| Timing offset to Cell 1 Asynchronous cells                                                                                                                                                                             | ms         | -           |             |          | 3                               |          |             |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |             |             |          |                                 |          |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |             |             |          |                                 |          |             |
| Note 3: $E_s/I_{ot}$ , RSRP and $I_o$ level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                               |            |             |             |          |                                 |          |             |

### A.5.1.17.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 2610 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 2560\text{ms} + 35\text{ms} = 2595\text{ms}$  is defined in clause 5.6.2.1.2.

This gives a total of 2610ms.

## A.5.1.18 E-UTRAN TDD Intra frequency handover for Cat-M1 UEs in CEModeB

### A.5.1.18.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency handover requirements specified in clause 5.6.2.3.

The test scenario comprises of one E-UTRA TDD carrier and two cells as given in tables A.5.1.18.1-1 and A.5.1.18.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

During period T2, the UE should report Event A3, and afterwards E-UTRAN shall send a RRC message to the UE implying handover to Cell 2. During T3 is defined as the end of the last TTI containing the RRC message from UE implying handover.

During the test, the UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.18.1-1: General test parameters for E-UTRAN TDD Intra frequency handover for Cat-M1 UEs in CEModeB test case**

| Parameter                      |                   | Unit | Value     | Comment                                          |
|--------------------------------|-------------------|------|-----------|--------------------------------------------------|

| Timing offset to Cell 1 Synchronous cells                                                                                                                                                                              | μs         | -         |           |          | 3                               |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |                                 |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |                                 |          |           |
| Note 3: Es/I <sub>ot</sub> , RSRP and I <sub>o</sub> level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                |            |           |           |          |                                 |          |           |

### A.5.1.18.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 2610 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 2560ms + 35ms = 2595ms is defined in clause 5.6.2.1.2.

This gives a total of 2610 ms.

## A.5.1.19 E-UTRAN FDD - FDD Intra frequency handover for UE Category 1bis

### A.5.1.19.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency handover requirements for UE category 1bis specified in clause 5.1.2.1.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.5.1.19.1-1 and A.5.1.19.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

**Table A.5.1.19.1-1: General test parameters for E-UTRAN FDD-FDD intra frequency handover test case**

| Parameter                  |                   | Unit | Value    | Comment                                          |
|----------------------------|-------------------|------|----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1   |                                                  |
|                            | Neighbouring cell |      | Cell 2   |                                                  |
| Final condition            | Active cell       |      | Cell 2   |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1        | Only one FDD carrier frequency is used.          |
| A3-Offset                  |                   | dB   | 0        |                                                  |
| Hysteresis                 |                   | dB   | 0        |                                                  |
| Time To Trigger            |                   | s    | 0        |                                                  |
| Filter coefficient         |                   |      | 0        | L3 filtering is not used                         |

| Timing offset to Cell 1 Asynchronous cells                                                                                                                                                                             | ms         | -        |          |          | 3                               |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |                                 |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |                                 |          |          |
| Note 3: Es/Iot, RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                      |            |          |          |          |                                 |          |          |

### A.5.1.19.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.1.2.1.2.

This gives a total of 50 ms.

## A.5.1.20 E-UTRAN TDD - TDD Intra frequency handover for UE Category 1bis

### A.5.1.20.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency handover requirements for UE category 1bis specified in clause 5.2.2.4.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.5.1.20.1-1 and A.5.1.20.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

**Table A.5.1.20.1-1: General test parameters for E-UTRAN TDD-TDD Intra frequency handover test case**

| Parameter                      |                   | Unit | Value    | Comment                                          |
|--------------------------------|-------------------|------|----------|--------------------------------------------------|

| Note 3:                                                  | Es/Iot, RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                      |          |          |          |                                 |          |          |

### A.5.1.20.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.4.2.

This gives a total of 50 ms.

## A.5.1.21 E-UTRAN FDD - FDD Intra frequency RACH-less handover

### A.5.1.21.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency RACH-less handover requirements specified in clause 5.1.2.1.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.5.1.21.1-1 and A.5.1.21.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying RACH-less handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3, and the PUSCH transmission in the cell2 is configured in the RRC message from cell1. T3 is defined as the end of the last TTI containing the RRC message implying handover.

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |            |          |          |

### A.5.1.21.2 Test Requirements

The UE shall start to transmit the PUSCH to Cell 2 less than 45 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 30 ms in the test;  $T_{interrupt}$  is defined in clause 5.1.2.1.2.2.

This gives a total of 45 ms.

### A.5.1.22 E-UTRAN TDD - TDD Intra frequency RACH-less handover

#### A.5.1.22.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency RACH-less handover requirements specified in clause 5.2.2.4.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.5.1.22.1-1 and A.5.1.22.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying RACH-less handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3, and the PUSCH transmission in the cell2 is configured in the RRC message from cell1. T3 is defined as the end of the last TTI containing the RRC message implying handover.

**Table A.5.1.22.1-1: General test parameters for E-UTRAN TDD-TDD Intra frequency RACH-less handover test case**

| Parameter                                   |                   | Unit | Value                                    | Comment                                    |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |          |            |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |            |          |          |

### A.5.1.22.2 Test Requirements

The UE shall start to transmit the PUSCH to Cell 2 less than 45 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 30 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.4.2.

This gives a total of 45 ms.

## A.5.1.23 E-UTRAN FDD – FDD Inter frequency RACH-less handover

### A.5.1.23.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD inter-frequency RACH-less handover requirements specified in clause 5.1.2.1.

The test scenario comprises of two E-UTRA FDD carriers and one cell on each carrier as given in tables A.5.1.23.1-1 and A.5.1.23.1-2. PDCCHs indicating new transmissions shall be sent continuously to ensure that the UE would not enter the DRX state. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of cell 2. Starting T2, cell 2

becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-frequency monitoring.

A RRC message implying RACH-less handover shall be sent to the UE during period T2, after the UE has reported Event A3, and the PUSCH transmission in the cell2 is configured in the RRC message from cell1. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |          |           |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |           |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |           |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |           |          |          |

### A.5.1.23.2 Test Requirements

The UE shall start to transmit the PUSCH to Cell 2 less than 45 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}}$  = 30 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.1.2.1.2.

This gives a total of 45 ms.

### A.5.1.24 E-UTRAN TDD – TDD Inter frequency RACH-less handover

#### A.5.1.24.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD inter frequency RACH-less handover requirements specified in clause 5.2.2.4.

The test scenario comprises of two E-UTRA TDD carriers and one cell on each carrier as given in tables Table A.5.1.24.1-1 and Table A.5.1.24.1-2. PDCCHs indicating new transmissions shall be sent continuously to ensure that the UE would not enter the DRX state. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying RACH-less handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3, and the PUSCH transmission in the cell2 is configured in the RRC message from cell1.

| <div>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</div> <div>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</div> <div>Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</div> |            |          |          |          |           |          |          |

### A.5.1.24.2 Test Requirements

The UE shall start to transmit the PUSCH to Cell 2 less than 45 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 30 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.4.2.

This gives a total of 45 ms.

### A.5.1.25 E-UTRAN FDD - FDD Intra frequency make-before-break handover

#### A.5.1.25.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency make-before-break handover requirements specified in clause 5.1.2.1.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.5.1.25.1-1 and A.5.1.25.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying make-before-break handover to cell 2. The RRC message implying make-before-break handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying make-before-break handover.

**Table A.5.1.25.1-1: General test parameters for E-UTRAN FDD-FDD intra frequency make-before-break handover test case**

| Parameter                                   |                   | Unit | Value                                    | Comment                                          |
|---------------------------------------------|-------------------|------|------------------------------------------|--------------------------------------------------|
| PDSCH parameters                            |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                 |
| PCFICH/PDCCH/PHICH parameters               |                   |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                 |
| Initial conditions                          | Active cell       |      | Cell 1                                   |                                                  |
|                                             | Neighbouring cell |      | Cell 2                                   |                                                  |
| Final condition                             | Active cell       |      | Cell 2                                   |                                                  |
| E-UTRA RF Channel Number                    |                   |      | 1                                        | Only one FDD carrier frequency is used.          |
| Channel Bandwidth ( $BW_{\text{channel}}$ ) |                   | MHz  | 10                                       |                                                  |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |          |            |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |            |          |          |

### A.5.1.25.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The make-before-break handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.1.2.1.2.3.

This gives a total of 50 ms.

The UE shall be scheduled on Cell 1 continuously throughout the test. From the start of T3 until the UE start to transmit the PRACH, at most 5 of all expected ACK/NACKs can be not transmitted by the UE.

Both the rate of correct handovers and the number of not transmitted ACK/NACKs have to be fulfilled simultaneously.

### A.5.1.26 E-UTRAN TDD - TDD Intra frequency make-before-break handover

#### A.5.1.26.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency make-before-break handover requirements specified in clause 5.2.2.4.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.5.1.26.1-1 and A.5.1.26.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying make-before-break handover to cell 2. The RRC message implying make-before-break handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying make-before-break handover.

