When either MCG DRX or SCG DRX is used, or both MCG DRX and SCG DRX are used in RRC\_CONNECTED state the physical layer measurement period ( $T_{\text{measure\_SSTD1}}$ ) of the SSTD measurement shall be as specified in table 8.8.7.2-1.

**Table 8.8.7.2-1: SSTD measurement requirement when DRX is used**

| DRX cycle length (s)                                                                                                                                                                                                                                                                                                                                                     | $T_{\text{measure\_SSTD1}}$ (s) (DRX cycles) |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| $\leq 0.04$                                                                                                                                                                                                                                                                                                                                                              | 0.2 (Note1)                                  |
| $0.04 < \text{DRX-cycle} \leq 2.56$                                                                                                                                                                                                                                                                                                                                      | Note2 (5)                                    |
| Note1: Number of DRX cycle depends upon the DRX cycle in use<br>Note2: Time depends upon the DRX cycle in use<br>Note3: DRX cycle length in this table refers to the DRX cycle length configured on the CG in which DRX is used. When DRX is used in both MCG and SCG, DRX cycle length in this table refers to the longer DRX cycle length between MCG DRX and SCG DRX. |                                              |

If PCell is changed without changing PCC, and/or if PSCell is changed without changing a frequency of PSCell or if both PCell and PSCell are change by swapping the PCC with the frequency of PSCell while the UE is performing SSTD measurements, then the UE shall also meet the SSTD measurement and accuracy requirements corresponding to the new PCell and/or PSCell. However in this case the UE shall restart the SSTD measurement. In this case the total physical layer measurement period of the SSTD measurement shall not exceed  $T_{\text{measure\_SSTD2}}$  as defined in the following expression:

$$T_{\text{measure\_SSTD2}} = (N+M+1) \cdot (T_{\text{measure\_SSTD1}}) + N \cdot T_{\text{PCell\_change\_DC}} + M \cdot T_{\text{PSCell\_change\_DC}}$$

Where:

N is the number of times the PCell is changed over the measurement period ( $T_{\text{measure\_SSTD2}}$ ),

M is the number of times the PSCell is changed over the measurement period ( $T_{\text{measure\_SSTD2}}$ ),

$T_{\text{PCell\_change\_DC}}$  is the time necessary to change the PCell; it can be up to 25 ms,

$T_{\text{PSCell\_change\_DC}}$  is the time necessary to change the PSCell; it can be up to 25 ms.

The measurement accuracy for the SSTD measurement when DRX is used as well as when no DRX is used shall be as specified in the sub-clause 9.1.20.

### 8.8.7.3 SSTD Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{\text{DCCH}}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report. When the UE is configured to perform SRS carrier based switching, an additional delay can be expected.

Reported measurements contained in periodically triggered measurement reports shall meet the requirements in sub-clause 9.1.20.

## 8.8.8 Intra-frequency measurements requirements on SCell

SCell intra-frequency measurements shall meet all applicable requirements in clause 8.3.3. In case where the SCell belongs to MCG, the term “common DRX” in clause 8.3.3 shall be deemed to be replaced with “MCG DRX”. In case where the SCell belongs to SCG, the term “common DRX” and PCell in clause 8.3.3 shall be replaced with “SCG DRX” and PSCell, respectively.

## 8.9 MBSFN Measurements

### 8.9.1 Introduction

The requirements specified in Section 8.9 apply for MBSFN measurements (MBSFN RSRP, MBSFN RSRQ, and MCH BLER defined in [4]), which are performed in `RRC_CONNECTED` and logged for MDT by UEs which are MBMS-capable and also indicate their MBSFN measurement logging capability [2].

UE shall measure MBSFN RSRP, MBSFN RSRQ and MCH BLER only in subframes and on carriers where UE is decoding PMCH. The requirements are specified for any carrier where PMCH is received by UE. The requirements specified in this section apply for any carrier frequency with configured MBSFN subframes with PMCH, which may be the same as or different from any serving unicast carrier.

The UE receiving PMCH on any non-serving carrier and performing MBSFN measurements shall not cause interruptions on any serving carrier in unicast subframes and in the subframes with non-MBSFN multicast transmissions such as system information.

The requirements in section 8.9 shall also apply, when the UE is configured to perform SRS carrier based switching.

The requirements in Section 8.9 apply for 15 kHz subcarrier spacing configured in MBSFN subframes. The same requirements apply also for 1.25 kHz and 7.5 kHz subcarrier spacing, provided that  $\text{MBSFN RSRP}[\text{dBm}/(\text{L}) \text{ kHz}] = \text{MBSFN RSRP}[\text{dBm}/15\text{kHz}] + 10 \cdot \log_{10}(\text{L}/15)$ , where L is 1.25 kHz or 7.5 kHz.

### 8.9.2 MBSFN RSRP Measurements

The UE physical layer shall be capable of performing the MBSFN RSRP measurement [4] within the MBSFN RSRP measurement period and report the measurement, while meeting the MBSFN RSRP measurement accuracy requirements specified in section 9.8.2.

The MBSFN RSRP measurement period is defined as the maximum between 640ms and the period during which the UE decodes [5, Section 10] 5 subframes containing PMCH transmissions.

The MBSFN RSRP measurement period is the same for UE using any DRX cycle, any `eDRX_CONN` cycle, or no DRX.

### 8.9.3 MBSFN RSRQ Measurements

The UE physical layer shall be capable of performing the MBSFN RSRQ measurement [4] within the MBSFN RSRQ measurement period and report the measurement, while meeting the MBSFN RSRQ measurement accuracy requirements specified in section 9.8.3.

The MBSFN RSRQ measurement period is defined as the maximum between 640ms and the period during which the UE decodes [5, Section 10] 5 subframes containing PMCH transmissions.

The MBSFN RSRQ measurement period is the same for UE using any DRX cycle, any `eDRX_CONN` cycle, and no DRX.

### 8.9.4 MCH BLER Measurements

The UE physical layer shall be capable of performing and reporting the MCH BLER measurement [4] to higher layers within the MCH BLER measurement period. The MCH BLER measurement reporting is according to section 9.8.4.

The MCH BLER measurement period is equal to the MBSFN logging interval configured by higher layers [2].

## 8.10 Proximity-based Services

### 8.10.1 Introduction

This section contains the requirements for the UE capable of ProSe Direct Communication and/or ProSe Direct Discovery in RRC\_CONNECTED state.

### 8.10.2 Requirements

When a UE in RRC\_CONNECTED state is performing transmissions and/or reception for ProSe Direct Discovery and/or ProSe Direct Communication, the UE shall meet all the requirements specified in Section 8.

Note: The UE may need to interrupt ProSe operation in order to meet the measurement requirements of Section 8.

#### 8.10.2.1 Initiation/Cease of SLSS transmissions with ProSe Direct Discovery

The requirements in this subclause are applicable to a UE capable of ProSe Direct Discovery and SLSS transmission and reception.

The requirements apply when the conditions for SLSS transmissions specified in [2] are met; *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType19*. The UE shall be capable of measuring the RSRP of the cell used to transmit ProSe Direct Discovery announcements and evaluate to initiate/cease SLSS transmissions within  $T_{\text{evaluate,SLSS}}$  where,

- $T_{\text{evaluate,SLSS}} = 0.4$  seconds when UE is not configured with DRX, or,
- $T_{\text{evaluate,SLSS}} =$  as specified in Table 8.10.2.1-1 when UE is configured with DRX.

**Table 8.10.2.1-1:  $T_{\text{evaluate,SLSS}}$  with ProSe Direct Discovery**

| DRX cycle length [s]                                          | $T_{\text{evaluate,SLSS}}$<br>[s] (number of DRX cycles) |
|---------------------------------------------------------------|----------------------------------------------------------|
| $\leq 0.04$                                                   | 0.4 (Note 1)                                             |
| $0.04 < \text{DRX-cycles} \leq 2.56$                          | Note 2 (6)                                               |
| Note1: Number of DRX cycles depends upon the DRX cycle in use |                                                          |
| Note2: Time depends upon the DRX cycles in use                |                                                          |

If higher layer filtering is configured, an additional delay in evaluation to initiate/cease SLSS transmissions can be expected.

For the cell used to transmit ProSe Direct Discovery announcements:

- RSRP related side conditions given in Sections 9.1.2.1 and 9.1.2.2 and RSRQ related side conditions given in Clause 9.1.5.1 for a corresponding Band are fulfilled,
- SCH<sub>RP</sub> and SCH<sub>Ês/Iot</sub> according to Annex B.2.1 for a corresponding Band are fulfilled.

#### 8.10.2.2 Initiation/Cease of SLSS transmissions with ProSe Direct Communication

The requirements in this subclause are applicable to a UE capable of ProSe Direct Communication.

The requirements apply when the conditions for SLSS transmissions specified in [2] are met; *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType18*. The UE shall be capable of measuring the RSRP of the cell used to transmit ProSe Direct Communication to evaluate to initiate/cease SLSS transmissions within  $T_{\text{evaluate,SLSS}}$

where,

- $T_{\text{evaluate,SLSS}} = 0.4$  seconds when UE is not configured with DRX.

- $T_{\text{evaluate,SLSS}}$  = as specified in Table 8.10.2.2-1 when UE is configured with DRX.

**Table 8.10.2.2-1:  $T_{\text{evaluate,SLSS}}$  with ProSe Direct Communication**

| DRX cycle length [s]                                          | $T_{\text{evaluate,SLSS}}$<br>[s] (number of DRX cycles) |
|---------------------------------------------------------------|----------------------------------------------------------|
| $\leq 0.04$                                                   | 0.4 (Note 1)                                             |
| $0.04 < \text{DRX-cycle} \leq 2.56$                           | Note 2 (6)                                               |
| Note1: Number of DRX cycles depends upon the DRX cycle in use |                                                          |
| Note2: Time depends upon the DRX cycles in use                |                                                          |

If higher layer filtering is configured, an additional delay in evaluation to initiate/cease SLSS transmissions can be expected.

For the cell used to transmit ProSe Direct Communication:

- RSRP related side conditions given in Sections 9.1.2.1 and 9.1.2.2 and RSRQ related side conditions given in Clause 9.1.5.1 for a corresponding Band are fulfilled,
- SCH<sub>RP</sub> and SCH<sub>Es/lot</sub> according to Annex B.2.1 for a corresponding Band are fulfilled.

## 8.11 Discovery Signal Measurements under Operation with Frame Structure 3

### 8.11.1 Introduction

This section contains requirements on the UE for measurement reporting in RRC\_CONNECTED state when discovery signal [16] is configured. The requirements are specified for E-UTRA CRS based discovery signal measurements and CSI-RS based discovery signal measurements.

The requirements in Section 8.11.2 shall apply for CRS based discovery signal measurements comprising RSRP and RSRQ measurements [4]. The requirements in Section 8.11.3 shall apply for CSI-RS based discovery signal measurements comprising CSI-RSRP measurements [4]. The requirements in Section 8.11.4 shall apply for UE RSSI measurements [4]. The requirements in Section 8.11.5 shall apply for UE channel occupancy measurements [2].

The measurement quantities are defined in [4], the measurement model is defined in [22] and measurement accuracy requirements are specified in Section 9. Control of measurement reporting is specified in TS 36.331 [2].

The requirements in Section 8.11 shall apply for carrier with E-UTRA operation following the frame structure type 3 [16].

The requirements in Section 9 are applicable for a UE performing measurements according to Section 8.11.

### 8.11.2 CRS based discovery signal measurements

#### 8.11.2.1 E-UTRAN intra-frequency measurements

NOTE: The requirements in this section are applicable only for measurements on SCC following the frame structure type 3 [16].

The UE shall be able to identify new intra-frequency FS3 cells and perform measurements of identified intra-frequency cells without an explicit intra-frequency neighbour cell list containing physical layer cell identities. During the RRC\_CONNECTED state the UE shall continuously measure identified intra-frequency cells and additionally search for and identify new intra-frequency cells.

##### 8.11.2.1.1 Requirements

###### 8.11.2.1.1.1 Requirements when no DRX is used

When no DRX is in use the UE shall be able to identify a new detectable FS3 intra-frequency cell within the cell identification time  $T_{\text{identify\_intra\_FS3}}$ , where the identification time of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_intra\_FS3\_CRS}}$ , where:

$T_{\text{identify\_intra\_FS3}}$  is the intra-frequency cell identification period as specified in Table 8.11.2.1.1.1-1,

$T_{\text{measure\_intra\_FS3\_CRS}}$  is the intra-frequency period for measurements as shown in Table 8.11.2.1.1.1-2,

$T_{\text{DMTC\_periodicity}}$  is the discovery signal measurement timing configuration periodicity of higher layer,

$L$  is the number of configured discovery signal occasions which are not available during  $T_{\text{identify\_intra\_FS3}}$  for cell identification at the UE due to the absence of the necessary radio signals from the cell or due to the corresponding downlink subframe being configured as an uplink subframe,

$M$  is the number of configured discovery signal occasions which are not available during  $T_{\text{measure\_intra\_FS3\_CRS}}$  for the measurements at the UE due to the absence of the necessary radio signals from the cell or due to the corresponding downlink subframe being configured as an uplink subframe.

**Table 8.11.2.1.1.1-1: Intra-frequency cell identification requirement under operation with frame structure 3**

| SCH $\hat{E}_s/\text{lot}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | CRS<br>measurement<br>bandwidth [RB]<br>Note2 | CRS $\hat{E}_s/\text{lot}$                 | $T_{\text{identify\_intra\_FS3}}$ [ms]              |

| NOTE 4: The requirements apply, provided that L is such that the intra-frequency cell identification period $T_{\text{identify\_intra\_FS3}}$ does not exceed $72 * k_1 * k_2 * T_{\text{DMTC\_periodicity}}$ .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                               |                                            |                                                     |

A cell shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_intra\_FS3}}$ :

- RSRP related side conditions given in Section 9.1.18.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Section 9.1.18.3 are fulfilled for a corresponding Band,
- SCH\_RP is according to Annex B.2.12 for a corresponding Band and SCH  $\hat{E}_s/\text{lot}$  is according to Table 8.11.2.1.1.1-1.

If higher layer filtering is used, an additional cell identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for intra-frequency measurements is  $T_{\text{measure\_intra\_FS3\_CRS}}$  as shown in Table 8.11.2.1.1.1-2, when no DRX is in use. The UE shall be capable of performing RSRP and RSRQ measurements for 3 identified intra-frequency cells, and the UE physical layer shall be capable of reporting measurements to higher layers within the measurement period of  $T_{\text{measure\_intra\_FS3\_CRS}}$ .

**Table 8.11.2.1.1.1-2: Intra-frequency measurement requirements under operation with frame structure 3**

| SCH Ês/lot          | CRS measurement bandwidth [RB] <sup>Note2</sup> | CRS Ês/lot      | T <sub>measure_intra_FS3_CRS</sub> [ms]       |
|---------------------|-------------------------------------------------|-----------------|-----------------------------------------------|
| 0 ≤ SCH Ês/lot      | <25                                             | -6 ≤ CRS Ês/lot | (5+M) * k1*k2* T <sub>DMTC_periodicity</sub>  |
| -6 ≤ SCH Ês/lot < 0 | <25                                             |                 | (20+M) * k1*k2* T <sub>DMTC_periodicity</sub> |
| 0 ≤ SCH Ês/lot      | ≥ 25                                            | 0 ≤ CRS Ês/lot  | (1+M) * k1*k2* T <sub>DMTC_periodicity</sub>  |
| -6 ≤ SCH Ês/lot < 0 | ≥ 25                                            |                 | (4+M) * k1*k2* T <sub>DMTC_periodicity</sub>  |

NOTE 1: Discovery signal occasion duration (*ds-OccasionDuration*) is 1 ms.

NOTE 2: The requirements for measurement bandwidth ≥ 25 RB are optional.

NOTE 3: k1=2 when the measurement gaps configured for inter-frequency measurements in DMTC occasions or for inter-frequency RSSI measurements in RMTC occasions on a carrier with frame structure 3 overlap with some but not all DMTC occasions of the measured cell; otherwise, k1=1, e.g., when measurement gaps configured for inter-frequency measurements on a carrier with frame structure 3 do not overlap with DMTC occasions of the measured cell or when the UE does not require the measurement gaps for the inter-frequency measurements. The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.

$$k2 = \max \left( 2, \left\lceil \frac{N_{FS3\_SCC}}{2} \right\rceil \right) \text{ when DMTC occasions in the measured cell not overlapping with the inter-}$$

frequency measurement gaps overlap with DMTC occasions of  $N_{FS3\_SCC}$  ( $N_{FS3\_SCC} > 0$ ) SCells on other FS3 carriers; otherwise, k2=1, e.g., when  $N_{FS3\_SCC}$  is 0.

NOTE 4: The requirements apply, provided that M is such that the intra-frequency measurement period T<sub>measure\_intra\_FS3\_CRS</sub> does not exceed 60\*k1\*k2 T<sub>DMTC\_periodicity</sub>.

The RSRP measurement accuracy for all measured cells shall be as specified in Section 9.1.18.2, and the RSRQ measurement accuracy for all measured cells shall be as specified in Section 9.1.18.3.

#### 8.11.2.1.1.1.1 Measurement Reporting Requirements

##### 8.11.2.1.1.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in Sections 9.1.18.2 and 9.1.18.3, respectively.

##### 8.11.2.1.1.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurements contained in event triggered periodic measurement reports shall meet the requirements in Sections 9.1.18.2 and 9.1.18.3, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.11.2.1.1.1.1.3.

##### 8.11.2.1.1.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurements contained in event triggered measurement reports shall meet the requirements in Sections 9.1.18.2 and 9.1.18.3, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than T<sub>identify\_intra\_FS3</sub> defined in Section 8.11.2.1.1.1. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_FS3}}$  defined in Section 8.11.2.1.1.1 becomes undetectable for a period  $\leq 8$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{identify\_intra\_FS3\_CRS}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting, an additional delay can be expected.

#### 8.11.2.1.1.2 Requirements when DRX is used

When DRX is in use the UE shall be able to identify a new detectable FS3 intra-frequency cell within the cell identification time  $T_{\text{identify\_intra\_FS3\_DRX}}$ , where the cell identification time of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_intra\_FS3\_CRS\_DRX}}$ , where:

$T_{\text{identify\_intra\_FS3\_DRX}}$  is the intra-frequency period for cell identification as shown in Table 8.11.2.1.1.2-1,

$T_{\text{measure\_intra\_FS3\_CRS\_DRX}}$  is the intra-frequency period for measurements as shown in Table 8.11.2.1.1.2-2,

$T_{\text{DMTC\_periodicity}}$  is the discovery signal measurement timing configuration periodicity of higher layer,

L is the number of configured discovery signal occasions during ON DURATION and which are not available during  $T_{\text{identify\_intra\_FS3\_DRX}}$  for cell identification at the UE due to the absence of the necessary radio signals from the cell or due to the corresponding downlink subframe being configured as an uplink subframe,

M is the number of configured discovery signal occasions during ON DURATION and which are not available during  $T_{\text{measure\_intra\_FS3\_CRS\_DRX}}$  for the measurements at the UE due to the absence of the necessary radio signals from the cell or due to the corresponding downlink subframe being configured as an uplink subframe.

| $-6 \leq \text{SCH } \hat{E}s/\text{lot} < 0$ | $< 25$                                        |                                           | $(24+L)^* \cdot k1 \cdot k2 \cdot \text{Max}\{T_{\text{DMTC\_periodicity}}, \text{DRX cycle length}\}$ |
| $0 \leq \text{SCH } \hat{E}s/\text{lot}$      | $\geq 25$                                     | $0 \leq \text{CRS } \hat{E}s/\text{lot}$  | $(2+M)^* \cdot k1 \cdot k2 \cdot \text{Max}\{T_{\text{DMTC\_periodicity}}, \text{DRX cycle length}\}$  |
| $-6 \leq \text{SCH } \hat{E}s/\text{lot} < 0$ | $\geq 25$                                     |                                           | $(8+M)^* \cdot k1 \cdot k2 \cdot \text{Max}\{T_{\text{DMTC\_periodicity}}, \text{DRX cycle length}\}$  |

NOTE 1: Discovery signal occasion duration (*ds-OccasionDuration*) is 1 ms.

NOTE 2: The requirements for measurement bandwidth  $\geq 25$  RB are optional.

NOTE 3:  $k1=2$  when the measurement gaps configured for inter-frequency measurements in DMTC occasions or for inter-frequency RSSI measurements in RMTC occasions on a carrier with frame structure 3 overlap with some but not all DMTC occasions of the measured cell during ON DURATION; otherwise,  $k1=1$ , e.g., when measurement gaps configured for inter-frequency measurements on a carrier with frame structure 3 do not overlap with DMTC occasions of the measured cell during ON DURATION or when the UE does not require the measurement gaps for the inter-frequency measurements. The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.

$$k2 = \max \left( 2, \left\lceil \frac{N_{\text{FS3\_SCC}}}{2} \right\rceil \right) \text{ when DMTC occasions in the measured cell not overlapping}$$

with the inter-frequency measurement gaps measurement gaps overlap with DMTC occasions of  $N_{\text{FS3\_SCC}}$  ( $N_{\text{FS3\_SCC}} > 0$ ) SCells during ON DURATION on other FS3 carriers; otherwise,  $k2=1$ , e.g., when  $N_{\text{FS3\_SCC}}$  is 0.

NOTE 4: The requirements apply, provided that L is such that the intra-frequency cell identification period  $T_{\text{identify\_intra\_FS3\_DRX}}$  does not exceed  $72 \cdot k1 \cdot k2 \cdot \text{Max}\{T_{\text{DMTC\_periodicity}}, \text{DRX cycle length}\}$ .

A cell shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_intra\_FS3\_DRX}}$ :

- RSRP related side conditions given in Section 9.1.18.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Section 9.1.18.3 are fulfilled for a corresponding Band,
- SCH<sub>RP</sub> is according to Annex B.2.12 for a corresponding Band and SCH  $\hat{E}$ s/lot is according to Table 8.11.2.1.1.2-1.

If higher layer filtering is used, an additional cell identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for intra-frequency measurements is  $T_{\text{measure\_intra\_FS3\_CRS\_DRX}}$  as shown in Table 8.11.2.1.1.2-2, when DRX is in use. The UE shall be capable of performing RSRP and RSRQ measurements for 3 identified intra-frequency cells, and the UE physical layer shall be capable of reporting measurements to higher layers within the measurement period of  $T_{\text{measure\_intra\_FS3\_CRS\_DRX}}$ .

**Table 8.11.2.1.1.2-2: Intra-frequency measurement requirements under operation with frame structure 3**

| SCH $\hat{E}$ s/lot                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | CRS measurement bandwidth [RB]<br>Note2 | CRS $\hat{E}$ s/lot                       | T <sub>measure_intra_FS3_CRS_DRX</sub> [ms]                                          |

The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.</p> $k2=\max\left(2,\left\lceil\frac{N_{FS3\_SCC}}{2}\right\rceil\right)$ when DMTC occasions in the measured cell not overlapping with the inter-frequency measurement gaps measurement gaps overlap with DMTC occasions of $N_{FS3\_SCC}$ ( $N_{FS3\_SCC}>0$ ) SCells during ON DURATION on other FS3 carriers; otherwise, $k2=1$ , e.g., when $N_{FS3\_SCC}$ is 0. <p>NOTE 4: The requirements apply, provided that M is such that the intra-frequency measurement period T<sub>measure_intra_FS3_CRS_DRX</sub> does not exceed <math>60*k1*k2*\text{Max}\{T_{\text{DMTC\_periodicity}}, \text{DRX cycle length}\}</math>.</p> |                                         |                                           |                                                                                      |

The RSRP measurement accuracy for all measured cells shall be as specified in Section 9.1.18.2, and the RSRQ measurement accuracy for all measured cells shall be as specified in Section 9.1.18.3.

#### 8.11.2.1.1.2.1 Measurement Reporting Requirements

##### 8.11.2.1.1.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in Sections 9.1.18.2 and 9.1.18.3, respectively.

##### 8.11.2.1.1.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurements contained in event triggered periodic measurement reports shall meet the requirements in Sections 9.1.18.2 and 9.1.18.3, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.11.2.1.1.2.1.3.

##### 8.11.2.1.1.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurements contained in event triggered measurement reports shall meet the requirements in Sections 9.1.18.2 and 9.1.18.3, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times T_{TI_{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_intra\_FS3\_DRX}$  defined in Section 8.11.2.1.1.2. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{identify\_intra\_FS3\_DRX}$  defined in Section 8.11.2.1.1.2 becomes undetectable for a period  $\leq 8$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{identify\_intra\_FS3\_CRS\_DRX}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting, an additional delay can be expected.

### 8.11.2.2 E-UTRAN inter-frequency measurements

The UE shall be able to identify new inter-frequency cells and perform RSRP and RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the PCell, even if no explicit neighbour list with physical layer cell identities is provided. The discovery signal occasion and the measurement gap should be aligned, provided that also the following additional conditions are fulfilled:

Entire discovery signal occasion should be contained in the measurement gap.

The subframe contained discovery signal for the measurement is not overlapped with the first 0.5 ms period and the last 0.5 ms period in every gap.

#### 8.11.2.2.1 E-UTRAN FDD-FS3 inter-frequency measurements

##### 8.11.2.2.1.1 E-UTRAN FDD – FS3 inter-frequency measurements when no DRX is used

When measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FS3 inter-frequency cell within the cell identification time  $T_{identify\_inter\_FS3}$ , which shall include detection of the cell and additionally performing a single measurement within the measurement period of  $T_{measure\_inter\_FS3\_CRS}$  when no DRX is used, where:

$T_{identify\_inter\_FS3}$  is the inter-frequency period for cell identification as shown in Table 8.11.2.2.1.1-1,

$T_{measure\_inter\_FS3\_CRS}$  is the inter-frequency period for measurements as shown in Table 8.11.2.2.1.1-2,

$T_{DMTC\_periodicity}$  is the discovery signal measurement timing configuration periodicity of higher layer,

$N_{freq}$  is defined in Section 8.1.2.1.1,

$N$  is the number of carriers operating under FS3 and which are subject to the channel assessment prior to transmissions,

$L$  is the number of configured discovery signal occasions which are not available during the time for cell identification at the UE during measurement gaps due to the absence of the necessary radio signals from the measured cell,

$M$  is the number of configured discovery signal occasions which are not available during  $T_{measure\_inter\_FS3\_CRS}$  for the measurements at the UE during measurement gaps due to the absence of the necessary radio signals from the measured cell.

If higher layer filtering is used, an additional cell identification delay can be expected.

The requirements in this section apply, provided that  $L$  and  $M$  are such that: the inter-frequency cell identification period  $T_{identify\_inter\_FS3}$  does not exceed  $75 * N_{freq} * \text{Max}\{T_{DMTC\_periodicity}, MGRP\}$ , and the inter-frequency period  $T_{measure\_inter\_FS3\_CRS}$  for measurements does not exceed  $60 * N_{freq} * \text{Max}\{T_{DMTC\_periodicity}, MGRP\}$ .

| NOTE 2: The requirements for measurement bandwidth $\geq 25$ RB are optional.      |                                                    |                                    |                                                                                   |

A cell shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{identify\_inter\_FS3}$ :

- RSRP related side conditions given in Section 9.1.18.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Section 9.1.18.3 are fulfilled for a corresponding Band,
- $\text{SCH\_RP}_{dBm}$  is according to Annex B.2.13.1 for a corresponding Band,
- $\text{SCH } \hat{E}s/lot$  is according to Table 8.11.2.2.1.1-1.

When measurement gaps are scheduled for FS3 inter-frequency measurements or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with measurement accuracy as specified in Sections 9.1.18.2 and 9.1.18.3, respectively, with measurement period given by table 8.11.2.2.1.1-2.

The UE shall be capable of performing RSRP and RSRQ measurements of at least 3 identified inter-frequency cells per FS3 inter-frequency for up to 3 FS3 inter-frequencies and the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with the measurement period defined in table 8.11.2.2.1.1-2 when no DRX is in use, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps.

The RSRP measurement accuracy for all measured cells shall be as specified in Section 9.1.18.2, and the RSRQ measurement accuracy for all measured cells shall be as specified in Section 9.1.18.3.

#### 8.11.2.2.1.1.1 Measurement Reporting Requirements

##### 8.11.2.2.1.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.18.2 and 9.1.18.3, respectively.

##### 8.11.2.2.1.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurements contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.18.2, and 9.1.18.3, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.11.2.2.1.1.1.3.

##### 8.11.2.2.1.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurements contained in event triggered measurement reports shall meet the requirements in sections 9.1.18.2 and 9.1.18.3, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_inter\_FS3}$  defined in Section 8.11.2.2.1.1. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{identify\_inter\_FS3}$  defined in Section 8.11.2.2.1.1 and then triggers the measurement report as per TS 36.331 [2], the event triggered measurement reporting delay shall be less than  $T_{measure\_inter\_FS3\_CRS}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  while measurement gap has not been available and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting, an additional delay can be expected.

#### 8.11.2.2.1.2 E-UTRAN FDD – FS3 inter-frequency measurements when DRX is used

When measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FS3 inter-frequency cell within the cell identification time  $T_{identify\_inter\_FS3\_DRX}$ , which shall include detection of the cell and additionally performing a single measurement within the measurement period of  $T_{measure\_inter\_FS3\_CRS\_DRX}$  when DRX is used, where:

$T_{identify\_inter\_FS3\_DRX}$  is the inter-frequency period for measurements as shown in Table 8.11.2.2.1.2-1,

$T_{measure\_inter\_FS3\_CRS\_DRX}$  is the inter-frequency period for measurements as shown in Table 8.11.2.2.1.2-2,

$T_{DMTC\_periodicity}$  is the discovery signal measurement timing configuration periodicity of higher layer,

$N_{freq}$  is defined in Section 8.1.2.1.1,

$N$  is the number of carriers operating under FS3 and which are subject to the channel assessment prior to transmissions,

L is the number of configured discovery signal occasions which are not available during the time for cell identification at the UE during measurement gaps due to the absence of the necessary radio signals from the measured cell,

M is the number of configured discovery signal occasions which are not available during  $T_{\text{measure\_inter\_FS3\_CRS\_DRX}}$  for the measurements at the UE during measurement gaps due to the absence of the necessary radio signals from the measured cell.

The requirements in this section apply, provided that L and M are such that: the inter-frequency cell identification period  $T_{\text{identify\_inter\_FS3\_DRX}}$  does not exceed  $75 \cdot N_{\text{freq}} \cdot \text{Max}\{T_{\text{DMTC\_periodicity}}, \text{MGRP}, \text{DRX cycle length}\}$ , and the inter-frequency period  $T_{\text{measure\_inter\_FS3\_CRS\_DRX}}$  for measurements does not exceed  $60 \cdot N_{\text{freq}} \cdot \text{Max}\{T_{\text{DMTC\_periodicity}}, \text{MGRP}, \text{DRX cycle length}\}$ .

If higher layer filtering is used, an additional cell identification delay can be expected.

| NOTE 1: Discovery signal occasion duration ( <i>ds-OccasionDuration</i> ) is 1 ms. |                                                 |                                            |                                                                                                                                 |
| NOTE 2: The requirements for measurement bandwidth $\geq 25$ RB are optional.      |                                                 |                                            |                                                                                                                                 |

A cell shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_inter\_FS3\_DRX}}$ :

- RSRP related side conditions given in Section 9.1.18.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Section 9.1.18.3 are fulfilled for a corresponding Band,
- $\text{SCH\_RP}_{\text{dBm}}$  is according to Annex B.2.13.1 for a corresponding Band,
- $\text{SCH } \hat{E}_s/\text{lot}$  is according to Table 8.11.2.2.1.2-1.

The UE shall be capable of performing RSRP and RSRQ measurements of at least 3 identified inter-frequency cells per FS3 inter-frequency for up to 3 FS3 inter-frequencies and the UE physical layer shall be capable of reporting RSRP and

RSRQ measurements to higher layers with the measurement period defined in table 8.11.2.2.1.2-2 when DRX is in use, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps.

The RSRP measurement accuracy for all measured cells shall be as specified in Section 9.1.18.2, and the RSRQ measurement accuracy for all measured cells shall be as specified in Section 9.1.18.3.

#### 8.11.2.2.1.2.1 Measurement Reporting Requirements

##### 8.11.2.2.1.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.18.2 and 9.1.18.3, respectively.

##### 8.11.2.2.1.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurements contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.18.2 and 9.1.18.3, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.11.2.2.1.2.1.3.

##### 8.11.2.2.1.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurements contained in event triggered measurement reports shall meet the requirements in sections 9.1.18.2, and 9.1.18.3, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_inter\_FS3\_DRX}$  defined in Section 8.11.2.2.1.2. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{identify\_inter\_FS3\_DRX}$  defined in Section 8.11.2.2.1.2 becomes undetectable for a period  $\leq 8$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{identify\_inter\_FS3\_CRS\_DRX}$  provided the timing to that cell has not changed more than  $\pm 50$  Ts and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting, an additional delay can be expected.

#### 8.11.2.2.2 E-UTRAN TDD – FS3 inter-frequency measurements

##### 8.11.2.2.2.1 E-UTRAN TDD – FS3 inter-frequency measurements when no DRX is used

The requirements in this section for UE configured with TDD PCell and no DRX are the same as the requirements in Section 8.11.2.2.1.1.

##### 8.11.2.2.2.2 E-UTRAN TDD – FS3 inter-frequency measurements when DRX is used

The requirements in this section for UE configured with TDD PCell and DRX are the same as the requirements in Section 8.11.2.2.1.2.

### 8.11.3 CSI-RS based discovery signal measurements

#### 8.11.3.1 E-UTRAN intra-frequency measurements

The UE shall be able to identify new intra-frequency FS3 TPs and perform CSI-RSRP measurements of intra-frequency TPs with an explicit intra-frequency TP list containing physical layer cell identities. During the RRC\_CONNECTED

state the UE shall continuously measure identified intra-frequency TPs and additionally search for and identify new intra-frequency TPs.

### 8.11.3.1.1 Requirements

#### 8.11.3.1.1.1 Requirements when no DRX is used

When no DRX is in use the UE shall be able to identify a new detectable FS3 intra-frequency TP within the identification period  $T_{\text{identify\_intra\_TP\_FS3}}$ , where identification of a TP shall include cell identification and additionally performing a single measurement on the TP.

$$T_{\text{identify\_intra\_TP\_FS3}} = T_{\text{identify\_intra\_FS3}} + T_{\text{measure\_intra\_FS3\_CSI-RS}},$$

where

$T_{\text{identify\_intra\_FS3}}$  is the intra-frequency period for cell identification in Section 8.11.2.1.1.1,

$T_{\text{measure\_intra\_FS3\_CSI-RS}}$  is the intra-frequency period for TP measurement as shown in Table 8.11.3.1.1.1-1,

$T_{\text{DMTC\_periodicity}}$  is the discovery signal measurement timing configuration periodicity of higher layer,

$M$  is the number of configured discovery signal occasions which are not available during  $T_{\text{measure\_intra\_FS3\_CSI-RS}}$  for the measurements at the UE due to the absence of the necessary radio signals from the TP or due to the corresponding downlink subframe being configured as an uplink subframe.

During  $T_{\text{identify\_intra\_TP\_FS3}}$  over multiple discovery signal occasions, the UE may assume the following:

- in all the discovery signal occasions, which are available at the UE, the corresponding necessary cell-specific discovery signals are always available from the same set of TPs in the measured cell, and
- in all the discovery signal occasions, which are not available at the UE, the corresponding necessary cell-specific discovery signals are not available from any TP within the same measured cell.

A TP shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_intra\_TP\_FS3}}$ :

- CSI-RSRP related side conditions given in Section 9.1.18.4 are fulfilled for a corresponding Band,
- $SCH\_RP$  is according to Annex B.2.12 for a corresponding Band and  $SCH\ \hat{E}_s/I_{ot}$  is according to Section 8.11.2.1.1.1.

Identification of a TP shall include identification of the cell and additionally performing a single measurement on the TP within the measurement period of  $T_{\text{measure\_intra\_FS3\_CSI-RS}}$  when no DRX is used. If higher layer filtering is used, an additional TP identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for intra-frequency measurements is  $T_{\text{measure\_intra\_FS3\_CSI-RS}}$  as shown in table 8.11.3.1.1.1-1, when no DRX is in use. The UE shall be capable of performing CSI-RSRP measurements for 3 identified intra-frequency TPs, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{\text{measure\_intra\_FS3\_CSI-RS}}$

**Table 8.11.3.1.1.1-1: Intra-frequency TP measurement requirements under operation with frame structure 3**

| SCH $\hat{E}_s/\text{lot}$                     | CRS measurement bandwidth [RB] <sup>Note2</sup> | CSI-RS $\hat{E}_s/\text{lot}$                | $T_{\text{measure\_intra\_FS3\_CSI-RS}}$ [ms]                   |
|------------------------------------------------|-------------------------------------------------|----------------------------------------------|-----------------------------------------------------------------|
| $0 \leq \text{SCH } \hat{E}_s/\text{lot}$      | $< 25$                                          | $0 \leq \text{CSI-RS } \hat{E}_s/\text{lot}$ | $(5+M) \cdot k_1 \cdot k_2 \cdot T_{\text{DMTC\_periodicity}}$  |
| $-6 \leq \text{SCH } \hat{E}_s/\text{lot} < 0$ | $< 25$                                          |                                              | $(20+M) \cdot k_1 \cdot k_2 \cdot T_{\text{DMTC\_periodicity}}$ |
| $0 \leq \text{SCH } \hat{E}_s/\text{lot}$      | $\geq 25$                                       | $0 \leq \text{CSI-RS } \hat{E}_s/\text{lot}$ | $(1+M) \cdot k_1 \cdot k_2 \cdot T_{\text{DMTC\_periodicity}}$  |
| $-6 \leq \text{SCH } \hat{E}_s/\text{lot} < 0$ | $\geq 25$                                       |                                              | $(4+M) \cdot k_1 \cdot k_2 \cdot T_{\text{DMTC\_periodicity}}$  |

NOTE 1: Discovery signal occasion duration (*ds-OccasionDuration*) is 1 ms.

NOTE 2: The requirements for measurement bandwidth  $\geq 25$  RB are optional.

NOTE 3:  $k_1=2$  when the measurement gaps configured for inter-frequency measurements in DMTC occasions or for inter-frequency RSSI measurements in RMTC occasions on a carrier with frame structure 3 overlap with some but not all DMTC occasions of the measured TP; otherwise,  $k_1=1$ , e.g., when measurement gaps configured for inter-frequency measurements on a carrier with frame structure 3 do not overlap with DMTC occasions of the measured TP or when the UE does not require the measurement gaps for the inter-frequency measurements. The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.

$$k_2 = \max \left( 2, \left\lceil \frac{N_{\text{FS3\_SCC}}}{2} \right\rceil \right) \text{ when DMTC occasions in the measured TP not overlapping with the inter-}$$

frequency measurement gaps measurement gaps overlap with DMTC occasions of  $N_{\text{FS3\_SCC}}$  ( $N_{\text{FS3\_SCC}} > 0$ ) SCCells on other FS3 carriers; otherwise,  $k_2=1$ , e.g., when  $N_{\text{FS3\_SCC}}$  is 0.

NOTE 4: The requirements apply, provided that M is such that the intra-frequency period for TP measurement  $T_{\text{measure\_intra\_FS3\_CSI-RS}}$  does not exceed  $60 \cdot k_1 \cdot k_2 \cdot T_{\text{DMTC\_periodicity}}$ .

The CSI-RSRP measurement accuracy for all measured TPs shall be as specified in Section 9.1.18.4.

#### 8.11.3.1.1.1.1 Measurement Reporting Requirements

##### 8.11.3.1.1.1.1.1 Periodic Reporting

Reported CSI-RSRP measurements contained in periodically triggered measurement reports shall meet the requirements in Section 9.1.18.4.

##### 8.11.3.1.1.1.1.2 Event-triggered Periodic Reporting

Reported CSI-RSRP measurements contained in event triggered periodic measurement reports shall meet the requirements in Section 9.1.18.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.11.3.1.1.1.1.3.

##### 8.11.3.1.1.1.1.3 Event Triggered Reporting

Reported CSI-RSRP measurements contained in event triggered measurement reports shall meet the requirements in Section 9.1.18.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_TP\_FS3}}$  defined in Section 8.11.3.1.1.1. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a TP which has been detectable at least for the time period  $T_{\text{identify\_intra\_TP\_FS3}}$  defined in Section 8.11.3.1.1.1 becomes undetectable for a period  $\leq 8$  seconds and then the TP becomes detectable again and triggers an event, the event

triggered measurement reporting delay shall be less than  $T_{\text{identify\_intra\_FS3\_CSI-RS}}$  provided the timing to that TP has not changed more than  $\pm 50$  Ts and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting, an additional delay can be expected.

#### 8.11.3.1.1.2 Requirements when DRX is used

When DRX is in use the UE shall be able to identify a new detectable FS3 intra-frequency TP within the identification period  $T_{\text{identify\_intra\_TP\_FS3\_DRX}}$ , where identification of a TP shall include cell identification and additionally performing a single measurement on the TP.

$$T_{\text{identify\_intra\_TP\_FS3\_DRX}} = T_{\text{identify\_intra\_FS3\_DRX}} + T_{\text{measure\_intra\_FS3\_CSI-RS\_DRX}},$$

where:

$T_{\text{identify\_intra\_FS3\_DRX}}$  is the intra-frequency period for cell identification in Section 8.11.2.1.1.2.

$T_{\text{measure\_intra\_FS3\_CSI-RS\_DRX}}$  is the intra-frequency period for TP measurement as shown in Table 8.11.3.1.1.2-1, where

$T_{\text{DMTC\_periodicity}}$  is the discovery signal measurement timing configuration periodicity of higher layer,

$M$  is the number of configured discovery signal occasions during ON DURATION and which are not available during  $T_{\text{measure\_intra\_FS3\_CSI-RS\_DRX}}$  for the measurements at the UE due to the absence of the necessary radio signals from the TP or due to the corresponding downlink subframe being configured as an uplink subframe.

During  $T_{\text{identify\_intra\_TP\_FS3\_DRX}}$  over multiple discovery signal occasions, the UE may assume the following:

- in all the discovery signal occasions, which are available at the UE, the corresponding necessary cell-specific discovery signals are always available from the same set of TPs in the measured cell, and
- in all the discovery signal occasions, which are not available at the UE, the corresponding necessary cell-specific discovery signals are not available from any TP within the same measured cell.

A TP shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_intra\_TP\_FS3\_DRX}}$ :

- CSI-RSRP related side conditions given in Section 9.1.18.4 are fulfilled for a corresponding Band,
- $SCH\_RP$  is according to Annex B.2.12 for a corresponding Band and  $SCH\ \hat{E}_s/I_{ot}$  is according to Section 8.11.2.1.1.2.

Identification of a TP shall include identification of the cell and additionally performing a single measurement on the TP within measurement period of  $T_{\text{measure\_intra\_FS3\_CSI-RS\_DRX}}$  when DRX is used. If higher layer filtering is used, an additional TP identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is  $T_{\text{measure\_intra\_FS3\_CSI-RS\_DRX}}$  as shown in Table 8.11.3.1.1.2-1, when DRX is in use. The UE shall be capable of performing CSI-RSRP measurements for 3 identified intra-frequency TPs, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{\text{measure\_intra\_FS3\_CSI-RS\_DRX}}$ .

**Table 8.11.3.1.1.2-1: Intra-frequency TP measurement requirements under operation with frame structure 3**

| SCH $\hat{E}_s/\text{lot}$          | CRS measurement bandwidth [RB] <sup>Note2</sup> | CSI-RS $\hat{E}_s/\text{lot}$    | T <sub>measure_intra_FS3_CSI-RS_DRX</sub> [ms]                       |
|-------------------------------------|-------------------------------------------------|----------------------------------|----------------------------------------------------------------------|
| 0 ≤ SCH $\hat{E}_s/\text{lot}$      | <25                                             | 0 ≤CSI-RS $\hat{E}_s/\text{lot}$ | (5+M) *k1*k2* Max{T <sub>DMTC_periodicity</sub> , DRX cycle length}  |
| -6 ≤ SCH $\hat{E}_s/\text{lot}$ < 0 | <25                                             |                                  | (20+M) *k1*k2* Max{T <sub>DMTC_periodicity</sub> , DRX cycle length} |
| 0 ≤ SCH $\hat{E}_s/\text{lot}$      | ≥ 25                                            | 0 ≤CSI-RS $\hat{E}_s/\text{lot}$ | (1+M) *k1*k2* Max{T <sub>DMTC_periodicity</sub> , DRX cycle length}  |
| -6 ≤ SCH $\hat{E}_s/\text{lot}$ < 0 | ≥ 25                                            |                                  | (4+M) *k1*k2* Max{T <sub>DMTC_periodicity</sub> , DRX cycle length}  |

NOTE 1: Discovery signal occasion duration (*ds-OccasionDuration*) is 1 ms.

NOTE 2: The requirements for measurement bandwidth ≥25 RB are optional.

NOTE 3: k1=2 when the measurement gaps configured for inter-frequency measurements in DMTC occasions or for inter-frequency RSSI measurements in RMTC occasions on a carrier with frame structure 3 overlap with some but not all DMTC occasions of the measured TP during ON DURATION; otherwise, k1=1, e.g., when measurement gaps configured for inter-frequency measurements on a carrier with frame structure 3 do not overlap with DMTC occasions of the measured TP during ON DURATION or when the UE does not require the measurement gaps for the inter-frequency measurements. The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.

$$k2 = \max\left(2, \left\lceil \frac{N_{FS3\_SCC}}{2} \right\rceil\right)$$
 when DMTC occasions in the measured TP not overlapping with the inter-frequency measurement gaps overlap with DMTC occasions of  $N_{FS3\_SCC}$  ( $N_{FS3\_SCC}>0$ ) SCells during ON DURATION on other FS3 carriers; otherwise, k2=1, e.g., when  $N_{FS3\_SCC}=0$ .

NOTE 4: The requirements apply, provided that M is such that the intra-frequency period for TP measurement T<sub>measure\_intra\_FS3\_CSI-RS\_DRX</sub> does not exceed 60\*k1\*k2\* Max{T<sub>DMTC\_periodicity</sub>, DRX cycle length}.

The CSI-RSRP measurement accuracy for all measured TPs shall be as specified in Section 9.1.18.4.

#### 8.11.3.1.1.2.1 Measurement Reporting Requirements

##### 8.11.3.1.1.2.1.1 Periodic Reporting

Reported CSI-RSRP measurements contained in periodically triggered measurement reports shall meet the requirements in Section 9.1.18.4.

##### 8.11.3.1.1.2.1.2 Event-triggered Periodic Reporting

Reported CSI-RSRP measurements contained in event triggered periodic measurement reports shall meet the requirements in Section 9.1.18.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.11.3.1.1.2.1.3.

##### 8.11.3.1.1.2.1.3 Event Triggered Reporting

Reported CSI-RSRP measurements contained in event triggered measurement reports shall meet the requirements in Section 9.1.18.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_TP\_FS3\_DRX}}$  defined in Section 8.11.3.1.1.2. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a TP which has been detectable at least for the time period  $T_{\text{identify\_intra\_TP\_FS3\_DRX}}$  defined in Section 8.11.3.1.1.2 becomes undetectable for a period  $\leq 8$  seconds and then the TP becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{identify\_intra\_FS3\_CSI-RS\_DRX}}$  provided the timing to that TP has not changed more than  $\pm 50$  Ts and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting, an additional delay can be expected.

### 8.11.3.2 E-UTRAN inter-frequency measurements

The UE shall be able to identify new inter-frequency TPs and perform CSI-RSRP measurements of the identified inter-frequency TPs with an explicit inter-frequency TP list containing physical layer cell identities. The discovery signal occasion and the measurement gap should be aligned, provided that also the following additional conditions are fulfilled:

Entire discovery signal occasion should be contained in the measurement gap.

The subframe contained discovery signal for the measurement is not overlapped with the first 0.5 ms period and the last 0.5 ms period in every gap.

#### 8.11.3.2.1 E-UTRAN FDD – FS3 inter-frequency measurements

##### 8.11.3.2.1.1 E-UTRAN FDD – FS3 inter-frequency measurements when no DRX is used

When measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FS3 inter-frequency TP within the TP identification time  $T_{\text{identify\_inter\_TP\_FS3}}$  according to the following expression:

$$T_{\text{identify\_inter\_TP\_FS3}} = T_{\text{identify\_inter\_FS3}} + T_{\text{measure\_inter\_FS3\_CSI-RS}},$$

where

$T_{\text{identify\_inter\_FS3}}$  is the inter-frequency period for cell identification in Section 8.11.2.2.1.1,

$T_{\text{measure\_inter\_FS3\_CSI-RS}}$  is the inter-frequency period for TP measurement as shown in Table 8.11.3.2.1.1-1,

$T_{\text{DMTC\_periodicity}}$  is the discovery signal measurement timing configuration periodicity of higher layer,

$N_{\text{freq}}$  is defined in section 8.1.2.1.1,

$N$  is the number of carriers operating under FS3 and which are subject to the channel assessment prior to transmissions,

$M$  is the number of configured discovery signal occasions which are not available during  $T_{\text{measure\_inter\_FS3\_CSI-RS}}$  for the measurements at the UE during measurement gaps due to the absence of the necessary radio signals from the measured TP.

The requirements in this section apply, provided that  $M$  is such that: the inter-frequency period  $T_{\text{measure\_inter\_FS3\_CSI-RS}}$  for TP measurements does not exceed  $60 * N_{\text{freq}} * \text{Max}\{T_{\text{DMTC\_periodicity}}, \text{MGRP}\}$ .

During  $T_{\text{identify\_inter\_TP\_FS3}}$  over multiple discovery signal occasions, the UE may assume the following:

- in all the discovery signal occasions, which are available at the UE, the corresponding necessary cell-specific discovery signals are always available from the same set of TPs in the measured cell, and
- in all the discovery signal occasions, which are not available at the UE, the corresponding necessary cell-specific discovery signals are not available from any TP within the same measured cell.

A TP shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_inter\_TP\_FS3}}$ :

- CSI-RSRP related side conditions given in Section 9.1.18.4 are fulfilled for a corresponding Band,
- SCH\_RP is according to Annex B.2.13.2 for a corresponding Band,

- SCH  $\hat{E}_s/\text{lot}$  is according to Table 8.11.2.2.1.1-1.

When measurement gaps are scheduled for FS3 inter-frequency measurements or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting CSI-RSRP measurements to higher layers with measurement accuracy as specified in section 9.1.18.4, with measurement period given by table 8.11.3.2.1.1-1.

The UE shall be capable of performing CSI-RSRP measurements of at least 3 identified inter-frequency TPs per FS3 inter-frequency for up to 3 FS3 inter-frequencies and the UE physical layer shall be capable of reporting CSI-RSRP measurements to higher layers with the measurement period defined in table 8.11.3.2.1.1-1 when no DRX is in use, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps.

**Table 8.11.3.2.1.1-1: Requirements to measure FS3 inter-frequency TP**

| SCH $\hat{E}_s/\text{lot}$                                                         | CSI-RS measurement bandwidth <sup>Note2</sup><br>[RB] | CSI-RS $\hat{E}_s/\text{lot}$                | T <sub>measure_inter_FS3_CSI-RS</sub> [ms]                                                                    |

| NOTE 1: Discovery signal occasion duration ( <i>ds-OccasionDuration</i> ) is 1 ms. |                                                       |                                              |                                                                                                               |
| NOTE 2: The requirements for measurement bandwidth $\geq 25$ RB are optional.      |                                                       |                                              |                                                                                                               |

The CSI-RSRP measurement accuracy for all measured TPs shall be as specified in section 9.1.18.4.

#### 8.11.3.2.1.1.1 Measurement Reporting Requirements

##### 8.11.3.2.1.1.1.1 Periodic Reporting

Reported CSI-RSRP measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.18.4.

##### 8.11.3.2.1.1.1.2 Event-triggered Periodic Reporting

Reported CSI-RSRP measurements contained in event triggered periodic measurement reports shall meet the requirements in section 9.1.18.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in section 8.11.3.2.1.1.1.3.

##### 8.11.3.2.1.1.1.3 Event Triggered Reporting

Reported CSI-RSRP measurements contained in event triggered measurement reports shall meet the requirements in section 9.1.18.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times T_{\text{TI\_DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_TP\_FS3}}$  defined in Section 8.11.3.2.1.1. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a TP which has been detectable at least for the time period  $T_{\text{identify\_inter\_TP\_FS3}}$  defined in Section 8.11.3.2.1.1 becomes undetectable for a period  $\leq 8$  seconds and then the TP becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{identify\_inter\_FS3\_CSI-RS}}$  provided the timing to that TP has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is

configured or LBT is performed by the UE on the carrier used for the measurement reporting, an additional delay can be expected.

#### 8.11.3.2.1.2 E-UTRAN FDD – FS3 inter-frequency measurements when DRX is used

When DRX is in use, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FS3 inter-frequency TP within  $T_{\text{identify\_inter\_TP\_FS3\_DRX}}$  according to the following expression:

$$T_{\text{identify\_inter\_TP\_FS3\_DRX}} = T_{\text{identify\_inter\_FS3\_DRX}} + T_{\text{measure\_inter\_FS3\_CSI-RS\_DRX}},$$

where

$T_{\text{identify\_inter\_FS3\_DRX}}$  is the inter-frequency period for cell identification in Section 8.11.2.2.1.2,

$T_{\text{measure\_inter\_FS3\_CSI-RS\_DRX}}$  is the inter-frequency period for TP measurement as shown in Table 8.11.3.2.1.2-1,

$T_{\text{DMTC\_periodicity}}$  is the discovery signal measurement timing configuration periodicity of higher layer,

$N_{\text{freq}}$  is defined in section 8.1.2.1.1,

$N$  is the number of carriers operating under FS3 and which are subject to the channel assessment prior to transmissions,

$M$  is the number of configured discovery signal occasions which are not available during  $T_{\text{measure\_inter\_FS3\_CSI-RS\_DRX}}$  for the measurements at the UE during measurement gaps due to the absence of the necessary radio signals from the measured cell.

The requirements in this section apply, provided that  $M$  is such that: the inter-frequency period  $T_{\text{measure\_inter\_FS3\_CSI-RS\_DRX}}$  for TP measurements does not exceed  $60 * N_{\text{freq}} * \text{Max}\{T_{\text{DMTC\_periodicity}}, \text{MGRP}, \text{DRX cycle length}\}$ .

During  $T_{\text{identify\_inter\_TP\_FS3\_DRX}}$  over multiple discovery signal occasions, the UE may assume the following:

- in all the discovery signal occasions, which are available at the UE, the corresponding necessary cell-specific discovery signals are always available from the same set of TPs in the measured cell, and
- in all the discovery signal occasions, which are not available at the UE, the corresponding necessary cell-specific discovery signals are not available from any TP within the same measured cell.

A TP shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_inter\_TP\_FS3\_DRX}}$ :

- CSI-RSRP related side conditions given in Sections 9.1.18.4 are fulfilled for a corresponding Band,
- SCH\_RP is according to Annex B.2.13.2 for a corresponding Band,
- SCH\_Es/Iot is according to Table 8.11.2.2.1.2-1.

When measurement gaps are scheduled for FS3 inter-frequency measurements or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting CSI-RSRP measurements to higher layers with measurement accuracy as specified in section 9.1.18.4, with measurement period given by table 8.11.3.2.1.2-1.

The UE shall be capable of performing CSI-RSRP measurements of at least 3 identified inter-frequency TPs per FS3 inter-frequency for up to 3 FS3 inter-frequencies and the UE physical layer shall be capable of reporting CSI-RSRP measurements to higher layers with the measurement period defined in table 8.11.3.2.1.2-1 when DRX is in use, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps.

**Table 8.11.3.2.1.2-1: Requirements to measure FS3 inter-frequency TP**

| SCH $\hat{E}s/lot$                                                                 | CSI-RS measurement bandwidth <sup>Note2</sup><br>[RB] | CSI-RS $\hat{E}s/lot$        | $T_{measure\_inter\_FS3\_CSI-RS\_DRX}$ [ms]                                  |

| $0 \leq SCH \hat{E}s/lot$                                                          | $\geq 25$                                             | $0 \leq CSI-RS \hat{E}s/lot$ | $(1*N_{freq} + M*N)*Max\{T_{DMTC\_periodicity}, MGRP, DRX\ cycle\ length\}$  |
| $-6 \leq SCH \hat{E}s/lot < 0$                                                     | $\geq 25$                                             |                              | $(4*N_{freq} + M*N)*Max\{T_{DMTC\_periodicity}, MGRP, DRX\ cycle\ length\}$  |
| NOTE 1: Discovery signal occasion duration ( <i>ds-OccasionDuration</i> ) is 1 ms. |                                                       |                              |                                                                              |
| NOTE 2: The requirements for measurement bandwidth $\geq 25$ RB are optional.      |                                                       |                              |                                                                              |

The CSI-RSRP measurement accuracy for all measured TPs shall be as specified in section 9.1.18.4.

#### 8.11.3.2.1.2.1 Measurement Reporting Requirements

##### 8.11.3.2.1.2.1.1 Periodic Reporting

Reported CSI-RSRP measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.18.4.

##### 8.11.3.2.1.2.1.2 Event-triggered Periodic Reporting

Reported CSI-RSRP measurements contained in event triggered periodic measurement reports shall meet the requirements in section 9.1.18.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in section 8.11.3.2.1.2.1.3.

##### 8.11.3.2.1.2.1.3 Event Triggered Reporting

Reported CSI-RSRP measurements contained in event triggered measurement reports shall meet the requirements in section 9.1.18.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_inter\_TP\_FS3\_DRX}$  defined in section 8.11.3.2.1.2. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a TP which has been detectable at least for the time period  $T_{identify\_inter\_TP\_SCE\_DRX}$  defined in clause 8.11.3.2.1.2 and then triggers the measurement report as per TS 36.331 [2], the event triggered measurement reporting delay shall be less than  $T_{measure\_inter\_FS3\_CSI-RS\_DRX}$  provided the timing to that TP has not changed more than  $\pm 50 T_s$  while measurement gap has not been available and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting, an additional delay can be expected.

### 8.11.3.2.2 E-UTRAN TDD – FS3 inter-frequency measurements

#### 8.11.3.2.2.1 E-UTRAN TDD – FS3 inter-frequency measurements when no DRX is used

The requirements in this section for UE configured with TDD PCell and no DRX are the same as the requirements in Section 8.11.3.2.1.1.

#### 8.11.3.2.2.2 E-UTRAN TDD – FS3 inter-frequency measurements when DRX is used

The requirements in this section for UE configured with TDD PCell and DRX are the same as the requirements in Section 8.11.3.2.1.2.

## 8.11.4 RSSI measurements

### 8.11.4.1 E-UTRAN intra-frequency measurements

NOTE: The requirements in this section are applicable only for measurements on SCC following the frame structure type 3 [16].

The UE physical layer shall be capable of performing the RSSI measurements [4] on one or more serving carriers operating under frame structure type 3 [16], if the carrier(s) are indicated by higher layers [2], and reporting the RSSI measurements to higher layers. The UE physical layer shall provide to higher layers a single RSSI sample for each OFDM symbol within each configured RSSI measurement duration [2] occurring with a configured RSSI measurement timing configuration periodicity [2]. The RSSI measurement period corresponds to  $\max(\text{reportInterval}, \text{rmtc-Period})$ , where *reportInterval* and *rmtc-Period* [2] are configured for the RSSI measurement by higher layers.

The RSSI measurement performed and reported according to this section shall meet the RSSI measurement accuracy requirement in Section 9.1.18.5.2.

### 8.11.4.2 E-UTRAN inter-frequency measurements

The UE physical layer shall be capable of performing the RSSI measurements [4] on one or more inter-frequency carriers operating under frame structure type 3 [16], if the carrier(s) are indicated by higher layers [2], and reporting the RSSI measurements to higher layers. The UE physical layer shall provide to higher layers a single RSSI sample for each OFDM symbol within each configured RSSI measurement duration [2] occurring with a configured RSSI measurement timing configuration periodicity [2]. The RSSI measurement period corresponds to  $\max(\text{reportInterval}, \text{rmtc-Period} * N_{\text{freq}}, \text{MGRP} * N_{\text{freq}})$ , where *reportInterval* and *rmtc-Period* [2] are configured for the RSSI measurement by higher layers, and  $N_{\text{freq}}$  is defined in clause 8.1.2.1.1.

If the UE requires measurement gaps to perform inter-frequency measurements, a single measurement gap pattern is used for all concurrent inter-frequency measurements, including inter-frequency RSSI measurements.

The RSSI measurement performed and reported according to this section shall meet the RSSI measurement accuracy requirement in Section 9.1.18.5.3.

## 8.11.5 Channel occupancy measurements

### 8.11.5.1 E-UTRAN intra-frequency channel occupancy measurements

NOTE: The requirements in this section are applicable only for measurements on SCC following the frame structure type 3 [16].

The UE shall be capable of estimating the channel occupancy on one or more serving carrier frequencies indicated by higher layers [2], based on RSSI samples provided by the physical layer. The channel occupancy measurement period corresponds to  $\max(\text{reportInterval}, \text{rmtc-Period})$ , where *reportInterval* and *rmtc-Period* [2] are configured for the channel occupancy measurement by higher layers.

The channel occupancy measurement performed and reported according to this section shall meet the channel occupancy measurement accuracy requirements in Section 9.1.18.6.1.

### 8.11.5.2 E-UTRAN inter-frequency channel occupancy measurements

The UE shall be capable of estimating the channel occupancy on one or more carrier frequencies indicated by higher layers [2], based on RSSI samples provided by the physical layer. The channel occupancy measurement period

corresponds to  $\max(\text{reportInterval}, \text{rmtc-Period} * N_{\text{freq}}, \text{MGRP} * N_{\text{freq}})$ , where *reportInterval* and *rmtc-Period* [2] are configured for the channel occupancy measurement by higher layers, and  $N_{\text{freq}}$  is defined in clause 8.1.2.1.1.

If the UE requires measurement gaps to perform inter-frequency measurements, a single measurement gap pattern is used for all concurrent inter-frequency measurements, including inter-frequency channel occupancy measurements.

The channel occupancy measurement performed and reported according to this section shall meet the channel occupancy measurement accuracy requirements in Section 9.1.18.6.2.

## 8.12 Discovery Signal Measurements for E-UTRA Carrier Aggregation under Operation with Frame Structure 3

### 8.12.1 Introduction

This section contains requirements on UE capabilities for support of E-UTRA carrier aggregation under operation with frame structure 3.

Non configured frequencies may be measured with measurement gaps according to the requirements in Section 8.11.2.2 and Section 8.11.3.2.

The requirements in Section 8.12 shall apply for SCC with E-UTRA operation following the frame structure type 3 [16].

### 8.12.2 CRS based discovery signal measurements for E-UTRA carrier aggregation

#### 8.12.2.1 Introduction

The requirements in Section 8.12.2 shall apply for CRS based discovery signal measurements comprising RSRP and RSRQ measurements [4].

#### 8.12.2.2 Measurements of a secondary component carrier

A secondary component carrier may be activated and deactivated by MAC-CE commands as specified in [17]. The applicable performance requirements depend on whether the SCell on the corresponding frequency is activated or deactivated.

#### 8.12.2.3 Measurements of a secondary component carrier with active SCell

When the SCell is activated, measurement performance requirements for the frequency are those given in Section 8.11.2.1. If common DRX is in use, then the requirements for that secondary component carrier are given by the DRX requirements in Section 8.11.2.1.1.2, otherwise the non-DRX requirements are applicable. The applicable measurement accuracy requirements are in Section 9.1.19.

#### 8.12.2.4 Measurements of a secondary component carrier with deactivated SCell

This section defines the measurement requirements of a secondary component carrier with deactivated SCell based on the parameter *measCycleSCell* defined in TS 36.331 [2].

##### 8.12.2.4.1 E-UTRAN secondary component carrier measurements when no common DRX is used

When no DRX is in use the UE shall be able to identify a new detectable cell on a secondary component carrier within the cell identification time  $T_{\text{identify\_SCC\_FS3}}$ , where the cell identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_SCC\_FS3\_CRS}}$ .

