Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://www.etsi.org/ipr).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This Technical Specification (TS) has been produced by the ETSI 3rd Generation Partnership Project (3GPP).

The present document may refer to technical specifications or reports using their 3GPP identities, UMTS identities or GSM identities. These should be interpreted as being references to the corresponding ETSI deliverables.

The cross reference between GSM, UMTS, 3GPP and ETSI identities can be found under www.etsi.org/key .

Foreword

This Technical Specification (TS) has been produced by the 3rd Generation Partnership Project (3GPP).

The present document is part 3 of a multi-part TS covering the 3rd Generation Partnership Project: Technical Specification Group Services and System Aspects; Telecommunication Management; Configuration Management, as identified below:

- Part 1: "3G Configuration Management: Concept and Requirements";
- Part 2: "Notification Integration Reference Point: Information Service Version 1";

Part 3: "Notification Integration Reference Point: CORBA Solution Set Version 1:1";

- Part 4: "Notification Integration Reference Point: CMIP Solution Set Version 1:1";
- Part 5: "Basic Configuration Management IRP Information Model (including NRM) Version 1";
- Part 6: "Basic Configuration Management IRP CORBA Solution Set Version 1:1";
- Part 7: "Basic Configuration Management IRP CMIP Solution Set Version 1:1";
- Part 8: "Name Convention for Managed Objects".

The contents of the present document are subject to continuing work within the TSG and may change following formal TSG approval. Should the TSG modify the contents of the present document, it will be re-released by the TSG with an identifying change of release date and an increase in version number as follows:

Version x.y.z

where:

- x the first digit:
 - 1 presented to TSG for information;
 - 2 presented to TSG for approval;
 - 3 or greater indicates TSG approved document under change control.
- y the second digit is incremented for all changes of substance, i.e. technical enhancements, corrections, updates, etc.
- z the third digit is incremented when editorial only changes have been incorporated in the document.

Introduction

Configuration Management (CM), in general, provides the operator with the ability to assure correct and effective operation of the 3G network as it evolves. CM actions have the objective to control and monitor the actual configuration on the Network Elements (NEs) and Network Resources (NRs), and they may be initiated by the operator or by functions in the Operations Systems (OSs) or NEs.

CM actions may be requested as part of an implementation programme (e.g. additions and deletions), as part of an optimisation programme (e.g. modifications), and to maintain the overall Quality of Service (QoS). The CM actions are initiated either as a single action on a NE of the 3G network or as part of a complex procedure involving actions on many NEs.

The Itf-N interface for CM is built up by a number of Integration Reference Points (IRPs) and a related Name Convention, which realise the functional capabilities over this interface. The basic structure of the IRPs is defined in ITU-T Recommendation X.736 [1] and OMG TC Document telecom [2]. For CM, a number of IRPs (and the Name

Convention) are defined herein, used by this as well as other specifications for Telecom Management (TM) produced by 3GPP. All these are included in 3GPP TS 32.106 from Part 2 and onwards.

The present document is Part 3 of 3GPP TS 32.106 (3GPP TS 32.106-3) - Notification IRP CORBA Solution Set.

IRP Solution Set version: The version of this CORBA Solution Set is 1:1, where the first "1" means that it corresponds to the Information Service (3GPP TS 32.106-2 [5]) version 1, and the second "1" means that it is the first CORBA Solution Set corresponding to this Information Service version.

1 Scope

The present document specifies the Common Object Request Broker Architecture (CORBA) Solution Set (SS) for the IRP whose semantics is specified in Notification IRP: Information Service (3GPP TS 32.106-2 [5]).

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies. In the case of a reference to a 3GPP document (including a GSM document), a non-specific reference implicitly refers to the latest version of that document *in the same Release as the present document*.

- [11] 3GPP TS 32.106-1: "3G Configuration Management: Concept and Requirements".

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply: Please refer to 3GPP TS 32.101 [9], 3GPP TS 32.102 [10] and 3GPP TS 32.106-1 [11].

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

CM	Configuration Management
CORBA	Common Object Request Broker Architecture (OMG)
EC	Event channel (OMG)

IDL	Interface Definition Language (OMG)
IS	Information Service
IOR	Interoperable Object Reference
NC	Notification Channel (OMG)
NE	Network Element
NV	Name and Value pair
EM	Element Manager
OMG	Object Management Group
QoS	Quality of Service
SS	Solution Set
UML	Unified Modelling Language (OMG)

4 Architectural features

The overall architectural feature of Notification IRP is specified in 3GPP TS 32.106-2 [5]. This clause specifies features that are specific to the CORBA Solution Set (SS).