**Table A.5.1.26.1-1: General test parameters for E-UTRAN TDD-TDD Intra frequency make-before-break handover test case**

| Parameter                                   |                   | Unit | Value                                    | Comment                                          |
|---------------------------------------------|-------------------|------|------------------------------------------|--------------------------------------------------|
| PDSCH parameters                            |                   |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2                 |
| PCFICH/PDCCHPHICH parameters                |                   |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2                 |
| Initial conditions                          | Active cell       |      | Cell 1                                   |                                                  |
|                                             | Neighbouring cell |      | Cell 2                                   |                                                  |
| Final condition                             | Active cell       |      | Cell 2                                   |                                                  |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |          |            |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |            |          |          |

### A.5.1.26.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct make-before-break handovers observed during repeated tests shall be at least 90%.

NOTE: The make-before-break handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.4.2.3.

This gives a total of 50 ms.

The UE shall be scheduled on Cell 1 continuously throughout the test. From the start of T3 until the UE start to transmit the PRACH, at most 3 of all expected ACK/NACKs can be not transmitted by the UE.

Both the rate of correct handovers and the number of not transmitted ACK/NACKs have to be fulfilled simultaneously.

### A.5.1.27 E-UTRAN FDD inter frequency handover for Cat-M1 UEs in CEModeA

#### A.5.1.27.1 Test Purpose and Environment

This test is to verify the requirement for the FDD inter frequency handover requirements specified in clause 5.5.2.1.

The test scenario comprises of two E-UTRA FDD carriers and one cell in each carrier as given in tables A.5.1.27.1-1 and A.5.1.27.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

Starting T2, cell 2 becomes detectable and the UE is expected to detect and send a measurement report. The RRC message implying handover to Cell 2 shall be sent to the UE during period T2, after the UE has reported Event A3. The *field sameSFN-Indication* is not included in the handover command. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

During the test, UE is configured with measurement gap to enable inter-frequency monitoring.

**Table A.5.1.27.1-1: General test parameters for E-UTRAN FDD inter frequency handover for Cat-M1 UEs in CEModeA test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    | Cell 1 is on RF channel number 1                 |
|                            | Neighbouring cell |      | Cell 2    | Cell 2 is on RF channel number 2                 |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1, 2      | Two FDD carriers are used.                       |
| A3-Offset                  |                   | dB   | 0         |                                                  |
| Hysteresis                 |                   | dB   | 0         |                                                  |
| Time To Trigger            |                   | s    | 0         |                                                  |
| Filter coefficient         |                   |      | 0         | L3 filtering is not used                         |
| DRX                        |                   |      |           | OFF                                              |
| CP length                  |                   |      | Normal    |                                                  |
| Access Barring Information |                   | -    | Not Sent  | No additional delays in random access procedure. |
| PRACH configuration        |                   |      | PRACH_4CE | As specified in A.3.16                           |
| PRACH initial CE level     |                   |      | 0         | Specified in the handover message                |

| Antenna Configuration                                                                                                                                                                                                  |            | 2x1       |           |          | 2x1       |          |           |
| Timing offset to Cell 1 Asynchronous cells                                                                                                                                                                             | ms         | -         |           |          | 3         |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |           |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |           |          |           |
| Note 3: Es/lot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                                         |            |           |           |          |           |          |           |

### A.5.1.27.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 170 ms.

## A.5.1.28 E-UTRAN HD-FDD inter frequency handover for Cat-M1 UEs in CEModeA

### A.5.1.28.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD inter frequency handover requirements specified in clause 5.5.2.2.

The test scenario comprises of two E-UTRA FDD carriers and one cell in each carrier as given in tables A.5.1.28.1-1 and A.5.1.28.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

Starting T2, cell 2 becomes detectable and the UE is expected to detect and send a measurement report. The RRC message implying handover to Cell 2 shall be sent to the UE during period T2, after the UE has reported Event A3. The *field sameSFN-Indication* is not included in the handover command. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

During the test, UE is configured with measurement gap to enable inter-frequency monitoring.

**Table A.5.1.28.1-1: General test parameters for E-UTRAN HD-FDD inter frequency handover for Cat-M1 UEs in CEModeA test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    | Cell 1 is on RF channel number 1                 |
|                            | Neighbouring cell |      | Cell 2    | Cell 2 is on RF channel number 2                 |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1, 2      | Two FDD carriers are used.                       |
| A3-Offset                  |                   | dB   | 0         |                                                  |
| Hysteresis                 |                   | dB   | 0         |                                                  |
| Time To Trigger            |                   | s    | 0         |                                                  |
| Filter coefficient         |                   |      | 0         | L3 filtering is not used                         |
| DRX                        |                   |      |           | OFF                                              |
| CP length                  |                   |      | Normal    |                                                  |
| Access Barring Information |                   | -    | Not Sent  | No additional delays in random access procedure. |
| PRACH configuration        |                   |      | PRACH_4CE | As specified in A.3.16                           |
| PRACH initial CE level     |                   |      | 0         | Specified in the handover message                |
| T1                         |                   | s    | 5         |                                                  |
| T2                         |                   | s    | ≤5        |                                                  |
| T3                         |                   | s    | 1         |                                                  |
| Gap pattern ID             |                   |      | 1         |                                                  |

| Timing offset to Cell 1 Asynchronous cells                                                                                                                                                                                    | ms         | -           |             |          | 3          |          |             |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |             |             |          |            |          |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |             |             |          |            |          |             |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                                                |            |             |             |          |            |          |             |

### A.5.1.28.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 170 ms.

## A.5.1.29 E-UTRAN TDD inter frequency handover for Cat-M1 UEs in CEModeA

### A.5.1.29.1 Test Purpose and Environment

This test is to verify the requirement for the TDD inter frequency handover requirements specified in clause 5.5.2.3.

The test scenario comprises of two E-UTRA TDD carriers and one cell in each carrier as given in tables A.5.1.29.1-1 and A.5.1.29.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

Starting T2, cell 2 becomes detectable and the UE is expected to detect and send a measurement report. The RRC message implying handover to Cell 2 shall be sent to the UE during period T2, after the UE has reported Event A3. The *field sameSFN-Indication* is not included in the handover command. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

During the test, UE is configured with measurement gap to enable inter-frequency monitoring.

**Table A.5.1.29.1-1: General test parameters for E-UTRAN TDD inter frequency handover for Cat-M1 UEs in CEModeA test case**

| Parameter                      |                   | Unit | Value     | Comment                                          |
|--------------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions             | Active cell       |      | Cell 1    | Cell 1 is on RF channel number 1                 |
|                                | Neighbouring cell |      | Cell 2    | Cell 2 is on RF channel number 2                 |
| Final condition                | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number       |                   |      | 1, 2      | Two TDD carriers are used.                       |
| A3-Offset                      |                   | dB   | 0         |                                                  |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |           |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |           |          |           |
| Note 3: Es/lot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                                         |            |           |           |          |           |          |           |

### A.5.1.29.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 170 ms.

## A.5.1.30 E-UTRAN FDD inter frequency handover for Cat-M1 UEs in CEModeB

### A.5.1.30.1 Test Purpose and Environment

This test is to verify the requirement for the FDD inter frequency handover requirements specified in clause 5.5.3.1.

The test scenario comprises of two E-UTRA FDD carriers and one cell in each carrier as given in tables A.5.1.30.1-1 and A.5.1.30.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

Starting T2, cell 2 becomes detectable and the UE is expected to detect and send a measurement report. The RRC message implying handover to Cell 2 shall be sent to the UE during period T2, after the UE has reported Event A3. The *field sameSFN-Indication* is not included in the handover command. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

During the test, UE is configured with measurement gap to enable inter-frequency monitoring.

**Table A.5.1.30.1-1: General test parameters for E-UTRAN FDD inter frequency handover for Cat-M1 UEs in CEModeB test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    | Cell 1 is on RF channel number 1                 |
|                            | Neighbouring cell |      | Cell 2    | Cell 2 is on RF channel number 2                 |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1, 2      | Two FDD carriers are used.                       |
| A3-Offset                  |                   | dB   | 0         |                                                  |
| Hysteresis                 |                   | dB   | 0         |                                                  |
| Time To Trigger            |                   | s    | 0         |                                                  |
| Filter coefficient         |                   |      | 0         | L3 filtering is not used                         |
| DRX                        |                   |      |           | OFF                                              |
| CP length                  |                   |      | Normal    |                                                  |
| Access Barring Information |                   | -    | Not Sent  | No additional delays in random access procedure. |
| PRACH configuration        |                   |      | PRACH_4CE | As specified in A.3.16                           |
| PRACH initial CE level     |                   |      | 0         | Specified in the handover message                |

| Timing offset to Cell 1 Asynchronous cells                                                                                                                                                                                    | ms         | -         |           |          | 3         |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |           |           |          |           |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |           |           |          |           |          |           |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                                                |            |           |           |          |           |          |           |

### A.5.1.30.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 170 ms.

## A.5.1.31 E-UTRAN HD-FDD inter frequency handover for Cat-M1 UEs in CEModeB

### A.5.1.31.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD inter frequency handover requirements specified in clause 5.5.3.2.

