record.
- **matching\_symbol** A matching symbol if used instead of a value.
- **ifpresent** The ifpresent matching attribute.
- **null** If no field is given.
- **omit** If the field is omitted.
- **not\_evaluated** Used if a @lazy or @fuzzy value contains not evaluated content.

**Attributes:**

- The same attributes as those of Value.

**11.3.3.13 RecordOfValue**

**RecordOfValue** is mapped to the following complex type:

```
<xsd:complexType name="RecordOfValue">
  <xsd:group ref="Values:Values"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

<xsd:group name="Values">
  <xsd:choice>
    <xsd:sequence>
      <xsd:choice>
        <xsd:element name="integer" type="Values:IntegerValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="float" type="Values:FloatValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="boolean" type="Values:BooleanValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="bitstring" type="Values:BitstringValue"
          minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="hexstring" type="Values:HexstringValue"
          minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="octetstring" type="Values:OctetstringValue"
          minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="charstring" type="Values:CharstringValue"
          minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="universal_charstring"
          type="Values:UniversalCharstringValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="record" type="Values:RecordValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="record_of" type="Values:RecordOfValue"
          minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="set" type="Values:SetValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="set_of" type="Values:SetOfValue"
          minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="enumerated" type="Values:EnumeratedValue"
          minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="union" type="Values:UnionValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="anytype" type="Values:AnytypeValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="address" type="Values:AddressValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="component" type="Values:ComponentValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="port" type="Values:PortValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="default" type="Values:DefaultValue" minOccurs="0"
          maxOccurs="unbounded"/>
        <xsd:element name="timer" type="Values:TimerValue" minOccurs="0"
          maxOccurs="unbounded"/>
      </xsd:choice>
    </xsd:sequence>
  </xsd:choice>
</xsd:group>
```

```

        <xsd:element name="matching_symbol" type="Templates:MatchingSymbol"/>
    </xsd:choice>
    <xsd:element name="ifpresent" type="SimpleTypes:TEEmpty" minOccurs="0"/>
    <xsd:element name="length" type="Values:LengthRestriction" minOccurs="0"/>
</xsd:sequence>
<xsd:element name="null" type="SimpleTypes:TEEmpty"/>
<xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
<xsd:element name="not_evaluated" type="SimpleTypes:TEEmpty"/>
</xsd:choice>
</xsd:group>

```

### Values Group:

- integer                      An integer value.
- float                        A float value.
- boolean                     A boolean value.
- verdicttype                A verdicttype value.
- bitstring                   A bitstring value.
- hexstring                  A hexstring value.
- octetstring                An octetstring value.
- charstring                 A charstring value.
- universal\_charstring      A universal charstring value.
- record                      A record value.
- record\_of                  A record of value.
- array                       An array value.
- set                         A set value.
- set\_of                      A set of value.
- enumerated                 An enumerated value.
- union                       A union value.
- anytype                    An anytype value.
- address                    An address value.
- component                 A component value.
- default                    A default value.
- matching\_symbol           A matching symbol if used instead of a value.
- ifpresent                  The ifpresent matching attribute.
- length                     The length matching attribute.
- null                        If no field is given.
- omit                        If the field is omitted.
- not\_evaluated             Used if a @lazy or @fuzzy value contains not evaluated content.

### Attributes:

- The same attributes as those of Value.

### 11.3.3.14 ArrayValue

**ArrayValue** is mapped to the following complex type:

```
<xsd:complexType name="ArrayValue">
  <xsd:group ref="Values:Values"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- **Values** Array value content described in clause 11.3.3.13.
- **ValueAtts** Value attributes described in clause 11.3.3.1.

### 11.3.3.15 SetValue

**SetValue** is mapped to the following complex type:

```
<xsd:complexType name="SetValue">
  <xsd:choice>
    <xsd:sequence>
      <xsd:choice>
        <xsd:group ref="Values:Value" minOccurs="0" maxOccurs="unbounded"/>
        <xsd:element name="matching_symbol" type="Templates:MatchingSymbol"/>
      </xsd:choice>
      <xsd:element name="ifpresent" type="SimpleTypes:TEEmpty" minOccurs="0"/>
    </xsd:sequence>
    <xsd:element name="null" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="not_evaluated" type="SimpleTypes:TEEmpty"/>
  </xsd:choice>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Sequence of Elements:**

- **Value** The value group is specified in clause 11.3.3.1. It is used for describing individual elements of the record.
- **matching\_symbol** A matching symbol if used instead of a value.
- **ifpresent** The ifpresent matching attribute.
- **null** If no field is given.
- **omit** If the field is omitted.
- **not\_evaluated** Used if a @lazy or @fuzzy value contains not evaluated content.

**Attributes:**

- The same attributes as those of Value.

### 11.3.3.16 SetOfValue

**SetOfValue** is mapped to the following complex type:

```
<xsd:complexType name="SetOfValue">
  <xsd:group ref="Values:Values"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- **Values** Set of value content described in clause 11.3.3.13.
- **ValueAtts** Value attributes described in clause 11.3.3.1.

### 11.3.3.17 EnumeratedValue

**EnumeratedValue** is mapped to the following complex type:

```
<xsd:complexType name="EnumeratedValue">
  <xsd:attributeGroup ref="Values:ValueAtts"/>

  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Items:**

- BaseValue Enumerated value content described in clause 11.3.3.1.
- ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.18 UnionValue

**UnionValue** is mapped to the following complex type:

```
<xsd:complexType name="UnionValue">
  <xsd:choice>
    <xsd:sequence>
      <xsd:choice>
        <xsd:group ref="Values:Value"/>
        <xsd:element name="matching_symbol" type="Templates:MatchingSymbol"/>
      </xsd:choice>
      <xsd:element name="ifpresent" type="SimpleTypes:TEEmpty" minOccurs="0"/>
    </xsd:sequence>
    <xsd:element name="null" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="not_evaluated" type="SimpleTypes:TEEmpty"/>
  </xsd:choice>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>
```

**Choice of Elements:**

- Value The chosen value. The value group is specified in clause 11.3.3.1.
- matching\_symbol A matching symbol if used instead of a value.
- ifpresent The ifpresent matching attribute.
- null If no field is given.
- omit If the field is omitted.
- not\_evaluated Used if a @lazy or @fuzzy value contains not evaluated content.

**Attributes:**

- The same attributes as those of Value.

### 11.3.3.19 AnytypeValue

**AnytypeValue** is mapped to the following complex type:

```
<xsd:complexType name="AnytypeValue">
  <xsd:choice>
    <xsd:sequence>
      <xsd:choice>
        <xsd:group ref="Values:Value"/>
        <xsd:element name="matching_symbol" type="Templates:MatchingSymbol"/>
      </xsd:choice>
      <xsd:element name="ifpresent" type="SimpleTypes:TEEmpty" minOccurs="0"/>
    </xsd:sequence>
```

```

    <xsd:element name="null" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="matching_symbol" type="Templates:MatchingSymbol"/>
    <xsd:element name="not_evaluated" type="SimpleTypes:TEEmpty"/>
  </xsd:choice>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

```

#### Choice of Elements:

- Value                      The chosen value. The value group is specified in clause 11.3.3.1.
- matching\_symbol        A matching symbol if used instead of a value.
- ifpresent                The ifpresent matching attribute.
- null                      If no field is given.
- omit                      If the field is omitted.
- not\_evaluated          Used if a @lazy or @fuzzy value contains not evaluated content.

#### Attributes:

- The same attributes as those of Value.

### 11.3.3.20 AddressValue

**AddressValue** is mapped to the following complex type:

```

<xsd:complexType name="AddressValue">
  <xsd:group ref="Values:Value"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

```

#### Items:

- Value                      The value group is specified in clause 11.3.3.1. It is used for describing the content of the address value.ValueAtts Value attributes described in clause 11.3.3.1.

### 11.3.3.21 ComponentValue

Value type used for component instances is mapped to the complex type specified below. The content of the XML elements based on the ComponentValue type shall be equal to the string produced by the valueToString operation (described in clause 7.2.2.2.1):

```

<xsd:complexType name="ComponentValue">
  <xsd:group ref="Values:BaseValue"/>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

```

#### Items:

- BaseValue                Enumerated value content described in clause 11.3.3.1.
- ValueAtts                Value attributes described in clause 11.3.3.1.

### 11.3.3.22 PortValue

Value type used for port instances is mapped to the complex type specified below. The content of the XML elements based on the PortValue type shall be equal to the string produced by the valueToString operation (described in clause 7.2.2.2.1):

```

<xsd:complexType name="PortValue">
  <xsd:choice>
    <xsd:element name="value" type="SimpleTypes:TString"/>
    <xsd:element name="null" type="SimpleTypes:TEEmpty"/>
  </xsd:choice>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

```

```

        <xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
    </xsd:choice>
    <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

```

#### Choice of Elements:

- value                      The universal charstring value as string.
- null                      If no value is given.
- omit                      If the value is omitted.

#### Attributes:

- The same attributes as those of Value.

### 11.3.3.23 DefaultValue

Value type used for default instances is mapped to the complex type specified below. The content of the XML elements based on the DefaultValue type shall be equal to the string produced by the valueToString operation (described in clause 7.2.2.2.1):

```

<xsd:complexType name="DefaultValue">
    <xsd:choice>
        <xsd:element name="value" type="SimpleTypes:TString"/>
        <xsd:element name="null" type="SimpleTypes:TEEmpty"/>
        <xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
        <xsd:element name="not_evaluated" type="Values:NotEvaluated"/>
    </xsd:choice>
    <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

```

#### Choice of Elements:

- value                      The universal charstring value as string.
- null                      If no value is given.
- omit                      If the value is omitted.
- not\_evaluated            Used if a @lazy or @fuzzy value contains not evaluated content.

#### Attributes:

- The same attributes as those of Value.

### 11.3.3.24 TimerValue

Value type used for timer instances is mapped to the complex type specified below. The content of the XML elements based on the TimerValue type shall be equal to the string produced by the valueToString operation (described in clause 7.2.2.2.1):

```

<xsd:complexType name="TimerValue">
    <xsd:choice>
        <xsd:element name="value" type="SimpleTypes:TString"/>
        <xsd:element name="null" type="SimpleTypes:TEEmpty"/>
        <xsd:element name="omit" type="SimpleTypes:TEEmpty"/>
    </xsd:choice>
    <xsd:attributeGroup ref="Values:ValueAtts"/>
</xsd:complexType>

```

#### Choice of Elements:

- value                      The universal charstring value as string.
- null                      If no value is given.

- omit If the value is omitted.

#### Attributes:

- The same attributes as those of Value.

### 11.3.3.25 MatchingMechanism

**MatchingMechanism** is mapped into a sub-element of a typed value element. The sub-element is based on the complex type specified below:

```
<xsd:complexType name="MatchingSymbol">
  <xsd:choice>
    <xsd:element name="any_value" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="any_value_or_none" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="any_element" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="any_element_or_none" type="SimpleTypes:TEEmpty"/>
    <xsd:element name="range" type="Templates:Range"/>
    <xsd:element name="list" type="Templates:MatchingList"/>
    <xsd:element name="complement" type="Templates:MatchingList"/>
    <xsd:element name="subset" type="Templates:MatchingList"/>
    <xsd:element name="superset" type="Templates:MatchingList"/>
    <xsd:element name="permutation" type="Templates:MatchingList"/>
    <xsd:element name="decmatch" type="Templates:DecMatch"/>
  </xsd:choice>
</xsd:complexType>
```

#### Choice of Elements:

- any\_value The *AnyValue* matching symbol.
- any\_value\_or\_none The *AnyValueOrNone* matching symbol.
- any\_element The *AnyElement* matching symbol.
- any\_element\_or\_none The *AnyElementOrNone* matching symbol.
- range A range template.
- list A template list.
- complement A complemented template list.
- subset A subset template.
- superset A superset template.
- permutation A permutation.
- pattern A pattern.
- decmatch A *MatchDecodedContent* matching mechanism.

#### Attributes:

- The same attributes as those of Value.