$T_{\text{identify\_SCC\_FS3}}$  is the time period for cell identification as specified in Table 8.12.2.4.1-1,

$T_{\text{measure\_SCC\_FS3\_CRS}}$  is the time period for measurements as shown in Table 8.12.2.4.1-2,

$T_{\text{DMTC\_periodicity}}$  is the discovery signal measurement timing configuration periodicity of higher layer,

L is the number of configured discovery signal occasions which are not available during  $T_{\text{identify\_SCC\_FS3}}$  for cell identification at the UE due to the absence of the necessary radio signals from the cell,

M is the number of configured discovery signal occasions which are not available during  $T_{\text{measure\_SCC\_FS3\_CRS}}$  for the measurements at the UE due to the absence of the necessary radio signals from the cell.

**Table 8.12.2.4.1-1: Cell identification with deactivated SCell on SCC under operation with frame structure 3**

| SCH $\hat{E}_s/\text{lot}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | CRS measurement bandwidth [RB]<br>Note2 | CRS $\hat{E}_s/\text{lot}$                 | $T_{\text{identify\_SCC\_FS3}}$ [ms]                     |

A cell shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_SCC\_FS3}}$ :

- RSRP related side condition given in Section 9.1.19 are fulfilled for a corresponding Band,
- $\text{SCH\_RP}|_{\text{dBm}}$  is according to Annex B.2.12 for a corresponding Band and SCH  $\hat{E}_s/\text{lot}$  is according to Table 8.12.2.4.1-1.

The measurement period for deactivated SCell measurements is  $T_{\text{measure\_SCC\_FS3\_CRS}}$  according to the parameter *measCycleSCell* shown in Table 8.12.2.4.1-1.

**Table 8.12.2.4.1-2: Measurement requirements on SCC with deactivated SCell under operation with frame structure 3 with deactivated SCell**

| SCH $\hat{E}_s/\text{lot}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | CRS<br>measurement<br>bandwidth [RB]<br>Note2 | CRS $\hat{E}_s/\text{lot}$                 | $T_{\text{measure\_SCC\_FS3\_CRS}}$ [ms] |

The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.</p> $k_2 = \max \left( 2, \left\lceil \frac{N_{\text{FS3\_SCC}}}{2} \right\rceil \right)$ <p>when DMTC occasions in the measured cell not overlapping with the inter-frequency measurement gaps overlap with DMTC occasions of <math>N_{\text{FS3\_SCC}}</math> (<math>N_{\text{FS3\_SCC}} &gt; 0</math>) SCells on other FS3 carriers; otherwise, <math>k_2=1</math>, e.g., when <math>N_{\text{FS3\_SCC}}=0</math>.</p> <p>Note 4: The requirements apply, provided that M is such that the time period <math>T_{\text{measure\_SCC\_FS3\_CRS}}</math> for measurements does not exceed <math>60*k_1*k_2*\text{measCycleSCell}</math>.</p> |                                               |                                            |                                          |

The UE shall be capable of performing RSRP and RSRQ measurements for 3 identified cells on a secondary component carrier, and the UE physical layer shall be capable of reporting measurements to higher layers within the measurement period of  $T_{\text{measure\_SCC\_FS3\_CRS}}$ .

The measurement accuracy for all measured cells shall be as specified in Section 9.1.19.

A UE may reconfigure the receiver bandwidth or turn on/off one of the RF chains when performing measurements on one SCC with deactivated SCell. This may cause interruptions on PCell that are specified in Section 7.8.

#### 8.12.2.4.1.1 Measurement Reporting Requirements

##### 8.12.2.4.1.1.1 Periodic Reporting

Reported measurements contained in periodically triggered measurement reports shall meet the requirements in Section 9.

##### 8.12.2.4.1.1.2 Event-triggered Periodic Reporting

Reported measurements contained in event triggered periodic measurement reports shall meet the requirements in Section 9.

The first report in event triggered periodic CRS based measurement reporting shall meet the requirements specified in Section 8.12.2.4.1.1.3.

##### 8.12.2.4.1.1.3 Event Triggered Reporting

Reported measurements contained in event triggered measurement reports shall meet the requirements in Section 9.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which is caused by no UL resources for UE to send

the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_SCC\_FS3}}$  defined in Section 8.12.2.4.1. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_SCC\_FS3}}$  defined in Section 8.12.2.4.1 becomes undetectable for a period  $\leq 8$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{identify\_SCC\_FS3\_CRS}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

#### 8.12.2.4.2 E-UTRAN secondary component carrier measurements when common DRX is used

When DRX is in use the UE shall be able to identify a new detectable FS3 cell on a secondary component carrier within the cell identification time  $T_{\text{identify\_SCC\_FS3\_DRX}}$ , according to the parameter *measCycleSCell*, where the cell identification time of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_SCC\_FS3\_CRS\_DRX}}$ .

$T_{\text{identify\_SCC\_FS3\_DRX}}$  is the time period for cell identification as shown in Table 8.12.2.4.2-1,

$T_{\text{measure\_SCC\_FS3\_CRS\_DRX}}$  is the time period for measurements as shown in Table 8.12.2.4.2-2,

$T_{\text{DMTC\_periodicity}}$  is the discovery signal measurement timing configuration periodicity of higher layer,

$L$  is the number of configured discovery signal occasions during ON DURATION and which are not available during  $T_{\text{identify\_SCC\_FS3\_DRX}}$  for cell identification at the UE due to the absence of the necessary radio signals from the cell,

$M$  is the number of configured discovery signal occasions during ON DURATION and which are not available during  $T_{\text{measure\_SCC\_FS3\_CRS\_DRX}}$  for the measurements at the UE due to the absence of the necessary radio signals from the cell.

**Table 8.12.2.4.2-1: Cell identification on SCC with deactivated SCell under operation with frame structure 3**

A cell shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_SCC\_FS3\_DRX}}$ :

- RSRP related side condition given in Section 9.1.19 are fulfilled for a corresponding Band,
- $SCH\_RP_{\text{dBm}}$  is according to Annex B.2.12 for a corresponding Band and  $SCH\ \hat{E}s/\text{lot}$  is according to Table 8.12.2.4.2-1.

The measurement period for deactivated scell measurements is  $T_{\text{measure\_SCC\_FS3\_CRS\_DRX}}$  according to the parameter *measCycleSCell* shown in Table 8.12.2.4.2-2.

**Table 8.12.2.4.2-2: Measurement requirements on SCC with deactivated SCell under operation with frame structure 3**

The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.</p> $k_2 = \max\left(2, \left\lceil \frac{N_{\text{FS3\_SCC}}}{2} \right\rceil\right)$ when DMTC occasions in the measured cell not overlapping with the inter-frequency measurement gaps overlap with DMTC occasions of $N_{\text{FS3\_SCC}}$ ( $N_{\text{FS3\_SCC}} > 0$ ) SCells during ON DURATION on other FS3 carriers; otherwise, $k_2=1$ , e.g., when $N_{\text{FS3\_SCC}}=0$ . <p>Note 4: The requirements apply, provided that M is such that the time period <math>T_{\text{measure\_SCC\_FS3\_CRS\_DRX}}</math> for measurements does not exceed <math>60 \cdot k_1 \cdot k_2 \cdot \text{Max}\{\text{measCycleSCell, DRX cycle length}\}</math>.</p> |                                         |                                           |                                                                                          |

The UE shall be capable of performing RSRP and RSRQ measurements for 3 identified cells on a secondary component carrier, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{\text{measure\_SCC\_FS3\_CRS\_DRX}}$ .

The measurement accuracy for all measured cells shall be as specified in Section 9.1.19.

A UE may reconfigure receiver bandwidth taking into account the SCell activation/deactivation status, and when making measurements of cells on one SCC with deactivated SCell. This may cause interruptions (packet drops) to a PCell. No interruptions while the On Duration timer is running shall be allowed when common DRX is used. The requirement considers only interruptions due to reconfiguration of the receiver bandwidth, and not due to other causes such as RF impairments or channel conditions.

#### 8.12.2.4.2.1 Measurement Reporting Requirements

##### 8.12.2.4.2.1.1 Periodic Reporting

Reported measurements contained in periodically triggered measurement reports shall meet the requirements in Section 9.

#### 8.12.2.4.2.1.2 Event-triggered Periodic Reporting

Reported measurements contained in event triggered periodic measurement reports shall meet the requirements in Section 9.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.12.2.4.2.1.3.

#### 8.12.2.4.2.1.3 Event Triggered Reporting

Reported measurements contained in event triggered measurement reports shall meet the requirements in Section 9.

The UE shall not send any event triggered CRS based measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which is caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_SCC\_FS3}$  defined in Section 8.12.2.4.2. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{identify\_SCC\_FS3\_DRX}$  defined in Section 8.12.2.4.2 becomes undetectable for a period  $\leq 8$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{identify\_SCC\_FS3\_CRS\_DRX}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

### 8.12.3 Requirements for CSI-RS based discovery signal measurements for E-UTRA carrier aggregation

#### 8.12.3.1 Introduction

The requirements in Section 8.12.3 shall apply for CSI-RS based discovery signal measurements comprising CSI-RSRP measurements [4].

#### 8.12.3.2 Measurements of a secondary component carrier

A Secondary component carrier may be activated and deactivated by MAC-CE commands as specified in [17]. The applicable performance requirements depend on whether the SCell on the corresponding frequency is activated or deactivated.

#### 8.12.3.3 Measurements of a secondary component carrier with active SCell

When the SCell is activated, measurement performance requirements for the frequency are those given in Section 8.11.3.1. If common DRX is in use, then the requirements for that secondary component carrier are given by the DRX requirements in Section 8.11.3.1.1.2, otherwise the non DRX requirements are applicable. The applicable measurement accuracy requirements are in Section 9.1.19.

#### 8.12.3.4 Measurements of a secondary component carrier with deactivated SCell

This section defines the measurement requirements of a secondary component carrier with deactivated SCell based on the parameter *measCycleSCell* defined in TS 36.331 [2].

##### 8.12.3.4.1 E-UTRAN secondary component carrier measurements when no common DRX is used

When no DRX is in use the UE shall be able to identify a new detectable FS3 TP on a secondary component carrier within the cell identification time  $T_{identify\_SCC\_TP\_FS3}$ , where the identification of a TP shall include cell identification and a single measurement on the TP within the measurement period  $T_{measure\_SCC\_FS3\_CSI-RS}$ .

$$T_{\text{identify\_SCC\_TP\_FS3}} = T_{\text{identify\_SCC\_FS3}} + T_{\text{measure\_SCC\_FS3\_CSI-RS}},$$

where:

$T_{\text{identify\_SCC\_FS3}}$  is the time period for cell identification in Section 8.12.2.4.1,

$T_{\text{measure\_SCC\_FS3\_CSI-RS}}$  is the time period for TP measurement in Table 8.12.3.4.1-1,

M is the number of configured discovery signal occasions which are not available for the measurements at the UE during  $T_{\text{measure\_SCC\_FS3\_CSI-RS}}$  due to the absence of the necessary radio signals from the cell.

During  $T_{\text{identify\_SCC\_TP\_FS3}}$  over multiple discovery signal occasions, the UE may assume the following:

- in all the discovery signal occasions, which are available at the UE, the corresponding necessary cell-specific discovery signals are always available from the same set of TPs in the measured cell, and
- in all the discovery signal occasions, which are not available at the UE, the corresponding necessary cell-specific discovery signals are not available from any TP within the same measured cell.

**Table 8.12.3.4.1-1: Measurement requirements for a TP on SCC with deactivated SCell under operation with frame structure 3**

| SCH $\hat{E}_s/\text{lot}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | CSI-RS measurement bandwidth [RB] <sup>Note2</sup> | CSI-RS $\hat{E}_s/\text{lot}$     | T <sub>measure_SCC_FS3_CSI-RS</sub> [ms] |

| <div>Note 1: Discovery signal occasion duration (<i>ds-OccasionDuration</i>) is 1 ms.</div> <div>Note 2: The requirements for measurement bandwidth ≥ 25 RB are optional.</div> <div>Note 3: k1=2 when the measurement gaps configured for inter-frequency measurements in DMTC occasions or for inter-frequency RSSI measurements in RMTC occasions on a carrier with frame structure 3 overlap with some but not all DMTC occasions of the measured TP; otherwise, k1=1, e.g., when measurement gaps configured for inter-frequency measurements on a carrier with frame structure 3 do not overlap with DMTC occasions of the measured TP or when the UE does not require the measurement gaps for the inter-frequency measurements. The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.</div> <div><math display="block">k2 = \max \left( 2, \left\lceil \frac{N_{FS3\_SCC}}{2} \right\rceil \right)</math> when DMTC occasions in the measured TP not overlapping with the inter-frequency measurement gaps overlap with DMTC occasions of <math>N_{FS3\_SCC}</math> (<math>N_{FS3\_SCC}&gt;0</math>) SCells on other FS3 carriers; otherwise, k2=1, e.g., when <math>N_{FS3\_SCC}=0</math>.</div> <div>Note 4: The requirements apply, provided that M is such that the time period T<sub>measure_SCC_FS3_CSI-RS</sub> for TP measurement does not exceed 60*k1*k2* measCycleSCell.</div> |                                                    |                                   |                                          |

A TP shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{\text{identify\_SCC\_TP\_FS3}}$ :

- CSI-RSRP related side condition given in Section 9.1.19 are fulfilled for a corresponding Band,
- $\text{SCH\_RP}_{\text{dBm}}$  is according to Annex B.2.12 for a corresponding Band and SCH  $\hat{E}_s/\text{lot}$  is according to Table 8.12.2.4.1-1.

The UE shall be capable of performing RSRP measurements for 3 identified TPs on a secondary component carrier, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{\text{measure\_SCC\_FS3\_CSI-RS}}$ .

The measurement accuracy for all measured TPs shall be as specified in Section 9.1.19.

A UE may reconfigure the receiver bandwidth or turn on/off one of the RF chains when performing measurements on one SCC with deactivated SCell. This may cause interruptions on PCell that are specified in Section 7.8.

#### 8.12.3.4.1.1 Measurement Reporting Requirements

##### 8.12.3.4.1.1.1 Periodic Reporting

Reported measurements contained in periodically triggered measurement reports shall meet the requirements in Section 9.

##### 8.12.3.4.1.1.2 Event-triggered Periodic Reporting

Reported measurements contained in event triggered periodic measurement reports shall meet the requirements in Section 9.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.12.3.4.1.1.3.

##### 8.12.3.4.1.1.3 Event Triggered Reporting

Reported measurements contained in event triggered measurement reports shall meet the requirements in Section 9.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times T_{TI_{DCCH}}$ . This measurement reporting delay excludes a delay which is caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_SCC\_TP\_FS3}$  defined in Section 8.12.3.4.1. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a TP which has been detectable at least for the time period  $T_{identify\_SCC\_TP\_FS3}$  defined in Section 8.12.3.4.1 becomes undetectable for a period  $\leq [8]$  seconds and then the TP becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{identify\_SCC\_FS3\_CSI-RS}$  provided the timing to that TP has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

#### 8.12.3.4.2 E-UTRAN secondary component carrier measurements when common DRX is used

When DRX is in use the UE shall be able to identify a new detectable FS3 TP on a secondary component carrier within  $T_{identify\_SCC\_TP\_FS3\_DRX}$ , according to the parameter *measCycleSCell*, where the identification of a TP shall include cell identification and a single measurement on the TP within the measurement period  $T_{measure\_SCC\_FS3\_CSI-RS\_DRX}$ .

$$T_{identify\_SCC\_TP\_FS3\_DRX} = T_{identify\_SCC\_FS3\_DRX} + T_{measure\_SCC\_FS3\_CSI-RS\_DRX},$$

where:

$T_{identify\_SCC\_FS3\_DRX}$  is the time period for cell identification in Section 8.12.2.4.2,

$T_{measure\_SCC\_FS3\_CSI-RS\_DRX}$  is the time period for TP measurement in Table 8.12.3.4.2-1,

$M$  is the number of configured discovery signal occasions during ON DURATION and which are not available during  $T_{measure\_SCC\_FS3\_CSI-RS\_DRX}$  for the measurements at the UE due to the absence of the necessary radio signals from the cell.

During  $T_{identify\_SCC\_TP\_FS3\_DRX}$  over multiple discovery signal occasions, the UE may assume the following:

- in all the discovery signal occasions, which are available at the UE, the corresponding necessary cell-specific discovery signals are always available from the same set of TPs in the measured cell, and
- in all the discovery signal occasions, which are not available at the UE, the corresponding necessary cell-specific discovery signals are not available from any TP within the same measured cell.

**Table 8.12.3.4.2-1: Measurement requirements for a TP on SCC with deactivated SCell under operation with frame structure 3**

The requirements apply, provided that the inter-frequency measurement gap pattern does not overlap with all DMTC occasions of the measured cell.</div> <div><math display="block">k2= \max \left( 2, \left\lceil \frac{N_{FS3\_SCC}}{2} \right\rceil \right)</math> when DMTC occasions in the measured TP not overlapping with the inter-frequency measurement gaps overlap with DMTC occasions of <math>N_{FS3\_SCC}</math> (<math>N_{FS3\_SCC}&gt;0</math>) SCells during ON DURATION on other FS3 carriers; otherwise, <math>k2=1</math>, e.g., when <math>N_{FS3\_SCC}=0</math>.</div> <div>Note 4: The requirements apply, provided that M is such that the time period <math>T_{measure\_SCC\_FS3\_CSI-RS\_DRX}</math> for TP measurement does not exceed <math>60*k1*k2*Max\{measCycleSCell, DRX cycle length\}</math>.</div> |                                                    |                              |                                                            |

A TP shall be considered detectable when the following conditions are met during the discovery signal occasions which are available during  $T_{identify\_SCC\_TP\_FS3\_DRX}$ :

- CSI-RSRP related side condition given in Section 9.1.19 are fulfilled for a corresponding Band,
- $SCH\_RP|_{dBm}$  is according to Annex B.2.12 for a corresponding Band and  $SCH \hat{E}s/lot$  is according to Table 8.12.2.4.2-1.

The UE shall be capable of performing CSI-RSRP measurements for 3 identified TPs on a secondary component carrier, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{measure\_SCC\_FS3\_CSI-RS\_DRX}$ .

The measurement accuracy for all measured TPs shall be as specified in Section 9.1.19.

A UE may reconfigure receiver bandwidth taking into account the SCell activation/deactivation status, and when making measurements of TPs on one SCC with deactivated SCell. This may cause interruptions (packet drops) to a PCell. No interruptions while the On Duration timer is running shall be allowed when common DRX is used. The requirement considers only interruptions due to reconfiguration of the receiver bandwidth, and not due to other causes such as RF impairments or channel conditions.

#### 8.12.3.4.2.1 Measurement Reporting Requirements

##### 8.12.3.4.2.1.1 Periodic Reporting

Reported measurements contained in periodically triggered measurement reports shall meet the requirements in Section 9.

#### 8.12.3.4.2.1.2 Event-triggered Periodic Reporting

Reported measurements contained in event triggered periodic measurement reports shall meet the requirements in Section 9.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in Section 8.12.3.4.2.1.3.

#### 8.12.3.4.2.1.3 Event Triggered Reporting

Reported measurements contained in event triggered measurement reports shall meet the requirements in Section 9.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which is caused by no UL resources for UE to send the measurement report or by the LBT procedure performed by the UE in order to determine that the channel is clear for performing uplink transmission.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_SCC\_TP\_FS3\_DRX}$  defined in Section 8.12.3.4.2. When L3 filtering is used or IDC autonomous denial is configured or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

If a TP which has been detectable at least for the time period  $T_{identify\_SCC\_TP\_FS3\_DRX}$  defined in Section 8.12.3.4.2 becomes undetectable for a period  $\leq 8$  seconds and then the TP becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{identify\_SCC\_FS3\_CSI-RS\_DRX}$  provided the timing to that TP has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or LBT is performed by the UE on the carrier used for the measurement reporting an additional delay can be expected.

## 8.13 Measurements for UE Category M1

### 8.13.1 Introduction

The UE category M1 applicability of the requirements in subclause 8.13 is defined in Section 3.6.

This clause contains requirements on the UE regarding measurement reporting in RRC\_CONNECTED state. The requirements are specified for E-UTRA intra frequency measurements. These measurements may be used by the E-UTRAN, e.g. for handover decisions. The measurement quantities are defined in [4], the measurement model is defined in [22] and measurement accuracies are specified in clause 9. Control of measurement reporting is specified in TS 36.331 [2].

When the UE is provided with IDC solution, the UE shall also perform RRM measurements and meet the corresponding requirements in clause 8.

### 8.13.2 Requirements for UE category M1 with CE mode A

The UE category M1 applicability of the requirements in subclause 8.13.2 is defined in Section 3.6. The requirements defined in clause 8.13.2 apply provided the following conditions are met:

- UE is configured with measurement gap according to any of gap patterns defined in Table 8.1.2.1-1.

Alternatively, the UE shall meet the requirements in subclause 8.13.2 defined for Gap Pattern ID#0 without using any measurement gaps provided:

- UE indicates it does not need gaps with the capability `intraFreq-CE-NeedForGaps-r13` [2, TS 36.331] for the frequency band of the serving cell, or
- UE is not configured with any reporting configuration that requires measurement on any intra-frequency neighbour cell.

### 8.13.2.1 E-UTRAN intra frequency measurements by UE category M1 with CE mode A

The UE shall be able to identify new intra-frequency cells and perform RSRP and RSRQ measurements of identified intra-frequency cells without an explicit intra-frequency neighbour cell list containing physical layer cell identities. During the RRC\_CONNECTED state the UE shall continuously measure identified intra frequency cells and additionally search for and identify new intra frequency cells.

#### 8.13.2.1.1 E-UTRAN FDD intra frequency measurements

##### 8.13.2.1.1.1 E-UTRAN intra frequency measurements when no DRX is used

When no DRX is in use the UE shall be able to identify and measure a new detectable FDD intra frequency cell according to requirements in Table 8.13.2.1.1.1-1 when  $SCH\ \hat{E}_s/I_{ot} \geq -6$  dB, provided

- $G=1$ , or
- $r_{max} * G < 80$ ms, or
- UE is receiving PDSCH.

Otherwise, requirements in Table 8.13.2.1.1.1-3 apply, where  $r_{max}$  and  $G$  are given by higher layer parameter  $mPDCCH-NumRepetition$  and  $mPDCCH-startSF-UESS$  respectively as defined in TS 36.213 [3].

**Table 8.13.2.1.1.1-1: Requirement on cell identification delay and measurement delay for FDD intrafrequency cell**

| Gap pattern ID | Cell identification delay ( $T_{identify\_intra\_UE\ cat\ M1}$ ) | Measurement delay ( $T_{measure\_intra\_UE\ cat\ M1}$ ) |
|----------------|------------------------------------------------------------------|---------------------------------------------------------|
| 0              | $1.44 * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ seconds            | $480 * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ ms         |
| 1              | $2.88 * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ seconds            | $960 * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ ms         |

$K_{intra\_M1\_NC} = 100 / X$  where  $X$  is signalled by the RRC parameter  $measGapSharingScheme$  [2] and is defined as in Table 8.13.2.1.1.1-2.  $N_{freq}$  is total number of inter-frequency layers to be monitored as defined in 8.1.2.1.1. When inter frequency measurement is not configured,  $K_{intra\_M1\_NC}=1$  regardless whether or how parameter  $measGapSharingScheme$  [2] is configured.

**Table 8.13.2.1.1.1-2: Value of parameter X for CEModeA**

| $measGapSharingScheme$ | Value of X (%)             |
|------------------------|----------------------------|
| '00'                   | $\frac{100}{N_{freq} + 1}$ |
| '01'                   | 40                         |
| '10'                   | 50                         |
| '11'                   | 60                         |

**Table 8.13.2.1.1.1-3: Requirement on cell identification delay and measurement delay for FDD intrafrequency cell with MPDCCH scaling**

| Gap pattern ID | Cell identification delay ( $T_{identify\_intra\_UE\ cat\ M1}$ )                           | Measurement delay ( $T_{measure\_intra\_UE\ cat\ M1}$ )                      |
|----------------|--------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| 0              | $\text{Max}(20 * r_{max} * G / 1000, 1.44) * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ seconds | $\text{Max}(5 * r_{max} * G, 480) * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ ms |
| 1              | $\text{Max}(20 * r_{max} * G / 1000, 2.88) * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ seconds | $\text{Max}(5 * r_{max} * G, 960) * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ ms |

$$K_{RSTD\_M1\_NC} = \frac{1}{1 - \max\left(\frac{40}{T_{PRS}}, \frac{N_{PRS}}{T_{PRS}}\right)}$$

$K_{RSTD\_M1\_NC}$  is applicable provided following conditions are met:

- $T_{\text{PRS}} > 40 \text{ ms}$
- $T_{\text{PRS}} > N_{\text{PRS}}$
- PRS bandwidth is less than the bandwidth of the cell used for RSTD measurement in which case gaps are required

where

- $T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.211 [16],
- $N_{\text{PRS}}$  is the number of consecutive downlink positioning subframes in a positioning occasion defined in TS 36.211

Otherwise  $K_{\text{RSTD\_M1\_NC}} = 1$ .

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.1 and 9.1.21.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.6 are fulfilled for a corresponding Band,
- $\text{SCH\_RP}$  and  $\text{SCH\_Es/Iot}$  according to Annex Table B.2.14-1 for a corresponding Band.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_intra\_UE cat M1}}$ . If higher layer filtering is used, an additional cell identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is according to Table 8.13.2.1.1.1-1. When measurement gaps are activated the UE shall be capable of performing measurements for at least 6 cells. If the UE has identified more than 6 cells, the UE shall perform measurements but the reporting rate of RSRP and RSRQ measurement of cells from UE physical layer to higher layers may be decreased.

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.1 and 9.1.21.2.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.6.

#### 8.13.2.1.1.1.1 Measurement Reporting Requirements

##### 8.13.2.1.1.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.2.1.1.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.1.1.1.1.3.

##### 8.13.2.1.1.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty

is:  $2 \times T_{\text{TTI}_{\text{DCCH}}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  defined in Clause 8.13.2.1.1.1. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  defined in clause 8.13.2.1.1.1 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{Measurement\_Period\_UE cat M1, Intra}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.2.1.1.2 E-UTRAN intra frequency measurements when DRX is used

When DRX is in use the UE shall be able to identify a new detectable FDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  as shown in table 8.13.2.1.1.2-1.

When eDRX\_CONN is in use the UE shall be able to identify a new detectable FDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  as shown in table 8.13.2.1.1.2-1A.

**Table 8.13.2.1.1.2-1: Requirement to identify a newly detectable FDD intrafrequency cell**

| Gap pattern ID                                                | DRX cycle length (s)                 | $T_{\text{identify\_intra\_UE cat M1\_NC}}$ (s) (DRX cycles)                                                             |
|---------------------------------------------------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| 0                                                             | $\leq 0.04$                          | $1.44 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                     |
|                                                               | $0.04 < \text{DRX-cycle} \leq 0.08$  | Note 2 ( $40 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                     |
|                                                               | 0.128                                | $3.2 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ( $25 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $20 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                     |
| 1                                                             | $< 0.128$                            | $2.88 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                     |
|                                                               | 0.128                                | $3.2 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ( $25 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $20 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                     |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                      |                                                                                                                          |
| Note 2: Time depends upon the DRX cycle in use                |                                      |                                                                                                                          |

**Table 8.13.2.1.1.2-1A: Requirement to identify a newly detectable FDD intrafrequency cell when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{identify\_intra\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|--------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $20 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                    |

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.1 and 9.1.21.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.6 are fulfilled for a corresponding Band,
- SCH\_RP and SCH\_Ês/Iot according to Annex B.2.14-1 for a corresponding Band

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is  $T_{\text{measure\_intra\_UE cat M1}}$ . When DRX is used,  $T_{\text{measure\_intra\_UE cat M1\_NC}}$  is as specified in table 8.13.2.1.1.2-2. When eDRX\_CONN is used,  $T_{\text{measure\_intra\_UE cat M1\_NC}}$  is as specified in table 8.13.2.1.1.2-3. The UE shall be capable of performing RSRP and RSRQ measurements for 6 identified-intra-frequency cells, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{\text{measure\_intra\_UE cat M1}}$ .

**Table 8.13.2.1.1.2-2: Requirement to measure FDD intrafrequency cells**

| Gap pattern ID                                                | DRX cycle length (s)                    | $T_{\text{measure\_intra\_UE cat M1\_NC}}$ (s) (DRX cycles)           |
|---------------------------------------------------------------|-----------------------------------------|-----------------------------------------------------------------------|
| 0                                                             | $<0.128$                                | $0.48 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note1)   |
|                                                               | $0.128 \leq \text{DRX-cycle} \leq 2.56$ | Note 2 ( $5 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )   |
| 1                                                             | $<0.256$                                | $0.960 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1) |
|                                                               | $0.256 \leq \text{DRX-cycle} \leq 2.56$ | Note 2 ( $*K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )      |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                         |                                                                       |
| Note 2: Time depends upon the DRX cycle in use                |                                         |                                                                       |

**Table 8.13.2.1.1.2-3: Requirement to measure FDD intrafrequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{measure\_intra\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $5 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.1 and 9.1.21.2.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.6.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.2.1.1.2.1 Measurement Reporting Requirements

##### 8.13.2.1.1.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.2.1.1.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.1.1.2.1.3.

##### 8.13.2.1.1.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times T_{\text{TI\_DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_UE cat M1}}$  defined in Clause 8.13.2.1.1.2. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  defined in clause 8.13.2.1.1.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_intra\_UE cat M1\_NC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

### 8.13.2.1.2 E-UTRAN intra frequency measurements for HD-FDD

#### 8.13.2.1.2.1 E-UTRAN intra frequency measurements when no DRX is used

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.13.2.1.1.1 also apply for this section provided the following conditions are met:

- at least downlink subframe # 0 or downlink subframe # 5 per radio frame of an intra-frequency cell to be identified by the UE is available at the UE over  $T_{\text{identify\_intra\_UE cat M1}}$ ;
- at least one downlink subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell over  $T_{\text{measure\_intra\_UE cat M1}}$ .
- RSRP related side conditions given in Sections 9.1.2.1 and 9.1.2.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.x.1 are fulfilled for a corresponding Band,
- $SCH\_RP$  and  $SCH\ \hat{E}s/Iot$  according to Annex Table B.2.14-2 for a corresponding Band

#### 8.13.2.1.2.2 E-UTRAN intra frequency measurements when DRX is used

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

When DRX is in use the UE shall be able to identify a new detectable HD-FDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  as shown in table 8.13.2.1.2.2-1.

When eDRX\_CONN is in use, the UE shall be able to identify a new detectable FDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  as shown in table 8.13.2.1.2.2-1A.

**Table 8.13.2.1.2.2-1: Requirement to identify a newly detectable HD-FDD intrafrequency cell**

| Gap pattern ID                                                | DRX cycle length (s)                 | $T_{\text{identify\_intra\_UE cat M1\_NC}}$ (s) (DRX cycles)                                                             |
|---------------------------------------------------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| 0                                                             | $\leq 0.04$                          | $1.44 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                     |
|                                                               | $0.04 < \text{DRX-cycle} \leq 0.08$  | Note 2 ( $40 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                     |
|                                                               | 0.128                                | $3.2 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ( $32 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $25 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                     |
| 1                                                             | $\leq 0.08$                          | $2.88 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                     |
|                                                               | 0.128                                | $3.2 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ( $32 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $25 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                     |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                      |                                                                                                                          |
| Note 2: Time depends upon the DRX cycle in use                |                                      |                                                                                                                          |

**Table 8.13.2.1.2.2-1A: Requirement to identify a newly detectable HD-FDD intrafrequency cell when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{identify\_intra\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|--------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $25 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                    |

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.1 and 9.1.21.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.6 are fulfilled for a corresponding Band,
- $SCH\_RP$  and  $SCH\ \hat{E}s/Iot$  according to Annex Table B.2.14-2 for a corresponding Band

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is  $T_{\text{measure\_intra\_UE cat M1}}$ .

When DRX is used,  $T_{\text{measure\_intra\_UE cat M1\_NC}}$  is as specified in table 8.13.2.1.2.2-2. When eDRX\_CONN is used,  $T_{\text{measure\_intra\_UE cat M1\_NC}}$  is as specified in table 8.13.2.1.2.2-3. The UE shall be capable of performing RSRP and RSRQ measurements for 6 identified-intra-frequency cells, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{\text{measure\_intra\_UE cat M1}}$ .

**Table 8.13.2.1.2.2-2: Requirement to measure HD-FDD intrafrequency cells**

| Gap pattern ID                                                | DRX cycle length (s)                   | $T_{\text{measure\_intra\_UE cat M1\_NC}}$ (s) (DRX cycles)                                                              |
|---------------------------------------------------------------|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| 0                                                             | <0.08                                  | $0.48 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                     |
|                                                               | $0.08 \leq \text{DRX-cycle} \leq 0.16$ | Note 2 ( $7 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                      |
|                                                               | $0.16 < \text{DRX-cycle} \leq 2.56$    | Note 2 ( $5 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                      |
| 1                                                             | <0.16                                  | $0.96 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                     |
|                                                               | DRX-cycle=0.16                         | $1.12 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ( $7 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.16 < \text{DRX-cycle} \leq 2.56$    | Note 2 ( $5 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )                                                      |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                        |                                                                                                                          |
| Note 2: Time depends upon the DRX cycle in use                |                                        |                                                                                                                          |

**Table 8.13.2.1.2.2-3: Requirement to measure HD-FDD intrafrequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{measure\_intra\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $5 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.1 and 9.1.21.2.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.6.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.2.1.2.2.1 Measurement Reporting Requirements

##### 8.13.2.1.2.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.2.1.2.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.1.2.2.1.3.

##### 8.13.2.1.2.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 * T_{\text{TI\_DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  defined in Clause 8.13.2.1.2.2 When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  defined in clause 8.13.2.1.2.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_intra\_UE cat M1\_NC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

### 8.13.2.1.3 E-UTRAN TDD intra frequency measurements

#### 8.13.2.1.3.1 E-UTRAN intra frequency measurements when no DRX is used

When no DRX is in use, the UE shall be able to identify and measure a new detectable TDD intra frequency cell according to requirements in Table 8.13.2.1.3.1-1 when  $SCH\ \hat{E}s/I_{ot} \geq -6$  dB, provided

- $G=1$ , or
- $r_{max} * G < 80$ ms, or
- UE is receiving PDSCH.

Otherwise, requirements in Table 8.13.2.1.3.1-3 apply, where  $r_{max}$  and  $G$  are given by higher layer parameter *mPDCCH-NumRepetition* and *mPDCCH-startSF-U ESS* respectively as defined in TS 36.213 [3].

**Table 8.13.2.1.3.1-1: Requirement on cell identification delay and measurement delay for TDD intrafrequency cell**

| Gap pattern ID | Cell identification delay ( $T_{identify\_intra\_UE\ cat\ M1}$ ) | Measurement delay ( $T_{measure\_intra\_UE\ cat\ M1}$ ) |
|----------------|------------------------------------------------------------------|---------------------------------------------------------|
| 0              | $1.44 * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ seconds            | $480 * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ ms         |
| 1              | $2.88 * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ seconds            | $960 * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ ms         |

$K_{intra\_M1\_NC} = 100 / X$  where  $X$  is signalled by the RRC parameter *measGapSharingScheme* [2] and is defined as in Table 8.13.2.1.3.1-2.  $N_{freq}$  is total number of inter-frequency layers to be monitored as defined in 8.1.2.1.1. When inter frequency measurement is not configured,  $K_{intra\_M1\_NC}=1$  regardless whether or how parameter *measGapSharingScheme* [2] is configured.

**Table 8.13.2.1.3.1-2: Value of parameter X for CEModeA**

| <i>measGapSharingScheme</i> | Value of X (%)             |
|-----------------------------|----------------------------|
| '00'                        | $\frac{100}{N_{freq} + 1}$ |
| '01'                        | 40                         |
| '10'                        | 50                         |
| '11'                        | 60                         |

**Table 8.13.2.1.3.1-3: Requirement on cell identification delay and measurement delay for TDD intrafrequency cell with MPDCCH scaling**

| Gap pattern ID | Cell identification delay ( $T_{identify\_intra\_UE\ cat\ M1}$ )                           | Measurement delay ( $T_{measure\_intra\_UE\ cat\ M1}$ )                      |
|----------------|--------------------------------------------------------------------------------------------|------------------------------------------------------------------------------|
| 0              | $\text{Max}(20 * r_{max} * G / 1000, 1.44) * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ seconds | $\text{Max}(5 * r_{max} * G, 480) * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ ms |
| 1              | $\text{Max}(20 * r_{max} * G / 1000, 2.88) * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ seconds | $\text{Max}(5 * r_{max} * G, 960) * K_{intra\_M1\_NC} * K_{RSTD\_M1\_NC}$ ms |

$$K_{RSTD\_M1\_NC} = \frac{1}{1 - \max(\frac{40}{T_{PRS}}, \frac{N_{PRS}}{T_{PRS}})}$$

$K_{RSTD\_M1\_NC}$  is applicable provided following conditions are met:

- $T_{PRS} > 40$  ms
- $T_{PRS} > N_{PRS}$
- PRS bandwidth is less than the bandwidth of the cell used for RSTD measurement in which case gaps are required

where

- $T_{PRS}$  is the cell-specific positioning subframe configuration period as defined in TS 36.211 [16],
- $N_{PRS}$  is the number of consecutive downlink positioning subframes in a positioning occasion defined in TS 36.211

Otherwise  $K_{RSTD\_M1\_NC} = 1$ .

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.1 and 9.1.21.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.6 are fulfilled for a corresponding Band,
- $SCH\_RP$  and  $SCH\ \hat{E}s/lot$  according to Annex Table B.2.14-1 for a corresponding Band.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{measure\_intra\_UE\ cat\ M1}$ . If higher layer filtering is used, an additional cell identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is according to Table 8.13.2.1.3.1-1. When measurement gaps are activated the UE shall be capable of performing measurements for at least 6 cells. If the UE has identified more than 6 cells, the UE shall perform measurements but the reporting rate of RSRP and RSRQ measurements of cells from UE physical layer to higher layers may be decreased.

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.1 and 9.1.21.2.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.6.

#### 8.13.2.1.3.1.1 Measurement Reporting Requirements

##### 8.13.2.1.3.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.2.1.3.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.1.3.1.1.3.

##### 8.13.2.1.3.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_intra\_UE\ cat\ M1\_NC}$  defined in Clause 8.13.2.1.3.1. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{identify\_intra\_UE\ cat\ M1\_NC}$  defined in clause 8.13.2.1.3.1 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the

event triggered measurement reporting delay shall be less than  $T_{\text{Measurement\_Period Intra\_UE cat M1\_NC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.2.1.3.2 E-UTRAN intra frequency measurements when DRX is used

When DRX is in use the UE shall be able to identify a new detectable TDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1}}$  as shown in table 8.13.2.1.3.2-1.

When eDRX\_CONN is in use the UE shall be able to identify a new detectable TDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_NC}}$  as shown in table 8.13.2.1.3.2-1A.

**Table 8.13.2.1.3.2-1: Requirement to identify a newly detectable TDD intrafrequency cell**

| Gap pattern ID                                                | DRX cycle length (s)                 | $T_{\text{identify\_intra\_UE cat M1\_NC}}$ (s) (DRX cycles)                                                             |
|---------------------------------------------------------------|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------|

| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                      |                                                                                                                          |
| Note 2: Time depends upon the DRX cycle in use                |                                      |                                                                                                                          |

**Table 8.13.2.1.3.2-1A: Requirement to identify a newly detectable TDD intrafrequency cell when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{identify\_intra\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|--------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $20 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                    |

A cell shall be considered detectable when

- RSRP related side conditions given in Clause 9.1.21.1 and 9.1.21.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.6 are fulfilled for a corresponding Band,
- SCH\_RP and SCH\_Es/Iot according to Annex Table B.2.14-1 for a corresponding Band

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is  $T_{\text{measure\_intra\_UE cat M1}}$ . When DRX is used,  $T_{\text{measure\_intra\_UE cat M1\_NC}}$  is as specified in table 8.13.2.1.3.2-2. When eDRX\_CONN is used,  $T_{\text{measure\_intra\_UE cat M1\_NC}}$  is as specified in table 8.13.2.1.3.2-3. The UE shall be capable of performing RSRP and RSRQ measurements for 6 identified intra-frequency cells and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{\text{measure\_intra\_UE cat M1}}$ .

**Table 8.13.2.1.3.2-2: Requirement to measure TDD intra frequency cells**

| Gap pattern ID                                                | DRX cycle length (s)                    | $T_{\text{measure\_intra\_UE cat M1\_NC}}$ (s) (DRX cycles)          |
|---------------------------------------------------------------|-----------------------------------------|----------------------------------------------------------------------|

| 1                                                             | $< 0.256$                               | $0.96 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1) |
|                                                               | $0.256 \leq \text{DRX-cycle} \leq 2.56$ | Note 2 ( $5 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ )  |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                         |                                                                      |
| Note 2: Time depends upon the DRX cycle in use                |                                         |                                                                      |

**Table 8.13.2.1.3.2-3: Requirement to measure TDD intra frequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                          | $T_{\text{measure\_intra\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|-----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$         | Note ( $5 * K_{\text{intra\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ) |
| Note: Time depends upon the eDRX_CONN cycle in use. |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.1 and 9.1.21.2.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.6.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.2.1.3.2.1 Measurement Reporting Requirements

##### 8.13.2.1.3.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.2.1.3.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.1.3.2.1.3.

##### 8.13.2.1.3.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_intra\_UE\ cat\ M1\_NC}$  defined in Clause 8.13.2.1.3.2. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{identify\_intra\_UE\ cat\ M1\_NC}$  defined in clause 8.13.2.1.3.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{measure\_intra\_UE\ cat\ M1\_NC}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.2.2 Void

#### 8.13.2.3 E-UTRAN OTDOA Intra-Frequency RSTD Measurements for Cat-M1 UE in CEModeA

All intra-frequency RSTD measurement requirements specified in Sections 8.13.2.3 shall apply without DRX as well as for any DRX and eDRX\_CONN cycles specified in TS 36.331 [2]. All the measurement requirements specified in Sections 8.13.2.3 shall apply provided that the UE is configured:

- with the single PRS configuration for the reference cell and all the neighbour cells and
- with the measurement gap pattern ID #0 specified in Clause 8.1.2.1 if the PRS bandwidth is less than the bandwidth of the cell used for the RSTD measurement in which case gaps are required

##### 8.13.2.3.1 E-UTRAN FDD Intra-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{RSTD\ IntraFreqFDD, Cat\_M}$  ms as given below (see also Figure 8.13.2.3.1-1):

$$T_{\text{RSTD IntraFreqFDD, Cat}_M} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \text{ ms},$$

where

$T_{\text{RSTD IntraFreqFDD, Cat}_M}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] for UE not configured with measurement gaps for intra-frequency RSTD. For UE configured with measurement gaps for intra-frequency RSTD measurements,  $T_{\text{PRS}} = \max(T_{\text{PRS}}, \text{MGRP})$ , where MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1.

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24],

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion;  $N_{\text{actual\_PRS}} = N_{\text{PRS}}$  for UE not configured with measurement gaps for intra-frequency RSTD measurements; for UE configured with measurement gaps for intra-frequency RSTD measurements  $N_{\text{actual\_PRS}}$  is the number of PRS subframes which can be measured by UE within MGL, where  $N_{\text{actual\_PRS}} = (\text{MGL}-2)$  if  $\text{MGRP} \geq N_{\text{PRS}} > (\text{MGL}-2)$ ,  $N_{\text{actual\_PRS}} = (\text{MGL}-2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{\text{MGRP}} \right\rfloor$  if  $N_{\text{PRS}} > \text{MGRP}$ , and  $N_{\text{actual\_PRS}} = N_{\text{PRS}}$  if  $N_{\text{PRS}} \leq (\text{MGL}-2)$ .

$N_{\text{PRS\_total}}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.21.20.

$T_{\text{PRS}}$ ,  $N_{\text{PRS}}$ ,  $N_{\text{actual\_PRS}}$  and  $N_{\text{PRS\_total}}$  are the parameters of the same cell, for which  $T_{\text{PRS}} \cdot \left\lceil \frac{N_{\text{PRS\_total}}}{N_{\text{actual\_PRS}}} \right\rceil$  is the largest among all the measured cells.

$T_{\text{MIB}}$  is the time required for acquiring the MIB information of the target cell.  $T_{\text{MIB}} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

Editor's note: TBD how to capture prsOccGroupLength in the measurement period.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{\text{RSTD InterFreqFDD, Cat}_M}$**

| Positioning subframe configuration period $T_{\text{PRS}}$                                                                                                                                                                                                                                                                                        | Number of PRS positioning occasions $M$                                                  |                                                                                          |

| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                                          |                                                                                          |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \geq -6 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -13 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.22 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE as illustrated in Figure 8.13.2.3.1-1.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.21.20.

If the intra-frequency handover occurs while intra-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the intra-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}} = T_{\text{RSTD IntraFreqFDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the intra-frequency handover occurs during  $T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}}$ .

$T_{\text{HO}}$  is the time during which the intra-frequency RSTD measurement may not be possible due to intra-frequency handover.

**Figure 8.13.2.3.1-1: Illustration of the RSTD reporting time requirement in an FDD system.**

Furthermore, due to the intra-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

### 8.13.2.3.1.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.20.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$  defined in Clause 8.13.2.3.1.

### 8.13.2.3.2 E-UTRAN TDD Intra-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  ms as given below:

$$T_{RSTD \text{ IntraFreqTDD, Cat\_M}} = T_{PRS} \cdot (M - 1) + \Delta + T_{MIB},$$

where

$T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{PRS}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] for UE not configured with measurement gaps for intra-frequency RSTD. For UE configured with measurement gaps for intra-frequency RSTD measurements,  $T_{PRS} = \max(T_{PRS}, \text{MGRP})$ , where MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1.

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{PRS} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{PRS}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355 [24],

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion;  $N_{\text{actual\_PRS}} = N_{PRS}$  for UE not configured with measurement gaps for intra-frequency RSTD measurements; for UE configured with measurement gaps for intra-frequency RSTD measurements  $N_{\text{actual\_PRS}}$  is the number of PRS subframes which can be measured by UE within MGL, where  $N_{\text{actual\_PRS}} = (MGL-2)$  if  $\text{MGRP} \geq N_{PRS} > (MGL-2)$ ,  $N_{\text{actual\_PRS}} = (MGL-2) \cdot \left\lfloor \frac{N_{PRS}}{\text{MGRP}} \right\rfloor$  if  $N_{PRS} > \text{MGRP}$ , and  $N_{\text{actual\_PRS}} = N_{PRS}$  if  $N_{PRS} \leq (MGL-2)$ .

$N_{PRS\_total}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.21.20.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |

| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / I_{ot} \right)_{ref} \geq -6 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / I_{ot} \right)_i \geq -13 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / I_{ot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / I_{ot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.22 for a corresponding Band

$\text{PRS } \hat{E}_s / I_{ot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.21.20.

If the intra-frequency handover occurs while intra-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the intra-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

$(T_{RSTD \text{ IntraFreqTDD, Cat\_M, HO}})$  shall be according to the following expression:

$$T_{RSTD \text{ IntraFreqTDD, Cat\_M, HO}} = T_{RSTD \text{ IntraFreqTDD, Cat\_M}} + K \times T_{PRS} + T_{HO} \quad \text{ms},$$

where:

$K$  is the number of times the intra-frequency handover occurs during  $T_{\text{RSTD IntraFreqTDD, Cat\_M, HO}}$ ,

$T_{\text{HO}}$  is the time during which the intra-frequency RSTD measurement may not be possible due to intra-frequency handover.

Furthermore, due to the intra-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

The intra-frequency requirements in this clause (8.13.2.3.2) shall apply for all TDD special subframe configurations specified in TS 36.211 [16] and for the TDD uplink-downlink configurations as specified in Table 8.13.2.3.2-2.

**Table 8.13.2.3.2-2: TDD uplink-downlink subframe configurations applicable for TDD intra-frequency requirements**

| PRS Transmission Bandwidth [RB]                                                      | Applicable TDD uplink-downlink configurations |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| 6                                                                                    | 1, 2, 3, 4 and 5                              |
| Note: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [16]. |                                               |

#### 8.13.2.3.2.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.20.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  defined in Clause 8.13.2.3.2.

#### 8.13.2.3.3 E-UTRAN HD-FDD Intra-Frequency OTDOA Measurements

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.13.2.3.1 also apply for this section except the reporting delay requirement provided the following conditions are met:

- all positioning subframes indicated in the OTDOA assistance data and specified in Section 9.1.21.20 are available for RSTD measurements in the measured and reference cells.

##### 8.13.2.3.3.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.20.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH

repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times T_{TI_{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than measurement period defined in Clause 8.13.2.3.3.

#### 8.13.2.4 E-UTRAN OTDOA Inter-Frequency RSTD Measurements for Cat-M1 UE in CEModeA

All inter-frequency RSTD measurement requirements specified in Sections 8.13.2.4 shall apply, provided that

- the UE is capable of inter-frequency RSTD measurements for OTDOA [24], and
- either the measurement gap pattern ID # 0 specified in Clause 8.1.2.1 is used or the UE supports capability of conducting inter-frequency measurements without gaps.

All inter-frequency RSTD measurement requirements specified in Sections 8.13.2.4 shall apply without DRX as well as for any DRX and eDRX\_CONN cycles specified in TS 36.331 [2].

All positioning subframes indicated in the OTDOA assistance data and specified in sub-clause 9.1.21.17 are available for RSTD measurements in the measured and reference cell.

All the measurement requirements specified in Sections 8.13.2.4 shall apply provided that the UE is configured with the single PRS configuration for the reference cell and all the neighbour cells.

##### 8.13.2.4.1 E-UTRAN FDD Inter-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD InterFreqFDD, Cat\_M}}$  ms as given below (see also Figure 8.13.2.3.1-1):

$$T_{\text{RSTD InterFreqFDD, Cat\_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \text{ ms},$$

where

$T_{\text{RSTD InterFreqFDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24]; if  $T_{\text{PRS}} < \text{MGRP}$ ,  $T_{\text{PRS}}$  equals to MGRP; MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1,

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24];

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion and can be measured by UE within MGL; if  $\text{MGRP} \geq N_{\text{PRS}} > (\text{MGL} - 2\text{ms})$ ,  $N_{\text{actual\_PRS}}$  equals to  $(\text{MGL} - 2\text{ms})$ ; if  $N_{\text{PRS}} > \text{MGRP}$ ,  $N_{\text{actual\_PRS}}$  equals to

$$(\text{MGL} - 2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{\text{MGRP}} \right\rfloor;$$

$N_{\text{PRS\_total}}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.21.17.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

Editor's note: the formula and parameters are to be further checked and may be updated.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |

|                                                                                                                                                                                                                                                                                                                                                   | f1 <sup>Note1</sup>                                                        | f1 and f2 <sup>Note2</sup>                                                 |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ InterFreqFDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \geq -6 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -13 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.20 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{RSTD \text{ InterFreqFDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.21.17.

If the inter-frequency handover occurs while inter-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the inter-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{RSTD \text{ InterFreqFDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{RSTD \text{ InterFreqFDD, Cat\_M, HO}} = T_{RSTD \text{ InterFreqFDD, Cat\_M}} + K \times T_{PRS} + T_{HO} \quad ms,$$

where:

$K$  is the number of times the inter-frequency handover occurs during  $T_{\text{RSTD InterFreqFDD, Cat\_M, HO}}$ .

$T_{\text{HO}}$  is the time during which the inter-frequency RSTD measurement may not be possible due to inter-frequency handover.

Furthermore, due to the inter-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

#### 8.13.2.4.1.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.17.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  defined in Clause 8.13.2.4.1.

#### 8.13.2.4.2 E-UTRAN TDD Inter-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure inter-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  ms as given below:

$$T_{\text{RSTD InterFreqTDD, Cat\_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \text{ ms},$$

where

$T_{\text{RSTD InterFreqTDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24]; if  $T_{\text{PRS}} < \text{MGRP}$ ,

$T_{\text{PRS}}$  equals to MGRP; MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1,

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24];

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion and can be measured by UE within MGL; if  $\text{MGRP} \geq N_{\text{PRS}} > (\text{MGL} - 2\text{ms})$ ,  $N_{\text{actual\_PRS}}$  equals to  $(\text{MGL} - 2\text{ms})$ ; if  $N_{\text{PRS}} > \text{MGRP}$ ,  $N_{\text{actual\_PRS}}$  equals to  $(\text{MGL} - 2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{\text{MGRP}} \right\rfloor$ ;

$N_{\text{PRS\_total}}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.21.17.

$T_{\text{PRS}}$ ,  $N_{\text{PRS}}$ ,  $N_{\text{actual\_PRS}}$  and  $N_{\text{PRS\_total}}$  are the parameters of the same cell, for which  $T_{\text{PRS}} \cdot \left\lceil \frac{N_{\text{PRS\_total}}}{N_{\text{actual\_PRS}}} \right\rceil$  is the largest among all the measured cells.

$T_{\text{MIB}}$  is the time required for acquiring the MIB information of the target cell.  $T_{\text{MIB}} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{\text{PRS}}$                                                                                                                                                                                                                                                                                        | Number of PRS positioning occasions $M$                                                  |                                                                                          |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------|
|                                                                                                                                                                                                                                                                                                                                                   | f1 <sup>Note1</sup>                                                                      | f1 and f2 <sup>Note2</sup>                                                               |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                                          |                                                                                          |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \geq -6 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -13 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.20 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.21.17.

If the inter-frequency handover occurs while inter-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the inter-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{\text{RSTD InterFreqTDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{\text{RSTD InterFreqTDD, Cat\_M, HO}} = T_{\text{RSTD InterFreqTDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the inter-frequency handover occurs during  $T_{\text{RSTD InterFreqTDD, Cat\_M, HO}}$ ,

$T_{\text{HO}}$  is the time during which the inter-frequency RSTD measurement may not be possible due to inter-frequency handover.

Furthermore, due to the inter-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

The inter-frequency requirements in this clause (8.13.2.4.2) shall apply for all TDD special subframe configurations specified in TS 36.211 [16] and for the TDD uplink-downlink configurations as specified in Table 8.13.2.4.2-2.

**Table 8.13.2.4.2-2: TDD uplink-downlink subframe configurations applicable for TDD inter-frequency requirements**

| PRS Transmission Bandwidth [RB]                                                      | Applicable TDD uplink-downlink configurations |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| 6                                                                                    | 1, 2, 3, 4 and 5                              |
| Note: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [16]. |                                               |

#### 8.13.2.4.2.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.17.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  defined in Clause 8.13.2.4.2.

#### 8.13.2.4.3 E-UTRAN HD-FDD Inter-Frequency OTDOA Measurements

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.13.2.4.1 also apply for this section except reporting delay requirement provided the following conditions are met:

- all positioning subframes indicated in the OTDOA assistance data and specified in Section 9.1.21.17 are available for RSTD measurements in the measured and reference cells.

#### 8.13.2.4.3.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.17.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than measurement period as defined in Clause 8.13.2.4.3.

### 8.13.2.5 E-UTRAN E-CID Measurements Requirements for UE category M1 with CE mode A

#### 8.13.2.5.1 Intra-frequency FDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeA

##### 8.13.2.5.1.1 Introduction

The requirements in section 8.13.2.5.1 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN FDD intra-frequency RSRP and RSRQ measurements [24].

##### 8.13.2.5.1.2 Measurement Requirements

The requirements in section 8.13.2.1.1 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.2.5.1.3.

##### 8.13.2.5.1.3 Measurement Reporting Delay

This requirement assumes that that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.1, 9.1.21.2 and 9.1.21.6.

#### 8.13.2.5.2 Intra-frequency HD-FDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeA

##### 8.13.2.5.2.1 Introduction

The requirements in section 8.13.2.5.2 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN HD-FDD intra-frequency RSRP and RSRQ measurements [24].

##### 8.13.2.5.2.2 Measurement Requirements

The requirements in section 8.13.2.1.2 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.2.5.2.3.

##### 8.13.2.5.2.3 Measurement Reporting Delay

This requirement assumes that that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.1, 9.1.21.2 and 9.1.21.6.

### 8.13.2.5.3 Intra-frequency TDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeA

#### 8.13.2.5.3.1 Introduction

The requirements in section 8.13.2.5.3 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN TDD intra-frequency RSRP and RSRQ measurements [24].

#### 8.13.2.5.3.2 Measurement Requirements

The requirements in section 8.13.2.1.3 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.2.5.3.3.

#### 8.13.2.5.3.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.1, 9.1.21.2 and 9.1.21.6.

### 8.13.2.5.4 Inter-frequency FDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeA

#### 8.13.2.5.4.1 Introduction

The requirements in section 8.13.2.5.4 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN FDD inter-frequency RSRP and RSRQ measurements [24].

#### 8.13.2.5.4.2 Measurement Requirements

The requirements in section 8.13.2.6.1 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.2.5.4.3.

#### 8.13.2.5.4.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

### 8.13.2.5.5 Inter-frequency HD-FDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeA

#### 8.13.2.5.5.1 Introduction

The requirements in section 8.13.2.5.5 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN HD-FDD inter-frequency RSRP and RSRQ measurements [24].

#### 8.13.2.5.5.2 Measurement Requirements

The requirements in section 8.13.2.6.2 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.2.5.5.3.

#### 8.13.2.5.5.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of

the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

### 8.13.2.5.6 Inter-frequency TDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeA

#### 8.13.2.5.6.1 Introduction

The requirements in section 8.13.2.5.6 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN TDD inter-frequency RSRP and RSRQ measurements [24].

#### 8.13.2.5.6.2 Measurement Requirements

The requirements in section 8.13.2.6.3 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.2.5.6.3.

#### 8.13.2.5.6.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

### 8.13.2.5.7 E-UTRAN FDD UE Rx-Tx Time Difference Measurements for UE category M1 in CEModeA

When no DRX is used the physical layer measurement period of the UE Rx-Tx time difference measurement shall be 480 ms.

When DRX is used in RRC\_CONNECTED state the physical layer measurement period ( $T_{\text{measure\_FDD\_UE\_Rx\_Tx1}}$ ) of the UE Rx-Tx time difference measurement shall be as specified in table 8.13.2.5.7-1.

**Table 8.13.2.5.7-1: FDD UE Rx-Tx time difference measurement requirement when DRX is used**

| DRX cycle length (s)                                         | $T_{\text{measure\_FDD\_UE\_Rx\_Tx1}}$ (s) (DRX cycles) |
|--------------------------------------------------------------|---------------------------------------------------------|
| < 0.128                                                      | 0.48 (Note1)                                            |
| $0.128 \leq \text{DRX-cycle} \leq 2.56$                      | Note2 (5)                                               |
| Note1: Number of DRX cycle depends upon the DRX cycle in use |                                                         |
| Note2: Time depends upon the DRX cycle in use                |                                                         |

If the UE is performing UE Rx-Tx time difference measurement while the PCell is changed due to the handover then the UE shall restart the Rx-Tx measurement on the new cell. In this case the UE shall also meet the UE Rx-Tx time difference measurement and accuracy requirements. However the physical layer measurement period of the UE Rx-Tx measurement shall not exceed  $T_{\text{measure\_FDD\_UE\_Rx\_Tx3}}$  as defined in the following expression:

$$T_{\text{measure\_FDD\_UE\_Rx\_Tx3}} = (K+1) \cdot (T_{\text{measure\_FDD\_UE\_Rx\_Tx1}}) + K \cdot T_{\text{PCell\_change\_handover}}$$

Where:

K is the number of times the PCell is changed over the measurement period ( $T_{\text{measure\_FDD\_UE\_Rx\_Tx3}}$ ),

$T_{\text{PCell\_change\_handover}}$  is the time necessary to change the PCell due to handover.

The measurement accuracy for the UE Rx-Tx time difference measurement when DRX is used as well as when no DRX is used shall be as specified in the sub-clause 9.1.21.19.

### 8.13.2.5.7.1 UE Rx-Tx Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.21.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive ECID-RequestLocationInformation message and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeA} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeA}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode A provided that  $\text{pusch-maxNumRepetitionCEmodeA} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than the physical layer measurement period defined in Clause 8.13.2.5.7.

### 8.13.2.5.8 E-UTRAN TDD UE Rx-Tx Time Difference Measurements for UE category M1 in CEModeA

When no DRX is used the physical layer measurement period of the UE Rx-Tx time difference measurement shall be 480 ms.

When DRX is used in RRC\_CONNECTED state the physical layer measurement period ( $T_{\text{measure\_TDD\_UE\_Rx\_Tx1}}$ ) of the UE Rx-Tx time difference measurement shall be as specified in table 8.13.2.5.8-1.

**Table 8.13.2.5.8-1: TDD UE Rx-Tx time difference measurement requirement when DRX is used**

| DRX cycle length (s)                                         | $T_{\text{measure\_TDD\_UE\_Rx\_Tx1}}$ (s) (DRX cycles) |
|--------------------------------------------------------------|---------------------------------------------------------|
| < 0.128                                                      | 0.48 (Note1)                                            |
| $0.128 \leq \text{DRX-cycle} \leq 2.56$                      | Note2 (5)                                               |
| Note1: Number of DRX cycle depends upon the DRX cycle in use |                                                         |
| Note2: Time depends upon the DRX cycle in use                |                                                         |

If the UE is performing UE Rx-Tx time difference measurement while the PCell is changed due to the handover then the UE shall restart the Rx-Tx measurement on the new cell. In this case the UE shall also meet the UE Rx-Tx time difference measurement and accuracy requirements. However the physical layer measurement period of the UE Rx-Tx measurement shall not exceed  $T_{\text{measure\_TDD\_UE\_Rx\_Tx3}}$  as defined in the following expression:

$$T_{\text{measure\_TDD\_UE\_Rx\_Tx3}} = (K+1) \cdot (T_{\text{measure\_TDD\_UE\_Rx\_Tx1}}) + K \cdot T_{\text{PCell\_change\_handover}}$$

Where:

K is the number of times the PCell is changed over the measurement period ( $T_{\text{measure\_TDD\_UE\_Rx\_Tx3}}$ ),

$T_{\text{PCell\_change\_handover}}$  is the time necessary to change the PCell due to handover.

The measurement accuracy for the UE Rx-Tx time difference measurement when DRX is used as well as when no DRX is used shall be as specified in the sub-clause 9.1.21.19.

### 8.13.2.5.8.1 UE Rx-Tx Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.21.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive ECID-RequestLocationInformation message and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeA} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeA}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode A

provided that  $\text{pusch-maxNumRepetitionCEmodeA} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than the physical layer measurement period defined in Clause 8.13.2.5.8.

#### 8.13.2.5.9 E-UTRAN HD-FDD UE Rx-Tx Time Difference Measurements for UE category M1 in CEModeA

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands.

The requirements defined in clause 8.13.2.5.7 also apply for this section except the measurement reporting requirements provided the following conditions are met:

- At least one downlink and one uplink subframes per radio frame are available for the UE Rx-Tx time difference measurement in the measured cell.
- at least downlink subframe # 0 or downlink subframe # 5 per radio frame of an intra-frequency cell to be identified by the UE is available at the UE;
- $\text{SCH\_RP}$  and  $\text{SCH\_Es/Iot}$  according to Annex Table B.2.14-2 for a corresponding Band

##### 8.13.2.5.9.1 UE Rx-Tx Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.19.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive ECID-RequestLocationInformation message and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeA} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeA}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode A provided that  $\text{pusch-maxNumRepetitionCEmodeA} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than the physical layer measurement period defined in Clause 8.13.2.5.9.

#### 8.13.2.6 E-UTRAN inter frequency measurements by UE category M1 with CE mode A

The UE shall be able to identify new inter-frequency cells and perform RSRP and RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the PCell, even if no explicit neighbour list with physical layer cell identities is provided. During the RRC\_CONNECTED state the UE shall continuously measure identified inter frequency cells and additionally search for and identify new inter frequency cells.

