Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: *"Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards"*, which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<http://webapp.etsi.org/IPR/home.asp>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by ETSI Technical Committee Access, Terminals, Transmission and Multiplexing (ATTM).

The present document is part 17 of a multi-part deliverable covering Access, Terminals, Transmission and Multiplexing (ATTM); Integrated Broadband Cable and Television Networks; IPCablecom 1.5, as identified below:

- Part 1: "Overview";
- Part 2: "Architectural framework for the delivery of time critical services over cable Television networks using cable modems";
- Part 3: "Audio Codec Requirements for the Provision of Bi-Directional Audio Service over Cable Television Networks using Cable Modems";
- Part 4: "Network Call Signalling Protocol";
- Part 5: "Dynamic Quality of Service for the Provision of Real Time Services over Cable Television Networks using Cable Modems";
- Part 6: "Event Message Specification";
- Part 7: "Media Terminal Adapter (MTA) Management Information Base (MIB)";
- Part 8: "Network Call Signalling (NCS) MIB Requirements";
- Part 9: "Security";
- Part 10: "Management Information Base (MIB) Framework";
- Part 11: "Media Terminal Adapter (MTA) device provisioning";
- Part 12: "Management Event Mechanism";
- Part 13: "Trunking Gateway Control Protocol - MGCP option";
- Part 14: "Embedded MTA Analog Interface and Powering Specification";
- Part 15: "Analog Trunking for PBX Specification";
- Part 16: "Signalling for Call Management Server";
- Part 17: "CMS Subscriber Provisioning Specification";**
- Part 18: "Media Terminal Adapter Extension MIB";
- Part 19: "IPCablecom Audio Server Protocol Specification - MGCP option";
- Part 20: "Management Event MIB Specification";

Part 21: "Signalling Extension MIB Specification".

NOTE 1: Additional parts may be proposed and will be added to the list in future versions.

NOTE 2: The choice of a multi-part format for this deliverable is to facilitate maintenance and future enhancements.

1 Scope

The present document defines the interface used between the Call Management Server (CMS) and Provisioning Server (PS) for the exchange of service provisioning information. The interface employs a Web Service model. Specified in Web Service Description Language 1.1 (WSDL 1.1), the interface transports XML encoded objects within Simple Object Access Protocol 1.1 (SOAP 1.1) encoded messages over an HTTP 1.1 transport. This interface is secured via IPSec.

The data model transported upon this interface is specifically designed to be extensible, allowing incorporation of as yet undefined IPCablecom features and specific vendor extensions.

The scope of the present document is limited to the provisioning of an IPCablecom CMS by a single service provider. Additionally:

- The CMS provisioning interface is limited to the exchange of service activation data between the CMS and the PS. The interface between the PS and the back-office Operations Support System (OSS) is out of scope.
- CMS element management and network element provisioning (dial plans, etc.) are out of scope.
- Customer record creation/billing is considered part of the back-office OSS application and is currently out of scope.

2 References

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the reference document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <http://docbox.etsi.org/Reference>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication ETSI cannot guarantee their long term validity.

2.1 Normative references

The following referenced documents are necessary for the application of the present document.

- [1] PacketCable 1.5 PKT-TR-ARCH1.5-V02-700412: "Architecture Framework Technical Report", April 12 2007, Cable Television Laboratories, Inc.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

active: service flow is said to be "active" when it is permitted to forward data packets

NOTE: A service flow must first be admitted before it is active.

endpoint: Terminal, Gateway or Multipoint Conference Unit

Internet key exchange: key-management mechanism used to negotiate and derive keys for SAs in IPsec

local number portability: allows a customer to retain the same number when switching from one local service provider to another

media gateway: provides the bearer circuit interfaces to the PSTN and transcodes the media stream

pre-shared key: shared secret key passed to both parties in a communication flow, using an unspecified manual or out-of-band mechanism

registration, admissions and status: RAS Channel is an unreliable channel used to convey the RAS messages and bandwidth changes between two H.323 entities

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

AAA	Authentication, Authorization and Accounting
BPP	Basic POTS Provisioning
CFP	Call Feature Provisioning
CM	DOCSIS Cable Modem
CMS	Call Management Server

CMS	Cryptographic Message Syntax
CMTS	Cable Modem Termination System
Codec	COder-DECoder
CSR	Customer Service Representative
DOCSIS	Data-Over-Cable Service Interface Specifications
DQoS	Dynamic Quality of Service
ESP	IPSec Encapsulating Security Payload
FQDN	Fully Qualified Domain Name
HTTP	Hypertext Transfer Protocol
IETF	Internet Engineering Task Force
IKE	Internet Key Exchange
IP	Internet Protocol
IPSec	Internet Protocol Security
LNP	Local Number Portability
MGCP	Media Gateway Control Protocol
MIB	Management Information Base
MTA	Multimedia Terminal Adapter
NCS	Network Call Signalling
OSS	Operations Support System
PCSP	IPCablecom CMS Subscriber Provisioning
PS	Provisioning Server
PSTN	Public Switched Telephone Network
RAS	Registration, Admissions and Status
RFC	Request for Comments
SDP	Session Description Protocol
SNMP	Simple Network Management Protocol
SOAP	Simple Object Access Protocol
STP	Signalling Transfer Point
TFTP	Trivial File Transfer Protocol
TLV	Type-Length-Value
UDP	User Datagram Protocol

5 Technical Overview

5.1 Void

Figure 1: Void

5.2 IPCablecom Reference Architecture

Figure 2 shows the reference architecture for the IPCablecom 1.5 Network. Refer to the Architecture Document [1] for more detailed information on this reference architecture.