The test scenario comprises of two E-UTRA FDD carriers and one cell in each carrier as given in tables A.5.1.31.1-1 and A.5.1.31.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

Starting T2, cell 2 becomes detectable and the UE is expected to detect and send a measurement report. The RRC message implying handover to Cell 2 shall be sent to the UE during period T2, after the UE has reported Event A3. The *field sameSFN-Indication* is not included in the handover command. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

During the test, UE is configured with measurement gap to enable inter-frequency monitoring.

**Table A.5.1.31.1-1: General test parameters for E-UTRAN HD-FDD inter frequency handover for Cat-M1 UEs in CEModeB test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    | Cell 1 is on RF channel number 1                 |
|                            | Neighbouring cell |      | Cell 2    | Cell 2 is on RF channel number 2                 |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1, 2      | Two FDD carriers are used.                       |
| A3-Offset                  |                   | dB   | 0         |                                                  |
| Hysteresis                 |                   | dB   | 0         |                                                  |
| Time To Trigger            |                   | s    | 0         |                                                  |
| Filter coefficient         |                   |      | 0         | L3 filtering is not used                         |
| DRX                        |                   |      |           | OFF                                              |
| CP length                  |                   |      | Normal    |                                                  |
| Access Barring Information |                   | -    | Not Sent  | No additional delays in random access procedure. |
| PRACH configuration        |                   |      | PRACH_4CE | As specified in A.3.16                           |
| PRACH initial CE level     |                   |      | 0         | Specified in the handover message                |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |             |             |          |            |          |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |             |             |          |            |          |             |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                                                |            |             |             |          |            |          |             |

### A.5.1.31.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 170 ms.

## A.5.1.32 E-UTRAN TDD inter frequency handover for Cat-M1 UEs in CEModeB

### A.5.1.32.1 Test Purpose and Environment

This test is to verify the requirement for the TDD inter frequency handover requirements specified in clause 5.5.3.3.

The test scenario comprises of two E-UTRA TDD carriers and one cell in each carrier as given in tables A.5.1.32.1-1 and A.5.1.32.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

Starting T2, cell 2 becomes detectable and the UE is expected to detect and send a measurement report. The RRC message implying handover to Cell 2 shall be sent to the UE during period T2, after the UE has reported Event A3. The *field sameSFN-Indication* is not included in the handover command. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

During the test, UE is configured with measurement gap to enable inter-frequency monitoring.

**Table A.5.1.32.1-1: General test parameters for E-UTRAN TDD inter frequency handover for Cat-M1 UEs in CEModeB test case**

| Parameter                      |                   | Unit | Value     | Comment                                          |
|--------------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions             | Active cell       |      | Cell 1    | Cell 1 is on RF channel number 1                 |
|                                | Neighbouring cell |      | Cell 2    | Cell 2 is on RF channel number 2                 |
| Final condition                | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number       |                   |      | 1, 2      | Two TDD carriers are used.                       |
| A3-Offset                      |                   | dB   | 0         |                                                  |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |           |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |           |          |           |
| Note 3: Es/I <sub>ot</sub> , RSRP and I <sub>o</sub> level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                |            |           |           |          |           |          |           |

### A.5.1.32.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 170 ms.

### A.5.1.33 E-UTRAN FDD-FDD Intra frequency handover for Cat-M1 UEs in CEModeA without SFN acquisition

#### A.5.1.33.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency handover requirements without SFN acquisition specified in clause 5.5.2.1.

The test scenario comprises of one E-UTRA FDD carrier and two cells as given in tables A.5.1.33.1-1 and A.5.1.33.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

E-UTRAN shall send a RRC message implying handover to Cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. The field sameSFN-Indication and mib-RepetitionStatus are included in the handover command. T3 is defined as the end of the last TTI containing the RRC message implying handover.

During the test, UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.33.1-1: General test parameters for E-UTRAN FDD-FDD intra frequency handover for Cat-M1 UEs in CEModeA without SFN acquisition test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    |                                                  |
|                            | Neighbouring cell |      | Cell 2    |                                                  |

| Timing offset to Cell 1 Synchronous cells                                                                                                                                                                              | us         | -         |           |          | 3                               |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |                                 |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |                                 |          |           |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                                         |            |           |           |          |                                 |          |           |

### A.5.1.13.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 50 ms.

## A.5.1.34 E-UTRAN HD-FDD Intra frequency handover for Cat-M1 UEs in CEModeA without SFN acquisition

### A.5.1.34.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency handover requirements without SFN acquisition specified in clause 5.5.2.2.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.5.1.34.1-1 and A.5.1.34.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

E-UTRAN shall send a RRC message implying handover to Cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. The field sameSFN-Indication and mib-RepetitionStatus are included in the handover command. T3 is defined as the end of the last TTI containing the RRC message implying handover.

During the test, UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.34.1-1: General test parameters for E-UTRAN HD-FDD intra frequency handover for Cat-M1 UEs in CEModeA without SFN acquisition test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    |                                                  |
|                            | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1         | Only one FDD carrier frequency is used.          |

| Timing offset to Cell 1 Synchronous cells                                                                                                                                                                                     | us         | -           |             |          | 3                               |          |             |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |             |             |          |                                 |          |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |             |             |          |                                 |          |             |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves                                                                                 |            |             |             |          |                                 |          |             |

### A.5.1.34.2 Test Requirements

The UE shall finish the transmission of all the repetitions of the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 50 ms.

## A.5.1.35 E-UTRAN TDD Intra frequency handover for Cat-M1 UEs in CEModeA without SFN acquisition

### A.5.1.35.1 Test Purpose and Environment

This test is to verify the requirement for the TDD intra frequency handover requirements without SFN acquisition specified in clause 5.5.2.3.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.5.1.35.1-1 and A.5.1.35.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

E-UTRAN shall send a RRC message implying handover to Cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. The field sameSFN-Indication and mib-RepetitionStatus are included in the handover command. T3 is defined as the end of the last TTI containing the RRC message implying handover.

During the test, UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.35.1-1: General test parameters for E-UTRAN TDD Intra frequency handover for Cat-M1 UEs in CEModeA without SFN acquisition test case**

| Parameter                      |                   | Unit | Value     | Comment                                          |
|--------------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions             | Active cell       |      | Cell 1    |                                                  |
|                                | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition                | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number       |                   |      | 1         | Only one TDD carrier frequency is used.          |
| A3-Offset                      |                   | dB   | 0         |                                                  |
| Hysteresis                     |                   | dB   | 0         |                                                  |
| Time To Trigger                |                   | s    | 0         |                                                  |
| Filter coefficient             |                   |      | 0         | L3 filtering is not used                         |
| DRX                            |                   |      |           | OFF                                              |
| CP length                      |                   |      | Normal    |                                                  |
| Access Barring Information     |                   | -    | Not Sent  | No additional delays in random access procedure. |
| Special subframe configuration |                   |      | 6         | As specified in table 4.2-1 in TS 36.211         |
| Uplink-downlink configuration  |                   |      | 1         | As specified in table 4.2-2 in TS 36.211         |
| PRACH configuration index      |                   |      | PRACH_4CE | As specified in A.3.16                           |
| PRACH initial CE level         |                   |      | 0         | Specified in the handover message                |

| Timing offset to Cell 1 Synchronous cells                                                                                                                                                                                     | μs         | -         |           |          | 3                               |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |           |           |          |                                 |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |           |           |          |                                 |          |           |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves                                                                                 |            |           |           |          |                                 |          |           |

### A.5.1.35.2 Test Requirements

The UE shall finish the transmission of all the repetitions of the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 50 ms.

## A.5.1.36 E-UTRAN FDD-FDD Intra frequency handover for Cat-M1 UEs in CEModeB without SFN acquisition

### A.5.1.36.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency handover requirements without SFN acquisition specified in clause 5.5.3.1.

The test scenario comprises of one E-UTRA FDD carrier and two cells as given in tables A.5.1.36.1-1 and A.5.1.36.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

During period T2, the UE should report Event A3, and afterwards E-UTRAN shall send a RRC message to the UE implying handover to Cell 2. The field sameSFN-Indication and mib-RepetitionStatus are included in the handover command. T3 is defined as the end of the last TTI containing the RRC message from UE implying handover.

During the test, the UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.36.1-1: General test parameters for E-UTRAN FDD-FDD intra frequency handover for Cat-M1 UEs in CEModeB without SFN acquisition test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    |                                                  |
|                            | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1         | Only one FDD carrier frequency is used.          |
| A3-Offset                  |                   | dB   | 0         |                                                  |
| Hysteresis                 |                   | dB   | 0         |                                                  |

| Timing offset to Cell 1 Synchronous cells                                                                                                                                                                              | us         | -         |           |          | 3                               |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |                                 |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |                                 |          |           |
| Note 3: Es/Iot, RSRP and I0 level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                                         |            |           |           |          |                                 |          |           |

## A.5.1.36.2 Test Requirements

The UE shall finish transmission of all repetitions of the PRACH to Cell 2 less than 50ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35ms is defined in clause 5.6.2.1.2.