##### 8.13.2.6.1 E-UTRAN FDD - FDD inter frequency measurements

###### 8.13.2.6.1.1 E-UTRAN FDD - FDD inter frequency measurements when no DRX is used

When no DRX is in use the UE shall be able to identify and measure a new detectable FDD inter-frequency cell according to requirements in Table 8.13.2.6.1.1-1 when  $\text{SCH\_Es/Iot} \geq -6$  dB, provided

- $G=1$ , or
- $r_{\text{max}} * G < 80\text{ms}$ , or
- UE is receiving PDSCH.

Otherwise, requirements in Table 8.13.2.6.1.1-3 apply, where  $r_{\text{max}}$  and  $G$  are given by higher layer parameter  $m\text{PDCCH-NumRepetition}$  and  $m\text{PDCCH-startSF-U ESS}$  respectively as defined in TS 36.213 [3].

**Table 8.13.2.6.1.1-1: Requirement on cell identification delay and measurement delay for FDD interfrequency cell**

| Gap pattern ID | Cell identification delay ( $T_{\text{identify\_inter\_UE cat M1\_NC}}$ ) | Measurement delay ( $T_{\text{measure\_inter\_UE cat M1\_NC\_NC}}$ ) |
|----------------|---------------------------------------------------------------------------|----------------------------------------------------------------------|
| 0              | $1.44 * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ seconds       | $480 * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ms        |
| 1              | $2.88 * K_{\text{inter\_M1\_NC}}$ seconds                                 | $960 * K_{\text{inter\_M1\_NC}}$ ms                                  |

$$K_{\text{inter\_M1\_NC}} = \frac{N_{\text{freq}} * 100}{(100 - X)}$$

where X is signalled by the RRC parameter *measGapSharingScheme* [2] and is defined as in Table 8.13.2.6.1.1-2.

$N_{\text{freq}}$  is total number of inter-frequency layers to be monitored as defined in 8.1.2.1.1.

**Table 8.13.2.6.1.1-2: Value of parameter X for CEModeA**

| <i>measGapSharingScheme</i> | Value of X (%)                    |
|-----------------------------|-----------------------------------|
| '00'                        | $\frac{100}{N_{\text{freq}} + 1}$ |
| '01'                        | 40                                |
| '10'                        | 50                                |
| '11'                        | 60                                |

**Table 8.13.2.6.1.1-3: Requirement on cell identification delay and measurement delay for FDD interfrequency cell with MPDCCH scaling**

| Gap pattern ID | Cell identification delay ( $T_{\text{identify\_inter\_UE cat M1}}$ )                                           | Measurement delay ( $T_{\text{measure\_inter\_UE cat M1}}$ )                                      |
|----------------|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| 0              | $\text{Max}(20 * r_{\text{max}} * G / 1000, 1.44) * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ seconds | $\text{Max}(5 * r_{\text{max}} * G, 480) * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ms |
| 1              | $\text{Max}(20 * r_{\text{max}} * G / 1000, 2.88) * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ seconds | $\text{Max}(5 * r_{\text{max}} * G, 960) * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ms |

$$K_{\text{RSTD\_M1\_NC}} = \frac{1}{1 - \max\left(\frac{40}{T_{\text{PRS}}}, \frac{N_{\text{PRS}}}{T_{\text{PRS}}}\right)}$$

$K_{\text{RSTD\_M1\_NC}}$  is applicable provided following conditions are met:

-  $T_{\text{PRS}} > 40 \text{ ms}$

-  $T_{\text{PRS}} > N_{\text{PRS}}$

where

-  $T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.211 [16],

-  $N_{\text{PRS}}$  is the number of consecutive downlink positioning subframes in a positioning occasion defined in TS 36.211

Otherwise  $K_{\text{RSTD\_M1\_NC}} = 1$ .

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.9 and 9.1.22.10 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.13 and 9.1.21.14 are fulfilled for a corresponding Band,
- $SCH\_RP$  and  $SCH\_Es/Iot$  according to Annex Table B.2.14-1 for a corresponding Band.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_inter\_UE cat M1\_NC}}$ . If higher layer filtering is used, an additional cell identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for inter frequency measurements is according to Table 8.13.2.6.1.1-1. When measurement gaps are scheduled for FDD inter frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with measurement accuracy as specified in sub-clauses 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per FDD inter-frequency for up to 2 FDD inter-frequencies and the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with the measurement period defined in Table 8.13.2.6.1.1-1.

#### 8.13.2.6.1.1.1 Measurement Reporting Requirements

##### 8.13.2.6.1.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

##### 8.13.2.6.1.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.6.1.1.1.3.

##### 8.13.2.6.1.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  defined in Clause 8.13.2.6.1.1. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  defined in clause 8.13.2.6.1.1 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{Measurement\_Period\_UE cat M1\_NC, Inter}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.2.6.1.2 E-UTRAN inter frequency measurements when DRX is used

When DRX is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD inter-frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  as shown in table 8.13.2.6.1.2-1.

When eDRX\_CONN is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD inter-frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  as shown in table 8.13.2.6.1.2-1A.

**Table 8.13.2.6.1.2-1: Requirement to identify a newly detectable FDD interfrequency cell**

| Gap pattern ID                                                | DRX cycle length (s)                 | $T_{\text{identify\_inter\_UE cat M1\_NC}}$ (s) (DRX cycles)                                                     |
|---------------------------------------------------------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 0                                                             | $\leq 0.04$                          | $1.44 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                 |

|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $20 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                 |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                      |                                                                                                                  |
| Note 2: Time depends upon the DRX cycle in use                |                                      |                                                                                                                  |

**Table 8.13.2.6.1.2-1A: Requirement to identify a newly detectable FDD interfrequency cell when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{identify\_inter\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|--------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $20 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )     |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                    |

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.9 and 9.1.21.10 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.13 and 9.21.14 are fulfilled for a corresponding Band,
- SCH\_RP and SCH\_Es/Iot according to Annex B.2.14-1 for a corresponding Band

When DRX or eDRX\_CONN is in use, the UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per FDD inter-frequency and the UE physical layer shall be capable of reporting RSRP and RSRQ to higher layers with the measurement period  $T_{\text{measure\_inter\_UE cat M1\_NC}}$ , either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps. When DRX is used,  $T_{\text{measure\_inter\_UE cat M1\_NC}}$  is as defined in Table 8.13.2.6.1.2-2, and when eDRX\_CONN is in use,  $T_{\text{measure\_inter\_UE cat M1\_NC}}$  is as defined in Table 8.13.2.6.1.2-3.

**Table 8.13.2.6.1.2-2: Requirement to measure FDD interfrequency cells**

| Gap pattern ID                                                | DRX cycle length (s)                    | $T_{\text{measure\_inter\_UE cat M1\_NC}}$ (s) (DRX cycles)                  |
|---------------------------------------------------------------|-----------------------------------------|------------------------------------------------------------------------------|
| 0                                                             | $< 0.128$                               | $0.48 * K_{\text{inter\_M1 cat M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)  |
|                                                               | $0.128 \leq \text{DRX-cycle} \leq 2.56$ | Note 2 ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )              |
| 1                                                             | $< 0.256$                               | $0.960 * K_{\text{inter\_M1 cat M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1) |
|                                                               | $0.256 \leq \text{DRX-cycle} \leq 2.56$ | Note 2 ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )              |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                         |                                                                              |
| Note 2: Time depends upon the DRX cycle in use                |                                         |                                                                              |

**Table 8.13.2.6.1.2-3: Requirement to measure FDD interfrequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{measure\_inter\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )     |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.9 and 9.1.21.10.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.13 and 9.1.21.14.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

### 8.13.2.6.1.2.1 Measurement Reporting Requirements

#### 8.13.2.6.1.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

#### 8.13.2.6.1.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.6.1.2.1.3.

#### 8.13.2.6.1.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times T_{\text{TTI}_{\text{DCCH}}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  defined in Clause 8.13.2.6.1.2. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  defined in clause 8.13.2.6.1.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_inter\_UE cat M1\_NC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

### 8.13.2.6.2 E-UTRAN inter-frequency measurements for HD-FDD

#### 8.13.2.6.2.1 E-UTRAN inter-frequency measurements when no DRX is used

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.13.2.6.1.1 also apply for this section provided the following conditions are met:

- at least downlink subframe # 0 or downlink subframe # 5 per radio frame of an inter-frequency cell to be identified by the UE is available at the UE over  $T_{\text{identify\_inter\_UE cat M1\_NC}}$ ;
- at least one downlink subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell over  $T_{\text{measure\_inter\_UE cat M1\_NC}}$ .
- RSRP related side conditions given in Sections 9.1.21.9 and 9.1.21.10 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.13 and 9.1.21.14 are fulfilled for a corresponding Band,
- $SCH\_RP$  and  $SCH\ \hat{E}_s/lot$  according to Annex Table B.2.14-2 for a corresponding Band

#### 8.13.2.6.2.2 E-UTRAN inter frequency measurements when DRX is used

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

When DRX is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD inter-frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  as shown in table 8.13.2.6.2.2-1.

When eDRX\_CONN is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD inter-frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  as shown in table 8.13.2.6.2.2-1A.

**Table 8.13.2.6.2.2-1: Requirement to identify a newly detectable HD-FDD interfrequency cell**

| Gap pattern ID                                                | DRX cycle length (s)                 | $T_{\text{identify\_inter\_UE cat M1\_NC}}$ (s) (DRX cycles)                                                     |
|---------------------------------------------------------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 0                                                             | $\leq 0.04$                          | $1.44 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note1)                                                  |
|                                                               | $0.04 < \text{DRX-cycle} \leq 0.08$  | Note 2 ( $40 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                 |
|                                                               | 0.128                                | $3.2 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ( $32 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $25 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                 |
| 1                                                             | $\leq 0.08$                          | $2.88 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note1)                                                  |
|                                                               | 0.128                                | $3.2 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ( $32 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $25 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                 |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                      |                                                                                                                  |
| Note 2: Time depends upon the DRX cycle in use                |                                      |                                                                                                                  |

**Table 8.13.2.6.2.2-1A: Requirement to identify a newly detectable HD-FDD interfrequency cell when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{identify\_inter\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|--------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $25 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )     |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                    |

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.9 and 9.1.21.10 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.13 and 9.1.21.14 are fulfilled for a corresponding Band,
- SCH\_RP and SCH\_Es/Iot according to Annex Table B.2.14-2 for a corresponding Band

When DRX or eDRX\_CONN is in use, the UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per FDD inter-frequency and the UE physical layer shall be capable of reporting RSRP and RSRQ to higher layers with the measurement period  $T_{\text{measure\_inter\_UE cat M1\_NC}}$ , either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps. When DRX is used,  $T_{\text{measure\_inter\_UE cat M1\_NC}}$  is as defined in Table 8.13.2.6.2.2-2, and when eDRX\_CONN is in use,  $T_{\text{measure\_inter\_UE cat M1\_NC}}$  is as defined in Table 8.13.2.6.2.2-3.

**Table 8.13.2.6.2.2-2: Requirement to measure HD-FDD interfrequency cells**

| Gap pattern ID                                                | DRX cycle length (s)                   | $T_{\text{measure\_inter\_UE cat M1\_NC}}$ (s) (DRX cycles)                                                      |
|---------------------------------------------------------------|----------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 0                                                             | $< 0.08$                               | $0.48 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                 |

|                                                               | $0.16 < \text{DRX-cycle} \leq 2.56$    | Note 2 ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                  |
| 1                                                             | $< 0.16$                               | $0.96 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                 |
|                                                               | DRX-cycle=0.16                         | $1.12 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ( $7 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.16 < \text{DRX-cycle} \leq 2.56$    | Note 2 ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                  |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                        |                                                                                                                  |
| Note 2: Time depends upon the DRX cycle in use                |                                        |                                                                                                                  |

**Table 8.13.2.6.2.2-3: Requirement to measure HD-FDD interfrequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{measure\_inter\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )     |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.10 and 9.1.21.11.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.13 and 9.1.21.14.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.2.6.2.2.1 Measurement Reporting Requirements

##### 8.13.2.6.2.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

##### 8.13.2.6.2.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.6.2.2.1.3.

##### 8.13.2.6.2.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_inter\_UE\ cat\ M1\_NC}$  defined in Clause 8.13.2.6.2.2 When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{identify\_inter\_UE\ cat\ M1\_NC}$  defined in clause 8.13.2.6.2.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{measure\_inter\_UE\ cat\ M1\_NC}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.2.6.3 E-UTRAN TDD inter frequency measurements

##### 8.13.2.6.3.1 E-UTRAN inter frequency measurements when no DRX is used

When no DRX is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify and measure a new detectable TDD inter frequency cell according to requirements in Table 8.13.2.6.3.1-1 when  $SCH\ \hat{E}_s/I_{ot} \geq -6$  dB, provided

- $G=1$ , or
- $r_{max} * G < 80ms$ , or
- UE is receiving PDSCH.

Otherwise, requirements in Table 8.13.2.6.3.1-3 apply, where  $r_{max}$  and  $G$  are given by higher layer parameter *mPDCCH-NumRepetition* and *mPDCCH-startSF-UESS* respectively as defined in TS 36.213 [3].

**Table 8.13.2.6.3.1-1: Requirement on cell identification delay and measurement delay for TDD interfrequency cell**

| Gap pattern ID | Cell identification delay ( $T_{\text{identify\_inter\_UE cat M1\_NC}}$ ) | Measurement delay ( $T_{\text{measure\_inter\_UE cat M1\_NC}}$ ) |
|----------------|---------------------------------------------------------------------------|------------------------------------------------------------------|
| 0              | $1.44 * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ seconds       | $480 * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ms    |
| 1              | $2.88 * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ seconds       | $960 * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ms    |

$$K_{\text{inter\_M1\_NC}} = \frac{N_{\text{freq}} * 100}{(100 - X)}$$

where X is signalled by the RRC parameter *measGapSharingScheme* [2] and is defined as in Table 8.13.2.6.3.1-2.

$N_{\text{freq}}$  is total number of inter-frequency layers to be monitored as defined in 8.1.2.1.1.

**Table 8.13.2.6.3.1-2: Value of parameter X for CEModeA**

| <i>measGapSharingScheme</i> | Value of X (%)                    |
|-----------------------------|-----------------------------------|
| '00'                        | $\frac{100}{N_{\text{freq}} + 1}$ |
| '01'                        | 40                                |
| '10'                        | 50                                |
| '11'                        | 60                                |

**Table 8.13.2.6.3.1-3: Requirement on cell identification delay and measurement delay for TDD interfrequency cell with MPDCCH scaling**

| Gap pattern ID | Cell identification delay ( $T_{\text{identify\_inter\_UE cat M1}}$ )                                           | Measurement delay ( $T_{\text{measure\_inter\_UE cat M1}}$ )                                      |
|----------------|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------|
| 0              | $\text{Max}(20 * r_{\text{max}} * G / 1000, 1.44) * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ seconds | $\text{Max}(5 * r_{\text{max}} * G, 480) * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ms |
| 1              | $\text{Max}(20 * r_{\text{max}} * G / 1000, 2.88) * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ seconds | $\text{Max}(5 * r_{\text{max}} * G, 960) * K_{\text{inter\_M1\_NC}} * K_{\text{RSTD\_M1\_NC}}$ ms |

$$K_{\text{RSTD\_M1\_NC}} = \frac{1}{1 - \max(\frac{40}{T_{\text{PRS}}}, \frac{N_{\text{PRS}}}{T_{\text{PRS}}})}$$

$K_{\text{RSTD\_M1\_NC}}$  is applicable provided following conditions are met:

- $T_{\text{PRS}} > 40$  ms
- $T_{\text{PRS}} > N_{\text{PRS}}$

where

- $T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.211 [16],
- $N_{\text{PRS}}$  is the number of consecutive downlink positioning subframes in a positioning occasion defined in TS 36.211

Otherwise  $K_{\text{RSTD\_M1\_NC}} = 1$ .

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.9 and 9.1.21.10 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.13 and 9.1.21.14 are fulfilled for a corresponding Band,
- SCH<sub>RP</sub> and SCH<sub>Ê</sub>/Iot according to Annex Table B.2.14-1 for a corresponding Band.

When measurement gaps are scheduled for TDD inter frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP and RSRQ to higher layers with measurement accuracy as specified in sub-clauses 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14 with measurement period ( $T_{\text{measure\_inter\_UE cat M1\_NC}}$ ) given by table 8.13.2.6.3.1-1:

The UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per TDD inter-frequency and the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with the measurement period  $T_{\text{measure\_inter\_UE cat M1\_NC}}$ .

#### 8.13.2.6.3.1.1 Measurement Reporting Requirements

##### 8.13.2.6.3.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

##### 8.13.2.6.3.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.6.3.1.1.3.

##### 8.13.2.6.3.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times T_{\text{TI}_{\text{DCCH}}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  defined in Clause 8.13.2.6.3.1. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  defined in clause 8.13.2.6.3.1 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{Measurement\_Period Inter\_UE cat M1\_NC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.2.6.3.2 E-UTRAN inter frequency measurements when DRX is used

When DRX is in use and when DRX or eDRX\_CONN is in use, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable TDD inter frequency cell within  $T_{\text{identify\_inter\_UE cat M1}}$  as shown in table 8.13.2.6.3.2-1.

When eDRX\_CONN is in use the UE shall be able to identify a new detectable TDD inter frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_NC}}$  as shown in table 8.13.2.6.3.2-1A.

**Table 8.13.2.6.3.2-1: Requirement to identify a newly detectable TDD interfrequency cell**

| Gap pattern ID                                                | DRX cycle length (s)                 | $T_{\text{identify\_inter\_UE cat M1\_NC}}$ (s) (DRX cycles)                                                     |
|---------------------------------------------------------------|--------------------------------------|------------------------------------------------------------------------------------------------------------------|
| 0                                                             | $\leq 0.04$                          | $1.44 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                 |
|                                                               | $0.04 < \text{DRX-cycle} \leq 0.08$  | Note 2 ( $40 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                 |
|                                                               | 0.128                                | $3.2 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ( $25 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $20 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                 |
| 1                                                             | $< 0.128$                            | $2.88 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1)                                                 |
|                                                               | 0.128                                | $3.2 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ( $25 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ ) |
|                                                               | $0.128 < \text{DRX-cycle} \leq 2.56$ | Note 2 ( $20 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )                                                 |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                      |                                                                                                                  |
| Note 2: Time depends upon the DRX cycle in use                |                                      |                                                                                                                  |

**Table 8.13.2.6.3.2-1A: Requirement to identify a newly detectable TDD interfrequency cell when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{identify\_inter\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|--------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $20 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )     |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                    |

A cell shall be considered detectable when

- RSRP related side conditions given in Clause 9.1.21.9 and 9.1.21.10 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.13 and 9.1.21.14 are fulfilled for a corresponding Band,
- SCH\_RP and SCH\_Es/Iot according to Annex Table B.2.14-1 for a corresponding Band

When DRX or eDRX\_CONN is in use, the UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per TDD inter-frequency for up to 3 TDD inter-frequencies and the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with the measurement period  $T_{\text{measure\_inter\_UE cat M1\_NC}}$ , either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps. When DRX is in use,  $T_{\text{measure\_inter\_UE cat M1\_NC}}$  is as defined in Table 8.13.2.6.3.2-2, and when eDRX\_CONN is in use,  $T_{\text{measure\_inter\_UE cat M1\_NC}}$  is as defined in Table 8.13.2.6.3.2-3.

**Table 8.13.2.6.3.2-2: Requirement to measure TDD inter frequency cells**

| Gap pattern ID                                                | DRX cycle length (s)                    | $T_{\text{measure\_inter\_UE cat M1\_NC}}$ (s) (DRX cycles)      |
|---------------------------------------------------------------|-----------------------------------------|------------------------------------------------------------------|
| 0                                                             | $< 0.128$                               | $0.48 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1) |
|                                                               | $0.128 \leq \text{DRX-cycle} \leq 2.56$ | Note 2 ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )  |
| 1                                                             | $< 0.256$                               | $0.96 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ (Note 1) |
|                                                               | $0.256 \leq \text{DRX-cycle} \leq 2.56$ | Note 2 ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )  |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                         |                                                                  |
| Note 2: Time depends upon the DRX cycle in use                |                                         |                                                                  |

**Table 8.13.2.6.3.2-3: Requirement to measure TDD inter frequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                          | $T_{\text{measure\_inter\_UE cat M1\_NC}}$ (s) (eDRX_CONN cycles) |
|-----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$         | Note ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_NC}}$ )     |
| Note: Time depends upon the eDRX_CONN cycle in use. |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.9 and 9.1.21.10.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.13 and 9.1.21.14.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.2.6.3.2.1 Measurement Reporting Requirements

##### 8.13.2.6.3.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

##### 8.13.2.6.3.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.2.6.3.2.1.3.

##### 8.13.2.6.3.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.9, 9.1.21.10, 9.1.21.13 and 9.1.21.14.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{identify\_inter\_UE\ cat\ M1\_NC}$  defined in Clause 8.13.2.6.3.2. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{identify\_inter\_UE\ cat\ M1\_NC}$  defined in clause 8.13.2.6.3.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{measure\_inter\_UE\ cat\ M1\_NC}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.2.7 Maximum allowed layers for multiple monitoring for UE category M1 with CE mode A

The UE UE category M1 configured with CE mode A shall be capable of monitoring at least:

- Depending on UE capability, 2 FDD E-UTRA inter-frequency carriers, and
- Depending on UE capability, 2 TDD E-UTRA carriers.

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 5 carrier frequency layers, which include one serving carrier frequency and any of the above defined combination of E-UTRA FDD inter-frequency and E-UTRA TDD inter-frequency layers.

### 8.13.3 Requirements for UE category M1 with CE mode B

The UE category M1 applicability of the requirements in subclause 8.13.3 is defined in Section 3.6. The requirements defined in clause 8.13.3 apply provided the following conditions are met:

- UE is configured with measurement gap according to any of gap patterns defined in Table 8.1.2.1-1.

Alternatively, the UE shall meet the requirements in subclause 8.13.3 defined for Gap Pattern ID#0 without using any measurement gaps provided:

- UE indicates it does not need gaps with the capability `intraFreq-CE-NeedForGaps-r13` [2, TS36.331] for the frequency band of the serving cell, or

- UE is not configured with any reporting configuration that requires measurement on any intra-frequency neighbour cell.

### 8.13.3.1 E-UTRAN intra frequency measurements by UE category M1 with CE mode B

The UE shall be able to identify new intra-frequency cells and perform RSRP and RSRQ measurements of identified intra-frequency cells without an explicit intra-frequency neighbour cell list containing physical layer cell identities. During the RRC\_CONNECTED state the UE shall continuously measure identified intra frequency cells and additionally search for and identify new intra frequency cells.

#### 8.13.3.1.1 E-UTRAN FDD intra frequency measurements

##### 8.13.3.1.1.1 E-UTRAN intra frequency measurements when no DRX is used

When no DRX is in use the UE shall be able to identify and measure a new detectable FDD intra frequency cell according to requirements in Table 8.13.3.1.1.1-1 provided that additional conditions table 8.13.3.1.1.1-1 is met, and

- $G=1$ , or
- $r_{\max} * G < 800\text{ms}$ , or
- UE is receiving PDSCH.

Otherwise, requirements in Table 8.13.3.1.1.1-4 apply, where  $r_{\max}$  and  $G$  are given by higher layer parameter *mPDCCH-NumRepetition* and *mPDCCH-startSF-U ESS* respectively as defined in TS 36.213 [3].

**Table 8.13.3.1.1.1-1: Requirement on cell identification delay and measurement delay for FDD intrafrequency cell**

| Neighbouring cell SCH $\hat{E}_s$ /lot:<br>Q2 [dB] | Gap pattern<br>ID | Cell identification delay<br>( $T_{\text{identify\_intra\_UE cat M1}}$ ) | Measurement delay<br>( $T_{\text{measure\_intra\_UE cat M1}}$ )        |
|----------------------------------------------------|-------------------|--------------------------------------------------------------------------|------------------------------------------------------------------------|
| $-15 \leq Q2 < -6$                                 | 0                 | $320.8 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ S}$   | $800 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$  |
|                                                    | 1                 | $321.6 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ S}$   | $1600 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$ |
| $Q2 \geq -6$                                       | 0                 | $21.8 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ S}$    | $800 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$  |
|                                                    | 1                 | $22.6 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ S}$    | $1600 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$ |

**Table 8.13.3.1.1.1-2: Void**

$K_{\text{intra\_M1\_EC}} = 100 / X$  where  $X$  is signalled by the RRC parameter *measGapSharingScheme* [2] and is defined as in Table 8.13.3.1.1.1-3.  $N_{\text{freq}}$  is total number of inter-frequency layers to be monitored as defined in 8.1.2.1.1. When inter frequency measurement is not configured,  $K_{\text{intra\_M1\_EC}}=1$  regardless whether or how parameter *measGapSharingScheme* [2] is configured.

**Table 8.13.3.1.1.1-3: Value of parameter X for CEModeB**

| <i>measGapSharingScheme</i> | Value of X (%)                    |
|-----------------------------|-----------------------------------|
| '00'                        | $\frac{100}{N_{\text{freq}} + 1}$ |

| '10'                        | 75                                |
| '11'                        | 87.5                              |

**Table 8.13.3.1.1-4: Requirement on cell identification delay and measurement delay for FDD intrafrequency cell**

| Neighbouring cell SCH<br>Ês/lot: Q2 [dB] | Gap<br>pattern ID | Cell identification delay<br>( $T_{\text{identify\_intra\_UE cat M1}}$ )                                    | Measurement delay<br>( $T_{\text{measure\_intra\_UE cat M1}}$ )                                            |
|------------------------------------------|-------------------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| $-15 \leq Q2 < -6$                       | 0                 | $\text{Max}(400 * r_{\text{max}} * G / 1000, 320.8) * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} S$ | $\text{Max}(5 * r_{\text{max}} * G, 800) * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$  |
|                                          | 1                 | $\text{Max}(400 * r_{\text{max}} * G / 1000, 321.6) * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} S$ | $\text{Max}(5 * r_{\text{max}} * G, 1600) * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$ |
| $Q2 \geq -6$                             | 0                 | $\text{Max}(20 * r_{\text{max}} * G / 1000, 21.8) * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} S$   | $\text{Max}(5 * r_{\text{max}} * G, 800) * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$  |
|                                          | 1                 | $\text{Max}(20 * r_{\text{max}} * G / 1000, 22.6) * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} S$   | $\text{Max}(5 * r_{\text{max}} * G, 1600) * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$ |

$$K_{\text{RSTD\_M1\_EC}} = \frac{1}{1 - \max\left(\frac{40}{T_{\text{PRS}}}, \frac{N_{\text{PRS}}}{T_{\text{PRS}}}\right)}$$

$K_{\text{RSTD\_M1\_NC}}$  is applicable provided following conditions are met:

- $T_{\text{PRS}} > 40 \text{ ms}$
- $T_{\text{PRS}} > N_{\text{PRS}}$
- PRS bandwidth is less than the bandwidth of the cell used for RSTD measurement in which case gaps are required

where

- $T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.211 [16],
- $N_{\text{PRS}}$  is the number of consecutive downlink positioning subframes in a positioning occasion defined in TS 36.211

Otherwise  $K_{\text{RSTD\_M1\_EC}} = 1$ .

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.3 and 9.1.21.4 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.7 are fulfilled for a corresponding Band,
- SCH<sub>RP</sub> and SCH Ês/lot according to Annex Table B.2.14-3 for a corresponding Band.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_intra\_UE cat M1\_EC}}$ . If higher layer filtering is used, an additional cell identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is according to Table 8.13.3.1.1-1. When measurement gaps are activated the UE shall be capable of performing measurements for at least 6 cells. If the UE has identified more than 6 cells, the UE shall perform measurements but the reporting rate of RSRP and RSRQ measurements of cells from UE physical layer to higher layers may be decreased.

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.x.3 and 9.1.x.4.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.x.5.

### 8.13.3.1.1.1.1 Measurement Reporting Requirements

#### 8.13.3.1.1.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.17.3 and 9.1.x.4.

#### 8.13.3.1.1.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.1.1.1.1.3.

#### 8.13.3.1.1.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in Clause 8.13.3.1.1.1. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in clause 8.13.3.1.1.1 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{Measurement\_Period\_UE cat M1\_EC, Intra}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.1.1.2 E-UTRAN intra frequency measurements when DRX is used

When DRX is in use the UE shall be able to identify a new detectable FDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  as shown in table 8.13.3.1.1.2-1 provided that additional conditions Table 8.13.3.1.1.2-1 is met.

When eDRX\_CONN is in use the UE shall be able to identify a new detectable FDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  as shown in table 8.13.3.1.1.2-1B.

**Table 8.13.3.1.1.2-1: Requirement to identify a newly detectable FDD intrafrequency cell**

| Neighbouring cell SCH $\hat{E}_s/\text{lot}$ : Q2 [dB] | Gap pattern ID                                        | DRX cycle length (s) | T <sub>identify_intra UE cat M1</sub> (s) (DRX cycles)             |
|--------------------------------------------------------|-------------------------------------------------------|----------------------|--------------------------------------------------------------------|
| -15≤ Q2 < -6                                           | 0                                                     | ≤0.64                | 320.8 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> (Note1) |

| Q2≥-6                                                  | 0                                                     | ≤0.64                | 21.8 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> (Note1)  |
|                                                        |                                                       | 0.64< DRX-cycle≤2.56 | Note2(24 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> )    |
|                                                        | 1                                                     | DRX-cycle ≤ 0.640    | 22.6 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> (Note1)  |
|                                                        |                                                       | 0.64< DRX-cycle≤2.56 | Note2(24 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> )    |
| Note1:                                                 | Number of DRX cycle depends upon the DRX cycle in use |                      |                                                                    |
| Note2:                                                 | Time depends upon the DRX cycle in use                |                      |                                                                    |

**Table 8.13.3.1.1.2-1A: Void****Table 8.13.3.1.1.2-1B: Requirement to identify a newly detectable FDD intrafrequency cell when eDRX\_CONN is used**

| eDRX_CONN cycle length (s)                         | T <sub>identify_intra UE cat M1_EC</sub> (s) (eDRX_CONN cycles)  |
|----------------------------------------------------|------------------------------------------------------------------|
| 2.56 < eDRX_CONN cycle ≤ 10.24                     | Note (400 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> ) |
| NOTE: Time depends upon the eDRX_CONN cycle in use |                                                                  |

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.3 and 9.1.21.4 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.7 are fulfilled for a corresponding Band,
- SCH\_RP and SCH  $\hat{E}_s/\text{lot}$  according to Annex Table B.2.14-3 for a corresponding Band

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is T<sub>measure\_intra UE cat M1\_EC</sub>. When DRX is used, T<sub>measure\_intra UE cat M1\_EC</sub> is as specified in table 8.13.3.1.1.2-2 provided that additional conditions table 8.13.3.1.1.2-2 is met. When eDRX\_CONN is used, T<sub>measure\_intra UE cat M1\_EC</sub> is as specified in table 8.13.3.1.1.2-4. The UE shall be capable of performing RSRP and RSRQ measurements for 6 identified-intra-frequency cells, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of T<sub>measure\_intra UE cat M1\_EC</sub>.

**Table 8.13.3.1.1.2-2: Requirement to measure FDD intrafrequency cells**

| Target cell SCH $\hat{E}_s/\text{lot}$ : Q2 [dB] | Gap pattern ID                                        | DRX cycle length (s) | T <sub>measure_intra_UE cat M1</sub> (s) (DRX cycles)            |
|--------------------------------------------------|-------------------------------------------------------|----------------------|------------------------------------------------------------------|
| Q2≥-15                                           | 0                                                     | ≤0.16                | 0.8 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> (Note1) |
|                                                  |                                                       | 0.16<DRX-cycle≤2.56  | Note2(5 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> )   |

|                                                  |                                                       | 0.32<DRX-cycle≤2.56  | Note2(5 * K <sub>intra_M1_EC</sub> * K <sub>RSTD_M1_EC</sub> )   |
| Note1:                                           | Number of DRX cycle depends upon the DRX cycle in use |                      |                                                                  |
| Note2:                                           | Time depends upon the DRX cycle in use                |                      |                                                                  |

**Table 8.13.3.1.1.2-3: Void**

**Table 8.13.3.1.1.2-4: Requirement to measure FDD intrafrequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{measure\_intra\_UE cat M1\_EC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $5 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}}$ ) |
| NOTE: Time depends upon the eDRX_CONN cycle in use |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.3 and 9.1.21.4.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.7.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.3.1.1.2.1 Measurement Reporting Requirements

##### 8.13.3.1.1.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

##### 8.13.3.1.1.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.1.1.2.1.3.

##### 8.13.3.1.1.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times T_{\text{TTI\_DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times T_{\text{TTI\_DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in Clause 8.13.3.1.1.2. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in clause 8.13.3.1.1.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_intra\_UE cat M1\_EC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.1.2 E-UTRAN intra frequency measurements for HD-FDD

##### 8.13.3.1.2.1 E-UTRAN intra frequency measurements when no DRX is used

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.13.3.1.1.1 also apply for this section provided the following conditions are met:

- at least downlink subframe # 0 and downlink subframe # 5 per radio frame of an intra-frequency cell to be identified by the UE is available at the UE over  $T_{\text{identify\_intra\_UE cat M1\_EC}}$ ;

- at least two consecutive downlink subframe per radio frame of measured cell is available at the UE for RSRP measurements assuming measured cell is identified cell over  $T_{\text{measure\_intra\_UE cat M1\_EC}}$ .
- RSRP related side conditions given in Sections 9.1.21.3 and 9.1.21.4 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.7 are fulfilled for a corresponding Band,
- SCH<sub>RP</sub> and SCH<sub>ES</sub>/lot according to Annex Table B.2.14-4

#### 8.13.3.1.2.2 E-UTRAN intra frequency measurements when DRX is used

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

When DRX is in use the UE shall be able to identify a new detectable HD-FDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  as shown in table 8.13.3.1.2.2-1 provided that additional conditions table 8.13.3.1.2.2-1 is met.

When eDRX\_CONN is in use, the UE shall be able to identify a new detectable FDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  as shown in table 8.13.3.1.2.2-1B.

**Table 8.13.3.1.2.2-1: Requirement to identify a newly detectable HD-FDD intrafrequency cell**

| Neighbouring cell SCH E's/lot: Q2 [dB] | Gap pattern ID                                        | DRX cycle length (s) | T <sub>identify_intra_UE cat M1</sub> (s) (DRX cycles)          |
|----------------------------------------|-------------------------------------------------------|----------------------|-----------------------------------------------------------------|
| -15≤ Q2 < -6                           | 0                                                     | ≤0.64                | 320.8 * K <sub>intra_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1) |
|                                        |                                                       | 0.64< DRX-cycle≤2.56 | Note2(400 * K <sub>intra_M1</sub> * K <sub>RSTD_M1_EC</sub> )   |
|                                        | 1                                                     | DRX-cycle ≤ 0.640    | 321.6 * K <sub>intra_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1) |
|                                        |                                                       | 0.64< DRX-cycle≤2.56 | Note2 (400 * K <sub>intra_M1</sub> * K <sub>RSTD_M1_EC</sub> )  |
| Q2≥-6                                  | 0                                                     | ≤0.64                | 21.8 * K <sub>intra_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1)  |

|                                        | 1                                                     | DRX-cycle ≤ 0.640    | 22.6 * K <sub>intra_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1)  |
|                                        |                                                       | 0.64< DRX-cycle≤2.56 | Note2 (24 * K <sub>intra_M1</sub> * K <sub>RSTD_M1_EC</sub> )   |
| Note1:                                 | Number of DRX cycle depends upon the DRX cycle in use |                      |                                                                 |
| Note2:                                 | Time depends upon the DRX cycle in use                |                      |                                                                 |

**Table 8.13.3.1.2.2-1A: Void**

**Table 8.13.3.1.2.2-1B: Requirement to identify a newly detectable HD-FDD intrafrequency cell when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{identify\_intra\_UE cat M1\_EC}} (s)$ (eDRX_CONN cycles)  |
|----------------------------------------------------|---------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $400 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}}$ ) |
| NOTE: Time depends upon the eDRX_CONN cycle in use |                                                                     |

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.3 and 9.1.21.4 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.7 are fulfilled for a corresponding Band,
- SCH<sub>RP</sub> and SCH<sub>ES</sub>/lot according to Annex Table B.2.14-4 for a corresponding Band

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is  $T_{\text{measure\_intra\_UE cat M1\_EC}}$ . When DRX is used,  $T_{\text{measure\_intra\_UE cat M1\_EC}}$  is as specified in table 8.13.3.1.2.2-2 provided that additional conditions Table 8.13.3.1.2.2-2 is met. When eDRX\_CONN cycle is used,  $T_{\text{measure\_intra\_UE cat M1\_EC}}$  is as specified in table 8.13.3.1.2.2-4. The UE shall be capable of performing RSRP and RSRQ measurements for 6 identified-intra-frequency

cells, and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of  $T_{\text{measure\_intra\_UE cat M1\_EC}}$ .

**Table 8.13.3.1.2.2-2: Requirement to measure HD-FDD intrafrequency cells**

| Note1:                                          | Number of DRX cycle depends upon the DRX cycle in use |                       |                                                               |
| Note2:                                          | Time depends upon the DRX cycle in use                |                       |                                                               |

**Table 8.13.3.1.2.2-3: Void**

**Table 8.13.3.1.2.2-4: Requirement to measure HD-FDD intrafrequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{measure\_intra\_UE cat M1\_EC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | NOTE ( $5 * K_{\text{intra\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}}$ ) |
| NOTE: Time depends upon the eDRX_CONN cycle in use |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.3 and 9.1.21.4.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.7.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.3.1.2.2.1 Measurement Reporting Requirements

##### 8.13.3.1.2.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

##### 8.13.3.1.2.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.1.2.2.1.3.

##### 8.13.3.1.2.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurements contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in Clause 8.13.3.1.2.2 When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in clause 8.13.3.1.2.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_intra\_UE cat M1\_EC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

### 8.13.3.1.3 E-UTRAN TDD intra frequency measurements

#### 8.13.3.1.3.1 E-UTRAN intra frequency measurements when no DRX is used

When no DRX is in use the UE shall be able to identify and measure a new detectable TDD intra frequency cell according to requirements in Table 8.13.3.1.3.1-1 provided that additional conditions Table 8.13.3.1.3.1-2 is met, and

- $G=1$ , or
- $r_{\text{max}} * G < 800\text{ms}$ , or
- UE is receiving PDSCH.

Otherwise, requirements in Table 8.13.3.1.3.1-4 apply, where  $r_{\text{max}}$  and  $G$  are given by higher layer parameter *mPDCCH-NumRepetition* and *mPDCCH-startSF-U ESS* respectively as defined in TS 36.213 [3].

**Table 8.13.3.1.3.1-1: Requirement on cell identification delay and measurement delay for TDD intrafrequency cell**

$K_{\text{intra\_M1\_EC}} = 100 / X$  where  $X$  is signalled by the RRC parameter *measGapSharingScheme* [2] and is defined as in Table 8.13.3.1.3.1-3.  $N_{\text{freq}}$  is total number of inter-frequency layers to be monitored as defined in 8.1.2.1.1. When inter frequency measurement is not configured,  $K_{\text{intra\_M1\_EC}}=1$  regardless whether or how parameter *measGapSharingScheme* [2] is configured.

$$K_{\text{RSTD\_M1\_EC}} = \frac{1}{1 - \max\left(\frac{40}{T_{\text{PRS}}}, \frac{N_{\text{PRS}}}{T_{\text{PRS}}}\right)}$$

$K_{\text{RSTD\_M1\_EC}}$  is applicable provided following conditions are met:

- $T_{\text{PRS}} > 40 \text{ ms}$
- $T_{\text{PRS}} > N_{\text{PRS}}$
- PRS bandwidth is less than the bandwidth of the cell used for RSTD measurement in which case gaps are required

where

- $T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.211 [16],
- $N_{\text{PRS}}$  is the number of consecutive downlink positioning subframes in a positioning occasion defined in TS 36.211

Otherwise  $K_{\text{RSTD\_M1\_EC}} = 1$ .

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.21.3 and 9.1.21.4 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.7 are fulfilled for a corresponding Band,

- SCH\_RP and SCH  $\hat{E}_s/\text{lot}$  according to Annex Table B.2.14-3 for a corresponding Band.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_intra\_UE cat M1\_EC}}$ . If higher layer filtering is used, an additional cell identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is according to Table 8.13.3.1.3.1-1. When measurement gaps are activated the UE shall be capable of performing measurements for at least 6 cells. If the UE has identified more than 6 cells, the UE shall perform measurements but the reporting rate of RSRP and RSRQ measurements of cells from UE physical layer to higher layers may be decreased.

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.3 and 9.1.21.4.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.7.

#### 8.13.3.1.3.1.1 Measurement Reporting Requirements

##### 8.13.3.1.3.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

##### 8.13.3.1.3.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.1.3.1.1.3.

##### 8.13.3.1.3.1.1.3 Event Triggered Reporting

Reported RSRP measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times T_{\text{TTI}_{\text{DCCH}}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times T_{\text{TTI}_{\text{DCCH}}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in Clause 8.13.3.1.3.1. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in clause 8.13.3.1.3.1 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{Measurement\_Period Intra\_UE cat M1\_EC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.1.3.2 E-UTRAN intra frequency measurements when DRX is used

When DRX is in use the UE shall be able to identify a new detectable TDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  as shown in table 8.13.3.1.3.2-1 provided that additional conditions table 8.13.3.1.3.2-1 is met.

When eDRX\_CONN is in use the UE shall be able to identify a new detectable TDD intra frequency cell within  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  as shown in table 8.13.3.1.3.2-1B.

**Table 8.13.3.1.3.2-1: Requirement to identify a newly detectable TDD intrafrequency cell**

| Neighbouring cell SCH $\hat{E}_s/I_{ot}$ : Q2 [dB] | Gap pattern ID                                        | DRX cycle length (s) | T <sub>identify_intra_UE cat M1</sub> (s) (DRX cycles)             |

A cell shall be considered detectable when

- RSRP related side conditions given in Clause 9.1.21.3 and 9.1.21.4 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.21.7 are fulfilled for a corresponding Band,
- SCH\_RP and SCH  $\hat{E}_s/I_{ot}$  according to Annex Table B.2.14-3 for a corresponding Band

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is T<sub>measure\_intra\_UE cat M1\_EC</sub>. When DRX is used, T<sub>measure\_intra\_UE cat M1\_EC</sub> is as shown in table 8.13.3.1.3.2-2 provided that additional conditions Table 8.13.3.1.3.2-2 is met. When eDRX\_CONN is used, T<sub>measure\_intra\_UE cat M1\_EC</sub> is as shown in table 8.13.3.1.3.2-4. The UE shall be capable of performing RSRP and RSRQ measurement for 6 identified intra-frequency cells and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of T<sub>measure\_intra\_UE cat M1\_EC</sub>.

| NOTE: Time depends upon the eDRX_CONN cycle in use. |                                                                |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.3 and 9.1.21.4.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.21.7.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.3.1.3.2.1 Measurement Reporting Requirements

##### 8.13.3.1.3.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

##### 8.13.3.1.3.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.1.3.2.1.3.

##### 8.13.3.1.3.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.3 and 9.1.x.4.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that that

the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in Clause 8.13.3.1.3.2. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_intra\_UE cat M1\_EC}}$  defined in clause 8.13.3.1.3.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_intra\_UE cat M1\_EC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.1.4 E-UTRAN FDD intra frequency measurements with autonomous gaps for UE category M1 with CE mode B

The requirements defined in this subclause 8.13.3.1.4 apply provided the following condition is met:

- Tx diversity or transmission using multiple antennas are supported in the target cell to be detected.
- Repetitions of MIB/SIB1-BR are supported in the target cell to be detected.

##### 8.13.3.1.4.1 Identification of a new CGI of E-UTRA cell with autonomous gaps

No explicit neighbour list is provided to the UE for identifying a new CGI of E-UTRA cell. The UE shall identify and report the CGI when requested by the network for the purpose 'reportCGI'. The UE may make autonomous gaps in downlink reception and uplink transmission for receiving MIB and SIB1-BR message according to clause 5.5.3.1 of TS 36.331 [2]. Note that a UE is not required to use autonomous gap if *si-RequestForHO* is set to false. If autonomous gaps are used for measurement with the purpose of 'reportCGI', regardless of whether DRX or eDRX\_CONN is used or not, or whether SCell(s) are configured or not, the UE shall be able to identify a new CGI of E-UTRA cell within:

$$T_{\text{identify\_CGI\_Cat M1, intra}} = T_{\text{basic\_identify\_CGI\_Cat M1, intra}} \quad ms$$

Where

$T_{\text{basic\_identify\_CGI\_Cat M1, intra}} = 5120$  ms. This is the time period used in the above equation where the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell is defined, provided that the E-UTRA cell has been already identified by the UE.

A cell shall be considered identifiable following conditions are fulfilled:

- RSRP related side conditions given in Clause 9.1 are fulfilled for a corresponding Band,
- $\text{SCH\_RP}$  and  $\text{SCH\_E}/\text{IoT}$  according to Annex B.2.14 for a corresponding Band

The MIB of an E-UTRA cell whose CGI is identified shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to [5].

The requirement for identifying a new CGI of an E-UTRA cell within  $T_{\text{basic\_identify\_CGI\_Cat M1, intra}}$  is applicable when no DRX is used as well as when any of DRX and eDRX\_CONN cycles specified in TS 36.331 [2] is used.

Within the time,  $T_{\text{identify\_CGI\_Cat M1, intra}}$  ms, over which the UE identifies the new CGI of E-UTRA cell, the PBCH repetition and SIB1-BR repetition level in the target cell shall be as specified in Table 8.13.3.1.4.1-1.

**Table 8.13.3.1.4.1-1: Conditions in target cell during  $T_{\text{basic\_identify\_CGI\_Cat M1, intra}}$** 

| Target cell                 |                                           |                          |             |
|-----------------------------|-------------------------------------------|--------------------------|-------------|
| $\hat{E}_s/\text{lot}$ [dB] | PBCH repetition                           | SIB1-BR repetition level | SIB1-BR TBS |
| $\geq -15$                  | Configured as specified in TS 36.211 [16] | 16                       | 208         |

#### 8.13.3.1.4.2 ECGI Reporting Delay

The ECGI reporting delay occurs due to the delay uncertainty when inserting the ECGI measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH. In case DRX is used, the ECGI reporting may be delayed until the next DRX cycle. In case eDRX\_CONN is used, the ECGI reporting may be delayed until the next eDRX\_CONN cycle. If IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.1.5 E-UTRAN intra frequency measurements with autonomous gaps for HD-FDD UE category M1 with CE mode B

The requirements in this section are applicable for the UE which supports half duplex FDD operation on one or more supported frequency bands [2].

The requirements defined in this subclause 8.13.3.1.5 apply provided the following condition is met:

- Tx diversity or transmission using multiple antennas are supported in the target cell to be detected.
- Repetitions of MIB/SIB1-BR are supported in the target cell to be detected.

##### 8.13.3.1.5.1 Identification of a new CGI of E-UTRA cell with autonomous gaps

The CGI requirements defined in clause 8.13.3.1.4.1 also apply for this section.

##### 8.13.3.1.5.2 ECGI Reporting Delay

The ECGI reporting delay defined in clause 8.13.3.1.5.2 also apply for this section

#### 8.13.3.1.6 E-UTRAN TDD intra frequency measurements with autonomous gaps for UE category M1 with CE mode B

The requirements defined in this subclause 8.13.3.1.6 apply provided the following condition is met:

- Tx diversity or transmission using multiple antennas are supported in the target cell to be detected.
- Repetitions of MIB/SIB1-BR are supported in the target cell to be detected.

##### 8.13.3.1.6.1 Identification of a new CGI of E-UTRA cell with autonomous gaps

No explicit neighbour list is provided to the UE for identifying a new CGI of E-UTRA cell. The UE shall identify and report the CGI when requested by the network for the purpose 'reportCGI'. The UE may make autonomous gaps in downlink reception and uplink transmission for receiving MIB and SIB1-BR messages according to clause 5.5.3.1 of TS 36.331 [2]. Note that a UE is not required to use autonomous gap if si-RequestForHO is set to false. If autonomous gaps are used for measurement with the purpose of 'reportCGI', regardless of whether DRX or eDRX\_CONN is used or not, or whether SCell(s) are configured or not, the UE shall be able to identify a new CGI of E-UTRA cell within:

$$T_{\text{identify\_CGI\_Cat M1, intra}} = T_{\text{basic\_identify\_CGI\_Cat M1, intra}} \quad ms$$

Where

$T_{\text{basic\_identify\_CGI\_Cat M1, intra}} = 5120$  ms. This is the time period used in the above equation where the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell is defined, provided that the E-UTRA cell has been already identified by the UE.

A cell shall be considered identifiable when the following conditions are fulfilled:

- RSRP related side conditions given in Clause 9.1 are fulfilled for a corresponding Band,
- SCH\_RP and SCH  $\hat{E}_s/\text{lot}$  according to Annex B.2.14 for a corresponding Band

The MIB of an E-UTRA cell whose CGI is identified shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to [5].

The requirement for identifying a new CGI of an E-UTRA cell within  $T_{\text{basic\_identify\_CGI\_Cat M1, intra}}$  is applicable when no DRX is used as well as when any of the DRX or eDRX\_CONN cycles specified in TS 36.331 [2] is used.

Within the time,  $T_{\text{identify\_CGI\_Cat M1, intra}}$  ms, over which the UE identifies the new CGI of E-UTRA cell, the PBCH repetition and SIB1-BR repetition level in the target cell shall be as specified Table 8.13.3.1.6.1-2.

**Table 8.13.3.1.6.1-1: Conditions in target cell during  $T_{\text{basic\_identify\_CGI\_Cat M1, intra}}$**

| Target cell                 |                                                            |                          |             |
|-----------------------------|------------------------------------------------------------|--------------------------|-------------|
| $\hat{E}_s/\text{lot}$ [dB] | PBCH repetition level                                      | SIB1-BR repetition level | SIB1-BR TBS |
| $\geq -15$                  | Configured with repetition, as specified in TS 36.211 [16] | 16                       | 208         |

#### 8.13.3.1.6.2 ECGI Reporting Delay

The ECGI reporting delay occurs due to the delay uncertainty when inserting the ECGI measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH. In case DRX is used, the ECGI reporting may be delayed until the next DRX cycle. In case eDRX\_CONN is used, the ECGI reporting may be delayed until the next eDRX\_CONN cycle. If IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.2 Void

#### 8.13.3.3 E-UTRAN OTDOA Intra-Frequency RSTD Measurements for Cat-M1 UE in CEModeB

All intra-frequency RSTD measurement requirements specified in Sections 8.13.3.3 shall apply without DRX as well as for any DRX and eDRX\_CONN cycles specified in TS 36.331 [2].

All the measurement requirements specified in Sections 8.13.3.3 shall apply provided that the UE is configured:

- with the single PRS configuration for the reference cell and all the neighbour cells and
- with the measurement gap pattern ID #0 specified in Clause 8.1.2.1 if the PRS bandwidth is less than the bandwidth of the cell used for the RSTD measurement in which case gaps are required.

##### 8.13.3.3.1 E-UTRAN FDD Intra-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD IntraFreqFDD, Cat_M}}$  ms as given below (see also Figure 8.13.3.3.1-1):

$$T_{\text{RSTD IntraFreqFDD, Cat_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \text{ ms,}$$

where

$T_{\text{RSTD IntraFreqFDD, Cat_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] for UE not configured with measurement gaps for intra-frequency RSTD. For UE configured with measurement gaps for intra-frequency RSTD measurements,  $T_{\text{PRS}} = \max(T_{\text{PRS}}, \text{MGRP})$ , where MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1.

$M$  is the number of PRS positioning occasions as defined in Table 8.13.3.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{PRS} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{PRS}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24];

$N_{actual\_PRS}$  is the cell-specific number of PRS subframes within a PRS occasion;  $N_{actual\_PRS} = N_{PRS}$  for UE not configured with measurement gaps for intra-frequency RSTD measurements; for UE configured with measurement gaps for intra-frequency RSTD measurements  $N_{actual\_PRS}$  is the number of PRS subframes which can be measured by UE within MGL, where  $N_{actual\_PRS} = (MGL-2)$  if  $MGRP \geq N_{PRS} > (MGL-2)$ ,  $N_{actual\_PRS} = (MGL-2) \cdot \left\lfloor \frac{N_{PRS}}{MGRP} \right\rfloor$  if  $N_{PRS} > MGRP$ , and  $N_{actual\_PRS} = N_{PRS}$  if  $N_{PRS} \leq (MGL-2)$ .

$N_{PRS\_total}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.21.21.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.3.3.1-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqFDD, Cat}_M}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |

|                                                                                                                                                                                                                                                                                                                                                   | f1 <sup>Note1</sup>                                                        | f1 and f2 <sup>Note2</sup>                                                 |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ IntraFreqFDD, Cat}_M}$  provided:

$(PRS \hat{E}_s / Iot)_{ref} \geq -15$  dB for all Frequency Bands for the reference cell,

$(PRS \hat{E}_s / Iot)_i \geq -15$  dB for all Frequency Bands for neighbour cell  $i$ ,

$(PRS \hat{E}_s / Iot)_{ref}$  and  $(PRS \hat{E}_s / Iot)_i$  conditions apply for all subframes of at least  $L = \frac{M}{2}$  PRS positioning

occasions,

PRP 1,2|dBm according to Annex B.2.22 for a corresponding Band

$PRS \hat{E}_s / Iot$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE as illustrated in Figure 8.13.3.3.1-1.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.21.21.

If the intra-frequency handover occurs while intra-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the intra-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}} = T_{\text{RSTD IntraFreqFDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the intra-frequency handover occurs during  $T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}}$ .

$T_{\text{HO}}$  is the time during which the intra-frequency RSTD measurement may not be possible due to intra-frequency handover.

**Figure 8.13.3.3.1-1: Illustration of the RSTD reporting time requirement in an FDD system.**

Furthermore, due to the intra-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

#### 8.13.3.3.1.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.21.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  defined in Clause 8.13.3.3.1.

### 8.13.3.3.2 E-UTRAN TDD Intra-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  ms as given below:

$$T_{\text{RSTD IntraFreqTDD, Cat\_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}},$$

where

$T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] for UE not configured with measurement gaps for intra-frequency RSTD. For UE configured with measurement gaps for intra-frequency RSTD measurements,  $T_{\text{PRS}} = \max(T_{\text{PRS}}, \text{MGRP})$ , where MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1.

$M$  is the number of PRS positioning occasions as defined in Table 8.13.3.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24];

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion;  $N_{\text{actual\_PRS}} = N_{\text{PRS}}$  for UE not configured with measurement gaps for intra-frequency RSTD measurements; for UE configured with measurement gaps for intra-frequency RSTD measurements  $N_{\text{actual\_PRS}}$  is the number of PRS subframes which can be measured by UE within MGL, where  $N_{\text{actual\_PRS}} = (\text{MGL}-2)$  if  $\text{MGRP} \geq N_{\text{PRS}} > (\text{MGL}-2)$ ,  $N_{\text{actual\_PRS}} = (\text{MGL}-2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{\text{MGRP}} \right\rfloor$  if  $N_{\text{PRS}} > \text{MGRP}$ , and  $N_{\text{actual\_PRS}} = N_{\text{PRS}}$  if  $N_{\text{PRS}} \leq (\text{MGL}-2)$ .

$N_{\text{PRS\_total}}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.21.21.

$T_{\text{PRS}}$ ,  $N_{\text{PRS}}$ ,  $N_{\text{actual\_PRS}}$  and  $N_{\text{PRS\_total}}$  are the parameters of the same cell, for which  $T_{\text{PRS}} \cdot \left\lceil \frac{N_{\text{PRS\_total}}}{N_{\text{actual\_PRS}}} \right\rceil$  is the largest among all the measured cells.

$T_{\text{MIB}}$  is the time required for acquiring the MIB information of the target cell.  $T_{\text{MIB}} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.3.3.1-1: Number of PRS positioning occasions within  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$** 

| Positioning subframe configuration period $T_{\text{PRS}}$                                                                                                                                                                                                                                                                                        | Number of PRS positioning occasions $M$                                                  |                                                                                          |

|                                                                                                                                                                                                                                                                                                                                                   | f1 <sup>Note1</sup>                                                                      | f1 and f2 <sup>Note2</sup>                                                               |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                                          |                                                                                          |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  provided:

$(\text{PRS } \hat{E}_s / \text{Iot})_{\text{ref}} \geq -15 \text{ dB}$  for all Frequency Bands for the reference cell,  
 $(\text{PRS } \hat{E}_s / \text{Iot})_i \geq -15 \text{ dB}$  for all Frequency Bands for neighbour cell  $i$ ,  
 $(\text{PRS } \hat{E}_s / \text{Iot})_{\text{ref}}$  and  $(\text{PRS } \hat{E}_s / \text{Iot})_i$  conditions apply for all subframes of at least  $L = \frac{M}{2}$  PRS positioning occasions,

PRP 1,2<sub>dBm</sub> according to Annex B.2.22 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.21.21.

If the intra-frequency handover occurs while intra-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the intra-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

$(T_{\text{RSTD IntraFreqTDD, Cat\_M, HO}})$  shall be according to the following expression:

$$T_{\text{RSTD IntraFreqTDD, Cat\_M, HO}} = T_{\text{RSTD IntraFreqTDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the intra-frequency handover occurs during  $T_{\text{RSTD IntraFreqTDD, Cat\_M, HO}}$ ,

$T_{\text{HO}}$  is the time during which the intra-frequency RSTD measurement may not be possible due to intra-frequency handover.

Furthermore, due to the intra-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

The intra-frequency requirements in this clause (8.13.3.3.2) shall apply for all TDD special subframe configurations specified in TS 36.211 [16] and for the TDD uplink-downlink configurations as specified in Table 8.13.3.3.2-2.

**Table 8.13.3.3.2-2: TDD uplink-downlink subframe configurations applicable for TDD intra-frequency requirements**

| PRS Transmission Bandwidth [RB]                                                      | Applicable TDD uplink-downlink configurations |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| 6                                                                                    | 1, 2, 3, 4 and 5                              |
| Note: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [16]. |                                               |

#### 8.13.3.3.2.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.21.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  defined in Clause 8.13.3.3.2.

#### 8.13.3.3.3 E-UTRAN HD-FDD Intra-Frequency OTDOA Measurements

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.13.3.3.1 also apply for this section except the reporting delay requirement provided the following conditions are met:

- all positioning subframes indicated in the OTDOA assistance data and specified in Section 9.1.21.21 are available for RSTD measurements in the measured and reference cells.

##### 8.13.3.3.3.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.21.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than measurement period defined in Clause 8.13.3.3.3.

#### 8.13.3.4 E-UTRAN E-CID Measurements Requirements for UE category M1 with CE mode B

##### 8.13.3.4.1 Intra-frequency E-CID FDD RSRP and RSRQ Measurements for Cat-M1 UE in CEModeB

###### 8.13.3.4.1.1 Introduction

The requirements in section 8.13.3.4.1 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN FDD intra-frequency RSRP and RSRQ measurements [24].

###### 8.13.3.4.1.2 Measurement Requirements

The requirements in section 8.13.3.1.1 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.3.4.1.3.

###### 8.13.3.4.1.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.3, 9.1.21.4 and 9.1.21.7.

##### 8.13.3.4.2 Intra-frequency HD-FDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeB

###### 8.13.3.4.2.1 Introduction

The requirements in section 8.13.3.4.2 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN HD-FDD intra-frequency RSRP and RSRQ measurements [24].

###### 8.13.3.4.2.2 Measurement Requirements

The requirements in section 8.13.3.4.2 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.3.4.2.3.

###### 8.13.3.4.2.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.3, 9.1.21.4 and 9.1.21.7.

##### 8.13.3.4.3 Intra-frequency TDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeB

###### 8.13.3.4.3.1 Introduction

The requirements in section 8.13.3.4.3 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN TDD intra-frequency RSRP and RSRQ measurements [24].

#### 8.13.3.4.3.2 Measurement Requirements

The requirements in section 8.13.3.4.3 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.3.4.3.3.

#### 8.13.3.4.3.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where *pusch-maxNumRepetitionCEmodeB* [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that *pusch-maxNumRepetitionCEmodeB* > 1, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.3, 9.1.21.4 and 9.1.21.7.

### 8.13.3.4.4 Inter-frequency E-CID FDD RSRP and RSRQ Measurements for Cat-M1 UE in CEModeB

#### 8.13.3.4.4.1 Introduction

The requirements in section 8.13.3.4.4 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN FDD inter-frequency RSRP and RSRQ measurements [24].

#### 8.13.3.4.4.2 Measurement Requirements

The requirements in section 8.13.3.5.1 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.3.4.4.3.

#### 8.13.3.4.4.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where *pusch-maxNumRepetitionCEmodeB* [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that *pusch-maxNumRepetitionCEmodeB* > 1, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.11, 9.1.21.12, 9.1.21.15 and 9.1.21.16.

### 8.13.3.4.5 Inter-frequency HD-FDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeB

#### 8.13.3.4.5.1 Introduction

The requirements in section 8.13.3.4.5 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN HD-FDD inter-frequency RSRP and RSRQ measurements [24].

#### 8.13.3.4.5.2 Measurement Requirements

The requirements in section 8.13.3.5.2 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.3.4.5.3.

#### 8.13.3.4.5.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where *pusch-maxNumRepetitionCEmodeB* [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that *pusch-maxNumRepetitionCEmodeB* > 1, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.11, 9.1.21.12, 9.1.21.15 and 9.1.21.16.

#### 8.13.3.4.6 Inter-frequency TDD E-CID RSRP and RSRQ Measurements for Cat-M1 UE in CEModeB

##### 8.13.3.4.6.1 Introduction

The requirements in section 8.13.3.4.6 shall apply provided the UE has received ECID-RequestLocationInformation message from E-SMLC via LPP requesting the UE to report E-CID E-UTRAN TDD inter-frequency RSRP and RSRQ measurements [24].

##### 8.13.3.4.6.2 Measurement Requirements

The requirements in section 8.13.3.5.3 also apply for this section except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in section 8.13.3.4.6.3.

##### 8.13.3.4.6.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in section 9.1.21.11, 9.1.21.12, 9.1.21.15 and 9.1.21.16.

#### 8.13.3.5 E-UTRAN inter frequency measurements by UE category M1 with CE Mode B

The UE shall be able to identify new inter-frequency cells and perform RSRP and RSRQ measurements of identified inter-frequency cells if carrier frequency information is provided by the PCell, even if no explicit neighbour list with physical layer cell identities is provided. During the RRC\_CONNECTED state the UE shall continuously measure identified inter frequency cells and additionally search for and identify new inter frequency cells.

##### 8.13.3.5.1 E-UTRAN FDD - FDD inter frequency measurements

###### 8.13.3.5.1.1 E-UTRAN FDD - FDD inter frequency measurements when no DRX is used

When no DRX is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify and measure a new detectable FDD inter-frequency cell according to requirements in Table 8.13.3.5.1.1-1 when additional condition in Table 8.13.3.5.1.1-1 is met, and

- $G=1$ , or
- $r_{\text{max}} \cdot G < 800\text{ms}$ , or
- UE is receiving PDSCH.

Otherwise, requirements in Table 8.13.3.5.1.1-3 apply, where  $r_{\text{max}}$  and  $G$  are given by higher layer parameter  $m\text{PDCCH-NumRepetition}$  and  $m\text{PDCCH-startSF-U ESS}$  respectively as defined in TS 36.213 [3].