4.1 Notification services

In the CORBA Solution Set, notifications are emitted by IRPAgent using CORBA Notification service (OMG TC Document telecom [2]).

CORBA Event service (OMG CORBA services [3]) provides event routing and distribution capabilities. CORBA Notification service provides, in addition to Event service, event filtering and support for Quality of Service (QoS) as well.

A subset of CORBA Notification services shall be used to support the implementation of notification. This CORBA Notification service subset, in terms of OMG Notification service (OMG TC Document telecom [2]) defined methods, is identified in the present.

4.1.1 Support of Push and Pull Interface

The IRPAgent shall support the OMG Notification push interface model. Additionally, it may support the OMG Notification pull interface model as well.

4.1.2 Support of multiple notifications in one push operation

For efficiency, IRPAgent uses the following OMG Notification Service (OMG TC Document telecom [2]) defined interface to pack multiple notifications and push them to IRPManager using one method push_structured_events. The method takes as input a parameter of type EventBatch as defined in the OMG CosNotification module (OMG TC Document telecom [2]). This data type is a sequence of Structured Events (see clause 4). Upon invocation, this parameter will contain a sequence of Structured Events being delivered to IRPManager by IRPAgent to which it is connected.

The maximum number of events that will be transmitted within a single invocation of this operation is controlled by IRPAgent wide configuration parameter. The amount of time IRPAgent will accumulate individual events into the sequence before invoking this operation is controlled by IRPAgent wide configuration parameter as well.

IRPAgent may push EventBatch with only one Structured Event.

The OMG Notification service (OMG TC Document telecom [2]) defined IDL module is shown below.

module CosNotifyComm {

```
Interface SequencePushConsumer : NotifyPublish {
    void push_structured_events(
        in CosNotification::EventBatch notifications)
    raises( CosEventComm::Disconnected);
    ...
```

```
}; // SequencePushConsumer
```

}; // CosNotifyComm

5 Mapping

5.1 Operation mapping

Notification IRP: IS (3GPP TS 32.106-2 [5]) defines semantics of operations visible across this IRP.

Table 1 maps the operations defined in Notification IRP: IS (3GPP TS 32.106-2 [5]) to their equivalents (methods) in this Solution Set (SS). It also qualifies if a method is Mandatory (M) or Optional (O)

ch_push, attach_push_b, attach_pull ch notification_IRP_version subscription_status	M, O, O M M

5.2 Operation parameter mapping

3GPP TS 32.106-2 [5] defines semantics of parameters carried in operations across the Notification IRP. Table 2 through table 12 indicate the mapping of these parameters, as per operation, to their equivalents defined in this SS.

IS Oper	ation parameter	SS Method parameter	Qualifier

5.3 Notification parameter mapping

Notification IRP: IS (3GPP TS 32.106-2 [5]) defines a generic notify and its parameters. This SS does not provide the mapping of these parameters to their CORBA SS equivalents.

Other IRPs using the Notification IRP such as Alarm IRP: IS (3GPP TS 32.111-2 [6]) extend the generic notify for their specific use. Their corresponding SS documents shall define the mapping from their specific notification parameters (defined in their IS document) to their SS equivalents. These SS documents shall qualify their SS equivalents as well.

5.4 Attribute mapping

Notification IRP: IS (3GPP TS 32.106-2 [5]) defines the semantics of common attributes carried in notifications. This SS does not provide the mapping of these attributes to their CORBA SS equivalents. Other IRPs such as Alarm IRP: IS (3GPP TS 32.111-2 [6]) identify and qualify these common attributes for use in their environment. Their corresponding SS documents define the mapping of these attributes to their SS equivalents.

6 Use of OMG Notification StructuredEvent

Notification IRP: IS (3GPP TS 32.106-2 [5]) defines attributes that are commonly present in notifications of all notification categories such as notifications emitted from Alarm IRP IRPAgent.

In CORBA SS, OMG defined StructuredEvent (OMG TC Document telecom [2]) is used to carry notification. This clause identifies the OMG defined StructuredEvent attributes that carry the common attributes defined in 3GPP TS 32.106-2 [5].

The composition of OMG StructuredEvent is:

```
Header
Fixed Header
Domain_name
Type_name
Event_name
Variable Header
Body
Filterable_body_fields
Remaining_body
```

Table 13 shows the OMG Structured Event attributes (middle column) that are used to carry the common notification attributes defined in Notification IRP: IS (3GPP TS 32.106-2 [5]).

