Intellectual Property Rights

Essential patents

IPRs essential or potentially essential to normative deliverables may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (https://ipr.etsi.org/).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Trademarks

The present document may include trademarks and/or tradenames which are asserted and/or registered by their owners. ETSI claims no ownership of these except for any which are indicated as being the property of ETSI, and conveys no right to use or reproduce any trademark and/or tradename. Mention of those trademarks in the present document does not constitute an endorsement by ETSI of products, services or organizations associated with those trademarks.

Foreword

This Technical Specification (TS) has been produced by Joint Technical Committee (JTC) Broadcast of the European Broadcasting Union (EBU), Comité Européen de Normalisation ELECtrotechnique (CENELEC) and the European Telecommunications Standards Institute (ETSI).

NOTE: The EBU/ETSI JTC Broadcast was established in 1990 to co-ordinate the drafting of standards in the specific field of broadcasting and related fields. Since 1995 the JTC Broadcast became a tripartite body by including in the Memorandum of Understanding also CENELEC, which is responsible for the standardization of radio and television receivers. The EBU is a professional association of broadcasting organizations whose work includes the co-ordination of its members' activities in the technical, legal, programme-making and programme-exchange domains. The EBU has active members in about 60 countries in the European broadcasting area; its headquarters is in Geneva.

Modal verbs terminology

In the present document "shall", "shall not", "should", "should not", "may", "need not", "will", "will not", "can" and "cannot" are to be interpreted as described in clause 3.2 of the <u>ETSI Drafting Rules</u> (Verbal forms for the expression of provisions).

"must" and "must not" are NOT allowed in ETSI deliverables except when used in direct citation.

1 Scope

Higher Order Ambisonics (HOA) signals are able to deliver a significantly enhanced immersive sound compared to conventional stereo or 5.1 channel audio signals. However, there are some use cases where HOA signals cannot be transported because of the large number of HOA input channels. The present document provides an HOA transport format which allows unrestricted HOA order signals to be transported.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply:

MPEG-H Audio Stream (MHAS): self-contained stream format to transport ISO/IEC 23008-3 data

MPEG-H 3DA: MPEG-H 3D Audio standard defined in ISO/IEC 23008-3 [1] to [4].

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

	ACN		Ambisonic Channel Number
	AGC		Adaptive Gain Control
	AU		Access Unit
	BG		Background (audio channel)
	CRC		Cyclic Redundancy Check
	DAW		Digital Audio Workstation
	FG		Foreground (audio channel)
	HDMI		High-Definition Multimedia Interface
	HD-SDI		High-Definition Serial Digital Interface
	HOA		Higher Order Ambisonics
	HTF		HOA Transport Format
	HTFAS		HOA Transport Format Audio Stream
	ISO		International Organization for Standardization
	MHAS		MPEG-H Audio Stream
	MMT		MPEG media transport
	MPEG		Moving Pictures Experts Group
	MPEG-I	HLC	MPEG-H Audio Low Complexity profile
N	NOTE:	As defined	in ISO/IEC 23008-3 [1].

VHTF Vector based HOA Transport Format

4 Higher Order Ambisonics (HOA) Transport Format

4.1 Introduction

Higher Order Ambisonics (HOA) signals are able to deliver a significantly enhanced immersive sound compared to conventional stereo or 5.1 channel audio signals. However, there are some use cases where HOA signals cannot be transported because of the large number of HOA input channels.

One use case is mobile devices where the number of input channels is limited by N Pulse-Code Modulation (PCM) channels. As shown in Figure 1 (a), if N is 8, a maximum of First Order Ambisonics (FOA which requires 4 PCM channels) can be transported.

Another use case is a typical broadcast workflow as shown in Figure 1 (b). Here, a contribution encoder can transmit 16 PCM channels from the remote truck to the Network Operation Centre (NOC) or local affiliate(s). However, the use of single High-Definition Serial Digital Interface (HD-SDI) link has a limitation of being able to transport only 16 PCM channels. This restricts the transport to a maximum of 3rd order HOA signals (requiring 16 PCM channels) with the additional restriction that there are no additional discrete audio elements to be transported. If additional audio elements are to be transported, only a maximum of 2rd order HOA (requiring 9 PCM channels) can be transported.

The present document aims to specify an HOA transport format which allows unrestricted HOA order signals to be transported. This not only includes the above two cases, but also any other cases with limitations in bandwidth and the number of transport channels. Other examples include High-Definition Multimedia Interface (HDMI) or other wired or wireless connectivity interfaces.

(b)

4.2 Generic HOA Transport Format

To transport higher than 1st order HOA over the mobile device as shown in Figure 1 (a), an HOA Transport Encoder is used in the production devices, such as a microphone array or a digital audio workstation (DAW). As shown in Figure 2 (a), the HOA transport encoder encodes the input HOA of any order into the **HOA transport format (HTF)** which contains *I* transport audio signals along with the HOA Side-info data. The number *I* of transport audio signals is usually much lower than the number of HOA input coefficients.