This gives a total of 50ms.

## A.5.1.37 E-UTRAN HD-FDD Intra frequency handover for Cat-M1 UEs in CEModeB without SFN acquisition

### A.5.1.37.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency handover requirements without SFN acquisition specified in clause 5.5.3.2.

The test scenario comprises of one E-UTRA FDD carrier and two cells as given in tables A.5.1.37.1-1 and A.5.1.37.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

During period T2, the UE should report Event A3, and afterwards E-UTRAN shall send a RRC message to the UE implying handover to Cell 2. The field sameSFN-Indication and mib-RepetitionStatus are included in the handover command. During T3 is defined as the end of the last TTI containing the RRC message from UE implying handover.

During the test, UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.37.1-1: General test parameters for E-UTRAN HD-FDD intra frequency handover for Cat-M1 UEs in CEModeB without SFN acquisition test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    |                                                  |
|                            | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition            | Active cell       |      | Cell 2    |                                                  |

| Timing offset to Cell 1 Synchronous cells                                                                                                                                                                              | us         | -           |             |          | 3                               |          |             |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |             |             |          |                                 |          |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |             |             |          |                                 |          |             |
| Note 3: Es/I <sub>ot</sub> , RSRP and I <sub>o</sub> level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                |            |             |             |          |                                 |          |             |

### A.5.1.37.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 35\text{ms}$  is defined in clause 5.6.2.1.2.

This gives a total of 50ms.

## A.5.1.38 E-UTRAN TDD Intra frequency handover for Cat-M1 UEs in CEModeB without SFN acquisition

### A.5.1.38.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency handover requirements without SFN acquisition specified in clause 5.5.3.3.

The test scenario comprises of one E-UTRA TDD carrier and two cells as given in tables A.5.1.38.1-1 and A.5.1.38.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

During period T2, the UE should report Event A3, and afterwards E-UTRAN shall send a RRC message to the UE implying handover to Cell 2. The field sameSFN-Indication and mib-RepetitionStatus are included in the handover command. During T3 is defined as the end of the last TTI containing the RRC message from UE implying handover.

During the test, the UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.38.1-1: General test parameters for E-UTRAN TDD Intra frequency handover for Cat-M1 UEs in CEModeB without SFN acquisition test case**

| Parameter                      |                   | Unit | Value     | Comment                                          |
|--------------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions             | Active cell       |      | Cell 1    |                                                  |
|                                | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition                | Active cell       |      | Cell 2    |                                                  |
| A3-Offset                      |                   | dB   | 0         |                                                  |
| Hysteresis                     |                   | dB   | 0         |                                                  |
| Time To Trigger                |                   | s    | 0         |                                                  |
| Filter coefficient             |                   |      | 0         | L3 filtering is not used                         |
| DRX                            |                   |      |           | OFF                                              |
| CP length                      |                   |      | Normal    |                                                  |
| Access Barring Information     |                   | -    | Not Sent  | No additional delays in random access procedure. |
| Special subframe configuration |                   |      | 6         | As specified in table 4.2-1 in TS 36.211         |
| Uplink-downlink configuration  |                   |      | 1         | As specified in table 4.2-2 in TS 36.211         |
| PRACH configuration            |                   |      | PRACH_4CE | As specified in clause A.3.16                    |
| PRACH initial CE level         |                   |      | 0         | Specified in handover message                    |
| T1                             |                   | s    | 5         |                                                  |

| Timing offset to Cell 1 Synchronous cells                                                                                                                                                                              | μs         | -         |           |          | 3                               |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |                                 |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |                                 |          |           |
| Note 3: $E_s/I_{ot}$ , RSRP and $I_o$ level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                               |            |           |           |          |                                 |          |           |

### A.5.1.38.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 35\text{ms}$  is defined in clause 5.6.2.1.2.

This gives a total of 50 ms.

## A.5.2 E-UTRAN Handover to other RATs

### A.5.2.1 E-UTRAN FDD – UTRAN FDD Handover

#### A.5.2.1.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD to UTRAN FDD handover requirements specified in clause 5.3.1.

The test parameters are given in Tables A.5.2.1.1-1, A.5.2.1.1-2 and A.5.2.1.1-3. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.2.1.1-1: General test parameters for E-UTRAN FDD to UTRAN FDD handover test case**

| Parameter                                         |                   | Unit | Value                                    | Comment                                                         |
|---------------------------------------------------|-------------------|------|------------------------------------------|-----------------------------------------------------------------|

| Propagation Condition                                                                                                  |              | AWGN          |       |        |
| Note 1: The DPCH level is controlled by the power control loop                                                         |              |               |       |        |
| Note 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to $I_{or}$ . |              |               |       |        |

### A.5.2.1.2 Test Requirements

The UE shall start to transmit the UL DPCH to Cell 2 less than 190 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.3.1.1.1.

$T_{\text{interrupt}}$  = 140 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.3.1.1.2.

This gives a total of 190 ms.

## A.5.2.2 E-UTRAN TDD - UTRAN FDD Handover

### A.5.2.2.1 Test Purpose and Environment

This test is to verify the E-UTRAN TDD – UTRAN FDD handover requirements specified in clause 5.3.1.

The test scenario comprises of one E-UTRAN TDD cell and one UTRAN FDD cell as given in the tables A.5.2.2.1-1, A.5.2.2.1-2 and A.5.2.2.1-3. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. At start of time duration T1, the UE does not have any timing information of cell 2. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before the start of T2 to enable the monitoring of UTRAN FDD. A neighbouring cell list, including the UTRAN cell (cell2), shall be sent to the UE before T2 starts. During the time T2 cell 2 becomes detectable and the UE is expected to detect and send the measurement report. A RRC message implying handover shall be sent to the UE during T2, after the UE has reported event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.2.2.1-1: General test parameters for E-UTRAN TDD-UTRAN FDD handover**

| Parameter                                         |                | Unit | Value                                    | Comment                                                              |
|---------------------------------------------------|----------------|------|------------------------------------------|----------------------------------------------------------------------|
| PDSCH parameters (E-UTRAN TDD)                    |                |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2                                     |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN TDD)       |                |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2                                     |
| Initial conditions                                | Active cell    |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.                             |
|                                                   | Neighbour cell |      | Cell 2                                   | Cell 2 is on UTRA RF channel number 1.                               |
| Final conditions                                  | Active cell    |      | Cell 2                                   |                                                                      |
| Special subframe configuration                    |                |      | 6                                        | As specified in table 4.2-1 in TS 36.211. Applicable to cell 1.      |
| Uplink-downlink configuration                     |                |      | 1                                        | As specified in table 4.2-2 in TS 36.211. Applicable to cell 1       |
| E-UTRAN TDD measurement quantity                  |                |      | RSRP                                     |                                                                      |
| Inter-RAT (UTRA FDD) measurement quantity         |                |      | CPICH Ec/Io                              |                                                                      |
| b2-Threshold1                                     |                | dBm  | -90                                      | Absolute E-UTRAN RSRP threshold for event B2                         |
| b2-Threshold2-UTRA                                |                | dB   | -18                                      | UTRAN FDD CPICH Ec/Io threshold for event B2                         |
| Hysteresis                                        |                | dB   | 0                                        |                                                                      |
| DRX                                               |                |      | OFF                                      | No DRX configured.                                                   |
| Time to Trigger                                   |                | ms   | 0                                        |                                                                      |
| Filter coefficient                                |                |      | 0                                        |                                                                      |
| CP length                                         |                |      | Normal                                   | Applicable to cell 1                                                 |
| Gap pattern configuration Id                      |                |      | 0                                        | As specified in Table 8.1.2.1-1; to start before T2 starts           |
| E-UTRA RF Channel Number                          |                |      | 1                                        | One E-UTRA TDD carrier frequency is used.                            |
| E-UTRA Channel Bandwidth (BW <sub>channel</sub> ) |                | MHz  | 10                                       |                                                                      |
| UTRA RF Channel Number                            |                |      | 1                                        | One UTRA FDD carrier frequency is used.                              |
| Monitored UTRA FDD cell list size                 |                |      | 12                                       | UTRA cells on UTRA RF channel 1 provided in the cell list before T2. |
| Post-verification period                          |                |      | False                                    | Post verification is not used.                                       |
| T1                                                |                | s    | 5                                        |                                                                      |

| OCNS                      | dB                                                                                                                    | -0.941        | -0.941 | Note 2 |
| $\hat{I}_{or}/I_{oc}$     | dB                                                                                                                    | -infinity     | -1.8   | -1.8   |
| $I_{oc}$                  | dBm/3.84 MHz                                                                                                          | -70           |        |        |
| CPICH_Ec/I <sub>o</sub>   | dB                                                                                                                    | -infinity     | -14    | -14    |
| Propagation Condition     |                                                                                                                       | AWGN          |        |        |
| Note 1:                   | The DPCH level is controlled by the power control loop                                                                |               |        |        |
| Note 2:                   | The power of the OCNS channel that is added shall make the total power from the cell to be equal to I <sub>or</sub> . |               |        |        |

### A.5.2.2.2 Test Requirements

The UE shall start to transmit the UL DPCCH to Cell 2 less than 190 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.1.1.1.1.