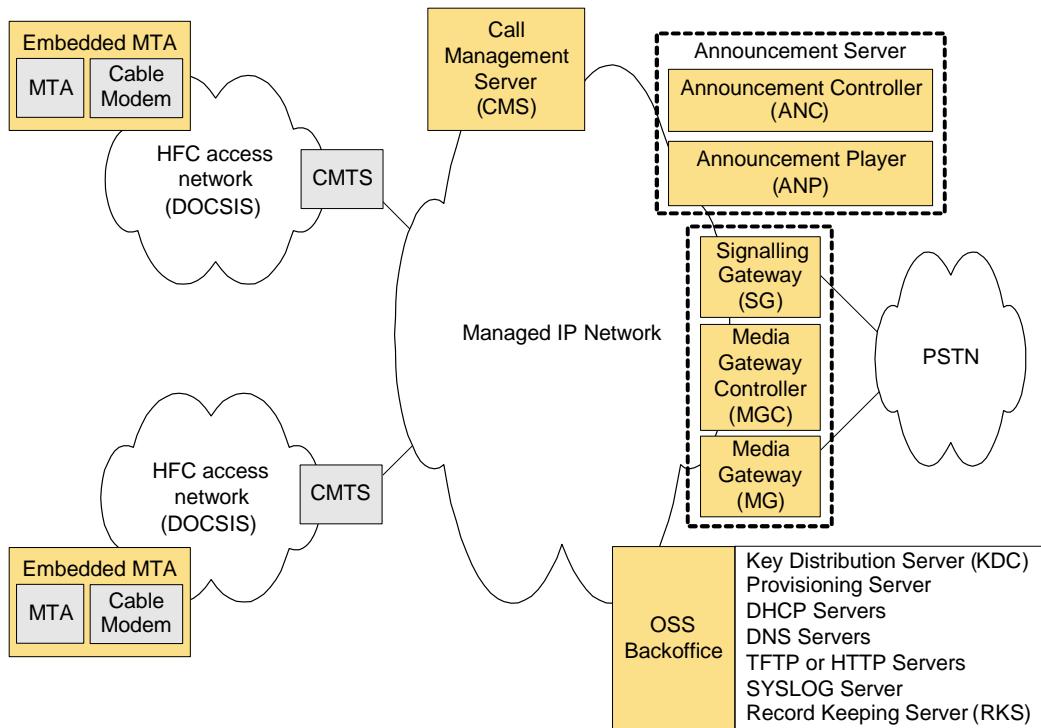

Figure 2: IPCablecom 1.5 Network Component Reference Model

5.3 Components and Interfaces

Provisioning is defined as the operations necessary to provide a specified service to a customer. IPCablecom service provisioning can be viewed as two distinct operations: MTA provisioning and CMS subscriber provisioning. Figure 3 presents the provisioning related interfaces maintained by the PS and other authorized Back Office Components to various IPCablecom elements. Interfaces not explicitly labelled are undefined and out of scope for IPCablecom.

The present document is intended to set the requirements for the provisioning interface between the CMS and the PS or optionally other authorized Back Office Components (see Pkt-prov-p1 in figure 3).

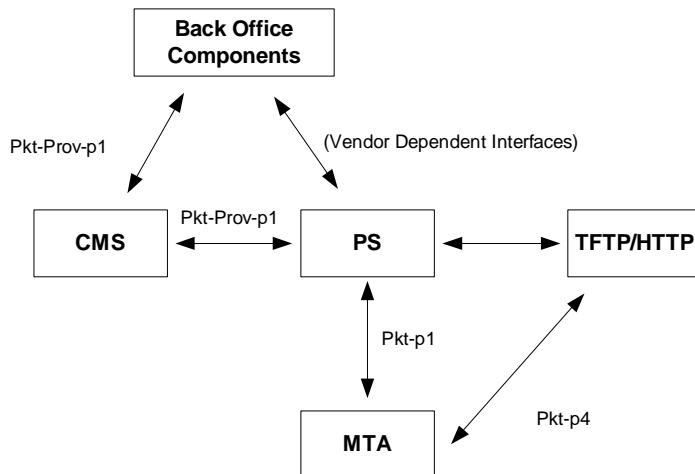

Figure 3: Provisioning Component Interfaces

5.4 Components

5.4.1 Back Office Components (Service Provider Business and Service Management Systems)

These are the Back Office Components that a service provider uses to manage customers and other components that make up their business. These systems provide the IPCablecom provisioning process with service orders or optionally individual workflow tasks to activate services for customers. These systems may also receive accounting or usage data used to create customer-billing events.

5.4.2 Provisioning Server

This system forms the interface between the provider's Back Office Components and some or all of the IPCablecom elements. IPCablecom does not address the implementation of this system or its relationship to other OSSs that a service provider might employ.

The Provisioning Server is defined in [2] as consisting of a provisioning application that contains provisioning logic and a provisioning SNMP entity that provides access to active components. Here we will refer to the Provisioning Server without distinguishing between these two entities.

5.4.3 CMS

The Call Management Server component is described in [1]. This component provides call control and signalling-related services for the MTA and CMTS components in the IPCablecom network.

5.4.4 MTA

A Media Terminal Adapter is an IPCablecom client device that contains a subscriber-side interface to the customer's CPE (e.g. telephone) and a network side signalling interface to call control elements in the network. This component is described in [1].

5.4.5 TFTP

A configuration file service that is the basis for most device configuration in an IPCablecom network. This could be a standalone TFTP Service that delivers statically-defined files to devices or a dynamic service that creates configurations on-the-fly from other data sources.

5.5 Interface Descriptions

5.5.1 Pkt-p1

This interface is defined in [2].

5.5.2 Pkt-p4

This interface is defined in [2].

5.5.3 Pkt-prov-p1

The interface defined in the present document.

6 Assumptions

- The Back Office components is responsible for coordinating endpoint updates with affected network entities (MTAs, CMTSs, etc.) and the CMS.
 - CMS will not play a manager role nor does it specify SNMP communications to an MTA during CMS provisioning.
 - The CMS and PS reside in the same secure provisioning domain. Security related information will be outlined in the Security Document [3].
-

7 Subscriber Provisioning

Subscriber provisioning consists of:

- Customer record/billing support.
- Equipment setup/configuration.

7.1 Customer Records (Billing)

Establishment of a customer record that contains the information needed to deliver service, bill, and collect payment from a customer. Customer record creation/billing is considered part of the back office OSS application and is currently out of scope for IPCablecom.

7.2 Equipment Setup and Configuration

This may include physical installation and/or connection of equipment as well as any software and/or database updates necessary to actually deliver the service to the customer. Equipment setup affects two major components in an IPCablecom environment:

- Customer premises equipment. For IPCablecom, this is the MTA. The provisioning for the MTA is defined in [2] and will not be discussed in the present document.
- Call Management Server. Provisioning of the CMS itself can be broken down into two main areas: basic POTS provisioning and call feature provisioning.

7.2.1 CMS Basic POTS Provisioning (BPP)

BPP provides the CMS with the minimal set of data necessary for routing of simple telephony service (POTS) in the IPCablecom network. This minimal set of data consists of a telephone number mapped to its associated MTA's FQDN and NCS endpoint identifier. This data will be used to setup translation tables enabling the CMS to route calls to the appropriate device/port given a specific telephone number. BPP provisioning for each customer is required before that customer can receive any calls in an IPCablecom network.

7.2.2 CMS Call Feature Provisioning (CFP)

In addition to BPP, CFP is performed to provide call features to a customer. CFP is more complicated than BPP as the parameters passed may vary on a feature-by-feature basis and may also be dependent on vendor specific implementations.