To transport higher than 3rd order HOA over the SDI framework, an HOA Transport Encoder is placed in front of the contribution encoder as shown in Figure 2 (b). For example, the HOA transport encoder converts input 49 HOA coefficients (6th order HOA signal) to the HOA transport format which contains 13 transport audio channels along with a single HOA Side-info channel. The 16 channel HD-SDI can carry these (13+1) channels with 2 empty channels.

For error protection in SDI transmission, the HOA Side-info can be modulated with communications modem technologies into a PCM control track signal that fits into the audio signal bandwidth [i.1].

Figure 2: HOA Transport Format for (a) mobile devices and (b) broadcast chain

Annex A presents an example guideline about HOA transport over Serial Digital Interface (SDI) utilizing communications modem technologies [i.1].

Annex B shows the HOA content production workflow where the HOA transport encoder is placed outside the broadcast chain.

In Table 1, the syntax of the configuration of Generic HOA transport format is defined as a binary representation format. In Table 2, the corresponding semantics of the configuration of Generic HOA transport format is defined.

4.3 ISO/IEC 23008-3-based HOA Transport Format (HoaTransportType = 1)

4.3.1 Introduction

This clause defines Type 1 of the HOA Transport Format (HoaTransportType = 1) which is based on ISO/IEC 23008-3 (MPEG-H 3D Audio) [1] to [4].

4.3.2 HOA Transport Format defined in ISO/IEC 23008-3

In [2], the HOA input signal is analysed and encoded into the spatial coding parameters and the directional and ambient signals. The number of signals is usually lower than the number of HOA input coefficients. The HOA Frame Creater converts the resulting HOA spatial coding parameters to the HOA payloads HOAConfig() and HOAFrame().

In some environments (see e.g. Figure 2), the HOA spatial encoder is separated from the MPEG-H 3D Audio Core encoder. In this case, the HOA Transport Format consists of spatial coding parameters and the predominant and ambient signals. This HOA Transport Format can be transmitted from the HOA spatial encoder to the MPEG-H 3D Audio Core encoder. Compared with the input HOA, the HOA Transport Format usually requires a significantly reduced number of transport channels.

4.3.3 Implementation of HOA Transport Encoder (TE) and HOA Emission Encoder (EE)

Based on [2], the following terms are defined for simplicity:

- The combination of the **Spatial HOA Encoder** and the **HOA Frame Creater** is defined as the **HOA Encoder**.
- The predominant and ambient signals are defined as HOA Transport Audio Signals.
- The combination of the **HOAConfig** and **HOAFrame** is defined as the **HOA Side-info**.
- The combination of the HOA Transport Audio Signals and the HOA Side-info is defined as HOA Transport Format.

As shown in annexes A and B, there are several ways to design the broadcast chain. To make these systems working, it is beneficial to design the HOA Transport Encoder (TE) and the Emission Encoder (EE) such that:

- The bit-rate, the number of transport channels, and hoaIndependencyFlag are determined at EE. An hoaIndependencyFlag indicates whether a frame is independently decodable.
- Delay and complexity increase at TE and EE should be minimized.

Thus, three design criteria are defined:

- Predominant audio channels (or called Foreground Audio (FG) channels): A V-vector represents the spatial distribution of the sound field for a particular vector-based predominant. FG audio channels and full V-vector elements are transmitted from TE to EE. At EE, a subset of FG audio channels and a subset of V-vector elements are selected and transmitted without any modification (no delay is required). If the EE modifies any FG audio channel, one frame delay is required for the adaptive gain correction (AGC) lookahead.
- 2) Ambient audio channels (or called background audio (BG) channels): As BG channels, H_BG, original HOA coefficients, H, are transmitted from TE to EE without applying any decorrelation and energy compensation: H_BG=H. At EE, a subset of BG channels is selected and transmitted without any modification (no delay is required). If the EE modifies any BG audio channel, one frame delay is required for the AGC lookahead.
- 3) To create random access points at EE, all the HOA Side-info parameter shall be encoded independently at TE. The predictive coding is not allowed at TE.

In the TE implementation, the total number of FGs and BGs are selected as 4 and 9, respectively. At EE, a subset of FGs and BGs is selected based on the EE bit rate. ChannelType is set to be 1 where Vector-based Signals are used to describe FGs or 2 where Additional Ambient HOA Coefficients are used to describe BGs. Table 6 describes different behaviours of FGs and BGs according to the parameter MinNumOfCoeffsForAmbHOA and codedVVecLength. The MinNumOfCoeffsForAmbHOA indicates the minimum number of ambient HOA coefficients for BG. The codedVVecLength value indicates the elements of the transmitted V-vector used to synthesize the vector-based signals:

- 0) Complete vector length (NumOfHoaCoeffs elements). Indicates that all of the coefficients for the predominant vectors (NumOfHoaCoeffs) are specified.
- 1) Vector elements 1 to MinNumOfCoeffsForAmbHOA and all elements defined in ContAddHoaCoeff are not transmitted.