$T_{\text{interrupt}}$  = 140 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.3.1.1.2.

This gives a total of 190 ms.

## A.5.2.3 E-UTRAN FDD- GSM Handover

### A.5.2.3.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN to GSM cell handover delay specified in clause 5.3.3.

The test parameters are given in Table A.5.2.3.1 -1, A.5.2.3.1 -2 and A.5.2.3.1 -3 below. In the measurement control information it is indicated to the UE that event-triggered reporting with Event B1 shall be used. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

The RRC message implying handover to cell 2 shall be sent to the UE during period T2, after the UE has reported Event B1. The start of T3 is defined as the end of last E-UTRAN TTI containing the RRC message implying handover.

The requirements are also applicable for a UE not requiring measurement gap, in which case no measurement gap pattern should be sent for the parameters specified in Table A.5.2.3.1-1.

**Table A.5.2.3.1 -1: General test parameters for E-UTRAN FDD-GSM handover**

| Parameter                      |                | Unit | Value                                    | Comment                                           |
|--------------------------------|----------------|------|------------------------------------------|---------------------------------------------------|
| PDSCH parameters               |                |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                  |
| PCFICH/PDCCH/PHICH parameters  |                |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                  |

They are not settable parameters themselves.                                                                                                   |            |          |

**Table A.5.2.3.1 - 3: Cell Specific Parameters for Handover from E-UTRAN FDD to GSM cell case (cell 2)**

| Parameter                  | Unit | Cell 2 (GSM) |        |
|----------------------------|------|--------------|--------|
|                            |      | T1           | T2, T3 |
| Absolute RF Channel Number |      | ARFCN 1      |        |
| RXLEV                      | dBm  | -85          | -75    |

### A.5.2.3.2 Test Requirements

The UE shall begin to send access bursts on the new DCCH of the target cell less than 100 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this test case is expressed as:

$$T_{\text{Handover delay}} = 90 \text{ ms (Table 5.3.3.2.1-1)} + T_{\text{offset}} + T_{\text{UL}}$$

$T_{\text{offset}}$  : Equal to 4.65 ms, GSM timing uncertainty between the time from when the UE is ready to transmit until the start of the next timeslot in GSM 26 multiframe structure

$T_{UL}$ : Equal to 4.65 ms, the time the UE has to wait in case the next timeslot is an idle frame or a SACCH frame.

This gives a total of 99.3 ms, allow 100 ms in the test case.

## A.5.2.4 E-UTRAN TDD - UTRAN TDD Handover

### A.5.2.4.1 Test Purpose and Environment

#### A.5.2.4.1.1 Void

#### A.5.2.4.1.2 1.28 Mcps TDD option

This test is to verify the requirement for E-UTRAN TDD to UTRAN TDD handover requirements specified in clause 5.3.2.

The test scenario comprises of 1 E-UTRA TDD cell and 1 UTRA TDD cell as given in tables Table A.5.2.4.1.2-1, Table A.5.2.4.1.2-2, and Table A.5.2.4.1.2-3. Gap pattern configuration #0 as defined in table 8.1.2.1-1 is provided.

The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively.

E-UTRAN shall send a RRC message implying handover to UE. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event B2. The end of the last TTI containing handover message is begin of T3 duration.

**Table A.5.2.4.1.2-1: General test parameters for E-UTRA TDD to UTRA(1.28 Mcps TDD OPTION) handover test case**

| Note 1: In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                                  |              |               |        |        |       |    |    |
| Note 2: PCCPCH_RSCP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |              |               |        |        |       |    |    |

A.5.2.4.1.3      Void

#### A.5.2.4.2      Test Requirements

A.5.2.4.2.1      Void

A.5.2.4.2.2      1.28 Mcps TDD option

The UE shall start to transmit the SYNCH-UL sequence in the UpPTS to Cell 2 less than 120 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.3.2.2.1.

$T_{\text{interrupt}}$  is defined in clause 5.3.2.2.2.  $T_{\text{interrupt}} = 70$  ms in the test as following:

$$T_{\text{interrupt}1} = T_{\text{offset}} + T_{\text{UL}} + 30 \cdot F_{\text{SFN}} + 20 \text{ ms}$$

$$T_{\text{offset}} = 10 \text{ ms}; T_{\text{UL}} = 10 \text{ ms}; \text{ and } F_{\text{SFN}} = 1 \text{ for UE decoding SFN.}$$

This gives a total of 120 ms.

A.5.2.4.2.3      Void

### A.5.2.5      E-UTRAN FDD – UTRAN TDD Handover

#### A.5.2.5.1      Test Purpose and Environment

A.5.2.5.1.1      Void

A.5.2.5.1.2      1.28 Mcps TDD option

This test is to verify the requirement for the E-UTRAN FDD to UTRAN TDD handover requirements specified in clause 5.3.2.

The test scenario comprises of two cells, E-UTRA TDD cell1 and UTRA TDD cell2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #1 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-RAT frequency monitoring. The test parameters are given in Tables A.5.2.5.1-1, A.5.2.5.1-2 and A.5.2.5.1-3.

A RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.2.5.1.2-1: General test parameters for E-UTRA FDD to UTRA (1.28 Mcps TDD option) handover test case**

| Parameter                        |                | Unit | Value                                    | Comment                                                     |
|----------------------------------|----------------|------|------------------------------------------|-------------------------------------------------------------|
| PDSCH parameters                 |                |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                            |
| PCFICH/PDCCH/PHICH parameters    |                |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                            |
| Initial conditions               | Active cell    |      | Cell 1                                   | E-UTRA FDD cell                                             |

A.5.2.5.1.3 Void

## A.5.2.5.2 Test Requirements

A.5.2.5.2.1 Void

A.5.2.5.2.2 1.28 Mcps TDD option

The UE shall start to transmit the SYNCH-UL sequence in the UpPTS to Cell 2 less than 120 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.3.2.2.1.

$T_{\text{interrupt}}$  is defined in clause 5.3.2.2.2.  $T_{\text{interrupt}} = 70$  ms in the test as following:

$$T_{\text{interrupt1}} = T_{\text{offset}} + T_{\text{UL}} + 30 \cdot F_{\text{SFN}} + 20 \text{ ms}$$

$$T_{\text{offset}} = 10 \text{ ms}; T_{\text{UL}} = 10 \text{ ms}; \text{ and } F_{\text{SFN}} = 1 \text{ for UE decoding SFN.}$$

This gives a total of 120 ms.

A.5.2.5.2.3 Void

## A.5.2.6 E-UTRAN TDD - GSM Handover

### A.5.2.6.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN to GSM cell handover delay specified in clause 5.3.3.

The test parameters are given in Table A.5.2.6.1-1, A.5.2.6.1-2 and A.5.2.6.1-3 below. In the measurement control information it is indicated to the UE that event-triggered reporting with Event B1 shall be used. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

The RRC message implying handover to cell 2 shall be sent to the UE during period T2, after the UE has reported Event B1. The start of T3 is defined as the end of last E-UTRAN TTI containing the RRC message implying handover.

The requirements are also applicable for a UE not requiring measurement gap, in which case no measurement gap pattern should be sent for the parameters specified in Table A.5.2.6.1-1.