Common attributes defined in Notification IRP: IS (3GPP TS 32.106-2 [5])	defined by	Comment
There is no corresponding SS attribute.		It indicates that the StructuredEvent, carried in the Notification, is defined by a specific 3GPP IRP such as Alarm IRP, as opposed to OMG specified Telecommunication, healthcare, utility, finance, etc. It indicates the CORBA SS version number as well. It is a string. Legal values are defined in module. For Alarm IRP version 1:1, the value is ALARM_IRP_VERSION_1_1.
eventType	type_name	It indicates event types of this notification. The semantics of the event type is defined by ITU-T TMN Recommendations. Each IRP, such as Alarm IRP IS version 1, shall identify the ITU-T defined event types for their use. Each such IRP document shall define the values of the identified event Types as well.

Table 13: Attributes of StructuredEvent

		Dependent on the notification category, possible legal values are:
		COMMUNICATIONS_ALARM (clause 8.1.1 of ITU-T Recommendation X.736 [8]), QUALITY_OF_SERVICE_ALARM (clause 8.1.1 of ITU-T Recommendation X.736 [8]), PROCESSING_ERROR_ALARM (clause 8.1.1 of ITU-T Recommendation X.736 [8]), EQUIPMENT_ALARM (clause 8.1.1 of ITU-T Recommendation X.736 [8]), ENVIRONMENTAL_ALARM (clause 8.1.1 of ITU-T Recommendation X.736 [8]),
		PHYSICAL_VIOLATION (ITU-T Recommendation X.736 [1]), INTEGRITY_VIOLATION (ITU-T Recommendation X.736 [1]), SECURITY_VIOLATION (ITU-T Recommendation X.736 [1]),
		TIME_DOMAIN_VIOLATION (ITU-T Recommendation X.736 [1]), OPERATIONAL_VIOLATION (ITU-T Recommendation X.736 [1]).
		The bracketed number of each type indicates the reference where the semantics of the type is specified.
		It is a string. See each individual CORBA SS IDL module for each IRP using the Notification IRP, for legal values used by that IRP version.
		Since each IRP except Notification IRP specifies its own set of event type, the values specified by each IRP are only unique within one IRP. For uniqueness among all IRPs' specifications, the values of event type shall be coupled with the notification category, the value carried in domain_name of the same notification.
extended EventType	event_name	The legal values carried in this attribute are specified by the IRP using the notification. For example, Alarm IRP: CORBA SS (3GPP TS 32.111-3 [7]) defines and uses the following values:
		NOTIFY_FM_NEW_ALARM, NOTIFY_FM_CHANGED_ALARM, NOTIFY_FM_ACK_STATE_CHANGED, NOTIFY_FM_CLEARED_ALARM and NOTIFY_FM_ALARM_LIST_REBUILT.
		It is a string. See each individual CORBA SS IDL module for each IRP using the Notification IRP, for legal values used by that IRP version.
		Since each IRP except Notification IRP specifies its own set of extended event type, the values specified by each IRP are only unique within one IRP. For uniqueness among all IRPs' specification, the values of extended event type shall be coupled with the notification category, the value carried in domain_name of the same notification.
There is no corresponding SS attribute.	variable Header	
managed Object Class, managed Object Instance	(name-value) pair of filterable_	Name of NV pair is a string, NV_MANAGED_OBJECT_INSTANCE. Value of NV pair is a string. Syntax and semantics of this string conform to the Managed Object string representation specified in (3GPP TS 32.106-8 [4]). Note that two SS attributes are carried in this one NV pair since the string
notificationId		representation specified in 3GPP TS 32.106-8 [4] can convey the semantics of managedObjectClass and managedObjectInstance in one string. Name of NV pair is a string, NV_NOTIFICATION_ID.
	of filterable_ body_fields	Value of NV pair is a long.
eventTime	One NV pair of filterable_	Name of NV pair is a string, NV_EVENT_TIME. Value of NV pair is an IRPTime.
	body_fields	
systemDN	One NV pair of	Name of NV pair is a string, NV_SYSTEM_DN. Value of NV pair is a string. Syntax and semantics of this string conforms to the

	filterable_	Managed Object string representation specified in 3GPP TS 32.106-8 [4].
	body_fields	
There is no	remaining_	
corresponding SS	Body	
attribute.		

7 IRPAgent's Behaviour

This clause describes some IRPAgent's behaviour not captured by IDL.

7.1 Subscription

IRPManager can invoke multiple attach_push, multiple attach_push_b or multiple attach_pull using different manager_reference(s). As far as IRPAgent is concerned, the IRPAgent will emit notifications to multiple "places" with their independent filter requirements. IRPAgent will not know if the notifications are going to the same IRPManager.