2) Vector elements 1 to MinNumOfCoeffsForAmbHOA are not transmitted. Indicates that those coefficients of the predominant vectors corresponding to the number greater than a MinNumOfCoeffsForAmbHOA are specified.

Table 6: Different behaviour of FGs and BGs according to MinNumOfCoeffsForAmbHOA and codedVVecLength (the number of FGs and BGs are 4 and 9, respectively)

MinNumOfCoeffsForAmbHOA codedVVecLength	0	4	9
0	 H_BG = H - H_FG Full V vectors decorrMethod: not activated 	 H_BG = H - H_FG Full V vectors decorrMethod = 1 (1~4) 	 H_BG = H - H_FG Full V vectors decorrMethod = 1 (1~9)
1	 H_BG = H No V for 1~9 decorrMethod: not activated 	 H_BG = H No V for 1~9 decorrMethod = 1 (1~4) 	 H_BG = H No V for 1~9 decorrMethod = 1 (1~9)
2	 H_BG = H - H_FG Full V vectors decorrMethod: not activated 	 H_BG = H for 1~4 H_BG = H - H_FG for 5~9 No V for 1~4 decorrMethod = 1 (1~4) 	 H_BG = H No V for 1~9 decorrMethod = 1 (1~9)

To meet the first two design criteria as outlined, the following conditions shall hold:

- For BG, H_BG = H instead of H_BG = H H_FG. H_FG is the FG contribution to BG.
- For BG, decorrelation shall not be activated.
- For FG, full V-vector elements shall be transmitted.

Therefore, TE and EE are designed as shown in Figure 3.

Figure 3: HOA Transport Encoder (TE) and Emission Encoder (EE) settings

At TE, codedVVecLength=1 and MinNumOfCoeffsForAmbHOA=0 are selected, 4 channels of FG and 9 channels of BG are transmitted to EE. Although codedVVecLength=1, full V-vectors are transmitted (instead of the elements between #BG+1 and #HOA coefficients).

At EE, codedVVecLength=1 and MinNumOfCoeffsForAmbHOA=0 are selected. Since codedVVecLength=1, only the V-vector elements between #BG+1 and #HOA coefficients are selected and transmitted. According to the bit rate at EE, the number of transport channels is determined for core encoding. If the subset of audio channels and the subset of HOA parameters are selected at EE without additional processing, there is no increase in complexity and delay for HOA spatial processing.

Order Rate	1	2	3	4	5	6
Low	#FG=0	#FG=2	#FG=2	#FG=2	#FG=2	#FG=2
	#BG=4	#BG=4	#BG=4	#BG=4	#BG=4	#BG=4
Mid	#FG=0	#FG=4	#FG=4	#FG=4	#FG=4	#FG=4
	#BG=4	#BG=4	#BG=4	#BG=4	#BG=4	#BG=4
High	#FG=0	#FG=0	#FG=3	#FG=3	#FG=3	#FG=3
	#BG=4	#BG=9	#BG=9	#BG=9	#BG=9	#BG=9

Table 7: Example of the numbers of FG and BG channels according to the HOA orders and bit rates

As an example, Table 7 shows the numbers of FG and BG channels according to the HOA orders and the bit rates. The total number of audio transport channels is the sum of the number of FG and BG channels.

Figure 4: Example of HOA Transport Signals and HOA Side-info selection at the emission encoder

Example of HOA Transport Audio Signals and HOA Side-info selection at the emission encoder is shown in Figure 4:

- The numbers of FGs and BGs are determined based on Table 7. For rate = 192 kbps (low rate) and HOA order = 4, #FG=2 and #BG=4 are selected. Thus, from 4 FG and 9 BG audio channels transmitted from TE, first 2 FGs (FG#1 and FG#2) and 4 BGs (BG#1, BG#2, BG#3 and BG#4) are selected at EE. The selected audio channels are used as input to the core encoder without applying any decorrelation.
- Although codedVVecLength=1 and MinNumOfCoeffsForAmbHOA=0 at TE, TE transmits every element of V-vector. At EE, only the V-vector elements between 5 (=#BG+1) and 25 (=#HOA coefficients) are selected for the emission bit stream.

In summary, to implement the HOA Transport Encoder (TE) and the Emission Encoder (EE), the following configurations are used. More detailed description of each variable can be found at ISO/IEC 23008-3 [4].