**Table 8.13.3.5.1.1-1: Requirement on cell identification delay and measurement delay for FDD interfrequency cell**

| Neighbouring cell SCH $\bar{E}_s/\text{lot}$ :<br>Q2 [dB] | Gap pattern<br>ID | Cell identification delay<br>( $T_{\text{identify\_intra\_UE cat M1}}$ )       | Measurement delay<br>( $T_{\text{measure\_intra\_UE cat M1}}$ )               |
|-----------------------------------------------------------|-------------------|--------------------------------------------------------------------------------|-------------------------------------------------------------------------------|
| $-15 \leq Q2 < -6$                                        | 0                 | $320.8 \cdot K_{\text{inter\_M1\_EC}} \cdot K_{\text{RSTD\_M1\_EC}} \text{ S}$ | $800 \cdot K_{\text{inter\_M1\_EC}} \cdot K_{\text{RSTD\_M1\_EC}} \text{ ms}$ |
|                                                           | 1                 | $321.6 \cdot K_{\text{inter\_M1}} \text{ S}$                                   | $1600 \cdot K_{\text{inter\_M1}} \text{ ms}$                                  |
| $Q2 \geq -6$                                              | 0                 | $21.8 \cdot K_{\text{inter\_M1\_EC}} \cdot K_{\text{RSTD\_M1\_EC}} \text{ S}$  | $800 \cdot K_{\text{inter\_M1\_EC}} \cdot K_{\text{RSTD\_M1\_EC}} \text{ ms}$ |
|                                                           | 1                 | $22.6 \cdot K_{\text{inter\_M1\_EC}} \text{ S}$                                | $1600 \cdot K_{\text{inter\_M1\_EC}} \text{ ms}$                              |

$K_{\text{inter\_M1\_EC}} = \frac{N_{\text{freq}} * 100}{(100 - X)}$  where X is signalled by the RRC parameter *measGapSharingScheme* [2] and is defined as in Table 8.13.3.5.1.1-2.  $N_{\text{freq}}$  is total number of inter-frequency layers to be monitored as defined in 8.1.2.1.1.

**Table 8.13.3.5.1.1-2: Value of parameter X for CEModeB**

| <i>measGapSharingScheme</i> | Value of X (%)                    |
|-----------------------------|-----------------------------------|
| '00'                        | $\frac{100}{N_{\text{freq}} + 1}$ |
| '01'                        | 50                                |
| '10'                        | 75                                |
| '11'                        | 87.5                              |

**Table 8.13.3.5.1.1-3: Requirement on cell identification delay and measurement delay for FDD interfrequency cell**

| Neighbouring cell SCH<br>Es/lot: Q2 [dB] | Gap<br>pattern ID | Cell identification delay<br>( $T_{\text{identify\_inter\_UE cat M1}}$ )                                    | Measurement delay<br>( $T_{\text{measure\_inter\_UE cat M1}}$ )                                            |
|------------------------------------------|-------------------|-------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| -15 ≤ Q2 < -6                            | 0                 | $\text{Max}(400 * r_{\text{max}} * G / 1000, 320.8) * K_{\text{inter\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} S$ | $\text{Max}(5 * r_{\text{max}} * G, 800) * K_{\text{inter\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$  |
|                                          | 1                 | $\text{Max}(400 * r_{\text{max}} * G / 1000, 321.6) * K_{\text{inter\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} S$ | $\text{Max}(5 * r_{\text{max}} * G, 1600) * K_{\text{inter\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$ |
| Q2 ≥ -6                                  | 0                 | $\text{Max}(20 * r_{\text{max}} * G / 1000, 21.8) * K_{\text{inter\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} S$   | $\text{Max}(5 * r_{\text{max}} * G, 800) * K_{\text{inter\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$  |
|                                          | 1                 | $\text{Max}(20 * r_{\text{max}} * G / 1000, 22.6) * K_{\text{inter\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} S$   | $\text{Max}(5 * r_{\text{max}} * G, 1600) * K_{\text{inter\_M1\_EC}} * K_{\text{RSTD\_M1\_EC}} \text{ ms}$ |

$$K_{\text{RSTD\_M1\_EC}} = \frac{1}{1 - \max\left(\frac{40}{T_{\text{PRS}}}, \frac{N_{\text{PRS}}}{T_{\text{PRS}}}\right)}$$

$K_{\text{RSTD\_M1\_NC}}$  is applicable provided following conditions are met:

- $T_{\text{PRS}} > 40 \text{ ms}$
- $T_{\text{PRS}} > N_{\text{PRS}}$

where

- $T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.211 [16],
- $N_{\text{PRS}}$  is the number of consecutive downlink positioning subframes in a positioning occasion defined in TS 36.211

Otherwise  $K_{\text{RSTD\_M1\_EC}} = 1$ .

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.x.1 and 9.1.x.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.x.1 are fulfilled for a corresponding Band,
- SCH<sub>RP</sub> and SCH<sub>Es/lot</sub> according to Annex Table B.2.x-1 for a corresponding Band.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of  $T_{\text{measure\_inter\_UE cat M1\_EC}}$ . If higher layer filtering is used, an additional cell identification delay can be expected.

In the RRC\_CONNECTED state the measurement period for inter frequency measurements is according to Table 8.13.3.5.1.1-1. When measurement gaps are scheduled for FDD inter frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with measurement accuracy as specified in sub-clauses 9.1.x.1 and 9.1.x.2.

The UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per FDD inter-frequency for up to 3 FDD inter-frequencies and the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with the measurement period defined in Table 8.13.3.5.1.1-1.

#### 8.13.3.5.1.1.1 Measurement Reporting Requirements

##### 8.13.3.5.1.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.3.5.1.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.5.1.1.1.3.

##### 8.13.3.5.1.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where *pusch-maxNumRepetitionCEmodeB* [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that *pusch-maxNumRepetitionCEmodeB* > 1, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in Clause 8.13.3.5.1.1. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in clause 8.13.3.5.1.1 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{Measurement\_Period\_UE cat M1\_EC, Inter}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.5.1.2 E-UTRAN inter frequency measurements when DRX is used

When DRX is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD inter-frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  as shown in table 8.13.3.5.1.2-1.

When eDRX\_CONN is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD inter-frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  as shown in table 8.13.3.5.1.2-1.

**Table 8.13.3.5.1.2-1: Requirement to identify a newly detectable FDD interfrequency cell**

| Neighbouring cell SCH Ês/lot: Q2 [dB] | Gap pattern ID                                        | DRX cycle length (s) | Tidentify_intra_UE cat M1 (s) (DRX cycles) |
|---------------------------------------|-------------------------------------------------------|----------------------|--------------------------------------------|
| -15≤ Q2 < -6                          | 0                                                     | ≤0.64                | 320.8 * Kinter_M1 * KRSTD_M1_EC (Note1)    |
|                                       |                                                       | 0.64< DRX-cycle≤2.56 | Note2(400 * Kinter_M1 * KRSTD_M1_EC)       |
|                                       | 1                                                     | DRX-cycle ≤ 0.640    | 321.6 * Kinter_M1 * KRSTD_M1_EC (Note1)    |
|                                       |                                                       | 0.64< DRX-cycle≤2.56 | Note2(400 * Kinter_M1 * KRSTD_M1_EC)       |
| Q2≥-6                                 | 0                                                     | ≤0.64                | 21.8 * Kinter_M1 * KRSTD_M1_EC (Note1)     |
|                                       |                                                       | 0.64< DRX-cycle≤2.56 | Note2(24 * Kinter_M1 * KRSTD_M1_EC)        |
|                                       | 1                                                     | DRX-cycle ≤ 0.640    | 22.6 * Kinter_M1 * KRSTD_M1_EC (Note1)     |
|                                       |                                                       | 0.64< DRX-cycle≤2.56 | Note2(24 * Kinter_M1 * KRSTD_M1_EC)        |
| Note1:                                | Number of DRX cycle depends upon the DRX cycle in use |                      |                                            |
| Note2:                                | Time depends upon the DRX cycle in use                |                      |                                            |

**Table 8.13.3.5.1.2-1B: Requirement to identify a newly detectable FDD interfrequency cell when eDRX\_CONN is used**

| eDRX_CONN cycle length (s)                         | T <sub>identify_inter UE cat M1_EC</sub> (s) (eDRX_CONN cycles) |
|----------------------------------------------------|-----------------------------------------------------------------|
| 2.56 < eDRX_CONN cycle ≤ 10.24                     | Note (400 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> )   |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                 |

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.x.1 and 9.1.x.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.x.1 are fulfilled for a corresponding Band,
- SCH\_RP and SCH Ês/lot according to Annex B.2.x-1 for a corresponding Band

When DRX or eDRX\_CONN is in use, the UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per FDD inter-frequency and the UE physical layer shall be capable of reporting RSRP and RSRQ to higher layers with the measurement period T<sub>measure\_inter UE cat M1\_EC</sub>, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps. When DRX is used, T<sub>measure\_inter UE cat M1\_EC</sub> is as defined in Table 8.13.3.5.1.2-2, and when eDRX\_CONN is in use, T<sub>measure\_inter UE cat M1\_EC</sub> is as defined in Table 8.13.3.5.1.2-2.

**Table 8.13.3.5.1.2-2: Requirement to measure FDD interfrequency cells**

| Target cell SCH Ês/lot: Q2 [dB] | Gap pattern ID                                        | DRX cycle length (s) | Tmeasure_intra_UE cat M1 (s) (DRX cycles) |
|---------------------------------|-------------------------------------------------------|----------------------|-------------------------------------------|
| Q2≥-15                          | 0                                                     | ≤0.16                | 0.8 * Kinter_M1 * KRSTD_M1_EC (Note1)     |
|                                 |                                                       | 0.16<DRX-cycle≤2.56  | Note2(5 * Kinter_M1 * KRSTD_M1_EC)        |
|                                 | 1                                                     | ≤0.32                | 1.6 * Kinter_M1 * KRSTD_M1_EC (Note1)     |
|                                 |                                                       | 0.32<DRX-cycle≤2.56  | Note2(5 * Kinter_M1 * KRSTD_M1_EC)        |
| Note 1:                         | Number of DRX cycle depends upon the DRX cycle in use |                      |                                           |
| Note 2:                         | Time depends upon the DRX cycle in use                |                      |                                           |

**Table 8.13.3.5.1.2-3: Requirement to measure FDD interfrequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | T <sub>measure_inter UE cat M1_EC</sub> (s) (eDRX_CONN cycles) |
|----------------------------------------------------|----------------------------------------------------------------|
| 2.56 < eDRX_CONN cycle ≤ 10.24                     | Note (5 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> )    |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.x.1 and 9.1.x.2.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.x.3.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.3.5.1.2.1 Measurement Reporting Requirements

##### 8.13.3.5.1.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.3.5.1.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.5.1.2.1.3.

##### 8.13.3.5.1.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where *pusch-maxNumRepetitionCEmodeB* [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that *pusch-maxNumRepetitionCEmodeB* > 1, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in Clause 8.13.3.5.1.2. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in clause 8.13.3.5.1.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_inter\_UE cat M1\_EC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.5.2 E-UTRAN inter-frequency measurements for HD-FDD

##### 8.13.3.5.2.1 E-UTRAN inter-frequency measurements when no DRX is used

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.13.3.5.1.1 also apply for this section provided the following conditions are met:

- RSRP related side conditions given in Sections 9.1.2.1 and 9.1.2.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.x.1 are fulfilled for a corresponding Band,
- $\text{SCH\_RP}$  and  $\text{SCH\_Es/Iot}$  according to Annex Table B.2.x-2 for a corresponding Band

##### 8.13.3.5.2.2 E-UTRAN inter frequency measurements when DRX is used

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

When DRX is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD inter-frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  as shown in table 8.13.3.5.2.2-1.

When eDRX\_CONN is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD inter-frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  as shown in table 8.13.3.5.2.2-1.

**Table 8.13.3.5.2.2-1: Requirement to identify a newly detectable HD-FDD interfrequency cell**

| Neighbouring cell SCH $\hat{E}$ s/lot: Q2 [dB] | Gap pattern ID                                        | DRX cycle length (s) | Tidentify_intra_UE cat M1 (s) (DRX cycles)                      |
|------------------------------------------------|-------------------------------------------------------|----------------------|-----------------------------------------------------------------|
| -15≤ Q2 < -6                                   | 0                                                     | ≤0.64                | 320.8 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1) |
|                                                |                                                       | 0.64< DRX-cycle≤2.56 | Note2(400 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> )   |

|                                                |                                                       | 0.64< DRX-cycle≤2.56 | Note2(400 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> )   |
| Q2≥-6                                          | 0                                                     | ≤0.64                | 21.8 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1)  |
|                                                |                                                       | 0.64< DRX-cycle≤2.56 | Note2(24 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> )    |
|                                                | 1                                                     | DRX-cycle ≤ 0.640    | 22.6 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1)  |
|                                                |                                                       | 0.64< DRX-cycle≤2.56 | Note2(24 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> )    |
| Note 1:                                        | Number of DRX cycle depends upon the DRX cycle in use |                      |                                                                 |
| Note 2:                                        | Time depends upon the DRX cycle in use                |                      |                                                                 |

**Table 8.13.3.5.2.2-1B: Requirement to identify a newly detectable HD-FDD interfrequency cell when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{identify\_inter\_UE cat M1\_EC}} (s)$ (eDRX_CONN cycles) |
|----------------------------------------------------|--------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $400 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_EC}}$ )    |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                    |

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.x.1 and 9.1.x.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.x.1 are fulfilled for a corresponding Band,
- SCH\_RP and SCH  $\hat{E}$ s/lot according to Annex Table B.2.x-2 for a corresponding Band

When DRX or eDRX\_CONN is in use, the UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per FDD inter-frequency and the UE physical layer shall be capable of reporting RSRP and RSRQ to higher layers with the measurement period  $T_{\text{measure\_inter\_UE cat M1\_EC}}$ , either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps. When DRX is used,  $T_{\text{measure\_inter\_UE cat M1\_EC}}$  is as defined in Table 8.13.3.5.2.2-2, and when eDRX\_CONN is in use,  $T_{\text{measure\_inter\_UE cat M1\_EC}}$  is as defined in Table 8.13.3.5.2.2-2.

**Table 8.13.3.5.2.2-2: Requirement to measure HD-FDD interfrequency cells**

| Neighbouring cell SCH Ês/lot: Q2 [dB] | Gap pattern ID                                        | DRX cycle length (s) | T <sub>measure_intra_UE cat M1</sub> (s) (DRX cycles)         |
|---------------------------------------|-------------------------------------------------------|----------------------|---------------------------------------------------------------|
| Q2≥-15                                | 0                                                     | <0.128               | 0.8 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1) |

|                                       | 1                                                     | ≤0.32                | 1.6 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> (Note1) |
|                                       |                                                       | 0.32<DRX-cycle≤2.56  | Note2(5 * K <sub>inter_M1</sub> * K <sub>RSTD_M1_EC</sub> )   |
| Note 1:                               | Number of DRX cycle depends upon the DRX cycle in use |                      |                                                               |
| Note 2:                               | Time depends upon the DRX cycle in use                |                      |                                                               |

**Table 8.13.3.5.2.2-3: Requirement to measure HD-FDD interfrequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                         | $T_{\text{measure\_inter\_UE cat M1\_EC}}$ (s) (eDRX_CONN cycles) |
|----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$        | Note ( $5 * K_{\text{inter\_M1}} * K_{\text{RSTD\_M1\_EC}}$ )     |
| Note: Time depends upon the eDRX_CONN cycle in use |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.x.1 and 9.1.x.2.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.x.3.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.3.5.2.2.1 Measurement Reporting Requirements

##### 8.13.3.5.2.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.3.5.2.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.5.2.2.1.3.

##### 8.13.3.5.2.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times T_{\text{TTI\_DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times T_{\text{TTI\_DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in Clause 8.13.3.5.2.2 When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in clause 8.13.3.5.2.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_inter\_UE cat M1\_EC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.5.3 E-UTRAN TDD inter frequency measurements

##### 8.13.3.5.3.1 E-UTRAN inter frequency measurements when no DRX is used

When no DRX is in use and when measurement gaps are scheduled, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify and measure a new detectable TDD inter frequency cell according to requirements in Table 8.13.3.5.3.1-1 when additional condition in Table 8.13.3.5.3.1-1 is met, and

- $G=1$ , or
- $r_{\text{max}} * G < 800\text{ms}$ , or

- UE is receiving PDSCH.

Otherwise, requirements in Table 8.13.3.5.3.1-3 apply, where  $r_{\max}$  and  $G$  are given by higher layer parameter  $mPDCCH\text{-}NumRepetition$  and  $mPDCCH\text{-}startSF\text{-}UESS$  respectively as defined in TS 36.213 [3].

**Table 8.13.3.5.3.1-1: Requirement on cell identification delay and measurement delay for TDD interfrequency cell**

| Neighbouring cell SCH<br>Es/lot: Q2 [dB]            | Gap<br>pattern ID | Cell identification delay ( $T_{\text{identify\_intra\_UE cat M1}}$ ) for<br>neighbouring cell SCH Es/lot (Q): $-15 \leq Q2 < -6$<br>[dB] | Measurement delay<br>( $T_{\text{measure\_intra\_UE cat M1}}$ )                                                                                                       |

$$K_{\text{RSTD\_M1\_EC}} = \frac{1}{1 - \max\left(\frac{40}{T_{\text{PRS}}}, \frac{N_{\text{PRS}}}{T_{\text{PRS}}}\right)}$$

$K_{\text{RSTD\_M1\_NC}}$  is applicable provided following conditions are met:

- $T_{\text{PRS}} > 40 \text{ ms}$
- $T_{\text{PRS}} > N_{\text{PRS}}$

where

- $T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.211 [16],
- $N_{\text{PRS}}$  is the number of consecutive downlink positioning subframes in a positioning occasion defined in TS 36.211

Otherwise  $K_{\text{RSTD\_M1\_EC}} = 1$ .

A cell shall be considered detectable when

- RSRP related side conditions given in Sections 9.1.x.1 and 9.1.x.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.x.1 are fulfilled for a corresponding Band,
- SCH<sub>RP</sub> and SCH Ês/lot according to Annex Table B.2.x-1 for a corresponding Band.

When measurement gaps are scheduled for TDD inter frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP and RSRQ to higher layers with measurement accuracy as specified in sub-clauses 9.1.x.1 and 9.1.x.2 with measurement period ( $T_{\text{measure\_inter\_UE cat M1\_EC}}$ ) given by table 8.13.3.5.3.1-1:

The UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per TDD inter-frequency and the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with the measurement period  $T_{\text{measure\_inter\_UE cat M1\_EC}}$ .

### 8.13.3.5.3.1.1 Measurement Reporting Requirements

#### 8.13.3.5.3.1.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

#### 8.13.3.5.3.1.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.5.3.1.1.3.

#### 8.13.3.5.3.1.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in Clause 8.13.3.5.3.1. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in clause 8.13.3.5.3.1 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{Measurement\_Period Inter\_UE cat M1\_EC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

### 8.13.3.5.3.2 E-UTRAN inter frequency measurements when DRX is used

When DRX is in use and when DRX or eDRX\_CONN is in use, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable TDD inter frequency cell within  $T_{\text{identify\_inter\_UE cat M1}}$  as shown in table 8.13.3.5.3.2-1.

When eDRX\_CONN is in use the UE shall be able to identify a new detectable TDD inter frequency cell within  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  as shown in table 8.13.3.5.3.2-1.

**Table 8.13.3.5.3.2-1: Requirement to identify a newly detectable TDD interfrequency cell**

| Neighbouring cell SCH $\hat{E}_s/\text{lot}$ : Q2 [dB]        | Gap pattern ID | DRX cycle length (s) | T <sub>identify_intra_UE cat M1</sub> (s) (DRX cycles)          |

| Note: Time depends upon the eDRX_CONN cycle in use |                                                                    |

A cell shall be considered detectable when

- RSRP related side conditions given in Clause 9.1.x.1 and 9.1.x.2 are fulfilled for a corresponding Band,
- RSRQ related side conditions given in Clause 9.1.x.1 are fulfilled for a corresponding Band,
- SCH\_RP and SCH  $\hat{E}_s/\text{lot}$  according to Annex Table B.2.x-1 for a corresponding Band

When DRX or eDRX\_CONN is in use, the UE shall be capable of performing RSRP and RSRQ measurements of at least 4 inter-frequency cells per TDD inter-frequency for up to 3 TDD inter-frequencies and the UE physical layer shall be capable of reporting RSRP and RSRQ measurements to higher layers with the measurement period  $T_{\text{measure\_inter\_UE cat M1\_EC}}$ , either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps. When DRX is in use,  $T_{\text{measure\_inter\_UE cat M1\_EC}}$  is as defined in Table 8.13.3.5.3.2-2, and when eDRX\_CONN is in use,  $T_{\text{measure\_inter\_UE cat M1\_EC}}$  is as defined in Table 8.13.3.5.3.2-2.

| Note 2: Time depends upon the DRX cycle in use.                |                                          |                   |                          |                                                                     |

**Table 8.13.3.5.3.2-3: Requirement to measure TDD inter frequency cells when eDRX\_CONN cycle is used**

| eDRX_CONN cycle length (s)                          | $T_{\text{measure\_inter\_UE cat M1\_EC}}$ (s) (eDRX_CONN cycles) |
|-----------------------------------------------------|-------------------------------------------------------------------|
| $2.56 < \text{eDRX\_CONN cycle} \leq 10.24$         | Note (5 * $K_{\text{inter\_M1}}$ * $K_{\text{RSTD\_M1\_EC}}$ )    |
| Note: Time depends upon the eDRX_CONN cycle in use. |                                                                   |

The RSRP measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.x.1 and 9.1.x.2.

The RSRQ measurement accuracy for all measured cells shall be as specified in the sub-clauses 9.1.x.3.

The requirements in this subclause apply regardless of MPDCCH monitoring configuration.

#### 8.13.3.5.3.2.1 Measurement Reporting Requirements

##### 8.13.3.5.3.2.1.1 Periodic Reporting

Reported RSRP and RSRQ measurement contained in periodically triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

##### 8.13.3.5.3.2.1.2 Event-triggered Periodic Reporting

Reported RSRP and RSRQ measurement contained in event triggered periodic measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 8.13.3.5.3.2.1.3.

##### 8.13.3.5.3.2.1.3 Event Triggered Reporting

Reported RSRP and RSRQ measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.x.1 and 9.1.x.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeB} \times T_{\text{TTI\_DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeB}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode B provided that  $\text{pusch-maxNumRepetitionCEmodeB} > 1$ , otherwise uncertainty is defined as  $2 \times T_{\text{TTI\_DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in Clause 8.13.3.5.3.2. When L3 filtering is used or IDC autonomous denial is configured an additional delay can be expected.

If a cell which has been detectable at least for the time period  $T_{\text{identify\_inter\_UE cat M1\_EC}}$  defined in clause 8.13.3.5.3.2 becomes undetectable for a period  $\leq 5$  seconds and then the cell becomes detectable again and triggers an event, the event triggered measurement reporting delay shall be less than  $T_{\text{measure\_inter\_UE cat M1\_EC}}$  provided the timing to that cell has not changed more than  $\pm 50 T_s$  and the L3 filter has not been used. When L3 filtering is used or IDC autonomous denial is configured, an additional delay can be expected.

#### 8.13.3.6 Maximum allowed layers for multiple monitoring for UE category M1 with CE mode B

The UE UE category M1 configured with CE mode B shall be capable of monitoring at least:

- Depending on UE capability, 2 FDD E-UTRA inter-frequency carriers, and
- Depending on UE capability, 2 TDD E-UTRA carriers.

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 5 carrier frequency layers, which include one serving carrier frequency and any of the above defined combination of E-UTRA FDD inter-frequency and E-UTRA TDD inter-frequency layers.

### 8.13.3.7 E-UTRAN OTDOA Inter-Frequency RSTD Measurements for Cat-M1 UE in CEModeB

All inter-frequency RSTD measurement requirements specified in Sections 8.13.3.7 shall apply, provided that

- the UE is capable of inter-frequency RSTD measurements for OTDOA [24], and
- either the measurement gap pattern ID # 0 specified in Clause 8.1.2.1 is used or the UE supports capability of conducting inter-frequency measurements without gaps.

All inter-frequency RSTD measurement requirements specified in Sections 8.13.3.7 shall apply without DRX as well as for any DRX and eDRX\_CONN cycles specified in TS 36.331 [2].

All positioning subframes indicated in the OTDOA assistance data and specified in sub-clause 9.1.21.18 are available for RSTD measurements in the measured and reference cell.

All the measurement requirements specified in Sections 8.13.3.7 shall apply provided that the UE is configured with the single PRS configuration for the reference cell and all the neighbour cells.

#### 8.13.3.7.1 E-UTRAN FDD Inter-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD InterFreqFDD, Cat}_M}$  ms as given below (see also Figure 8.13.2.3.1-1):

$$T_{\text{RSTD InterFreqFDD, Cat}_M} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \text{ ms},$$

where

$T_{\text{RSTD InterFreqFDD, Cat}_M}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24]; if  $T_{\text{PRS}} < \text{MGRP}$ ,

$T_{\text{PRS}}$  equals to MGRP; MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1,

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24];

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion and can be measured by UE within MGL; if  $\text{MGRP} \geq N_{\text{PRS}} > (\text{MGL}-2\text{ms})$ ,  $N_{\text{actual\_PRS}}$  equals to  $(\text{MGL}-2\text{ms})$ ; if  $N_{\text{PRS}} > \text{MGRP}$ ,  $N_{\text{actual\_PRS}}$  equals to

$$(\text{MGL} - 2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{\text{MGRP}} \right\rfloor;$$

$N_{\text{PRS\_total}}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.21.18.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

Editor's note: the formula and parameters are to be further checked and may be updated.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |

| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ InterFreqFDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \geq -15 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -15 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.20 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{RSTD \text{ InterFreqFDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.21.18.

If the inter-frequency handover occurs while inter-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the inter-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{RSTD \text{ InterFreqFDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{RSTD \text{ InterFreqFDD, Cat\_M, HO}} = T_{RSTD \text{ InterFreqFDD, Cat\_M}} + K \times T_{PRS} + T_{HO} \quad \text{ms},$$

where:

$K$  is the number of times the inter-frequency handover occurs during  $T_{\text{RSTD InterFreqFDD, Cat\_M, HO}}$ .

$T_{\text{HO}}$  is the time during which the inter-frequency RSTD measurement may not be possible due to inter-frequency handover.

Furthermore, due to the inter-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

#### 8.13.3.7.1.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.18.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  defined in Clause 8.13.3.7.1.

#### 8.13.3.7.2 E-UTRAN TDD Inter-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure inter-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  ms as given below:

$$T_{\text{RSTD InterFreqTDD, Cat\_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \text{ ms},$$

where

$T_{\text{RSTD InterFreqTDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24]; if  $T_{\text{PRS}} < \text{MGRP}$ ,

$T_{\text{PRS}}$  equals to MGRP; MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1,

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24];

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion and can be measured by UE within MGL; if  $MGRP \geq N_{\text{PRS}} > (MGL - 2\text{ms})$ ,  $N_{\text{actual\_PRS}}$  equals to  $(MGL - 2\text{ms})$ ; if  $N_{\text{PRS}} > MGRP$ ,  $N_{\text{actual\_PRS}}$  equals to  $(MGL - 2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{MGRP} \right\rfloor$ ;

$N_{\text{PRS\_total}}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.21.18.

$T_{\text{PRS}}$ ,  $N_{\text{PRS}}$ ,  $N_{\text{actual\_PRS}}$  and  $N_{\text{PRS\_total}}$  are the parameters of the same cell, for which  $T_{\text{PRS}} \cdot \left\lceil \frac{N_{\text{PRS\_total}}}{N_{\text{actual\_PRS}}} \right\rceil$  is the largest among all the measured cells.

$T_{\text{MIB}}$  is the time required for acquiring the MIB information of the target cell.  $T_{\text{MIB}} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{\text{PRS}}$                                                                                                                                                                                                                                                                                        | Number of PRS positioning occasions $M$                                                  |                                                                                          |

|                                                                                                                                                                                                                                                                                                                                                   | f1 <sup>Note1</sup>                                                                      | f1 and f2 <sup>Note2</sup>                                                               |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                                          |                                                                                          |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \geq -15 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -15 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.20 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.21.18.

If the inter-frequency handover occurs while inter-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the inter-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{\text{RSTD InterFreqTDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{\text{RSTD InterFreqTDD, Cat\_M, HO}} = T_{\text{RSTD InterFreqTDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the inter-frequency handover occurs during  $T_{\text{RSTD InterFreqTDD, Cat\_M, HO}}$ ,

$T_{\text{HO}}$  is the time during which the inter-frequency RSTD measurement may not be possible due to inter-frequency handover.

Furthermore, due to the inter-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

The inter-frequency requirements in this clause (8.13.3.7.2) shall apply for all TDD special subframe configurations specified in TS 36.211 [16] and for the TDD uplink-downlink configurations as specified in Table 8.13.3.7.2-2.

**Table 8.13.3.7.2-2: TDD uplink-downlink subframe configurations applicable for TDD inter-frequency requirements**

| PRS Transmission Bandwidth [RB]                                                      | Applicable TDD uplink-downlink configurations |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| 6                                                                                    | 1, 2, 3, 4 and 5                              |
| Note: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [16]. |                                               |

#### 8.13.3.7.2.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.18.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  defined in Clause 8.13.3.7.2.

#### 8.13.3.7.3 E-UTRAN HD-FDD Inter-Frequency OTDOA Measurements

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.13.3.7.1 also apply for this section except reporting delay requirement provided the following conditions are met:

- all positioning subframes indicated in the OTDOA assistance data and specified in Section 9.1.21.18 are available for RSTD measurements in the measured and reference cells.

#### 8.13.3.7.3.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.21.18.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than measurement period as defined in Clause 8.13.3.7.3.

## 8.14 Measurements for UE category NB1

### 8.14.1 Introduction

This clause contains requirements on the UE category NB1 regarding measurement in RRC\_CONNECTED state. The requirements are specified for NB-IoT intra frequency measurements for serving NB-IoT cell. These measurements may be used by the NB-IoT for uplink power control. The measurement quantities are defined in [4], the measurement model is defined in [22] and measurement accuracies are specified in clause 9. During the RRC\_CONNECTED state the UE shall continuously measure serving NB-IoT cell.

The UE shall meet all applicable requirements specified in clause 8.14 under the following conditions:

- at least 1 DL subframe per radio frame of serving NB-IoT cell is available at the UE during measurement period.

### 8.14.2 NB-IoT intra frequency measurements under normal coverage

#### 8.14.2.1 NB-IoT intra frequency measurements when no DRX is used

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is 800ms. The NRSRP measurement accuracy shall be as specified in the sub-clauses 9.1.22.1.

#### 8.14.2.2 NB-IoT intra frequency measurements when DRX is used

When DRX is used in the RRC\_CONNECTED state the measurement period for intra frequency measurements is  $T_{\text{measure\_intra}}$  as shown in table 8.14.2.2-1.

**Table 8.14.2.2-1: Requirement for intrafrequency measurement**

| DRX cycle length (s)                          | $T_{\text{measure\_intra}}$ (s) (DRX cycles) |
|-----------------------------------------------|----------------------------------------------|
| $0.256 < \text{DRX-cycle} \leq 10.24$         | Note1 ([5])                                  |
| Note1: Time depends upon the DRX cycle in use |                                              |

The NRSRP measurement accuracy shall be as specified in the sub-clauses 9.1.22.1

### 8.14.3 NB-IoT intra frequency measurements under enhanced coverage

#### 8.14.3.1 NB-IoT intra frequency measurements when no DRX is used

In the RRC\_CONNECTED state the measurement period for intra frequency measurements is 1600ms. The NRSRP measurement accuracy shall be as specified in the sub-clauses 9.1.22.1.

#### 8.14.3.2 NB-IoT intra frequency measurements when DRX is used

When DRX is used in the RRC\_CONNECTED state the measurement period for intra frequency measurements is  $T_{\text{measure\_intra}}$  as shown in table 8.14.3.2-1.

**Table 8.14.3.2-1: Requirement for intrafrequency measurement**

| DRX cycle length (s)                          | $T_{\text{measure\_intra}}$ (s)<br>(DRX cycles) |
|-----------------------------------------------|-------------------------------------------------|
| $0.256 < \text{DRX-cycle} \leq 10.24$         | Note1 ([5])                                     |
| Note1: Time depends upon the DRX cycle in use |                                                 |

The NRSRP measurement accuracy shall be as specified in the sub-clauses 9.1.22.1.

## 8.15 Void

## 8.16 Measurements for UE Category M2

### 8.16.1 Introduction

The UE category M2 applicability of the requirements in subclause 8.16 is defined in Section 3.6.

This clause contains requirements on the UE regarding measurement reporting in RRC\_CONNECTED state. The requirements are specified for E-UTRA intra frequency measurements. These measurements may be used by the E-UTRAN, e.g. for handover decisions. The measurement quantities are defined in [4], the measurement model is defined in [22] and measurement accuracies are specified in clause 9. Control of measurement reporting is specified in TS 36.331 [2].

When the UE is provided with IDC solution, the UE shall also perform RRM measurements and meet the corresponding requirements in clause 8.

### 8.16.2 Requirements for UE category M2 with CE mode A

#### 8.16.2.1 E-UTRAN FDD UE Rx-Tx Time Difference Measurements for UE category M2 in CEModeA

When no DRX is used the physical layer measurement period of the UE Rx-Tx time difference measurement shall be 480 ms.

When DRX is used in RRC\_CONNECTED state the physical layer measurement period ( $T_{\text{measure\_FDD\_UE\_Rx\_Tx1}}$ ) of the UE Rx-Tx time difference measurement shall be as specified in table 8.16.2.1-1.

**Table 8.16.2.1-1: FDD UE Rx-Tx time difference measurement requirement when DRX is used**

| DRX cycle length (s)                                          | $T_{\text{measure\_FDD\_UE\_Rx\_Tx1}}$ (s) (DRX cycles) |
|---------------------------------------------------------------|---------------------------------------------------------|
| $< 0.128$                                                     | 0.48 (Note1)                                            |
| $0.128 \leq \text{DRX-cycle} \leq 2.56$                       | Note2 (5)                                               |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                                         |
| Note 2: Time depends upon the DRX cycle in use                |                                                         |

If the UE is performing UE Rx-Tx time difference measurement while the PCell is changed due to the handover then the UE shall restart the Rx-Tx measurement on the new cell. In this case the UE shall also meet the UE Rx-Tx time difference measurement and accuracy requirements. However the physical layer measurement period of the UE Rx-Tx measurement shall not exceed  $T_{\text{measure\_FDD\_UE\_Rx\_Tx3}}$  as defined in the following expression:

$$T_{\text{measure\_FDD\_UE\_Rx\_Tx3}} = (K+1) * (T_{\text{measure\_FDD\_UE\_Rx\_Tx1}}) + K * T_{\text{PCell\_change\_handover}}$$

Where:

K is the number of times the PCell is changed over the measurement period ( $T_{\text{measure\_FDD\_UE\_Rx\_Tx3}}$ ),

$T_{\text{PCell\_change\_handover}}$  is the time necessary to change the PCell due to handover.

The measurement accuracy for the UE Rx-Tx time difference measurement when DRX or eDRX\_CONN is used as well as when no DRX is used shall be as specified in the sub-clause 9.1.25.3.

### 8.16.2.1.1 UE Rx-Tx Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.5.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive ECID-RequestLocationInformation message and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeA} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-maxNumRepetitionCEmodeA}$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode A provided that  $\text{pusch-maxNumRepetitionCEmodeA} > 1$ , otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than the physical layer measurement period defined in Clause 8.16.2.1.

### 8.16.2.2 E-UTRAN TDD UE Rx-Tx Time Difference Measurements for UE category M2 in CEModeA

When no DRX is used the physical layer measurement period of the UE Rx-Tx time difference measurement shall be 480 ms.

When DRX is used in RRC\_CONNECTED state the physical layer measurement period ( $T_{\text{measure\_TDD\_UE\_Rx\_Tx1}}$ ) of the UE Rx-Tx time difference measurement shall be as specified in table 8.16.2.2-1.

**Table 8.16.2.2-1: TDD UE Rx-Tx time difference measurement requirement when DRX is used**

| DRX cycle length (s)                                          | $T_{\text{measure\_TDD\_UE\_Rx\_Tx1}}$ (s) (DRX cycles) |
|---------------------------------------------------------------|---------------------------------------------------------|
| < 0.128                                                       | 0.48 (Note1)                                            |
| $0.128 \leq \text{DRX-cycle} \leq 2.56$                       | Note2 (5)                                               |
| Note 1: Number of DRX cycle depends upon the DRX cycle in use |                                                         |
| Note 2: Time depends upon the DRX cycle in use                |                                                         |

If the UE is performing UE Rx-Tx time difference measurement while the PCell is changed due to the handover then the UE shall restart the Rx-Tx measurement on the new cell. In this case the UE shall also meet the UE Rx-Tx time difference measurement and accuracy requirements. However the physical layer measurement period of the UE Rx-Tx measurement shall not exceed  $T_{\text{measure\_TDD\_UE\_Rx\_Tx3}}$  as defined in the following expression:

$$T_{\text{measure\_TDD\_UE\_Rx\_Tx3}} = (K+1) \cdot (T_{\text{measure\_TDD\_UE\_Rx\_Tx1}}) + K \cdot T_{\text{PCell\_change\_handover}}$$

Where:

K is the number of times the PCell is changed over the measurement period ( $T_{\text{measure\_TDD\_UE\_Rx\_Tx3}}$ ),

$T_{\text{PCell\_change\_handover}}$  is the time necessary to change the PCell due to handover.

The measurement accuracy for the UE Rx-Tx time difference measurement when DRX or eDRX\_CONN is used as well as when no DRX is used shall be as specified in the sub-clause 9.1.25.3.

### 8.16.2.2.1 UE Rx-Tx Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.5.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive ECID-RequestLocationInformation message and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $\text{pusch-maxNumRepetitionCEmodeA} \times \text{TTI}_{\text{DCCH}}$ , where  $\text{pusch-}$

$maxNumRepetitionCEmodeA$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode A provided that  $pusch-maxNumRepetitionCEmodeA > 1$ , otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than the physical layer measurement period defined in Clause 8.16.2.2.

### 8.16.2.2a E-UTRAN HD-FDD UE Rx-Tx Time Difference Measurements for UE category M2 in CEModeA

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands.

The requirements defined in clause 8.16.2.1 also apply for this section except the measurement reporting requirements provided the following conditions are met:

- At least one downlink and one uplink subframes per radio frame are available for the UE Rx-Tx time difference measurement in the measured cell.
- at least downlink subframe # 0 or downlink subframe # 5 per radio frame of an intra-frequency cell to be identified by the UE is available at the UE;
- SCH\_RP and SCH  $\hat{E}_s$ /lot according to Annex Table B.2.14-2 for a corresponding Band

#### 8.16.2.2a.1 UE Rx-Tx Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.5.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive ECID-RequestLocationInformation message and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $pusch-maxNumRepetitionCEmodeA \times TTI_{DCCH}$ , where  $pusch-maxNumRepetitionCEmodeA$  [2] is the maximum number of PUSCH repetitions configured for the UE in CE Mode A provided that  $pusch-maxNumRepetitionCEmodeA > 1$ , otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than the physical layer measurement period defined in Clause 8.16.2.2a.

### 8.16.2.3 E-UTRAN OTDOA Intra-Frequency RSTD Measurements for Cat-M2 UE in CEModeA

All intra-frequency RSTD measurement requirements specified in Sections 8.16.2.3 shall apply without DRX as well as for any DRX and eDRX\_CONN cycles specified in TS 36.331 [2].

All the measurement requirements specified in Sections 8.16.2.3 shall apply provided that the UE is configured:

- with the single PRS configuration for the reference cell and all the neighbour cells and
- with the measurement gap pattern ID #0 specified in Clause 8.1.2.1 if the PRS bandwidth is less than the bandwidth of the cell used for the RSTD measurement in which case gaps are required.

#### 8.16.2.3.1 E-UTRAN FDD Intra-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$  ms as given below (see also Figure 8.16.2.3.1-1):

$$T_{RSTD \text{ IntraFreqFDD, Cat\_M}} = T_{PRS} \cdot (M - 1) + \Delta + T_{MIB} \text{ ms},$$

where

$T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] for UE not configured with measurement gaps for intra-frequency RSTD. For UE configured with measurement gaps for intra-frequency RSTD measurements,  $T_{\text{PRS}} = \max(T_{\text{PRS}}, \text{MGRP})$ , where MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1.

$M$  is the number of PRS positioning occasions as defined in Table 8.16.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355 [24],

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion;  $N_{\text{actual\_PRS}} = N_{\text{PRS}}$  for UE not configured with measurement gaps for intra-frequency RSTD measurements; for UE configured with measurement gaps for intra-frequency RSTD measurements  $N_{\text{actual\_PRS}}$  is the number of PRS subframes which can be measured by UE within MGL, where  $N_{\text{actual\_PRS}} = (\text{MGL}-2)$  if  $\text{MGRP} \geq N_{\text{PRS}} > (\text{MGL}-2)$ ,  $N_{\text{actual\_PRS}} = (\text{MGL}-2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{\text{MGRP}} \right\rfloor$  if  $N_{\text{PRS}} > \text{MGRP}$ , and  $N_{\text{actual\_PRS}} = N_{\text{PRS}}$  if  $N_{\text{PRS}} \leq (\text{MGL}-2)$ .

$N_{\text{PRS\_total}}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.25.4.

$T_{\text{PRS}}$ ,  $N_{\text{PRS}}$ ,  $N_{\text{actual\_PRS}}$  and  $N_{\text{PRS\_total}}$  are the parameters of the same cell, for which  $T_{\text{PRS}} \cdot \left\lceil \frac{N_{\text{PRS\_total}}}{N_{\text{actual\_PRS}}} \right\rceil$  is the largest among all the measured cells.

$T_{\text{MIB}}$  is the time required for acquiring the MIB information of the target cell.  $T_{\text{MIB}} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.16.2.3.1-1: Number of PRS positioning occasions within  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{\text{PRS}}$                                                                                                                                                                                                                                                                                        | Number of PRS positioning occasions $M$                                                  |                                                                                          |

|                                                                                                                                                                                                                                                                                                                                                   | f1 <sup>Note1</sup>                                                                      | f1 and f2 <sup>Note2</sup>                                                               |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{\text{PRS\_Total}}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                                          |                                                                                          |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  provided:

$(\text{PRS } \hat{E}_s / \text{Iot})_{\text{ref}} \geq -6 \text{ dB}$  for all Frequency Bands for the reference cell,

$(\text{PRS } \hat{E}_s / \text{Iot})_i \geq -13 \text{ dB}$  for all Frequency Bands for neighbour cell  $i$ ,

$(\text{PRS } \hat{E}_s / \text{Iot})_{\text{ref}}$  and  $(\text{PRS } \hat{E}_s / \text{Iot})_i$  conditions apply for all subframes of at least  $L = \frac{n}{2}$  PRS positioning occasions,

PRP 1,2<sub>dBm</sub> according to Annex B.2.23 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE as illustrated in Figure 8.16.2.3.1-1.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.25.4.

If the intra-frequency handover occurs while intra-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the intra-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

$(T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}})$  shall be according to the following expression:

$$T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}} = T_{\text{RSTD IntraFreqFDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the intra-frequency handover occurs during  $T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}}$ .

$T_{\text{HO}}$  is the time during which the intra-frequency RSTD measurement may not be possible due to intra-frequency handover.

**Figure 8.16.2.3.1-1: Illustration of the RSTD reporting time requirement in an FDD system.**

Furthermore, due to the intra-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

### 8.16.2.3.1.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.4.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$  defined in Clause 8.16.2.3.1.

### 8.16.2.3.2 E-UTRAN TDD Intra-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  ms as given below:

$$T_{RSTD \text{ IntraFreqTDD, Cat\_M}} = T_{PRS} \cdot (M - 1) + \Delta + T_{MIB},$$

where

$T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{PRS}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] for UE not configured with measurement gaps for intra-frequency RSTD. For UE configured with measurement gaps for intra-frequency RSTD measurements,  $T_{PRS} = \max(T_{PRS}, MGRP)$ , where MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1.

$M$  is the number of PRS positioning occasions as defined in Table 8.16.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{PRS} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{PRS}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355 [24],

$N_{PRS\_total}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.25.4.

$N_{actual\_PRS}$  is the cell-specific number of PRS subframes within a PRS occasion;  $N_{actual\_PRS} = N_{PRS}$  for UE not configured with measurement gaps for intra-frequency RSTD measurements; for UE configured with measurement gaps for intra-frequency RSTD measurements  $N_{actual\_PRS}$  is the number of PRS subframes which can be measured by UE within MGL, where  $N_{actual\_PRS} = (MGL-2)$  if  $MGRP \geq N_{PRS} > (MGL-2)$ ,  $N_{actual\_PRS} = (MGL - 2) \cdot \left\lfloor \frac{N_{PRS}}{MGRP} \right\rfloor$  if  $N_{PRS} > MGRP$ , and  $N_{actual\_PRS} = N_{PRS}$  if  $N_{PRS} \leq (MGL-2)$ .

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.16.2.3.1-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|----------------------------------------------------------------------------|
|                                                                                                                                                                                                                                                                                                                                                   | <b>f1</b> Note1                                                            | <b>f1 and f2</b> Note2                                                     |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \geq -6 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -13 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{n}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.23 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.25.4.

If the intra-frequency handover occurs while intra-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the intra-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

$(T_{RSTD \text{ IntraFreqTDD, Cat\_M, HO}})$  shall be according to the following expression:

$$T_{RSTD \text{ IntraFreqTDD, Cat\_M, HO}} = T_{RSTD \text{ IntraFreqTDD, Cat\_M}} + K \times T_{PRS} + T_{HO} \quad \text{ms},$$

where:

$K$  is the number of times the intra-frequency handover occurs during  $T_{\text{RSTD IntraFreqTDD, Cat\_M, HO}}$ ,

$T_{\text{HO}}$  is the time during which the intra-frequency RSTD measurement may not be possible due to intra-frequency handover.

Furthermore, due to the intra-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

The intra-frequency requirements in this clause (8.16.2.3.2) shall apply for all TDD special subframe configurations specified in TS 36.211 [16] and for the TDD uplink-downlink configurations as specified in Table 8.16.2.3.2-2.

**Table 8.16.2.3.2-2: TDD uplink-downlink subframe configurations applicable for TDD intra-frequency requirements**

| PRS Transmission Bandwidth [RB]                                                      | Applicable TDD uplink-downlink configurations |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| 6,                                                                                   | 1, 2, 3, 4 and 5                              |
| 25                                                                                   | 0, 1, 2, 3, 4, 5 and 6                        |
| Note: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [16]. |                                               |

#### 8.16.2.3.2.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.4.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  defined in Clause 8.16.2.3.2.

#### 8.16.2.3.3 E-UTRAN HD-FDD Intra-Frequency OTDOA Measurements

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.16.2.3.1 also apply for this section except the reporting delay requirement provided the following conditions are met:

- all positioning subframes indicated in the OTDOA assistance data and specified in Section 9.1.25.4 are available for RSTD measurements in the measured and reference cells.

##### 8.16.2.3.3.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.4.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH

repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than measurement period defined in Clause 8.16.2.3.3.

#### 8.16.2.4 E-UTRAN OTDOA Inter-Frequency RSTD Measurements for Cat-M2 UE in CEModeA

All inter-frequency RSTD measurement requirements specified in Sections 8.16.2.4 shall apply, provided that

- the UE is capable of inter-frequency RSTD measurements for OTDOA [24], and
- either the measurement gap pattern ID # 0 specified in Clause 8.1.2.1 is used or the UE supports capability of conducting inter-frequency measurements without gaps.

All inter-frequency RSTD measurement requirements specified in Sections 8.16.2.4 shall apply without DRX as well as for any DRX and eDRX\_CONN cycles specified in TS 36.331 [2].

All positioning subframes indicated in the OTDOA assistance data and specified in sub-clause 9.1.25.1 are available for RSTD measurements in the measured and reference cell.

All the measurement requirements specified in Sections 8.16.2.4 shall apply provided that the UE is configured with the single PRS configuration for the reference cell and all the neighbour cells.

##### 8.16.2.4.1 E-UTRAN FDD Inter-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD InterFreqFDD, Cat\_M}}$  ms as given below (see also Figure 8.x1.2.3.1-1):

$$T_{\text{RSTD InterFreqFDD, Cat\_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \text{ ms},$$

where

$T_{\text{RSTD InterFreqFDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24]; if  $T_{\text{PRS}} < \text{MGRP}$ ,  $T_{\text{PRS}}$  equals to MGRP; MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1,

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355 [24];

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion and can be measured by UE within MGL; if  $\text{MGRP} \geq N_{\text{PRS}} > (\text{MGL} - 2\text{ms})$ ,  $N_{\text{actual\_PRS}}$  equals to  $(\text{MGL} - 2\text{ms})$ ; if  $N_{\text{PRS}} > \text{MGRP}$ ,  $N_{\text{actual\_PRS}}$  equals to

$$(\text{MGL} - 2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{\text{MGRP}} \right\rfloor;$$

$N_{\text{PRS\_total}}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.25.3.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |

|                                                                                                                                                                                                                                                                                                                                                   | <b>f1</b> Note1                                                            | <b>f1 and f2</b> Note2                                                     |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ InterFreqFDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \geq -6 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -13 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.21 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{RSTD \text{ InterFreqFDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.25.1.

If the inter-frequency handover occurs while inter-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the inter-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

$(T_{RSTD \text{ InterFreqFDD, Cat\_M, HO}})$  shall be according to the following expression:

$$T_{RSTD \text{ InterFreqFDD, Cat\_M, HO}} = T_{RSTD \text{ InterFreqFDD, Cat\_M}} + K \times T_{PRS} + T_{HO} \quad \text{ms},$$

where:

$K$  is the number of times the inter-frequency handover occurs during  $T_{\text{RSTD InterFreqFDD, Cat\_M, HO}}$ .

$T_{\text{HO}}$  is the time during which the inter-frequency RSTD measurement may not be possible due to inter-frequency handover.

Furthermore, due to the inter-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

#### 8.16.2.4.1.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.1.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  defined in Clause 8.16.2.4.1.

#### 8.16.2.4.2 E-UTRAN TDD Inter-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure inter-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  ms as given below:

$$T_{\text{RSTD InterFreqTDD, Cat\_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \quad \text{ms},$$

where

$T_{\text{RSTD InterFreqTDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24]; if  $T_{\text{PRS}} < \text{MGRP}$ ,  $T_{\text{PRS}}$  equals to MGRP; MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1,

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{\text{PRS}} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{\text{PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24];

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion and can be measured by UE within MGL; if  $\text{MGRP} \geq N_{\text{PRS}} > (\text{MGL} - 2\text{ms})$ ,  $N_{\text{actual\_PRS}}$  equals to  $(\text{MGL} - 2\text{ms})$ ; if  $N_{\text{PRS}} > \text{MGRP}$ ,  $N_{\text{actual\_PRS}}$  equals to

$$(\text{MGL} - 2) \cdot \left\lfloor \frac{N_{\text{PRS}}}{\text{MGRP}} \right\rfloor;$$

$N_{PRS\_total}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.25.3.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{RSTD\_InterFreqTDD, Cat\_M}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |

| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD\_InterFreqTDD, Cat\_M}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \geq -6 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -13 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.21 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{RSTD\_InterFreqTDD, Cat\_M}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.25.1.

If the inter-frequency handover occurs while inter-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the inter-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

$(T_{RSTD\_InterFreqTDD, Cat\_M, HO})$  shall be according to the following expression:

$$T_{RSTD\_InterFreqTDD, Cat\_M, HO} = T_{RSTD\_InterFreqTDD, Cat\_M} + K \times T_{PRS} + T_{HO} \quad ms,$$

where:

$K$  is the number of times the inter-frequency handover occurs during  $T_{\text{RSTD InterFreqTDD, Cat\_M, HO}}$ ,

$T_{\text{HO}}$  is the time during which the inter-frequency RSTD measurement may not be possible due to inter-frequency handover.

Furthermore, due to the inter-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

The inter-frequency requirements in this clause (8.16.2.4.2) shall apply for all TDD special subframe configurations specified in TS 36.211 [16] and for the TDD uplink-downlink configurations as specified in Table 8.16.2.4.2-2.

**Table 8.16.2.4.2-2: TDD uplink-downlink subframe configurations applicable for TDD inter-frequency requirements**

| PRS Transmission Bandwidth [RB]                                                      | Applicable TDD uplink-downlink configurations |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| 6                                                                                    | 1, 2, 3, 4 and 5                              |
| 24                                                                                   | 0, 1, 2, 3, 4, 5 and 6                        |
| Note: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [16]. |                                               |

#### 8.16.2.4.2.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.1.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  defined in Clause 8.16.2.4.2.

#### 8.16.2.4.3 E-UTRAN HD-FDD Inter-Frequency OTDOA Measurements

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.16.2.4.1 also apply for this section except reporting delay requirement provided the following conditions are met:

- all positioning subframes indicated in the OTDOA assistance data and specified in Section 9.1.25.1 are available for RSTD measurements in the measured and reference cells.

#### 8.16.2.4.3.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.1.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH.

This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than measurement period as defined in Clause 8.16.2.4.3.

### 8.16.3 Requirements for UE category M2 with CE mode B

#### 8.16.3.1 E-UTRAN OTDOA Intra-Frequency RSTD Measurements for Cat-M2 UE in CEModeB

All intra-frequency RSTD measurement requirements specified in Sections 8.16.3.1 shall apply without DRX as well as for any DRX and eDRX\_CONN cycles specified in TS 36.331 [2].

All the measurement requirements specified in Sections 8.16.3.1 shall apply provided that the UE is configured:

- with the single PRS configuration for the reference cell and all the neighbour cells and
- with the measurement gap pattern ID #0 specified in Clause 8.1.2.1 if the PRS bandwidth is less than the bandwidth of the cell used for the RSTD measurement in which case gaps are required.

##### 8.16.3.1.1 E-UTRAN FDD Intra-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$  ms as given below (see also Figure 8.16.3.1.1-1):

$$T_{RSTD \text{ IntraFreqFDD, Cat\_M}} = T_{PRS} \cdot (M - 1) + \Delta + T_{MIB} \text{ ms,}$$

where

$T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{PRS}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] for UE not configured with measurement gaps for intra-frequency RSTD. For UE configured with measurement gaps for intra-frequency RSTD measurements,  $T_{PRS} = \max(T_{PRS}, MGRP)$ , where MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1.

$M$  is the number of PRS positioning occasions as defined in Table 8.16.3.1.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{PRS} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{PRS}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355 [24],

$N_{actual\_PRS}$  is the cell-specific number of PRS subframes within a PRS occasion;  $N_{actual\_PRS} = N_{PRS}$  for UE not configured with measurement gaps for intra-frequency RSTD measurements; for UE configured with measurement gaps for intra-frequency RSTD measurements  $N_{actual\_PRS}$  is the number of PRS subframes which can be measured by UE within MGL, where  $N_{actual\_PRS} = (MGL-2)$  if  $MGRP \geq N_{PRS} > (MGL-2)$ ,  $N_{actual\_PRS} = (MGL-2) \cdot \left\lfloor \frac{N_{PRS}}{MGRP} \right\rfloor$  if  $N_{PRS} > MGRP$ , and  $N_{actual\_PRS} = N_{PRS}$  if  $N_{PRS} \leq (MGL-2)$ .

$N_{PRS\_total}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.25.5.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.16.3.1.1-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|----------------------------------------------------------------------------|
|                                                                                                                                                                                                                                                                                                                                                   | <b>f1</b> <small>Note1</small>                                             | <b>f1 and f2</b> <small>Note2</small>                                      |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \geq -15 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -15 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{n}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.23 for a corresponding Band

$\text{PRS } \hat{E}_s / \text{Iot}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{RSTD \text{ IntraFreqFDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE as illustrated in Figure 8.16.3.1.1-1.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.25.5.

If the intra-frequency handover occurs while intra-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the intra-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

$(T_{RSTD \text{ IntraFreqFDD, Cat\_M, HO}})$  shall be according to the following expression:

$$T_{RSTD \text{ IntraFreqFDD, Cat\_M, HO}} = T_{RSTD \text{ IntraFreqFDD, Cat\_M}} + K \times T_{PRS} + T_{HO} \quad ms,$$

where:

$K$  is the number of times the intra-frequency handover occurs during  $T_{\text{RSTD IntraFreqFDD, Cat\_M, HO}}$ .

$T_{\text{HO}}$  is the time during which the intra-frequency RSTD measurement may not be possible due to intra-frequency handover.

**Figure 8.16.3.1.1-1: Illustration of the RSTD reporting time requirement in an FDD system.**

Furthermore, due to the intra-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

#### 8.16.3.1.1.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.5.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  defined in Clause 8.16.3.1.1.

#### 8.16.3.1.2 E-UTRAN TDD Intra-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  ms as given below:

$$T_{\text{RSTD IntraFreqTDD, Cat\_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}},$$

where

$T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{\text{PRS}}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] for UE not configured with measurement gaps for intra-frequency RSTD. For UE configured with measurement gaps for intra-frequency RSTD measurements,  $T_{\text{PRS}} = \max(T_{\text{PRS}}, \text{MGRP})$ , where MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1.

$M$  is the number of PRS positioning occasions as defined in Table 8.16.3.1.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{PRS} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{PRS}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24],

$N_{actual\_PRS}$  is the cell-specific number of PRS subframes within a PRS occasion;  $N_{actual\_PRS} = N_{PRS}$  for UE not configured with measurement gaps for intra-frequency RSTD measurements; for UE configured with measurement gaps for intra-frequency RSTD measurements  $N_{actual\_PRS}$  is the number of PRS subframes which can be measured by UE within MGL, where  $N_{actual\_PRS} = (MGL-2)$  if  $MGRP \geq N_{PRS} > (MGL-2)$ ,  $N_{actual\_PRS} = (MGL-2) \cdot \left\lceil \frac{N_{PRS}}{MGRP} \right\rceil$  if  $N_{PRS} > MGRP$ , and  $N_{actual\_PRS} = N_{PRS}$  if  $N_{PRS} \leq (MGL-2)$ .

$N_{PRS\_total}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.25.5.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.16.3.1.2-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |

| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ IntraFreqTDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \geq -15 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -15 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{n}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.23 for a corresponding Band

$\text{PRS } \hat{E}_s / I_{\text{ot}}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.25.5.

If the intra-frequency handover occurs while intra-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the intra-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{\text{RSTD IntraFreqTDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{\text{RSTD IntraFreqTDD, Cat\_M, HO}} = T_{\text{RSTD IntraFreqTDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the intra-frequency handover occurs during  $T_{\text{RSTD IntraFreqTDD, Cat\_M, HO}}$ ,

$T_{\text{HO}}$  is the time during which the intra-frequency RSTD measurement may not be possible due to intra-frequency handover.

Furthermore, due to the intra-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

The intra-frequency requirements in this clause (8.16.3.1.2) shall apply for all TDD special subframe configurations specified in TS 36.211 [16] and for the TDD uplink-downlink configurations as specified in Table 8.16.3.1.2-2.

**Table 8.16.3.1.2-2: TDD uplink-downlink subframe configurations applicable for TDD intra-frequency requirements**

| PRS Transmission Bandwidth [RB]                                                      | Applicable TDD uplink-downlink configurations |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| 6                                                                                    | 1, 2, 3, 4 and 5                              |
| 25                                                                                   | 0, 1, 2, 3, 4, 5 and 6                        |
| Note: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [16]. |                                               |

#### 8.16.3.1.2.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.5.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqTDD, Cat\_M}}$  defined in Clause 8.16.3.1.2.

### 8.16.3.1.3 E-UTRAN HD-FDD Intra-Frequency OTDOA Measurements

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.16.3.1.1 also apply for this section except the reporting delay requirement provided the following conditions are met:

- all positioning subframes indicated in the OTDOA assistance data and specified in Section 9.1.25.5 are available for RSTD measurements in the measured and reference cells.

#### 8.16.3.1.3.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.5.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than measurement period defined in Clause 8.16.3.1.3.

### 8.16.3.2 E-UTRAN OTDOA Inter-Frequency RSTD Measurements for Cat-M2 UE in CEModeB

All inter-frequency RSTD measurement requirements specified in Sections 8.16.3.2 shall apply, provided that

- the UE is capable of inter-frequency RSTD measurements for OTDOA [24], and
- either the measurement gap pattern ID # 0 specified in Clause 8.1.2.1 is used or the UE supports capability of conducting inter-frequency measurements without gaps.

All inter-frequency RSTD measurement requirements specified in Sections 8.16.3.2 shall apply without DRX as well as for any DRX and eDRX\_CONN cycles specified in TS 36.331 [2].

All positioning subframes indicated in the OTDOA assistance data and specified in sub-clause 9.1.25.2 are available for RSTD measurements in the measured and reference cell.

All the measurement requirements specified in Sections 8.16.3.2 shall apply provided that the UE is configured with the single PRS configuration for the reference cell and all the neighbour cells.

#### 8.16.3.2.1 E-UTRAN FDD Inter-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure intra-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{RSTD \text{ InterFreqFDD, Cat\_M}}$  ms as given below (see also Figure 8.x1.2.3.1-1):

$$T_{RSTD \text{ InterFreqFDD, Cat\_M}} = T_{PRS} \cdot (M - 1) + \Delta + T_{MIB} \text{ ms,}$$

where

$T_{RSTD \text{ InterFreqFDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{PRS}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24]; if  $T_{PRS} < MGRP$ ,

$T_{PRS}$  equals to MGRP; MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1,

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{PRS} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{PRS}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355 [24];

$N_{actual\_PRS}$  is the cell-specific number of PRS subframes within a PRS occasion and can be measured by UE within MGL; if  $MGRP \geq N_{PRS} > (MGL-2ms)$ ,  $N_{actual\_PRS}$  equals to  $(MGL-2ms)$ ; if  $N_{PRS} > MGRP$ ,  $N_{actual\_PRS}$  equals to

$$(MGL - 2) \cdot \left\lceil \frac{N_{PRS}}{MGRP} \right\rceil;$$

$N_{PRS\_total}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.25.2.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{actual\_PRS}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{actual\_PRS}} \right\rceil$  is the largest among all the measured cells.

$T_{MIB}$  is the time required for acquiring the MIB information of the target cell.  $T_{MIB} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{RSTD \text{ IntraFreqFDD, Cat}_M}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                    |                                                                            |

| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{actual\_PRS}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                            |                                                                            |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{RSTD \text{ InterFreqFDD, Cat}_M}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \geq -15 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -15 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{ref} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP 1,2<sub>dBm</sub> according to Annex B.2.21 for a corresponding Band

$\text{PRS } \hat{E}_s / I_{\text{ot}}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD InterFreqFDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.25.2.

If the inter-frequency handover occurs while inter-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the inter-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{\text{RSTD InterFreqFDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{\text{RSTD InterFreqFDD, Cat\_M, HO}} = T_{\text{RSTD InterFreqFDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the inter-frequency handover occurs during  $T_{\text{RSTD InterFreqFDD, Cat\_M, HO}}$ .

$T_{\text{HO}}$  is the time during which the inter-frequency RSTD measurement may not be possible due to inter-frequency handover.

Furthermore, due to the inter-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

#### 8.16.3.2.1.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.2.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD IntraFreqFDD, Cat\_M}}$  defined in Clause 8.16.3.2.1.

#### 8.16.3.2.2 E-UTRAN TDD Inter-Frequency OTDOA Measurements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure inter-frequency RSTD, specified in TS 36.214 [4], for at least  $n=16$  cells, including the reference cell, on the same carrier frequency  $f_1$  as that of the reference cell within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  ms as given below:

$$T_{\text{RSTD InterFreqTDD, Cat\_M}} = T_{\text{PRS}} \cdot (M - 1) + \Delta + T_{\text{MIB}} \quad \text{ms},$$

where

$T_{\text{RSTD InterFreqTDD, Cat\_M}}$  is the total time for detecting and measuring at least  $n$  cells,

$T_{PRS}$  is the cell-specific positioning subframe configuration period as defined in TS 36.355 [24] ; if  $T_{PRS} < \text{MGRP}$ ,  $T_{PRS}$  equals to MGRP; MGRP is the Measurement Gap Repetition Period as defined in section 8.1.2.1,

$M$  is the number of PRS positioning occasions as defined in Table 8.13.2.3.1-1, where downlink positioning subframes defined in TS 36.211 [16], and

$\Delta = T_{PRS} \cdot \left\lceil \frac{n}{M} \right\rceil$  ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time,

$N_{PRS}$  is the cell-specific number of PRS subframes within a PRS occasion as defined in TS36.355[24];

$N_{\text{actual\_PRS}}$  is the cell-specific number of PRS subframes within a PRS occasion and can be measured by UE within MGL; if  $\text{MGRP} \geq N_{PRS} > (\text{MGL}-2\text{ms})$ ,  $N_{\text{actual\_PRS}}$  equals to  $(\text{MGL}-2\text{ms})$ ; if  $N_{PRS} > \text{MGRP}$ ,  $N_{\text{actual\_PRS}}$  equals to  $(\text{MGL} - 2) \cdot \left\lfloor \frac{N_{PRS}}{\text{MGRP}} \right\rfloor$ ;

$N_{PRS\_total}$  is the minimum number of PRS subframes per cell measurement as specified in Section 9.1.25.2.