7.3 Static Versus Dynamic Subscriber Provisioning Data

Data required by the CMS for subscriber provisioning falls into two classifications:

- 1) Static, billed, permanently assigned service state. This data does not change call to call. Examples would be DQoS settings, call feature subscribed/non-subscribed states, caller ID information, etc.
- 2) Dynamic, non-billed, semi permanent service state. Often this information is subscriber alterable, either at an endpoint via *XX key code or via a web interface into the CMS. An example would be the user settable parameters of a call feature, such as Call Forward Busy Line (CFBL). The CFBL forwarding number is dynamic, non-billed service state. The subscribed/non-subscribed state of CFBL is static data maintained by the PS.

In the IPCablecom CMS/PS scope, the PS owns all static provisioning state, and the CMS owns all dynamic provisioning state.

8 Requirements

8.1 General Requirements

- The interface shall make no assumptions regarding PS and CMS implementation technologies.
Multiple partnering vendors will undoubtedly provide CMS and PS implementations on various hardware, software, and development language platforms. A platform and language neutral interface is required.
- The interface shall support Basic POTS Provisioning.
The interface's data model shall include the minimum amount of information required to support basic POTS service.
- The interface shall support Call Feature Provisioning.
The interface's data model shall support subscription to any IPCablecom call feature.
- The interface's data model shall be extensible.
The present focus of the interface is telephony data. However, to the extent possible, the interface should be extensible for future IPCablecom Multimedia services. It is desirable to have a single, extensible provisioning data model and transport to support all IPCablecom features and capabilities, some of which are not yet defined.
- The interface shall not impact any MTA operations in progress.
Endpoint specific data may be added, deleted, or modified on the MTA without affecting other MTA endpoints or sessions in progress. CMS endpoint provisioning scenarios that would result in an endpoint/MTA to be taken out of service must be carefully documented.
- The interface shall be capable of accommodating present (NCS) and future signalling protocols.

8.2 Transport Requirements

- The transport shall make no assumptions regarding the physical networking infrastructure between a PS and a CMS.
It is anticipated that multiple service providers will be interoperating over a single access network. Thus, multiple enterprises will be communicating, potentially using CMS and PS implementations from various vendors, over various network infrastructures (firewalls, proxies, etc.). The CMS/PS transport protocol should facilitate the ability to penetrate arbitrary network infrastructure.
- The transport shall support unidirectional transfer of single data model objects from the PS to the CMS.

- The transport shall support efficient streaming of multiple data model objects from the PS to the CMS.
 - The transport may support unidirectional transfer of single data model objects from the CMS to the PS.
 - The transport may support efficient streaming of multiple data model objects from the CMS to the PS.
 - The transport shall include semantics to support new, updated, and removed data model objects.
 - The transport shall support informational requests between PS and CMS.
 - The transport shall handle conditions such as CMS busy, errors, etc.
 - The transport shall provide positive/negative acknowledgement of operation received.

The transport shall implement an at-least-once type of message semantics. The sender shall not discard its request until the receiver acknowledges it (acknowledgements are not acknowledged.) The transport must be able to detect data corruption during transport, etc. and notify the sender of such conditions.

- The transport shall provide positive/negative acknowledgement of operation handled.
 - The PS shall be able to initiate a transfer of data model objects ("push").
 - The transport shall be secure.

9 Data Model

This clause provides a high level description of the PCSP data model and its XML encoding. It is intended as descriptive and non-authoritative. The authoritative definition of the data model and its encoding is found in the PCSP XML schema in annex A.

9.1 Overview

The data model for IPCablecom CMS provisioning is displayed in figure 4. It consists of two categories of entities:

- Objects.
 - Relations between objects.

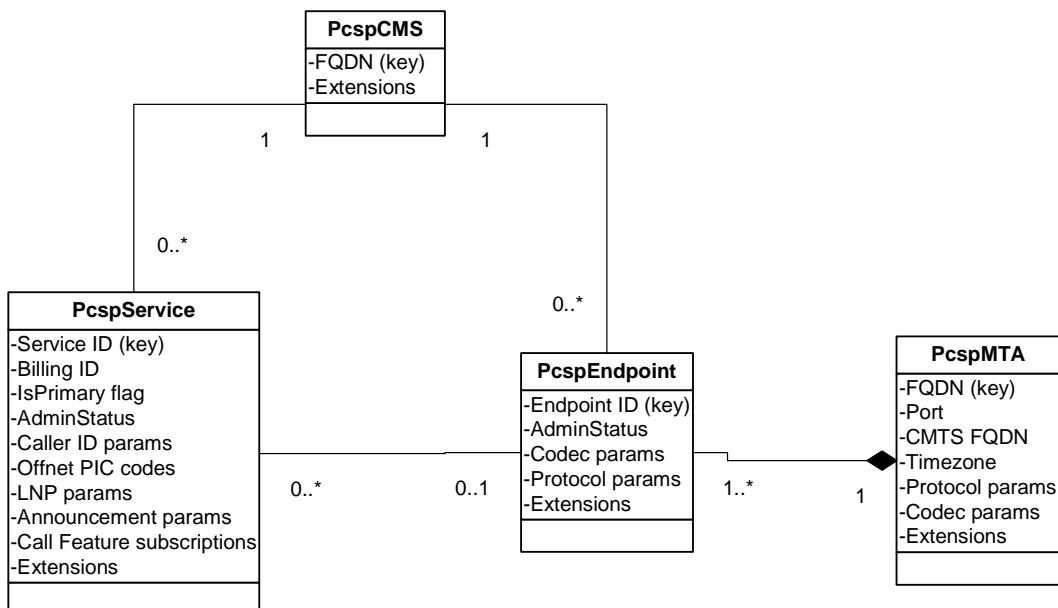

Figure 4: CMS Provisioning Data Model

The following entities shall be supported:

- The PcsService object is the entity to which an IPCablecom 1.5 customer subscribes. It represents a phone number and all related functionality (call features, etc.).
- A PcsMTA object represents a Media Terminal Adapter, which aggregates one or more endpoints physically contained within the MTA.
- The PcsEndpoint object represents a physical endpoint on an MTA/Gateway.
- A PcsCMS object maintains associations between endpoints/CMSs and services/CMSs.
- PcsRelations represent associations between objects. In figure 4, they are presented as connections between objects.

PcsService and PcsEndpoint are distinct objects in order to support multiple services (phone numbers) per endpoint. Distinct PcsMta and PcsEndpoint objects allow an MTA's endpoints to be managed by different service providers. The PcsCms object essentially maintains a collection of endpoints and services.

All objects are extensible.

9.1.1 PcsService Object

The service object is the entity to which an IPCablecom 1.5 customer subscribes. It represents a phone number and all related functionality. The data model allows more than one service to be provisioned to a single endpoint.