- Configuration of TE:
 - HoaOrder: decided by the input HOA
 - IsScreenRelative: decided at TE
 - UsesNfc: content dependent:
 - This element determines whether or not the HOA Near Field Compensation (NFC) has been applied to the coded signal.
 - MinAmbHoaOrder = -
 - This element determines the minimum HOA order used for the coding of the ambient HOA representation.
 - numHOATransportChannels = 13
 - CodedSpatialInterpolationTime = 3
 - This element determines the time of the spatio-temporal interpolation of the Vector-based directional signals.
 - SpatialInterpolationMethod = 0
 - This element determines the spatial interpolation window.
 - CodedVVecLength = 1
 - ChannelType: decided at TE
 - This element stores the type of the i-th channel.
 - HOAFrameLengthIndicator = 1
 - Indicates the Frame Length L (number of samples) of the HOA Spatial Decoding relative to the Core Coder Frame Length.
 - hoaIndependencyFlag = 1
 - This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame.
 - NbitsQ = 4~15
 - The type of dequantization of the V-vector is signalled by the word NbitsQ.
 - The NbitsQ value of 4 indicates vector-quantization.
 - When NbitsQ equals 5, a uniform 8 bit scalar dequantization is performed.
 - In contrast, an NbitsQ value of greater or equal to 6 indicates the application of Huffman decoding of a scalar-quantized V-vector.
- configurations of EE:
 - HoaOrder: sent from TE
 - IsScreenRelative: decided at EE (set to 0 to disable the Screen Relative functionality)
 - UsesNfc = sent from TE
 - MinAmbHoaOrder = -1
 - numHOATransportChannels: decided at EE
 - CodedSpatialInterpolationTime = 3

- SpatialInterpolationMethod = 0
- CodedVVecLength = 1
- ChannelType: sent from TE
- HOAFrameLengthIndicator = 1
- hoaIndependencyFlag = decided at EE
- NbitsQ = decided at EE

4.4 ISO/IEC 23008-3-based HOA Transport Format modified for SN3D Normalization (HoaTransportType = 2)

This clause defines Type 2 of the HOA Transport Format (HoaTransportType = 2). Implementation guidelines of HOA Transport Encoder (TE) and HOA Emission Encoder (EE) defined in clause 4.3.3 also apply for the HOA Transport Format Type 2.

The ISO/IEC 23008-3 syntax tables [4] are modified for implementing SN3D Normalization. Removing '_E' provides the same variable name as in the ISO/IEC 23008-3 syntax tables [4].

The variables in Table 15 are defined in ISO/IEC 23008-3 [4]. Removing '_E' provides the same variable name as in the ISO/IEC 23008-3 [4].

HoaOrder_E	This element determines the HOA order of the coded signal.
NumOfHoaCoeffs_E	This element determines the number of HOA coefficients of the coded HOA representation, which is equal to the number
	of HOA coefficients to be reconstructed.
IsScreenRelative_E	This element indicates if the HOA representation shall be rendered with respect to the reproduction screen size as described in ISO/IEC 23008-3 [4], clause 18.4.
	0: not screen related 1: screen related

Table 15: Semantics of HOAConfig	SN3D()
	_0.100()

MinAmbHoaOrder_E	This element determines the minimum HOA order used for the
	coding of the ambient HOA representation by
	Min Jublics Ouder, E
	$\mathbf{F}_{\mathbf{L}} = \mathbf{Coded}_{\mathbf{L}} + \mathbf{E} = \mathbf{Coded}_{\mathbf{L}} + \mathbf{E} + \mathbf{E} + \mathbf{E}$
	The value -1 indicates that the number of decorrelated
	ambiance coefficients is equal to zero. Thus the HOA
	ambiance coefficients to equal to 2010. That the the residual ambiance
	representation is transmitted without a residual ambiance
	HOA representation of lower order and all transport channels
	have a flexible channel type. The value 6 is used to extend the
	HOA and a size size size size size size size size
	HUA order signaling.
MinNumOfCoeffsForAmbHOA_E	This element determines the minimum number of ambient
	HOA coefficients
Num Of Addition all Gadamar R	This also and data main as the number of additional transment
NumOIAdditionalCoders_E	This element determines the number of additional transport
	channels used for coding the directional and/or additional
	HOA coefficients of the ambient component. These transport
	channels have a flavible Channel III and T
	channel Type_E.
CodedVVecLength_E	This element indicates the length of the transmitted data
	vector used to synthesize the vector-based signals
Marilla a Oudard Ba Da Buan and the ad	This classes tig diseases the merimum LIOA and a of the
MaxHoaOrderToBetransmitted_E	This element indicates the maximum HOA order of the