**Table A.5.2.6.1-1: General test parameters for E-UTRAN TDD to GSM neighbours handover test case in AWGN propagation condition**

| Parameter                                         |                | Unit | Value                                    | Comment                                           |
|---------------------------------------------------|----------------|------|------------------------------------------|---------------------------------------------------|
| PDSCH parameters                                  |                |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2                  |
| PCFICH/PDCCH/PHICH parameters                     |                |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2                  |
| Gap Pattern Id                                    |                |      | 1                                        | As specified in TS 36.133 clause 8.1.2.1.         |
| Initial conditions                                | Active cell    |      | Cell 1                                   |                                                   |
|                                                   | Neighbour cell |      | Cell 2                                   |                                                   |
| Final conditions                                  | Active cell    |      | Cell 2                                   |                                                   |
| Uplink-downlink configuration of cell 1           |                |      | 1                                        | As specified in table 4.2.2 in TS 36.211          |
| Special subframe configuration of cell 1          |                |      | 6                                        | As specified in table 4.2.1 in TS 36.211          |
| CP length of cell 1                               |                |      | Normal                                   |                                                   |
| Inter-RAT measurement quantity                    |                |      | GSM Carrier RSSI                         |                                                   |
| E-UTRA RF Channel Number                          |                |      | 1                                        | E-UTRA RF Channel Number                          |
| E-UTRA Channel Bandwidth (BW <sub>channel</sub> ) |                | MHz  | 10                                       | E-UTRA Channel Bandwidth (BW <sub>channel</sub> ) |
| Threshold other system                            |                | dBm  | -80                                      | Absolute GSM carrier RSSI threshold for event B1. |
| Hysteresis                                        |                | dB   | 0                                        |                                                   |
| Time to Trigger                                   |                | ms   | 0                                        |                                                   |
| Filter coefficient                                |                |      | 0                                        | L3 filtering is not used                          |
| DRX                                               |                |      | OFF                                      |                                                   |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN       |          |
| NOTE 1: OCNG shall be used such that cell 1 is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                               |            |            |          |
| NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |            |          |
| NOTE 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |            |          |

**Table A.5.2.6.1-3: Cell Specific Parameters for Handover E-UTRAN to GSM cell case (cell 2)**

| Parameter                  | Unit | Cell 2 (GSM) |        |
|----------------------------|------|--------------|--------|
|                            |      | T1           | T2, T3 |
| Absolute RF Channel Number |      | ARFCN 1      |        |
| RXLEV                      | dBm  | -85          | -75    |

### A.5.2.6.2 Test Requirements

The UE shall begin to send access bursts on the new DCCH of the target cell less than 100 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this test case is expressed as:

$$T_{\text{Handover delay}} = 90 \text{ ms (Table 5.3.3.2.1-1)} + T_{\text{offset}} + T_{\text{UL}}$$

$T_{\text{offset}}$ : Equal to 4.65 ms, GSM timing uncertainty between the time from when the UE is ready to transmit until the start of the next timeslot in GSM 26 multiframe structure

$T_{\text{UL}}$ : Equal to 4.65 ms, the time the UE has to wait in case the next timeslot is an idle frame or a SACCH frame.

This gives a total of 99.3 ms, allow 100 ms in the test case.

## A.5.2.7 E-UTRAN FDD – UTRAN FDD Handover; Unknown Target Cell

### A.5.2.7.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD to UTRAN FDD handover requirements for the case when the target cell is unknown as specified in clause 5.3.1.

The test parameters are given in Tables A.5.2.7.1-1, A.5.2.7.1-2 and A.5.2.7.1-3. The test consists of two successive time periods, with time durations of T1, T2. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, cell 2 becomes detectable and the UE receives a RRC handover command from the network. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. No Gap pattern configuration shall be used.

**Table A.5.2.7.1-1: General test parameters for E-UTRAN FDD to UTRAN FDD handover test case**

| Parameter                                         |                   | Unit | Value                                    | Comment                                                         |

| PICH Ec/lor                                                                                                            | dB           | -15           |      |
| DCH Ec/lor                                                                                                             | dB           | Note 1        |      |
| OCNS Ec/lor                                                                                                            | dB           | Note 2        |      |
| $\hat{I}_{or}/I_{oc}$                                                                                                  | dB           | -infinity     | -1.8 |
| $I_{oc}$                                                                                                               | dBm/3,84 MHz | -70           | -70  |
| CPICH Ec/lo                                                                                                            | dB           | -infinity     | -14  |
| Propagation Condition                                                                                                  | AWGN         |               |      |
| Note 1: The DPCH level is controlled by the power control loop                                                         |              |               |      |
| Note 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to $I_{or}$ . |              |               |      |

### A.5.2.7.2 Test Requirements

The UE shall start to transmit the UL DPCCH to Cell 2 less than 290 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay is 50ms. See clause 5.3.1.1.1.

$T_{interrupt}$  is 240ms. See clause 5.3.1.1.2.

This gives a total of 290ms in the test case.

## A.5.2.8 E-UTRAN FDD - GSM Handover; Unknown Target Cell

### A.5.2.8.1 Test Purpose and Environment

This test is to verify the E-UTRAN FDD to GSM handover requirements for the case when the target GSM cell is unknown as specified in clause 5.3.3.

The test parameters are given in Table A.5.2.8.1-1, A.5.2.8.1-2 and A.5.2.8.1-3 below. The test consists of two successive time periods, with time duration of T1, T2 respectively. At the start of time duration T1, the UE will not have any timing information of cell 2. Starting T2, cell 2 becomes detectable and the UE receives a RRC handover command from the network. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. No Gap pattern configuration shall be used.

**Table A.5.2.8.1-1: General test parameters for E-UTRAN FDD to GSM handover test case; unknown target cell**

| Parameter                     |                | Unit | Value                                    | Comment                                |
|-------------------------------|----------------|------|------------------------------------------|----------------------------------------|
| PDSCH parameters              |                |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1       |
| PCFICH/PDCCH/PHICH parameters |                |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1       |
| Gap Pattern Id                |                |      | None                                     | No measurement gaps shall be provided. |
| Initial conditions            | Active cell    |      | Cell 1                                   |                                        |
|                               | Neighbour cell |      | Cell 2                                   |                                        |
| Final conditions              | Active cell    |      | Cell 2                                   |                                        |

**Table A.5.2.8.1-3: Cell specific parameters for cell # 2 in E-UTRAN FDD to GSM handover test case; unknown target cell**

| Parameter                  | Unit | Cell 2 (GSM) |     |
|----------------------------|------|--------------|-----|
|                            |      | T1           | T2  |
| Absolute RF Channel Number |      | ARFCN 1      |     |
| RXLEV                      | dBm  | -Infinity    | -75 |

#### A.5.2.8.2 Test Requirements

The UE shall begin to send access bursts on the new DCCH of the target cell less than 200 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this test case is expressed as:

$$T_{\text{Handover delay}} = 190 \text{ ms (Table 5.3.3.2.1-1)} + T_{\text{offset}} + T_{\text{UL}}$$

$T_{\text{offset}}$ : Equal to 4.65 ms is the GSM timing uncertainty from the time when the UE is ready to transmit until the start of the next timeslot in GSM 26 multiframe structure

$T_{UL}$ : Equal to 4.65 ms is the time the UE has to wait in case the next timeslot is an idle frame or a SACCH frame.

This gives a total of 199.3 ms, allow 200 ms in the test case.

## A.5.2.9 E-UTRAN TDD - GSM Handover; Unknown Target Cell

### A.5.2.9.1 Test Purpose and Environment

This test is to verify the E-UTRAN TDD to GSM handover requirements for the case when the target GSM cell is unknown as specified in clause 5.3.3.

The test parameters are given in Table A.5.2.9.1 -1, A.5.2.9.1 -2 and A.5.2.9.1 -3 below. The test consists of two successive time periods, with time duration of T1, T2 respectively. At the start of time duration T1, the UE will not have any timing information of cell 2. Starting T2, cell 2 becomes detectable and the UE receives a RRC handover command from the network. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. No Gap pattern configuration shall be used.

| $\hat{E}_s / N_{oc}$                                                                                                                                           | dB         | 4        |          |
| RSRP <sup>Note 3</sup>                                                                                                                                         | dBm/15 kHz | -94      |          |
| Propagation Condition                                                                                                                                          |            | AWGN     |          |
| Note 1: OCNG shall be used such that cell 1 is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.       |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as |            |          |          |
| AWGN of appropriate power for $N_{oc}$ to be fulfilled.                                                                                                        |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                             |            |          |          |

**Table A.5.2.9.1 - 3: Cell specific parameters for cell # 2 in E-UTRAN TDD to GSM handover test case; unknown target cell**

| Parameter                  | Unit | Cell 2 (GSM) |     |
|----------------------------|------|--------------|-----|
|                            |      | T1           | T2  |
| Absolute RF Channel Number |      | ARFCN 1      |     |
| RXLEV                      | dBm  | -Infinity    | -75 |

### A.5.2.9.2 Test Requirements

The UE shall begin to send access bursts on the new DCCH of the target cell less than 200 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this test case is expressed as:

$$T_{\text{Handover delay}} = 190 \text{ ms (Table 5.3.3.2.1-1)} + T_{\text{offset}} + T_{\text{UL}}$$

$T_{\text{offset}}$ : Equal to 4.65 ms is the GSM timing uncertainty from the time when the UE is ready to transmit until the start of the next timeslot in GSM 26 multiframe structure

$T_{UL}$ : Equal to 4.65 ms is the time the UE has to wait in case the next timeslot is an idle frame or a SACCH frame.

This gives a total of 199.3 ms, allow 200 ms in the test case.

## A.5.2.10 E-UTRAN TDD to UTRAN TDD handover: unknown target cell

### A.5.2.10.1 Test Purpose and Environment

This test is to verify the requirement for E-UTRAN TDD to UTRAN TDD handover requirements specified in clause 5.3.2 when the target UTRAN TDD cell is unknown.

The test scenario comprises of 1 E-UTRAN TDD cell and 1 UTRAN TDD cell as given in tables A.5.2.10.1-1, A.5.2.10.1-2, and A.5.2.10.1-3. No gap pattern is configured in the test case.