$T_{PRS}$ ,  $N_{PRS}$ ,  $N_{\text{actual\_PRS}}$  and  $N_{PRS\_total}$  are the parameters of the same cell, for which  $T_{PRS} \cdot \left\lceil \frac{N_{PRS\_total}}{N_{\text{actual\_PRS}}} \right\rceil$  is the largest among all the measured cells.

$T_{\text{MIB}}$  is the time required for acquiring the MIB information of the target cell.  $T_{\text{MIB}} = 0$  if the SFN of at least one cell in OTDOA assistance data is known to the UE.

**Table 8.13.2.3.1-1: Number of PRS positioning occasions within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$**

| Positioning subframe configuration period $T_{PRS}$                                                                                                                                                                                                                                                                                               | Number of PRS positioning occasions $M$                                           |                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
|                                                                                                                                                                                                                                                                                                                                                   | f1 <sup>Note1</sup>                                                               | f1 and f2 <sup>Note2</sup>                                                        |
| 160 ms                                                                                                                                                                                                                                                                                                                                            | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{\text{actual\_PRS}}} \right\rceil$ | $32 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| >160 ms                                                                                                                                                                                                                                                                                                                                           | $8 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{\text{actual\_PRS}}} \right\rceil$  | $16 \cdot \left\lceil \frac{N_{PRS\_Total}}{N_{\text{actual\_PRS}}} \right\rceil$ |
| Note 1: When only intra-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1.<br>Note 2: When intra-frequency RSTD and inter-frequency RSTD measurements are performed over cells belonging to the serving FDD carrier frequency f1 and one inter-frequency carrier frequency f2, respectively. |                                                                                   |                                                                                   |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells  $i$  out of at least  $(n-1)$  neighbor cells within  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  provided:

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \geq -15 \text{ dB for all Frequency Bands for the reference cell,}$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \geq -15 \text{ dB for all Frequency Bands for neighbour cell } i,$$

$$\left( \text{PRS } \hat{E}_s / \text{Iot} \right)_{\text{ref}} \text{ and } \left( \text{PRS } \hat{E}_s / \text{Iot} \right)_i \text{ conditions apply for all subframes of at least } L = \frac{M}{2} \text{ PRS positioning occasions,}$$

PRP  $1,2|_{\text{dBm}}$  according to Annex B.2.21 for a corresponding Band

$\text{PRS } \hat{E}_s / I_{\text{ot}}$  is defined as the ratio of the average received energy per PRS RE during the useful part of the symbol to the average received power spectral density of the total noise and interference for this RE, where the ratio is measured over all REs which carry PRS.

The time  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells  $i$  shall be fulfilled according to the accuracy as specified in the sub-clause 9.1.25.2.

If the inter-frequency handover occurs while inter-frequency RSTD measurements are being performed then the UE shall complete the ongoing OTDOA measurement session. The UE shall also meet the inter-frequency OTDOA measurement and accuracy requirements. However in this case the RSTD measurement period

( $T_{\text{RSTD InterFreqTDD, Cat\_M, HO}}$ ) shall be according to the following expression:

$$T_{\text{RSTD InterFreqTDD, Cat\_M, HO}} = T_{\text{RSTD InterFreqTDD, Cat\_M}} + K \times T_{\text{PRS}} + T_{\text{HO}} \quad \text{ms},$$

where:

$K$  is the number of times the inter-frequency handover occurs during  $T_{\text{RSTD InterFreqTDD, Cat\_M, HO}}$ ,

$T_{\text{HO}}$  is the time during which the inter-frequency RSTD measurement may not be possible due to inter-frequency handover.

Furthermore, due to the inter-frequency handover the UE shall meet the RSTD measurement accuracy for a PRS bandwidth which is not larger than the minimum channel bandwidth of all the PCells during the RSTD measurement period.

The inter-frequency requirements in this clause (8.16.3.2.2) shall apply for all TDD special subframe configurations specified in TS 36.211 [16] and for the TDD uplink-downlink configurations as specified in Table 8.16.3.2.2-2.

**Table 8.16.3.2.2-2: TDD uplink-downlink subframe configurations applicable for TDD inter-frequency requirements**

| PRS Transmission Bandwidth [RB]                                                      | Applicable TDD uplink-downlink configurations |
|--------------------------------------------------------------------------------------|-----------------------------------------------|
| 6                                                                                    | 1, 2, 3, 4 and 5                              |
| 24                                                                                   | 0, 1, 2, 3, 4, 5 and 6                        |
| Note: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [16]. |                                               |

#### 8.16.3.2.2.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.2.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{\text{rep}} \times \text{TTI}_{\text{DCCH}}$ , where  $N_{\text{rep}}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times \text{TTI}_{\text{DCCH}}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than  $T_{\text{RSTD InterFreqTDD, Cat\_M}}$  defined in Clause 8.16.3.2.2.

### 8.16.3.2.3 E-UTRAN HD-FDD Inter-Frequency OTDOA Measurements

The requirements in this section are applicable for the UE which supports half duplex operation on one or more supported frequency bands [2].

The requirements defined in clause 8.16.3.2.1 also apply for this section except reporting delay requirement provided the following conditions are met:

- all positioning subframes indicated in the OTDOA assistance data and specified in Section 9.1.25.2 are available for RSTD measurements in the measured and reference cells.

#### 8.16.3.2.3.1 RSTD Measurement Reporting Delay

Reported measurement contained in event triggered measurement reports shall meet the requirements in sections 9.1.25.2.

The UE shall not send any measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between the point when UE receive both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message as specified in TS 36.355 [24], and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is:  $N_{rep} \times TTI_{DCCH}$ , where  $N_{rep}$  [21] is the maximum number of PUSCH repetitions configured for the UE, otherwise uncertainty is defined as  $2 \times TTI_{DCCH}$ . This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The measurement reporting delay shall be less than measurement period as defined in Clause 8.16.3.2.3.

## 8.17 Void

## 8.18 Measurements for non-BL/CE UE

### 8.18.1 Introduction

The non-BL/CE UE applicability of the requirements in subclause 8.18 is defined in Section 3.6.

### 8.18.2 Requirements for non-BL/CE UE with CE Mode B

#### 8.18.2.1 E-UTRAN intra frequency measurements

##### 8.18.2.1.1 E-UTRAN FDD intra frequency measurements with autonomous gaps for non-BL/CE with CE Mode B

The requirements defined in this subclause 8.18.2.1.4 apply provided the following condition is met:

- Tx diversity or transmission using multiple antennas are supported in the target cell to be detected.
- Repetitions of MIB/SIB1-BR are supported in the target cell to be detected.

##### 8.18.2.1.1.1 Identification of a new CGI of E-UTRA cell with autonomous gaps

No explicit neighbour list is provided to the UE for identifying a new CGI of E-UTRA cell. The UE shall identify and report the CGI when requested by the network for the purpose 'reportCGI'. The UE may make autonomous gaps in downlink reception and uplink transmission for receiving MIB and SIB1-BR message according to clause 5.5.3.1 of TS 36.331 [2]. Note that a UE is not required to use autonomous gap if si-RequestForHO is set to false. If autonomous gaps are used for measurement with the purpose of 'reportCGI', regardless of whether DRX or eDRX\_CONN is used or not, or whether SCell(s) are configured or not, the UE shall be able to identify a new CGI of E-UTRA cell within:

$$T_{\text{identify\_CGI\_non-BL/CE, intra}} = T_{\text{basic\_identify\_CGI\_non-BL/CE, intra}} \quad ms$$

Where

$T_{\text{basic\_identify\_CGI\_non-BL/CE, intra}} = 2640$  ms. This is the time period used in the above equation where the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell is defined, provided that the E-UTRA cell has been already identified by the UE.

A cell shall be considered identifiable following conditions are fulfilled:

- RSRP related side conditions given in Clause 9.1 are fulfilled for a corresponding Band,
- SCH<sub>RP</sub> and SCH  $\hat{E}_s/\text{lot}$  according to Annex B.2.14 for a corresponding Band

The MIB of an E-UTRA cell whose CGI is identified shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to [5].

The requirement for identifying a new CGI of an E-UTRA cell within  $T_{\text{basic\_identify\_CGI\_non-BL/CE, intra}}$  is applicable when no DRX is used as well as when any of DRX and eDRX\_CONN cycles specified in TS 36.331 [2] is used.

Within the time,  $T_{\text{identify\_CGI\_non-BL/CE, intra}}$  ms, over which the UE identifies the new CGI of E-UTRA cell, the PBCH repetition and SIB1-BR repetition level in the target cell shall be as specified in Table 8.18.2.1.1.1-1.

**Table 8.18.2.1.1.1-1: Conditions in target cell during  $T_{\text{basic\_identify\_CGI\_non-BL/CE, intra}}$**

| Target cell                 |                                           |                          |                    |
|-----------------------------|-------------------------------------------|--------------------------|--------------------|
| $\hat{E}_s/\text{lot}$ [dB] | PBCH repetition                           | SIB1-BR repetition level | SIB1-BR TBS [bits] |
| $\geq -15$                  | Configured as specified in TS 36.211 [16] | 16                       | 208                |

#### 8.18.2.1.1.2 ECGI Reporting Delay

The ECGI reporting delay occurs due to the delay uncertainty when inserting the ECGI measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH. In case DRX is used, the ECGI reporting may be delayed until the next DRX cycle. In case eDRX\_CONN is used, the ECGI reporting may be delayed until the next eDRX\_CONN cycle. If IDC autonomous denial is configured, an additional delay can be expected.

#### 8.18.2.1.2 E-UTRAN intra frequency measurements with autonomous gaps for HD-FDD non-BL/CE with CE Mode B

The requirements in this section are applicable for the UE which supports half duplex FDD operation on one or more supported frequency bands [2].

The requirements defined in this subclause 8.13.3.1.5 apply provided the following condition is met:

- Tx diversity or transmission using multiple antennas are supported in the target cell to be detected.
- Repetitions of MIB/SIB1-BR are supported in the target cell to be detected.

#### 8.18.2.1.2.1 Identification of a new CGI of E-UTRA cell with autonomous gaps

The CGI requirements defined in clause 8.18.2.1.1.1 also apply for this section.

#### 8.18.2.1.2.2 ECGI Reporting Delay

The ECGI reporting delay defined in clause 8.18.2.1.1.2 also apply for this section

#### 8.18.2.1.3 E-UTRAN TDD intra frequency measurements with autonomous gaps for non-BL/CE with CE Mode B

The requirements defined in this subclause 8.18.2.1.3 apply provided the following condition is met:

- Tx diversity or transmission using multiple antennas are supported in the target cell to be detected.
- Repetitions of MIB/SIB1-BR are supported in the target cell to be detected.

#### 8.18.2.1.3.1 Identification of a new CGI of E-UTRA cell with autonomous gaps

No explicit neighbour list is provided to the UE for identifying a new CGI of E-UTRA cell. The UE shall identify and report the CGI when requested by the network for the purpose 'reportCGI'. The UE may make autonomous gaps in

downlink reception and uplink transmission for receiving MIB and SIB1-BR messages according to clause 5.5.3.1 of TS 36.331 [2]. Note that a UE is not required to use autonomous gap if si-RequestForHO is set to false. If autonomous gaps are used for measurement with the purpose of 'reportCGI', regardless of whether DRX or eDRX\_CONN is used or not, or whether SCell(s) are configured or not, the UE shall be able to identify a new CGI of E-UTRA cell within:

$$T_{\text{identify\_CGI\_non-BL/CE, intra}} = T_{\text{basic\_identify\_CGI\_non-BL/CE, intra}} \text{ ms}$$

Where

$T_{\text{basic\_identify\_CGI\_non-BL/CE, intra}} = 2640$  ms. This is the time period used in the above equation where the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell is defined, provided that the E-UTRA cell has been already identified by the UE.

A cell shall be considered identifiable when the following conditions are fulfilled:

- RSRP related side conditions given in Clause 9.1 are fulfilled for a corresponding Band,
- SCH\_RP and SCH Ês/lot according to Annex B.2.14 for a corresponding Band

The MIB of an E-UTRA cell whose CGI is identified shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to [5].

The requirement for identifying a new CGI of an E-UTRA cell within  $T_{\text{basic\_identify\_CGI\_non-BL/CE, intra}}$  is applicable when no DRX is used as well as when any of the DRX or eDRX\_CONN cycles specified in TS 36.331 [2] is used.

Within the time,  $T_{\text{identify\_CGI\_non-BL/CE, intra}}$  ms, over which the UE identifies the new CGI of E-UTRA cell, the PBCH repetition and SIB1-BR repetition level in the target cell shall be as specified Table 8.18.2.1.3.1-1.

**Table 8.18.2.1.3.1-1: Conditions in target cell during  $T_{\text{basic\_identify\_CGI\_non-BL/CE, intra}}$**

| Target cell |                                                            |                          |                    |
|-------------|------------------------------------------------------------|--------------------------|--------------------|
| Ês/lot [dB] | PBCH repetition level                                      | SIB1-BR repetition level | SIB1-BR TBS [bits] |
| ≥ -15       | Configured with repetition, as specified in TS 36.211 [16] | 16                       | 208                |

#### 8.18.2.1.3.2 ECGI Reporting Delay

The ECGI reporting delay occurs due to the delay uncertainty when inserting the ECGI measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH. In case DRX is used, the ECGI reporting may be delayed until the next DRX cycle. In case eDRX\_CONN is used, the ECGI reporting may be delayed until the next eDRX\_CONN cycle. If IDC autonomous denial is configured, an additional delay can be expected.

## 9 Measurements performance requirements for UE

One of the key services provided by the physical layer is the measurements used to trigger or perform a multitude of functions. Both the UE and the E-UTRAN are required to perform measurements. The physical layer measurement model and a complete list of measurements are specified in [25] and [22] respectively. The physical layer measurements are described and defined in [4]. In this clause for each measurement the relevant requirements on the measurement period, reporting range, granularity and performance in terms of accuracy are specified.

Since the UE reference sensitivity requirements are different depending on supported band, this is noted in each case with definition of the range  $I_o$  for each frequency band. Definitions of each frequency bands can be found in [5].

Except for requirements in sections 9.1.2A, 9.1.3A, 9.1.5A and 9.1.6A, the accuracy requirements in this clause are applicable for AWGN radio propagation conditions and assume independent interference (noise) at each receiver antenna port.

### 9.1 E-UTRAN measurements

#### 9.1.1 Introduction

The requirements in this clause are applicable for a UE:

- in state RRC\_CONNECTED
- performing measurements with appropriate measurement gaps as defined in Clause 8.1.2.1.
- that is synchronised to the cell that is measured.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in [25].

The accuracy requirements in this clause are valid for the reported measurement result after layer 1 filtering. The accuracy requirements are verified from the measurement report at point D in the measurement model having the higher layer filtering disabled.

In the requirements of Section 9 for the UE capable of CA and the UEs configured with up to four downlink SCell(s), the applicable exceptions for side conditions are specified in Annex B, Sections B.4.2 and B.4.3, respectively.

## 9.1.2 Intra-frequency RSRP Accuracy Requirements

### 9.1.2.1 Absolute RSRP Accuracy

Unless otherwise specified, the requirements for absolute accuracy of RSRP in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Table 9.1.2.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

**Table 9.1.2.1-1: RSRP Intra frequency absolute accuracy**

| Accuracy         |                   | Conditions |                                                                                    |                             |                           |                           |

| ±8               | ±11               | ≥-6 dB     | FDD_A, TDD_A, FDD_B, FDD_C, TDD_C, FDD_D, FDD_E, TDD_E, FDD_F, FDD_G, FDD_H, FDD_N | N/A                         | -70                       | -50                       |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.

NOTE 2: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.

NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.2.2 Relative Accuracy of RSRP

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on the same frequency.

The accuracy requirements in Table 9.1.2.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2}|_{dBm}$  according to Annex B.3.8 for a corresponding Band.

**Table 9.1.2.2-1: RSRP Intra frequency relative accuracy**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                   | Conditions                       |                                                |                             |                           |

### 9.1.2.3 Absolute RSRP Accuracy under Time Domain Measurement Resource Restriction

The requirements for absolute accuracy of RSRP in this clause shall apply to a cell on the same frequency as that of the serving cell when a time domain measurement resource restriction pattern for performing RSRP measurements on this cell is configured by higher layers (TS 36.331 [2]).

The accuracy requirements in Table 9.1.2.3-1 are valid under the following conditions:

Cell specific reference signals in the measured cell are transmitted either from one, two or four antenna ports,

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled,

$RSRP|_{dBm}$  according to Annex B.3.9 for a corresponding Band,

The time domain measurement resource restriction pattern configured for the measured cell indicates at least one subframe per radio frame for performing the RSRP measurement,

Four symbols containing CRS are available in all subframes indicated by the time domain measurement resource restriction pattern.

**Table 9.1.2.3-1: RSRP Intra frequency absolute accuracy under time domain measurement resource restriction**

| Accuracy                                                                                                                                                                                                                                                                                                                         |                   | Conditions |                                                                                    |                                    |                           |                           |

| NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in that symbol.                                                                                                                                                                                                                             |                   |            |                                                                                    |                                    |                           |                           |
| NOTE 2: Io is defined in subframes indicated by the time domain measurement resource restriction pattern configured for performing RSRP measurements of this cell. The Io range defined by the minimum and the maximum Io levels applies to CRS and non-CRS symbols. Io may be different in different symbols within a subframe. |                   |            |                                                                                    |                                    |                           |                           |
| NOTE 3: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.                                                                                                                                                                                                                      |                   |            |                                                                                    |                                    |                           |                           |
| NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                                                                                                                              |                   |            |                                                                                    |                                    |                           |                           |

For time domain measurements restriction under colliding CRS with ABS configured in non-MBSFN subframes, requirements in Section 9.1.2.1 apply.

#### 9.1.2.4 Relative Accuracy of RSRP under Time Domain Measurement Resource Restriction

The requirements for relative accuracy of RSRP in this clause shall apply to a cell on the same frequency as that of the serving cell when a time domain measurement resource restriction pattern for performing RSRP measurements for this cell is configured by higher layers (TS 36.331 [2]).

The accuracy requirements in Table 9.1.2.4-1 are valid under the following conditions:

Cell specific reference signals in the measured cell are transmitted either from one, two or four antenna ports,

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled,

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.10 for a corresponding Band,

The time domain measurement resource restriction pattern configured for the measured cell indicates at least one subframe per radio frame for performing the RSRP measurement,

Four symbols containing CRS are available in all subframes indicated by the time domain measurement resource restriction pattern.

**Table 9.1.2.4-1: RSRP Intra frequency relative accuracy under time domain measurement resource restriction**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                   | Conditions                       |                                                |                                    |                           |

The <math>l_o</math> range defined by the minimum and the maximum <math>l_o</math> levels applies to CRS and non-CRS symbols. <math>l_o</math> may be different in different symbols within a subframe.</p> <p>NOTE 4: The same bands and the same <math>l_o</math> conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.</p> <p>NOTE 5: The condition level is increased by <math>\Delta &gt; 0</math>, when applicable, as described in Sections B.4.2 and B.4.3.</p> <p>NOTE 6: E-UTRA operating band groups are as defined in Section 3.5.</p> |                   |                                  |                                                |                                    |                           |

For time domain measurements restriction under colliding CRS with ABS configured in non-MBSFN subframes, requirements in Section 9.1.2.2 apply.

### 9.1.2.5 Absolute RSRP Accuracy under Time Domain Measurement Resource Restriction with CRS assistance information

The requirements for absolute accuracy of RSRP in this clause shall apply to a cell on the same frequency as that of the serving cell when a time domain measurement resource restriction pattern for performing RSRP measurements on this cell is configured by higher layers (TS 36.331 [2]) and the CRS assistance information is provided. The requirements apply for UEs supporting CRS interference handling.

The accuracy requirements in Table 9.1.2.5-1 are valid under the following conditions:

Cell specific reference signals in the measured cell are transmitted either from one, two or four antenna ports,

Conditions defined in 36.101 Section 7.3 for reference sensitivity are fulfilled,

$RSRP_{dBm}$  according to Annex B.3.11 for a corresponding Band,

The time domain measurement resource restriction pattern configured for the measured cell indicates at least one subframe per radio frame for performing the RSRP measurement,

Four symbols containing CRS are available in all subframes indicated by the time domain measurement resource restriction pattern,

The UE is provided with the CRS assistance information (TS 36.331 [2]) and the CRS assistance information is valid throughout the entire evaluation period.

The requirements in this section shall also be met when the number of transmit antenna ports [16] of one or more cells whose CRS assistance information is provided [2] is different from the number of transmit antenna ports of the measured cell.

**Table 9.1.2.5-1: RSRP Intra frequency absolute accuracy under Time Domain Measurement Resource Restriction with CRS assistance information**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                   | Conditions             |                                                                                    |                                              |                                         |                                         |

| NOTE 1: This Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.<br>NOTE 2: Io is defined in subframes indicated by the time domain measurement resource restriction pattern configured for performing RSRP measurements of this cell. The specified Io range applies to CRS and non-CRS symbols. Io may be different in different symbols within a subframe.<br>NOTE 3: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 4: E-UTRA operating band groups are as defined in Section 3.5. |                   |                        |                                                                                    |                                              |                                         |                                         |

### 9.1.2.6 Relative Accuracy of RSRP under Time Domain Measurement Resource Restriction with CRS assistance information

The requirements for relative accuracy of RSRP in this clause shall apply to a cell on the same frequency as that of the serving cell when a time domain measurement resource restriction pattern for performing RSRP measurements for this cell is configured by higher layers (TS 36.331 [2]) and the CRS assistance information is provided. The requirements apply for UEs supporting CRS interference handling.

The accuracy requirements in Table 9.1.2.6-1 are valid under the following conditions:

Cell specific reference signals in the measured cell are transmitted either from one, two or four antenna ports,

Conditions defined in 36.101 Section 7.3 for reference sensitivity are fulfilled,

$\text{RSRP}_{1,2|\text{dBm}}$  according to Annex B.3.12 for a corresponding Band,

The time domain measurement resource restriction pattern configured for the measured cell indicates at least one subframe per radio frame for performing the RSRP measurement,

Four symbols containing CRS are available in all subframes indicated by the time domain measurement resource restriction pattern,

The UE is provided with the CRS assistance information (TS 36.331 [2]) and the CRS assistance information is valid throughout the entire evaluation period.

The requirements in this section shall also be met also when the number of transmit antenna ports [16] of one or more cells whose CRS assistance information is provided [2] is different from the number of transmit antenna ports of the measured cell.

**Table 9.1.2.6-1: RSRP Intra frequency relative accuracy under Time Domain Measurement Resource Restriction with CRS assistance information**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                   | Conditions                          |                                                |                                |                           |

### 9.1.2.7 Absolute RSRP Accuracy for UE Category 1bis

Unless otherwise specified, the requirements for absolute accuracy of RSRP in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Table 9.1.2.7-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

**Table 9.1.2.7-1: RSRP Intra frequency absolute accuracy for UE category 1bis**

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.2.8 Relative Accuracy of RSRP for UE Category 1bis

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on the same frequency.

The accuracy requirements in Table 9.1.2.8-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.8 for a corresponding Band.

**Table 9.1.2.8-1: RSRP Intra frequency relative accuracy for UE category 1bis**

| Accuracy         |                   | Conditions                               |                                                |                             |                           |

|                  |                   |                                          | FDD_F                                          | -118.5                      | -50                       |
|                  |                   |                                          | FDD_G                                          | -118                        | -50                       |
|                  |                   |                                          | FDD_H                                          | -117.5                      | -50                       |
|                  |                   |                                          | FDD_N                                          | -114.5                      | -50                       |
| $\pm 4$          | $\pm 4$           | $\geq -6$ dB                             | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}_s/\text{lot}$  is the minimum  $\hat{E}_s/\text{lot}$  of the pair of cells to which the requirement applies.  
NOTE 3: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

## 9.1.2A Intra-frequency RSRP Accuracy Requirements in High Doppler Conditions

The accuracy requirements in this clause are applicable for EVA300 and EVA600 propagation conditions and assume independent interference (noise) at each receiver antenna port. The accuracy requirements in this clause are also applicable for EVA875 and HST875 propagation conditions when *highSpeedEnhancedMeasFlag* is configured and assume independent interference (noise) at each receiver antenna port.

### 9.1.2A.1 Absolute RSRP Accuracy in high Doppler conditions

The requirements for absolute accuracy of RSRP in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Table 9.1.2A.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

**Table 9.1.2A1-1: RSRP Intra frequency absolute accuracy**

| Accuracy         |                   | Conditions             |                                                                                    |                                             |                                         |                                         |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.2A.2 Relative Accuracy of RSRP in high Doppler conditions

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on the same frequency.

The accuracy requirements in Table 9.1.2A.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub>[dBm] according to Annex B.3.8 for a corresponding Band.

Table 9.1.2A.2-1: RSRP Intra frequency relative accuracy

| Accuracy         |                   | Conditions                       |                                                |                             |                           |

|                  |                   |                                  | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}s/lot$  is the minimum  $\hat{E}s/lot$  of the pair of cells to which the requirement applies.  
NOTE 3: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

## 9.1.3 Inter-frequency RSRP Accuracy Requirements

### 9.1.3.1 Absolute RSRP Accuracy

The requirements for absolute accuracy of RSRP in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.3.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.3 for a corresponding Band

Table 9.1.3.1-1: RSRP Inter frequency absolute accuracy

| Accuracy         |                   | Conditions     |                                                                                    |                             |                           |                           |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.3.2 Relative Accuracy of RSRP

The relative accuracy of RSRP in inter frequency case is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.3.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.4 for a corresponding Band

$$\left| RSRP1_{dBm} - RSRP2_{dBm} \right| \leq 27dB$$

$$| \text{Channel 1}_{Io} - \text{Channel 2}_{Io} | \leq 20 \text{ dB}$$

**Table 9.1.3.2-1: RSRP Inter frequency relative accuracy**

| Accuracy                                                                                                                  |                   | Conditions                       |                                                |                             |                           |

|                                                                                                                           |                   |                                  | FDD_G                                          | -118                        | -50                       |
|                                                                                                                           |                   |                                  | FDD_H                                          | -117.5                      | -50                       |
|                                                                                                                           |                   |                                  | FDD_N                                          | -114.5                      | -50                       |
| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth.                                                      |                   |                                  |                                                |                             |                           |
| NOTE 2: The parameter $\hat{E}s/Iot$ is the minimum $\hat{E}s/Iot$ of the pair of cells to which the requirement applies. |                   |                                  |                                                |                             |                           |
| NOTE 3: The condition level is increased by $\Delta>0$ , when applicable, as described in Sections B.4.2 and B.4.3.       |                   |                                  |                                                |                             |                           |
| NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.                                                       |                   |                                  |                                                |                             |                           |

### 9.1.3.3 Absolute RSRP Accuracy for UE Category 1bis

The requirements for absolute accuracy of RSRP in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.3.3-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>dBm</sub> according to Annex B.3.3 for a corresponding Band

**Table 9.1.3.3-1: RSRP Inter frequency absolute accuracy for UE category 1bis**

| Accuracy         |                   | Conditions     |                                                                                    |                             |                           |                           |
|------------------|-------------------|----------------|------------------------------------------------------------------------------------|-----------------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$ | $I_o$ <sup>Note 1</sup> range                                                      |                             |                           |                           |

|                  |                   |                | FDD_G                                                                              | -118                        | N/A                       | -70                       |
|                  |                   |                | FDD_H                                                                              | -117.5                      | N/A                       | -70                       |
|                  |                   |                | FDD_N                                                                              | -114.5                      | N/A                       | -70                       |
| ±9               | ±12               | ≥-6 dB         | FDD_A, TDD_A, FDD_B, FDD_C, TDD_C, FDD_D, FDD_E, TDD_E, FDD_F, FDD_G, FDD_H, FDD_N | N/A                         | -70                       | -50                       |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.3.4 Relative Accuracy of RSRP for UE Category 1bis

The relative accuracy of RSRP in inter frequency case is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.3.4-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.4 for a corresponding Band

$$\left| RSRP1_{dBm} - RSRP2_{dBm} \right| \leq 27dB$$

$$| \text{Channel 1}_I_o - \text{Channel 2}_I_o | \leq 20 \text{ dB}$$

**Table 9.1.3.4-1: RSRP Inter frequency relative accuracy for UE category 1bis**

| Accuracy         |                   | Conditions                       |                                                |                             |                           |
|------------------|-------------------|----------------------------------|------------------------------------------------|-----------------------------|---------------------------|

|                  |                   |                                  | E-UTRA operating band groups <sup>Note 4</sup> | Minimum $I_o$               | Maximum $I_o$             |
| dB               | dB                | dB                               |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| ±5.5             | ±7                | ≥-6 dB                           | FDD_A, TDD_A                                   | -121                        | -50                       |
|                  |                   |                                  | FDD_B                                          | -120.5                      | -50                       |
|                  |                   |                                  | FDD_C, TDD_C                                   | -120                        | -50                       |
|                  |                   |                                  | FDD_D                                          | -119.5                      | -50                       |
|                  |                   |                                  | FDD_E, TDD_E                                   | -119                        | -50                       |
|                  |                   |                                  | FDD_F                                          | -118.5                      | -50                       |
|                  |                   |                                  | FDD_G                                          | -118                        | -50                       |
|                  |                   |                                  | FDD_H                                          | -117.5                      | -50                       |
|                  |                   |                                  | FDD_N                                          | -114.5                      | -50                       |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}s/lot$  is the minimum  $\hat{E}s/lot$  of the pair of cells to which the requirement applies.  
NOTE 3: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.3A Inter-frequency RSRP Accuracy Requirements in High Doppler Conditions

The accuracy requirements in this clause are applicable for [EVA300 and EVA600] propagation conditions and assume independent interference (noise) at each receiver antenna port.

#### 9.1.3A.1 Absolute RSRP Accuracy in high Doppler conditions

The requirements for absolute accuracy of RSRP in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.3A.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>dBm</sub> according to Annex B.3.3 for a corresponding Band

**Table 9.1.3A.1-1: RSRP Inter frequency absolute accuracy**

| Accuracy         |                   | Conditions |                                                                                    |                             |                           |                           |

NOTE 1: I<sub>o</sub> is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.  
 NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

#### 9.1.3A.2 Relative Accuracy of RSRP in high Doppler conditions

The relative accuracy of RSRP in inter frequency case is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.3A.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.4 for a corresponding Band

$$\left| RSRP1 \Big|_{dBm} - RSRP2 \Big|_{dBm} \right| \leq 27dB$$

$$| \text{Channel 1\_Io} - \text{Channel 2\_Io} | \leq 20 \text{ dB}$$

Table 9.1.3A.2-1: RSRP Inter frequency relative accuracy

| Accuracy                                                                                                                  |                   | Conditions                       |                                                |                             |                           |

| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth.                                                      |                   |                                  |                                                |                             |                           |
| NOTE 2: The parameter $\hat{E}s/lot$ is the minimum $\hat{E}s/lot$ of the pair of cells to which the requirement applies. |                   |                                  |                                                |                             |                           |
| NOTE 3: The condition level is increased by $\Delta>0$ , when applicable, as described in Sections B.4.2 and B.4.3.       |                   |                                  |                                                |                             |                           |
| NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.                                                       |                   |                                  |                                                |                             |                           |

## 9.1.4 RSRP Measurement Report Mapping

The reporting range of RSRP is defined from -156 dBm to -44 dBm with 1 dB resolution.

The mapping of measured quantity is defined in Table 9.1.4-1. The range in the signalling may be larger than the guaranteed accuracy range.

Table 9.1.4-1: RSRP measurement report mapping

| Reported value | Measured quantity value | Unit |
|----------------|-------------------------|------|
| RSRP_-17       | RSRP < -156             | dBm  |
| RSRP_-16       | -156 ≤ RSRP < -155      | dBm  |
| ...            | ...                     | ...  |
| RSRP_-03       | -143 ≤ RSRP < -142      | dBm  |
| RSRP_-02       | -142 ≤ RSRP < -141      | dBm  |
| RSRP_-01       | -141 ≤ RSRP < -140      | dBm  |
| RSRP_00        | RSRP < -140             | dBm  |
| RSRP_01        | -140 ≤ RSRP < -139      | dBm  |
| RSRP_02        | -139 ≤ RSRP < -138      | dBm  |
| ...            | ...                     | ...  |
| RSRP_95        | -46 ≤ RSRP < -45        | dBm  |
| RSRP_96        | -45 ≤ RSRP < -44        | dBm  |
| RSRP_97        | -44 ≤ RSRP              | dBm  |

## 9.1.5 Intra-frequency RSRQ Accuracy Requirements

### 9.1.5.1 Absolute RSRQ Accuracy

The requirements for absolute accuracy of RSRQ in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Table 9.1.5.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP|dBm according to Annex B.3.1 for a corresponding Band

Table 9.1.5.1-1: RSRQ Intra frequency absolute accuracy

| Accuracy                                                                                                                                             |                   | Conditions         |                                                |                             |                           |

| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth.                                                                                 |                   |                    |                                                |                             |                           |
| NOTE 2: The same bands and the same $I_o$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement. |                   |                    |                                                |                             |                           |
| NOTE 3: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.                                |                   |                    |                                                |                             |                           |
| NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.                                                                                  |                   |                    |                                                |                             |                           |

### 9.1.5.2 Absolute RSRQ Accuracy under Time Domain Measurement Resource Restriction

The requirements for absolute accuracy of RSRQ in this clause shall apply to a cell on the same frequency as that of the serving cell when a time domain measurement resource restriction pattern for performing RSRQ measurements of this cell is configured by higher layers (TS 36.331 [2]).

The accuracy requirements in Table 9.1.5.2-1 are valid under the following conditions:

Cell specific reference signals in the measured cell are transmitted either from one, two or four antenna ports,

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled,

$RSRP_{dBm}$  according to Annex B.3.9 for a corresponding Band,

The time domain measurement resource restriction pattern configured for the measured cell indicates at least one subframe per radio frame for performing the RSRQ measurement,

The RSRQ measurement is not performed in any subframe other than those indicated by the time domain measurement resource restriction pattern configured for the measured cell,

Four symbols containing CRS are available in all subframes indicated by the time domain measurement resource restriction pattern.

**Table 9.1.5.2-1: RSRQ Intra frequency absolute accuracy under time domain measurement resource restriction**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                   | Conditions             |                                                |                                    |                           |

| <p>NOTE 1: This minimum <math>I_o</math> condition is expressed as the average <math>I_o</math> per RE over all REs in that symbol.</p> <p>NOTE 2: <math>I_o</math> is defined in subframes indicated by the time domain measurement resource restriction pattern configured for performing RSRQ measurements of this cell. The <math>I_o</math> range defined by the minimum and the maximum <math>I_o</math> levels applies to CRS and non-CRS symbols. <math>I_o</math> may be different in different symbols within a subframe.</p> <p>NOTE 3: The same bands and the same <math>I_o</math> conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.</p> <p>NOTE 4: The condition level is increased by <math>\Delta &gt; 0</math>, when applicable, as described in Sections B.4.2 and B.4.3.</p> <p>NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.</p> |                   |                        |                                                |                                    |                           |

For time domain measurements restriction under colliding CRS with ABS configured in non-MBSFN subframes, requirements in Section 9.1.5.1 apply.

### 9.1.5.3 Absolute RSRQ Accuracy under Time Domain Measurement Resource Restriction with CRS assistance information

The requirements for absolute accuracy of RSRQ in this section shall apply to a cell on the same frequency as that of the serving cell when a time domain measurement resource restriction pattern for performing RSRQ measurements of this cell is configured by higher layers (TS 36.331 [2]) and the CRS assistance information is provided. The requirements apply for UEs supporting CRS interference handling.

The accuracy requirements in Table 9.1.5.3-1 are valid under the following conditions:

Cell specific reference signals in the measured cell are transmitted either from one, two or four antenna ports,

Conditions defined in 36.101 Section 7.3 for reference sensitivity are fulfilled,

$RSRP|_{dBm}$  according to Annex B.3.11 for a corresponding Band,

The time domain measurement resource restriction pattern configured for the measured cell indicates at least one subframe per radio frame for performing the RSRQ measurement,

The RSRQ measurement is not performed in any subframe other than those indicated by the time domain measurement resource restriction pattern configured for the measured cell,

Four symbols containing CRS are available in all subframes indicated by the time domain measurement resource restriction pattern,

The UE is provided with the CRS assistance information (TS 36.331 [2]) and the CRS assistance information is valid throughout the entire evaluation period.

The requirements in this section shall also be met when the number of transmit antenna ports [16] of one or more cells whose CRS assistance information is provided [2] is different from the number of transmit antenna ports of the measured cell.

**Table 9.1.5.3-1: RSRQ Intra frequency absolute accuracy under Time Domain Measurement Resource Restriction with CRS assistance information**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                   | Conditions                       |                                                |                                  |                    |

| <p>NOTE 1: This <math>Io</math> condition is expressed as the average <math>Io</math> per RE over all REs in that symbol.</p> <p>NOTE 2: <math>Io</math> is defined in subframes indicated by the time domain measurement resource restriction pattern configured for performing RSRQ measurements of this cell. The specified <math>Io</math> range applies to CRS and non-CRS symbols. <math>Io</math> may be different in different symbols within a subframe.</p> <p>NOTE 3: The same bands and the same <math>Io</math> conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.</p> <p>NOTE 4: The condition level is increased by <math>\Delta &gt; 0</math>, when applicable, as described in Sections B.4.2 and B.4.3.</p> <p>NOTE 5: The gap between the <math>\hat{E}s/lot</math> level in table 9.1.5.3-1 and 9.1.5.2-1 is due to the interference from either PCell or at least one neighbour cell indicated within the CRS assistance information.</p> <p>NOTE 6: E-UTRA operating band groups are as defined in Section 3.5.</p> |                   |                                  |                                                |                                  |                    |

#### 9.1.5.4 Absolute WB-RSRQ Accuracy

The requirements in this section shall apply when the measurement configuration message received by the UE contains *widebandRSRQ-Meas* parameter in TS 36.331 [2]. The WB-RSRQ accuracy figures in Table 9.1.5.4-1 are relative to the value that would be obtained by using the *AllowedMeasBandwidth* in TS 36.331 [2].

The accuracy requirements in Table 9.1.5.4-1 are valid under the following conditions:

The value of the parameter, *AllowedMeasBandwidth* in TS 36.331 [2], is 50 resource blocks or larger

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in TS 36.101 [5] Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band.

Table 9.1.5.4-1: WB-RSRQ Intra frequency absolute accuracy

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                   | Conditions               |                     |                                        |                        |                           |

### 9.1.5.5 Absolute RSRQ Accuracy for UE Category 1bis

The requirements for absolute accuracy of RSRQ in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Table 9.1.5.5-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

Table 9.1.5.5-1: RSRQ Intra frequency absolute accuracy for UE category 1bis

## 9.1.5A Intra-frequency RSRQ Accuracy Requirements in High Doppler Conditions

The accuracy requirements in this clause are applicable for EVA300 and EVA600 propagation conditions and assume independent interference (noise) at each receiver antenna port. The accuracy requirements in this clause are also applicable for EVA875 and HST875 propagation conditions when *highSpeedEnhancedMeasFlag* is configured and assume independent interference (noise) at each receiver antenna port.

### 9.1.5A.1 Absolute RSRQ Accuracy in high Doppler conditions

The requirements for absolute accuracy of RSRQ in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Table 9.1.5A.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

**Table 9.1.5A.1-1: RSRQ Intra frequency absolute accuracy**

| Accuracy                                                                                                                                                      |                   | Conditions |                                                |                             |                           |

## 9.1.6 Inter-frequency RSRQ Accuracy Requirements

### 9.1.6.1 Absolute RSRQ Accuracy

The requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.6.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.3 for a corresponding Band

Table 9.1.6.1-1: RSRQ Inter frequency absolute accuracy

|                  |                   |                | FDD_H                                          | -117.5                      | -50                       |
| $\pm 3.5$        | $\pm 4$           | $\geq -6$ dB   | FDD_N                                          | -114.5                      | -50                       |
|                  |                   |                | Note 2                                         | Note 2                      | Note 2                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.6.2 Relative Accuracy of RSRQ

The relative accuracy of RSRQ in inter frequency case is defined as the RSRQ measured from one cell compared to the RSRQ measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.6.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2,dBm}$  according to Annex B.3.4 for a corresponding Band

$$\left| RSRP1_{dBm} - RSRP2_{dBm} \right| \leq 27dB$$

$$| \text{Channel } 1_{Io} - \text{Channel } 2_{Io} | \leq 20 \text{ dB}$$

Table 9.1.6.2-1: RSRQ Inter frequency relative accuracy

| Accuracy         |                   | Conditions                       |                                                |                             |                           |

|                  |                   |                                  | FDD_E, TDD_E                                   | -119                        | -50                       |
|                  |                   |                                  | FDD_F                                          | -118.5                      | -50                       |
|                  |                   |                                  | FDD_G                                          | -118                        | -50                       |
|                  |                   |                                  | FDD_H                                          | -117.5                      | -50                       |
| $\pm 4$          | $\pm 4$           | $\geq -6$ dB                     | FDD_N                                          | -114.5                      | -50                       |
|                  |                   |                                  | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}s/lot$  is the minimum  $\hat{E}s/lot$  of the pair of cells to which the requirement applies.  
NOTE 3: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.6.3 Absolute WB-RSRQ Accuracy

The requirements in this section shall apply when the measurement configuration message received by the UE contains *widebandRSRQ-Meas* parameter in TS 36.331 [2]. The WB-RSRQ accuracy figures in Table 9.1.6.3-1 are relative to the value that would be obtained by using the *AllowedMeasBandwidth* in TS 36.331 [2].

The accuracy requirements in Table 9.1.6.3-1 are valid under the following conditions:

The value of the parameter, *AllowedMeasBandwidth* in TS 36.331 [2], is 50 resource blocks or larger

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in TS 36.101 [5] Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>dBm</sub> according to Annex B.3.1 for a corresponding Band.

**Table 9.1.6.3-1: WB-RSRQ Inter frequency absolute accuracy**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                   | Conditions                   |                           |                                        |                         |                           |

| NOTE 1: $I_o$ is the average across all the resource blocks within the <i>AllowedMeasBandwidth</i> in TS 36.331 [2].<br>NOTE 2: $I_{o1}$ is the $I_o$ level in the resource blocks other than central 6 resource blocks within the <i>AllowedMeasBandwidth</i> in TS 36.331 [2] and $I_{o2}$ is the $I_o$ level in central 6 resource blocks. The $I_{o1}$ and $I_{o2}$ have the same range as defined for $I_o$ .<br>NOTE 3: $I_{ot}$ is the received power spectrum density of total interference and noise for all the resource blocks, other than central 6 resource blocks.<br>NOTE 4: The same bands and the same $I_o$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 5: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 6: E-UTRA operating band groups are as defined in Section 3.5. |                   |                              |                           |                                        |                         |                           |

### 9.1.6.4 Relative WB-RSRQ Accuracy

The requirements in this section shall apply when the measurement configuration message received by the UE contains *widebandRSRQ-Meas* parameter in TS 36.331 [2]. The WB-RSRQ accuracy figures in Table 9.1.6.4-1 are relative to the value that would be obtained by using the *AllowedMeasBandwidth* in TS 36.331 [2].

The accuracy requirements in Table 9.1.6.4-1 are valid under the following conditions:

The value of the parameter, *AllowedMeasBandwidth* in TS 36.331 [2], is 50 resource blocks or larger for the measured cells from different frequencies

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in TS 36.101 [5] Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.4 for a corresponding Band

$$\left| RSRP1_{dBm} - RSRP2_{dBm} \right| \leq 27 dB$$

$$| \text{Channel 1}_{I_o} - \text{Channel 2}_{I_o} | \leq 20 \text{ dB}$$

Table 9.1.6.4-1: WB-RSRQ Inter frequency relative accuracy

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                   | Conditions               |                     |                                        |                        |                           |

| NOTE 1: $lo$ is the average across all the resource blocks within the <i>AllowedMeasBandwidth</i> in TS 36.331 [2].<br>NOTE 2: $lo1$ is the $lo$ level in the resource blocks other than central 6 resource blocks within the <i>AllowedMeasBandwidth</i> in TS 36.331 [2] and $lo2$ is the $lo$ level in central 6 resource blocks. The $lo1$ and $lo2$ have the same range as defined for $lo$ .<br>NOTE 3: $lot$ is the received power spectrum density of total interference and noise for all the resource blocks, other than central 6 resource blocks. The parameter $\hat{E}s/lot$ is the minimum $\hat{E}s/lot$ of the pair of cells to which the requirement applies<br>NOTE 4: The same bands and the same $lo$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 5: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 6: E-UTRA operating band groups are as defined in Section 3.5. |                   |                          |                     |                                        |                        |                           |

### 9.1.6.5 Absolute RSRQ Accuracy for UE Category 1bis

The requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.6.5-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.3 for a corresponding Band

Table 9.1.6.5-1: RSRQ Inter frequency absolute accuracy for UE category 1bis

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                   |                   | Conditions     |                                        |                     |                           |

### 9.1.6.6 Relative Accuracy of RSRQ for UE Category 1bis

The relative accuracy of RSRQ in inter frequency case is defined as the RSRQ measured from one cell compared to the RSRQ measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.6.6-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2|dBm}$  according to Annex B.3.4 for a corresponding Band

$$\left| RSRP_{1|dBm} - RSRP_{2|dBm} \right| \leq 27dB$$

$$| \text{Channel } 1_{Io} - \text{Channel } 2_{Io} | \leq 20 \text{ dB}$$

**Table 9.1.6.6-1: RSRQ Inter frequency relative accuracy for UE category 1bis**

### 9.1.6A Inter-frequency RSRQ Accuracy Requirements in High Doppler Conditions

The accuracy requirements in this clause are applicable for [EVA300 and EVA600] propagation conditions and assume independent interference (noise) at each receiver antenna port.

#### 9.1.6A.1 Absolute RSRQ Accuracy in high Doppler conditions

The requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.6A.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP|dBm$  according to Annex B.3.3 for a corresponding Band

Table 9.1.6A.1-1: RSRQ Inter frequency absolute accuracy

| Accuracy         |                   | Conditions     |                                                |                             |                           |
|------------------|-------------------|----------------|------------------------------------------------|-----------------------------|---------------------------|

|                  |                   |                | FDD_G                                          | -118                        | -50                       |
|                  |                   |                | FDD_H                                          | -117.5                      | -50                       |
| $\pm 5$          | $\pm 5.5$         | $\geq -6$ dB   | FDD_N                                          | -114.5                      | -50                       |
|                  |                   |                | Note 2                                         | Note 2                      | Note 2                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.6A.2 Relative Accuracy of RSRQ in high Doppler conditions

The relative accuracy of RSRQ in inter frequency case is defined as the RSRQ measured from one cell compared to the RSRQ measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.6A.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2|dBm}$  according to Annex B.3.4 for a corresponding Band

$$\left| RSRP_{1|dBm} - RSRP_{2|dBm} \right| \leq 27dB$$

$$| \text{Channel 1}_Io - \text{Channel 2}_Io | \leq 20 \text{ dB}$$

Table 9.1.6A.2-1: RSRQ Inter frequency relative accuracy

| Accuracy         |                   | Conditions                       |                                                |                             |                           |
|------------------|-------------------|----------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$ <sup>Note 2</sup> | $Io$ <sup>Note 1</sup> range                   |                             |                           |
|                  |                   |                                  | E-UTRA operating band groups <sup>Note 5</sup> | Minimum $Io$                | Maximum $Io$              |
| dB               | dB                | dB                               |                                                | dBm/15kHz <sup>Note 4</sup> | dBm/BW <sub>Channel</sub> |
| $\pm 3.5$        | $\pm 5.0$         | $\geq -3$ dB                     | FDD_A, TDD_A                                   | -121                        | -50                       |
|                  |                   |                                  | FDD_B                                          | -120.5                      | -50                       |
|                  |                   |                                  | FDD_C, TDD_C                                   | -120                        | -50                       |
|                  |                   |                                  | FDD_D                                          | -119.5                      | -50                       |
|                  |                   |                                  | FDD_E, TDD_E                                   | -119                        | -50                       |
|                  |                   |                                  | FDD_F                                          | -118.5                      | -50                       |
|                  |                   |                                  | FDD_G                                          | -118                        | -50                       |
|                  |                   |                                  | FDD_H                                          | -117.5                      | -50                       |
| $\pm 4.5$        | $\pm 5.0$         | $\geq -6$ dB                     | FDD_N                                          | -114.5                      | -50                       |
|                  |                   |                                  | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}s/lot$  is the minimum  $\hat{E}s/lot$  of the pair of cells to which the requirement applies.  
NOTE 3: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

## 9.1.7 RSRQ Measurement Report Mapping

The reporting range of RSRQ is defined from -34 dB to 2.5 dB with 0.5 dB resolution.

The mapping of measured quantity is defined in table 9.1.7-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.1.7-1: RSRQ measurement report mapping**

| Reported value | Measured quantity value        | Unit |
|----------------|--------------------------------|------|
| RSRQ_-30       | $\text{RSRQ} < -34$            | dB   |
| RSRQ_-29       | $-34 \leq \text{RSRQ} < -33.5$ | dB   |
| ...            | ...                            | ...  |
| RSRQ_-02       | $-20.5 \leq \text{RSRQ} < -20$ | dB   |
| RSRQ_-01       | $-20 \leq \text{RSRQ} < -19.5$ | dB   |
| RSRQ_00        | $\text{RSRQ} < -19.5$          | dB   |
| RSRQ_01        | $-19.5 \leq \text{RSRQ} < -19$ | dB   |
| RSRQ_02        | $-19 \leq \text{RSRQ} < -18.5$ | dB   |
| ...            | ...                            | ...  |
| RSRQ_32        | $-4 \leq \text{RSRQ} < -3.5$   | dB   |
| RSRQ_33        | $-3.5 \leq \text{RSRQ} < -3$   | dB   |
| RSRQ_34        | $-3 \leq \text{RSRQ}$          | dB   |
| RSRQ_35        | $-3 \leq \text{RSRQ} < -2.5$   | dB   |
| RSRQ_36        | $-2.5 \leq \text{RSRQ} < -2$   | dB   |
| ...            | ...                            | ...  |
| RSRQ_45        | $2 \leq \text{RSRQ} < 2.5$     | dB   |
| RSRQ_46        | $2.5 \leq \text{RSRQ}$         | dB   |

Note: The ranges from RSRQ\_-30 to RSRQ\_-01 and from RSRQ\_35 to RSRQ\_46 apply for the UE who can support extended RSRQ range in [31].

## 9.1.8 Power Headroom

The requirements in this clause shall apply for power headroom Type 1 and for power headroom Type 2, which are specified in clause 5.1.1.2 in [3].

For a UE not configured with a secondary cell, the power headroom provides the serving eNB with information about the differences between the UE configured maximum output power ( $P_{\text{CMAX}}$ ) defined in TS 36.101 [5] and the estimated power for UL-SCH transmission of the serving cell [3]. In this case the UE shall meet requirements for power headroom Type 1.

For a UE configured with a secondary cell, the power headroom provides the serving eNB with information about the differences between the UE configured maximum output power ( $P_{\text{CMAX},c}$ ) defined in TS 36.101[5] and the estimated power for UL-SCH transmission per activated serving cell  $c$ , or the estimated power for simultaneous PUSCH and PUCCH transmission on PCell [3]. In this case the UE shall meet requirements for both power headroom Type 1 and Type 2.

### 9.1.8.1 Period

The reported power headroom shall be estimated over 1 subframe.

When *extendedPHR* is not configured [17], the Type 1 power headroom shall be estimated for the primary serving cell as defined in clause 5.1.1.2 in TS 36.213 [3].

When *extendedPHR* is configured [17], the Type 1 and Type 2 power headroom shall be estimated for each activated serving cell with configured uplink as defined in clause 5.1.1.2 in TS 36.213 [3].

### 9.1.8.2 Reporting Delay

The power headroom reporting delay is defined as the time between the beginning of the power headroom reference period and the time when the UE starts transmitting the power headroom over the radio interface. The reporting delay of the power headroom shall be 0 ms, which is applicable for all configured triggering mechanisms for power headroom reporting.

### 9.1.8.3 Void

### 9.1.8.4 Report Mapping

The power headroom reporting range is from -23 ...+40 dB. Table 9.1.8.4-1 defines the report mapping.

**Table 9.1.8.4-1: Power headroom report mapping**

| Reported value    | Measured quantity value (dB) |
|-------------------|------------------------------|
| POWER_HEADROOM_0  | $-23 \leq PH < -22$          |
| POWER_HEADROOM_1  | $-22 \leq PH < -21$          |
| POWER_HEADROOM_2  | $-21 \leq PH < -20$          |
| POWER_HEADROOM_3  | $-20 \leq PH < -19$          |
| POWER_HEADROOM_4  | $-19 \leq PH < -18$          |
| POWER_HEADROOM_5  | $-18 \leq PH < -17$          |
| ...               | ...                          |
| POWER_HEADROOM_57 | $34 \leq PH < 35$            |
| POWER_HEADROOM_58 | $35 \leq PH < 36$            |
| POWER_HEADROOM_59 | $36 \leq PH < 37$            |
| POWER_HEADROOM_60 | $37 \leq PH < 38$            |
| POWER_HEADROOM_61 | $38 \leq PH < 39$            |
| POWER_HEADROOM_62 | $39 \leq PH < 40$            |
| POWER_HEADROOM_63 | $PH \geq 40$                 |

## 9.1.9 UE Rx – Tx time difference

### 9.1.9.1 Measurement Requirement

The UE RX-TX time difference is measured from the PCell.

The accuracy requirements in Table 9.1.9.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

No changes to the uplink transmission timing are applied during the measurement period.

$RSRP|_{dBm}$  according to Annex B.3.5 for a corresponding Band

**Table 9.1.9.1-1: UE Rx – Tx time difference measurement accuracy**

| Accuracy                | $\hat{\epsilon}_s/\text{lot}$ | Downlink transmission bandwidth of PCell | Conditions                                     |                             |                           |
|-------------------------|-------------------------------|------------------------------------------|------------------------------------------------|-----------------------------|---------------------------|
|                         |                               |                                          | Io <sup>Note 1</sup> range                     |                             |                           |
| $T_s$ <sup>Note 2</sup> | dB                            | MHz                                      | E-UTRA operating band groups <sup>Note 6</sup> | Minimum Io                  | Maximum Io                |
|                         |                               |                                          |                                                | dBm/15kHz <sup>Note 5</sup> | dBm/BW <sub>Channel</sub> |
| $\pm 20$                | $\geq -3$ dB                  | $\geq 1.4$ MHz                           | FDD_A <sup>Note 7</sup> , TDD_A                | -121                        | -50                       |
|                         |                               |                                          | FDD_B                                          | -120.5                      | -50                       |
|                         |                               |                                          | FDD_C, TDD_C                                   | -120                        | -50                       |
|                         |                               |                                          | FDD_D                                          | -119.5                      | -50                       |
|                         |                               |                                          | FDD_E, TDD_E                                   | -119                        | -50                       |
|                         |                               |                                          | FDD_F                                          | -118.5                      | -50                       |
|                         |                               |                                          | FDD_G <sup>Note 4</sup>                        | -118                        | -50                       |
|                         |                               |                                          | FDD_H                                          | -117.5                      | -50                       |
|                         |                               |                                          | FDD_N                                          | -114.5                      | -50                       |
| $\pm 14$                | $\geq -3$ dB                  | $\geq 3$ MHz                             | Note 3                                         | Note 3                      | Note 3                    |
| $\pm 10$                | $\geq -3$ dB                  | $\geq 5$ MHz                             | Note 3                                         | Note 3                      | Note 3                    |
| $\pm 7$                 | $\geq -3$ dB                  | $\geq 10$ MHz                            | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1: When in dBm/15kHz, the minimum Io condition is expressed as the average Io per RE over all REs in that symbol. Io may be different in different symbols within a subframe.

NOTE 2:  $T_s$  is the basic timing unit defined in TS 36.211.

NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with downlink bandwidth  $\geq 1.4$  MHz.

NOTE 4: Except Band 29.

NOTE 5: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.

NOTE 6: E-UTRA operating band groups are as defined in Section 3.5.

NOTE 7: Except Band 32.

### 9.1.9.2 Measurement Report mapping

The reporting range of UE Rx - Tx time difference is defined from 0 to  $20472T_s$  with  $2T_s$  resolution for UE Rx - Tx time difference less than  $4096T_s$  and  $8T_s$  for UE Rx - Tx time difference equal to or greater than  $4096T_s$ .

The mapping of measured quantity is defined in Table 9.1.9.2-1.

**Table 9.1.9.2-1: UE Rx - Tx time difference measurement report mapping**

| Reported value             | Measured quantity value            | Unit  |
|----------------------------|------------------------------------|-------|
| RX-TX_TIME_DIFFERENCE_0000 | $T_{UE\ Rx-Tx} < 2$                | $T_s$ |
| RX-TX_TIME_DIFFERENCE_0001 | $2 \leq T_{UE\ Rx-Tx} < 4$         | $T_s$ |
| RX-TX_TIME_DIFFERENCE_0002 | $4 \leq T_{UE\ Rx-Tx} < 6$         | $T_s$ |
| ...                        | ...                                | ...   |
| RX-TX_TIME_DIFFERENCE_2046 | $4092 \leq T_{UE\ Rx-Tx} < 4094$   | $T_s$ |
| RX-TX_TIME_DIFFERENCE_2047 | $4094 \leq T_{UE\ Rx-Tx} < 4096$   | $T_s$ |
| RX-TX_TIME_DIFFERENCE_2048 | $4096 \leq T_{UE\ Rx-Tx} < 4104$   | $T_s$ |
| RX-TX_TIME_DIFFERENCE_2049 | $4104 \leq T_{UE\ Rx-Tx} < 4112$   | $T_s$ |
| ...                        | ...                                | ...   |
| RX-TX_TIME_DIFFERENCE_4093 | $20456 \leq T_{UE\ Rx-Tx} < 20464$ | $T_s$ |
| RX-TX_TIME_DIFFERENCE_4094 | $20464 \leq T_{UE\ Rx-Tx} < 20472$ | $T_s$ |
| RX-TX_TIME_DIFFERENCE_4095 | $20472 \leq T_{UE\ Rx-Tx}$         | $T_s$ |

### 9.1.9.3 Measurement Requirement under Time Domain Measurement Resource Restriction

The requirements in this section apply for UE configured with a time-domain measurement resource restriction pattern for PCell measurements. The UE Rx-Tx time difference is measured from the Pcell.

The accuracy requirements in Table 9.1.9.3-1 are valid under the following conditions:

- Cell specific reference signals are transmitted either from one, two or four antenna ports,

- Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled,
- No changes to the uplink transmission timing are applied during the measurement period,

RSRP<sub>dBm</sub> according to Annex B.3.5 for a corresponding Band,

- The time domain measurement resource restriction pattern configured for the PCell indicates at least one subframe per radio frame for performing the PCell measurements [2],
- Four symbols containing CRS are available in all subframes indicated by the time domain measurement resource restriction pattern.

**Table 9.1.9.3-1: UE Rx-Tx time difference measurement accuracy under time domain measurement resource restriction**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Conditions                       |                                          |                                                |                             |                           |

| <p>NOTE 1: When in dBm/15kHz, the minimum <math>Io</math> condition is expressed as the average <math>Io</math> per RE over all REs in that symbol. <math>Io</math> may be different in different symbols within a subframe.</p> <p>NOTE 2: <math>T_s</math> is the basic timing unit defined in TS 36.211.</p> <p>NOTE 3: The same bands and the same <math>Io</math> conditions for each band apply for this requirement as for the corresponding requirement with downlink bandwidth ≤ 3 MHz.</p> <p>NOTE 4: Except Band 29.</p> <p>NOTE 5: <math>Io</math> is defined for the subframes indicated by the time-domain measurement resource restriction pattern for serving cell measurements. The specified <math>Io</math> range applies to CRS and non-CRS symbols. <math>Io</math> may be different in different symbols within a subframe.</p> <p>NOTE 6: CRS <math>\hat{E}s/lot</math> is in subframes indicated for PCell measurements by the time-domain measurement resource restriction pattern.</p> <p>NOTE 7: The condition level is increased by <math>\Delta &gt; 0</math>, when applicable, as described in Sections B.4.2 and B.4.3.</p> <p>NOTE 8: E-UTRA operating band groups are as defined in Section 3.5.</p> <p>NOTE 9: Except Band 32.</p> |                                  |                                          |                                                |                             |                           |

NOTE: It is up to the UE implementation whether the UE Rx-Tx time difference measurement is performed in any subframe or in subframes indicated by the time-domain measurement resource restriction pattern.

#### 9.1.9.4 Measurement Requirement when Time Domain Measurement Resource Restriction Pattern is Configured with CRS Assistance Information

The UE Rx-Tx time difference measurement is performed for the PCell.

For UE configured with a time-domain measurement resource restriction pattern for PCell measurements, the accuracy requirements in Table 9.1.9.4-1 apply provided that the following conditions are met for the PCell:

- PCell cell specific reference signals are transmitted from one, two or four antenna ports,
- Conditions defined in 36.101 Section 7.3 for reference sensitivity are fulfilled,
- No changes to the uplink transmission timing are applied during the measurement period,
- RSRP<sub>dBm</sub> according to Annex B.3.13 for a corresponding Band,

- The time domain measurement resource restriction pattern configured for the measured cell indicates at least one subframe per radio frame for performing the RSRP measurement,
- Four symbols containing CRS are available in all subframes indicated by the time domain measurement resource restriction pattern, and
- The UE is provided via PCell with the CRS assistance information (TS 36.331 [2]) and the CRS assistance information is valid throughout the entire evaluation period.

The requirements in this section shall also be met when the number of transmit antenna ports [16] of one or more cells whose CRS assistance information is provided [2] is different from the number of transmit antenna ports of the measured cell.

When the CRS assistance information is provided, the transmission bandwidth [30] in all intra-frequency cells in the CRS assistance information [2] is the same or larger than the transmission bandwidth of the PCell for which measurement is performed.

**Table 9.1.9.4-1: UE Rx-Tx time difference measurement accuracy**

NOTE 1: This Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.  
NOTE 2: Ts is the basic timing unit defined in TS 36.211.  
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with downlink bandwidth ≤ 3 MHz.  
NOTE 4: Except Band 29.  
NOTE 5: Io is defined in subframes indicated for PCell measurements by the time domain measurement resource restriction pattern. The specified Io range applies to CRS and non-CRS symbols. Io may be different in different symbols within a subframe.  
NOTE 6: CRS Es/lot is in subframes indicated for PCell measurements by the time-domain measurement resource restriction pattern.  
NOTE 7: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 8: E-UTRA operating band groups are as defined in Section 3.5.  
NOTE 9: Except Band 32.

NOTE: It is up to the UE implementation whether the UE Rx-Tx time difference measurement is performed in any subframe or in subframes indicated by the time-domain measurement resource restriction pattern.

## 9.1.10 Reference Signal Time Difference (RSTD)

NOTE: This measurement is used for UE positioning purposes.

### 9.1.10.1 Intra-Frequency Accuracy Requirement

The accuracy requirements in Table 9.1.10.1-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.6 for a corresponding Band

There are no measurement gaps overlapping with the PRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu$ s.

If using CRS, in addition to PRS, is enabled in the OTDOA assistance data, the CRS measurement bandwidth is not smaller than the minimum PRS bandwidth.

**Table 9.1.10.1-1: RSTD measurement accuracy**

| Accuracy                | Conditions                                                                                                                          |                                                                                                                                                                              |                                                                                                                |                                                |                                 |                           |

NOTE 1: This minimum  $I_o$  condition is expressed as the average  $I_o$  per RE over all REs in an OFDM symbol.