If IRPManager invokes multiple attach_push, attach_push_b or attach_pull using the same manager_reference and with an already subscribed notification_category, IRPAgent shall raise AlreadySubscribed exception to all invocations except one.

IRPManager can invoke multiple attach_push using the same manager_reference and with one or more notyet-subscribed notification_categories. In this case, if IRPAgent supports all the notification categories requested, IRPAgent shall accept the invocation; otherwise, it raises

AtLeastOneNotificationCategoryNotSupported exception. IRPAgent shall have similar behaviour for attach_push_b and attach_pull.

When IRPManager is in subscription by invoking attach_push, IRPManager can change the filter constraint, using change_subscription_filter, applicable to the notification categories specified in the attach_push.

When IRPManager is in subscription by invoking attach_push_b, IRPManager can change the filter constraint during subscription using the OMG defined Notification Service Filter Interface. IRPManager shall not use change_subscription_filter; otherwise it shall get an exception.

7.2 IRPAgent supports multiple categories of Notifications

IRPAgent may emit multiple categories of Notifications. IRPAgent may have mechanism for IRPManager to pull for notifications of multiple categories.

IRPManager can query IRPAgent about the categories of notifications supported by using get_notification_categories.

IRPManager uses a parameter, notification_categories, in attach_push, attach_push_b and attach_pull to specify one or more categories of notifications wanted.

IRPManager uses a zero-length sequence in notification_categories of attach_push, attach_push_b and attach_pull to specify that all IRPAgent supported categories of notifications are wanted. If IRPManager uses attach_push with zero-length sequence in notification_categories and if the operation is successful, IRPAgent shall reject subsequent attach_push operation, regardless if the notification_categories contains a zero-length sequence or one or more specific notification categories. IRPAgent shall have similar behaviour for attach_push_b and attach_pull.

7.3 IRPAgent's integrity risk of attach_push_b Method

In the case that IRPAgent implements this method by extending or using OMG compliant Notification Service, the following IRPManager behaviour illustrates a risk to IRPAgent's integrity.

Given the object reference (IOR) of the SequenceProxyPushSupplier (as the mandatory output parameter of the subject method), IRPManager can invoke sequenceProxyPushSupplier.MyAdmin method.

IRPManager can then obtain the consumer admin object of the proxy. Then IRPManager can invoke consumerAdmin.MyChannel to get the IOR of the Notification Channel. IRPManager then can call eventChannel.MyFactory which will provide IRPManager the IOR of the EventChannelFactory itself. IRPManager can then able to invoke methods directly on the EventChannelFactory, like get_all_channels which lists all channel numbers and create_channel which allows IRPManager to create any number of additional channels.

A malicious IRPManager can, given access to the EventChannelFactory, get a list of existing channels and start connecting them together at random thus compromising the IRPAgent's integrity. Deployment of this attach_push_b needs strong authentication and authorisation mechanism in place.

attach_push is mandatory. IRPAgent compliant to this IRP shall implement it.

attach_push_b is optional. It is recommended that IRPAgent concerned with integrity risk should not implement the attach_push_b option.

7.4 Quality of Service Parameters

The OMG Notification Service [2] supports a variety of Quality of Service (QoS) properties, such as reliability and priority, that may be expressed to indicate the delivery characteristics of notifications. While many of these QoS parameters need to be based on Service Level Agreements, a number of them need to be specified as required. The following OMG Notification Service QoS parameter settings are required:

- 1. The order policy shall be set to FifoOrder (First-in, First-out) [2].
- 2. The message priority shall be set to 0, i.e., no priority [2].
- 3. The Start Time Supported shall be set to false, i.e., do not use Start Time [2].
- 4. The Stop Time Supported shall be set to false, i.e., do not use Stop Time [2].

When the OMG Notification Service is used, the IRPAgent has the responsibility of setting the OMG Notification Service Quality of Service parameters.

When the OMG Notification Service is not used, the IRPAgent has the responsibility to provide First-in, First-out notification ordering and to not provide priority to one Event Type and/or Extended Event Type over others.

8

Example of Notification related to alarm

The following is an example of Notification related to alarm.

If type_name == NOTIFY_FM_NEW_ALARM, then the filterable_body_field attributes can contain:

```
{
    systemDN, "...";
    alarmId, "abce232",
        notificationId, 4467,
    managedObjectInstance, "...",
        eventTime, ...,
    probableCause, 3,
    perceivedSeverity, 2,
    specificProblems, "xxx",
    additionalText, "...",
    ...
}
```

```
Annex A (normative):
Notification IRP CORBA IDL
```