	ChannelSideInfoData_SN3D().
NumOfVecSigs_E	This element determines the number of active vector-based
5 -	signals in the current HOAExamo SN2D()
	Signals in the current HOAFTalle_SNSD().
NumOfAddHoaChans_E	This element determines the total number of additional
	A appendix in the current UOA Frame $(M2D)$
	amplent non channels in the current hour rame SN3DO.
hee Independency Flog. F	This flog signals that the surrent frame is an independent
hoaIndependencyFlag_E	This flag signals that the current frame is an independent
hoaIndependencyFlag_E	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about
hoaIndependencyFlag_E	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame.
hoaIndependencyFlag_E	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame.
hoaIndependencyFlag_E ChannelType_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is
hoaIndependencyFlag_E ChannelType_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D().
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds E[NumOfVecSigs]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D().
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the surrent frame.
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame.
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation.
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This is a frame in the previous frame (if 1) the traces of
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal.
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The Nbitson Elil value determines the decoding method of
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The NbitsQ_E[i] value determines the decoding method of
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The NbitsQ_E[i] value determines the decoding method of the V-Vector associated with the Vector-based signal of the
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The NbitsQ_E[i] value determines the decoding method of the V-Vector associated with the Vector-based signal of the i-th channel. An NbitsQ_E[i] value of 4 determines the
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The NbitsQ_E[i] value determines the decoding method of the V-Vector associated with the Vector-based signal of the i-th channel. An NbitsQ_E[i] value of 4 determines the decoding of a vector-quantized V vector. The value 5
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The NbitsQ_E[i] value determines the decoding method of the V-Vector associated with the Vector-based signal of the i-th channel. An NbitsQ_E[i] value of 4 determines the decoding of a vector-quantized V vector. The value 5
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The NbitsQ_E[i] value determines the decoding method of the V-Vector associated with the Vector-based signal of the i-th channel. An NbitsQ_E[i] value of 4 determines the decoding of a vector-quantized V vector. The value 5 determines the decoding of a uniform 8bit scalar quantized
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The NbitsQ_E[i] value determines the decoding method of the V-Vector associated with the Vector-based signal of the i-th channel. An NbitsQ_E[i] value of 4 determines the decoding of a vector-quantized V vector. The value 5 determines the decoding of a uniform 8bit scalar quantized V-vector. If the value is greater than 5, Huffman decoding of
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. The NbitsQ_E[i] value determines the decoding method of the V-Vector associated with the Vector-based Signal of the i-th channel. An NbitsQ_E[i] value of 4 determines the decoding of a vector-quantized V vector. The value 5 determines the decoding of a uniform 8bit scalar quantized V-vector. If the value is greater than 5, Huffman decoding of the V-Vector is determined
hoaIndependencyFlag_E ChannelType_E[i] VecSigChannelIds_E[NumOfVecSigs] AmbCoeffIdx_E[i] NewChannelTypeOne_E[i] NbitsQ_E[i]	This flag signals that the current frame is an independent frame that can be decoded without having knowledge about the previous frame. This element stores the type of the i-th channel which is defined in Table ChannelType_SN3D(). This element stores the channel index of each active vector- based signal of the current frame. This element determines the index of the HOA signal where channel i contributes to the reconstructed HOA representation. This flag indicates if in the previous frame (k-1) the transport channel was not initialized as a Vector-based Signal. AmbCoeffTransitionState E[i]	This decoder-internal variable tracks the state of the life-cycle	
	of an additional ambient UOA asofficient. These states are	
	or an additional ampient HOA coefficient. Those states are	
	Fade-In, Continuous State, and Fade-out. The	
	AmbCoeffIdxTransition_E signals a change of the state	
	in the bitstream. When an additional ambient HOA coefficient	
	is faded in, the CodedAmbCoeffIdx_E word is sent to signal	
	the new AmbCoeffIdx E. In all other states, the	
	AmbCoeffIdy F of the previous frame is used	
Jub Cooff Tilu Tuon siti on R	This element indicates that in this frame on additional embient	
AllDCOELLIGXITALISICIOILE		
	HOA coefficient is either being faded in or faded out. This flag	
	will update the decoder-internal	
	AmbCoeffTransitionState_E variable for this transport	
	channel accordingly.	
CodedAmbCoeffIdx_E	This element reads the coded index of the additional ambient	
	HOA coefficient.	
VVec E(k)[i]	This is the V vector for the k-th frame for the i-th channel.	
_ 、 ,		
VVecLength_E	This variable indicates the number of vector elements to read	
	out.	
VVecCoeffId E	This vector contains the indices of the transmitted V-vector	
	coefficients	
VogVol F	An integer value between 0 and 255	
Vecval_E	An integer value between 0 and 255.	
aVal E	A temporary variable used during decoding of the	
	MogtorData E	
	A lluffman and ward to be lluffman decoded	
nullval_E	A Huiman code word, to be Huiman-decoded.	
sonVal E	This is the coded sign value used during decoding	
bgiiva1_E		
intAddVal E	This is additional integer value used during decoding	
WeightIdx_E	The index in WeightValCdbk E used to dequantize a vector-	
-	quantized V vector	
nBitco F	Field size for reading Weight Tdr. E to decode a vector	
	Field Size for reading weightidx_E to decode a vector-	
	quantized v vector.	
weightvalCdbk_E	Codebook which contains a vector of positive real-valued	
	weighting coefficients. Only necessary if NumVvecIndices_E	
	is > 1.	
VvecIdx_E	An index used to dequantize a vector-quantized V vector.	
nbitsIdx_E	Field size for reading VvecIdx_E to decode a vector-	
	quantized V vector.	
WeightVal_E	A real-valued weighting coefficient to decode a vector-	
	quantized V vector.	

The variables in Table 16 are newly defined for the Type 2 HOA Transport Format.