### 11.3.3.26 MatchingList

**MatchingList** is mapped to the following complex type. This complex type is also used for mapping of permutations.

```
<xsd:complexType name="MatchingList">
  <xsd:sequence>
    <xsd:group ref="Values:Value" minOccurs="0" maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

**Items:**

- Value Individual values present in the list. The Value group is specified in clause 11.3.3.1.

**11.3.3.27 ValueRange**

**ValueRange** is mapped to the following complex type:

```
<xsd:complexType name="Range">
  <xsd:sequence>
    <xsd:element name="excludeLower" minOccurs="0"/>
    <xsd:element name="lower" type="Values:Value" minOccurs="0"/>
    <xsd:element name="excludeUpper" minOccurs="0"/>
    <xsd:element name="upper" type="Values:Value" minOccurs="0"/>
  </xsd:sequence>
</xsd:complexType>
```

**Items:**

- excludeLower Present if the lower bound is excluded.
- lower The lower bound of the range. The element is omitted in case of integer range whose lower bound is equal to *-infinity*. The associated Value type is described in clause 11.3.3.1.
- excludeUpper Present if the upper bound is excluded.
- upper The upper bound of the range. The element is omitted in case of integer range whose upper bound is equal to *infinity*. The associated Value type is described in clause 11.3.3.1.

**11.3.3.28 CharacterPattern**

**CharacterPattern** is mapped to the following complex type:

```
<xsd:complexType name="Pattern">
  <xsd:sequence>
    <xsd:choice>
      <xsd:element name="charstring" type="Values:CharstringValue"/>
      <xsd:element name="universal_charstring" type="Values:UniversalCharstringValue"/>
    </xsd:choice>
  </xsd:sequence>
</xsd:complexType>
```

**Items:**

- charstring A pattern string in the charstring format.
- universal\_charstring A pattern string in the universal charstring format.

**11.3.3.29 MatchDecodedContent**

**MatchDecodedContent** is mapped to the following complex type:

```
<xsd:complexType name="DecMatch">
  <xsd:sequence>
    <xsd:group ref="Values:Value"/>
  </xsd:sequence>
</xsd:complexType>
```

**Items:**

- Value The content of the *MatchDecodedContent* matching mechanism. The Value group is described in clause 11.3.3.1.

## 11.3.4 Abstract logging types mapping

### 11.3.4.1 TciValueTemplate

**TciValueTemplate** is mapped to the following complex type:

```
<xsd:group name="TypedTemplate">
  <xsd:choice>
    <xsd:element name="integer" type="Templates:SimpleTemplate"/>
    <xsd:element name="float" type="Templates:SimpleTemplate"/>
    <xsd:element name="boolean" type="Templates:SimpleTemplate"/>
    <xsd:element name="verdicttype" type="Templates:SimpleTemplate"/>
    <xsd:element name="bitstring" type="Templates:SimpleTemplate"/>
    <xsd:element name="hexstring" type="Templates:SimpleTemplate"/>
    <xsd:element name="octetstring" type="Templates:SimpleTemplate"/>
    <xsd:element name="charstring" type="Templates:SimpleTemplate"/>
    <xsd:element name="universal_charstring" type="Templates:SimpleTemplate"/>
    <xsd:element name="record" type="Templates:RecordTemplate"/>
    <xsd:element name="record_of" type="Templates:RecordOfTemplate"/>
    <xsd:element name="array" type="Templates:RecordOfTemplate"/>
    <xsd:element name="set" type="Templates:RecordTemplate"/>
    <xsd:element name="set_of" type="Templates:RecordOfTemplate"/>
    <xsd:element name="enumerated" type="Templates:SimpleTemplate"/>
    <xsd:element name="union" type="Templates:UnionTemplate"/>
    <xsd:element name="anytype" type="Templates:AnytypeTemplate"/>
    <xsd:element name="address" type="Templates:AddressTemplate"/>
  </xsd:choice>
</xsd:group>

<xsd:group name="SpecialTemplate">
  <xsd:choice>
    <xsd:element name="omit" type="Templates:omit"/>
    <xsd:element name="any" type="Templates:any"/>
    <xsd:element name="anyoromit" type="Templates:anyoromit"/>
    <xsd:element name="templateDef" type="SimpleTypes:TString"/>
  </xsd:choice>
</xsd:group>

<xsd:complexType name="TciValueTemplate">
  <xsd:choice>
    <xsd:group ref="Values:Value"/>
    <xsd:group ref="Templates:TypedTemplate"/>
    <xsd:group ref="Templates:SpecialTemplate"/>
  </xsd:choice>
</xsd:complexType>
```

#### Choice of Elements:

- Value A structured and typed template definition.
- TypedTemplate A typed template definition. It is an obsolete feature kept for backwards compatibility reasons. The referenced group contains a choice of the following elements:
  - o integer An integer template.
  - o float A float template.
  - o boolean A boolean template.
  - o verdicttype A verdicttype template.
  - o bitstring A bitstring template.
  - o hexstring A hexstring template.
  - o octetstring An octetstring template.
  - o charstring A charstring template.
  - o universal\_charstring A universal charstring template.

- o record           A record template.
  - o record\_of       A record of template.
  - o array           An array template.
  - o set             A set template.
  - o set\_of          A set of template.
  - o enumerated      An enumerated template.
  - o union           A union template.
  - o anytype         An anytype template.
  - o address         An address template.
- SpecialTemplate   This group contains special matching elements. It is an obsolete feature kept for backwards compatibility reasons. The referenced group contains a choice of the following elements:
  - o omit            An omit template.
  - o any             An any template.
  - o anyoromit       An anyoromit template.
  - o templateDef     A complex template definition in text format.

#### Attributes:

- none.

### 11.3.4.2 TciNonValueTemplate

**TciNonValueTemplate** is mapped to the following complex type:

```
<xsd:complexType name="TciNonValueTemplate">
  <xsd:sequence>
    <xsd:choice>
      <xsd:element name="any" type="Templates:any"/>
      <xsd:element name="all" type="Templates:all"/>
      <xsd:element name="templateDef" type="SimpleTypes:TString"/>
      <xsd:element name="null" type="Templates:null"/>
      <xsd:group ref="Values:Value"/>
    </xsd:choice>
  </xsd:sequence>
</xsd:complexType>
```

#### Choice of Elements:

- any            An any template.
- all            An all template.
- templateDef   A complex template definition in text format.
- null           No template is given.
- Value          A structured and typed template definition.

#### Attributes:

- none.

### 11.3.4.3 TciValueList

**TciValueList** is mapped to the following complex type:

```
<xsd:complexType name="TciValueListType">
  <xsd:sequence>
    <xsd:element name="val" type="Values:Value"
      maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

**Sequence of Elements:**

- **val** The values in the value list.

**Attributes:**

- none.

### 11.3.4.4 TciValueDifference

**TciValueDifference** is mapped to the following complex type:

```
<xsd:complexType name="TciValueDifference">
  <xsd:sequence>
    <xsd:element name="val" type="SimpleTypes:xpath"/>
    <xsd:element name="tmpl"
type="SimpleTypes:xpath"/>
  </xsd:sequence>
  <xsd:attributeGroup ref="Values:ValueAtts"/>
  <xsd:attribute name="desc" type="SimpleTypes:TString"
use="optional"/>
</xsd:complexType>
```

**Sequence of Elements:**

- **val** A reference to the mismatching value.
- **tmpl** A reference to the template.

**Attributes:**

- The same attributes as those of Value.
- **desc** The reason of the mismatch.

### 11.3.4.5 TciValueDifferenceList

**TciValueDifferenceList** is mapped to the following complex type:

```
<xsd:complexType name="TciValueDifferenceList">
  <xsd:sequence>
    <xsd:element name="diff" type="Templates:TciValueDifference"
      maxOccurs="unbounded"/>
  </xsd:sequence>
</xsd:complexType>
```

**Sequence of Elements:**

- **diff** The value/template differences in the value difference list.

**Attributes:**

- none.

## 11.4 Mapping of the operations on the logging interface

### 11.4.0 Mapping rules

Every operation provided at the logging interface has a corresponding complex type definition in XML. These complex type definitions are extensions of Event.

#### 11.4.1 Event

**Event** is mapped to the following complex type:

```
<!-- common definition for all events -->
<xsd:complexType name="Event" mixed="true">
  <xsd:sequence>
    <xsd:element name="am" type="SimpleTypes:TString"/>
  </xsd:sequence>
  <xsd:attribute name="ts" type="xsd:long" use="required"/>
  <xsd:attribute name="src" type="SimpleTypes:TString" use="optional"/>
  <xsd:attribute name="line" type="SimpleTypes:TInteger" use="optional"/>

  <!-- general identifier structure for test components, ports and timer -->
  <xsd:attribute name="name" type="SimpleTypes:TString" use="required"/>
  <xsd:attribute name="id" type="SimpleTypes:TString" use="required"/>
  <xsd:attribute name="type" type="SimpleTypes:TString" use="required"/>
</xsd:complexType>
```

##### Elements:

- **am** A message, to be used for further information in the log.

##### Attributes:

- **ts** The time when the event is produced.
- **src** The source file of the test specification.
- **line** The line number where the request is performed.
- **name** The name of the component which produces this event.
- **id** The id of the component which produces this event.
- **type** The type of the component which produces this event.

### 11.4.2 The TCI-TL interface

#### 11.4.2.1 TCI-TL provided

The TCI-TL Provided interface is mapped to the following interface:

```
<!-- testcases -->
<xsd:complexType name="tliTcExecute">
  <xsd:complexContent mixed="true">
    <xsd:extension base="Events:Event">
      <xsd:sequence>
        <xsd:element name="tcId" type="Types:TciTestCaseIdType"/>
        <xsd:element name="tciPars" type="Types:TciParameterListType" minOccurs="0"/>
        <xsd:element name="dur" type="SimpleTypes:TriTimerDurationType" minOccurs="0"/>
      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>

<xsd:complexType name="tliTcStart">
  <xsd:complexContent mixed="true">
    <xsd:extension base="Events:Event">
      <xsd:sequence>
        <xsd:element name="tcId" type="Types:TciTestCaseIdType"/>
      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>
```

```

        <xsd:element name="tciPars" type="Types:TciParameterListType" minOccurs="0"/>
        <xsd:element name="dur" type="SimpleTypes:TriTimerDurationType" minOccurs="0"/>
      </xsd:sequence>
    </xsd:extension>
  </xsd:complexContent>
</xsd:complexType>

<xsd:complexType name="tliTcStop">
  <xsd:complexContent mixed="true">
    <xsd:extension base="Events:Event"/>

## 12 C# mapping

### 12.1 Introduction

The C# mapping for the TTCN-3 Control Interface defines how the IDL [6] definitions described in clause 7 are mapped to the .Net language C# [13].

### 12.2 Names and scopes

#### 12.2.1 Names

Although there are almost no conflicts between identifiers used in the IDL definition and C#, some naming translation rules are applied to the IDL identifiers.

C# interfaces are omitting the trailing Type used in the IDL definition. In addition to that, the capital letter "I" is added to the beginning of interface names.

EXAMPLE 1: The IDL type **TciTestCaseIdType** maps to **ITciTestCaseId** in C#.

C# names of enumerated items start with a capital letter and the remaining letters are low-case letters. If the enumerated item name is composed of several worlds, each word starts with a capital letter.

EXAMPLE 2: The identifier for boolean type defined in **TciTypeClassType** enumeration is **BooleanType** in C#.

The resulting mapping conforms to the standard C# coding conventions.

#### 12.2.2 Scopes

The TCI interfaces are mapped to the namespace **Etsi.Ttcn3.Tci**. All IDL type declarations are mapped to C# interface declarations within this namespace. The associated assembly file is **Etsi.Ttcn3.Tci.dll**.

### 12.3 Null value mapping

The distinct value **null** specified in the IDL definition is equal to **null** in C#.

### 12.4 Type mapping

#### 12.4.1 Basic type mapping

##### 12.4.1.0 Mapped types

Table 9 gives an overview on how the used basic IDL types are mapped to the .Net types.

**Table 9: Basic type mapping**

| IDL Type       | C# Type/Interface |
|----------------|-------------------|
| Boolean        | bool              |
| TChar          | char              |
| TFloat         | double            |
| TInteger       | int / TciVerdict  |
| TString        | string            |
| TStringSeq     | string[]          |
| TUniversalChar | uint              |

**TBoolean**

The IDL TBoolean type is mapped to the C# type bool.

**TFloat**

The IDL TFloat type is mapped to the C# type double.

**TChar**

The IDL TChar type is mapped to the C# type char.

**TInteger**

The IDL TInteger type is usually mapped to the C# type int. Only in case of operations defined for the IDL type TciVerdictValue, the IDL TInteger type is mapped to Etsi.Ttcn3.Tci.TciVerdict enumeration.

**TString**

The IDL TString type is mapped to the C# class string without range checking or bounds for characters in the string. All possible strings defined in TTCN-3 can be converted to C# string class.

**TStringSeq**

The IDL TStringSeq type is mapped to a string array.

**TUniversalChar**

The IDL TUniversalChar type is mapped to the C# type uint. The integer uses the canonical form as defined in ISO/IEC 10646 [5], clause 6.2.

**12.4.1.1 TciVerdict**

In case of verdict operations, the IDL TInteger type is mapped to the **TciVerdict** enumeration. This enumeration is defined as follows:

```
public enum TciVerdict {
    None = 0,
    Pass = 1,
    Inconc = 2,
    Fail = 3,
    Error = 4
    User_Error = 5
}
```

**12.4.2 Structured type mapping****12.4.2.0 Mapping rules**

The TCI IDL description defines user-defined types as native types. In the C# mapping, these types are mapped to C# interfaces. The interfaces define methods and properties being available for classes implementing this interface.

**12.4.2.1 TciParameterPassingModeType**

**TciParameterPassingModeType** is mapped to the following enumeration:

```
public enum TciParameterPassingMode {
    TciIn = 0,
    TciInOut = 1,
    TciOut = 2
}
```

```
}
```

### 12.4.2.2 TciParameterType

**TciParameterType** is mapped to the following interface:

```
public interface ITciParameter {
    string ParameterName { get; set; }
    TciParameterPassingMode ParameterPassingMode { get; set; }
    ITciValue Parameter { get; set; }
}
```

#### Members:

- **ParameterName**  
Gets or sets the parameter name.
- **ParameterPassingMode**  
Gets or sets the parameter passing mode of this parameter.
- **Parameter**  
Used for getting or setting value of the parameter. The parameter can be an instance of **ITciValue** or the distinct value **null**.

### 12.4.2.3 TciParameterListType

**TciParameterListType** is mapped to the following interface:

```
public interface ITciParameterList: System.Collections.IEnumerable {
    int Size { get; }
    bool IsEmpty { get; }
    ITciParameter this[int index] { get; }
    void Clear();
    void Add(ITciParameter comp);
}
```

#### Members:

- **Size**  
Returns the number of parameters in this list.
- **IsEmpty**  
Returns **true** if this list contains no parameters.
- **GetEnumerator**  
Inherited from **IEnumerable**. Returns an enumerator for this object and allows to use the list in a foreach loop.
- **operator**  
Returns a **ITciParameter** instance at the specified position. **IndexOutOfRangeException** is thrown if the index is less than zero or greater or equal to the list size.
- **Clear**  
Removes all parameters from the list.
- **Add**  
Adds a parameter to the end of the list.

### 12.4.2.4 TciTypeClassType

**TciTypeClassType** is mapped to the following enumeration:

```
public enum TciTypeClass {
    Address = 0,
    Anytype = 1,
    Bitstring = 2,
```

```

    BooleanType = 3,
    Charstring = 5,
    Component = 6,
    Enumerated = 7,
    Float = 8,
    Hexstring = 9,
    IntegerType = 10,
    Octetstring = 12,
    Record = 13,
    RecordOf = 14,
    Array = 15
    Set = 16,
    SetOf = 17,
    Union = 18,
    UniversalCharstring = 20,
    Verdict = 21
}

```

#### 12.4.2.5 TciTestComponentKindType

**TciTestComponentKindType** is mapped to the following enumeration:

```

public enum TciTestComponentKind {
    TciCtrlComp = 0,
    TciMtcComp = 1,
    TciPtcComp = 2,
    TciSystemComp = 3,
    TciAliveComp = 4
}

```

#### 12.4.2.6 TciBehaviourIdType

**TciBehaviourIdType** C# mapping is derived from the `IQualifiedName` interface:

```

public interface ITciBehaviourId : IQualifiedName {}

```

#### 12.4.2.7 TciTestCaselIdType

**TciTestCaselIdType** C# mapping is derived from the `IQualifiedName` interface:

```

public interface ITciTestCaseId : IQualifiedName {}

```

#### 12.4.2.8 TciTestCaselIdListType

**TciTestCaselIdListType** is mapped to the following interface:

```

public interface ITciTestCaseIdList: System.Collections.IEnumerable {
    int Size { get; }
    bool IsEmpty { get; }
    ITciTestCaseId this[int index] { get; }
}

```

##### Members:

- **Size**  
Returns the number of test case identifiers in this list.
- **IsEmpty**  
Returns `true` if this list contains no parameters.
- **GetEnumerator**  
Inherited from `IEnumerable`. Returns an enumerator for this object and allows to use the list in a `foreach` loop.
- **operator**  
Returns a `ITciTestCaseId` instance at the specified position. `IndexOutOfRangeException` is thrown if the index is less than zero or greater or equal to the list size.

### 12.4.2.9 TciModuleIdType

**TciModuleIdType** C# mapping is derived from the `IQualifiedName` interface:

```
public interface ITciModuleId : IQualifiedName {
}
```

### 12.4.2.10 TciModuleIdListType

**TciModuleIdListType** is mapped to the following interface:

```
public interface ITciModuleIdList: System.Collections.IEnumerable {
    int Size { get; }
    bool IsEmpty { get; }
    ITciModuleId this[int index] { get; }
}
```

#### Members:

- **Size**  
Returns the number of module identifiers in this list.
- **IsEmpty**  
Returns `true` if this list contains no parameters.
- **GetEnumerator**  
Inherited from `IEnumerable`. Returns an enumerator for this object and allows to use the list in a `foreach` loop.
- **operator**  
Returns a `ITciModuleId` instance at the specified position. `IndexOutOfRangeException` is thrown if the index is less than zero or greater or equal to the list size.

### 12.4.2.11 TciModuleParameterIdType

**TciModuleIdType** C# mapping is derived from the `IQualifiedName` interface:

```
public interface ITciModuleParameterId : IQualifiedName {
}
```

### 12.4.2.12 TciModuleParameterType

**TciModuleParameterType** is mapped to the following interface:

```
public interface ITciModuleParameter {
    ITciModuleParameterId ModuleParameterName { get; }
    ITciValue DefaultValue { get; }
}
```

#### Members:

- **ModuleParameterName**  
Returns the qualified module parameter name as defined in the TTCN-3 specification.
- **DefaultValue**  
Returns the default value of this `TciModuleParameter` or the distinct value `null` if the default value is not specified.

### 12.4.2.13 TciModuleParameterListType

**TciModuleParameterListType** is mapped to the following interface:

```
public interface ITciModuleParameterList: System.Collections.IEnumerable {
    int Size { get; }
    bool IsEmpty { get; }
    ITciModuleParameter this[int index] { get; }
}
```

```
}
```

**Members:**

- **Size**  
Returns the number of module identifiers in this list.
- **IsEmpty**  
Returns `true` if this list contains no parameters.
- **GetEnumerator()**  
Inherited from `IEnumerable`. Returns an enumerator for this object and allows to use the list in a foreach loop.
- **Indexing operator**  
Returns a `ITciModuleId` instance at the specified position. `IndexOutOfRangeException` is thrown if the index is less than zero or greater or equal to the list size.

**12.4.2.14 TciParameterTypeType**

**TciParameterTypeType** is mapped to the following interface:

```
public interface ITciParameterType {
    string ParameterName {get; }
    ITciType ParameterType { get; }
    TciParameterPassingMode ParameterPassingMode { get; }
}
```

**Members:**

- **ParameterName**  
Returns the name of the parameter.
- **ParameterType**  
Returns the type of the parameter.
- **ParameterPassingMode**  
Returns the passing mode of this parameter.

**12.4.2.15 TciParameterTypeListType**

**TciParameterListType** is mapped to the following interface:

```
public interface ITciParameterTypeList: System.Collections.IEnumerable {
    int Size { get; }
    bool IsEmpty { get; }
    ITciParameterType this[int index] { get; }
}
```

**Members:**

- **Size**  
Returns the number of parameters in this list.
- **IsEmpty**  
Returns `true` if this list contains no parameters.
- **GetEnumerator**  
Inherited from `IEnumerable`. Returns an enumerator for this object and allows to use the list in a foreach loop.
- **Indexing operator**  
Returns a `ITciParameter` instance at the specified position. `IndexOutOfRangeException` is thrown if the index is less than zero or greater or equal to the list size.

- **Clear**  
Removes all parameters from the list.
- **Add**  
Adds a parameter to the end of the list.

#### 12.4.2.16 TciMatchingTypeType

**TciMatchingTypeType** is mapped to the following enumeration:

```
public enum TciMatchingType
{
    TemplateList = 0,
    ComplementedList = 1,
    AnyValue = 2,
    AnyValueOrNone = 3,
    ValueRange = 4,
    Subset = 5,
    Superset = 6,
    AnyElement = 7,
    AnyElementsOrNone = 8,
    Pattern = 9,
    MatchDecodedContent = 10,
    OmitTemplate = 11
}
```

#### 12.4.2.17 LengthRestriction

**LengthRestriction** is mapped to the following interface:

```
public interface ITciLengthRestriction
{
    long LowerBoundary { get; set; }
    long UpperBoundary { get; set; }
    bool IsUpperBoundaryInfinity { get; set; }
}
```

##### Methods:

- **LowerBoundary** Gets or sets the lower boundary of the length restriction.
- **UpperBoundary** Gets or sets the upper boundary of the length restriction.
- **IsUpperBoundaryInfinity** Gets or sets the upper boundary infinity setting.

#### 12.4.2.18 Permutation

**Permutation** is mapped to the following interface:

```
public interface ITciPermutation
{
    long StartPosition { get; set; }
    long Length { get; set; }
}
```

##### Methods:

- **StartPosition** Gets or sets the position of the first item of the permutation in the **RecordOfValue**.
- **Length** Gets or sets the number of elements or matching mechanisms of the **RecordOfValue** that are included in the permutation.

#### 12.4.2.19 RangeBoundary

**RangeBoundary** is mapped to the following interface:

```
public interface ITciRangeBoundary
```

```

{
    ITciValue Boundary { get; set; }
    bool IsInclusive { get; set; }
    bool IsInfinity { get; set; }
}

```

#### Methods:

- **Boundary** Gets or sets the boundary value.
- **IsInclusive** Gets or sets whether the boundary value is a part of the allowed range or not.
- **IsInfinity** Gets or sets whether the boundary is infinity.

### 12.4.3 Abstract type mapping

#### 12.4.3.0 Mapping rules

The TTCN-3 data types are modelled in C# using the abstract type mapping as defined in this clause. The **ITciType** interface defines only operations used to retrieve in TTCN-3 defined types. No TTCN-3 types can be constructed using the **ITciType** interface. Types are modelled using the single interface **ITciType**, that provides methods to identify types and to retrieve values of a given type.

#### 12.4.3.1 Type

The IDL type **Type** is mapped to the following interface:

```

public interface ITciType {
    ITciModuleId DefiningModule { get; }
    string Name { get; }
    TciTypeClass TypeClass { get; }
    ITciValue NewInstance();
    ITciMatchingMechanism NewTemplate(TciMatchingType matchingType);
    string TypeEncoding { get; }
    string TypeEncodingVariant { get; }
    string[] EncodeAttributes { get; }
    string[] GetVariantAttributes(string encoding);
    string[] TypeExtension { get; }
    ITciValue ParseValue (string val);
    ITciRangeBoundary LowerTypeBoundary { get; }
    ITciRangeBoundary UpperTypeBoundary { get; }
    ITciLengthRestriction TypeLengthRestriction { get; }
    ITciMatchingMechanism TypeMatchingMechanism { get; }
}

```

#### Members:

- **DefiningModule**  
Returns the module identifier of the module the type has been defined in. If the type represents a TTCN-3 base type the distinct value null will be returned.
- **Name**  
Returns name of the type as defined in the TTCN-3 module.
- **TypeClass**  
Returns the type class of the respective type.
- **NewInstance**  
Returns a freshly created value of the given type. This initial value of the created value is undefined.
- **NewTemplate**  
Returns a freshly created matching mechanism of this type. The **matchingType** parameter determines what kind of matching mechanism will be created. If the created matching mechanism contains additional data properties, these properties are uninitialized in the created matching mechanism.

- **TypeEncoding**  
Returns the type encoding attribute as defined in the TTCN-3 module, if any. If no encoding attribute has been defined, the distinct value `null` will be returned.
- **TypeEncodingVariant**  
This property returns the type encoding variant attribute as defined in TTCN-3, if any. If no encoding variant attribute has been defined, the distinct value `null` will be returned.
- **EncodeAttributes**  
Returns all encode attributes of the type as defined in the TTCN-3 module. If no encode attribute has been defined, the distinct value `null` is returned.
- **GetVariantAttributes**  
Returns all variant attributes of the type as defined in the TTCN-3 module. If no encoding attribute has been defined, the distinct value `null` is returned.
- **TypeExtension**  
Returns the type extension attributes as defined in the TTCN-3 module. If no extension attributes have been defined, the distinct value `null` will be returned.
- **ParseValue**  
Parses the value provided in the parameter and in case of successful parsing returns a `Value` object representing the parsed value. In case of an error or if value parsing is not supported by the tool, the method returns `null`.
- **LowerTypeBoundary**  
Gets the lower range boundary of the type or `null`.
- **UpperTypeBoundary**  
Gets the upper range boundary of the type or `null`.
- **TypeLengthRestriction**  
Gets the length restriction of the type or `null`.
- **TypeMatchingMechanism**  
Gets the matching mechanism restricting the type or `null`.

## 12.4.4 Abstract value mapping

### 12.4.4.0 Mapping rules

TTCN-3 values can be retrieved from the TE and constructed using the `ITCiValue` interface. The value mapping interface is constructed hierarchically with `ITCiValue` as the basic interface. Specialized interfaces for different types of values have been defined.

#### 12.4.4.1 Value

The IDL type **Value** is mapped to the following interface:

```
public interface ITCiValue {
    ITCiType Type { get; }
    bool NotPresent { get; }
    string ValueEncoding { get; }
    string ValueEncodingVariant { get; }
    string[] EncodeAttributes { get; }
    string[] GetVariantAttributes(string encoding);
    bool IsMatchingSymbol { get; }
    string ValueToString();
    bool IsLazy { get; }
    bool IsFuzzy { get; }
    bool IsEvaluated { get; }
    ITCiLengthRestriction LengthRestriction { get; set; }
    ITCiLengthRestriction NewLengthRestriction ();
    bool IsIfPresentEnabled { get; set; }
```

```

ITciRangeBoundary LowerTypeBoundary { get; }
ITciRangeBoundary UpperTypeBoundary { get; }
ITciLengthRestriction TypeLengthRestriction { get; }
ITciMatchingMechanism TypeMatchingMechanism { get; }
bool IsOptional { get; }
}

```

#### Members:

- **Type**  
Returns the type of the specified value.
- **NotPresent**  
Returns `true` if the specified value is `omit`, `false` otherwise.
- **ValueEncoding**  
This property returns the value encoding attribute as defined in TTCN-3, if any. If no encoding attribute has been defined the distinct value `null` will be returned.
- **ValueEncodingVariant**  
This property returns the value encoding variant attribute as defined in TTCN-3, if any. If no encoding variant attribute has been defined the distinct value `null` will be returned.
- **EncodeAttributes**  
Returns all encode attributes of the value as defined in the TTCN-3 module. If no encode attribute has been defined, the distinct value `null` is returned.
- **GetVariantAttributes**  
Returns all variant attributes of the value as defined in the TTCN-3 module. If no encoding attribute has been defined, the distinct value `null` is returned.
- **IsMatchingSymbol**  
Returns `true` if the specified value is a matching symbol (see clause 7.2.2.2.1 for more details), `false` otherwise.
- **ValueToString**  
Returns the same string as produced by the `any2unistr` predefined function with the specified value as its parameter.
- **IsLazy**  
Returns `true` if the specified value is `@lazy`, `false` otherwise.
- **IsFuzzy**  
Returns `true` if the specified value is `@fuzzy`, `false` otherwise.
- **IsEvaluated**  
Returns `true` if the specified value contains an evaluation result, `false` otherwise (see clause 7.2.2.2.1 for more details).
- **LengthRestriction**  
Gets or sets a length restriction matching attribute attached to the value.
- **NewLengthRestriction**  
Creates a new instance of the `LengthRestriction` interface.
- **IfPresentEnabled**  
Gets or sets whether the `ifpresent` matching attribute is attached to the value or not.
- **LowerTypeBoundary**  
Gets the value's type's lower range boundary or `null`.
- **UpperTypeBoundary**  
Gets the value's type's upper range boundary or `null`.

- **TypeLengthRestriction**  
Gets the value's type's length restriction or null.
- **TypeMatchingMechanism**  
Gets the values's type restriction matching mechanism.
- **IsOptional**  
Returns whether the value is either an optional field or a template without the **present** or **value** restriction.

#### 12.4.4.2 IntegerValue

**IntegerValue** is mapped to the following interface:

```
public interface ITciIntegerValue : ITciValue {
    long IntegerValue { get; set; }
    string StringValue { get; set; }
}
```

**Members:**

- **IntegerValue**  
Gets or sets the numeric value of the object. In case the numeric value exceeds the allowed value range of the **long** type, **long.MaxValue** or **long.MinValue** is returned.
- **StringValue**  
Get or sets the value of the object. The string assigned to the property shall have the same format as TTCN-3 integer literals. The integer literal can be optionally preceded by a sign character ('+' or '-').

#### 12.4.4.3 FloatValue

**FloatValue** is mapped to the following interface:

```
public interface ITciFloatValue : ITciValue {
    double FloatValue { get; set; }
    string StringValue { get; set; }
}
```

**Members:**

- **FloatValue**  
Gets or sets the numeric value of the object. In case the numeric value exceeds the allowed value range of the **double** type, **double.MaxValue** or **double.MinValue** is returned.
- **StringValue**  
Get or sets the value of the object. The string assigned to the property shall have the same format as TTCN-3 float literals. The float literal can be optionally preceded by a sign character ('+' or '-').

#### 12.4.4.4 BooleanValue

**BooleanValue** is mapped to the following interface:

```
public interface ITciBooleanValue : ITciValue {
    bool BooleanValue { get; set; }
}
```

**Members:**

- **BooleanValue**  
Gets or sets the boolean value of the object.

#### 12.4.4.5 CharstringValue

**CharstringValue** is mapped to the following interface:

```
public interface ITciCharstringValue : ITciValue {
```

```

    string StringValue { get; set; }
    char this[int position] { get; set; }
    int Length { get; set; }
}

```

#### Members:

- **StringValue**  
Gets or sets the string value of the TTCN-3 charstring. Strings assigned to this property shall contain only characters allowed in TTCN-3 charstring type.
- **Indexing operator**  
Get or sets the character value of the TTCN-3 charstring at the specified position. **IndexOutOfRangeException** is thrown if the position is less than zero or greater or equal to the string length.
- **Length**  
Gets or sets the length of this **ITciCharstringValue** in characters. The property returns zero if the value of this object is **omit**. In case the new length is greater than the length of the current string, characters with ordinal value 0 are added to the end of the string. If the new length is less than the length of the current string, the current string is truncated.

#### 12.4.4.6 BitstringValue

**BitstringValue** is mapped to the following interface:

```

public interface ITciBitstringValue : ITciValue {
    string StringValue { get; set; }
    byte this[int position] { get; set; }
    int Length { get; set; }
    bool IsMatchingAt (int position);
    ITciMatchingMechanism GetMatchingAt (int position);
    void SetMatchingAt (int position, ITciMatchingMechanism template);
}

```

#### Members:

- **StringValue**  
Gets or sets the string value of the TTCN-3 bitstring. The only allowed characters in the string passed to this property are '0' and '1'. The string returned by the property contains a sequence of '0' and '1' digits.
- **Indexing operator**  
Get or sets the value of the bit at the specified position. All non-zero values shall be interpreted as if the bit was present. **IndexOutOfRangeException** is thrown if the position is less than zero or greater or equal to the string length.
- **Length**  
Gets or sets the length of this **ITciBitstringValue** in bits. The property returns zero if the value of this object is **omit**. In case the new length is greater than the length of the current bitstring, the bitstring is padded with empty bits. If the new length is less than the length of the current bitstring, the current bitstring is truncated.
- **IsMatchingAt**  
Returns **true** if the item at **position** of this TTCN-3 bitstring is a matching mechanism inside a value (**AnyElement**, **AnyElementsOrNone**) and **false** otherwise.
- **GetMatchingAt**  
If the **position** of this TTCN-3 bitstring contains a matching mechanism inside a value (**AnyElement**, **AnyElementsOrNone**), the method returns it. Otherwise the distinct value **null** is returned.
- **SetMatchingAt**  
Sets a matching mechanism at **position**. Only two matching mechanisms are allowed: **AnyElement** and **AnyElementsOrNone**.

#### 12.4.4.7 OctetstringValue

**OctetstringValue** is mapped to the following interface:

```
public interface ITciOctetstringValue : ITciValue {
    string StringValue { get; set; }
    byte this[int position] { get; set; }
    int Length { get; set; }
    bool IsMatchingAt (int position);
    ITciMatchingMechanism GetMatchingAt (int position);
    void SetMatchingAt (int position, ITciMatchingMechanism template);
}
```

##### Members:

- **StringValue**  
Gets or sets the string value of the TTCN-3 octetstring. The only allowed characters in the string passed to this property are hexadecimal digits. The length of the string passed to this property shall be even. The string returned by this property is a sequence of pairs of hexadecimal digits.
- **Indexing operator**  
Get or sets the value of the octet at the specified position. `IndexOutOfRangeException` is thrown if the position is less than zero or greater or equal to the string length.
- **Length**  
Gets or sets the length of this `ITciOctetstringValue` in octets. The property returns zero if the value of this object is `omit`. In case the new length is greater than the length of the current octetstring, the octetstring is padded with empty octets. If the new length is less than the length of the current octetstring, the current octetstring is truncated.
- **IsMatchingAt**  
Returns `true` if the item at `position` of this TTCN-3 octetstring is a matching mechanism inside a value (`AnyElement`, `AnyElementsOrNone`) and `false` otherwise.
- **GetMatchingAt**  
If the `position` of this TTCN-3 octetstring contains a matching mechanism inside a value (`AnyElement`, `AnyElementsOrNone`), the method returns it. Otherwise the distinct value `null` is returned.
- **SetMatchingAt**  
Sets a matching mechanism at `position`. Only two matching mechanisms are allowed: `AnyElement` and `AnyElementsOrNone`.

#### 12.4.4.8 UniversalCharstringValue

**UniversalCharstringValue** is mapped to the following interface:

```
public interface ITciUniversalCharstringValue : ITciValue {
    string StringValue { get; set; }
    uint this[int position] { get; set; }
    int Length { get; set; }
}
```

##### Members:

- **StringValue**  
Gets or sets the string value of the TTCN-3 universal charstring. If the TTCN-3 universal charstring value contains characters that have higher ordinal value than `char.MaxValue`, these characters will be represented by a character `0xFFFFD` (the Unicode replacement character) in the string returned by this property.
- **Indexing operator**  
Get or sets the character value of the TTCN-3 universal charstring at the specified position. The unsigned number used by this property is character ordinal value. `IndexOutOfRangeException` is thrown if the position is less than zero or greater or equal to the string length.

- **Length**  
Gets or sets the length of this `ITciUniversalCharstringValue` in characters. The property returns zero if the value of this object is `omit`. In case the new length is greater than the length of the current string, characters with ordinal value 0 are added to the end of the string. If the new length is less than the length of the current string, the current string is truncated.

#### 12.4.4.9 HexstringValue

**HexstringValue** is mapped to the following interface:

```
public interface ITciHexstringValue : ITciValue {
    stringValue { get; set; }
    byte this[int position] { get; set; }
    int Length { get; set; }
    bool IsMatchingAt (int position);
    ITciMatchingMechanism GetMatchingAt (int position);
    void SetMatchingAt (int position, ITciMatchingMechanism template);
}
```

##### Members:

- **stringValue**  
Gets or sets the string value of the TTCN-3 hexstring. The only allowed characters in the string passed to this property are hexadecimal digits. The string returned by this property is a sequence of hexadecimal digits.
- **Indexing operator**  
Get or sets the hex digit at the specified position. Only the lower four bits of the passed value are used in this assignment. The upper four bits are ignored. `IndexOutOfRangeException` is thrown if the position is less than zero or greater or equal to the string length.
- **Length**  
Gets or sets the length of this `ITciHexstringValue` in hex digits. The property returns zero if the value of this object is `omit`. In case the new length is greater than the length of the current hexstring, the hexstring is padded with zeroes. If the new length is less than the length of the current hexstring, the current hexstring is truncated.
- **IsMatchingAt**  
Returns `true` if the item at `position` of this TTCN-3 hexstring is a matching mechanism inside a value (`AnyElement`, `AnyElementsOrNone`) and `false` otherwise.
- **GetMatchingAt**  
If the `position` of this TTCN-3 hexstring contains a matching mechanism inside a value (`AnyElement`, `AnyElementsOrNone`), the method returns it. Otherwise the distinct value `null` is returned.
- **SetMatchingAt**  
Sets a matching mechanism at `position`. Only two matching mechanisms are allowed: `AnyElement` and `AnyElementsOrNone`.

#### 12.4.4.10 RecordValue

**RecordValue** is mapped to the following interface:

```
public interface ITciRecordValue : ITciValue {
    ITciValue GetField(string fieldName);
    void SetField(string fieldName, ITciValue value);
    string[] GetFieldNames();
    void SetFieldOmitted(string fieldName);
}
```

##### Members:

- **GetField**  
Returns the value of the field named `fieldName`. The return value is the common abstract base type `ITciValue`, as a record field can have any type defined in TTCN-3. If the field cannot be obtained from the record the distinct value `null` will be returned.

- **SetField**  
Sets the field named `fieldName` of the record to value. No assumption shall be made on how a field is stored in a record. An internal implementation might choose to store a reference to this value or to copy the value. It is safe to assume that the value will be copied. Therefore it should be assumed that subsequent modifications of value will not be considered in the record.
- **GetFieldNames**  
Returns an array of String of field names, the empty sequence, if the record has no fields.
- **SetFieldOmitted**  
Sets the field named `fieldName` of the record to omit.

#### 12.4.4.11 RecordOfValue

**RecordOfValue** is mapped to the following interface:

```
public interface ITciRecordOfValue : ITciValue, System.Collections.IEnumerable {
    ITciValue this[int position] { get; set; }
    void AppendField(ITciValue value);
    ITciType ElementType { get; }
    int Length { get; set; }
    int Offset { get; }
    int PermutationCount { get; }
    ITciPermutation GetPermutation (int index);
    ITciPermutation NewPermutation ();
    void DefinePermutation (ITciPermutation permutation);
    void RemovePermutation (int index);
    void ClearPermutations ();
}
```

##### Members:

- **Indexing operator**  
Returns or sets the value of the record of at the specified position. The class of this property is the common abstract base interface `ITciValue`, as a `record of` can have fields of any type defined in TTCN-3. When getting the value an `ITciValue` instance is returned only if `position` is between zero and `(length - 1)`. The distinct value `null` is returned otherwise. When setting the value, if `position` is greater than the current length, the record of will be extended to have the length `(position + 1)`. The `record of` elements between the original position at `length` and `(position - 1)` will be set to `omit`. No assumption shall be made on how a field is stored in a `record of`. An internal implementation might choose to store a reference to this value or to copy the value. It is safe to assume that the value will be copied. Therefore it should be assumed that subsequent modifications of value will not be considered in the `record of`.
- **GetEnumerator**  
Inherited from `IEnumerable`. Returns an enumerator for this object and allows to use the object in a `foreach` loop.
- **appendField**  
Appends the value at the end of the `record of`, i.e. at position `length`. No assumption shall be made on how a field is stored in a `record of`. An internal implementation might choose to store a reference to this value or to copy the value. It is safe to assume that the value will be copied. Therefore it should be assumed that subsequent modifications of value will not be considered in the `record of`.
- **ElementType**  
Returns the type of the elements of this `record of`.
- **Length**  
Gets or sets the actual length of the `record of` value. When getting the length, zero is returned if the `record of` value is `omit`. When setting the length, if the new length is greater than the original length, newly created elements have the value `omit`. If the new length is less or equal than the original length, this operation will be ignored.

- **Offset**  
Returns the lowest possible index. For a record of or set of value this is always 0. For an array value, this is the lower index bound used in the type definition.
- **PermutationCount**  
Returns the number of permutations in the **record of** or array value.
- **GetPermutation**  
Returns the permutation at the specified index. The allowed index range is from 0 to (**getPermutationCount()** - 1).
- **NewPermutation**  
Creates a new instance of the **Permutation** interface.
- **DefinePermutation**  
Creates permutation from existing elements of a **record of** value. The **permutation** parameter shall not include elements that are already a part of other existing permutations attached to the same **record of**. No elements are added to the **record of** by this operation.
- **RemovePermutation**  
Removes the permutation at the specified index. The allowed index range is from 0 to (**getPermutationCount()** - 1). No elements are removed from the **record of** by this operation. When the operation completes, the existing elements at positions specified by the removed permutation do not belong to any permutation.
- **ClearPermutations**  
Removes all permutations from the value. The elements that belonged to the removed permutation are not removed.

#### 12.4.4.12 UnionValue

**UnionValue** is mapped to the following interface:

```
public interface ITciUnionValue : ITciValue {
    ITciValue GetVariant(string variantName);
    void SetVariant(string variantName, ITciValue value);
    string PresentVariantName { get; }
    string[] GetVariantNames();
}
```

##### Members:

- **GetVariant**  
Returns the value of the TTCN-3 union variant, if **variantName** equals the result of **GetPresentVariantName**. The distinct value **null** is returned otherwise. **variantName** denotes the name of the union variant as defined in TTCN-3.
- **SetVariant**  
Sets **variantName** of the union to **value**. If **variantName** is not defined for this union this operation will be ignored. If another variant was selected the new variant will be selected instead.
- **GetPresentVariantName**  
Returns the variant name that has a value in this union set as a **string**. The distinct value **null** will be returned if no variant is selected.
- **GetVariantNames**  
Returns an array of **string** of variant names, the empty sequence, if the union has no fields. If the **UnionValue** represents the TTCN-3 **anytype**, i.e. the value of the **Type** property is **TciTypeClass.Anytype**, all predefined and user-defined TTCN-3 types will be returned.

#### 12.4.4.13 EnumeratedValue

**EnumeratedValue** is mapped to the following interface:

```
public interface ITciEnumeratedValue : ITciValue {
    string EnumValue { get; set; }
    int IntValue { get; set; }
}
```

**Members:**

- **EnumValue**  
Returns or sets the enumerated value. The value of the property is equal to the identifier in the TTCN-3 specification. If the value assigned to the property is not an allowed value for this enumeration, the assignment will be ignored.
- **IntValue**  
Returns or sets the integer value. This integer should equal the user-assigned integer value in the TTCN-3 specification or the automatically assigned integer value. If the integer assigned to the property is not allowed for this enumeration, the assignment will be ignored.

#### 12.4.4.14 VerdictValue

**VerdictValue** is mapped to the following interface:

```
public interface ITciVerdictValue : ITciValue {
    TciVerdict Verdict { get; set; }
}
```

**Members:**

- **Verdict**  
Returns the value of this **VerdictValue**. Note that a **VerdictValue** can be set to any of the verdicts defined in the **TciVerdict** enumeration at any time. The **VerdictValue** does not perform any verdict calculations as defined in TTCN-3. For example, it is legal to set the **VerdictValue** first to **TciVerdict.ErrorVerdict** and then to **TciVerdict.Pass**.

#### 12.4.4.15 AddressValue

**AddressValue** is mapped to the following interface:

```
public interface ITciAddressValue : ITciValue {
    ITciValue Address { get; set; }
}
```

**Members:**

- **Address**  
Gets or sets the value represented by this **AddressValue**.

### 12.4.5 Abstract template mapping

#### 12.4.5.0 Mapping rules

TTCN-3 matching mechanisms can be retrieved from the TE and constructed using the **ITciMatchingMechanism** interface. The template mapping interface is constructed hierarchically with **ITciMatchingMechanism** as the basic interface. Specialized interfaces for different types of matching mechanisms have been defined.

#### 12.4.5.1 MatchingMechanism

The IDL type **MatchingMechanism** is mapped to the following interface:

```
public interface ITciMatchingMechanism : ITciValue
{
```

```

    TciMatchingType MatchingType { get; }
}

```

#### Members:

- MatchingType  
Returns the matching mechanism type.

### 12.4.5.2 MatchingList

The IDL type **MatchingList** is mapped to the following interface:

```

public interface ITciMatchingList : ITciMatchingMechanism
{
    int Size { get; }
    ITciValue this[int position] { get; }
    void Add (ITciValue item);
    void Remove (int position);
    void Clear ();
}

```

#### Methods:

- Size  
Returns the number of items in the matching mechanism.
- Indexing operator  
Returns a value or template at the specified position.
- Add  
Adds a value or template to the matching mechanism.
- Remove  
Removes a value or template from the specified position.
- Clear  
Removes all values and templates from the matching mechanism.

### 12.4.5.3 ValueRange

The IDL type **ValueRange** is mapped to the following interface:

```

public interface ITciValueRange : ITciMatchingMechanism
{
    ITciRangeBoundary LowerBoundary { get; set; }
    ITciRangeBoundary UpperBoundary { get; set; }
}

```

#### Methods:

- LowerBoundary  
Gets or sets the lower boundary of the range.
- UpperBoundary  
Gets or sets the upper boundary of the range.

### 12.4.5.4 CharacterPattern

The IDL type **CharacterPattern** is mapped to the following interface:

```

public interface ITciCharacterPattern : ITciMatchingMechanism
{
    ITciValue PatternString { get; set; }
}

```

**Methods:**

- **PatternString** Gets or sets the character pattern definition of this pattern (either a `ITciCharstringValue` or `ITciUniversalCharstringValue`).

**12.4.5.5 MatchDecodedContent**

The IDL type **MatchDecodedContent** is mapped to the following interface:

```
public interface ITciMatchDecodedContent : ITciMatchingMechanism
{
    ITciValue Content { get; set; }
}
```

**Methods:**

- **Content** Gets or sets the value or matching mechanism used as an argument of the `decmatch` matching mechanism.

**12.4.6 Abstract logging types mapping****12.4.6.0 Mapping rules**

Additional types are defined to ease the logging of object states and matches between values and templates.

**12.4.6.1 TciValueTemplate**

**TciValueTemplate** is mapped to the following interface:

```
public interface ITciValueTemplate {
    bool IsOmit { get; }
    bool IsAny { get; }
    bool IsAnyOrOmit { get; }
    string TemplateDef { get; }
}
```

**Members:**

- **IsOmit**  
Returns `true` if the template is `omit`, `false` otherwise.
- **IsAny**  
Returns `true` if the template is `any`, `false` otherwise.
- **IsAnyOrOmit**  
Returns `true` if the template is `AnyValueOrNone`, `false` otherwise.
- **TemplateDef**  
This property returns the template definition.

**12.4.6.2 TciNonValueTemplate**

**TciNonValueTemplate** is mapped to the following interface:

```
public interface ITciNonValueTemplate {
    bool IsAny { get; }
    bool IsAll { get; }
    string TemplateDef { get; }
}
```

**Members:**

- **IsAny**  
Returns `true` if the template is `any`, `false` otherwise.

- **IsAll**  
Returns `true` if the template is `all`, `false` otherwise.
- **TemplateDef**  
This operation returns the template definition.

### 12.4.6.3 TciValueList

**TciValueList** is mapped to the following interface:

```
public interface ITciValueList: IEnumerable {
    int Size { get; }
    bool IsEmpty { get; }
    ITciValue this[int index] { get; }
}
```

#### Members:

- **Size**  
Returns the number of values in this list.
- **IsEmpty**  
Returns `true` if this list contains no values.
- **GetEnumerator**  
Inherited from `IEnumerable`. Returns an enumerator for this object and allows to use the list in a `foreach` loop.
- **Indexing operator**  
Returns an `ITciValue` instance at the specified position. `IndexOutOfRangeException` is thrown if the index is less than zero or greater or equal to the list size.

### 12.4.6.4 TciValueDifference

**TciValueDifference** is mapped to the following interface:

```
public interface ITciValueDifference {
    ITciValue Value { get; }
    ITciValueTemplate ValueTemplate { get; }
    string Description { get; }
}
```

#### Members:

- **Value**  
Returns the value of this `ITciValueDifference`.
- **Template**  
Returns the template of this `ITciValueDifference`.
- **Description**  
Returns the description of the mismatch.

### 12.4.6.5 TciValueDifferenceList

**TciValueDifferenceList** is mapped to the following interface:

```
public interface ITciValueDifferenceList : IEnumerable {
    int Size { get; }
    bool IsEmpty { get; }
    ITciValueDifference this[int index] { get; }
}
```

**Members:**

- **Size**  
Returns the number of differences in this list.
- **IsEmpty**  
Returns `true` if this list contains no parameters.
- **GetEnumerator**  
Inherited from `IEnumerable`. Returns an enumerator for this object and allows to use the list in a `foreach` loop.
- **Indexing operator**  
Returns a `ITciValueDifference` instance at the specified position. `IndexOutOfRangeException` is thrown if the index is less than zero or greater or equal to the list size.

**12.4.6.6 TciStatusType**

**TciStatusType** is mapped to the following enumeration:

```
public enum TciStatus {
    TciOk = 0,
    TciError = -1
}
```

**12.4.6.7 ComponentStatusType**

**ComponentStatusType** is mapped to the following enumeration:

```
public enum TciComponentStatus {
    InactiveC = 0,
    RunningC = 1,
    StoppedC = 2,
    KilledC = 3,
    NullC = 4
}
```

**12.4.6.8 TimerStatusType**

**TimerStatusType** is mapped to the following enumeration:

```
public enum TciTimerStatus {
    RunningT = 0,
    InactiveT = 1,
    ExpiredT = 2,
    NullT = 3
}
```

**12.5 Mapping of interfaces****12.5.0 Calling rules**

The TCI IDL definition defines four interfaces, the TCI-TM, the TCI-CH, the TCI-CD, and the TCI-TL interface. The operations are defined for different directions within this interface, i.e. some operations can only be called by the TTCN-3 Executable (TE), the System Adaptor (SA) or the Platform Adaptor (PA) on the Test Management and Control (TMC) while others can only be called by the TMC on the TE. This is reflected by dividing the TCI IDL interfaces in two sub interfaces, each suffixed by `Required` or `Provided`.

Table 10: TCI sub-interfaces

| Calling                 | Called | Interface       |
|-------------------------|--------|-----------------|
| TE                      | TMC    | ITciTMPProvided |
| TMC                     | TE     | ITciTMRequired  |
| TE                      | CD     | ITciCDProvided  |
| CD                      | TE     | ITciCDRequired  |
| TE                      | CH     | ITciCHProvided  |
| CH                      | TE     | ITciCHRequired  |
| TE, TMC, CD, CH, SA, PA | TL     | ITciTLProvided  |

For better readability, references to types and interfaces defined in the Etsi.Ttcn3.Tci namespace and Etsi.Ttcn3.Tri namespace (described in [3]) that appear in the following interface definitions use a simple identifier form instead of a fully qualified one. Names of these types and interfaces start with a prefix that can be used for identification of its origin.

## 12.5.1 TCI-TM interface

### 12.5.1.1 TCI-TM provided

The **TCI-TM provided** interface is mapped to the following interface:

```
public interface ITciTMPProvided {
    void TciTestCaseStarted(ITciTestCaseId testCaseId,
        ITciParameterList parameterList, double timer);
    void TciTestCaseTerminated(ITciVerdictValue verdict,
        ITciParameterList parameterList);
    void TciControlTerminated();
    ITciValue TciGetModulePar(ITciModuleParameterId parameterId);
    void TciLog(ITriComponentId testComponentId,
        string message);
    void TciError(string message);
}
```

### 12.5.1.2 TCI-TM required

The **TCI-TM required** interface is mapped to the following interface:

```
public interface ITciTMRequired {
    void TciRootModule(ITciModuleId moduleId);
    ITciModuleIdList TciGetImportedModules();
    ITciModuleParameterList TciGetModuleParameters(ITciModuleId moduleId);
    ITciTestCaseIdList TciGetTestCases();
    ITciParameterTypeList TciGetTestCaseParameters(ITciTestCaseId testCaseId);
    ITriPortIdList TciGetTestCaseTsi(
        ITciTestCaseId testCaseId);
    void TciStartTestCase(ITciTestCaseId testCaseId,
        ITciParameterList parameterList);
    void TciStopTestCase();
    ITriComponentId TciStartControl();
    void TciStopControl();
}
```

## 12.5.2 TCI-CD interface

### 12.5.2.1 TCI-CD provided

The **TCI-CD provided** interface is mapped to the following interface:

```
public interface ITciCDProvided {
    ITciValue Decode(ITriMessage message,
        ITciType decodingHypothesis);
    ITriMessage Encode(ITciValue value);
    int DecodeValue(ITriMessage message,
        ITciType decodingHypothesis,
        string decodingInfo,
        out ITciValue decodedValue);
}
```

```

    ITriMessage EncodeValue(ITciValue value,
        string encodingInfo);
}

```

### 12.5.2.2 TCI-CD required

The **TCI-CD required** interface is mapped to the following interface:

```

public interface ITciCDRequired {
    ITciType GetTypeForName(string typeName);
    ITciType GetInteger();
    ITciType GetFloat();
    ITciType GetBoolean();
    ITciType GetCharstring();
    ITciType GetUniversalCharstring();
    ITciType GetHexstring();
    ITciType GetBitstring();
    ITciType GetOctetstring();
    ITciType GetVerdict();
    void TciErrorReq(string message);
}

```

## 12.5.3 TCI-CH interface

### 12.5.3.1 TCI-CH provided

The **TCI-CH provided** interface is mapped to the following interface:

```

public interface ITciCHProvided {
    void TciSendConnected(ITriPortId sender,
        ITriComponentId receiver, ITciValue sendMessage);
    void TciSendConnectedBC(ITriPortId sender,
        ITciValue sendMessage);
    void TciSendConnectedMC(ITriPortId sender,
        ITriComponentIdList receivers,
        ITciValue sendMessage);
    void TciCallConnected(ITriPortId sender,
        ITriComponentId receiver,
        ITriSignatureId signature,
        ITciParameterList parameterList);
    void TciCallConnectedBC(ITriPortId sender,
        ITriSignatureId signature,
        ITciParameterList parameterList);
    void TciCallConnectedMC(ITriPortId sender,
        ITriComponentIdList receivers,
        ITriSignatureId signature,
        ITciParameterList parameterList);
    void TciReplyConnected(ITriPortId sender,
        ITriComponentId receiver,
        ITriSignatureId signature,
        ITciParameterList parameterList, ITciValue returnValue);
    void TciReplyConnectedBC(ITriPortId sender,
        ITriSignatureId signature,
        ITciParameterList parameterList, ITciValue returnValue);
    void TciReplyConnectedMC(ITriPortId sender,
        ITriComponentIdList receivers,
        ITriSignatureId signature,
        ITciParameterList parameterList, ITciValue returnValue);
    void TciRaiseConnected(ITriPortId sender,
        ITriComponentId receiver,
        ITriSignatureId signature, ITciValue except);
    void TciRaiseConnectedBC(ITriPortId sender,
        ITriSignatureId signature, ITciValue except);
    void TciRaiseConnectedMC(ITriPortId sender,
        ITriComponentIdList receivers,
        ITriSignatureId signature, ITciValue except);
    ITriComponentId TciCreateTestComponentReq(int kind,
        ITciType componentType, string name, ITciValue hostId);
    void TciStartTestComponentReq(ITriComponentId comp,
        ITciBehaviourId behavior, ITciParameterList parameterList);
    void TciStopTestComponentReq(ITriComponentId comp);
    void TciConnectReq(ITriPortId fromPort,
        ITriPortId toPort);
    void TciDisconnectReq(ITriPortId fromPort,

```

```

    ITriPortId toPort);
void TciTestComponentTerminatedReq(ITriComponentId comp,
    ITciVerdictValue verdict);
bool TciTestComponentRunningReq(ITriComponentId comp);
ITriComponentId TciGetMmcReq();
void TciMapReq(ITriPortId fromPort,
    ITriPortId toPort);
void TciMapParamReq(ITriPortId fromPort,
    ITriPortId toPort, Etsi.Ttcn3.Tci.ITciParameterList parameterList);
void TciUnmapReq(ITriPortId fromPort,
    ITriPortId toPort);
void TciUnmapParamReq(ITriPortId fromPort,
    ITriPortId toPort, Etsi.Ttcn3.Tci.ITciParameterList parameterList);
void TciExecuteTestCaseReq(ITriComponentId component,
    ITriPortIdList tsiPortList);
void TciResetReq();
bool TciTestComponentDoneReq(ITriComponentId component, out TciVerdict verdict);
void TciKillTestComponentReq(ITriComponentId component);
bool TciTestComponentAliveReq(ITriComponentId component);
bool TciTestComponentKilledReq(ITriComponentId component, out TciVerdict verdict);
}

```

### 12.5.3.2 TCI-CH required

The **TCI-CH required** interface is mapped to the following interface:

```

public interface ITciCHRequired {
    void TciQueueMsgConnected(ITriPortId sender,
        ITriComponentId receiver,
        ITciValue receivedMessage);
    void TciQueueCallConnected(ITriPortId sender,
        ITriComponentId receiver,
        ITriSignatureId signature,
        ITciParameterList parameterList);
    void TciQueueReplyConnected(ITriPortId sender,
        ITriComponentId receiver,
        ITriSignatureId signature,
        ITciParameterList parameterList, ITciValue returnValue);
    void TciQueueRaiseConnected(ITriPortId sender,
        ITriComponentId receiver,
        ITriSignatureId signature, ITciValue except);
    ITriComponentId TciCreateTestComponent(int kind,
        ITciType componentType, string name);
    void TciStartTestComponent(ITriComponentId comp,
        ITciBehaviourId behavior, ITciParameterList parameterList);
    void TciStopTestComponent(ITriComponentId comp);
    void TciConnect(ITriPortId fromPort,
        ITriPortId toPort);
    void TciDisconnect(ITriPortId fromPort,
        ITriPortId toPort);
    void TciTestComponentTerminated(ITriComponentId comp,
        ITciVerdictValue verdict);
    bool TciTestComponentRunning(ITriComponentId comp);
    bool TciTestComponentDone(ITriComponentId comp, out TciVerdict verdict);
    ITriComponentId TciGetMtc();
    void TciExecuteTestCase (ITciTestCaseId testCaseId,
        ITriPortIdList tsiPortList);
    void TciReset();
    void TciMap(ITriPortId fromPort,
        ITriPortId toPort);
    void TciMapParam(ITriPortId fromPort,
        ITriPortId toPort, Etsi.Ttcn3.Tci.ITciParameterList parameterList);
    void TciUnmap(ITriPortId fromPort,
        ITriPortId toPort);
    void TciUnmapParam(ITriPortId fromPort,
        ITriPortId toPort, Etsi.Ttcn3.Tci.ITciParameterList parameterList);
    void TciKillTestComponent(ITriComponentId component);
    bool TciTestComponentAlive (ITriComponentId component);
    bool TciTestComponentKilled(ITriComponentId component, out TciVerdict verdict);
}

```

## 12.5.4 TCI-TL interface

### 12.5.4.1 TCI-TL provided

The **TCI-TL provided** interface is mapped to the following interface:

```
public interface ITciTLProvided {
    void TliTcExecute(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciTestCaseId tcId,
        ITciParameterList tciPars, ITriTimerDuration dur);
    void TliTcStart(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciTestCaseId tcId,
        ITciParameterList tciPars, ITriTimerDuration dur);
    void TliTcStop(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, string reason);
    void TliTcStarted(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciTestCaseId tcId,
        ITciParameterList tciPars, ITriTimerDuration dur);
    void TliTcTerminated(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITciTestCaseId tcId,
        ITciParameterList tciPars, ITciVerdictValue verdict,
        string reason);
    void TliCtrlStart(string am, System.DateTime ts, string src, int line,
        ITriComponentId c);
    void TliCtrlStop(string am, System.DateTime ts, string src, int line,
        ITriComponentId c);
    void TliCtrlTerminated(string am, System.DateTime ts, string src, int
        line, ITriComponentId c);
    void TliMsend_m(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITriPortId to, ITciValue msgValue,
        ITciValue addrValue, TciStatus encoderFailure,
        ITriMessage msg, ITriAddress address,
        TriStatus transmissionFailure);
    void TliMsend_m_BC(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITriPortId to, ITciValue msgValue,
        TciStatus encoderFailure, ITriMessage msg,
        TriStatus transmissionFailure);
    void TliMsend_m_MC(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITriPortId to, ITciValue msgValue,
        ITciValueList addrValues, TciStatus encoderFailure,
        ITriMessage msg,
        ITriAddressList addresses,
        TriStatus transmissionFailure);
    void TliMsend_c(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITriPortId to, ITciValue msgValue,
        TriStatus transmissionFailure);
    void TliMsend_c_BC(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITriPortIdList to, ITciValue msgValue,
        TriStatus transmissionFailure);
    void TliMsend_c_MC(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITriPortIdList to, ITciValue msgValue,
        TriStatus transmissionFailure);
    void TliMDetected_m(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITriPortId from, ITriMessage msg,
        ITriAddress address);
    void TliMDetected_c(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITriPortId from, ITciValue msgValue);
    void TliMMismatch_m(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITciValue msgValue, ITciValueTemplate msgTpl,
        ITciValueDifferenceList diffs, ITciValue address,
        ITciValueTemplate addressTpl);
    void TliMMismatch_c(string am, System.DateTime ts, string src, int line,
        ITriComponentId c, ITriPortId at,
        ITciValue msgValue, ITciValueTemplate msgTpl,
        ITciValueDifferenceList diffs, ITriComponentId from,
        ITciNonValueTemplate fromTpl);
    void TliMReceive_m(string am, System.DateTime ts, string src, int line,
```

```

    ITriComponentId c, ITriPortId at,
    ITciValue msgValue, ITciValueTemplate msgTpl, ITciValue address,
    ITciValueTemplate addressTpl);

## 12.6 Optional parameters

Clause 7.3 in [1] defines that a reserved value shall be used to indicate the absence of an optional parameter. For the C# language mapping the distinct value `null` shall be used to indicate the absence of an optional value. For example, if in the `TciReplyConnected` operation the value parameter shall be omitted the operation invocation shall be `TciReplyConnected (sender, receiver, signature, parameterList, null)`.

## 12.7 Error Handling

All operations called from the TM, CH or CD that return have succeeded. If an erroneous situation has been identified by the TE a test case error will be communicated to the user using the procedures as defined in clause 7.3.1.2.6 (`TciError`). If an operation called by the TE in the TM, CH, CD, or TL produces an error, this erroneous situation should be communicated to the TE using the procedures as defined in clause 7.3.2.1.12 (`TciErrorReq`).

Beside this error handling and exceptions specified for indexing operators no additional error handling is defined in the C# mapping.

## Annex A (normative): IDL Specification of TCI

This annex defines the TTCN-3 Control Interfaces using the Interface Definition Language (IDL).

```
// *****
// * Interface definitions for the TTCN-3 Control Interfaces
// *****

module tciInterface {

    /* Forward declaration */
    interface Value;
    interface Type;

    // *****
    // * Data types taken from the TRI definitions
    // *****

    // Connection
    native TriPortIdType ;
    native TriPortIdListType;
    native TriComponentIdType ;
    native TriComponentIdListType;

    // Communications
    native TriMessageType;
    native TriParameterType;
    native TriParameterListType;
    native TriAddressType;
    native TriAddressListType;
    native TriExceptionType;
    native TriSignatureIdType;

    // Miscellaneous
    native TriStatusType;
    native TriTimerIdType;
    native TriTimerDurationType;

# Annex B (normative): XML Mapping for TCI TL Provided

## B.0 Introduction

This annex defines a mapping for the logging interface of TCI using eXtended Markup Language (XML) schema definitions.

## B.1 TCI-TL XML Schema for Simple Types

```
<?xml version="1.0" encoding="UTF-8"?>
<xsd:schema xmlns:xsd="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://uri.etsi.org/ttcn-3/tci/SimpleTypes_v4_10_1.xsd"
  xmlns:SimpleTypes="http://uri.etsi.org/ttcn-3/tci/SimpleTypes_v4_10_1.xsd"
  elementFormDefault="qualified">

  <!-- Basic definitions -->
  <xsd:simpleType name="xpath">
    <!-- this string should be XPATH compliant -->
    <xsd:restriction base="xsd:string"/>
  </xsd:simpleType>

  <xsd:simpleType name="TBoolean">
    <xsd:restriction base="xsd:boolean"/>
  </xsd:simpleType>

  <xsd:simpleType name="TString">
    <xsd:restriction base="xsd:string"/>
  </xsd:simpleType>

  <xsd:simpleType name="TInteger">
    <xsd:restriction base="xsd:integer"/>
  </xsd:simpleType>

  <!-- Miscellaneous -->
  <xsd:simpleType name="TriTimerDurationType">
    <xsd:restriction base="xsd:float"/>
  </xsd:simpleType>

  <xsd:simpleType name="TciParameterPassingModeType">
    <xsd:restriction base="xsd:string">
      <xsd:enumeration value="in"/>
      <xsd:enumeration value="inout"/>
      <xsd:enumeration value="out"/>
    </xsd:restriction>
  </xsd:simpleType>

  <xsd:simpleType name="TriStatusType">
    <xsd:restriction base="xsd:string">
      <xsd:enumeration value="TRI_Ok"/>
      <xsd:enumeration value="TRI_Error"/>
    </xsd:restriction>

## Annex C (informative): Use scenarios

### C.0 Introduction

This annex contains use scenarios that should help users of the TCI and tool vendors providing the TCI understand the semantics of the operations defined within the present document.

The scenarios are defined in terms of UML sequence diagrams. The sequence diagram shows the interactions between the TCI entities. The scenarios are explained and where applicable underpinned with a TTCN-3 fragment corresponding to the scenario.

---

### C.1 Initialization, collecting information, logging

#### C.1.1 Use scenario: initialization

##### C.1.1.0 Scenario description

The scenario in figure C.1 shows the initialization phase for a test system when a TTCN-3 module is to be selected for execution. At first, a root module has to be set with `tcIRootModule`. The module parameters of the root module can be obtained with `tcIGetModuleParameters`. Module parameter information can be used to ask the test system user for concrete values for each module parameter. The list of test cases available in the root module can be retrieved with `tcIGetTestCases`. These test cases can be directly executed from the test management. Their parameters and their test system interface can be obtained with `tcIGetTestCaseParameters` and `tcIGetTestCaseTSI`, respectively.

### C.1.1.1 Sequence diagram

**Figure C.1: Use scenario - initialization**

### C.1.1.2 TTCN-3 fragment

The initialization is outside the scope of TTCN-3.

## C.1.2 Use scenario: requesting module parameters

### C.1.2.0 Scenario description

The scenario in figure C.2 shows how a test component requests the actual value of a module parameter needed for the execution of its test behaviour. At first, the type of a module parameter is requested, then the value can be constructed by the TM and given to the TE.

### C.1.2.1 Sequence diagram

Figure C.2: Use scenario - requesting module Pars

### C.1.2.2 TTCN-3 fragment

```

module AModule {
  ...
  modulepar {
    integer AModulePar
  }
  ...
  function AFunction (...) ... {
    integer x;
    ...
    x:= 2+AModulePar; // an expression with a module parameter
    ...
  }
  ...
}

```

## C.1.3 Use scenario: logging

### C.1.3.0 Scenario description

The scenario in figure C.3 shows logging of information during the execution of a test behaviour by a test component. The message to be logged is propagated to the test logging.

### C.1.3.1 Sequence diagram

Figure C.3: Use scenario - logging

### C.1.3.2 TTCN-3 fragment

```

module AModule {
  ...
  function AFunction (...) ... {
    ...
    log("AMessage");
    ...
  }
  ...
}

```

---

## C.2 Execution of test cases and control

### C.2.1 Use scenario: execution of control

#### C.2.1.0 Scenario description

The scenario in figure C.4 shows the sequence of operations to execute the control part of a TTCN-3 module. The module containing the control part is selected first, then the control is started, then it is executed until the execution is terminated by TE.

### C.2.1.1 Sequence diagram

**Figure C.4: Use scenario - execution of control**

### C.2.1.2 TTCN-3 fragment

```

module AModule {
  ...
  control {
    ...
  }
  ...
}
  
```

## C.2.2 Use scenario: test case execution within control

### C.2.2.0 Scenario description

The scenario in figure C.5 shows how a test case is executed within the control part.

### C.2.2.1 Sequence diagram

Figure C.5: Use scenario - test case execution within control

### C.2.2.2 TTCN-3 fragment

```

module AModule {
  ...
  testcase ATestCase(...)... {
    ... //the test case behaviour
  }
  ...
  control {
    ...
    execute(ATestCase(...));
    ...
  }
  ...
}

```

## C.2.3 Use scenario: direct test case execution

### C.2.3.0 Scenario description

The scenario in figure C.6 shows how a test case can be directly executed from the test management outside the control part. After selecting the TTCN-3 module containing the test case to be executed, the start of the test case is requested. When the test case completes its execution, the test management is informed by the TE of the test case termination.

### C.2.3.1 Sequence diagram

**Figure C.6: Use scenario - direct test case execution**

### C.2.3.2 TTCN-3 fragment

The direct execution of a test case is outside the scope of TTCN-3.

## C.2.4 Use scenario: execute test case to TRI

### C.2.4.0 Scenario description

The scenario in figure C.7 shows how the TRI is informed about the execution of a test case so that it can set up and initialize system ports when needed. The execute test case request has to be issued before the test behaviour on the MTC of the current test case is started.

### C.2.4.1 Sequence diagram

Figure C.7: Use scenario - execute test case to TRI

### C.2.4.2 TTCN-3 fragment

```

module AModule {
  ...
  testcase ATestCase(...)... {
    ... //the test case behaviour
  }
  ...
  control {
    ...
    execute(ATestCase(...));
    ...
  }
  ...
}

```

## C.3 Component handling

### C.3.1 Use scenario: local control component creation

#### C.3.1.0 Scenario description

The scenario in figure C.8 demonstrates the creation of the control component on the same node where the user interface to the test management TCI-TM resides. A control component is created whenever the control part of a TTCN-3 module is executed. Whenever the test management TCI-TM issues the start of the control part, a create test component request is sent to the TCI-CH, which propagates it to the TE where the control component should be created. In this case it is the TE on the same node. The identifier for the control component is returned and given to the TCI-TM. The identifier is then used to start the behaviour of the control part on the control component.

### C.3.1.1 Sequence diagram

Figure C.8: Use scenario - local control component creation

### C.3.1.2 TTCN-3 fragment

```

module AModule {
    ...
    control {
        ...
    }
    ...
}
  
```

## C.3.2 Use scenario: remote control component creation

### C.3.2.0 Scenario description

The scenario in figure C.9 demonstrates the creation of the control component on another node than where the user interface to the test management TCI-TM resides. A control component is created whenever the control part of a TTCN-3 module is executed. Whenever the test management TCI-TM issues the start of the control part, a create test component request is sent to the TCI-CH, which propagates it to the TE where the control component should be created. In this case it is the TE on another remote node. The identifier for the control component is returned and given to the TCI-TM. The identifier is then used to start the behaviour of the control part on the control component.

### C.3.2.1 Sequence diagram

Figure C.9: Use scenario - remote control component creation

### C.3.2.2 TTCN-3 fragment

```

module AModule {
    ...
    control {
        ...
    }
    ...
}
  
```

## C.3.3 Use scenario: local MTC creation

### C.3.3.0 Scenario description

The scenario in figure C.10 demonstrates the local creation of the main test component. Local is meant for two cases:

- 1) on the same node where the user interface to the test management TCI-TM resides (when a test case is started directly); or
- 2) on the same node where the control component resides (when a test case is executed from a control part).