The PcsService object contains the following generic information (for complete details, see the PCSP XML schema):

- ServiceId - a unique identifier for the service.
- BillingId - the identifier of another service, which will be billed for activity on this service.
- IsPrimary flag - with multiple services provisioned upon an endpoint, one service shall have this flag set to indicate the default service to use for outgoing calls.
- PrimaryRingPattern - index into MTA cadence table, selecting a ring pattern for this service.
- Administrative status of this service (suspended, enabled, number has changed, etc.).
- DisplayName - the display information used for Call Name Delivery feature (CNAM).
- DisplayNumber - the display information used for Call Number Delivery feature (CND).
- Announcement settings (enable, language, time zone, etc.).
- Carrier codes (long distance carrier code, intra-lata carrier code, international carrier code).
- Local number portability control (porting status, STP lookup flag, etc.).
- Call features - A service includes a list of subscribed call feature objects.
- Extensions - This object is extensible in two locations: the main body of the object and the call feature list.

9.1.2 PcsMta Object

A Media Terminal Adapter aggregates one or more endpoints (physically contained within the MTA). It contains the following generic information (for complete details, see the PCSP XML schema):

- MTA's FQDN, uniquely identifying this MTA.
- MTA's NCS listener port (default: 2427).
- FQDN of controlling CMTS.
- Time zone within which this MTA is physically located.

- Signalling protocol designation. This is the default protocol selection for all contained endpoints, unless overridden by an individual endpoint.
- Codec designation - default codec selection for all contained endpoints, unless overridden by an individual endpoint.
- IPSec Control Flag - The IPSec Control Flag indicates whether IPSec is used for NCS Signalling between the CMS and the MTA. By default, IPSec is turned on all endpoints, but can be provisioned otherwise on a per endpoint basis.
- MTA Profile Name - Optional; An MTA Profile Indicator identifiable by the CMS.
- A single point for extension.

9.1.3 PktcEndpoint Object

An endpoint is a physical port on a MTA/Gateway. It contains the following generic information (for complete details, see the PCSP XML schema):

- EndpointId - uniquely identifies this endpoint.
- Signalling protocol selection. Optionally overrides MTA setting.
- Administrative status of the endpoint (disconnected, normal service, test mode, etc.).
- Codec selection. Optionally overrides MTA setting.
- IPSec Control Flag - Optionally overrides the MTA setting.
- A single point for extension.

9.1.4 PktcCMS Object

This object maintains associations between Endpoints/CMSs and Services/CMSs. It contains the following generic information (for complete details, see the PCSP XML schema):

- FQDN uniquely identifying this CMS.
- A single point for extension.

9.1.5 Inter Object Relationships

Within figure 4, the lines connecting the classes represent object "relations" (sometimes called associations). The relations depicted in figure 4 shall be supported:

- Service/CMS. A typical CMS will own a block of phone numbers.
- Endpoint/CMS. An endpoint requires a CMS for signalling purposes.
- Service/Endpoint. A phone number must be attached to a physical endpoint.
- Endpoint/MTA. MTAs physically contain endpoints.

9.2 Relations are encoded using the PcsprRelation entity.XML Encoding

Objects of the data model will be encoded using XML.

9.2.1 The PCSP XML Schema

Annex A contains the PCSP XML schema. The schema defines the XML encoding syntax for the following entities (the entities shall conform to the schema):

- The PcsService, PcsEndpoint, PcsMta, and PcsCms objects. These are the main data model objects.
- PcsRelation. This is used to establish or teardown relations between objects.
- PcsImportExport. A general purpose document format that can contain a large number of objects or relations. This will typically be used to export full data sets from a PS to a CMS.

The schema should be employed by validating XML parsers to determine syntactic correctness of encoded entities.

9.2.2 Sample PCSP Entity Encodings

Sample XML encodings of all the PCSP data model entities can be found in annex B.

9.2.3 Object Extensions

The PCSP XML schema permits extensions for all objects (PcsService, PcsEndpoint, PcsMta and PcsCms). Extensions are accomplished via the <Extension> element placed in each object. Most objects specify this element at the end of the main body of the object. PcsService includes an additional <Extension> element at the end of the call feature list.

There are a few simple rules for the <Extension> element:

- All <Extension> elements shall specify a namespace definition.
- All sub-elements of <Extension> must be namespace qualified.

These two rules permit the XML parsing system to validate the <Extension> content against a vendor supplied XML schema file. Annex C contains an extension example.

10 Messaging

10.1 Overview

The PCSP interface follows a Web Service paradigm. The interface employs SOAP 1.1 messages to transfer XML encoded entities (from the PCSP data model) between client and server. Messages are transported between client and server using the HTTP 1.1 protocol. For a complete discussion of the transport considerations, see annex F.

The interface is modelled on a synchronous request/response pattern (or remote procedure call - RPC). The following messaging patterns are supported between client and server:

- PUT message. Client writes one or more XML encoded objects or relations to the server. Both creation of new objects and modification of existing objects are supported.
- DELETE message. Client requests one or more objects or relations be deleted from the server.
- GET message. Read one or more XML encoded objects from the server (objects only...relations are not supported).
- CMDSTATUS message. Used to transfer "out of band" commands and status between the client and server. Client can notify server of various state conditions. Client can command server to perform various actions. This message is vendor extensible.

10.2 CMS and PS Messaging Role Requirements

In general, both CMS and PS may be implemented to fully support client and server messaging roles. However, within the scope of IPCablecom CMS provisioning, the CMS and PS assume the role requirements specified in table 1.

Table 1: CMS and PS Messaging Roles

Message	CMS as client	CMS as server	PS as client	PS as server
GET	OPTIONAL	SHALL	SHALL	OPTIONAL
PUT	OPTIONAL	SHALL	SHALL	OPTIONAL
DELETE	OPTIONAL	SHALL	SHALL	OPTIONAL
CMDSTATUS	SHALL	SHALL	SHALL	SHALL

The following points should be noted:

- A CMS shall support the server role for GET, PUT and DELETE.
- A PS shall support the client role for GET, PUT and DELETE.
- CMS and PS shall support client and server roles for CMDSTATUS.
- All other behaviour is OPTIONAL.

These requirements enforce provisioning data flows from the PS to the CMS and also ensure that the CMS is not required to push dynamic data changes (user adjustable call feature changes, etc.) back to the PS.

The PS is able to read specific objects from the CMS. This use case is supported primarily to allow the PS to retrieve user call feature settings ("dynamic data") owned by the CMS. This is accomplished by reading specific PcsService objects from the CMS.

Figure 5 displays all the required messaging roles.