Table 16: New semantics of HOAConfig_SN3D()

HOAFrameLengthIndicator_E	Indicates the Frame Length L (number of samples) of the HOA	
	Spatial Decoding relative to the Core Coder Frame Length as	
	defined in Table 17.	
outputFrameLength_E	The number of samples per frame, using the original sampling	
	frequency.	
CodedSpatialInterpolationTime_E	This element determines the time of the spatio-temporal	
	interpolation of the Vector-based directional signals as defined	
	in Table 18.	

outputEramol ongth E	HOAFrameLengthIndicator_E					
outputFrameLength_E	0	1	2	3

N ms* = ceil((sampling frequency * N)) in samples								

Due to the signal normalization of SN3D the following decoder configuration is required:

- To decorrelate the first MinNumOfCoeffsForAmbHOA coefficients of the ambient HOA component the Ambience Synthesis processing includes an inverse spatial transform based on the mode matrix Ψ . This mode matrix shall be SN3D normalized.
- When decoding vector-quantized V-vectors, a V-vector is represented by a weighted summation of the V-vector code vectors. These code vectors shall be SN3D normalized.

4.5 V-vector based HOA Transport Format (HoaTransportType = 3)

This clause defines the V-vector based HOA Transport Format (VHTF) (HoaTransportType = 3).

24

Figure 5: VHTF representation of HOA

As shown in Figure 5, VHTF is composed of audio signals, $\{A_i\}$, and the associated V-vectors, $\{V_i\}$. An input HOA signal, *H*, can be approximated by:

$$\widetilde{H} = \sum_{i=0}^{N-1} A_i V_i^T$$

where an *i*-th V-vector, V_i , is the spatial representation of the *i*-th audio signal, A_i . N is the number of transport channels. The dynamic range of each V_i is bound by [-1, 1]. Examples of V-vector based spatial representation are given in Figure 6.

Figure 6: Examples for different spatial beam representations that can be expressed by V-vectors

VHTF can also represent an original input HOA, which means $\tilde{H} = H$, in the following conditions:

- if V_i has all zero elements but a value of one at an *i*-th element index, i.e. $[0 \ 0 \ \cdots \ 1 \ \cdots \ 0]^T$;
- and if A_i is the *i*-th HOA coefficients.

Thus, VHTF can represent both pre-dominant and ambient sound field elements.

As shown in Table 19, the HOAFrame_VvecTransportFormat() holds the information that is required to decode the *L* samples (HoaFrameLength in Table 1) of an HOA frame.

Table 19: Syntax of HOAFrame	_VvecTransportFormat()
------------------------------	------------------------

Syntax	No. of bits	Mnemonic
HOAFrame_VvecTransportFormat()		
{		
<pre>VvectorBits = codedVvectorBitDepth*2+2;</pre>	3	uimsbf
<pre>PriorityBits = ceil(log2(NumOfTransportChannels));</pre>		
<pre>for (i=0;i<numoftransportchannels;i++) pre="" {<=""></numoftransportchannels;i++)></pre>		
<pre>priorityOfTC[i];</pre>	PriorityBits	uimsbf
<pre>interpolationOfTC[i];</pre>	1	bslbf
<pre>for (j=0;j<numofhoacoeffs; j++){<="" pre=""></numofhoacoeffs;></pre>	-	
<pre>Vvector[i][j]=((VvecVal+1)*2^(1-VvectorBits))-1.0;</pre>	VvectorBits	uimsbf
}		
}		

NumOfTransportChannels	This element contains information about the number of transport channels
codedVvectorBitDepth	This element contains information about the coded bit depth of a V-vector.
NumOfHoaCoeffs	This element contains information about the number of HOA coefficients defined in Table 1.
VvectorBits	This element contains information about the bit depth of a V-vector.
PriorityBits	This element contains information about the bit depth of HOA transport channel priority.
<pre>priorityOfTC[i]</pre>	This element contains information about the priority of the i-th transport channel (the channel with a lower priority value is more important, thus the channel with priorityOfTC[i] = 0 is the channel with the highest priority).
interpolationOfTc[i]	This flag indicates for i-th transport channel if the spatio-temporal interpolation with the VVector[i] of the previous frame shall be performed (interpolationOfTc[i]=1). If interpolationOfTc[i]=0, no spatio-temporal interpolation shall be performed. This spatio-temporal interpolation for an <i>n</i> -th frame and an <i>i</i> -th transport channel is performed as: $H_i(n) = (w_{in} \cdot A_i(n))V_i^T(n) + (w_{out} \cdot A_i(n))V_i^T(n-1)$ where w_{in} and w_{out} are the fade-in and fade-out windows as defined as: $w_{in} = 0.5 \left[1 - \cos\left(\frac{l}{L}\pi\right)\right] l = [0,, L-1]$ $w_{out} = 0.5 \left[1 - \cos\left(\frac{l+L}{L}\pi\right)\right] l = [0,, L-1].$
VvecVal	An integer value between 0 and 2 ^{VvectorBits} -1.
Vvector[i][j]	This element contains information about a vector element representing spatial information. Its value is bounded by [-1,1].

5 HOA Transport Format Audio Stream

5.1 Introduction

This clause defines an HOA Transport Format Audio Stream (HTFAS) which is a self-contained audio stream format to transport HTF data. Similar to MPEG-H 3D audio stream (MHAS), the transport mechanism uses a packetized approach [4]. Both, configuration data as well as coded payload data is embedded into separate packets. Synchronization and length information is added to enable a self-synchronizing syntax.