The test consists of two successive time periods, with time durations of T1 and T2 respectively. During time duration T1, a RRC message implying handover to UTRA 1.28Mcps TDD cell shall be sent to the UE. The end of the last TTI containing handover message is the beginning of T2 duration.

**Table A.5.2.10.1-1: General test parameters for E-UTRAN TDD to unknown UTRAN TDD cell handover test case**

| Note1:                                  | In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                         |               |     |           |    |
| Note2:                                  | P-CCPCH RSCP levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |               |     |           |    |

### A.5.2.10.2 Test Requirements

The UE shall start to transmit the SYNCH-UL sequence in the UpPTS to Cell 2 less than 280 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.3.2.2.1.

$T_{\text{interrupt}}$  is defined in clause 5.3.2.2.2.  $T_{\text{interrupt}} = 230$  ms in the test as following:

$$T_{\text{interrupt1}} = T_{\text{offset}} + T_{\text{UL}} + 30 \cdot F_{\text{SFN}} + 180 \text{ ms}$$

$$T_{\text{offset}} = 10 \text{ ms}; T_{\text{UL}} = 10 \text{ ms}; \text{ and } F_{\text{SFN}} = 1 \text{ for UE decoding SFN.}$$

This gives a total of 280 ms.

## A.5.2.10A E-UTRAN FDD – UTRAN FDD Multicarrier Handover with two target cells

### A.5.2.10A.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD to UTRAN FDD handover requirements specified in clause 5.3.1 in a 2 cell multicarrier configuration. It is applicable to UEs that support DC-HSDPA, DB-DC-HSDPA and which do not support 3C-HSDPA or 4C-HSDPA.

The test parameters are given in Tables A.5.2.10A.1-1, A.5.2.10A.1-2 and A.5.2.10A.1-3. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 and cell 3 become detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover to cell 2 and cell 3 shall be sent to the UE during period T2, after the UE has reported Event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target Primary Serving HS-DSCH cell and cell 3 as the target Secondary Serving HS-DSCH cell.

**Table A.5.2.10A.1-1: General test parameters for E-UTRAN FDD to UTRAN FDD handover test case**

| Parameter                                         |                   | Unit | Value                                    | Comment                                                         |
|---------------------------------------------------|-------------------|------|------------------------------------------|-----------------------------------------------------------------|
| PDSCH parameters                                  |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                                |
| PCFICH/PDCCH/PHICH parameters                     |                   |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                                |
| Initial conditions                                | Active cell       |      | Cell 1                                   | E-UTRAN cell                                                    |
|                                                   | Neighbouring cell |      | Cell 2                                   | UTRAN cell                                                      |
| Final condition                                   | Active cell       |      | Cell 2 and cell 3                        | UTRAN cell                                                      |
| Channel Bandwidth (BW <sub>channel</sub> )        |                   | MHz  | 10                                       |                                                                 |
| Gap Pattern Id                                    |                   |      | 0                                        | As specified in Table 8.1.2.1-1 started before T2 starts        |
| E-UTRAN FDD measurement quantity                  |                   |      | RSRP                                     |                                                                 |
| Inter-RAT (UTRAN FDD) measurement quantity        |                   |      | CPICH Ec/Io                              |                                                                 |
| b2-Threshold1                                     |                   | dBm  | -90                                      | Absolute E-UTRAN RSRP threshold for event B2                    |
| b2-Threshold2-UTRA                                |                   | dB   | -18                                      | Absolute UTRAN CPICH Ec/Io threshold for event B2               |
| Hysteresis                                        |                   | dB   | 0                                        |                                                                 |

| Note 1: The DPCH level is controlled by the power control loop                                                  |              |                              |      |      |                                |      |      |
| Note 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to Ior |              |                              |      |      |                                |      |      |
| Note 3: The UE shall be scheduled continuously with HS-DSCH data during T3 using both cell 2 and cell 3         |              |                              |      |      |                                |      |      |

### A.5.2.10A.2 Test Requirements

The UE shall start to transmit the UL DPCH to Cell 2 less than 210 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.3.1.1.1.

$T_{\text{interrupt}}$  = 160 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.3.1.1.2.

This gives a total of 210 ms.

## A.5.2.10B E-UTRAN TDD – UTRAN FDD Multicarrier Handover with two target cells

### A.5.2.10B.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN TDD to UTRAN FDD handover requirements specified in clause 5.3.1 in a 2 cell multicarrier configuration. It is applicable to UEs that support DC-HSDPA, DB-DC-HSDPA and which do not support 3C-HSDPA or 4C-HSDPA.

The test parameters are given in Tables A.5.2.10B.1-1, A.5.2.10B.1-2 and A.5.2.10B.1-3. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 and cell 3 become detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover to cell 2 and cell 3 shall be sent to the UE during period T2, after the UE has reported Event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target Primary Serving HS-DSCH cell and cell 3 as the target Secondary Serving HS-DSCH cell.

**Table A.5.2.10B.1-1: General test parameters for E-UTRAN TDD to UTRAN FDD handover test case**

| Parameter                                         |                | Unit | Value                                    | Comment                                                              |

| Note 1:                | The DPCH level is controlled by the power control loop                                                  |                              |      |      |                                |      |      |
| Note 2:                | The power of the OCNS channel that is added shall make the total power from the cell to be equal to Ior |                              |      |      |                                |      |      |
| Note 3:                | The UE shall be scheduled continuously with HS-DSCH data during T3 using both cell 2 and cell 3         |                              |      |      |                                |      |      |

### A.5.2.10B.2 Test Requirements

The UE shall start to transmit the UL DPCH to Cell 2 less than 210 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.3.1.1.1.

$T_{\text{interrupt}}$  = 160 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.3.1.1.2.

This gives a total of 210 ms.

### A.5.2.11 E-UTRAN FDD – UTRAN FDD Handover for 5MHz Bandwidth

#### A.5.2.11.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.5.2.1.1.

The parameters of this test are the same as defined in Subclause A.5.2.1.1 except that the values of the parameters in the Table A.5.2.11.1-1 will replace the values of the corresponding parameters in A.5.2.1.1-1, and the values of the parameters in the Table A.5.2.11.1-2 will replace the values of the corresponding parameters in A.5.2.1.1-2.

**Table A.5.2.11.1-1: General test parameters for E-UTRAN FDD to UTRAN FDD handover test case for 5MHz bandwidth**

| Parameter                                                                   | Unit | Value                                     | Comment                          |
|-----------------------------------------------------------------------------|------|-------------------------------------------|----------------------------------|
| PDSCH parameters                                                            |      | DL Reference Measurement Channel R.5 FDD  | As specified in clause A.3.1.1.1 |
| PCFICH/PDCCH/PHICH parameters                                               |      | DL Reference Measurement Channel R.11 FDD | As specified in clause A.3.1.2.1 |
| E-UTRA Channel Bandwidth (BW <sub>channel</sub> )                           | MHz  | 5                                         |                                  |
| Note 1: See Table A.5.2.1.1-1 for other general test parameters.            |      |                                           |                                  |
| Note 2: This test is according to the principle defined in section A.3.7.2. |      |                                           |                                  |

**Table A.5.2.11.1-2: Cell specific test parameters for E-UTRAN FDD to UTRAN FDD handover test case (cell 1)**

| Parameter                                                                                                                                                     | Unit        | Cell 1 (E-UTRA) |           |           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|-----------------|-----------|-----------|
|                                                                                                                                                               |             | T1              | T2        | T3        |
| BW <sub>channel</sub>                                                                                                                                         | MHz         | 5               |           |           |
| OCNG Patterns defined in A.3.2.1.15 (OP.15 FDD) and in A.3.2.1.16 (OP.16 FDD)                                                                                 |             | OP.15 FDD       | OP.15 FDD | OP.16 FDD |
| I <sub>o</sub> <sup>Note 2</sup>                                                                                                                              | dBm/4.5 MHz | -70.22          | -70.22    | -70.22    |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. |             |                 |           |           |
| Note 2: RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.         |             |                 |           |           |
| Note 3: See Table A.5.2.1.1-2 for other cell specific test parameters.                                                                                        |             |                 |           |           |

#### A.5.2.11.2 Test Requirements

The test requirements defined in section A.5.2.1.2 shall apply to this test case.

### A.5.3 E-UTRAN Handover to Non-3GPP RATs

#### A.5.3.1 E-UTRAN FDD – HRPD Handover

##### A.5.3.1.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD to HRPD handover requirements specified in clause 5.4.1.