A main test component is created whenever a test case is executed: a create test component request is sent to the TCI-CH, which propagates it to the TE where the main test component should be created. In this case it is the TE on the same node. The identifier for the main test component is returned and given to the TCI-TM. The identifier is then used to start the test case behaviour on the main test component (this is not shown here, but handled the same way as in the scenarios described in clauses C.2.2 and C.2.3).

### C.3.3.1 Sequence diagram

Figure C.10: Use scenario - local MTC creation

### C.3.3.2 TTCN-3 fragment

```

module AModule {
  ...
  testcase ATestCase (...)runs on MTCType... {
    ... //the test case behaviour
  }
  ...
}
  
```

## C.3.4 Use scenario: remote MTC creation

### C.3.4.0 Scenario description

The scenario in figure C.11 demonstrates the remote creation of the main test component. Remote is meant for two cases:

- 1) on another node than where the user interface to the test management TCI-TM resides (when a test case is started directly); or
- 2) on another node than where the control component resides (when a test case is executed from a control part).

A main test component is created whenever a test case is executed: a create test component request is sent to the TCI-CH, which propagates it to the TE where the main test component should be created. In this case it is the TE on another node. The identifier for the main test component is returned and given to the TCI-TM. The identifier is then used to start the test case behaviour on the main test component (this is not shown here, but handled the same way as in the scenarios described in clauses C.2.2 and C.2.3).

### C.3.4.1 Sequence diagram

Figure C.11: Use scenario - remote MTC creation

### C.3.4.2 TTCN-3 fragment

```

module AModule {
  ...
  testcase ATestCase(...)runs on MTCType ... {
    ... //the test case behaviour
  }
  ...
}

```

## C.3.5 Use scenario: component handling for test case execution within control

### C.3.5.0 Scenario description

The scenario in figure C.12 demonstrates the handling of components for the test case execution within a control part. When the control part is started, a control component is created and its component identifier returned to the test management. For each test case to be executed within the control part, a main test component is created and the component identifier returned to the control component. Afterwards, the test case behaviour is started on the main test component and the test management is informed about the start of the test case. When the main test component terminates, a request for the main test component termination together with the local verdict of the main test component is propagated to enable the derivation of the global test verdict and to enable the information about the test case termination.

### C.3.5.1 Sequence diagram

Figure C.12: Use scenario: component handling for test case execution within control

### C.3.5.2 TTCN-3 fragment

```

module AModule {
  ...
  testcase ATestCase(...)... {
    ... //the test case behaviour
  }
  ...
  control {
    ...
    execute(ATestCase(...));
    ...
  }
  ...
}

```

## C.3.6 Use scenario: component handling for direct test case execution

### C.3.6.0 Scenario description

The scenario in figure C.13 shows how test components are handled when a test case is executed directly, i.e. outside a control part. When a test case is started, the main test component is created and the test case behaviour started on this main test component at first. Whenever a parallel test component is used within a test case, it is handled the same: the parallel test component is started first: giving a test component create request to the TCI-CH entity, which propagates the test component create to the TE in which the parallel test component is to be created. The identifier for the created parallel test component is returned. The identifier is then used to start the PTC behaviour for the start operation. When the PTC terminates its execution, a test component terminate request together with the local test verdict is issued to inform TCI-CH about this termination. The same is done when the main test component terminates. In addition, the termination of the main test component leads to the overall termination of the test case.

### C.3.6.1 Sequence diagram

Figure C.13: Use scenario: component handling for direct test case execution

### C.3.6.2 TTCN-3 fragment

```

module AModule {
  ...
  function APTCBehaviour(...) runs on APTCType {
    ... //the PTC behaviour
  }
  ...
  testcase ATestCase(...)... {
    ... //the test case behaviour
    var APTCType PTC:= APTCType.create;
    ...
    PTC.start(APTCBehaviour(...));
    ...
  }
  ...
}

```

## C.3.7 Use scenario: propagation of map/connect

### C.3.7.0 Scenario description

The scenario in figure C.14 shows how ports are mapped. The request to map a port is propagated to the TE where the map is finally performed. The propagation of connect requests works analogously.

### C.3.7.1 Sequence diagram

Figure C.14: Use scenario: propagation of map

### C.3.7.2 TTCN-3 fragment

```

module AModule {
  ...
  type port A { ... }
  type component CA { port A a }
  type component CB { port A a }
  ...
  testcase ATestCase(...)runs on CA system CB {
    var CA ptc := CA.create;
    ... //the test case behaviour
    map(ptc:a, System:a);
    ...
  }
  ...
}

```

## C.3.8 Use scenario: propagation of unmap/disconnect

### C.3.8.0 Scenario description

The scenario in figure C.15 shows how ports are unmapped. The request to unmap a port is propagated to the TE where the unmap is finally performed. The propagation of disconnect requests works analogously.

### C.3.8.1 Sequence diagram

Figure C.15: Use scenario - propagation of map

### C.3.8.2 TTCN-3 fragment

```

module AModule {
  ...
  type port A { ... }
  type component CA { port A a }
  type component CB { port A a }
  ...
  testcase ATestCase(...)runs on CA system CB {
    var CA ptc := CA.create;
    ... //the test case behaviour
    unmap(ptc:a,system:a);
    ...
  }
  ...
}

```

## C.4 Termination of test cases and control

### C.4.1 Use scenario: stop a test case

#### C.4.1.0 Scenario description

The scenario in figure C.16 shows how a test case is stopped from the test management during test case execution. Once the TM has received information about a started test case, a stop test case can be requested up until receiving the information that the test case has been terminated. Upon stopping a test case, all parallel test components will be stopped and the test system will be reset.

### C.4.1.1 Sequence diagram

Figure C.16: Use scenario: stop a test case

### C.4.1.2 TTCN-3 fragment

There is no TTCN-3 code related to how the TM chooses to implement test case termination. This is outside the scope of TTCN-3.

## C.4.2 Use scenario: stop control

### C.4.2.0 Scenario description

The scenario in figure C.17 shows how a control part is stopped from the test management during control part execution. A control part can be stopped in between starting the control and its termination. If the control part receives a stop test case request while a test case is executing, the executing test case is to be stopped. Furthermore, the test system is to be reset as described in figure C.16.

### C.4.2.1 Sequence diagram

Figure C.17: Use scenario - stop control

### C.4.2.2 TTCN-3 fragment

Stopping a control part from the test management is outside the scope of TTCN-3 so that no TTCN-3 fragment exists.

## C.4.3 Use scenario: termination of control after error

### C.4.3.0 Scenario description

The scenario in figure C.18 shows the handling of error situations during the execution of a control part when no test case is being executed. The test management is informed about the error situation and has then to terminate the execution of the control part explicitly. Upon termination of the control part, the test system will be reset.

### C.4.3.1 Sequence diagram

Figure C.18: Use scenario - termination of control after error

### C.4.3.2 TTCN-3 fragment

There is no TTCN-3 fragment for this scenario since error situations are exceptional cases in a test system and not a TTCN-3 concept as such. Rather, the TTCN-3 semantics describes various potential error situations in a test system.

## C.4.4 Use scenario: termination of a test case after error

### C.4.4.0 Scenario description

The scenario in figure C.19 shows the handling of error situations during the direct execution of a test case. The test management is informed about the error situation. The TM has then to explicitly terminate test case execution. Upon stopping a test case, the parallel test components will be stopped and the test system is to be reset.

## C.4.4.1 Sequence diagram

Figure C.19: Use scenario - termination of a test case after error

### C.4.4.2 TTCN-3 fragment

There is no TTCN-3 fragment for this scenario since error situations are exceptional cases in a test system and not a TTCN-3 concept as such. Rather, the TTCN-3 semantics describes various potential error situations in a test system.

## C.4.5 Use scenario: reset

### C.4.5.0 Scenario description

The scenario in figure C.20 shows the reset of the test system. In that case all involved TEs together with their TRI System Adaptors (SA) and Platform Adaptors (PA) are reset.

### C.4.5.1 Sequence diagram

Figure C.20: Use scenario - reset

### C.4.5.2 TTCN-3 fragment

There is no TTCN-3 fragment for this scenario since reset as required after error situations are exceptional cases in a test system and not a TTCN-3 concept as such.

## C.5 Communication

### C.5.1 Use scenario: local intercomponent communication

#### C.5.1.0 Scenario description

The scenario in figure C.21 shows the communication between test components (main test component or parallel test components), which reside on the same node. A communication request is given to the TCI-CH, which then decide where to enqueue this communication template. In this case, the communication is done locally via the TE on the same node. The scenario shows a message-based communication using the send operation - the scenario is the same for call, reply, and raise operations.

### C.5.1.1 Sequence diagram

**Figure C.21: Use scenario - local intercomponent communication**

### C.5.1.2 TTCN-3 fragment

```

module AModule {
  ...
  type port APortType message { ... }
  ...
  type component ATCType {
    ...
    APortType APort;
    ...
  }
  ...
  template AType AMessageTemplate { ... }
  ...
  function APTCBehaviour(...) runs on APTCType {
    ... //the PTC behaviour
  }
  ...
  testcase ATestCase(...) runs on ATCType... {
    ... //the test case behaviour
    var ATCType PTC1:= ATCType.create;
    connect(PTC1:APort,mtc:APort);
    ...
    PTC1.start(APTCBehaviour(...));
    APort.send(AMessageTemplate); //sending data to a test component
    ...
  }
  ...
}

```

## C.5.2 Use scenario: internode communication between test components

### C.5.2.0 Scenario description

The scenario in figure C.22 shows the communication between test components (main test component or parallel test components), which reside on different nodes. A communication request is given to the TCI-CH, which then decides where to enqueue this communication template. In this case, the communication is done remotely via the TE on another node. The scenario shows a message based communication using the send operation - the scenario is the same for call, reply, and raise operations.

### C.5.2.1 Sequence diagram

Figure C.22: Use scenario - internode communication between test components

### C.5.2.2 TTCN-3 fragment

```

module AModule {
  ...
  type port APortType message { ... }
  ...
  type component ATCType {
    ...
    APortType APort;
    ...
  }
  ...
  template AType AMessageTemplate { ... }
  ...
  function APTCBehaviour(...) runs on ATCType {
    ... //the PTC behaviour
    ...
  }
  ...
  testcase ATestCase(...) runs on ATCType... {
    ... //the test case behaviour
    var ATCType PTC1:= ATCType.create;
    connect(PTC1:APort,mtc:APort);
    ...
    PTC1.start(APTCBehaviour(...));
    APort.send(AMessageTemplate); //sending data to a test component
    ...
  }
  ...
}

```

## C.5.3 Use scenario: encoding

### C.5.3.0 Scenario description

The scenario in figure C.23 shows the encoding of data, which is sent to the SUT. The encoded data is received from the coding/decoding entity via the TCI-CD. The encoded value is sent to the SUT via the TRI-SA. The scenario is the same for the call, the reply, and the raise operations.

### C.5.3.1 Sequence diagram

Figure C.23: Use scenario - encoding

### C.5.3.2 TTCN-3 fragment

```

module AModule {
  ...
  type port APortType message { ... }
  ...
  type component APTCType {
    ...
    APortType APort;
    ...
  }
  ...
  template AType AMessageTemplate { ... }
  ...
  testcase ATestCase(...) runs on APTCType system APTCType {
    ... //the test case behaviour
    map(mtc:APort,system:APort);
    ...
    APort.send(AMessageTemplate); //sending data to the SUT
    ...
  }
  ...
} with { encoding "..."}

```

## C.5.4 Use scenario: decoding

### C.5.4.0 Scenario description

The scenario in figure C.24 shows the decoding of data, which is received from the SUT via the TRI-SA. The decoded data is received from the coding/decoding entity via the TCI-CD. The scenario is the same for the receive, the getcall, the getreply, the catch, and the check operations.

### C.5.4.1 Sequence diagram

Figure C.24: Use scenario - decoding

### C.5.4.2 TTCN-3 fragment

```

module AModule {
  ...
  type port APortType message { ... }
  ...
  type component APTCType {
    ...
    APortType APort;
    ...
  }
  ...
  template AType AMessageTemplate { ... }
  ...
  testcase ATestCase(...) runs on APTCType system APTCType {
    ... //the test case behaviour
    map(mtc:APort, system:APort);
    ...
    APort.receive(AMessageTemplate); //receiving data from the SUT
    ...
  }
  ...
} with { encoding "..."}

```