5.2 Syntax of HOA Transport Format Audio Stream

In Tables 21, 22 and 23, the syntax elements of HTFAS are defined. In Table 24, the corresponding semantics of HTFAS is defined.

Table 21: Syntax of HOATransportFormatAudioStream()

Syntax	No. of bits	Mnemonic
HOATransportFormatAudioStream()		
<pre>{ while (bitsAvailable() != 0) { HOATransportFormatAudioStreamPacket(); } }</pre>		

Table 22: Syntax of HOATransportFormatAudioStreamPacket ()

Syntax	No. of bits	Mnemonic

break;		
}		
ByteAlign();		
}		
NOTE: A packet with HTFASPacketType 'HTF_PACTYP_HTFCFG' should be transi	nitted before pac	kets with
HTFASPacketType 'HTF_PACTYP_HTFFRAME'.		

Table 24: Semantics of HOATransportFormatAudioStream()

HTFASPacketType	This element contains information about the payload type in the actual packet. A decoder which does not support a certain HTFASPacketType shall skip this packet and continue with the next packet. The values of HTFASPacketType are given in Table 25.
HTFASPacketLabel	This element contains information about an indication of which packets belong together.
HTFASPacketLength	This element contains information about the length of the HTFASPacketPayload () in Bytes.
HoaTransportType	 This element contains information about the HOA transport mode: 0: HOA coefficients as defined in Table 1. 1: ISO/IEC 23008-3 [1] to [4] based HOA Transport Format as defined in clause 4.3. 2: Modified ISO/IEC 23008-3 [1] to [4] based HOA Transport Format for SN3D normalization as defined in clause 4.4. 3: V-vector based HOA Transport Format as defined in clause 4.5.

htfTimeStamp	This element contains information about the time stamp.
HOATransportFormatConfig()	An HTF configuration structure as defined in Table 1.
HOATransportFormatFrame()	An HTF frame payload as defined in clauses 4.2, 4.3, 4.4 and 4.5.
htfas_fill_data_byte	8-bit data elements, no restrictions apply.
syncSpacingLength	This element contains information about the length in Bytes between the last two packets with HTF_PACTYP_SYNC.
htfasParity16Data	This element contains information about a 16-bit field that contains the CRC value that yields a zero output of the 16 registers in the decoder with the polynomial: $x^{16} + x^{15} + x^5 + 1$ and the initial state of the shift register of 0xFFFF.
htfasParity32Data	This element contains information about a 32-bit field that contains the CRC value that yields a zero output of the 32 registers in the decoder with the polynomial: $x^{32} + x^{26} + x^{23} + x^{22} + x^{16} + x^{12} + x^{11} + x^{10} + x^8 + x^7 + x^5 + x^4 + x^2 + x + 1$ and the initial state of the shift register of 0xFFFFFFF.
htfas_descriptor_data_byte	This element contains information used to embed MPEG-2 TS/PS descriptors in the streams. Data conveyed as htfas_descriptor_data_byte has the same syntax and semantics as defined for descriptor() in ISO/IEC 13818-1 [5].
isActive_AUDIOTRUNCATION	If 1 the audio truncation message is active, if 0 the decoder should ignore the message.
truncFromBegin	If 0 truncate samples from the end, if 1 truncate samples from the beginning.
nTruncSamples	number of samples to truncate.
ByteAlign()	Up to 7 fill bits to achieve byte alignment with respect to the beginning of the syntactic element in which ByteAlign() occurs.

Table 25: Value of HTFASPacketType

HTFASPacketType	Value
HTF_PACTYP_FILLDATA	0
HTF_PACTYP_HTFCFG	1
HTF_PACTYP_HTFFRAME	2
/* reserved */	3 - 5
HTF_PACTYP_SYNC	6
HTF_PACTYP_SYNCGAP	7
/* reserved */	8
HTF_PACTYP_CRC16	9
HTF_PACTYP_CRC32	10
HTF_PACTYP_DESCRIPTOR	11
/* reserved */	12 - 16
HTF_PACTYP_AUDIOTRUNCATION	17
/* reserved */	18 - max value

5.3 Application Examples of HOA Transport Format Audio Stream

A simple broadcast can be implemented as shown in Figure 7.

Figure 7: HTFAS - Example 1

As in [1] to [4], then embedding HTFAS into MPEG-2 Transport streams, fast synchronization to a stream at random access points is most important, while bitrate overhead is usually less critical. To improve synchronization to the stream, packets of type HTF_PACTYP_SYNC may be embedded more frequently and in addition the HTF_PACTYP_SYNCGAP type may also be embedded. Figures 8 and 9 indicate some possible solutions.