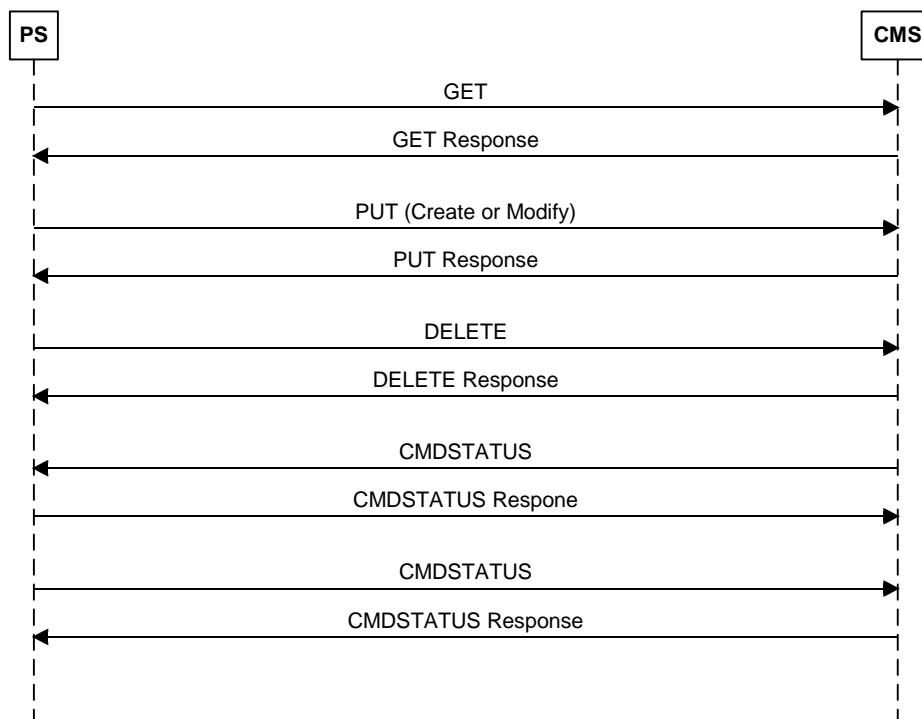

Figure 5: Required Messaging Flows

10.3 WSDL Document

The PCSP interface is specified using Web Service Description Language 1.1. Just as with a Corba IDL, the WSDL interface definition specifies the remote methods on the interface, the arguments the methods accepts, the return values from the methods, and any interface specific data types that must be defined. Additionally, the WSDL definition also specifies the message encoding format (SOAP 1.1) and the transport binding (HTTP 1.1).

The WSDL is fed into various Web Services toolkits, available for most operating systems and languages, to automatically generate client interface stubs, server skeletons, and SOAP marshalling support.

PCSP clients and servers shall conform to this WSDL definition presented in annex D.

11 Security

The PCSP interface is secured using the IPSec ESP protocol in transport mode. Key management is implemented using IKE with pre-shared keys. This security infrastructure is already used at the CMS for various interfaces. See [3] for full details.

Annex A (normative): PCSP XML Schema

```
*<?xml version="1.0" encoding="UTF-8"?>
<!--
    IPCablecom CMS Subscriber/Service Provisioning (PCSP) schema.

    PCSP defines a messaging interface and an XML encoding format for objects
    transmitted over that interface. This schema defines the XML encoding syntax for
    the objects transmitted over the PCSP interface.

    Encodings for PcspService, PcspEndpoint, PcspMta, and PcspCms objects are specified.
    A PcspRelation encoding describes associations between objects.
    A PcspImportExport encoding is used to produce instance documents containing large numbers of
    objects.
-->

        </xs:sequence>
    </xs:complexType>
</xs:element>
<!--
===== Call Features. =====

A service includes a list of call feature objects, each encoding one of the call features
described in PKT-TR-VOIPBRF-R01-000608 and PKT-TR-VOIPERF-R01-000831.

```

Each call feature includes its "static" state data (owned by the PS):
 Feature name (implicitly as the element name),
 Subscribed/non subscribed state,
 Administrative state the feature.

Many call features include just this information.
 Absence of a specific call feature implies the feature is not subscribed.
 The subscribed state is used to indicate that an explicitly listed call feature is not subscribed (an atypical case).

Several features extend the "static" parameter set with feature specific data.
 This feature specific data is typically configured by the user (via handset or by calling a CSR).

The PCSP spec classifies the user adjustable data as "dynamic", meaning that it is owned by the CMS. Changes to the dynamic data in the CMS are not required to be pushed back to the PS.

```
-->
<!--
  Always -
    false/0: Subscriber may change forward-to number.
    true/1: Service provider (only) may change forward-to number
-->
<xss:element name="Always" type="xs:boolean"/>
<!--
  ForwardTo - Service Id to which call will be forwarded.
  Note: empty strings are allowed.
-->
<xss:element name="ForwardTo" type="xs:string"/>
<!--
  ListOfServiceId - a list of Service Ids.
-->
<xss:element name="ListOfServiceId">
  <xss:complexType>
    <xss:sequence>
      <xss:element name="ServiceId" type="xs:string" minOccurs="0" maxOccurs="unbounded"/>
    </xss:sequence>
  </xss:complexType>
</xss:element>
<!--
  ListOfSpeedDial - list of Service Ids / speed dial # pairs.
  Each pair contains a one or two digit speed dial number and its associated service id.
-->
<xss:element name="SdPair">
  <xss:complexType>
    <xss:sequence>
      <xss:element name="SdNum">
        <xss:simpleType>
          <xss:restriction base="xs:integer">
            <xss:minInclusive value="0"/>
            <xss:maxInclusive value="99"/>

  </xss:complexType>
</xss:element>
<!--
  The definition of each of the supported call features...
-->
<!--
  All call features can be considered in two parts.
  1. Common section containing the administrative state of the feature (the "static" data).
  2. An optional section containing feature specific parameters, typically set by the end user
(the "dynamic" data).
-->
<!--
  The "base object" for all call features, containing:
-->
Subscribed -
  0/false: feature is not subscribed
  1/true: feature is subscribed.
```

```

UsageBilling -
    0/false: do not generate billing records on feature usage
    1/true: generate billing records on feature usage.

AdminStatus -
    0: feature is suspended by service provider.
    1: feature is enabled by service provider..

In general, presence of a call feature implies that it is subscribed.
The Subscribed flag is supported for the atypical case of wanting to
indicate that an explicitly listed call feature is not subscribed.

-->

<!--
===== MAIN OBJECT DEFINITIONS =====

```

There are 6 encodings defined in the PCSP schema.