NOTE 2:  $T_s$  is the basic timing unit defined in TS 36.211 [16].

NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA assistance data defined in [24].

NOTE 4: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth  $\geq 6$  RB.

NOTE 5: The serving cell, the reference cell, and the measured neighbour cell  $i$  are on the same carrier frequency.

NOTE 6: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.

NOTE 7: The  $I_o$  is defined in PRS positioning subframes. The same  $I_o$  range applies to PRS and non-PRS symbols.  $I_o$  levels are different in PRS and non-PRS symbols within the same subframe.

NOTE 8: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.10.2 Inter-Frequency Accuracy Requirement

The accuracy requirements in Table 9.1.10.2-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.7 for a corresponding Band

There are no measurement gaps overlapping with the PRS subframes in cells belonging to the serving carrier frequency.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu$ s.

If using CRS, in addition to PRS, is enabled in the OTDOA assistance data, the CRS measurement bandwidth is not smaller than the minimum PRS bandwidth.

Table 9.1.10.2-1: RSTD measurement accuracy

| Accuracy             | Conditions                                                                                                       |                                                                                                                                                                             |                                                                                                                |                                                |                              |                               |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.

NOTE 2: Ts is the basic timing unit defined in TS 36.211 [16].

NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA assistance data defined in [24].

NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 6 RB.

NOTE 5: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.

NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.

NOTE 7: If a CA capable UE is configured with one or two SCell(s), the serving cell channel bandwidth is the minimum of the serving cell channel bandwidths in the component carriers involved in the RSTD measurement. If any of the serving cells is not involved in this RSTD measurement for CA, the channel bandwidth of that serving cell is not included in the determination of the minimum PRS bandwidth.

NOTE 8: E-UTRA operating band groups are as defined in Section 3.5.

NOTE 9: Requirement is not applicable if gap pattern with ID=2 or ID=3 is in use.

### 9.1.10.3 RSTD Measurement Report Mapping

The reporting range of RSTD is defined from -15391Ts to 15391Ts with 1Ts resolution for absolute value of RSTD less or equal to 4096Ts and 5Ts for absolute value of RSTD greater than 4096Ts.

The mapping of measured quantity is defined in Table 9.1.10.3-1.

**Table 9.1.10.3-1: RSTD report mapping**

| Reported Value | Measured Quantity Value | Unit           |
|----------------|-------------------------|----------------|
| RSTD_0000      | -15391 > RSTD           | T <sub>s</sub> |
| RSTD_0001      | -15391 ≤ RSTD < -15386  | T <sub>s</sub> |
| ...            | ...                     | ...            |
| RSTD_2258      | -4106 ≤ RSTD < -4101    | T <sub>s</sub> |
| RSTD_2259      | -4101 ≤ RSTD < -4096    | T <sub>s</sub> |
| RSTD_2260      | -4096 ≤ RSTD < -4095    | T <sub>s</sub> |
| RSTD_2261      | -4095 ≤ RSTD < -4094    | T <sub>s</sub> |
| ...            | ...                     | ...            |
| RSTD_6353      | -3 ≤ RSTD < -2          | T <sub>s</sub> |
| RSTD_6354      | -2 ≤ RSTD < -1          | T <sub>s</sub> |
| RSTD_6355      | -1 ≤ RSTD ≤ 0           | T <sub>s</sub> |
| RSTD_6356      | 0 < RSTD ≤ 1            | T <sub>s</sub> |
| RSTD_6357      | 1 < RSTD ≤ 2            | T <sub>s</sub> |
| RSTD_6358      | 2 < RSTD ≤ 3            | T <sub>s</sub> |
| ...            | ...                     | ...            |
| RSTD_10450     | 4094 < RSTD ≤ 4095      | T <sub>s</sub> |
| RSTD_10451     | 4095 < RSTD ≤ 4096      | T <sub>s</sub> |
| RSTD_10452     | 4096 < RSTD ≤ 4101      | T <sub>s</sub> |
| RSTD_10453     | 4101 < RSTD ≤ 4106      | T <sub>s</sub> |
| ...            | ...                     | ...            |
| RSTD_12709     | 15381 < RSTD ≤ 15386    | T <sub>s</sub> |
| RSTD_12710     | 15386 < RSTD ≤ 15391    | T <sub>s</sub> |
| RSTD_12711     | 15391 < RSTD            | T <sub>s</sub> |

#### 9.1.10.4 Higher-Resolution RSTD Measurement Report Mapping

The reporting range of higher-resolution RSTD is defined from -15391 T<sub>s</sub> to 15391 T<sub>s</sub> with 0.5 T<sub>s</sub> resolution.

The UE shall report a reference quantity based on Table 9.1.10.3-1 and a relative quantity  $\Delta_{RSTD}$  defined in Table 9.1.10.4-1, so that the difference between the measured RSTD quantity and the lower bound of the corresponding range from Table 9.1.10.3-1 is between  $\Delta_{RSTD}$  and  $\Delta_{RSTD} + resolutionStep$ .

RSTD\_delta\_0 or RSTD\_delta\_1 specified in Table 9.1.10.4-1 can be reported together with any value from Table 9.1.10.3-1 in the range from RSTD\_2260 to RSTD\_10451. In this case, *resolutionStep* is 0.5.

Any relative quantity value from Table 9.1.10.4-1, except RSTD\_delta\_1, can be reported together with any value from Table 9.1.10.3-1 in the range from RSTD\_0000 to RSTD\_2259 or in the range from RSTD\_10452 to RSTD\_12711. In this case, *resolutionStep* is 1.0.

**Table 9.1.10.4-1: Relative quantity mapping for higher-resolution RSTD measurement reporting**

| Reported Relative Quantity Value | Measured Relative Quantity Value, $\Delta_{RSTD}$ | Unit           |
|----------------------------------|---------------------------------------------------|----------------|
| RSTD_delta_0                     | 0                                                 | T <sub>s</sub> |
| RSTD_delta_1                     | 0.5                                               | T <sub>s</sub> |

#### 9.1.10.5 Intra-Frequency Accuracy Requirement for UE Category 1bis

The accuracy requirements in Table 9.1.10.5-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.6 for a corresponding Band

There are no measurement gaps overlapping with the PRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu$ s.

**Table 9.1.10.5-1: RSTD measurement accuracy**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Conditions                                                                                                             |                                                                                                                                                                              |                                                                                                                |                                                |                              |                           |

Io levels are different in PRS and non-PRS symbols within the same subframe.</p> <p>NOTE 7: E-UTRA operating band groups are as defined in Section 3.5.</p> |                                                                                                                        |                                                                                                                                                                              |                                                                                                                |                                                |                              |                           |

### 9.1.10.6 Inter-Frequency Accuracy Requirement for UE Category 1bis

The accuracy requirements in Table 9.1.10.6-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.7 for a corresponding Band

There are no measurement gaps overlapping with the PRS subframes in cells belonging to the serving carrier frequency.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5 µs.

**Table 9.1.10.6-1: RSTD measurement accuracy**

| Accuracy             | Conditions                                                                                                 |                                                                                                                                                                             |                                                                                                                |                                                |                              |                                       |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.

NOTE 2: Ts is the basic timing unit defined in TS 36.211 [16].

NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA assistance data defined in [24].

NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 6 RB.

NOTE 5: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.

NOTE 6: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.11 Carrier aggregation measurement accuracy

This clause contains requirements on UE capabilities for support of E-UTRA FDD, TDD and TDD-FDD carrier aggregation. Requirements in this clause are applicable to all carrier aggregation capable UEs which have been

configured with up to four downlink SCell(s). Note: This clause covers measurement accuracy requirements for frequencies corresponding to those used for the PCell and SCell(s); measurements of any other frequency are considered to be inter-frequency measurements covered by the accuracy requirements in clause 9.1.3 for inter-frequency RSRP, clause 9.1.6 for inter-frequency RSRQ, and clause 9.1.17.3 for inter-frequency RS-SINR.

The requirements in this clause apply for bandwidths defined in the bandwidth combination set for the CA configurations supported by the UE [5].

#### 9.1.11.1 Primary component carrier accuracy requirement

RSRP measurements of cells on the primary component carrier shall meet the intra-frequency absolute accuracy requirements in section 9.1.2.1.

RSRQ measurements of cells on the primary component carrier shall meet the intra-frequency absolute accuracy requirements in section 9.1.5.1.

RS-SINR measurements of cells on the primary component carrier shall meet the intra-frequency absolute accuracy requirements in section 9.1.17.2.1.

Comparisons between RSRP of cells on the primary component carrier shall also meet the intra-frequency relative accuracy requirements in sections 9.1.2.2.

#### 9.1.11.2 Secondary component carrier accuracy requirement

RSRP measurements of cells on any of the secondary component carrier(s) shall meet the intra-frequency absolute accuracy requirements in section 9.1.2.1.

RSRQ measurements of cells on any of the secondary component carrier(s) shall meet the intra-frequency absolute accuracy requirements in section 9.1.5.1.

RS-SINR measurements of cells on any of the secondary component carrier(s) shall meet the intra-frequency absolute accuracy requirements in section 9.1.17.2.1.

Comparisons between RSRP of cells on the same secondary component carrier shall meet the intra-frequency relative accuracy requirements in sections 9.1.2.2

#### 9.1.11.3 Primary and secondary component carrier relative accuracy requirement

When measurements of cells on the primary component carrier are compared with measurements of cells on any of the secondary component carrier(s), the applicable relative accuracy requirements are:

RSRP inter-frequency accuracy requirements in section 9.1.3.2,

RSRQ inter-frequency accuracy requirements in section 9.1.6.2,

RS-SINR inter-frequency accuracy requirements in section 9.1.17.3.2.

#### 9.1.11.4 Secondary component carrier relative accuracy requirement

When measurements of cells on any of the secondary component carrier(s) are compared with measurements of cells on the other secondary component carrier, the applicable relative accuracy requirements are:

RSRP inter-frequency accuracy requirements in section 9.1.3.2,

RSRQ inter-frequency accuracy requirements in section 9.1.6.2,

RS-SINR inter-frequency accuracy requirements in section 9.1.17.3.2.

### 9.1.12 Reference Signal Time Difference (RSTD) Measurement Accuracy Requirements for Carrier Aggregation

This clause contains requirements for E-UTRA FDD, TDD and TDD-FDD carrier aggregation. This clause contains RSTD measurement accuracy requirements for a UE configured with one or two downlink SCell(s). The UE may operate in one of the E-UTRA carrier aggregations listed in clause 8.3.1. The requirements in this clause shall apply regardless whether the configured downlink secondary cell is activated or deactivated by the MAC-CE command [17].

The requirements apply for bandwidths defined in the bandwidth combination set for the CA configurations supported by the UE [5].

The RSTD measurements, which are obtained when both the reference cell and neighbouring cell belong to the primary component carrier, shall meet the intra-frequency RSTD accuracy requirements defined in clause 9.1.10.1.

The RSTD measurements, which are obtained when both the reference cell and neighbouring cell belong to the same secondary component carrier, shall meet the intra-frequency RSTD accuracy requirements defined in clause 9.1.10.1.

The RSTD measurements, which are obtained when the reference cell and neighbouring cell do not belong to the same carrier, shall meet the inter-frequency RSTD accuracy requirements defined in clause 9.1.10.2.

## 9.1.13 Measurement accuracy for UE category 0

### 9.1.13.1 Intra-frequency Absolute RSRP Accuracy for UE category 0

The requirements for absolute accuracy of RSRP in this clause apply to a cell on the same frequency as that of the serving cell for UE category 0.

The accuracy requirements in Table 9.1.13.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.27 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.13.1-1: RSRP Intra frequency absolute accuracy for UE category 0**

| Accuracy         |                   | Conditions         |                                                                                                            |                                             |                                         |                                         |

|                  |                   |                    | FDD-0_H                                                                                                    | -117.5                                      | N/A                                     | -70                                     |
|                  |                   |                    | FDD-0_N                                                                                                    | -114.5                                      | N/A                                     | -70                                     |
| $\pm 9$          | $\pm 12$          | $\geq -6$ dB       | FDD-0_A, TDD-0_A, FDD-0_B, FDD-0_C, TDD-0_C, FDD-0_D, FDD-0_E, TDD-0_E, FDD-0_F, FDD-0_G, FDD-0_H, FDD-0_N | N/A                                         | -70                                     | -50                                     |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.13.2 Intra-frequency Relative Accuracy of RSRP for UE category 0

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on the same frequency for category 0 UE.

The accuracy requirements in Table 9.1.13.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2}|_{dBm}$  according to Annex B.3.28 for a corresponding Band.

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.13.2-1: RSRP Intra frequency relative accuracy for UE category 0**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                   | Conditions                       |                                                |                             |                           |

### 9.1.13.3 Intra-frequency Absolute RSRQ Accuracy for UE category 0

The requirements for absolute accuracy of RSRQ in this clause apply to a cell on the same frequency as that of the serving cell for category 0 UE.

The accuracy requirements in Table 9.1.13.3-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP|_{dBm}$  according to Annex B.3.27 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRQ measurement assuming measured cell is identified cell.

**Table 9.1.13.3-1: RSRQ Intra frequency absolute accuracy for UE category 0**

| Accuracy         |                   | Conditions               |                                                |                             |                           |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

## 9.1.14 Accuracy requirements for Discovery Signal Measurements

### 9.1.14.1 Introduction

Discovery signal measurements are performed when higher layers indicate measurements based on discovery signals according to DMTC configuration [2]. The discovery measurement accuracy requirements are defined for the following physical layer measurements performed in discovery signal occasions [16],

RSRP measured in subframes of the configured discovery signal occasions as specified in [4],

CSI-RSRP measurements specified in [4],

RSRQ measured in subframes of the configured discovery signal occasions as specified in [4].

### 9.1.14.2 RSRP measurements in discovery signal occasions

Intra-frequency absolute RSRP measurement accuracy requirements in discovery signal occasions are the same as specified in Section 9.1.2.1.

Intra-frequency relative RSRP measurement accuracy requirements in discovery signal occasions are the same as specified in Section 9.1.2.2.

Inter-frequency absolute RSRP measurement accuracy requirements in discovery signal occasions are the same as specified in Section 9.1.3.1.

Inter-frequency relative RSRP measurement accuracy requirements in discovery signal occasions are the same as specified in Section 9.1.3.2.

Measurement report mapping for RSRP measurements in discovery signal occasions are the same as specified in Section 9.1.4.

### 9.1.14.3 CSI-RSRP measurements in discovery signal occasions

#### 9.1.14.3.1 Intra-frequency CSI-RSRP measurements

##### 9.1.14.3.1.1 Absolute CSI-RSRP measurement requirements

In this clause, absolute CSI-RSRP measurement accuracy requirements in discovery signal occasions apply to a cell or TP on the same frequency as that of the serving cell.

The accuracy requirements in Table 9.1.14.3.1.1-1 are valid under the following conditions:

CSI reference signals in discovery signal occasions are transmitted on one antenna port only from each TP,

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

CSI-RSRP is specified in Annex B.3.14 for a corresponding Band.

**Table 9.1.14.3.1.1-1: Intra-frequency absolute CSI-RSRP measurement accuracy**

| Accuracy                                                                                                              |                   | Conditions                 |                                                                                    |                             |                           |                           |
|-----------------------------------------------------------------------------------------------------------------------|-------------------|----------------------------|------------------------------------------------------------------------------------|-----------------------------|---------------------------|---------------------------|
| Normal condition                                                                                                      | Extreme condition | CSI $\hat{E}_s/\text{lot}$ | $I_o$ <sup>Note 1</sup> range                                                      |                             |                           |                           |

#### 9.1.14.3.1.2 Relative CSI-RSRP measurement requirements

In this section, the relative CSI-RSRP measurement is defined as the CSI-RSRP measured from one cell or TP compared to the CSI-RSRP measured on the same frequency from another cell or from another TP. If two TPs are compared, they may belong to the same or different cells.

The accuracy requirements in Table 9.1.14.3.1.2-1 are valid under the following conditions:

CSI reference signals in discovery signal occasions are transmitted on one antenna port only from each TP.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

CSI-RSRP is specified in Annex B.3.15 for a corresponding Band.

**Table 9.1.14.3.1.2-1: Intra-frequency relative CSI-RSRP measurement accuracy**

### 9.1.14.3.2 Inter-frequency CSI-RSRP measurements

#### 9.1.14.3.2.1 Absolute CSI-RSRP measurement requirements

In this clause, absolute CSI-RSRP measurement accuracy requirements for discovery signal measurements apply to a cell or TP on a different carrier frequency from that of the serving cell.

The accuracy requirements in Table 9.1.14.3.2.1-1 are valid under the following conditions:

CSI reference signals in discovery signal occasions are transmitted on one antenna port only from each TP.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

CSI-RSRP is specified in Annex B.3.16 for a corresponding Band.

Table 9.1.14.3.2.1-1: Inter-frequency absolute CSI-RSRP measurement accuracy

| Accuracy         |                   | Conditions |                                                                                    |                             |                           |                           |

|                  |                   |            | FDD_C, TDD_C                                                                       | -120                        | N/A                       | -70                       |
|                  |                   |            | FDD_D                                                                              | -119.5                      | N/A                       | -70                       |
|                  |                   |            | FDD_E, TDD_E                                                                       | -119                        | N/A                       | -70                       |
|                  |                   |            | FDD_F                                                                              | -118.5                      | N/A                       | -70                       |
|                  |                   |            | FDD_G                                                                              | -118                        | N/A                       | -70                       |
|                  |                   |            | FDD_H                                                                              | -117.5                      | N/A                       | -70                       |
|                  |                   |            | FDD_N                                                                              | -114.5                      | N/A                       | -70                       |
| ±8               | ±11               | ≥0 dB      | FDD_A, TDD_A, FDD_B, FDD_C, TDD_C, FDD_D, FDD_E, TDD_E, FDD_F, FDD_G, FDD_H, FDD_N | N/A                         | -70                       | -50                       |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

## 9.1.14.3.2.2 Relative CSI-RSRP measurement requirements

In this section, the relative CSI-RSRP measurement is defined as the CSI-RSRP measured from one cell or TP compared to the CSI-RSRP measured on a different frequency from another cell or from another TP.

The accuracy requirements in Table 9.1.14.3.2.2-1 are valid under the following conditions:

CSI reference signals in discovery signal occasions are transmitted on one antenna port only from each TP.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

CSI-RSRP is specified in Annex B.3.17 for a corresponding Band.

$$\left| CSI\_RSRP1 \Big|_{dBm} - CSI\_RSRP2 \Big|_{dBm} \right| \leq 27dB$$

$$| Channel\ 1\_Io - Channel\ 2\_Io | \leq 20\ dB$$

Table 9.1.14.3.2.2-1: Inter-frequency relative CSI-RSRP measurement accuracy

| Accuracy         |                   | Conditions                   |                                                |                             |                           |
|------------------|-------------------|------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | CSI Ês/lot <sup>Note 2</sup> | Io <sup>Note 1</sup> range                     |                             |                           |
|                  |                   |                              | E-UTRA operating band groups <sup>Note 4</sup> | Minimum Io                  | Maximum Io                |
| dB               | dB                | dB                           |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| ±4.5             | ±6                | ≥0 dB                        | FDD_A, TDD_A                                   | -121                        | -50                       |
|                  |                   |                              | FDD_B                                          | -120.5                      | -50                       |
|                  |                   |                              | FDD_C, TDD_C                                   | -120                        | -50                       |
|                  |                   |                              | FDD_D                                          | -119.5                      | -50                       |
|                  |                   |                              | FDD_E, TDD_E                                   | -119                        | -50                       |
|                  |                   |                              | FDD_F                                          | -118.5                      | -50                       |
|                  |                   |                              | FDD_G                                          | -118                        | -50                       |
|                  |                   |                              | FDD_H                                          | -117.5                      | -50                       |
|                  |                   |                              | FDD_N                                          | -114.5                      | -50                       |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter CSI Ês/lot is the minimum CSI Ês/lot of the pair of cells or TPs to which the requirement applies.  
NOTE 3: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.14.3.3 CSI-RSRP measurement report mapping

The reporting range of CSI-RSRP is defined from -140 dBm to -44 dBm with 1 dB resolution.

The mapping of measured quantity is defined in Table 9.1.14.3.3-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.1.14.3.3-1: CSI-RSRP measurement report mapping**

| Reported value | Measured quantity value             | Unit |
|----------------|-------------------------------------|------|
| CSI_RSRP_00    | CSI_RSRP < -140                     | dBm  |
| CSI_RSRP_01    | $-140 \leq \text{CSI\_RSRP} < -139$ | dBm  |
| CSI_RSRP_02    | $-139 \leq \text{CSI\_RSRP} < -138$ | dBm  |
| ...            | ...                                 | ...  |
| CSI_RSRP_95    | $-46 \leq \text{CSI\_RSRP} < -45$   | dBm  |
| CSI_RSRP_96    | $-45 \leq \text{CSI\_RSRP} < -44$   | dBm  |
| CSI_RSRP_97    | $-44 \leq \text{CSI\_RSRP}$         | dBm  |

### 9.1.14.4 RSRQ measurements in discovery signal occasions

Intra-frequency absolute RSRQ measurement accuracy requirements in discovery signal occasions are the same as specified in Section 9.1.5.1.

Inter-frequency absolute RSRQ measurement accuracy requirements in discovery signal occasions are the same as specified in Section 9.1.6.1.

Inter-frequency relative RSRQ measurement accuracy requirements in discovery signal occasions are the same as specified in Section 9.1.6.2.

Measurement report mapping for RSRQ measurements in discovery signal occasions are the same as specified in Section 9.1.7.

## 9.1.15 Discovery signal measurements accuracy for E-UTRAN carrier aggregation

This clause contains requirements on UE capabilities for support of E-UTRA FDD, TDD and TDD-FDD carrier aggregation when discovery signal [16] is configured. Requirements in this clause are applicable to all carrier aggregation capable UEs which have been configured with up to four downlink SCell(s). Note : This clause covers measurement accuracy requirements for frequencies corresponding to those used for the PCell and SCell(s). Measurements of any other frequency are considered to be inter-frequency measurements covered by the accuracy requirements in clause 9.1.14.

The requirements in this clause apply for bandwidths defined in the bandwidth combination set for the CA configurations supported by the UE [5].

### 9.1.15.1 Requirements for CRS based discovery signal measurements accuracy for E-UTRAN carrier aggregation

#### 9.1.15.1.1 Primary component carrier accuracy requirement

RSRP and RSRQ measurements of cells on the primary component carrier shall meet the intrafrequency absolute accuracy requirements in sections 9.1.14.2 and 9.1.14.4. Comparisons between RSRP of cells on the primary component carrier shall also meet the intra-frequency relative accuracy requirements in sections 9.1.14.2.

#### 9.1.15.1.2 Secondary component carrier accuracy requirement

RSRP and RSRQ measurements of cells on any of the secondary component carrier(s) shall meet the intrafrequency absolute accuracy requirements in sections 9.1.14.2 and 9.1.14.4. Comparisons between RSRP of cells on the same secondary component carrier shall meet the intra-frequency relative accuracy requirements in sections 9.1.14.2.

#### 9.1.15.1.3 Primary and secondary component carrier relative accuracy requirement

When measurements of cells on the primary component carrier are compared with measurements of cells on any of the secondary component carrier(s), the applicable relative accuracy requirements are the RSRP and RSRQ inter-frequency accuracy requirements in sections 9.1.14.2 and 9.1.14.4.

#### 9.1.15.1.4 Secondary component carrier relative accuracy requirement

When measurements of cells on any of the secondary component carrier(s) are compared with measurements of cells on the other secondary component carrier, the applicable relative accuracy requirements are the RSRP and RSRQ inter-frequency accuracy requirements in sections 9.1.14.2 and 9.1.14.4.

### 9.1.15.2 Requirements for CSI-RS based discovery signal measurements accuracy for E-UTRAN carrier aggregation

#### 9.1.15.2.1 Primary component carrier accuracy requirement

RSRP measurements of cells on the primary component carrier shall meet the intrafrequency absolute accuracy requirements in sections 9.1.14.3.1.1. Comparisons between RSRP of cells on the primary component carrier shall also meet the intra-frequency relative accuracy requirements in sections 9.1.14.3.1.2.

#### 9.1.15.2.2 Secondary component carrier accuracy requirement

RSRP measurements of cells on any of the secondary component carrier(s) shall meet the intrafrequency absolute accuracy requirements in sections 9.1.14.3.1.1. Comparisons between RSRP of cells on the same secondary component carrier shall meet the intra-frequency relative accuracy requirements in sections 9.1.14.3.1.2.

#### 9.1.15.2.3 Primary and secondary component carrier relative accuracy requirement

When measurements of cells on the primary component carrier are compared with measurements of cells on any of the secondary component carrier(s), the applicable relative accuracy requirements are the RSRP inter-frequency accuracy requirements in sections 9.1.14.3.2.2.

#### 9.1.15.2.4 Secondary component carrier relative accuracy requirement

When measurements of cells on any of the secondary component carrier(s) are compared with measurements of cells on the other secondary component carrier, the applicable relative accuracy requirements are the RSRP inter-frequency accuracy requirements in sections 9.1.14.3.2.2.

### 9.1.16 Accuracy requirements for RSRQ measurement on all OFDM symbols

This clause contains requirements for RSRQ measurement when measurement configuration message received by the UE contains *measRSRQ-OnAllSymbols-r12* parameter in TS 36.331 [2].

Intra-frequency absolute RSRQ measurement accuracy requirements when measured on all OFDM symbols are the same as specified in Section 9.1.5.1.

Inter-frequency absolute RSRQ measurement accuracy requirements when measured on all OFDM symbols are the same as specified in Section 9.1.6.1.

Inter-frequency relative RSRQ measurement accuracy requirements when measured on all OFDM symbols are the same as specified in Section 9.1.6.2.

NOTE: The minimum  $I_o$  condition in Table 9.1.5.1-1, Table 9.1.6.1-1 and Table 9.1.6.2-1 is expressed as the average  $I_o$  per RE over all REs in that symbol.

NOTE: The  $I_o$  range defined by the minimum and the maximum  $I_o$  levels in Table 9.1.5.1-1, Table 9.1.6.1-1 and Table 9.1.6.2-1 applies to CRS and non-CRS symbols.  $I_o$  may be different in different symbols within a subframe.

NOTE:  $I_{ot}$  in Table 9.1.5.1-1, Table 9.1.6.1-1 and Table 9.1.6.2-1 is the received power spectrum density of total interference and noise averaged over CRS REs.

Intra-frequency absolute WB-RSRQ measurement accuracy requirements when measured on all OFDM symbols are the same as specified in Section 9.1.5.4.

Inter-frequency absolute WB-RSRQ measurement accuracy requirements when measured on all OFDM symbols are the same as specified in Section 9.1.6.3.

Inter-frequency relative WB-RSRQ measurement accuracy requirements when measured on all OFDM symbols are the same as specified in Section 9.1.6.4.

NOTE: The minimum  $I_o$  condition in Table 9.1.5.4-1, Table 9.1.6.3-1 and Table 9.1.6.4-1 is expressed as the average  $I_o$  per RE over all REs in that symbol across all the resource blocks within the *AllowedMeasBandwidth* in TS 36.331 [2].

NOTE: The  $I_{o1}$ ,  $I_{o2}$  and  $I_o$  range defined by the minimum and the maximum  $I_o$  levels in Table 9.1.5.4-1, Table 9.1.6.3-1 and Table 9.1.6.4-1 applies to CRS and non-CRS symbols.  $I_{o1}$ ,  $I_{o2}$  and  $I_o$  may be different in different symbols within a subframe.

NOTE:  $I_{ot}$  in Table 9.1.5.4-1, Table 9.1.6.3-1 and Table 9.1.6.4-1 is the received power spectrum density of total interference and noise averaged over CRS REs.

## 9.1.17 RS-SINR Measurements

### 9.1.17.1 Measurement Report Mapping

The reporting range of RS-SINR measurement is defined from -23 dB to 40 dB with 0.5 dB resolution.

The mapping of the measured quantity is defined in table 9.1.17.1 -1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.1.17.1-1: RS-SINR measurement report mapping**

| Reported Value | Measured Quantity Value    | Unit |
|----------------|----------------------------|------|
| RS-SINR_000    | $RS-SINR < -23$            | dB   |
| RS-SINR_001    | $-23 \leq RS-SINR < -22.5$ | dB   |
| ...            | ...                        | ...  |
| RS-SINR_126    | $39.5 \leq RS-SINR < 40$   | dB   |
| RS-SINR_127    | $40 \leq RS-SINR$          | dB   |

### 9.1.17.2 Intra-frequency RS-SINR Measurement Accuracy Requirements

#### 9.1.17.2.1 Absolute RS-SINR Measurement Accuracy Requirements

The requirements for absolute accuracy of intra-frequency RS-SINR in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Table 9.1.17.2.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.18 for a corresponding Band.

Table 9.1.17.2.1-1: Intra-frequency RS-SINR absolute accuracy

| Accuracy         |                   | Conditions                     |                                                |                             |                           |
|------------------|-------------------|--------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$                 | $I_o$ <sup>Note 1</sup> range                  |                             |                           |
|                  |                   |                                | E-UTRA operating band groups <sup>Note 4</sup> | Minimum $I_o$               | Maximum $I_o$             |
| dB               | dB                | dB                             |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| $\pm 3.0$        | $\pm 4$           | $\geq -3$ dB <sup>Note 5</sup> | FDD_A, TDD_A                                   | -121                        | -50                       |
|                  |                   |                                | FDD_B                                          | -120.5                      | -50                       |
|                  |                   |                                | FDD_C, TDD_C                                   | -120                        | -50                       |
|                  |                   |                                | FDD_D                                          | -119.5                      | -50                       |
|                  |                   |                                | FDD_E, TDD_E                                   | -119                        | -50                       |
|                  |                   |                                | FDD_F                                          | -118.5                      | -50                       |
|                  |                   |                                | FDD_G                                          | -118                        | -50                       |
|                  |                   |                                | FDD_H                                          | -117.5                      | -50                       |
| $\pm 3.5$        | $\pm 4$           | $\geq -6$ dB                   | FDD_N                                          | -114.5                      | -50                       |
|                  |                   |                                | Note 2                                         | Note 2                      | Note 2                    |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.  
NOTE 5: The requirements apply for  $\hat{E}s/lot \leq 25$  dB.

### 9.1.17.3 Inter-frequency RS-SINR Measurement Accuracy Requirements

#### 9.1.17.3.1 Absolute RS-SINR Measurement Accuracy Requirements

The requirements for absolute accuracy of inter-frequency RS-SINR in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.17.3.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.19 for a corresponding Band.

Table 9.1.17.3.1-1: Inter-frequency RS-SINR absolute accuracy

| Accuracy         |                   | Conditions                     |                                                |                             |                           |
|------------------|-------------------|--------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$                 | $I_o$ <sup>Note 1</sup> range                  |                             |                           |
|                  |                   |                                | E-UTRA operating band groups <sup>Note 4</sup> | Minimum $I_o$               | Maximum $I_o$             |
| dB               | dB                | dB                             |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| $\pm 3.0$        | $\pm 4$           | $\geq -3$ dB <sup>Note 5</sup> | FDD_A, TDD_A                                   | -121                        | -50                       |
|                  |                   |                                | FDD_B                                          | -120.5                      | -50                       |
|                  |                   |                                | FDD_C, TDD_C                                   | -120                        | -50                       |
|                  |                   |                                | FDD_D                                          | -119.5                      | -50                       |
|                  |                   |                                | FDD_E, TDD_E                                   | -119                        | -50                       |
|                  |                   |                                | FDD_F                                          | -118.5                      | -50                       |
|                  |                   |                                | FDD_G                                          | -118                        | -50                       |
|                  |                   |                                | FDD_H                                          | -117.5                      | -50                       |
| $\pm 3.5$        | $\pm 4$           | $\geq -6$ dB                   | FDD_N                                          | -114.5                      | -50                       |
|                  |                   |                                | Note 2                                         | Note 2                      | Note 2                    |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.  
NOTE 5: The requirements apply for  $\hat{E}s/lot \leq 25$  dB.

### 9.1.17.3.2 Relative RS-SINR Measurement Accuracy Requirements

The relative accuracy of inter-frequency RS-SINR in this clause is defined as the RS-SINR measured from one cell compared to the RS-SINR measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.17.3.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2}|_{dBm}$  according to Annex B.3.20 for a corresponding Band.

$$|RSRP1|_{dBm} - RSRP2|_{dBm}| \leq 27dB$$

$$|Channel\ 1\_Io - Channel\ 2\_Io| \leq 20\ dB$$

**Table 9.1.17.3.2-1: Inter-frequency RS-SINR relative accuracy**

| Accuracy         |                   | Conditions                       |                                                |                               |                    |
|------------------|-------------------|----------------------------------|------------------------------------------------|-------------------------------|--------------------|
| Normal condition | Extreme condition | $\hat{E}s/Iot$ <sup>Note 2</sup> | $I_o$ <sup>Note 1</sup> range                  |                               |                    |
|                  |                   |                                  | E-UTRA operating band groups <sup>Note 5</sup> | Minimum $I_o$                 | Maximum $I_o$      |
| dB               | dB                | dB                               |                                                | $dBm/15kHz$ <sup>Note 4</sup> | $dBm/BW_{Channel}$ |
| $\pm 3.5$        | $\pm 4$           | $\geq -3\ dB$ <sup>Note 6</sup>  | FDD_A, TDD_A                                   | -121                          | -50                |
|                  |                   |                                  | FDD_B                                          | -120.5                        | -50                |
|                  |                   |                                  | FDD_C, TDD_C                                   | -120                          | -50                |
|                  |                   |                                  | FDD_D                                          | -119.5                        | -50                |
|                  |                   |                                  | FDD_E, TDD_E                                   | -119                          | -50                |
|                  |                   |                                  | FDD_F                                          | -118.5                        | -50                |
|                  |                   |                                  | FDD_G                                          | -118                          | -50                |
|                  |                   |                                  | FDD_H                                          | -117.5                        | -50                |
|                  |                   |                                  | FDD_N                                          | -114.5                        | -50                |
| $\pm 4.0$        | $\pm 4$           | $\geq -6\ dB$                    | Note 3                                         | Note 3                        | Note 3             |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The parameter  $\hat{E}s/Iot$  is the minimum  $\hat{E}s/Iot$  of the pair of cells to which the requirement applies.  
 NOTE 3: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
 NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
 NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.  
 NOTE 6: The requirements apply for  $\hat{E}s/Iot \leq 25\ dB$ .

## 9.1.18 Accuracy Requirements for Measurements under Operation with Frame Structure 3

### 9.1.18.1 Introduction

The accuracy requirements in this section are defined for the following physical layer measurements: RSRP, RSRQ, CSI-RSRP, and RSSI, where the measurements are performed on cells of E-UTRA carriers during the configured DMTC occasion [2] under operation with frame structure 3 [16].

### 9.1.18.2 RSRP measurements

#### 9.1.18.2.1 RSRP measurement report mapping

The measurement report mapping for RSRP measurements is as defined in Section 9.1.4.

#### 9.1.18.2.2 Inter-frequency absolute RSRP measurement accuracy requirements

The requirements for absolute accuracy of RSRP in this clause apply to a cell that has a different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.18.2.2-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>dBm</sub> according to Annex B.3.23.1 for a corresponding Band.

The discovery signal occasion does not contain any MBSFN subframe and contains at least four CRS symbols over two adjacent slots.

**Table 9.1.18.2.2-1: RSRP inter-frequency absolute accuracy**

| Accuracy         |                   | Conditions |                                                |                             |                           |                           |
|------------------|-------------------|------------|------------------------------------------------|-----------------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | Ês/lot     | I <sub>o</sub> <sup>Note 1</sup> range         |                             |                           |                           |
|                  |                   |            | E-UTRA operating band groups <sup>Note 3</sup> | Minimum I <sub>o</sub>      |                           | Maximum I <sub>o</sub>    |
| dB               | dB                | dB         |                                                | dBm/15kHz <sup>Note 2</sup> | dBm/BW <sub>Channel</sub> | dBm/BW <sub>Channel</sub> |
| ±4.5             | ±9                | ≥-6 dB     | FS3_G                                          | -118                        | N/A                       | -70                       |
| ±8               | ±11               | ≥-6 dB     | FS3_G                                          | N/A                         | -70                       | -50                       |

NOTE 1: I<sub>o</sub> is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.18.2.3 Inter-frequency relative RSRP measurement accuracy requirements

The relative accuracy of inter-frequency RSRP measurement is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.18.2.3-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.4 for a corresponding Band

$$\left| RSRP1_{dBm} - RSRP2_{dBm} \right| \leq 27dB$$

$$| \text{Channel 1\_I}_o - \text{Channel 2\_I}_o | \leq 20 \text{ dB}$$

The discovery signal occasion does not contain any MBSFN subframe and contains at least four CRS symbols over two adjacent slots.

**Table 9.1.18.2.3-1: RSRP inter-frequency relative accuracy**

| Accuracy         |                   | Conditions               |                                                |                             |                           |
|------------------|-------------------|--------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | Ês/lot <sup>Note 2</sup> | I <sub>o</sub> <sup>Note 1</sup> range         |                             |                           |
|                  |                   |                          | E-UTRA operating band groups <sup>Note 4</sup> | Minimum I <sub>o</sub>      | Maximum I <sub>o</sub>    |
| dB               | dB                | dB                       |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| ±4.5             | ±6                | ≥-6 dB                   | FS3_G                                          | -118                        | -50                       |

NOTE 1: I<sub>o</sub> is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter Ês/lot is the minimum Ês/lot of the pair of cells to which the requirement applies.  
NOTE 3: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.18.2.4 Intra-frequency absolute RSRP measurement accuracy requirements

NOTE: These requirements are applicable only for CA under operation with frame structure 3 [16].

The requirements for absolute accuracy of RSRP in this clause apply to a cell on a serving carrier frequency.

The accuracy requirements in Table 9.1.18.2.4-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>dBm</sub> according to Annex B.3.21.1 for a corresponding Band.

The discovery signal occasion does not contain any MBSFN subframe and contains at least four CRS symbols over two adjacent slots.

**Table 9.1.18.2.4-1: RSRP intra frequency absolute accuracy**

| Accuracy         |                   | Conditions             |                                                |                             |                           |                           |
|------------------|-------------------|------------------------|------------------------------------------------|-----------------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}_s/\text{lot}$ | $I_o$ <sup>Note 1</sup> range                  |                             |                           |                           |
|                  |                   |                        | E-UTRA operating band groups <sup>Note 3</sup> | Minimum $I_o$               |                           | Maximum $I_o$             |
| dB               | dB                | dB                     |                                                | dBm/15kHz <sup>Note 2</sup> | dBm/BW <sub>Channel</sub> | dBm/BW <sub>Channel</sub> |
| $\pm 4.5$        | $\pm 9$           | $\geq -6$ dB           | FS3_G                                          | -118                        | N/A                       | -70                       |
| $\pm 8$          | $\pm 11$          | $\geq -6$ dB           | FS3_G                                          | N/A                         | -70                       | -50                       |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
 NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.18.2.5 Intra-frequency relative RSRP measurement accuracy requirements

NOTE: These requirements are applicable only for CA under operation with frame structure 3 [16].

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on the same carrier frequency.

The accuracy requirements in Table 9.1.18.2.5-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.22.1 for a corresponding Band.

The discovery signal occasion does not contain any MBSFN subframe and contains at least four CRS symbols over two adjacent slots.

**Table 9.1.18.2.5-1: RSRP intra frequency relative accuracy**

| Accuracy         |                   | Conditions                               |                                                |                             |                           |
|------------------|-------------------|------------------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}_s/\text{lot}$ <sup>Note 2</sup> | $I_o$ <sup>Note 1</sup> range                  |                             |                           |
|                  |                   |                                          | E-UTRA operating band groups <sup>Note 5</sup> | Minimum $I_o$               | Maximum $I_o$             |
| dB               | dB                | dB                                       |                                                | dBm/15kHz <sup>Note 4</sup> | dBm/BW <sub>Channel</sub> |
| $\pm 2$          | $\pm 3$           | $\geq -3$ dB                             | FS3_G                                          | -118                        | -50                       |
| $\pm 3$          | $\pm 3$           | $\geq -6$ dB                             | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The parameter  $\hat{E}_s/\text{lot}$  is the minimum  $\hat{E}_s/\text{lot}$  of the pair of cells to which the requirement applies.  
 NOTE 3: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
 NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
 NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.18.3 RSRQ measurements

#### 9.1.18.3.1 RSRQ measurement report mapping

The measurement report mapping for RSRQ measurements is as defined in Section 9.1.7.

### 9.1.18.3.2 Inter-frequency absolute RSRQ measurement accuracy requirements

The requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.18.3.2-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>dBm</sub> according to Annex B.3.23.2 for a corresponding Band.

The discovery signal occasion does not contain any MBSFN subframe and contains at least four CRS symbols over two adjacent slots.

**Table 9.1.18.3.2-1: RSRQ inter-frequency absolute accuracy**

| Accuracy                                                                                                                                                      |                   | Conditions |                                                |                             |                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition                                                                                                                                              | Extreme condition | Ês/lot     | I <sub>o</sub> <sup>Note 1</sup> range         |                             |                           |
|                                                                                                                                                               |                   |            | E-UTRA operating band groups <sup>Note 4</sup> | Minimum I <sub>o</sub>      | Maximum I <sub>o</sub>    |
| dB                                                                                                                                                            | dB                | dB         |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| ±2.5                                                                                                                                                          | ±4                | ≥-3 dB     | FS3_G                                          | -118                        | -50                       |
| ±3.5                                                                                                                                                          | ±4                | ≥-6 dB     | Note 2                                         | Note 2                      | Note 2                    |
| NOTE 1: I <sub>o</sub> is assumed to have constant EPRE across the bandwidth.                                                                                 |                   |            |                                                |                             |                           |
| NOTE 2: The same bands and the same I <sub>o</sub> conditions for each band apply for this requirement as for the corresponding highest accuracy requirement. |                   |            |                                                |                             |                           |
| NOTE 3: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.                                                   |                   |            |                                                |                             |                           |
| NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.                                                                                           |                   |            |                                                |                             |                           |

### 9.1.18.3.3 Inter-frequency relative RSRQ measurement accuracy requirements

The relative accuracy of RSRQ in inter frequency case is defined as the RSRQ measured from one cell compared to the RSRQ measured from another cell on a different frequency.

The accuracy requirements in Table 9.1.18.3.3-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.24.2 for a corresponding Band.

$$\left| RSRP1_{dBm} - RSRP2_{dBm} \right| \leq 27dB$$

$$\left| \text{Channel 1\_I}_o - \text{Channel 2\_I}_o \right| \leq 20 \text{ dB}$$

The discovery signal occasion does not contain any MBSFN subframe and contains at least four CRS symbols over two adjacent slots.

**Table 9.1.18.3.3-1: RSRQ inter-frequency relative accuracy**

| Accuracy         |                   | Conditions                       |                                                |                             |                           |
|------------------|-------------------|----------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$ <sup>Note 2</sup> | $Io$ <sup>Note 1</sup> range                   |                             |                           |
|                  |                   |                                  | E-UTRA operating band groups <sup>Note 5</sup> | Minimum $Io$                | Maximum $Io$              |
| dB               | dB                | dB                               |                                                | dBm/15kHz <sup>Note 4</sup> | dBm/BW <sub>Channel</sub> |
| $\pm 3$          | $\pm 4$           | $\geq -3$ dB                     | FS3_G                                          | -118                        | -50                       |
| $\pm 4$          | $\pm 4$           | $\geq -6$ dB                     | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}s/lot$  is the minimum  $\hat{E}s/lot$  of the pair of cells to which the requirement applies.  
NOTE 3: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

#### 9.1.18.3.4 Intra-frequency absolute RSRQ measurement accuracy requirements

NOTE: These requirements are applicable only for CA under operation with frame structure 3 [16].

The requirements for absolute accuracy of RSRQ in this clause apply to a cell on a serving carrier frequency.

The accuracy requirements in Table 9.1.18.3.4-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.21.2 for a corresponding Band.

The discovery signal occasion does not contain any MBSFN subframe and contains at least four CRS symbols over two adjacent slots.

**Table 9.1.18.3.4-1: RSRQ intra frequency absolute accuracy**

| Accuracy         |                   | Conditions     |                                                |                             |                           |
|------------------|-------------------|----------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$ | $Io$ <sup>Note 1</sup> range                   |                             |                           |
|                  |                   |                | E-UTRA operating band groups <sup>Note 4</sup> | Minimum $Io$                | Maximum $Io$              |
| dB               | dB                | dB             |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| $\pm 2.5$        | $\pm 4$           | $\geq -3$ dB   | FS3_G                                          | -118                        | -50                       |
| $\pm 3.5$        | $\pm 4$           | $\geq -6$ dB   | Note 2                                         | Note 2                      | Note 2                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

#### 9.1.18.4 CSI-RSRP measurements

##### 9.1.18.4.1 CSI-RSRP measurement report mapping

The measurement report mapping for CSI-RSRP measurements is as defined in Section 9.1.14.3.3.

##### 9.1.18.4.2 Inter-frequency absolute CSI-RSRP measurement accuracy requirements

In this clause, absolute CSI-RSRP measurement accuracy requirements for discovery signal measurements apply to a cell or TP operating under frame structure 3 [3] on a different carrier frequency from that of the serving cell.

The accuracy requirements in Table 9.1.18.4.2-1 are valid under the following conditions:

CSI reference signals in discovery signal occasions are transmitted on one antenna port only from each TP.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

CSI-RSRP is as specified in Annex B.3.23.3 for a corresponding Band.

The discovery signal occasion does not contain any MBSFN subframe and contains at least two CSI REs per resource block within the measured bandwidth in two adjacent slots.

**Table 9.1.18.4.2-1: Inter-frequency absolute CSI-RSRP measurement accuracy**

| Accuracy         |                   | Conditions |                                                |                             |                           |
|------------------|-------------------|------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | CSI Ês/lot | Io <sup>Note 1</sup> range                     |                             |                           |
|                  |                   |            | E-UTRA operating band groups <sup>Note 3</sup> | Minimum Io                  | Maximum Io                |
| dB               | dB                | dB         |                                                | dBm/15kHz <sup>Note 2</sup> | dBm/BW <sub>Channel</sub> |
| ±4.5             | ±9                | ≥0 dB      | FS3_G                                          | -118                        | N/A                       |
| ±8               | ±11               | ≥0 dB      | FS3_G                                          | N/A                         | -70                       |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.

NOTE 2: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.

NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.18.4.3 Inter-frequency relative CSI-RSRP measurement accuracy requirements

In this section, the relative CSI-RSRP measurement is defined as the CSI-RSRP measured from one cell or TP compared to the CSI-RSRP measured on a different frequency from another cell or from another TP, where at least one measured cell or TP is operating under frame structure 3 [3].

The accuracy requirements in Table 9.1.18.4.3-1 are valid under the following conditions:

CSI reference signals in discovery signal occasions are transmitted on one antenna port only from each TP.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

CSI-RSRP is as specified in Annex B.3.24.3 for a corresponding Band.

$$\left| CSI\_RSRP1_{dBm} - CSI\_RSRP2_{dBm} \right| \leq 27dB$$

$$| Channel\_1\_Io - Channel\_2\_Io | \leq 20\text{ dB}$$

The discovery signal occasion does not contain any MBSFN subframe and contains at least two CSI REs per resource block within the measured bandwidth in two adjacent slots.

**Table 9.1.18.4.3-1: Inter-frequency relative CSI-RSRP measurement accuracy**

| Accuracy         |                   | Conditions                   |                                                |                             |
|------------------|-------------------|------------------------------|------------------------------------------------|-----------------------------|
| Normal condition | Extreme condition | CSI Ês/lot <sup>Note 2</sup> | Io <sup>Note 1</sup> range                     |                             |
|                  |                   |                              | E-UTRA operating band groups <sup>Note 4</sup> | Minimum Io                  |
| dB               | dB                | dB                           |                                                | dBm/15kHz <sup>Note 3</sup> |
| ±4.5             | ±6                | ≥0 dB                        | FS3_G                                          | -118                        |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.

NOTE 2: The parameter CSI Ês/lot is the minimum CSI Ês/lot of the pair of cells or TPs to which the requirement applies.

NOTE 3: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.

NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.18.4.4 Intra-frequency absolute CSI-RSRP measurement accuracy requirements

NOTE: These requirements are applicable only for CA under operation with frame structure 3 [16].

In this clause, absolute CSI-RSRP measurement accuracy requirements in discovery signal occasions apply to a cell or TP on a serving carrier frequency operating under frame structure 3 [3].

The accuracy requirements in Table 9.1.18.4.4-1 are valid under the following conditions:

CSI reference signals in discovery signal occasions are transmitted on one antenna port only from each TP,

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

CSI-RSRP is as specified in Annex B.3.21.3 for a corresponding Band.

The discovery signal occasion does not contain any MBSFN subframe and contains at least two CSI REs per resource block within the measured bandwidth in two adjacent slots of the same subframe or different subframes.

**Table 9.1.18.4.4-1: Intra-frequency absolute CSI-RSRP measurement accuracy**

| Accuracy         |                   | Conditions |                                                |                             |                           |                           |
|------------------|-------------------|------------|------------------------------------------------|-----------------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | CSI Ês/lot | Io <sup>Note 1</sup> range                     |                             |                           |                           |
|                  |                   |            | E-UTRA operating band groups <sup>Note 3</sup> | Minimum Io                  |                           | Maximum Io                |
| dB               | dB                | dB         |                                                | dBm/15kHz <sup>Note 2</sup> | dBm/BW <sub>Channel</sub> | dBm/BW <sub>Channel</sub> |
| ±4.5             | ±9                | ≥0 dB      | FS3_G                                          | -118                        | N/A                       | -70                       |
| ±8               | ±11               | ≥0 dB      | FS3_G                                          | N/A                         | -70                       | -50                       |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.  
 NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

#### 9.1.18.4.5 Intra-frequency relative CSI-RSRP measurement accuracy requirements

NOTE: These requirements are applicable only for CA under operation with frame structure 3 [16].

In this section, the relative CSI-RSRP measurement is defined as the CSI-RSRP measured from one cell or TP compared to the CSI-RSRP measured on the same frequency from another cell or from another TP operating under frame structure 3 [16]. If two TPs are compared, they may belong to the same or different cells.

The accuracy requirements in Table 9.1.18.4.5-1 are valid under the following conditions:

CSI reference signals in discovery signal occasions are transmitted on one antenna port only from each TP.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

CSI-RSRP is as specified in Annex B.3.22.3 for a corresponding Band.

The discovery signal occasion does not contain any MBSFN subframe and contains at least two CSI REs per resource block within the measured bandwidth in two adjacent slots of the same subframe or different subframes.

**Table 9.1.18.4.5-1: Intra-frequency relative CSI-RSRP measurement accuracy**

| Accuracy         |                   | Conditions                   |                                                |                             |                           |
|------------------|-------------------|------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | CSI Ês/lot <sup>Note 2</sup> | Io <sup>Note 1</sup> range                     |                             |                           |
|                  |                   |                              | E-UTRA operating band groups <sup>Note 5</sup> | Minimum Io                  | Maximum Io                |
| dB               | dB                | dB                           |                                                | dBm/15kHz <sup>Note 4</sup> | dBm/BW <sub>Channel</sub> |
| ±2               | ±3                | ≥ 0 dB                       | FS3_G                                          | -118                        | -50                       |
| ±3               | ±3                | ≥ 0 dB                       | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The parameter CSI Ês/lot is the minimum CSI Ês/lot of the pair of cells or TPs to which the requirement applies.  
 NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
 NOTE 4: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.  
 NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

#### 9.1.18.5 RSSI measurements

##### 9.1.18.5.1 RSSI measurement report mapping

The reporting range of RSSI measurement is defined from -100 dBm to -25 dBm with 1 dBm resolution.

The mapping of the measured quantity is defined in table 9.1.18.5.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.1.18.5.1-1: RSSI measurement report mapping**

| Reported value | Measured quantity value       | Unit |
|----------------|-------------------------------|------|
| RSSI_00        | $\text{RSSI} < -100$          | dBm  |
| RSSI_01        | $-100 \leq \text{RSSI} < -99$ | dBm  |
| RSSI_02        | $-99 \leq \text{RSSI} < -98$  | dBm  |
| ...            | ...                           | ...  |
| RSSI_74        | $-27 \leq \text{RSSI} < -26$  | dBm  |
| RSSI_75        | $-26 \leq \text{RSSI} < -25$  | dBm  |
| RSSI_76        | $-25 \leq \text{RSSI}$        | dBm  |

### 9.1.18.5.2 Intra-frequency absolute RSSI measurement accuracy requirements

NOTE: These requirements are applicable only for CA under operation with frame structure 3 [16].

The intra-frequency RSSI requirements are specified in Table 9.1.18.5.2-1. The requirements apply for any configured *RSSI measDuration* [2], provided that:

- All symbols during each RSSI measurement duration are available for RSSI sampling within the same reporting interval.

**Table 9.1.18.5.2-1: Intra-frequency RSSI accuracy**

| Accuracy                                                                                                                                          |                   | Conditions                                     |                             |                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition                                                                                                                                  | Extreme condition | Io <sup>Note 1</sup> range                     |                             |                           |
|                                                                                                                                                   |                   | E-UTRA operating band groups <sup>Note 4</sup> | Minimum Io                  | Maximum Io                |
| dB                                                                                                                                                | dB                |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| ±3.5                                                                                                                                              | ±6.5              | FS3_G                                          | -118                        | -50                       |
| ±5.5                                                                                                                                              | ±8.5              | Note 2                                         | Note 2                      | Note 2                    |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.                                                                                 |                   |                                                |                             |                           |
| NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement. |                   |                                                |                             |                           |
| NOTE 3: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.                             |                   |                                                |                             |                           |
| NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.                                                                               |                   |                                                |                             |                           |

### 9.1.18.5.3 Inter-frequency absolute RSSI measurement accuracy requirements

The inter-frequency RSSI requirements are the same as specified in Section 9.1.18.5.2.

## 9.1.18.6 Channel occupancy measurements

### 9.1.18.6.1 Intra-frequency channel occupancy measurement accuracy requirements

NOTE: These requirements are applicable only for CA under operation with frame structure 3 [16].

The UE shall be able to correctly evaluate the intra-frequency channel occupancy configured according to 36.331 [2], provided that the following conditions are met:

- All symbols during each RSSI measurement duration are available for RSSI sampling within the same reporting interval,
- RSSI at the UE receiver meets the following condition with respect to the configured *channelOccupancyThreshold* [2]:

RSSI at the UE receiver is below  $\text{channelOccupancyThreshold} - \Delta_{\text{RSSI}}$ , or

RSSI at the UE receiver is above  $\text{channelOccupancyThreshold} + \Delta_{\text{RSSI}}$ ,

where  $\Delta_{RSSI}$  is the applicable RSSI measurement accuracy value from the RSSI measurement accuracy requirements specified in Section 9.1.18.5.2.

#### 9.1.18.6.2 Inter-frequency channel occupancy measurement accuracy requirements

The UE shall be able to correctly evaluate the inter-frequency channel occupancy configured according to 36.331 [2], provided that the following conditions are met:

- All symbols during each RSSI measurement duration are available for RSSI sampling within the same reporting interval,
- RSSI at the UE receiver meets the following condition with respect to the configured *channelOccupancyThreshold* [2]:

RSSI at the UE receiver is below *channelOccupancyThreshold* -  $\Delta_{RSSI}$ , or

RSSI at the UE receiver is above *channelOccupancyThreshold* +  $\Delta_{RSSI}$ ,

where  $\Delta_{RSSI}$  is the applicable RSSI measurement accuracy value from the RSSI measurement accuracy requirements specified in Section 9.1.18.5.3.

### 9.1.19 Accuracy Requirements for Carrier Aggregation for Measurements under Operation with Frame Structure 3

#### 9.1.19.1 Introduction

The accuracy requirements in this section are defined for the following physical layer measurements: RSRP, RSRQ, CSI-RSRP, and RSSI, where the measurements are performed on cells of E-UTRA carriers during the configured DMTC occasion [2] under operation with frame structure 3 [16].

#### 9.1.19.2 Accuracy requirements for measurements on SCC

The requirements in this section are for the measurements on cells of E-UTRA carriers operated under frame structure 3 on one SCC.

Absolute RSRP measurements of cells on SCC shall meet the intra-frequency absolute accuracy requirements in Section 9.1.18.2.4.

Comparisons between RSRP measurements of cells on the same SCC shall meet the intra-frequency relative accuracy requirements in Section 9.1.18.2.5.

Absolute RSRQ measurements of cells on SCC shall meet the intra-frequency absolute accuracy requirements in Section 9.1.18.3.4.

CSI-RSRP measurements of cells on SCC shall meet the intra-frequency absolute accuracy requirements in Section 9.1.18.4.4.

Comparisons between CSI-RSRP measurements of cells on the same SCC shall meet the intra-frequency relative accuracy requirements in Section 9.1.18.4.5.

RSSI measurements on SCC shall meet the intra-frequency absolute accuracy requirements in Section 9.1.18.5.3.

#### 9.1.19.3 Relative accuracy requirements for measurements on different SCCs

The requirements in this section are for the measurements on cells of E-UTRA carriers operated under frame structure 3 on two different SCCs.

When RSRP measurements of cells on any of the SCC are compared with RSRP measurements of cells on the other SCC, the applicable relative accuracy requirements are the inter-frequency relative RSRP measurement accuracy requirements in Section 9.1.18.2.3.

When RSRQ measurements of cells on any of the SCC are compared with RSRQ measurements of cells on the other SCC, the applicable relative accuracy requirements are the inter-frequency relative RSRQ measurement accuracy requirements in Section 9.1.18.3.3.

When CSI-RSRP measurements of cells on any of the SCC are compared with CSI-RSRP measurements of cells on the other SCC, the applicable relative accuracy requirements are the inter-frequency relative CSI-RSRP measurement accuracy requirements in Section 9.1.18.4.3.

#### 9.1.19.4 Relative accuracy requirements for measurements on SCC and PCC

The requirements in this section are for the measurements on cells of an E-UTRA carrier operated under frame structure 3 on SCC and cells on an E-UTRA carrier operated under frame structure 1 or 2 on PCC.

When RSRP measurements of cells on any of the SCC are compared with RSRP measurements of cells on the PCC, the applicable relative accuracy requirements are the inter-frequency relative RSRP measurement accuracy requirements in Section 9.1.18.2.3.

When RSRQ measurements of cells on any of the SCC are compared with RSRQ measurements of cells on the PCC, the applicable relative accuracy requirements are the inter-frequency relative RSRQ measurement accuracy requirements in Section 9.1.18.3.3.

When CSI-RSRP measurements of cells on any of the SCC are compared with CSI-RSRP measurements of cells on the PCC, the applicable relative accuracy requirements are the inter-frequency relative CSI-RSRP measurement accuracy requirements in Section 9.1.18.4.3.

### 9.1.20 SFN and Subframe Time Difference (SSTD)

#### 9.1.20.1 SSTD Accuracy Requirement

The SFN and subframe time difference (SSTD) is measured between MeNB and SeNB.

The accuracy requirements in Table 9.1.20.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

No changes to the uplink transmission timing are applied during the measurement period.

$RSRP_{dBm}$  according to Annex B.3.5 for a corresponding Band

Table 9.1.20.1-1: SFN and subframe time difference measurement accuracy

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | $\hat{E}_s/\text{lot}$ | MIN(PCell downlink transmission Bandwidth, PSCell downlink transmission Bandwidth) | Conditions                                     |                                    |                                 |

| $\pm 40$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | $\geq -3$ dB           | $\geq 3$ MHz                                                                       | Note 3                                         | Note 3                             | Note 3                          |
| NOTE 1: When in dBm/15kHz, the minimum Io condition is expressed as the average Io per RE over all REs in that symbol. Io may be different in different symbols within a subframe.<br>NOTE 2: $T_s$ is the basic timing unit defined in TS 36.211.<br>NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with downlink bandwidth $\geq 1.4$ MHz.<br>NOTE 4: Except Band 29.<br>NOTE 5: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 6: E-UTRA operating band groups are as defined in Section 3.5.<br>NOTE 7: Except Band 32. |                        |                                                                                    |                                                |                                    |                                 |

### 9.1.20.2 SSTD Measurement Report Mapping

SFN and subframe timing difference (SSTD) measurement report comprises 3 elements:

SFN offset between MeNB and SeNB ( $\Delta X$ )

Reporting range of  $\Delta X$  is between frame number # 0 to frame number # 1023 as defined in TS 36.331 [2].

Frame boundary offset between MeNB and SeNB ( $\Delta Y$ )

Reporting range of  $\Delta Y$  is between subframe number #-5 and subframe number# 4 as defined in TS 36.331 [2].

Subframe boundary offset between MeNB and SeNB ( $\Delta Z$ )

The reporting range of value of  $\Delta Z$  is within  $[-1320T_s, -700T_s]$  and  $[700T_s, 1320T_s]$  with reporting granularity of  $10T_s$ .

The mapping of measured Subframe boundary offset ( $\Delta Z$ ) is defined in Table 9.1.20.2-1.

Table 9.1.20.2-1: SSTD report mapping

| Reported Value               | Measured Quantity Value       | Unit  |
|------------------------------|-------------------------------|-------|
| SUBFRAME_BOUNDARY_OFFSET_00  | $\Delta Z \leq -1320$         | $T_s$ |
| SUBFRAME_BOUNDARY_OFFSET_01  | $-1320 < \Delta Z \leq -1310$ | $T_s$ |
| SUBFRAME_BOUNDARY_OFFSET_02  | $-1310 < \Delta Z \leq -1300$ | $T_s$ |
| ...                          | ...                           | ...   |
| SUBFRAME_BOUNDARY_OFFSET_62  | $-710 < \Delta Z \leq -700$   | $T_s$ |
| SUBFRAME_BOUNDARY_OFFSET_63  | $-700 < \Delta Z \leq 0$      | $T_s$ |
| SUBFRAME_BOUNDARY_OFFSET_64  | $0 < \Delta Z \leq 700$       | $T_s$ |
| SUBFRAME_BOUNDARY_OFFSET_65  | $700 < \Delta Z \leq 710$     | $T_s$ |
| ...                          | ...                           | ...   |
| SUBFRAME_BOUNDARY_OFFSET_125 | $1300 < \Delta Z \leq 1310$   | $T_s$ |
| SUBFRAME_BOUNDARY_OFFSET_126 | $1310 < \Delta Z \leq 1320$   | $T_s$ |
| SUBFRAME_BOUNDARY_OFFSET_127 | $1320 < \Delta Z$             | $T_s$ |

## 9.1.21 Measurement accuracy for UE category M1

### 9.1.21.1 Intra-frequency Absolute RSRP Accuracy for UE category M1 with CE mode A

The requirements for absolute accuracy of RSRP in this clause apply to a cell on the same frequency as that of the serving cell for UE category M1.

The accuracy requirements in Table 9.1.21.1-1 and Table 9.1.21.1-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.21.1-1: RSRP Intra frequency absolute accuracy for UE category M1 with CE mode A for FDD and TDD**

| Accuracy         |                   | Conditions             |                                                                                |                                             |                                         |                                         |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
 NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.21.2 Intra-frequency Relative Accuracy of RSRP for UE category M1 with CE mode A

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on the same frequency for category M1 UE.

The accuracy requirements in Table 9.1. 21.2-1 and Table 9.1. 21.2-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.8 for a corresponding Band.

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.21.2-1: RSRP Intra frequency relative accuracy for UE category M1 with CE mode A for FDD and TDD**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                   | Conditions                       |                                                |                             |                           |

### 9.1.21.3 Intra-frequency Absolute RSRP Accuracy for UE category M1 with CE mode B

The requirements for absolute accuracy of RSRP in this clause apply to a cell on the same frequency as that of the serving cell for UE category M1.

The accuracy requirements in Table 9.1.21.3-1 and Table 9.1.21.3-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.21.3-1: RSRP Intra frequency absolute accuracy for UE category M1 with CE mode B for FDD and TDD**

#### 9.1.21.4 Intra-frequency Relative Accuracy of RSRP for UE category M1 with CE mode B

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on the same frequency for category M1 UE.

The accuracy requirements in Table 9.1.21.4-1 and Table 9.1.21.4-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.8 for a corresponding Band.