29

Annex A (informative): Example guidelines for implementing HOA transport over SDI utilizing communications modem technologies

This annex presents guidelines about HOA transport over Serial Digital Interface (SDI) utilizing communications modem technologies [i.1]. This annex gives an example with Type 1 of the HOA Transport Format (HoaTransportType = 1), but it does not have to be limited by this HOA Transport Format. In a typical broadcast workflow, the use of single High-Definition SDI (HD-SDI) link has a limitation of being able to transport only 16 Pulse-Code Modulation (PCM) audio embedded channels. This restricts the transport to a maximum of 3rd order HOA signals (requiring 16 PCM channels) - and that, only if there are no additional data to be transported. If additional audio elements are to be transported, only a maximum of 2nd order HOA (requiring 9 PCM channels) can be transported.

Figure A.1: Block diagram of broadcast chain type-I that transports HOA signals (for simplicity, conversion modules from/to MPEG-2 or MMT or DASH/ROUTE are not described)

The block diagram of broadcast chain that transports N-channel HOA signals is shown in Figure A.1.

At a remote truck, the HOA transport encoder converts the *N*-channel HOA input coefficients into 16 PCM audio channels. The HOA transport encoder consists of the HOA encoder and Side-info modulation block:

- The HOA encoder encodes the HOA input signal into the HOA transport audio signals and the HOA Side-info. More detailed description can be found in clause C.5 of [2].
- For error protection in SDI transmission, the HOA Side-info is modulated with communications modem technologies into a PCM control track signal that fits into the audio signal bandwidth.
- A combination of the HOA transport audio signals and the modulated HOA Side-info signal is called as HOA transport format for SDI transmission. In Figure A.1, 15 audio streams and a single Side-info stream are transported through HD-SDI.

At the contribution encoder, a demodulation block converts the modulated Side-info PCM data into the HOA Side-info binary data. The HOA Side-info and the 15 audio streams are provided to the MPEG-H 3DA contribution encoder as input signals. As described in the section 4.7 of [1], the Contribution Mode of MPEG-H 3DA specifies a generic transport mechanism for audio signals with accompanying metadata. It is designed to be unaware of the signal type and of the content and structure of the associated metadata. A value of speakerLayoutType == 3 in the signaling of the referenceLayout in the mpegh3daConfig() indicates that MPEG-H 3D audio shall operate in Contribution Mode. In Contribution Mode, the rendering context shall operate in a pass-through mode. Then, MPEG-2 TS, MMT, or DASH/ROUTE can be used as a transport format between a remote truck and a network operating centre (NOC). This conversion is not described in Figure A.1 for simplicity.

At NOC, the contribution decoder reconstructs the HOA transport format for SDI transmission. Between the contribution decoder and encoder at NOC, several operations can be performed including program switching and monitoring.

At local affiliate, the contribution decoder also reconstructs the HOA transport format for SDI transmission. The HOA emission encoder is depicted in Figure A.2. Emission bit-rate and hoaIndependencyFlag are determined at the emission encoder. Based on a given emission bit-rate:

- 1) a subset of audio channels is selected for MPEG-H 3DA core coding; and
- 2) a subset of HOA Side-info is selected for transmission.

Then, the bit-stream generated from the MPEG-H 3DA core encoder will be transmitted to the users with over-the-top (OTT) streaming services or over-the-air (OTA) TV services.

Emission bit rate and independency flag

Figure A.2: Block diagram of HOA emission encoder

For example, a 6th order HOA input can be transported from a remote truck to a local affiliate as follows:

- At a remote truck, the HOA encoder converts the input 49 PCM channels to the HOA transport format for SDI, which contains 13 HOA transport audio signals along with a single HOA Side-info. The HOA Side-info binary data is modulated into a PCM channel. The 16 channel HD-SDI can carry these (13+1) PCM channels and 2 empty channels to the contribution encoder.
- 2) The contribution encoder demodulates Side-info data, which are encoded with MPEG-H 3DA contribution mode.
- 3) At the NOC and local affiliates, the contribution decoder reconstructs the 16 SDI channel PCM data. The contribution encoder demodulates Side-info data, which are encoded with MPEG-H 3DA contribution mode.
- 4) The emission encoder controls the emission bit rate, hoaIndependencyFlag, and the number of transport channels for the emission to the users. If hoaIndependencyFlag == 1 then the present frame shall be independently decodable. From 16 channels, 13 transport audio channels and 1 demodulated control data are extracted. Based on the configuration (e.g. emission bit rate, hoaIndependencyFlag) at the emission encoder, a subset of audio channels is selected for core encoding and a subset of the HOA side info is selected as an HOA control data. Bit-stream packetization is followed for final emission.

Annex B (informative): Example guidelines for HOA production

This annex provides example guidelines for HOA production. This annex gives an example with Type 1 of the HOA Transport Format (HoaTransportType = 1), but it does not have to be limited by this HOA Transport Format.

Figure B.1: Block diagram of HOA Content Production

Figure B.1 shows the block diagram of the HOA content production workflow. The HOA encoder can be placed outside the broadcast chain. In this case, the HOA transport format can be generated at an HOA content production device, such as a microphone or a digital audio workstation (DAW), and can be fed into the contribution encoder at the remote truck. The Side-info data modulation is an optional step depending on the input channel to the contribution encoder.