The 4 main object encodings:

PcspCms - a CMS. A collection of Services and Endpoints.
 PcspService - represents a phone number, its configuration, and call features.
 PcspMta - represents a physical MTA and its configuration. A collection of Endpoints.
 PcspEndpoint - represents an Endpoint on an MTA.

A PcspRelation object. This object encodes the associations between objects.

A PcspImportExport object. This is used to produce a bulk loading file for the CMS.

```
-->
<!--
PcspRelation.
```

The relation object specifies inter-object associations between the PcspCms, PcspService, PcspEndpoint, and PcspMta objects.

The "relOp" attribute specified if the relation is being added or deleted.

```
-->
<xss:element name="PcspRelation">
  <xss:complexType>
    <xss:sequence>
      <xss:element name="Class1" type="classType"/>
      <xss:element name="Key" type="xs:string"/>
      <xss:element name="Class2" type="classType"/>
      <xss:element name="ListOfKeys" type="ListOfKeys"/>
    </xss:sequence>
    <xss:attribute name="relOp" type="RelationOpType" use="required"/>
  </xss:complexType>
</xss:element>
<!--
The PcspCms object.
```

This object maintains associations between Endpoints, Services, and their managing CMSSs.

Contents...

CmsFqdn - FQDN uniquely identifying this CMS.

```
-->
<xss:element name="PcspCms">
  <xss:complexType>
    <xss:sequence>
      <xss:element name="CmsFqdn" type="nonEmptyString"/>
      <xss:element ref="Extension" minOccurs="0"/>
    </xss:sequence>
  </xss:complexType>
</xss:element>
<!--
The PcspEndpoint object.
```

An endpoint is a physical port on a MTA/Gateway.

Contents...

EndpointId - Uniquely identifies this endpoint. Format per
 "IPCablecom Network Based Call Signalling Protocol Specification".
 Example: "aaln/1@mta01.cablelabs.com"

AdminStatus -
 0: endpoint is disconnected
 1: normal - endpoint is in service
 2: test mode - endpoint is under test.

Protocol - optional override for MTA protocol setting.

Codec - optional override for MTA codec setting.

IPSecControl - optional override for the MTA IPSecControl setting.

```
-->
<xss:element name="PcspEndpoint">
  <xss:complexType>
    <xss:sequence>
      <xss:element name="EndpointId" type="nonEmptyString"/>
      <xss:element name="AdminStatus">
        <xss:simpleType>
          <xss:restriction base="xs:integer">
            <xss:enumeration value="0"/>
            <xss:enumeration value="1"/>
          </xss:restriction>
        </xss:simpleType>
      </xss:element>
    </xss:sequence>
  </xss:complexType>
</xss:element>
```

```

        <xs:enumeration value="2"/>
    </xs:restriction>
</xs:simpleType>
</xs:element>
<xs:element name="Protocol" type="protocolType" minOccurs="0"/>
<xs:element name="Codec" type="codecType" minOccurs="0"/>
<xs:element name="IPSecControl" type="xs:boolean" minOccurs="0"/>
<xs:element ref="Extension" minOccurs="0"/>
</xs:sequence>
</xs:complexType>
</xs:element>
<!--
    The PcsPmta object.
-->
```

A Media Terminal Adapter aggregates one or more endpoints (physically contained within the MTA).

Contents...

MtaFqdn - MTA's FQDN, uniquely identifying this MTA.

MtaPort - MTA's NCS listening port (default: 2427)

CmtsFqdn - FQDN of controlling CMTS. CMS needs this to establish MTA DQoS with correct CMTS.

MtaProfile - MTA Profile Name - Optional; An MTA Profile Indicator identifiable by the CMS.

Timezone - within which this MTA is physically located. Optional; If present overrides the CMS default setting for the time zone. As per RFC 1123 numeric timezone format.

Protocol - Optional; If present it must be set to "MGCP 1.0 NCS 1.0". This is the default for all contained endpoints.

Codec - Optional; If present it is the default for all contained endpoints.

IPSecControl - Optional; NCS IPSec Control Flag (default = True; IPSec enabled).

```
-->
<xs:element name="PcsPmta">
<xs:complexType>
<xs:sequence>
<xs:element name="MtaFqdn" type="nonEmptyString"/>

<xs:element ref="Extension" minOccurs="0"/>
</xs:sequence>
</xs:complexType>
</xs:element>
<!--
    The PcsPmta object.
-->
```

Contents...

ServiceId - unique identifier for the service.

AdminStatus -

- 0: suspended (i.e. bill not paid).
- 1: enabled (normal state).
- 2: number has changed.
- 3: out of service.
- 4: unassigned.

BillingId - An telephone number identifying another service to be billed instead of this service.

ExternalId - an arbitrary string used to carry such data as subscriber ID, etc.

IsPrimary - With multiple services provisioned upon an endpoint, one service MUST have this flag set to indicate the default service to use for outgoing calls.

- false/0: this service is not a primary service.
- true/1: this service is a primary service.

PrimaryRing - Primary Ringing Pattern ID. Index into MTA cadence table, selecting ring pattern for this service. Optional if the "Is Primary" flag is set to False. If not present, the CMS must use its normal ring pattern

DisplayName - Used for Call Name Delivery feature (CNAM)

DisplayNumber - Used for Call Number Delivery feature (CND)

Password - various call features require a password before any alterations are permitted.

Network announcement control. See previous definition. Optional; if not present the CMS must use its default settings.

Interexchange codes and Local Number Portability settings. See previous definitions. Optional; if not present the CMS must not assign any inter-exchange codes to the service.

Call features. See previous definitions.

Annex C (informative): Sample Object Extension

C.1 Extended Pcspservice Object Example

The following example illustrates the extension capabilities of the PCSP schema. The example extends a Pcspservice object with a new call feature and several new elements on the main body of the object.

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
    An example illustrating how to extend a Pcspservice object.
    This example extends the Pcspservice object with additional
    fields and call features.

    See details below.
-->
<Pcspservice xmlns="http://www.cablelabs.com/Pcsp/I01/schema"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns:pcsp="http://www.cablelabs.com/Pcsp/I01/schema">
<!--
    The main body of the Service object is filled with sample data that will
    allow the object to validate.
-->
<ServiceId>5551212</ServiceId>
<AdminStatus>0</AdminStatus>
<BillingId>5551212</BillingId>
<ExternalId>5551212</ExternalId>
<IsPrimary>true</IsPrimary>

    <LPIC>0</LPIC>
    <IPIC>0</IPIC>
</InterExchange>
<LNP>
    <PortingStatus>1</PortingStatus>
    <LNPT>true</LNPT>
</LNP>
<!--
    A Service object can be extended in two locations:
    1. The main body of the object.
    2. The call feature list.