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

| NOTE 1: $Io$ is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter $\hat{E}s/lot$ is the minimum $\hat{E}s/lot$ of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same $Io$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 5: E-UTRA operating band groups are as defined in Section 3.5. |                   |                                  |                                                |                             |                           |

### 9.1.21.5 RSRP Measurement Report Mapping

The reporting range of RSRP is the same as defined in section 9.1.4.

### 9.1.21.6 Intra-frequency Absolute Accuracy of RSRQ for UE category M1 with CE mode A

The requirements for absolute accuracy of RSRQ in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Tables 9.1.21.6-1 and 9.1.21.6-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

**Table 9.1.21.6-1: RSRQ Intra frequency absolute accuracy UE category M1 with CE mode A for FDD and TDD**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                     |                   | Conditions             |                                                |                                    |                                 |

### 9.1.21.7 Intra-frequency Absolute Accuracy of RSRQ for UE category M1 with CE mode B

The requirements for absolute accuracy of RSRQ in this clause apply to a cell on the same frequency as that of the serving cell.

The accuracy requirements in Tables 9.1.21.7-1 and 9.1.21.7-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 3: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 4: E-UTRA operating band groups are as defined in Section 3.5. |                   |                      |                                                |                             |                                             |

### 9.1.21.8 RSRQ Measurement Report Mapping

The reporting range of RSRQ is the same as defined in section 9.1.7.

### 9.1.21.9 Inter-frequency Absolute RSRP Accuracy for UE category M1 with CE mode A

The requirements for absolute accuracy of RSRP in this clause apply to a cell on another frequency than that of the serving cell for UE category M1.

The accuracy requirements in Table 9.1.21.9-1 and Table 9.1.21.9-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.21.9-1: RSRP Inter frequency absolute accuracy for UE category M1 with CE mode A for FDD and TDD**

|                  |                   |                        | FDD-M1_G                                                   | -118                        | N/A                       | -70                       |
|                  |                   |                        | FDD-M1_N                                                   | -114.5                      | N/A                       | -70                       |
| [±9]             | [±12]             | ≥-6 dB                 | FDD-M1_A, FDD-M1_D, FDD-M1_E, FDD-M1_F, FDD-M1_G, FDD-M1_N | N/A                         | -70                       | -50                       |

NOTE 1:  $\text{I}_0$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.21.10 Inter-frequency Relative Accuracy of RSRP for UE category M1 with CE mode A

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on another frequency for category M1 UE.

The accuracy requirements in Table 9.1.21.10-1 and Table 9.1.21.10-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.8 for a corresponding Band.

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.21.10-1: RSRP Inter frequency relative accuracy for UE category M1 with CE mode A for FDD and TDD**

| Accuracy         |                   | Conditions                               |                                                |                             |                           |
|------------------|-------------------|------------------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}_s/\text{lot}$ <sup>Note 2</sup> | $\text{I}_0$ <sup>Note 1</sup> range           |                             |                           |
|                  |                   |                                          | E-UTRA operating band groups <sup>Note 5</sup> | Minimum $\text{I}_0$        | Maximum $\text{I}_0$      |
| dB               | dB                | dB                                       |                                                | dBm/15kHz <sup>Note 4</sup> | dBm/BW <sub>Channel</sub> |
| [±7]             | [±8]              | ≥-3 dB                                   | FDD-M1_A, TDD-M1_A                             | -121                        | -50                       |
|                  |                   |                                          | FDD-M1_D                                       | -119.5                      | -50                       |
|                  |                   |                                          | FDD-M1_E, TDD-M1_E                             | -119                        | -50                       |
|                  |                   |                                          | FDD-M1_F                                       | -118.5                      | -50                       |
|                  |                   |                                          | FDD-M1_G                                       | -118                        | -50                       |
|                  |                   |                                          | FDD-M1_N                                       | -114.5                      | -50                       |
| [±8]             | [±8]              | ≥-6 dB                                   | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $\text{I}_0$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}_s/\text{lot}$  is the minimum  $\hat{E}_s/\text{lot}$  of the pair of cells to which the requirement applies.  
NOTE 3: The same bands and the same  $\text{I}_0$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

**Table 9.1.21.10-2: RSRP Inter frequency relative accuracy for UE category M1 with CE mode A for HD-FDD**

| Accuracy         |                   | Conditions                       |                                                |                             |                           |

|                  |                   |                                  | FDD-M1_D                                       | -119.5                      | -50                       |
|                  |                   |                                  | FDD-M1_E                                       | -119                        | -50                       |
|                  |                   |                                  | FDD-M1_F                                       | -118.5                      | -50                       |
|                  |                   |                                  | FDD-M1_G                                       | -118                        | -50                       |
|                  |                   |                                  | FDD-M1_N                                       | -114.5                      | -50                       |
| [±8]             | [±8]              | ≥-6 dB                           | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}s/lot$  is the minimum  $\hat{E}s/lot$  of the pair of cells to which the requirement applies.  
NOTE 3: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.21.11 Inter-frequency Absolute RSRP Accuracy for UE category M1 with CE mode B

The requirements for absolute accuracy of RSRP in this clause apply to a cell on another frequency than that of the serving cell for UE category M1.

The accuracy requirements in Table 9.1.21.11-1 and Table 9.1.21.11-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.21.11-1: RSRP Inter frequency absolute accuracy for UE category M1 with CE mode B for FDD and TDD**

| Accuracy         |                   | Conditions                         |                                                                                |                             |                           |                           |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.

NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

**9.1.21.12 Inter-frequency Relative Accuracy of RSRP for UE category M1 with CE mode B**

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on another frequency for category M1 UE.

The accuracy requirements in Table 9.1.21.12-1 and Table 9.1.21.12-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.8 for a corresponding Band.

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.21.12-1: RSRP Inter frequency relative accuracy for UE category M1 with CE mode B for FDD and TDD**

| Accuracy         |                   | Conditions                                 |                                                |                             |                           |
|------------------|-------------------|--------------------------------------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}_s/\text{lot}$ <sup>Note 2</sup>   | $I_o$ <sup>Note 1</sup> range                  |                             |                           |
|                  |                   |                                            | E-UTRA operating band groups <sup>Note 5</sup> | Minimum $I_o$               | Maximum $I_o$             |

| [±7]             | [±10]             | $\geq -12$ dB                              | FDD-M1_A, TDD-M1_A                             | -121                        | -50                       |
|                  |                   |                                            | FDD-M1_D                                       | -119.5                      | -50                       |
|                  |                   |                                            | FDD-M1_E, TDD-M1_E                             | -119                        | -50                       |
|                  |                   |                                            | FDD-M1_F                                       | -118.5                      | -50                       |
|                  |                   |                                            | FDD-M1_G                                       | -118                        | -50                       |
|                  |                   |                                            | FDD-M1_N                                       | -114.5                      | -50                       |
| [±8]             | [±11]             | $15 \leq \hat{E}_s/\text{lot} \leq -12$ dB | Note 3                                         | Note 3                      | Note 3                    |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.NOTE 2: The parameter  $\hat{E}_s/\text{lot}$  is the minimum  $\hat{E}_s/\text{lot}$  of the pair of cells to which the requirement applies.NOTE 3: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.

NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.

**Table 9.1.21.12-2: RSRP Inter frequency relative accuracy for UE category M1 with CE mode B for HD-FDD**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                   | Conditions                               |                                                |                             |                           |

| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter $\hat{E}_s/\text{lot}$ is the minimum $\hat{E}_s/\text{lot}$ of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same $I_o$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 5: E-UTRA operating band groups are as defined in Section 3.5. |                   |                                          |                                                |                             |                           |

### 9.1.21.13 Inter-frequency Absolute Accuracy of RSRQ for UE category M1 in CE mode A

The requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Tables 9.1.21.13-1 and 9.1.21.13-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP|dBm according to Annex B.3.3 for a corresponding Band

### 9.1.21.14 Inter-frequency Relative Accuracy of RSRQ for UE category M1 in CE mode A

The relative accuracy of RSRQ in inter frequency case is defined as the RSRQ measured from one cell compared to the RSRQ measured from another cell on a different frequency.

The accuracy requirements in Tables 9.1.21.14-1 and 9.1.21.14-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2|dBm}$  according to Annex B.3.4 for a corresponding Band

$$\left| RSRP_{1|dBm} - RSRP_{2|dBm} \right| \leq 27 dB$$

$$| Channel\ 1_{Io} - Channel\ 2_{Io} | \leq 20\ dB$$

### 9.1.21.15 Inter-frequency Absolute Accuracy of RSRQ for UE category M1 in CE mode B

The requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Tables 9.1.21.15-1 and 9.1.21.15-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.3 for a corresponding Band

**Table 9.1.21.15-1: RSRQ Inter frequency absolute accuracy UE category M1 with CE mode B for FDD and TDD**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                     |                   | Conditions                         |                                                |                             |                           |

### 9.1.21.16 Inter-frequency Relative Accuracy of RSRQ for UE category M1 in CE mode B

The relative accuracy of RSRQ in inter frequency case is defined as the RSRQ measured from one cell compared to the RSRQ measured from another cell on a different frequency.

The accuracy requirements in Tables 9.1.21.16-1 and 9.1.21.16-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2}|_{dBm}$  according to Annex B.3.4 for a corresponding Band

$$\left| RSRP1|_{dBm} - RSRP2|_{dBm} \right| \leq 27dB$$

$$| \text{Channel 1}_I_o - \text{Channel 2}_I_o | \leq 20 \text{ dB}$$

| NOTE 1: $Io$ is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter $\hat{E}s/lot$ is the minimum $\hat{E}s/lot$ of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same $Io$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 5: E-UTRA operating band groups are as defined in Section 3.5. |                   |                                    |                                                |                             |                           |

### 9.1.21.17 Inter-Frequency RSTD Accuracy Requirement for UE category M1 in CE mode A

The accuracy requirements in Table 9.1.21.17-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP  $1,2_{dBm}$  according to Annex B.3.31 for a corresponding Band

There are no measurement gaps overlapping with the PRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu s$ .

Table 9.1.21.17-1: RSTD measurement accuracy for CEModeA

| Accuracy                                                                                                                                                                                            | Conditions                                                                           |                                                                                                                                                            |                                                                                                                |                                                                                                                                        |                                 |               |                           |

| NOTE 1: This minimum $I_o$ condition is expressed as the average $I_o$ per RE over all REs in an OFDM symbol.                                                                                       |                                                                                      |                                                                                                                                                            |                                                                                                                |                                                                                                                                        |                                 |               |                           |
| NOTE 2: $T_s$ is the basic timing unit defined in TS 36.211 [16].                                                                                                                                   |                                                                                      |                                                                                                                                                            |                                                                                                                |                                                                                                                                        |                                 |               |                           |
| NOTE 3: PRS bandwidth is as indicated in <i>prs-Bandwidth</i> in the OTDOA assistance data defined in [24].                                                                                         |                                                                                      |                                                                                                                                                            |                                                                                                                |                                                                                                                                        |                                 |               |                           |
| NOTE 4: The $I_o$ is defined in PRS positioning subframes. The same $I_o$ range applies to PRS and non-PRS symbols. $I_o$ levels are different in PRS and non-PRS symbols within the same subframe. |                                                                                      |                                                                                                                                                            |                                                                                                                |                                                                                                                                        |                                 |               |                           |
| NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                 |                                                                                      |                                                                                                                                                            |                                                                                                                |                                                                                                                                        |                                 |               |                           |

### 9.1.21.18 Inter-Frequency RSTD Accuracy Requirement for UE category M1 in CE mode B

The accuracy requirements in Table 9.1.21.18-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.31 for a corresponding Band

There are no measurement gaps overlapping with the PRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu$ s.

Table 9.1.21.18-1: RSTD measurement accuracy for CEModeB

| Accuracy                                                                                                                                                                                                              | Conditions                                                                                                  |                                                                                                                                                            |                                                                                                                |                                                                                                                                               |                                                |                                       |                     |

| NOTE 4: The $\text{Io}$ is defined in PRS positioning subframes. The same $\text{Io}$ range applies to PRS and non-PRS symbols. $\text{Io}$ levels are different in PRS and non-PRS symbols within the same subframe. |                                                                                                             |                                                                                                                                                            |                                                                                                                |                                                                                                                                               |                                                |                                       |                     |
| NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                   |                                                                                                             |                                                                                                                                                            |                                                                                                                |                                                                                                                                               |                                                |                                       |                     |

### 9.1.21.19 UE RX-TX time difference Accuracy Requirement for Cat-M1

The UE RX-TX time difference is measured from the PCell.

The accuracy requirements in Table 9.1.21.19-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

No changes to the uplink transmission timing are applied during the measurement period.

RSRP<sub>dBm</sub> according to Annex B.2.14 for a corresponding Band

Table 9.1.21.19-1: UE Rx – Tx time difference measurement accuracy for CEModeA

| NOTE 1: When in dBm/15kHz, the minimum Io condition is expressed as the average Io per RE over all REs in that symbol. Io may be different in different symbols within a subframe. |                        |                                          |                            |            |                           |
| NOTE 2: Ts is the basic timing unit defined in TS 36.211.                                                                                                                          |                        |                                          |                            |            |                           |
| NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                |                        |                                          |                            |            |                           |

### 9.1.21.20 Intra-Frequency RSTD Accuracy Requirement for UE category M1 in CE mode A

The accuracy requirements in Table 9.1.21.20-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.33 for a corresponding Band

For a UE that does not need a measurement gap for intra-frequency RSTD measurement, there are no measurement gaps overlapping with the PRS subframes of the measured serving cell and PRS are available within the UE measurement bandwidth in all PRS subframes

For a UE that needs a measurement gap for intra-frequency RSTD measurement, the measurement gaps are configured to contain PRS subframes

The parameter *expectedRSTDUncertainty* signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5 μs.

Table 9.1.21.20-1: RSTD measurement accuracy for CEModeA

| Accuracy               | PRS $\hat{E}_s/\text{lot}$                                                                                 | Minimum PRS bandwidth, which is minimum of serving cell channel bandwidth and the PRS bandwidths of the reference cell and the measured neighbour cell $i$<br>Note 4 | Conditions                                                                                                     |                                                                                                                                               | Io <sup>Note 5</sup> range                     |                              |                           |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.  
NOTE 2: Ts is the basic timing unit defined in TS 36.211 [16].  
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA assistance data defined in [24].

|         |                                                                                                                                                                                             |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NOTE 4: | The serving cell, the reference cell, and the measured neighbour cell $i$ are on the same carrier frequency.                                                                                |
| NOTE 5: | The $l_0$ is defined in PRS positioning subframes. The same $l_0$ range applies to PRS and non-PRS symbols. $l_0$ levels are different in PRS and non-PRS symbols within the same subframe. |
| NOTE 6: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                 |
| NOTE 7: | The requirement applies when PRS are available within the UE measurement bandwidth in all PRS subframes and measurement gaps are not required.                                              |
| NOTE 8: | The requirement applies when measurement gaps are required.                                                                                                                                 |

#### 9.1.21.21 Intra-Frequency RSTD Accuracy Requirement for UE category M1 in CE mode B

The accuracy requirements in Table 9.1.21.21-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.33 for a corresponding Band

For a UE that does not need a measurement gap for intra-frequency RSTD measurement, there are no measurement gaps overlapping with the PRS subframes of the measured serving cell and PRS are available within the UE measurement bandwidth in all PRS subframes

For a UE that needs a measurement gap for intra-frequency RSTD measurement, the measurement gaps are configured to contain PRS subframes

The parameter *expectedRSTDUncertainty* signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu$ s.

Table 9.1.21.21-1: RSTD measurement accuracy for CEModeB

| Accuracy                | PRS $\hat{E}_s/\text{lot}$                                                                                 | Minimum PRS bandwidth, which is minimum of serving cell channel bandwidth and the PRS bandwidths of the reference cell and the measured neighbour cell $i$<br>Note 4 | Conditions                                                                                                     |                                                                                                                                               | Io <sup>Note 5</sup> range                     |                              |                           |

|                         |                                                                                                            |                                                                                                                                                                      |                                                                                                                |                                                                                                                                               | FDD-M1_N                                       | -114.5                       | -50                       |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.  
NOTE 2:  $T_s$  is the basic timing unit defined in TS 36.211 [16].  
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA assistance data defined in [24].

|         |                                                                                                                                                                                             |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NOTE 4: | The serving cell, the reference cell, and the measured neighbour cell $i$ are on the same carrier frequency.                                                                                |
| NOTE 5: | The $l_o$ is defined in PRS positioning subframes. The same $l_o$ range applies to PRS and non-PRS symbols. $l_o$ levels are different in PRS and non-PRS symbols within the same subframe. |
| NOTE 6: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                 |
| NOTE 7: | The requirement applies when PRS are available within the UE measurement bandwidth in all PRS subframes and measurement gaps are not required.                                              |
| NOTE 8: | The requirement applies when measurement gaps are required.                                                                                                                                 |

## 9.1.22 Measurement accuracy for UE Category NB1

### 9.1.22.1 Intra-frequency Absolute NRSRP Accuracy for UE Category NB1

The requirements for absolute accuracy of NRSRP in this clause apply to a cell on the same frequency as that of the serving cell for UE Category NB1 for stand-alone, guard-band and in-band deployments.

The accuracy requirements in Table 9.1.22.1-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one or two ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

NRSRP[dBm] according to Annex B.3.25 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for NRSRP measurement assuming measured cell is identified cell.

**Table 9.1.22.1-1: NRSRP Intra frequency absolute accuracy for UE Category NB1 for HD-FDD**

| Accuracy         |                   | Conditions                         |                                                |               |                           |                           |
|------------------|-------------------|------------------------------------|------------------------------------------------|---------------|---------------------------|---------------------------|

| $\pm 6$          | $\pm 9$           | $\geq -6$ dB                       | NFDD_G                                         | -122.9        | N/A                       | -70                       |
| $\pm 8$          | $\pm 11$          | $\geq -6$ dB                       | NFDD_G                                         | N/A           | -70                       | -50                       |
| $\pm 10.3$       | $\pm 13.3$        | $15 \leq \hat{E}_s/l_o \leq -6$ dB | NFDD_G                                         | -122.9        | N/A                       | -70                       |
| $\pm 12.3$       | $\pm 15.3$        | $15 \leq \hat{E}_s/l_o \leq -6$ dB | NFDD_G                                         | N/A           | -70                       | -50                       |

NOTE 1:  $l_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: E-UTRA operating band groups are as defined in Section 3.5.

### 9.1.22.2 Void

### 9.1.22.3 Intra-frequency Absolute NRSRQ Accuracy for UE Category NB1 in Normal Mode

The requirements for absolute accuracy of NRSRQ in this clause apply to a cell on the same frequency as that of the serving cell for NB-IoT UE for stand-alone, guard-band and in-band deployments.

The accuracy requirements in Table 9.1.22.3-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one or two antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

NRSRP[dBm] according to Annex B.3.25 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for NRSRQ measurement assuming measured cell is identified cell.

**Table 9.1.22.3-1: NRSRQ Intra frequency absolute accuracy for UE Category NB1 for HD-FDD**

NOTE 1:  $\text{I}_0$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $\text{I}_0$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

**9.1.22.4**      Void**9.1.22.5**      Inter-frequency Absolute NRSRP Accuracy for UE Category NB1

The requirements for absolute accuracy of NRSRP in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.22.5-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one or two antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

NRSRP[dBm] according to Annex B.3.26 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for NRSRP measurement assuming measured cell is identified cell.

**Table 9.1.22.5-1: NRSRP Inter frequency absolute accuracy for UE Category NB1 for HD-FDD**

| Accuracy         |                   | Conditions                           |                                                |                      |                           |                           |

NOTE 1:  $\text{I}_0$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: E-UTRA operating band groups are as defined in Section 3.5.

**9.1.22.6**      Void**9.1.22.7**      Inter-frequency Absolute NRSRQ Accuracy for UE Category NB1

The requirements for absolute accuracy of NRSRQ in this clause apply to a cell that has different carrier frequency from the serving cell.

The accuracy requirements in Table 9.1.22.7-1 are valid under the following conditions:

Cell specific reference signals are transmitted either from one or two antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

NRSRP<sub>dBm</sub> according to Annex B.3.26 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for NRSRQ measurement assuming measured cell is identified cell.

**Table 9.1.22.7-1: NRSRQ Inter frequency absolute accuracy for UE Category NB1 for HD-FDD**

| Accuracy         |                   | Conditions                           |                                                |               |                           |
|------------------|-------------------|--------------------------------------|------------------------------------------------|---------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}_s/\text{lot}$               | $I_o$ <sup>Note 1</sup> range                  |               |                           |
|                  |                   |                                      | E-UTRA operating band groups <sup>Note 3</sup> | Minimum $I_o$ | Maximum $I_o$             |
| dB               | dB                | dB                                   |                                                | dBm/15kHz     | dBm/BW <sub>channel</sub> |
| ±5.2             | ±8.2              | ≥ -3 dB                              | NFDD_G                                         | -122.9        | -50                       |
| ±7.2             | ±10.2             | ≥ -6 dB                              | Note 2                                         | Note 2        | Note 2                    |
| ±9.5             | ±12.5             | -15 ≤ $\hat{E}_s/\text{lot}$ ≤ -6 dB | NFDD_G                                         | -122.9        | -50                       |
| ±11.5            | ±14.5             | -15 ≤ $\hat{E}_s/\text{lot}$ ≤ -6 dB | Note 2                                         | Note 2        | Note 2                    |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
 NOTE 2: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
 NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

#### 9.1.22.8 Void

#### 9.1.22.9 NRSRP Measurement Report Mapping

The reporting range of NRSRP is defined from -156 dBm to -44 dBm with 1 dB resolution.

The mapping of measured quantity is defined in Table 9.1.22.9-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.1.22.9-1: NRSRP measurement report mapping**

| Reported value | Measured quantity value | Unit |
|----------------|-------------------------|------|
| NRSRP_00       | NRSRP < -156            | dBm  |
| NRSRP_01       | -156 ≤ NRSRP < -155     | dBm  |
| NRSRP_02       | -155 ≤ NRSRP < -154     | dBm  |
| ...            | ...                     | ...  |
| NRSRP_111      | -46 ≤ NRSRP < -45       | dBm  |
| NRSRP_112      | -45 ≤ NRSRP < -44       | dBm  |
| NRSRP_113      | -44 ≤ NRSRP             | dBm  |

#### 9.1.22.10 Intra-Frequency RSTD Accuracy Requirement for NB1 for normal coverage

The accuracy requirements in Table 9.1.22.10-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

NPRP 1,2<sub>dBm</sub> according to Annex B.3.29 for a corresponding Band

There are no measurement gaps overlapping with the NPRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5 μs.

Table 9.1.22.10-1: Intra RSTD measurement accuracy for normal coverage

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Conditions                                                                                                                              |                                                                                                           |                                                                                                                                                             |                                                |                                 |                           |

| NOTE 1: This minimum $I_0$ condition is expressed as the average $I_0$ per RE over all REs in an OFDM symbol.<br>NOTE 2: $T_s$ is the basic timing unit defined in TS 36.211 [16].<br>NOTE 3: The serving cell, the reference cell, and the measured neighbour cell $i$ are on the same carrier frequency.<br>NOTE 4: The $I_0$ is defined in NPRS positioning subframes. The same $I_0$ range applies to NPRS and non-NPRS symbols. $I_0$ levels are different in NPRS and non-NPRS symbols within the same subframe.<br>NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.<br>NOTE 6: $N_{\text{NPRS\_total}}$ can be in one or more NPRS positioning occasions. |                                                                                                                                         |                                                                                                           |                                                                                                                                                             |                                                |                                 |                           |

### 9.1.22.11 Inter-Frequency RSTD Accuracy Requirement for NB1 for normal coverage

The accuracy requirements in Table 9.1.22.11-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

NPRP  $1,2|_{\text{dBm}}$  according to Annex B.3.29 for a corresponding Band

There are no measurement gaps overlapping with the NPRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu\text{s}$ .

Table 9.1.22.11-1: Inter RSTD measurement accuracy for normal coverage

### 9.1.22.12 Intra-Frequency RSTD Accuracy Requirement for NB1 for enhanced coverage

The accuracy requirements in Table 9.1.22.12-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

NPRP 1,2<sub>dBm</sub> according to Annex B.3.29 for a corresponding Band

There are no measurement gaps overlapping with the NPRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu\text{s}$ .

Table 9.1.22.12-1: RSTD measurement accuracy for enhanced coverage

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Conditions                                                                                                |                                                                                                           |                                                                                                                                                      |                                                |                                 |                           |

### 9.1.22.13 Inter-Frequency RSTD Accuracy Requirement for NB1 for enhanced coverage

The accuracy requirements in Table 9.1.22.13-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

NPRP 1,2<sub>dBm</sub> according to Annex B.3.29 for a corresponding Band

There are no measurement gaps overlapping with the NPRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu\text{s}$ .

Table 9.1.22.13-1: RSTD measurement accuracy for enhanced coverage

NOTE 1: This minimum  $Io$  condition is expressed as the average  $Io$  per RE over all REs in an OFDM symbol.  
NOTE 2:  $T_s$  is the basic timing unit defined in TS 36.211 [16].  
NOTE 3: The serving cell, the reference cell, and the measured neighbour cell  $i$  are on the same carrier frequency.  
NOTE 4: The  $Io$  is defined in NPRS positioning subframes. The same  $Io$  range applies to NPRS and non-NPRS symbols.  $Io$  levels are different in NPRS and non-NPRS symbols within the same subframe.  
NOTE 5: E-UTRA operating band groups are as defined in Section 3.5.  
NOTE 6:  $N_{NPRS\_total}$  can be in one or more NPRS positioning occasions.

#### 9.1.22.14 NRSRQ Measurement Report Mapping

The reporting range of NRSRQ is defined from -34 dB to 2.5 dB with 0.5 dB resolution.

The mapping of measured quantity is defined in table 9.1.22.14-1. The range in the signalling may be larger than the guaranteed accuracy range.

Table 9.1.22.14-1: NRSRQ measurement report mapping

| Reported value | Measured quantity value  | Unit |
|----------------|--------------------------|------|
| NRSRQ_-30      | $NRSRQ < -34$            | dB   |
| NRSRQ_-29      | $-34 \leq NRSRQ < -33.5$ | dB   |

#### 9.1.23 Power Headroom for UE Category NB1

The requirements in this clause shall apply for power headroom for UE Category NB1 as defined in [31].

The power headroom provides the serving eNB with information about the differences between the UE configured maximum output power ( $P_{CMAX}$ ) defined in TS 36.101 [5] and the estimated power for UL-NSCH transmission of the serving cell [3].

**Table 9.1.23 -1: The applicability of power headroom report mapping requirements for different power class UE**

| Power class | Power headroom report mapping  |
|-------------|--------------------------------|
| PC3 and PC5 | As defined in section 9.1.23.3 |
| PC6         | As defined in section 9.1.23.4 |

### 9.1.23.1 Period

The reported power headroom shall be estimated over 1 slot of NPUSCH transmissions.

### 9.1.23.2 Reporting Delay

The power headroom reporting delay is defined as the time between the beginning of the power headroom reference period and the time when the UE starts transmitting the power headroom over the radio interface. The reporting delay of the power headroom shall be 0 ms, which is applicable for all configured triggering mechanisms for power headroom reporting.

### 9.1.23.3 Report Mapping for UE Category NB1

The power headroom reporting range is from [-54] ...+11 dB for UE category NB1 when the enhanced coverage level 0 is selected during the random access procedure [17]. The report mapping is defined in Table 9.1.23.3-1.

**Table 9.1.23.3-1: Power headroom report mapping for UE category NB1 when the enhanced coverage level 0 is selected during random access procedure [17]**

| Reported value   | Measured quantity value (dB) |
|------------------|------------------------------|
| POWER_HEADROOM_0 | $[-54] \leq PH < 5$          |
| POWER_HEADROOM_1 | $5 \leq PH < 8$              |
| POWER_HEADROOM_2 | $8 \leq PH < 11$             |
| POWER_HEADROOM_3 | $PH \geq 11$                 |

The power headroom reporting range is from [-54] ...+6 dB for UE category NB1 when enhanced coverage level other than 0 is selected during the random access procedure [17]. The report mapping is defined in Table 9.1.23.3-2.

**Table 9.1.23.3-2: Power headroom report mapping for UE category NB1 when the enhanced coverage level other than 0 is selected during random access procedure [17]**

| Reported value   | Measured quantity value (dB) |
|------------------|------------------------------|
| POWER_HEADROOM_0 | $[-54] \leq PH < -10$        |
| POWER_HEADROOM_1 | $-10 \leq PH < -2$           |
| POWER_HEADROOM_2 | $-2 \leq PH < 6$             |
| POWER_HEADROOM_3 | $PH \geq 6$                  |

#### 9.1.23.3.1 Void

#### 9.1.23.3.2 Void

#### 9.1.23.4 Report Mapping for UE Category NB1 for UE Power Class 6

The power headroom reporting range is -54 ... +11 dB for UE category NB1 when the enhanced coverage level 0 is selected during the random access procedure [17] for UE power class 6 [5]. The report mapping is defined in Table 9.1.23.4-1.

**Table 9.1.23.4-1: Power headroom report mapping for UE category NB1 when the enhanced coverage level 0 is selected during random access procedure [17] for UE PC6**

| Reported value   | Measured quantity value (dB) |
|------------------|------------------------------|
| POWER_HEADROOM_0 | $[-54] \leq PH < [5]$        |
| POWER_HEADROOM_1 | $[5] \leq PH < [8]$          |
| POWER_HEADROOM_2 | $[8] \leq PH < [11]$         |
| POWER_HEADROOM_3 | $PH \geq [11]$               |

The power headroom reporting range is from [-54] ...0 dB for UE category NB1 when the enhanced coverage level other than 0 is selected during the random access procedure [17] for UE power class of 6 [5]. The report mapping is defined in Table 9.1.23.4-2.

**Table 9.1.23.4-2: Power headroom report mapping for UE category NB1 when the enhanced coverage level other than 0 is selected during random access procedure [17] for UE PC6**

| Reported value   | Measured quantity value (dB) |
|------------------|------------------------------|
| POWER_HEADROOM_0 | $[-54] \leq PH < [-20]$      |
| POWER_HEADROOM_1 | $[-20] \leq PH < [-10]$      |
| POWER_HEADROOM_2 | $[-10] \leq PH < [0]$        |
| POWER_HEADROOM_3 | $PH \geq [0]$                |

#### 9.1.24 Void

#### 9.1.25 Measurement accuracy for UE category M2

##### 9.1.25.1 Inter-Frequency RSTD Accuracy Requirement for UE category M2 in CE mode A

The accuracy requirements in Table 9.1.25.1-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.32 for a corresponding Band

There are no measurement gaps overlapping with the PRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5 µs.

Table 9.1.25.1-1: RSTD measurement accuracy for CEModeA

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Conditions                                                                                                 |                                                                                                                                                            |                                                                                                                |                                                                                                                                               |                                                |                              |                           |

| NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.<br>NOTE 2: $T_s$ is the basic timing unit defined in TS 36.211 [16].<br>NOTE 3: PRS bandwidth is as indicated in <i>prs-Bandwidth</i> in the OTDOA assistance data defined in [24].<br>NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 6 RB.<br>NOTE 5: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.<br>NOTE 6: E-UTRA operating band groups are as defined in Section 3.5. |                                                                                                            |                                                                                                                                                            |                                                                                                                |                                                                                                                                               |                                                |                              |                           |

### 9.1.25.2 Inter-Frequency RSTD Accuracy Requirement for UE category M2 in CE mode B

The accuracy requirements in Table 9.1.25.2-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.32 for a corresponding Band

There are no measurement gaps overlapping with the PRS subframes of the measured serving cell.

The parameter expectedRSTDUncertainty signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5 µs.

Table 9.1.25.2-1: RSTD measurement accuracy for CEModeB

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Conditions                                                                                                  |                                                                                                                                                            |                                                                                                                |                                                                                                                                               |                                                |                              |                           |

| NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.<br>NOTE 2: $T_s$ is the basic timing unit defined in TS 36.211 [16].<br>NOTE 3: PRS bandwidth is as indicated in <i>prs-Bandwidth</i> in the OTDOA assistance data defined in [24].<br>NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 6 RB.<br>NOTE 5: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.<br>NOTE 6: E-UTRA operating band groups are as defined in Section 3.5. |                                                                                                             |                                                                                                                                                            |                                                                                                                |                                                                                                                                               |                                                |                              |                           |

### 9.1.25.3 UE RX-TX time difference Accuracy Requirement for Cat-M2

The UE RX-TX time difference is measured from the PCell.

The accuracy requirements in Table 9.1.25.3-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

No changes to the uplink transmission timing are applied during the measurement period.

$\text{RSRP}_{\text{dBm}}$  according to Annex B.2.14 for a corresponding Band

**Table 9.1.25.3-1: UE Rx – Tx time difference measurement accuracy for CEModeA**

| [±10]                   | ≥ -3 dB                | ≥ 24                                     | Note 3                                         | Note 3        | Note 3                    |

NOTE 1: When in dBm/15kHz, the minimum  $I_o$  condition is expressed as the average  $I_o$  per RE over all REs in that symbol.  $I_o$  may be different in different symbols within a subframe.

NOTE 2:  $T_s$  is the basic timing unit defined in TS 36.211.

NOTE 3: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding requirement with downlink bandwidth ≥ 1.4 MHz.

NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.

#### 9.1.25.4 Intra-Frequency RSTD Accuracy Requirement for UE category M2 in CE mode A

The accuracy requirements in Table 9.1.25.4-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.34 for a corresponding Band

For a UE that does not need a measurement gap for intra-frequency RSTD measurement, there are no measurement gaps overlapping with the PRS subframes of the measured serving cell and PRS are available within the UE measurement bandwidth in all PRS subframes

For a UE that needs a measurement gap for intra-frequency RSTD measurement, the measurement gaps are configured to contain PRS subframes

The parameter *expectedRSTDUncertainty* signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5 μs.

Table 9.1.25.4-1: RSTD measurement accuracy for CEModeA

| Accuracy                                                                                                                                                                                                              | Conditions                                                                                                              |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                       |                     |                           |

| NOTE 3: PRS bandwidth is as indicated in <i>prs-Bandwidth</i> in the OTDOA assistance data defined in [24].                                                                                                           |                                                                                                                         |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                       |                     |                           |
| NOTE 4: The same bands and the same $\text{Io}$ conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 6 RB.                                               |                                                                                                                         |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                       |                     |                           |
| NOTE 5: The serving cell, the reference cell, and the measured neighbour cell $i$ are on the same carrier frequency.                                                                                                  |                                                                                                                         |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                       |                     |                           |
| NOTE 6: The $\text{Io}$ is defined in PRS positioning subframes. The same $\text{Io}$ range applies to PRS and non-PRS symbols. $\text{Io}$ levels are different in PRS and non-PRS symbols within the same subframe. |                                                                                                                         |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                       |                     |                           |
| NOTE 7: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                   |                                                                                                                         |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                       |                     |                           |
| NOTE 8: The requirement applies when PRS are available within the UE measurement bandwidth in all PRS subframes and measurement gaps are not required.                                                                |                                                                                                                         |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                       |                     |                           |
| NOTE 9: The requirement applies when measurement gaps are required.                                                                                                                                                   |                                                                                                                         |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                       |                     |                           |

### 9.1.25.5 Intra-Frequency RSTD Accuracy Requirement for UE category M2 in CE mode B

The accuracy requirements in Table 9.1.25.5-1 are valid under the following conditions:

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

PRP 1,2<sub>dBm</sub> according to Annex B.3.34 for a corresponding Band

For a UE that does not need a measurement gap for intra-frequency RSTD measurement, there are no measurement gaps overlapping with the PRS subframes of the measured serving cell and PRS are available within the UE measurement bandwidth in all PRS subframes

For a UE that needs a measurement gap for intra-frequency RSTD measurement, the measurement gaps are configured to contain PRS subframes

The parameter *expectedRSTDUncertainty* signalled over LPP by E-SMLC as defined in TS 36.355 [24] is less than 5  $\mu$ s.

Table 9.1.25.5-1: RSTD measurement accuracy for CEModeB

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Conditions                                                                                                  |                                                                                                                                                                              |                                                                                                                |                                                                                                                                               |                                                |                                 |                           |

## 9.1.26 Measurement Accuracy for non-BL CE UE

### 9.1.26.1 Intra-frequency Absolute Accuracy of RSRP for non-BL CE UE in CE mode A

The requirements for absolute accuracy of RSRP in this clause apply to a cell on the same frequency as that of the serving cell for non-BL CE UE.

The accuracy requirements in Table 9.1.26.1-1 and Table 9.1.26.1-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.26.1-1: RSRP Intra frequency absolute accuracy for non-BL CE UE with CE mode A for FDD and TDD**

| Accuracy                                                                                                              |                   | Conditions             |                                                                                |                             |                           |                           |

| NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.                                                   |                   |                        |                                                            |                             |                           |                           |

### 9.1.26.2 Intra-frequency Relative Accuracy of RSRP for non-BL CE UE in CE mode A

The same requirement as for UE category M1 in Clause 9.1.21.2 applies.

### 9.1.26.3 Intra-frequency Absolute Accuracy of RSRP for non-BL CE UE in CE mode B

The requirements for absolute accuracy of RSRP in this clause apply to a cell on the same frequency as that of the serving cell for non-BL CE UE.

The accuracy requirements in Table 9.1.26.3-1 and Table 9.1.26.3-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.26.3-1: RSRP Intra frequency absolute accuracy for non-BL CE UE with CE mode B for FDD and TDD**

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

**9.1.26.4 Intra-frequency Relative Accuracy of RSRP for non-BL CE UE in CE mode B**

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on the same frequency for the non-BL CE UE.

The accuracy requirements in Table 9.1.26.4-1 and Table 9.1.26.4-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.8 for a corresponding Band.

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.26.4-1: RSRP Intra frequency relative accuracy for non-BL CE UE with CE mode B for FDD and TDD**

| Accuracy         |                   | Conditions                                 |                                                |                             |                           |

| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter $\hat{E}s/lot$ is the minimum $\hat{E}s/lot$ of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same $I_o$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 5: E-UTRA operating band groups are as defined in Section 3.5. |                   |                                    |                                                |                             |                           |

**9.1.26.5 RSRP Measurement Report Mapping**

The same RSRP reporting range as for UE category M1 in Clause 9.1.21.5 applies.

**9.1.26.6 Intra-frequency Absolute Accuracy of RSRQ for non-BL CE UE in CE mode A**

The same requirement as for UE category M1 in Clause 9.1.21.6 applies.

**9.1.26.7 Intra-frequency Absolute Accuracy of RSRQ for non-BL CE UE in CE mode B**

The requirements for absolute accuracy of RSRQ in this clause apply to a cell on the same frequency as that of the serving cell for the non-BL CE UE.

The accuracy requirements in Tables 9.1.26.7-1 and 9.1.26.7-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

**Table 9.1.26.7-1: RSRQ Intra frequency absolute accuracy for non-BL CE UE with CE mode B for FDD and TDD**

### 9.1.26.8 RSRQ Measurement Report Mapping

The same RSRQ reporting range as for UE category M1 in Clause 9.1.21.8 applies.

### 9.1.26.9 Inter-frequency Absolute Accuracy of RSRP for non-BL CE UE in CE mode A

The requirements for absolute accuracy of RSRP in this clause apply to a cell on another frequency than that of the serving cell for non-BL CE UE.

The accuracy requirements in Table 9.1.26.9-1 and Table 9.1.26.9-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.26.9-1: RSRP Inter frequency absolute accuracy for non-BL CE UE with CE mode A for FDD and TDD**

### 9.1.26.10 Inter-frequency Relative Accuracy of RSRP for non-BL CE UE in CE mode A

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on another frequency for the non-BL CE UE.

The accuracy requirements in Table 9.1.26.10-1 and Table 9.1.26.10-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.8 for a corresponding Band.

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.26.10-1: RSRP Inter frequency relative accuracy for non-BL CE UE with CE mode A for FDD and TDD**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                   | Conditions                       |                                                |                             |                           |

### 9.1.26.11 Inter-frequency Absolute Accuracy of RSRP for non-BL CE UE in CE mode B

The requirements for absolute accuracy of RSRP in this clause apply to a cell on another frequency than that of the serving cell for the non-BL UE.

The accuracy requirements in Table 9.1.26.11-1 and Table 9.1.26.11-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.1 for a corresponding Band

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.26.11-1: RSRP Inter frequency absolute accuracy for non-BL CE UE with CE mode B for FDD and TDD**

### 9.1.26.12 Inter-frequency Relative Accuracy of RSRP for non-BL CE UE in CE mode B

The relative accuracy of RSRP is defined as the RSRP measured from one cell compared to the RSRP measured from another cell on another frequency.

The accuracy requirements in Table 9.1.26.12-1 and Table 9.1.26.12-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.3.8 for a corresponding Band.

At least 1 DL subframe per radio frame of measured cell is available at the UE for RSRP measurement assuming measured cell is identified cell.

**Table 9.1.26.12-1: RSRP Inter frequency relative accuracy for non-BL CE UE with CE mode B for FDD and TDD**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                   | Conditions                       |                                                |                             |                           |

| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter $\hat{E}s/lot$ is the minimum $\hat{E}s/lot$ of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same $I_o$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.<br>NOTE 5: E-UTRA operating band groups are as defined in Section 3.5. |                   |                                  |                                                |                             |                           |

**9.1.26.13 Inter-frequency Absolute Accuracy of RSRQ for non-BL CE UE in CE mode A**

The same requirement as for UE category M1 in Clause 9.1.21.13 applies.

**9.1.26.14 Inter-frequency Relative Accuracy of RSRQ for non-BL CE UE in CE mode A**

The same requirement as for UE category M1 in Clause 9.1.21.14 applies.

**9.1.26.15 Inter-frequency Absolute Accuracy of RSRQ for non-BL CE UE in CE mode B**

The requirements for absolute accuracy of RSRQ in this clause apply to a cell that has different carrier frequency from the serving cell for the non-BL CE UE.

The accuracy requirements in Tables 9.1.26.15-1 and 9.1.26.15-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

RSRP[dBm] according to Annex B.3.3 for a corresponding Band

**Table 9.1.26.15-1: RSRQ Inter frequency absolute accuracy for non-BL CE UE with CE mode B for FDD and TDD**

| Accuracy                                                                                                                                                                                                                                                                                                                                                                                                                   |                   | Conditions                         |                                                |                               |                    |

### 9.1.26.16 Inter-frequency Relative Accuracy of RSRQ for non-BL CE UE in CE mode B

The relative accuracy of RSRQ in inter frequency case is defined as the RSRQ measured from one cell compared to the RSRQ measured from another cell on a different frequency.

The accuracy requirements in Tables 9.1.26.16-1 and 9.1.26.16-2 are valid under the following conditions:

Cell specific reference signals are transmitted either from one, two or four antenna ports.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

$RSRP_{1,2|dBm}$  according to Annex B.3.4 for a corresponding Band

$$\left| RSRP_{1|dBm} - RSRP_{2|dBm} \right| \leq 27dB$$

$$| \text{Channel 1}_{Io} - \text{Channel 2}_{Io} | \leq 20 \text{ dB}$$

## 9.2 UTRAN FDD Measurements

The requirements in this clause are applicable for a UE:

- in state RRC\_CONNECTED
- performing measurements according to clause 8.1.2.4 with appropriate measurement gaps
- that is synchronised to the cell that is measured.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in TS 25.302 [6].

The accuracy requirements in this clause are valid for the reported measurement result after layer 1 filtering. The accuracy requirements are verified from the measurement report at point D in the measurement model having the layer 3 filtering disabled.

## 9.2.1 UTRAN FDD CPICH RSCP

NOTE: This measurement is for handover between E-UTRAN and UTRAN FDD and for SON.

The requirements in this clause are valid for terminals supporting this capability.

The measurement period for RRC\_CONNECTED state is specified in clauses 8.1.2.4.1 and 8.1.2.4.2.

In RRC\_CONNECTED state the accuracy requirements shall meet the absolute accuracy requirements in table 9.2.1-1, under the following conditions:

- CPICH Ec/Io condition for a detectable cell is as specified in clauses 8.1.2.4.1, 8.1.2.4.2, 8.1.2.4.7, 8.1.2.4.8;
- SCH\_Ec/Io condition for a detectable cell is as specified in clauses 8.1.2.4.1, 8.1.2.4.2, 8.1.2.4.7, 8.1.2.4.8.

**Table 9.2.1-1: UTRAN FDD CPICH\_RSCP absolute accuracy**

| Accuracy                                                                                                                                                                                                                             |                   | Conditions                                   |              |              |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|----------------------------------------------|--------------|--------------|
| Normal condition                                                                                                                                                                                                                     | Extreme condition | Io range                                     |              |              |
|                                                                                                                                                                                                                                      |                   | UTRA operating bands                         | Minimum Io   | Maximum Io   |
| dB                                                                                                                                                                                                                                   | dB                |                                              | dBm/3.84 MHz | dBm/3.84 MHz |
| ±6                                                                                                                                                                                                                                   | ±9                | Band I, IV, VI, X XI, XIX and XXI            | -94          | -70          |
|                                                                                                                                                                                                                                      |                   | Band IX                                      | -93          | -70          |
|                                                                                                                                                                                                                                      |                   | Band II, V and VII                           | -92          | -70          |
|                                                                                                                                                                                                                                      |                   | Band III, VIII, XII, XIII, XIV , XX and XXII | -91          | -70          |
|                                                                                                                                                                                                                                      |                   | Band XXV, XXVI <sup>Note 1</sup>             | -90.5        | -70          |
| ±8                                                                                                                                                                                                                                   | ±11               | Note 2                                       | -70          | -50          |
| NOTE 1: For Band XXVI, the condition has the minimum Io of -92 dBm/3.84 MHz when the carrier frequency of the assigned UTRA channel is within 869-894 MHz for the UE which supports both Band V and Band XXVI operating frequencies. |                   |                                              |              |              |
| NOTE 2: The same bands apply for this requirement as for the corresponding highest accuracy requirement.                                                                                                                             |                   |                                              |              |              |

If the UE, in RRC\_CONNECTED state, needs measurement gaps to perform UTRAN FDD measurements, the relevant UTRAN FDD measurement procedure and measurement gap pattern stated in clause 8.1.2.4 shall apply.

The reporting range and mapping specified for FDD CPICH RSCP in TS 25.133 [18] shall apply.

## 9.2.2 Void

## 9.2.3 UTRAN FDD CPICH Ec/No

NOTE: This measurement is for handover between E-UTRAN and UTRAN FDD and for SON.

The requirements in this clause are valid for terminals supporting this capability.

The measurement period for RRC\_CONNECTED state is specified in clauses 8.1.2.4.1 and 8.1.2.4.2.

In RRC\_CONNECTED state the accuracy requirements shall be the same as the inter-frequency measurement accuracy requirements for FDD CPICH Ec/No in TS 25.133 [18].

If the UE, in RRC\_CONNECTED state, needs measurement gaps to perform UTRAN FDD measurements, the UTRAN FDD measurement procedure and measurement gap pattern stated in clause 8.1.2.4.1 shall apply.

The reporting range and mapping specified for FDD CPICH Ec/No in TS 25.133 [18] shall apply.

## 9.3 UTRAN TDD Measurements

The requirements in this clause are applicable for a UE:

- in state RRC\_CONNECTED
- performing measurements according to clause 8.1.2.4 with appropriate measurement gaps
- that is synchronised to the cell that is measured.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in TS 25.302 [6].

The accuracy requirements in this clause are valid for the reported measurement result after layer 1 filtering. The accuracy requirements are verified from the measurement report at point D in the measurement model having the layer 3 filtering disabled.

### 9.3.1 UTRAN TDD P-CCPCH RSCP

NOTE: This measurement is for handover between E-UTRAN and UTRAN TDD and for SON.

The requirements in this clause are valid for terminals supporting this capability.

The measurement period for RRC\_CONNECTED state is specified in clauses 8.1.2.4.3 and 8.1.2.4.4.

In RRC\_CONNECTED state the accuracy requirements shall be the same as the inter-frequency measurement accuracy requirements for TDD P-CCPCH in TS 25.123 [19].

If the UE, in RRC\_CONNECTED state, needs measurement gaps to perform UTRAN TDD measurements, the relevant UTRAN TDD measurement procedure and measurement gap pattern stated in clause 8.1.2.4 shall apply.

The reporting range and mapping specified for TDD P-CCPCH RSCP in TS 25.123 [19] shall apply.

### 9.3.2 Void

### 9.3.3 Void

## 9.4 GSM Measurements

The requirements in this clause are applicable for a UE:

- in state RRC\_CONNECTED
- performing measurements according to clause 8.1.2.4.5 with appropriate measurement gaps
- that is synchronised to the cell that is measured.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in TS 25.302 [6].

The accuracy requirements in this clause are valid for the reported measurement result after layer 1 filtering. The accuracy requirements are verified from the measurement report at point D in the measurement model having the layer 3 filtering disabled.

### 9.4.1 GSM carrier RSSI

NOTE: This measurement is for handover between E-UTRAN and GSM.

The requirements in this clause are valid for terminals supporting this capability.

The measurement period for RRC\_CONNECTED state is specified in clause 8.1.2.4.5.

In RRC\_CONNECTED state the measurement accuracy requirements for RXLEV in TS 45.008 [8] shall apply.

If the UE, in RRC\_CONNECTED state, needs measurement gaps to perform GSM measurements, the GSM measurement procedure and measurement gap pattern stated in clause 8.1.2.4.5 shall apply.

The reporting range and mapping specified for RXLEV in TS 45.008 [8] shall apply.

## 9.5 CDMA2000 1x RTT Measurements

The requirements in this clause are applicable for a UE:

- in RRC\_CONNECTED state.
- synchronised to the cell that is measured.

### 9.5.1 CDMA2000 1x RTT Pilot Strength

NOTE: This measurement is for handover between E-UTRAN and cdma2000 1 x RTT.

The requirements in this clause are valid for terminals supporting this capability.

CDMA2000 1xRTT Pilot Strength defined in sub-clause 5.1.10 of [4] shall meet the performance requirement defined in sub-clause 3.2.4 of [14] on the cdma2000 1xRTT neighbour cells indicated by the serving eNode B.

## 9.6 $P_{\text{CMAX},c}$

For a UE configured with a secondary cell, the UE is required to report the UE configured maximum output power ( $P_{\text{CMAX},c}$ ) together with the power headroom. This clause defines the requirements for the  $P_{\text{CMAX},c}$  reporting.

### 9.6.1 Report Mapping

The  $P_{\text{CMAX},c}$  reporting range is defined from -29dBm to 33 dBm with 1 dB resolution. Table 9.6.1-1 defines the reporting mapping.

**Table 9.6.1-1 Mapping of  $P_{\text{CMAX},c}$**

| Reported value | Measured quantity value            | Unit |
|----------------|------------------------------------|------|
| PCMAX_C_00     | $P_{\text{CMAX},c} < -29$          | dBm  |
| PCMAX_C_01     | $-29 \leq P_{\text{CMAX},c} < -28$ | dBm  |
| PCMAX_C_02     | $-28 \leq P_{\text{CMAX},c} < -27$ | dBm  |
| ...            | ...                                | ...  |
| PCMAX_C_61     | $31 \leq P_{\text{CMAX},c} < 32$   | dBm  |
| PCMAX_C_62     | $32 \leq P_{\text{CMAX},c} < 33$   | dBm  |
| PCMAX_C_63     | $33 \leq P_{\text{CMAX},c}$        | dBm  |

### 9.6.2 Estimation Period

When *extendedPHR* is configured and UE is required to include  $P_{\text{CMAX},c}$  in Extended PHR MAC control element as defined in subclause 5.4.6 in [17], the UE shall calculate the  $P_{\text{CMAX},c}$  per activated serving cell *c* for UL-SCH transmission according to subclause 6.2.5A of TS 36.101 [5] over 1 subframe.

### 9.6.3 Reporting Delay

The  $P_{\text{CMAX},c}$  reporting delay is defined as the time between the beginning of the  $P_{\text{CMAX},c}$  reference period and the time when the UE starts transmitting  $P_{\text{CMAX},c}$  over the radio interface. The reporting delay of the  $P_{\text{CMAX},c}$  shall be 0 ms, which is applicable for all configured triggering mechanisms for  $P_{\text{CMAX},c}$  reporting.

## 9.7 IEEE802.11 Measurements

The requirements in this clause are applicable for a UE:

- in RRC\_CONNECTED state.

- synchronised to the IEEE 802.11 access point that is measured.

### 9.7.1 WLAN RSSI

NOTE: This measurement is for access network selection and traffic steering between E-UTRAN and WLAN.

The requirements in this clause are valid for terminals supporting this capability.

WLAN RSSI defined in sub-clause 5.1.16 of [4] shall meet the performance requirement defined in [32].

### 9.7.2 WLAN RSSI Measurement Report Mapping

This sub-clause 9.7.2 doesn't apply to LPP *WLAN-MeasurementInformation*. The WLAN RSSI measurement report mapping is defined in [32] for LPP *WLAN-MeasurementInformation*.

The reporting range of WLAN RSSI is defined from -100 dBm to 40 dBm with 1 dB resolution.

The mapping of measured quantity is defined in Table 9.7.2-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.7.2-1: WLAN RSSI measurement report mapping**

| Reported value | Measured quantity value            | Unit |
|----------------|------------------------------------|------|
| WLAN RSSI_00   | WLAN RSSI < -100                   | dBm  |
| WLAN RSSI_01   | $-100 \leq \text{WLAN RSSI} < -99$ | dBm  |
| WLAN RSSI_02   | $-99 \leq \text{WLAN RSSI} < -98$  | dBm  |
| ...            | ...                                | ...  |
| WLAN RSSI_139  | $38 \leq \text{WLAN RSSI} < 39$    | dBm  |
| WLAN RSSI_140  | $39 \leq \text{WLAN RSSI} < 40$    | dBm  |
| WLAN RSSI_141  | $40 \leq \text{WLAN RSSI}$         | dBm  |

## 9.8 MBSFN Measurements

### 9.8.1 Introduction

MBSFN measurements include MBSFN RSRP, MBSFN RSRQ, and MCH BLER, which are defined in [4]. The measurements are used for MDT.

The requirements in Section 9.8 apply for 15 kHz subcarrier spacing configured in MBSFN subframes. The same requirements apply also for 1.25 kHz and 7.5 kHz subcarrier spacing, provided that  $\text{MBSFN RSRP[dBm/(L) kHz]} = \text{MBSFN RSRP[dBm/15kHz]} + 10 \cdot \log_{10}(L/15)$ , where L is 1.25 kHz or 7.5 kHz.

### 9.8.2 MBSFN RSRP

#### 9.8.2.1 Absolute MBSFN RSRP measurement accuracy requirements

The requirements for absolute accuracy of MBSFN RSRP in this clause apply to any carrier, which may be the same as or different from any serving unicast carrier, where PMCH is received while meeting performance requirements in Section 10 of [5].

The accuracy requirements in Table 9.8.2.1-1 are valid under the following conditions:

MBSFN RS are transmitted from antenna port 4 in the MBSFN subframes where PMCH is received.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

MBSFN RSRP[dBm/15kHz] is the same as RSRP[dBm/15kHz] specified in Annex B.3.1 for each corresponding Band.

**Table 9.8.2.1-1: Absolute MBSFN RSRP measurement accuracy**

| Accuracy         |                   | Conditions         |                                                                                    |                             |                           |                           |
|------------------|-------------------|--------------------|------------------------------------------------------------------------------------|-----------------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}_s/I_{ot}$ | $I_o$ <sup>Note 1</sup> range                                                      |                             |                           |                           |
|                  |                   |                    | E-UTRA operating band groups <sup>Note 3</sup>                                     | Minimum $I_o$               |                           | Maximum $I_o$             |
| dB               | dB                | dB                 |                                                                                    | dBm/15kHz <sup>Note 2</sup> | dBm/BW <sub>Channel</sub> | dBm/BW <sub>Channel</sub> |
| ±4.5             | ±9                | ≥-6 dB             | FDD_A, TDD_A                                                                       | -121                        | N/A                       | -70                       |
|                  |                   |                    | FDD_B                                                                              | -120.5                      | N/A                       | -70                       |
|                  |                   |                    | FDD_C, TDD_C                                                                       | -120                        | N/A                       | -70                       |

|                  |                   |                    | FDD_N                                                                              | -114.5                      | N/A                       | -70                       |
| ±8               | ±11               | ≥-6 dB             | FDD_A, TDD_A, FDD_B, FDD_C, TDD_C, FDD_D, FDD_E, TDD_E, FDD_F, FDD_G, FDD_H, FDD_N | N/A                         | -70                       | -50                       |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA operating band groups are as defined in Section 3.5.

### 9.8.2.2 MBSFN RSRP measurement report mapping

The reporting range of MBSFN RSRP is defined from -140 dBm to -44 dBm with 1 dB resolution, for 15kHz subcarrier spacing.

The mapping of measured quantity is defined in Table 9.8.2.2-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.8.2.2-1: MBSFN RSRP measurement report mapping**

| Reported value | Measured quantity value  | Unit         |
|----------------|--------------------------|--------------|
| MBSFN_RSRP_00  | MBSFN_RSRP < -140        | dBm / 15 kHz |
| MBSFN_RSRP_01  | -140 ≤ MBSFN_RSRP < -139 | dBm / 15 kHz |
| MBSFN_RSRP_02  | -139 ≤ MBSFN_RSRP < -138 | dBm / 15 kHz |
| ...            | ...                      | ...          |
| MBSFN_RSRP_95  | -46 ≤ MBSFN_RSRP < -45   | dBm / 15 kHz |
| MBSFN_RSRP_96  | -45 ≤ MBSFN_RSRP < -44   | dBm / 15 kHz |
| MBSFN_RSRP_97  | -44 ≤ MBSFN_RSRP         | dBm / 15 kHz |

### 9.8.2.3 MBSFN RSRP measurement report mapping for 7.5 kHz subcarrier spacing

The reporting range of MBSFN RSRP is defined from -143 dBm to -47 dBm with 1 dB resolution, for 7.5 kHz subcarrier spacing.

The mapping of measured quantity is defined in Table 9.8.2.3-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.8.2.3-1: MBSFN RSRP measurement report mapping**

| Reported value | Measured quantity value  | Unit          |
|----------------|--------------------------|---------------|
| MBSFN_RSRP_00  | MBSFN_RSRP < -143        | dBm / 7.5 kHz |
| MBSFN_RSRP_01  | -143 ≤ MBSFN_RSRP < -142 | dBm / 7.5 kHz |
| MBSFN_RSRP_02  | -142 ≤ MBSFN_RSRP < -141 | dBm / 7.5 kHz |
| ...            | ...                      | dBm / 7.5 kHz |
| MBSFN_RSRP_95  | -49 ≤ MBSFN_RSRP < -48   | dBm / 7.5 kHz |
| MBSFN_RSRP_96  | -48 ≤ MBSFN_RSRP < -47   | dBm / 7.5 kHz |
| MBSFN_RSRP_97  | -47 ≤ MBSFN_RSRP         | dBm / 7.5 kHz |

### 9.8.2.4 MBSFN RSRP measurement report mapping for 1.25 kHz subcarrier spacing

The reporting range of MBSFN RSRP is defined from -151 dBm to -55 dBm with 1 dB resolution, for 1.25 kHz subcarrier spacing.

The mapping of measured quantity is defined in Table 9.8.2.4-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.8.2.4-1: MBSFN RSRP measurement report mapping**

| Reported value | Measured quantity value  | Unit           |
|----------------|--------------------------|----------------|
| MBSFN_RSRP_00  | MBSFN_RSRP < -151        | dBm / 1.25 kHz |
| MBSFN_RSRP_01  | -151 ≤ MBSFN_RSRP < -150 | dBm / 1.25 kHz |
| MBSFN_RSRP_02  | -150 ≤ MBSFN_RSRP < -149 | dBm / 1.25 kHz |
| ...            | ...                      | dBm / 1.25 kHz |
| MBSFN_RSRP_95  | -57 ≤ MBSFN_RSRP < -56   | dBm / 1.25 kHz |
| MBSFN_RSRP_96  | -56 ≤ MBSFN_RSRP < -55   | dBm / 1.25 kHz |
| MBSFN_RSRP_97  | -55 ≤ MBSFN_RSRP         | dBm / 1.25 kHz |

## 9.8.3 MBSFN RSRQ

### 9.8.3.1 Absolute MBSFN RSRQ measurement accuracy requirements

The requirements for absolute accuracy of MBSFN RSRQ in this clause apply to any carrier, which may be the same as or different from a serving unicast carrier, where PMCH is received while meeting performance requirements in Section 10 of [5].

The accuracy requirements in Table 9.8.3.1-1 are valid under the following conditions:

MBSFN RS are transmitted from antenna port 4 in the MBSFN subframes where PMCH is received.

Conditions defined in 36.101 Clause 7.3 for reference sensitivity are fulfilled.

MBSFN RSRP[dBm/15kHz] is the same as RSRP[dBm/15kHz] specified in Annex B.3.1 for each corresponding Band.

**Table 9.8.3.1-1: Absolute MBSFN RSRQ measurement accuracy**

| Accuracy                                                                                                                                          |                   | Conditions |                                                |                             |                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|------------|------------------------------------------------|-----------------------------|---------------------------|
| Normal condition                                                                                                                                  | Extreme condition | Es/Iot     | Io <sup>Note 1</sup> range                     |                             |                           |
|                                                                                                                                                   |                   |            | E-UTRA operating band groups <sup>Note 4</sup> | Minimum Io                  | Maximum Io                |
| dB                                                                                                                                                | dB                | dB         |                                                | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| ±2.5                                                                                                                                              | ±4                | ≥-3 dB     | FDD_A, TDD_A                                   | -121                        | -50                       |
|                                                                                                                                                   |                   |            | FDD_B                                          | -120.5                      | -50                       |

| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.                                                                                 |                   |            |                                                |                             |                           |
| NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement. |                   |            |                                                |                             |                           |
| NOTE 3: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.                                       |                   |            |                                                |                             |                           |
| NOTE 4: E-UTRA operating band groups are as defined in Section 3.5.                                                                               |                   |            |                                                |                             |                           |

### 9.8.3.2 MBSFN RSRQ measurement report mapping

The reporting range of MBSFN RSRQ is defined from -23 dB to -8 dB with 0.5 dB resolution, for 15 kHz subcarrier spacing.

The mapping of measured quantity is defined in Table 9.8.3.2-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.8.3.2-1: MBSFN RSRQ measurement report mapping**

| Reported value | Measured quantity value               | Unit        |
|----------------|---------------------------------------|-------------|
| MBSFN_RSRQ_00  | $\text{MBSFN\_RSRQ} < -23$            | dB / 15 kHz |
| MBSFN_RSRQ_01  | $-23 \leq \text{MBSFN\_RSRQ} < -22.5$ | dB / 15 kHz |
| MBSFN_RSRQ_02  | $-22.5 \leq \text{MBSFN\_RSRQ} < -22$ | dB / 15 kHz |
| ...            | ...                                   | ...         |
| MBSFN_RSRQ_30  | $-8.5 \leq \text{MBSFN\_RSRQ} < -8$   | dB / 15 kHz |
| MBSFN_RSRQ_31  | $-8 \leq \text{MBSFN\_RSRQ}$          | dB / 15 kHz |

### 9.8.3.3 MBSFN RSRQ measurement report mapping for 7.5 kHz subcarrier spacing

The reporting range of MBSFN RSRQ is defined from -26 dB to -8 dB with 0.4 dB resolution, for 7.5 kHz subcarrier spacing.

The mapping of measured quantity is defined in Table 9.8.3.3-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.8.3.3-1: MBSFN RSRQ measurement report mapping**

| Reported value | Measured quantity value                 | Unit |
|----------------|-----------------------------------------|------|
| MBSFN_RSRQ_00  | $\text{MBSFN\_RSRQ} < -26.0$            | dB   |
| MBSFN_RSRQ_01  | $-26.0 \leq \text{MBSFN\_RSRQ} < -25.4$ | dB   |
| MBSFN_RSRQ_02  | $-25.4 \leq \text{MBSFN\_RSRQ} < -24.8$ | dB   |
| ...            | ...                                     | ...  |
| MBSFN_RSRQ_30  | $-8.6 \leq \text{MBSFN\_RSRQ} < -8$     | dB   |
| MBSFN_RSRQ_31  | $-8 \leq \text{MBSFN\_RSRQ}$            | dB   |

### 9.8.3.4 MBSFN RSRQ measurement report mapping for 1.25 kHz subcarrier spacing

The reporting range of MBSFN RSRQ is defined from -32 dB to -14 dB with 0.4 dB resolution, for 1.25 kHz subcarrier spacing.