    Here we extend the set of call features with the CfXYZ call feature.

    1. The VendorExt element requires to specify a valid namespace for the extension's schema.
This allows
        the parsing system to locate the schema file for the extension.
    2. Any content within the VendorExt element requires to be namespace qualified, enabling
validation against
        the extension's schema.
-->
<ListOfCallFeatures>
    <Extension xmlns:ext="http://www.cablelabs.com/SampleExtension">
        <ext:CfXYZ>
            <ext:Subscribed>true</ext:Subscribed>
            <ext:Enabled>true</ext:Enabled>
        </ext:CfXYZ>
    </Extension>
</ListOfCallFeatures>
<!--
    Here, we extend the data content of main body of the Service object.
-->
```

```
<Extension xmlns:ext="http://www.cablelabs.com/SampleExtension">
  <ext:A>Sample extension A</ext:A>
  <ext:B>Sample extension B</ext:B>
  <ext:C>Sample extension C</ext:C>
</Extension>
</PcspService>
```

C.2 The Extension Schema

```
<?xml version="1.0" encoding="UTF-8"?>
<!--
  The schema for the sample PcspService extension.

  This schema defines several extensions:

  A, B, and C for the main body of the Service object.
  Call feature CfXYZ for the Service's call feature list.

-->
<xsschema targetNamespace="http://www.cablelabs.com/SampleExtension"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" xmlns="http://www.cablelabs.com/SampleExtension"
  elementFormDefault="qualified">
  <xs:element name="A" type="xs:string"/>

<!--
    The <types> section defines custom datatypes required by the interface.

    PCSPI01 requires two custom datatypes:
        PcpspArg (and array of)
        PcpspObj (and array of).

    // PcpspArg (pseudo code)
    //
    class PcpspArg
    {
        // EntityName and key of a specific object.
        // Wildcard are currently not permitted.
        // Key is ignored when entity is PcpspRelation.
        //
        String entityName;
        String key;

        // Reserved for future use. Set to 0 for now.
        //
        int flags;
    }

    // PcpspObj (pseudo code).
    //
    class PcpspObj
    {
        // EntityName and key of the specific object.
        // Key is ignored when entity is PcpspRelation.
        //
        String entityName;
        String key;

        // cmdStatus:
        // PcpspObj as method output/result - shall be set to one of the status codes specified
below.
        // PcpspObj as input to Put() - shall be set to one of the following:
        //     1, create new object
        //     2, modify existing object.
        // This field is ignored when entity is PcpspRelation.
        //
        int cmdStatus;

        // XML encoding per PCSP Data Model Schema or 0 (null)
        //
        String xmlEncoding;
    }

    EntityNames; shall be one of the following:
    "PcpspService"
    "PcpspMta"
    "PcpspEndpoint"
    "PcpspCms"
    "PcpspRelation"

    Status codes: Used for method output or contained in the cmdStatus field of a PcpspObj result
(output).

    0 , Operation succeeded

```

```

1 , Object not found
2 , Invalid Put() mode specified.
3 , Object creation failed, object already exists
4 , Read op failed
5 , Create op failed
6 , Modify op failed
7 , Delete op failed
8 , Internal problem.
9 , Server Busy
10, Unsupported operation.
11, Vendor extension.

...extended as needed...

Annex E (informative): Data Encoding Evaluation

Options considered for the encoding of data objects and messaging follow.

E.1 XML

XML is a standard meta-language that allows organizations to design their own markup languages for document publishing and data exchange. Such markups are text based: designed to be obvious to both people and processes. XML offers:

- Open, standards based, platform independent data exchange.
- Standardized parsers for putting data into memory.
- Standardized interfaces (tree-oriented and stream-oriented) for processing the data.
- Standardized ways to display data.
- Standardized ways to query data.
- Standardized ways to link data.
- Standardized training of people in both publishing and data processing.

The cost: somewhat larger encoding size and increased parsing overhead.

The XML document is supervised by the XML Working Group of the World Wide Web Consortium (W3C). Special Interest Groups of experts from various fields contribute. It is a public standard - it is not the proprietary development of any company. The v1.0 document was accepted by the W3C as Recommendation on Feb 10, 1998 [i.6]. The document may be found at <http://www.w3.org/TR/REC-xml>.

E.2 ASN.1/BER

ASN.1 is a text based, platform independent syntax used to represent arbitrary data structures. Is it popularly employed for SNMP MIB representations. The Basic Encoding Rules is a simply recursive algorithm that produces a compact octet encoding from an ASN.1 description. BER encodes each item as a tag, indicating what type it is, a length indicating the size of the object, and a value, which contains the actual contents of the object.

See table E.1 at end of this clause.

E.3 Proprietary ASCII

Proprietary encodings are out of scope.

E.4 SDP (session description protocol)

Not flexible in term of contents. Used primarily to describe streaming media capabilities.

E.5 RADIUS

Radius data encoding (TLV) is too primitive and cannot enforce sequencing. RADIUS is difficult and limited to code structures.

E.6 SQL

Tied to a specific relational database implementation/schema. Some vendors may already have databases deployed with incompatible schema.

E.7 Options Summary

Table E.1: Data Encoding Options

Option	Pro	Con
XML	Flexible, ASCII tag-based Provides syntax checking through use of schema/DTD. Easy to extend without effecting transport. Allows for vendor extensions. Platform-independent Language-independent	Not secure, requires a secure transport layer. Will consume more CPU and network capacity than a binary encoding. Parse time, etc.
ASN.1/BER	Hierarchical structure for formatting of data. Defines a language for describing the data format (or "schema"). Data structures can be nested. Data is formatted in a platform independent way. Format can be extended IF the design includes a way of versioning the format so that the application knows which format it needs to use to parse the data content.	ASN.1 is not easily extensible. Backward compatibility of format versions can be difficult to incorporate into the design and to implement. Most implementations use compiled binary level parsers for each schema, which means that defining flexible applications becomes quite difficult. Debugging applications and their interoperability can be difficult in that a small formatting error can render a data "packet" unparseable/unreadable.
Proprietary ASCII	Out of scope	Out of scope
SDP (Session Description)		Not Flexible in term of contents. Used primarily to describe streaming media capabilities.
RADIUS		Radius data encoding (TLV) is too primitive. Cannot enforce sequencing. Difficult and limited to code structures.
SQL		Tied to relational database schema implementation - which some vendors may not use.

E.8 Recommendation: XML

XML provides a platform-agnostic, technology-neutral form of structuring messages and packaging data. It is an excellent choice to send data between heterogeneous applications without each application having to know about the proprietary format of the other. Because XML is a structured language, it is a good fit for hierarchical types of messages. Data can be easily mapped to elements, so the XML document (as a tree structure) takes care of the hierarchy maintenance. The costs: increased wire payload sizes and increased marshalling times (parsing) for objects.