The mapping of measured quantity is defined in Table 9.8.3.4-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 9.8.3.4-1: MBSFN RSRQ measurement report mapping**

| Reported value | Measured quantity value                 | Unit |
|----------------|-----------------------------------------|------|
| MBSFN_RSRQ_00  | $\text{MBSFN\_RSRQ} < -32$              | dB   |
| MBSFN_RSRQ_01  | $-32 \leq \text{MBSFN\_RSRQ} < -31.4$   | dB   |
| MBSFN_RSRQ_02  | $-31.4 \leq \text{MBSFN\_RSRQ} < -30.8$ | dB   |
| ...            | ...                                     | ...  |
| MBSFN_RSRQ_30  | $-14.6 \leq \text{MBSFN\_RSRQ} < -14$   | dB   |
| MBSFN_RSRQ_31  | $-14 \leq \text{MBSFN\_RSRQ}$           | dB   |

## 9.8.4 MCH BLER

MCH BLER shall be measured as defined in [4].

### 9.8.4.1 Measurement report mapping for MCH BLER

The UE shall report MCH BLER together with the corresponding total number of MCH blocks, which were received by the UE during the MCH BLER measurement period and used for calculating the reported MCH BLER.

The reporting range of MCH BLER is defined from 0.1% to 50% with uniform quantization in log domain.

The mapping of measured quantity is defined in Table 9.8.4.1-1. The range in the signalling may be larger than the range specified in the table below.

**Table 9.8.4.1-1: MCH BLER measurement report mapping**

| Reported value | Measured quantity value    | Unit |
|----------------|----------------------------|------|
| MCH BLER_00    | MCH BLER < 0.1             | %    |
| MCH BLER_01    | 0.1 ≤ MCH BLER < 0.123     | %    |
| MCH BLER_02    | 0.123 ≤ MCH BLER < 0.151   | %    |
| MCH BLER_03    | 0.151 ≤ MCH BLER < 0.186   | %    |
| MCH BLER_04    | 0.186 ≤ MCH BLER < 0.229   | %    |
| MCH BLER_05    | 0.229 ≤ MCH BLER < 0.282   | %    |
| MCH BLER_06    | 0.282 ≤ MCH BLER < 0.347   | %    |
| MCH BLER_07    | 0.347 ≤ MCH BLER < 0.426   | %    |
| MCH BLER_08    | 0.426 ≤ MCH BLER < 0.525   | %    |
| MCH BLER_09    | 0.525 ≤ MCH BLER < 0.645   | %    |
| MCH BLER_10    | 0.645 ≤ MCH BLER < 0.794   | %    |
| MCH BLER_11    | 0.794 ≤ MCH BLER < 0.976   | %    |
| MCH BLER_12    | 0.976 ≤ MCH BLER < 1.201   | %    |
| MCH BLER_13    | 1.201 ≤ MCH BLER < 1.478   | %    |
| MCH BLER_14    | 1.478 ≤ MCH BLER < 1.818   | %    |
| MCH BLER_15    | 1.818 ≤ MCH BLER < 2.236   | %    |
| MCH BLER_16    | 2.236 ≤ MCH BLER < 2.751   | %    |
| MCH BLER_17    | 2.751 ≤ MCH BLER < 3.384   | %    |
| MCH BLER_18    | 3.384 ≤ MCH BLER < 4.163   | %    |
| MCH BLER_19    | 4.163 ≤ MCH BLER < 5.121   | %    |
| MCH BLER_20    | 5.121 ≤ MCH BLER < 6.300   | %    |
| MCH BLER_21    | 6.300 ≤ MCH BLER < 7.750   | %    |
| MCH BLER_22    | 7.750 ≤ MCH BLER < 9.533   | %    |
| MCH BLER_23    | 9.533 ≤ MCH BLER < 11.728  | %    |
| MCH BLER_24    | 11.728 ≤ MCH BLER < 14.427 | %    |
| MCH BLER_25    | 14.427 ≤ MCH BLER < 17.478 | %    |
| MCH BLER_26    | 17.478 ≤ MCH BLER < 21.833 | %    |
| MCH BLER_27    | 21.833 ≤ MCH BLER < 26.858 | %    |
| MCH BLER_28    | 26.858 ≤ MCH BLER < 33.040 | %    |
| MCH BLER_29    | 33.040 ≤ MCH BLER < 40.645 | %    |
| MCH BLER_30    | 40.645 ≤ MCH BLER < 50     | %    |
| MCH BLER_31    | 50 ≤ MCH BLER              | %    |

### 9.8.4.2 Measurement report mapping for MCH Block Number

The reporting range of the total number of received MCH blocks during the measurement period is defined from 0 to 65152. The total number of received MCH blocks is quantized to two values  $n$  and  $m$  with the mappings defined in Table 9.8.4.2-1 and Table 9.8.4.2-2, respectively.

The range in the signalling may be larger than the range specified in the table below.

$N_R$  in Table 9.8.4.2-1 and Table 9.8.4.2-2 represents the total number of received MCH blocks.  $f(N_R)$  is a function of  $N_R$

with the definition that  $f(N_R) = \frac{N_R - (2^n - 1) \times 2^8}{2^n}$ , from where the quantized total number of MCH blocks is

found as  $(2^n - 1) \times 2^8 + m \times 2^n$ .

**Table 9.8.4.2-1: Number of received MCH blocks mapping to n**

| Reported value, n | Number of received MCH blocks |
|-------------------|-------------------------------|
| MCH_NR_N_00       | $0 \leq N_R < 256$            |
| MCH_NR_N_01       | $256 \leq N_R < 768$          |
| MCH_NR_N_02       | $768 \leq N_R < 1792$         |
| MCH_NR_N_03       | $1792 \leq N_R < 3840$        |
| MCH_NR_N_04       | $3840 \leq N_R < 7936$        |
| MCH_NR_N_05       | $7936 \leq N_R < 16128$       |
| MCH_NR_N_06       | $16128 \leq N_R < 32512$      |
| MCH_NR_N_07       | $32512 \leq N_R$              |

**Table 9.8.4.2-2: Number of received MCH blocks mapping to m**

| Reported value, m | $f(N_R)$                |
|-------------------|-------------------------|
| MCH_NR_M_00       | $0 \leq f(N_R) < 1$     |
| MCH_NR_M_01       | $1 \leq f(N_R) < 2$     |
| MCH_NR_M_02       | $2 \leq f(N_R) < 3$     |
| ...               | ...                     |
| MCH_NR_M_253      | $253 \leq f(N_R) < 254$ |
| MCH_NR_M_254      | $254 \leq f(N_R) < 255$ |
| MCH_NR_M_255      | $255 \leq f(N_R)$       |

## 9.9 ProSe Measurements

### 9.9.1 Introduction

The requirements in this section are applicable for a UE capable of ProSe Direct Communication and/or ProSe Direct Discovery.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in [25].

The accuracy requirements in this clause are:

- applicable for AWGN radio propagation conditions,
- assume independent interference (noise) at each receiver antenna port.
- valid for the reported measurement result after layer 1 filtering,
- are verified from the measurement report at point D in the measurement model having the higher layer filtering disabled.

### 9.9.2 Intra-Frequency S-RSRP Measurement Accuracy Requirements

#### 9.9.2.1 Absolute S-RSRP Accuracy

The requirements for absolute accuracy of S-RSRP in this clause apply to a ProSe synchronization source on the same frequency as that of the own ProSe UE performing the measurement.

The accuracy requirements in Table 9.9.2.1-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in 36.101 Clause 7.3D for reference sensitivity are fulfilled.
- S-RSRP[dBm] according to Annex B.5.1 for a corresponding Band are fulfilled.

**Table 9.9.2.1-1: Intra-frequency S-RSRP absolute accuracy for UE capable of ProSe Direct Communication and/or ProSe Direct Discovery**

| Accuracy         |                   | Conditions               |                                                 |                     |                           |                           |
|------------------|-------------------|--------------------------|-------------------------------------------------|---------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$<br>Note 4 | $Io$ Note 1 range                               |                     |                           |                           |
|                  |                   |                          | E-UTRA ProSe operating band groups<br>Note 3    | Minimum $Io$        |                           | Maximum $Io$              |

| $\pm 4.5$        | $\pm 9$           | $\geq -6$ dB             | FDD_A                                           | -121                | N/A                       | -70                       |
|                  |                   |                          | FDD_D                                           | -119.5              | N/A                       | -70                       |
|                  |                   |                          | FDD_E, TDD_E                                    | -119                | N/A                       | -70                       |
|                  |                   |                          | FDD_F                                           | -118.5              | N/A                       | -70                       |
|                  |                   |                          | FDD_G                                           | -118                | N/A                       | -70                       |
|                  |                   |                          | FDD_N                                           | -114.5              | N/A                       | -70                       |
| $\pm 8$          | $\pm 11$          | $\geq -6$ dB             | FDD_A, FDD_D, FDD_E, TDD_E, FDD_F, FDD_G, FDD_N | N/A                 | -70                       | -50                       |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA ProSe operating band groups are as defined in Section 3.5 for the corresponding E-UTRA operating bands.  
NOTE 4:  $\hat{E}s/lot$  for a SyncRef UE is the minimum of the  $\hat{E}s/lot$  of PSSS/PSBCH and the  $\hat{E}s/lot$  of SSSS

### 9.9.2.2 Relative Accuracy of S-RSRP

The relative accuracy of S-RSRP is defined as the S-RSRP measured from one ProSe synchronization source compared to the S-RSRP measured from another ProSe synchronization source on the same frequency.

The accuracy requirements in Table 9.9.2.2-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in 36.101 Clause 7.3D for reference sensitivity are fulfilled.
- S-RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.5.2 for a corresponding Band.

**Table 9.9.2.2-1: S-RSRP Intra frequency relative accuracy for UE capable of ProSe direct communication and/or ProSe Direct Discovery**

| Accuracy         |                   | Conditions               |                                              |                     |                           |
|------------------|-------------------|--------------------------|----------------------------------------------|---------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$ Note 2, 6 | $Io$ Note 1 range                            |                     |                           |
|                  |                   |                          | E-UTRA ProSe operating band groups<br>Note 5 | Minimum $Io$        | Maximum $Io$              |

| $\pm 2$          | $\pm 3$           | $\geq -3$ dB             | FDD_A                                        | -121                | -50                       |
|                  |                   |                          | FDD_D                                        | -119.5              | -50                       |
|                  |                   |                          | FDD_E, TDD_E                                 | -119                | -50                       |
|                  |                   |                          | FDD_F                                        | -118.5              | -50                       |
|                  |                   |                          | FDD_G                                        | -118                | -50                       |
|                  |                   |                          | FDD_N                                        | -114.5              | -50                       |
| $\pm 3$          | $\pm 3$           | $\geq -6$ dB             | Note 3                                       | Note 3              | Note 3                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}s/lot$  is the minimum  $\hat{E}s/lot$  of the pair of SyncRef UEs to which the requirement applies.  
NOTE 3: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA ProSe operating band groups are as defined in Section 3.5 for the corresponding E-UTRA operating bands.  
NOTE 6:  $\hat{E}s/lot$  for a SyncRef UE is the minimum of the  $\hat{E}s/lot$  of PSSS/PSBCH and the  $\hat{E}s/lot$  of SSSS

### 9.9.3 Intra-Frequency SD-RSRP Measurement Accuracy Requirements

The requirements in this clause are applicable for a remote ProSe UE:

- in state RRC\_IDLE or RRC\_CONNECTED if the frequency used for ProSe is the serving frequency, or
- is out of coverage on the frequency used for ProSe, and
- that is synchronised to the ProSe relay UE that is measured.

#### 9.9.3.1 Absolute SD-RSRP Accuracy

The requirements for absolute accuracy of SD-RSRP in this clause apply to a ProSe UE performing SD-RSRP measurements on the same frequency as used by the ProSe relay UE transmitting the relay Discovery message.

The accuracy requirements in Table 9.9.3.1-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in 36.101 Clause 7.3D for reference sensitivity are fulfilled.
- SD-RSRP[dBm] according to Annex B.5.4 for a corresponding Band are fulfilled.
- *numReTx* is configured as 3 for the relay Discovery transmissions. For *numReTx* < 3, the minimum  $\hat{E}_s/N_{oc}$  at which the accuracy requirements are fulfilled is expected to be higher than as specified for *numReTx*=3.

**Table 9.9.3.1-1: Intra-frequency SD-RSRP absolute accuracy for remote UE [2] capable of ProSe Direct Communication and ProSe Direct Discovery and configured by upper layers for relay operation.**

| Accuracy         |                   | Conditions                   |                                              |                     |                           |                           |

|                  |                   |                              | FDD_E                                        | -119                | N/A                       | -70                       |
|                  |                   |                              | FDD_F                                        | -118.5              | N/A                       | -70                       |
|                  |                   |                              | FDD_G                                        | -118                | N/A                       | -70                       |
|                  |                   |                              | FDD_N                                        | -114.5              | N/A                       | -70                       |
| ±8               | ±11               | ≥-1.5 dB                     | FDD_D, FDD_E, FDD_F,<br>FDD_G, FDD_N         | N/A                 | -70                       | -50                       |

NOTE 1: *Io* is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA ProSe operating band groups are as defined in Section 3.5 for the corresponding E-UTRA operating bands.  
NOTE 4: When *numReTx* is configured as 3 for the relay Discovery transmissions. For *numReTx* < 3, the minimum  $\hat{E}_s/N_{oc}$  at which the accuracy requirements are fulfilled is expected to be higher than as specified for *numReTx*=3.  
NOTE 5: Layer 1 filtering for SD-RSRP is performed using PSDCH (re)transmissions within a discovery period.

#### 9.9.3.2 Relative Accuracy of SD-RSRP

The relative accuracy of SD-RSRP in this clause apply to a ProSe UE performing SD-RSRP measurements on the same frequency as used by the ProSe relay UE transmitting the relay Discovery message.

The accuracy requirements in Table 9.9.3.2-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.

- Conditions defined in 36.101 Clause 7.3D for reference sensitivity are fulfilled.
- SD-RSRP[dBm] according to Annex B.5.5 for a corresponding Band are fulfilled.
- $numReTx$  is configured as 3 for the relay Discovery transmissions. For  $numReTx < 3$ , the minimum  $\hat{E}s/N_{oc}$  at which the accuracy requirements are fulfilled is expected to be higher than as specified for  $numReTx=3$ .

**Table 9.9.3.2-1: Intra-frequency SD-RSRP relative accuracy for remote UE [2] capable of ProSe Direct Communication and ProSe Direct Discovery and configured by upper layers for relay operation.**

| Accuracy                                                                                                                                                                                                                                         |                   | Conditions                          |                                                      |                             |                           |

| NOTE 1: $I_o$ is assumed to have constant EPRE across the bandwidth.                                                                                                                                                                             |                   |                                     |                                                      |                             |                           |
| NOTE 2: The parameter $\hat{E}s/N_{oc}$ is the minimum $\hat{E}s/N_{oc}$ of the pair of ProSe Relay UEs to which the requirement applies.                                                                                                        |                   |                                     |                                                      |                             |                           |
| NOTE 3: The same bands and the same $I_o$ conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.                                                                                             |                   |                                     |                                                      |                             |                           |
| NOTE 4: The condition level is increased by $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.                                                                                                                            |                   |                                     |                                                      |                             |                           |
| NOTE 5: E-UTRA ProSe operating band groups are as defined in Section 3.5 for the corresponding E-UTRA operating bands.                                                                                                                           |                   |                                     |                                                      |                             |                           |
| NOTE 6: When $numReTx$ is configured as 3 for the relay Discovery transmissions. For $numReTx < 3$ , the minimum $\hat{E}s/N_{oc}$ at which the accuracy requirements are fulfilled is expected to be higher than as specified for $numReTx=3$ . |                   |                                     |                                                      |                             |                           |
| NOTE 7: Layer 1 filtering for SD-RSRP is performed using PSDCH (re)transmissions within a discovery period.                                                                                                                                      |                   |                                     |                                                      |                             |                           |

## 9.10 V2X Measurements

### 9.10.1 Introduction

The requirements in this section are applicable for a UE capable of V2X sidelink communication.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in [25].

The accuracy requirements in this clause are:

- applicable for AWGN radio propagation conditions,
- assume independent interference (noise) at each receiver antenna port.
- valid for the reported measurement result after layer 1 filtering,
- are verified from the measurement report at point D in the measurement model having the higher layer filtering disabled.

### 9.10.2 Intra-Frequency S-RSRP Measurement Accuracy Requirements

#### 9.10.2.1 Absolute S-RSRP Accuracy

The requirements for absolute accuracy of S-RSRP in this clause apply to a V2X synchronization source on the same frequency as that of the own V2X UE performing the measurement.

The accuracy requirements in Table 9.10.2.1-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in 36.101 Clause 7.3.1G for reference sensitivity are fulfilled.
- S-RSRP<sub>dBm</sub> according to Annex B.6.2 for a corresponding Band are fulfilled.

**Table 9.10.2.1-1: Intra-frequency S-RSRP absolute accuracy for UE capable of V2X sidelink communication**

| Accuracy         |                   | Conditions               |                                            |                     |                           |                           |
|------------------|-------------------|--------------------------|--------------------------------------------|---------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$<br>Note 4 | $Io$ Note 1 range                          |                     |                           |                           |
|                  |                   |                          | E-UTRA V2X operating band groups<br>Note 3 | Minimum $Io$        |                           | Maximum $Io$              |
| dB               | dB                | dB                       |                                            | dBm/15kHz<br>Note 2 | dBm/BW <sub>Channel</sub> | dBm/BW <sub>Channel</sub> |
| ±4.5             | ±9                | ≥-6 dB                   | TDD_G                                      | -118                | N/A                       | -70                       |
| ±8               | ±11               | ≥-6 dB                   | TDD_G                                      | N/A                 | -70                       | -50                       |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA V2X operating band groups are as defined in Section 3.5 for the corresponding E-UTRA operating bands.  
NOTE 4:  $\hat{E}s/lot$  for a SyncRef UE is the minimum of the  $\hat{E}s/lot$  of PSSS/PSBCH and the  $\hat{E}s/lot$  of SSSS

### 9.10.2.2 Relative Accuracy of S-RSRP

The relative accuracy of S-RSRP is defined as the S-RSRP measured from one V2X synchronization source compared to the S-RSRP measured from another V2X synchronization source on the same frequency.

The accuracy requirements in Table 9.10.2.2-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in 36.101 Clause 7.3.1G for reference sensitivity are fulfilled.
- S-RSRP<sub>1,2</sub><sub>dBm</sub> according to Annex B.6.3 for a corresponding Band.

**Table 9.10.2.2-1: S-RSRP Intra frequency relative accuracy for UE capable of V2X sidelink communication**

| Accuracy         |                   | Conditions               |                                            |                  |                           |
|------------------|-------------------|--------------------------|--------------------------------------------|------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}s/lot$ Note 2, 6 | $Io$ Note 1 range                          |                  |                           |
|                  |                   |                          | E-UTRA V2X operating band groups<br>Note 5 | Minimum $Io$     | Maximum $Io$              |
| dB               | dB                | dB                       |                                            | dBm/15kHz Note 4 | dBm/BW <sub>Channel</sub> |
| ±2               | ±3                | ≥-3 dB                   | TDD_G                                      | -118             | -50                       |
| ±3               | ±3                | ≥-6 dB                   | Note 3                                     | Note 3           | Note 3                    |

NOTE 1:  $Io$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The parameter  $\hat{E}s/lot$  is the minimum  $\hat{E}s/lot$  of the pair of SyncRef UEs to which the requirement applies.  
NOTE 3: The same bands and the same  $Io$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 4: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 5: E-UTRA V2X operating band groups are as defined in Section 3.5 for the corresponding E-UTRA operating bands.  
NOTE 6:  $\hat{E}s/lot$  for a SyncRef UE is the minimum of the  $\hat{E}s/lot$  of PSSS/PSBCH and the  $\hat{E}s/lot$  of SSSS

## 9.10.3 PSSCH-RSRP Measurement Accuracy Requirements

### 9.10.3.1 Intra-frequency Absolute PSSCH-RSRP Accuracy

The requirements for absolute accuracy of PSSCH-RSRP in this clause apply to a UE performing PSSCH-RSRP measurements on the same frequency as used by operating V2X sidelink communication.

The accuracy requirements in this clause are:

- applicable for AWGN radio propagation conditions,
- assume independent interference (noise) at each receiver antenna port.

The accuracy requirements in Table 9.10.3.1-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in 36.101 Clause 7.3.1G for reference sensitivity are fulfilled.
- PSSCH-RSRP[dBm] according to Annex B.6.5 for a corresponding Band are fulfilled.

**Table 9.10.3.1-1: Intra-frequency PSSCH-RSRP absolute accuracy for UE capable of V2X sidelink communication**

| Accuracy         |                   | Conditions                         |                                                    |                     |                           |                           |
|------------------|-------------------|------------------------------------|----------------------------------------------------|---------------------|---------------------------|---------------------------|
| Normal condition | Extreme condition | $\hat{E}_s/\hat{I}_{ot}$<br>Note 4 | $I_o$ <sup>Note 1</sup> range                      |                     |                           |                           |
|                  |                   |                                    | E-UTRA V2X operating band groups <sup>Note 3</sup> | Minimum $I_o$       |                           | Maximum $I_o$             |
| dB               | dB                | dB                                 |                                                    | dBm/15kHz<br>Note 2 | dBm/BW <sub>Channel</sub> | dBm/BW <sub>Channel</sub> |
| ±[5]             | ±[9.5]            | ≥[0]dB                             | TDD_G                                              | -118                | N/A                       | -70                       |
| ±[8.5]           | ±[11.5]           | ≥[0] dB                            | TDD_G                                              | N/A                 | -70                       | -50                       |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 3: E-UTRA V2X operating band groups are as defined in Section 3.5 for the corresponding E-UTRA operating bands.

## 9.10.4 S-RSSI Measurement Accuracy Requirements

### 9.10.4.1 Intra-frequency absolute S-RSSI measurement accuracy requirements

The intra-frequency S-RSSI requirements are specified in Table 9.10.4.1-1. The requirements apply for measurement period of 1subframe (1ms) and for any configured measurement bandwidth larger than 5RBs (0.9MHz), provided that:

- All symbols during each RSSI measurement duration are available for RSSI sampling within the same measurement interval.

**Table 9.10.4.1-1: Intra-frequency S-RSSI absolute accuracy**

| Accuracy         |                   | Conditions                                         |                             |                           |
|------------------|-------------------|----------------------------------------------------|-----------------------------|---------------------------|
| Normal condition | Extreme condition | E-UTRA V2X operating band groups <sup>Note 4</sup> | Minimum $I_o$               | Maximum $I_o$             |
|                  |                   |                                                    |                             |                           |
| dB               | dB                |                                                    | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| ±2.5             | ±5.5              | TDD_G                                              | -118                        | -50                       |
| ±4.5             | ±7.5              | Note 2                                             | Note 2                      | Note 2                    |

NOTE 1:  $I_o$  is assumed to have constant EPRE across the bandwidth.  
NOTE 2: The same bands and the same  $I_o$  conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.  
NOTE 3: The condition level is increased by  $\Delta > 0$ , when applicable, as described in Sections B.4.2 and B.4.3.  
NOTE 4: E-UTRA V2X operating band groups are as defined in Section 3.5.

### 9.10.4.2 Intra-frequency relative S-RSSI measurement accuracy requirements

The relative accuracy of S-RSSI is defined as the RSRP measured on one configured measurement bandwidth compared to the S-RSSI measured on another configured measurement bandwidth. The intra-frequency S-RSSI relative requirements are specified in Table 9.10.4.2-1. The requirements apply for measurement period of 1000subframe (1s),

for any configured measurement bandwidth larger than 5RBs (0.9MHz), and for sampling interval of 20ms,50ms and 100ms, provided that:

- All symbols during each RSSI measurement duration are available for RSSI sampling within the same measurement interval.

**Table 9.10.4.2-1: Intra-frequency S-RSSI relative accuracy**

| Accuracy                                                                                                                                                      |                   | Conditions                                         |                             |                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|----------------------------------------------------|-----------------------------|---------------------------|
| Normal condition                                                                                                                                              | Extreme condition | E-UTRA V2X operating band groups <sup>Note 4</sup> | Minimum I <sub>o</sub>      | Maximum I <sub>o</sub>    |
|                                                                                                                                                               |                   |                                                    |                             |                           |
| dB                                                                                                                                                            | dB                |                                                    | dBm/15kHz <sup>Note 3</sup> | dBm/BW <sub>Channel</sub> |
| ±2.5                                                                                                                                                          | ±5.5              | TDD_G                                              | -118                        | -50                       |
| ±4.5                                                                                                                                                          | ±7.5              | Note 2                                             | Note 2                      | Note 2                    |
| NOTE 1: I <sub>o</sub> is assumed to have constant EPRE across the bandwidth.                                                                                 |                   |                                                    |                             |                           |
| NOTE 2: The same bands and the same I <sub>o</sub> conditions for each band apply for this requirement as for the corresponding highest accuracy requirement. |                   |                                                    |                             |                           |
| NOTE 3: The condition level is increased by Δ>0, when applicable, as described in Sections B.4.2 and B.4.3.                                                   |                   |                                                    |                             |                           |
| NOTE 4: E-UTRA V2X operating band groups are as defined in Section 3.5.                                                                                       |                   |                                                    |                             |                           |

## 10 Measurements Performance Requirements for E-UTRAN

### 10.1 Received Interference Power

The measurement period shall be 100 ms.

#### 10.1.1 Absolute accuracy requirement

**Table 10.1.1-1: Received Interference Power absolute accuracy**

| Parameter       | Unit        | Accuracy [dB] | Conditions                    |
|-----------------|-------------|---------------|-------------------------------|
|                 |             |               | I <sub>ob</sub> [dBm/180 kHz] |
| I <sub>ob</sub> | dBm/180 kHz | ± 4           | -117 ... -96                  |

#### 10.1.2 Relative accuracy requirement

The relative accuracy is defined as the Received Interference Power measured at one frequency compared to the Received Interference Power measured from the same frequency at a different time.

**Table 10.1.2-1: Received Interference Power relative accuracy**

| Parameter       | Unit        | Accuracy [dB] | Conditions                                |
|-----------------|-------------|---------------|-------------------------------------------|
|                 |             |               | I <sub>ob</sub> [dBm/180 kHz]             |
| I <sub>ob</sub> | dBm/180 kHz | ± 0.5         | -117 ... -96<br>AND for changes ≤ ±9.0 dB |

#### 10.1.3 Received Interference Power measurement report mapping

The reporting range for *Received Interference Power (RIP)* is from -126 ... -75 dBm.

In table 10.2.3-1 the mapping of measured quantity is defined. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.3-1: Received Interference Power measurement reporting range**

| Reported value | Measured quantity value    | Unit |
|----------------|----------------------------|------|
| RTWP_LEV_000   | $RIP < -126.0$             | dBm  |
| RTWP_LEV_001   | $-126.0 \leq RIP < -125.9$ | dBm  |
| RTWP_LEV_002   | $-125.9 \leq RIP < -125.8$ | dBm  |
| ...            | ...                        | ...  |
| RTWP_LEV_509   | $-75.2 \leq RIP < -75.1$   | dBm  |
| RTWP_LEV_510   | $-75.1 \leq RIP < -75.0$   | dBm  |
| RTWP_LEV_511   | $-75.0 \leq RIP$           | dBm  |

## 10.2 Angle of Arrival (AOA)

### 10.2.1 Range/mapping

The reporting range for AOA measurement is from 0 to 360 degree, with resolution of 0.5 degree.

The mapping of the measured quantity is defined in table 10.2.1-1.

**Table 10.2.1-1: AOA measurement report mapping**

| Reported value | Measured quantity value       | Unit   |
|----------------|-------------------------------|--------|
| AOA_ANGLE_000  | $0 \leq AOA\_ANGLE < 0.5$     | degree |
| AOA_ANGLE_001  | $0.5 \leq AOA\_ANGLE < 1$     | degree |
| AOA_ANGLE_002  | $1 \leq AOA\_ANGLE < 1.5$     | degree |
| ...            | ...                           | ...    |
| AOA_ANGLE_717  | $358.5 \leq AOA\_ANGLE < 359$ | degree |
| AOA_ANGLE_718  | $359 \leq AOA\_ANGLE < 359.5$ | degree |
| AOA_ANGLE_719  | $359.5 \leq AOA\_ANGLE < 360$ | degree |

## 10.3 Timing Advance ( $T_{ADV}$ )

### 10.3.1 Report mapping

The reporting range of  $T_{ADV}$  is defined from 0 to  $49232T_s$  with  $2T_s$  resolution for timing advance less or equal to  $4096T_s$  and  $8T_s$  for timing advance greater than  $4096T_s$ .

The mapping of measured quantity is defined in Table 10.3.1-1.

**Table 10.3.1-1:  $T_{ADV}$  measurement report mapping**

| Reported value    | Measured quantity value      | Unit  |
|-------------------|------------------------------|-------|
| TIME_ADVANCE_00   | $T_{ADV} < 2$                | $T_s$ |
| TIME_ADVANCE_01   | $2 \leq T_{ADV} < 4$         | $T_s$ |
| TIME_ADVANCE_02   | $4 \leq T_{ADV} < 6$         | $T_s$ |
| ...               | ...                          | ...   |
| TIME_ADVANCE_2046 | $4092 \leq T_{ADV} < 4094$   | $T_s$ |
| TIME_ADVANCE_2047 | $4094 \leq T_{ADV} < 4096$   | $T_s$ |
| TIME_ADVANCE_2048 | $4096 \leq T_{ADV} < 4104$   | $T_s$ |
| TIME_ADVANCE_2049 | $4104 \leq T_{ADV} < 4112$   | $T_s$ |
| ...               | ...                          | ...   |
| TIME_ADVANCE_7688 | $49216 \leq T_{ADV} < 49224$ | $T_s$ |
| TIME_ADVANCE_7689 | $49224 \leq T_{ADV} < 49232$ | $T_s$ |
| TIME_ADVANCE_7690 | $49232 \leq T_{ADV}$         | $T_s$ |

NOTE: For report mapping of type2  $T_{ADV}$  for TDD, the  $T_{ADV}$  equal to (eNB Rx – Tx time difference) +  $624T_s$ .

# 11 ProSe Requirements in Any Cell Selection state

## 11.1 Introduction

This section contains the requirements for the UE capable of ProSe Direct Communication and/or ProSe Direct Discovery when the UE is out of coverage on the carrier used for ProSe operation, as defined in [1]. The ProSe requirements shall apply provided that the sidelink used by the UE for ProSe Direct Communication and/or ProSe Direct Discovery is on the carrier that is preconfigured in the ProSe UE for out-of-coverage operation. The requirement apply when the UE is:

- in any cell selection state, or,
- out of coverage on the ProSe carrier and is associated with a serving cell on a non-ProSe carrier.

**Note:** Any cell selection state refers to a UE that is out of network coverage and is not associated with a serving cell on any carrier [1].

## 11.2 UE Transmit Timing for ProSe in Any Cell Selection State

### 11.2.1 Introduction

This clause contains requirements on the UE capable of ProSe Direct Communication and/or ProSe Direct Discovery regarding transmit timing if the UE is out of coverage on the carrier used for ProSe operation.

### 11.2.2 ProSe UE transmission timing

The requirements in this subclause are applicable when the reference timing used for deriving ProSe transmission is from another ProSe UE transmitting sidelink synchronization signals.

The sidelink transmissions takes place  $(N_{TA,SL} + N_{TA,offset}) \cdot T_s$  before the reception of the first detected path (in time) of the corresponding timing reference frame from the UE, with  $N_{TA,offset} = 0$  and  $N_{TA,SL} = 0$  [16]. The transmission timing error for sidelink transmissions shall be less than or equal to  $\pm T_e$  where the timing error limit value  $T_e$  is specified in Table 11.2.2-1.

**Table 11.2.2-1:  $T_e$  Timing Error Limit**

| Sidelink Bandwidth (MHz)                                         | $T_e$          |
|------------------------------------------------------------------|----------------|
| $\geq 1.4$                                                       | $24 \cdot T_s$ |
| <b>Note:</b> $T_s$ is the basic timing unit defined in TS 36.211 |                |

## 11.3 Initiation/Cease of SLSS Transmissions

### 11.3.1 Introduction

The requirements in this subclause apply when the conditions for SLSS transmissions specified in [2] are met and if *syncTxThreshOoC* is included in the preconfigured ProSe parameters.

### 11.3.2 Requirements

The UE shall be capable of measuring the S-RSRP of the selected SyncRef UE used to derive transmission timing for ProSe Direct Communication and/or ProSe Direct Discovery and evaluate it to initiate/cease SLSS transmissions within  $T_{evaluate,SLSS} = 0.8$  seconds.

If higher layer filtering for S-RSRP measurements is pre-configured, an additional delay in evaluation to initiate/cease SLSS transmissions can be expected.

For the selected SyncRef UE [2] used to derive transmission timing for ProSe Direct Communication and/or ProSe Direct Discovery:

- S-RSRP related side conditions given in Section 11.5 for a corresponding Band are fulfilled,

- ProSe SCH\_RP and SCH Ês/Iot according to Annex B.5.1 for a corresponding Band are fulfilled.

## 11.4 Measurements for ProSe in Any Cell Selection State

### 11.4.1 Introduction

This clause contains requirements for E-UTRA cell identification for the UE capable of ProSe Direct Communication and/or ProSe Direct Discovery if the UE is out of coverage on the carrier used for ProSe operation.

The UE can be preconfigured with ProSe resources for out of coverage ProSe operation.

The requirements in this section are applicable for the ProSe if the UE is out of coverage on the carrier used for ProSe operation using the preconfigured ProSe resources. The ProSe UE shall:

- continuously search for any detectable E-UTRA cell on the downlink carrier frequency associated with the preconfigured ProSe carrier frequency for out of coverage ProSe operation, and
- if in any cell selection state, then search cells also on other carriers and perform cell selection according to the procedure specified in section 4.1.

### 11.4.2 Requirements

#### 11.4.2.1 E-UTRA FDD

The requirements in this subclause are applicable when the preconfigured ProSe carrier is FDD (parameter *tdd-ConfigSL* is configured as *none*).

The UE capable of ProSe Direct Communication and/or ProSe Direct Discovery immediately upon being out of coverage on the ProSe carrier shall search for any detectable cell on the carrier preconfigured with ProSe resources.

The UE shall be able to identify a newly detectable E-UTRA FDD cell on the downlink carrier frequency associated with the preconfigured with ProSe carrier frequency:

- within  $T_{\text{basic\_identify\_OoC\_ProSe Tx\_ON}}$  if the UE is performing ProSe transmissions on the sidelink, or
- within  $T_{\text{basic\_identify\_OoC\_ProSe Tx\_OFF}}$  if the UE is not performing ProSe transmissions on the sidelink.

where,

$T_{\text{basic\_identify\_OoC\_ProSe Tx\_ON}} = 6.4$  seconds, and

$T_{\text{basic\_identify\_OoC\_ProSe Tx\_OFF}} = 32$  seconds.

An E-UTRA cell is considered detectable provided it meets the intra-frequency cell identification conditions specified in section 8.1.2.2.

#### 11.4.2.2 E-UTRA TDD

The requirements in this subclause are applicable when the preconfigured ProSe carrier is configured as TDD.

The UE capable of ProSe Direct Discovery immediately upon being out of coverage on the ProSe carrier shall search for any detectable cell on the carrier preconfigured with ProSe resources.

The UE shall be able to identify a newly detectable E-UTRA TDD cell on TDD carrier frequency preconfigured for ProSe operation:

- within  $T_{\text{basic\_identify\_OoC\_ProSe Tx\_ON}}$  if the UE is performing ProSe transmissions on the sidelink, or
- within  $T_{\text{basic\_identify\_OoC\_ProSe Tx\_OFF}}$  if the UE is not performing ProSe transmissions on the sidelink.

where,

$T_{\text{basic\_identify\_OoC\_ProSe Tx\_ON}} = 6.4$  seconds, and

$T_{\text{basic\_identify\_OoC\_ProSe Tx\_OFF}} = 32$  seconds.

An E-UTRA cell is considered detectable provided it meets the intra-frequency cell identification conditions specified in section 8.1.2.2.

The UE shall be allowed to interrupt ProSe Direct Discovery operation in order to meet the requirements in this subclause.

## 11.5 Selection / Reselection of ProSe Synchronization Reference

### 11.5.1 Introduction

This clause contains requirements for the measurements performed by the UE capable of ProSe Direct Communication and/or ProSe Direct Discovery if the UE is out of coverage on the carrier used for ProSe operation.

### 11.5.2 Selection/Reselection to intra-frequency SyncRef UE

#### 11.5.2.1 Introduction

This clause contains requirements for the measurement for the ProSe synchronization on the UE capable of ProSe Direct Communication and/or ProSe Direct Discovery if the UE is out of coverage on the carrier used for ProSe operation.

#### 11.5.2.2 Requirements

The UE shall be able to identify newly detectable SyncRef UE within  $T_{\text{detect, SyncRef UE}}$  seconds if SyncRef UE meets the selection / reselection criterion defined in TS 36.331 [2].

ProSe synchronization source, SyncRef UE, is defined as a ProSe synchronization source which is capable to transmit ProSe synchronization signals.

A SyncRef UE is considered to be detectable when

- S-RSRP related side conditions given in Section 9.9.2 are fulfilled for a corresponding Band,
- ProSe SCH<sub>RP</sub> and SCH<sub>Es/Iot</sub> are fulfilled according to Annex B.5.3 for a corresponding Band.

$T_{\text{detect, SyncRef UE}}$  is defined as 20 seconds at SCH<sub>Es/Iot</sub>  $\geq -4$  dB, provided that the ProSe UE is allowed to drop a maximum of 2% of its ProSe Direct Communication and ProSe Direct Discovery transmissions at the physical layer for the purpose of SyncRef UE selection / reselection.

The UE capable of ProSe Direct Communication and/or ProSe Direct Discovery shall be capable of performing S-RSRP measurements for 6 identified ProSe synchronization sources with the measurement period of 400 ms. It is assumed that the ProSe synchronization sources do not drop or delay more than one SLSS transmission within the measurement period. Otherwise, the measurement period may be extended.

## 11.6 Void

## 11.7 Selection / Reselection of ProSe relay UE

### 11.7.1 Introduction

This section contains the requirements related to selection and reselection of ProSe relay UE when the remote UE is out of coverage on the frequency used for ProSe Direct Communication.

The requirements apply for the selection and reselection of candidate relay UEs that are transmitting relay discovery signals within the discovery resource pool as configured for the remote UE, and follow a synchronization source that either the same or is synchronized to the one use by remote UE.

### 11.7.2 Selection / Reselection of intra-frequency ProSe relay UE

For a remote UE configured by upper layer for relay operation, the remote UE shall search for candidate relay UEs for selection and/or reselection every discovery period.

If the remote UE has a selected sidelink relay UE, then the remote UE shall measure the SD-RSRP of the selected relay once in every four discovery periods and evaluate if it meets the relay selection criterion as defined in [TS 36.331, 5.10.11.4].

The remote UE shall measure SD-RSRP of the candidate relay UEs every  $T_{\text{measure, ProSe\_Relay\_Intra}}$  for intra-frequency relay UEs that are detected and measured according to the measurement rules.

For an intra-frequency relay UEs that are detected, but that has not been selected or reselected to, the remote UE shall be capable of evaluating that the intra-frequency relay UE has met selection or reselection criterion defined in [2, 5.10.11.4] within  $T_{\text{evaluate, ProSe\_Relay\_Intra}}$  as specified in table 11.7.2-1.

The minimum requirements are required to meet when the selected and candidate relay UEs are transmitting relay discovery message every discovery period.

**Table 11.7.2-1:  $T_{\text{measure, ProSe\_Relay\_Intra}}$  and  $T_{\text{evaluate, ProSe\_Relay\_intra}}$**

| Discovery Period [s]                                       | $T_{\text{measure, ProSe\_Relay\_Intra}}$ [s] (number of discovery periods) | $T_{\text{evaluate, ProSe\_Relay\_intra}}$ [s] (number of discovery periods) |
|------------------------------------------------------------|-----------------------------------------------------------------------------|------------------------------------------------------------------------------|
| $0.04 \leq \text{Discovery period} \leq 10.24$             | Note 1 (4)                                                                  | Note 1 (16)                                                                  |
| NOTE 1: Time depends upon the configured Discovery period. |                                                                             |                                                                              |

## 12 V2V Sidelink Communication Requirements for V2V Operation on Dedicated V2V Carrier

### 12.1 Introduction

This section contains the requirements for the UE capable of V2V sidelink communication under the following conditions:

- no cell operates on the carrier used for the V2V sidelink communication and
- no configuration related to V2V communication is received by the UE from the serving cell.

### 12.2 Transmit Timing

This clause contains requirements regarding transmit timing for the UE capable of V2V sidelink communication under the following additional condition:

- the UE is pre-configured with parameters for enabling the UE to acquire timing synchronization.

#### 12.2.1 GNSS as timing reference

The requirements in this subclause are applicable when the reference timing used by the UE for V2V communication is derived from GNSS signals.

The sidelink transmissions takes place  $(N_{\text{TA,SL}} + N_{\text{TA offset}}) \cdot T_s$  before the subframe starting boundary derived from subclause 5.10.14 of TS 36.331 [2], where  $N_{\text{TA offset}} = 0$  and  $N_{\text{TA,SL}} = 0$ . The transmission timing error for sidelink transmissions shall be less than or equal to  $\pm T_e$  where the timing error limit value  $T_e$  is specified as  $12 \cdot T_s$  and  $T_s$  is the basic timing unit defined in TS 36.211.

### 12.3 Interruption

This clause contains interruption requirements for the UE capable of V2V sidelink communication under the following additional conditions:

- the UE is pre-configured with parameters for enabling the UE to acquire timing synchronization
- the UE has dedicated transmitter chain and dedicated receiver chain for the V2V operation

- the UE performs independent concurrent E-UTRAN operation in an E-UTRA band and stand-alone V2V sidelink operation.

The UE shall not cause any interruption on the serving cell when receiving or transmitting V2V sidelink communication signals.

## 12.4 Reliability of GNSS signal

This clause contains requirements regarding reliability of GNSS signal for the UE capable of V2V sidelink communication under the following additional condition:

- the UE is pre-configured with parameters for enabling the UE to acquire the GNSS synchronization.

If UE considers GNSS is a reliable synchronization reference, the UE shall meet timing accuracy requirement as specified in 12.2 and frequency accuracy requirement as specified in 6.5.1G of TS36.101.

---

# 13 V2X Requirements

## 13.1 Introduction

This section contains the requirements for the UE capable of V2X sidelink communication when the UE is out of coverage on the carrier used for V2X sidelink operation, as defined in [1]. The requirements apply when the UE is:

- in any cell selection state, or,
- out of coverage on the V2X sidelink carrier and is associated with a serving cell on a non-V2X sidelink carrier.

**Note:** Any cell selection state refers to a UE that is out of network coverage and is not associated with a serving cell on any carrier [1].

**Note:** When a UE in RRC\_CONNECTED state is performing transmissions and/or reception for V2X sidelink communication, the UE shall meet all the requirements specified in Section 8 assuming that UE has a dedicated RX/TX chain for V2X sidelink communication. Otherwise, the UE may interrupt the V2X sidelink communication in order to meet the measurement requirements specified in Section 8.

## 13.2 UE Transmit Timing

### 13.2.1 Introduction

This clause contains requirements of transmission timing for V2X sidelink communication when:

- GNSS is used as the synchronization reference source;
- Serving cell/PCell is used as the synchronization reference source;
- SyncRef UE is used as the synchronization reference source.

### 13.2.2 GNSS as synchronization reference source

The requirements in this subclause are applicable when the reference timing used by the UE for V2X sidelink communication is derived from GNSS.

The sidelink transmissions takes place  $(N_{TA,SL} + N_{TA,offset}) \cdot T_s$  before the subframe starting boundary as defined in

Clause 5.10.14 of TS 36.331 [2], where  $N_{TA,offset} = 0$  and  $N_{TA,SL} = 0$ .

The transmission timing error requirements for sidelink transmissions in Section 12.2 as specified for V2V Sidelink Communication shall apply.

### 13.2.3 Serving cell/PCell as synchronization reference source

The requirements in this subclause are applicable when the reference timing used for Sidelink transmissions is the serving cell (RRC\_IDLE) or PCell (RRC\_CONNECTED) on a non-V2X sidelink carrier.

The sidelink transmissions takes place  $(N_{TA,SL} + N_{TA\ offset}) \cdot T_s$  before the reception of the first detected path (in time) of the corresponding downlink frame from the reference cell, where  $N_{TA\ offset} = 0$  and  $N_{TA,SL} = 0$ .

The requirements in Section 7.1 as specified for PRACH transmissions shall apply.

### 13.2.4 SyncRef UE as synchronization reference source

The requirements in this subclause are applicable when the reference timing used for deriving sidelink transmission is from SyncRef UE transmitting sidelink synchronization signals.

The sidelink transmissions takes place  $(N_{TA,SL} + N_{TA\ offset}) \cdot T_s$  before the reception of the first detected path (in time) of the corresponding timing reference frame from the SyncRef UE, where  $N_{TA\ offset} = 0$  and  $N_{TA,SL} = 0$ .

The requirements in Section 11.2 as specified for ProSe in Any Cell Selection State shall apply.

## 13.3 Initiation/Cease of SLSS Transmissions

### 13.3.1 Introduction

The requirements in this subclause are applicable to the UE capable of V2X sidelink communication when:

- GNSS is used as the synchronization reference source;
- Serving cell / PCell is used as the synchronization reference source;
- SyncRef UE is used as the synchronization reference source.

#### 13.3.1.1 Initiation/Cease of SLSS transmissions with Serving cell / PCell as synchronization reference source

The requirements apply when the Serving cell / PCell is used as synchronization reference source and when the UE is

- out of coverage on the V2X sidelink carrier and in-coverage with a serving cell on a non-V2X sidelink carrier,

and when the conditions for SLSS transmissions specified in [2] are met; *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType21*. The UE shall be capable of measuring the RSRP of the cell used as synchronization reference source to evaluate to initiate/cease SLSS transmissions within  $T_{\text{evaluate,SLSS}}$

where,

- $T_{\text{evaluate,SLSS}} = 0.4$  seconds when UE is not configured with DRX.
- $T_{\text{evaluate,SLSS}} =$  as specified in Table 13.3.1.1-1 when UE is configured with DRX.

**Table 13.3.1.1-1:  $T_{\text{evaluate,SLSS}}$  with V2X sidelink communication**

| DRX cycle length [s]                                          | $T_{\text{evaluate,SLSS}}$<br>[s] (number of DRX cycles) |
|---------------------------------------------------------------|----------------------------------------------------------|
| $\leq 0.04$                                                   | 0.4 (Note 1)                                             |
| $0.04 < \text{DRX-cycle} \leq 2.56$                           | Note 2 (6)                                               |
| Note1: Number of DRX cycles depends upon the DRX cycle in use |                                                          |
| Note2: Time depends upon the DRX cycles in use                |                                                          |

If higher layer filtering is configured, an additional delay in evaluation to initiate/cease SLSS transmissions can be expected.

For the cell as synchronization reference source:

- RSRP related side conditions given in Sections 9.1.2.1 and 9.1.2.2 and RSRQ related side conditions given in Clause 9.1.5.1 for a corresponding Band are fulfilled,
- SCH<sub>RP</sub> and SCH<sub>Es/Iot</sub> according to Annex B.2.1 for a corresponding Band are fulfilled.

### 13.3.1.2 Initiation/Cease of SLSS transmissions with GNSS as synchronization reference source

The requirements apply when GNSS is used as synchronization reference source and when the UE is

- out of coverage on the V2X sidelink carrier and in-coverage with a serving cell on a non-V2X sidelink carrier,

and when the conditions for SLSS transmissions specified in [2] are met; *networkControlledSyncTx* is not configured; and *syncTxThreshIC* is included in *SystemInformationBlockType21*.

The requirements in Section 13.3.1.1 shall apply.

### 13.3.1.3 Initiation/Cease of SLSS transmissions with SyncRef UE as synchronization reference source

The requirements apply when SyncRef UE is used as synchronization reference source and when the UE is

- in any cell selection state, or
- out of coverage on the V2X sidelink carrier and is associated with a serving cell on a non-V2X sidelink carrier,

and when the conditions for SLSS transmissions specified in [2] are met and when SyncRef UE is used as synchronization reference source and if *syncTxThreshOoC* is included in the preconfigured V2X parameters.

The UE shall be capable of measuring the S-RSRP of the selected SyncRef UE used as synchronization reference source and evaluate it to initiate/cease SLSS transmissions within  $T_{\text{evaluate,SLSS}} = 0.64$  seconds.

If higher layer filtering for S-RSRP measurements is pre-configured, an additional delay in evaluation to initiate/cease SLSS transmissions can be expected.

For the selected SyncRef UE [2] used to derive transmission timing for V2X sidelink communication:

- S-RSRP related side conditions given in Section 13.4 for a corresponding Band are fulfilled,
- V2X SCH<sub>RP</sub> and SCH<sub>Es/Iot</sub> according to Annex B.6.4 for a corresponding Band are fulfilled.

## 13.4 Selection / Reselection of V2X Synchronization Reference Source

The requirements defined in section 13.4 do not apply to the UEs that do not support transmission and reception of SLSS.

A V2X SyncRef UE is considered to be detectable when

- S-RSRP related side conditions given in Section 9.10.2 are fulfilled for a corresponding Band,
- V2X SCH<sub>RP</sub> and SCH<sub>Es/Iot</sub> according to Annex B.6.4 for a corresponding Band are fulfilled.

When GNSS synchronization reference source is configured as the highest priority and

- UE is synchronized to GNSS directly,
- UE shall not drop any V2X SLSS and data transmission for the purpose of selection/reselection to the SyncRef UE.
- UE is synchronized to a SyncRef UE that is synchronized to GNSS directly or in-directly,

- UE shall not drop any V2X data transmission for the purpose of selection/reselection to the SyncRef UE. The UE shall be able to identify newly detectable intra-frequency V2X SyncRef UE within  $T_{\text{detect,SyncRef UE\_V2X}}$  seconds if the V2X SyncRef UE meets the selection / reselection criterion defined in TS 36.331 [2].  $T_{\text{detect,SyncRef UE\_V2X}}$  is defined as 1.6 seconds at SCH Es/Iot  $\geq 0$  dB, provided that the UE is allowed to drop a maximum of 30% of its SLSS transmissions during  $T_{\text{detect,SyncRef UE\_V2X}}$  for the purpose of selection / reselection to the SyncRef UE.
- in other case
  - The UE shall be able to identify newly detectable intra-frequency V2X SyncRef UE within  $T_{\text{detect,SyncRef UE\_V2X}}$  seconds if the SyncRef UE meets the selection / reselection criterion defined in TS 36.331 [2].  $T_{\text{detect,SyncRef UE\_V2X}}$  is defined as 8 seconds at SCH Es/Iot  $\geq 0$  dB, provided that the UE is allowed to drop a maximum of 6% of its V2X data and SLSS transmissions during  $T_{\text{detect,SyncRef UE\_V2X}}$  for the purpose of selection / reselection to the SyncRef UE. UE is allowed to drop up to 2 subframes of its V2X data reception per PSBCH monitoring occasion and overall drop rate shall not exceed [0.3%] of its V2X data reception during  $T_{\text{detect,SyncRef UE\_V2X}}$  for the purpose of selection / reselection to the SyncRef UE.

When serving cell/PCell synchronization reference source is configured as the highest priority,

- UE shall be able to identify newly detectable intra-frequency V2X SyncRef UE within  $T_{\text{detect,SyncRef UE\_V2X}}$  seconds if the SyncRef UE meets the selection / reselection criterion defined in TS 36.331 [2].  $T_{\text{detect,SyncRef UE\_V2X}}$  is defined as 8 seconds at SCH Es/Iot  $\geq 0$  dB, provided that the V2X UE is allowed to drop a maximum of 6% of its V2X data and SLSS transmissions for the purpose of selection / reselection to the SyncRef UE. UE is allowed to drop up to 2 subframes of its V2X data reception per PSBCH monitoring occasion and overall drop rate shall not exceed [0.3%] of its V2X data reception during  $T_{\text{detect,SyncRef UE\_V2X}}$  for the purpose of selection / reselection to the SyncRef UE.

UE shall be capable of performing S-RSRP measurements for 3 identified intra-frequency V2X SyncRef UE with the measurement period of 320 ms. It is assumed that the V2X SyncRef UE do not drop or delay any SLSS transmission within the measurement period. Otherwise, the measurement period may be extended.

When UE is synchronized to GNSS directly, before selection / reselection of the new synchronization reference source UE shall evaluate the GNSS synchronization source reliability for at least [20] seconds before changing the synchronization reference from GNSS to another synchronization reference source. UE shall be always synchronized to GNSS directly during the evaluation of GNSS synchronization source reliability.

## 13.5 Autonomous Resource Selection/Reselection measurements

### 13.5.1 Introduction

This section contains the requirements related to autonomous resource selection/reselection of the UE capable of V2X sidelink communication.

### 13.5.2 PSSCH-RSRP measurements

The UE physical layer shall be capable of performing the PSSCH-RSRP measurements [4] on the carrier operating V2X sidelink communication for determining the subset of resources to be excluded in PSSCH resource selection in sidelink transmission mode 4. The PSSCH-RSRP measurement period corresponds to one sub-frame and the measurement shall meet the PSSCH-RSRP measurement accuracy requirement in Section 9.10.

### 13.5.3 S-RSSI measurements

The UE physical layer shall be capable of performing the S-RSSI measurements [4] on the carrier operating V2X sidelink communication for determining the subset of resources to be excluded in PSSCH resource selection in sidelink transmission mode 4. The S-RSSI measurement period corresponds to 1 second and the filtered measurement shall meet the S-RSSI measurement accuracy requirement in Section 9.10.

## 13.6 Congestion Control measurements

The UE shall be capable of estimating the channel busy ratio for one or more transmission pools indicated by higher layers [2], based on S-RSSI measurements provided by the physical layer.

When no sidelink transmissions occur, the UE physical layer shall perform a single-shot S-RSSI measurement for each sub-channel included in all the subframes configured as transmission pools.

The S-RSSI measurement performed according to this section shall meet the S-RSSI measurement accuracy requirements defined in Section 9.10.4.

The UE shall perform channel busy ratio (CBR) measurement based on S-RSSI measurements as described in TS 36.214 [4].

## 13.7 Interruption

### 13.7.1 Interruptions to WAN due to V2X Sidelink Communication

This sub-clause contains the requirements related to the interruptions on the serving cell(s) due to V2X sidelink communication.

A UE capable of V2X sidelink communication may indicate its interest (initiation or termination) in V2X sidelink communication to the connected eNodeB using IE *SidelinkUEInformation* [2].

The UE is allowed an interruption of up to 1 subframe on the serving cell(s) during the RRC reconfiguration procedure that includes the V2X sidelink communication configuration message *sl-V2X-ConfigDedicated* [2] (setup and release). This interruption is for both uplink and downlink of the serving cell(s).

### 13.7.2 V2X Sidelink Communication Dropping due to synchronization reference source change

This sub-clause contains the requirements related to the interruptions on the V2X sidelink communication due to synchronization source change.

UE is allowed to drop V2V sidelink signal transmission or reception for up to 1 subframe when synchronization reference source is changed:

- from GNSS
  - to Serving cell/PCell;
  - to SyncRef UE that is not synchronized to GNSS directly or in-directly;
- from SyncRef UE that is synchronized to GNSS directly or in-directly
  - to Serving cell/PCell;
  - to SyncRef UE that is not synchronized to GNSS directly or in-directly;
- from Serving cell/PCell
  - to GNSS
  - to SyncRef UE that is synchronized to GNSS directly or in-directly;
- from SyncRef UE that is not synchronized to GNSS directly or in-directly
  - to GNSS;
  - to SyncRef UE that is synchronized to GNSS directly or in-directly;

UE is allowed to interruption any V2V sidelink signals including PSSCH, PSCCH, PSBCH and SLSS signals.

## 13.8 Reliability of GNSS signal

This clause contains requirements regarding reliability of GNSS signal for the UE capable of V2X sidelink communication under the following additional condition:

- The UE is configured or pre-configured with parameters for enabling the UE to acquire the GNSS synchronization.

If UE considers GNSS is a reliable synchronization reference, the UE shall meet timing accuracy requirement as specified in 12.2 and frequency accuracy requirement as specified in 6.5.1G of TS36.101. Otherwise, the UE shall be capable to select another synchronization reference source.

---

## Annex A (normative): Test Cases

### A.1 Purpose of annex

This Annex specifies test specific parameters for some of the functional requirements in sections 4 to 9. The tests provide additional information to how the requirements should be interpreted for the purpose of conformance testing. The tests in this Annex are described such that one functional requirement may be tested in one or several test and one test may verify several requirements. Some requirements may lack a test.

The conformance tests are specified in TS 36.521-3 [23]. Statistical interpretation of the requirements is described in Annex A.2.

---

### A.2 Requirement classification for statistical testing

Requirements in this specification are either expressed as absolute requirements with a single value stating the requirement, or expressed as a success rate. There are no provisions for the statistical variations that will occur when the parameter is tested.

Annex A outlines the tests in more detail and lists the test parameters needed. The test will result in an outcome of a test variable value for the device under test (DUT) inside or outside the test limit. Overall, the probability of a "good" DUT being inside the test limit(s) and the probability of a "bad" DUT being outside the test limit(s) should be as high as possible. For this reason, when selecting the test variable and the test limit(s), the statistical nature of the test is accounted for.

The statistical nature depends on the type of requirement. Some have large statistical variations, while others are not statistical in nature at all. When testing a parameter with a statistical nature, a confidence level is set. This establishes the probability that a DUT passing the test actually meets the requirements and determines how many times a test has to be repeated and what the pass and fail criteria are. Those aspects are not covered by TS 36.133. The details of the tests on how many times to run it and how to establish confidence in the tests are described in TS 36.521-3 [23]. This Annex establishes the variable to be used in the test and whether it can be viewed as statistical in nature or not.

#### A.2.1 Types of requirements in TS 36.133

##### A.2.1.1 Time and delay requirements on UE higher layer actions

A very large part of the RRM requirements are delay requirements:

- In E-UTRAN RRC\_IDLE state mobility (clause A.4) there is cell re-selection delay.
- In E-UTRAN RRC\_CONNECTED state mobility (clauses A.5 and A.8) there is handover delay, cell search delay and measurement reporting delay.
- In RRC Connection Control (clause A.6) there is RRC re-establishment delay.

All have in common that the UE is required to perform an action observable in higher layers (e.g. camp on the correct cell) within a certain time after a specific event (e.g. when a new strong pilot or reference signal appears). The delay time is statistical in nature for several reasons, among others that several of the measurements are performed by the UE in a fading radio environment.

The variations make a strict limit unsuitable for a test. Instead there is a condition set for a correct action by the UE, e.g. that the UE shall camp on the correct cell within X seconds. Then the rate of correct events is observed during repeated tests and a limit is set on the rate of correct events, usually 90% correct events are required. How the limit is applied in the test depends on the confidence required, further detailed are in TS 36.521-3 [23].

##### A.2.1.2 Measurements of power levels, relative powers and time

A very large number of requirements are on measurements that the UE performs:

- In E-UTRAN RRC\_CONNECTED state mobility (clause A.5) there are measurement reports.
- In Measurement Performance Requirements (clause A.9) there are requirements for all type of measurements.

The accuracy requirements on measurements are expressed in this specification as a fixed limit (e.g. +/-X dB), but the measurement error will have a distribution that is not easily confined in fixed limits. Assuming a Gaussian distribution of the error, the limits will have to be set at  $\pm 3.29\sigma$  if the probability of failing a "good DUT" in a single test is to be kept at 0.1%. It is more reasonable to set the limit tighter and test the DUT by counting the rate of measurements that are within the limits, in a way similar to the requirements on delay.

### A.2.1.3 Implementation requirements

A few requirements are strict actions the UE should take or capabilities the UE should have, without any allowance for deviations. These requirements are absolute and should be tested as such. Examples are:

- "Event triggered report rate" in E-UTRAN RRC\_CONNECTED state mobility (clauses A.5 and A.8)
- "Correct behaviour at time-out" in RRC connection control (clause A.6)

### A.2.1.4 Physical layer timing requirements

There are requirements on Timing and Signaling Characteristics (clauses A.7). There are both absolute and relative limits on timing accuracy depending upon the type of requirement. Examples are:

- Initial Transmit Timing (clause A.7.1) has an absolute limit on timing accuracy.
- Timing Advance (clause A.7.2) has a relative limit on timing accuracy.

## A.3 RRM test configurations

### A.3.1 Reference Measurement Channels

#### A.3.1.1 PDSCH

##### A.3.1.1.1 FDD

**Table A.3.1.1.1-1: PDSCH Reference Measurement Channels for FDD**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Unit | Value      |   |            |            |            |            |            |            |            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|------------|---|------------|------------|------------|------------|------------|------------|------------|
| Reference channel                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |      | R.2<br>FDD |   | R.5<br>FDD | R.7<br>FDD | R.0<br>FDD | R.1<br>FDD | R.3<br>FDD | R.4<br>FDD | R.6<br>FDD |
| Channel bandwidth                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | MHz  | 1.4        | 3 | 5          | 5          | 10         | 10         | 10         | 20         | 20         |

| For Sub-Frame 5                                                                                                                                                          | Bits | 6336     | 6048     | 6408     |
| For Sub-Frame 0                                                                                                                                                          | Bits | 5784     | 5520     | 5520     |
| For Sub-Frame 1, 2, 3, 6, 7, 8                                                                                                                                           | Bits | 0        | 0        | 6636     |
| Max. Throughput averaged over 1 frame                                                                                                                                    | kbps | 259.2    | 259.2    | 648      |
| Note 1: 2 symbols allocated to PDCCH for 10 MHz channel BW. 4 symbols allocated to PDCCH for 1.4 MHz channel BW. 3 OFDM symbols allocated to PDCCH for 5 MHz channel BW. |      |          |          |          |
| Note 2: Reference signal, synchronization signals and PBCH allocated as defined in 3GPP TS 36.211 [16].                                                                  |      |          |          |          |
| Note 3: If necessary the information bit payload size can be adjusted to facilitate the test implementation. The payload sizes are defined in 3GPP TS 36.213 [3].        |      |          |          |          |
| Note 4: Allocation is located in the middle of bandwidth.                                                                                                                |      |          |          |          |
| Note 5: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)                           |      |          |          |          |
| Note 6: PDSCH allocation applies only to subframes not configured as PRS subframes.                                                                                      |      |          |          |          |

## A.3.1.1.4 HD-FDD for UE category 0

Table A.3.1.1.4-1: PDSCH Reference Measurement Channels for HD-FDD

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Unit |            | Value      |

| Note 1: 2 symbols allocated to PDCCH for 10 MHz channel BW. 4 symbols allocated to PDCCH for 1.4 MHz channel BW. 3 OFDM symbols allocated to PDCCH for 5 MHz channel BW.<br>Note 2: Reference signal, synchronization signals and PBCH allocated as defined in 3GPP TS 36.211 [16].<br>Note 3: If necessary the information bit payload size can be adjusted to facilitate the test implementation. The payload sizes are defined in 3GPP TS 36.213 [3].<br>Note 4: Allocation is located in the middle of bandwidth.<br>Note 5: If more than one Code Block is present, an additional CRC sequence of L = 24 Bits is attached to each Code Block (otherwise L = 0 Bit)<br>Note 6: PDSCH allocation applies only to subframes not configured as PRS subframes.<br>Note 7: Sub-frame 0 or sub-frame 5 is randomly scheduled in downlink. |      |            |            |