Annex F (informative): Transport Protocol Evaluation

F.1 TFTP with IPsec

TFTP is already in use within the IPCablecom infrastructure (DOCSIS). It is intended as a lightweight file transfer protocol.

F.2 Batched RADIUS - multiple records in single request via event msgs

RADIUS is an IETF standard created primarily to handle Internet dial-up authentication, authorization, and accounting. RADIUS is currently the de facto standard used by most router manufacturers for such activities. Several vendors of IP telephony gateway equipment are already utilizing RADIUS' support for vendor extensions to deliver the information needed for billing.

RADIUS defines both a transport protocol and a document for message formats. As a transport protocol, RADIUS relies on user datagram protocol (UDP) for message broadcast and is port-based.

As a message format, the data is formatted based on tag-length-value (also called attribute-length-value). Standard authentication, authorization, and accounting tags are pre-defined and are minimally required. However, new attributes can be added without disturbing existing implementations of the protocol. RADIUS has a minimum total message length of 20 characters and a maximum length of 4 096 characters. Individual data fields support 247 bytes of data, for example, a 247 character URL or filename.

RADIUS has very poor reliability characteristics and essentially non-existent error recovery, and is very limited in new tags (can only define a total of 255) (compare that to 600 existing features in some PSTN class 5 switches).

F.3 Diameter

Diameter represents an activity in the working group of the IETF that is designed to be backward compatible to RADIUS. It is much more extensible, has increased security benefits, and is designed to minimize configuration. In addition, it supports cross-domain AAA very well by supporting a variety of security schemes such as public key, etc. Diameter supports fail-over to a backup server (it is designed for environments that have low failure requirements (99.99+)).

RADIUS/DIAMETER does not provide two-way communication (only acknowledgments); therefore, it does not fulfil the requirements.

F.4 Distributed Object Systems

F.4.1 CORBA/IOP

The distributed object technology championed by the Object Management Group. There are upwards of 800 OMG members behind this technology.

The Common Object Request Broker Architecture (CORBA) allows applications to communicate with one another by using an Object Request Broker (ORB). The ORB is middleware that establishes the client-server relationships between objects. The ORB registers clients and manages rights such as publish, subscribe and listener. Using an ORB, a client can transparently invoke a method on a server object, which can be on the same machine or across a network. The ORB intercepts the local call and is responsible for finding an object that can implement the request, pass it the parameters, invoke its method, and return the results.

The Interface Definition Language (IDL) is used to establish the ORB protocol contract between client and server objects. The ORB essentially hides the transportation details from the programmer. The IDL is complied into C++, Java, etc. implementations of client and server stubs, handling all data encoding/decoding chores required by the IIOP transport protocol used between clients and servers.

CORBA will handle the details of finding the server for a method call, transporting arguments from the client machine to the server machine, and transporting any return code back to the client machine.

ORBs are currently available from many vendors for more than three dozen hardware platforms and operating systems. CORBA is particularly popular on *nix platforms. However, in practice, ORB vendors compete on features. Persistent interoperability problems exist when one gets past the basics (security, etc.). The likelihood of two randomly selected ORBs being able to successfully communicate is low. From a development standpoint, CORBA tends to be very complex. Additionally, CORBA is a relatively expensive option (runtime and development licenses).

F.5 DCOM

Microsoft's Distributed Component Object Model. Shares the following characteristics with CORBA:

- Separates object interface from implementation. This is accomplished using MIDL (Microsoft's IDL variant).
- Allows transparency of location. Clients invoke methods on remote objects without knowing which machine the remote object runs upon.
- Uniform exception handling scheme (DCOM method calls return a flat HRESULT return status).

However:

- DCOM is based on DCE ORPC transport protocol, which is incompatible with IIOP transport used by CORBA.
- DCOM is basically a Microsoft only technology. It is standard on Win95, Win98 and NT platforms.

F.6 HTTP

Hypertext Transfer Protocol (HTTP) is the primary protocol for the World Wide Web. HTTP was designed to connect heterogeneous data sources together to create a distributed information system. It was also designed with extensibility in mind. A typical HTTP transaction:

- 1) client established connection to the server;
- 2) client issues a request to the server (with URL parameters);
- 3) server sends response containing status and requested URL;
- 4) either side can disconnect.

HTTP provides transaction headers for both client requests and server responses. The client transaction header can include parameters used to assist delivery of the desired information to the client (e.g. type of data format, language etc). The server transaction header can include parameters indicating information about the response (e.g. the status of the request (return code), the length of the data being sent, the content type, the language of the content, etc.).

Given the current state of the Web, HTTP is ubiquitous. It is also firewall friendly.

F.7 Options Summary

See table F.1 for transport options.

Table F.1: Transport Options

Option	Pro	Con
TFTP with IPSEC	Lightweight Already implemented for DOCSIS	Does not provide two way communication
RADIUS	Flexible - includes vendor-specific and customer-specific fields. IPCablecom may be able to define fields in this space. Used by many IP telephony accounting systems Already widely deployed on IP components such as routers.	Not all RADIUS products support AAA Application layer needs to handle reliability issues Inadequate built-in security, need an independent trust protocol or shared secret keys with edge routers
Socket based proprietary protocol with SSL		Proprietary. If pursued, we will probably end up writing most of what is currently available in SOAP or XMLP.
CORBA/IOP	Easy to implement, details of name resolution, packaging parameters into messages and transport are all managed by the CORBA infrastructure	Tends to be a more expensive solution. The CORBA infrastructure requires to either be developed or purchased, and in either case it requires to be deployed with the application. There may still remain issues re: interoperability or various CORBA/ORB products.
DCOM	DCOM and CORBA/IOP are similar technologies.	Basically a Microsoft Windows only option. Will not inter-operate with CORBA-IOP.
HTTP	HTTP already widely deployed as an underlying transport protocol for exchange between data sources (web servers) and data consumers (client browsers). Data transmission based on simple transactions. Simple, stateless, ASCII text based protocol. Allows for easy data exchange through most currently deployed network infrastructure (firewalls, etc.). Client can use simple method calls when making requests as - GET, POST, HEAD, PUT, DELETE, LINK, and UNLINK.	Being Stateless, the protocol has no memory of the transaction once it finishes. Can it keep up with required CMS transaction rate? Relatively expensive in terms of bandwidth and processing requirements.

F.8 Recommendation: HTTP 1.1

Based on the analysis above, it is recommended that HTTP 1.1 be the transport protocol used.