The test parameters are given in Tables A.5.3.1.1-1, A.5.3.1.1-2 and A.5.3.1.1-3. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.3.1.1-1: General test parameters for E-UTRAN FDD to HRPD handover test case**

| Parameter                                         |                   | Unit | Value                                    | Comment                                                              |
|---------------------------------------------------|-------------------|------|------------------------------------------|----------------------------------------------------------------------|
| PDSCH parameters                                  |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                                     |
| PCFICH/PDCCH/PHICH parameters                     |                   |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                                     |

| $\hat{E}_s / I_{ot}$                                                                                                                                                                                                          | dB         | 0               | 0   | 0        |
| Propagation Condition                                                                                                                                                                                                         |            | AWGN            |     |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |                 |     |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |                 |     |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |                 |     |          |

**Table A.5.3.1.1-3: Cell specific test parameters for HRPD (cell # 2) for handover from E-UTRAN FDD cell (cell #1)**

| Parameter                                     | Unit           | Cell 2 (HRPD) |    |    |
|-----------------------------------------------|----------------|---------------|----|----|
|                                               |                | T1            | T2 | T3 |
| $\frac{\text{Control } E_b}{N_t}$ (38.4 kbps) | dB             | 21            |    |    |
| $\frac{\text{Control } E_b}{N_t}$ (76.8 kbps) | dB             | 18            |    |    |
| $\hat{I}_{or}/I_{oc}$                         | dB             | -infinity     | 0  | 0  |
| $I_{oc}$                                      | dBm/1.2288 MHz | -55           |    |    |
| CDMA2000 HRPD Pilot Strength                  | dB             | -infinity     | -3 | -3 |
| Propagation Condition                         |                | AWGN          |    |    |

### A.5.3.1.2 Test Requirements

The UE shall start transmission of the reverse control channel in HRPD to Cell 2 less than 127 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.4.1.1.1.

$T_{\text{interrupt}}$  = 76.66 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.4.1.1.2.

This gives a total of 126.66 ms, allow 127 ms in the test.

## A.5.3.2 E-UTRAN FDD – cdma2000 1X Handover

### A.5.3.2.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD to cdma2000 1X handover requirements specified in clause 5.4.2.

The test parameters are given in Tables A.5.3.2.1-1, A.5.3.2.1-2 and A.5.3.2.1-3. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.3.2.1-1: General test parameters for E-UTRAN FDD to cdma2000 1X handover test case**

| Parameter                                         |                   | Unit | Value                                    | Comment                                                                            |
|---------------------------------------------------|-------------------|------|------------------------------------------|------------------------------------------------------------------------------------|

| Propagation Condition                          |                | AWGN                 |     |     |

### A.5.3.2.2 Test Requirements

The UE shall start transmission of the reverse control channel in cdma2000 1X to Cell 2 less than 300 ms from the beginning of time period T3.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 130 ms, which is specified in clause 5.4.2.1.1.

$T_{\text{interrupt}}$  = 170 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.4.2.1.2.

This gives a total of 300 ms.

## A.5.3.3 E-UTRAN FDD – HRPD Handover; Unknown Target Cell

### A.5.3.3.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD to HRPD handover requirements for the case when the target HRPD cell is unknown as specified in clause 5.4.1.

The test parameters are given in Tables A.5.3.3.1-1, A.5.3.3.1-2 and A.5.3.3.1-3. The test consists of two successive time periods, with time durations of T1 and T2 respectively. At the start of time duration T1, the UE does not have any timing information of cell 2. During time period T1, message containing Information Element *systemTimeInfo* as defined in clause 6.3.1 of TS 36.331 [2] shall be sent by the System Simulator (SS). No gap patterns are configured in the test case. No HRPD neighbour cell list shall be provided to the UE.

A RRC message implying handover to the unknown HRPD cell shall be sent to the UE towards the end of the time period T1. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.3.3.1-1: General test parameters for E-UTRAN FDD to HRPD handover test case; unknown target HRPD cell**

| Parameter                                         |                   | Unit | Value                                    | Comment                                                    |

| $\hat{E}_s / I_{ot}$                                                                                                                                                                                                          | dB         | 0                    | 0   |
| Propagation Condition                                                                                                                                                                                                         |            | AWGN                 |     |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |                      |     |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |                      |     |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |                      |     |

**Table A.5.3.3.1-3: Cell specific test parameters for unknown HRPD (cell # 2) for handover from E-UTRAN FDD cell (cell #1)**

| Parameter                                             | Unit           | Cell 2 (HRPD) |    |
|-------------------------------------------------------|----------------|---------------|----|
|                                                       |                | T1            | T2 |
| $\frac{\text{Control } E_b}{N_t} (38.4 \text{ kbps})$ | dB             | 21            |    |
| $\frac{\text{Control } E_b}{N_t} (76.8 \text{ kbps})$ | dB             | 18            |    |
| $\hat{I}_{or} / I_{oc}$                               | dB             | -infinity     | 0  |
| $I_{oc}$                                              | dBm/1.2288 MHz | -55           |    |
| CDMA2000 HRPD Pilot Strength                          | dB             | -infinity     | -3 |
| Propagation Condition                                 |                | AWGN          |    |

### A.5.3.3.2 Test Requirements

The UE shall start transmission of the reverse control channel in HRPD to Cell 2 less than 127 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay is expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

$T_{\text{interrupt}}$  also includes time to detect HRPD cell; see clause 5.4.1.1.2

This gives a total of 126.66 ms, allow 127 ms in the test case.

## A.5.3.4 E-UTRAN FDD – cdma2000 1X Handover; Unknown Target cell

### A.5.3.4.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD to cdma2000 1X handover requirements for the case when the target cdma2000 1X cell is unknown as specified in clause 5.4.2.

The test parameters are given in Tables A.5.3.4.1-1, A.5.3.4.1-2 and A.5.3.4.1-3. The test consists of two successive time periods, with time durations of T1 and T2 respectively. At the start of time duration T1, the UE does not have any timing information of cell 2. During time period T1, message containing Information Element *systemTimeInfo* as defined in clause 6.3.1 of TS 36.331 [2] shall be sent by the System Simulator (SS). No gap patterns are configured in the test case. No cdma2000 1X neighbour cell list shall be provided to the UE.

A RRC message implying handover to the unknown cdma2000 1X cell shall be sent to the UE towards the end of the time period T1. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.3.2.1-1: General test parameters for E-UTRAN FDD to cdma2000 1X handover test case; unknown target cdma2000 1X cell**

| Parameter                                          |                   | Unit | Value                                    | Comment                                                    |
|----------------------------------------------------|-------------------|------|------------------------------------------|------------------------------------------------------------|
| PDSCH parameters                                   |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                           |
| PCFICH/PDCCH/PHICH parameters                      |                   |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                           |
| Initial conditions                                 | Active cell       |      | Cell 1                                   | E-UTRAN FDD cell                                           |
|                                                    | Neighbouring cell |      | Cell 2                                   | cdma2000 1X cell                                           |
| Final condition                                    | Active cell       |      | Cell 2                                   | cdma2000 1X cell                                           |
| Channel Bandwidth ( $BW_{\text{channel}}$ )        |                   | MHz  | 10                                       |                                                            |
| DRX                                                |                   |      | OFF                                      | Non-DRX test                                               |
| Access Barring Information                         |                   | -    | Not sent                                 | No additional delays in random access procedure            |

| Propagation Condition                          |                | AWGN                 |     |

#### A.5.3.4.2 Test Requirements

The UE shall start transmission of the reverse control channel in cdma2000 1X to Cell 2 less than 300 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay is expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

$T_{\text{interrupt}}$  also includes time to detect cdma2000 1X cell; see clause 5.4.2.1.2

This gives a total of 300 ms.

## A.5.3.5 E-UTRAN TDD – HRPD Handover

### A.5.3.5.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN TDD to HRPD handover requirements specified in clause 5.4.1.

The test parameters are given in Tables A.5.3.5.1-1, A.5.3.5.1-2 and A.5.3.5.1-3. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.3.5.1-1: General test parameters for E-UTRAN TDD to HRPD handover test case**

| Parameter                                         |                   | Unit | Value                                    | Comment                                                              |
|---------------------------------------------------|-------------------|------|------------------------------------------|----------------------------------------------------------------------|
| PDSCH parameters                                  |                   |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2                                     |
| PCFICH/PDCCH/PHICH parameters                     |                   |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2                                     |
| Initial conditions                                | Active cell       |      | Cell 1                                   | E-UTRAN TDD cell                                                     |
|                                                   | Neighbouring cell |      | Cell 2                                   | HRPD cell                                                            |
| Final condition                                   | Active cell       |      | Cell 2                                   | HRPD cell                                                            |
| Channel Bandwidth (BW <sub>channel</sub> )        |                   | MHz  | 10                                       |                                                                      |
| Gap Pattern Id                                    |                   |      | 0                                        | As specified in Table 8.1.2.1-1 started before T2 starts             |
| E-UTRAN TDD measurement quantity                  |                   |      | RSRP                                     |                                                                      |
| Inter-RAT (HRPD) measurement quantity             |                   |      | CDMA2000 HRPD Pilot Strength             |                                                                      |
| b2-Threshold1                                     |                   | dBm  | -90                                      | Absolute E-UTRAN RSRP threshold for event B2                         |
| b2-Threshold2-CDMA2000                            |                   | dB   | -7                                       | Absolute 'CDMA2000 HRPD Pilot Strength' threshold for event B2       |
| Hysteresis                                        |                   | dB   | 0                                        |                                                                      |

| $I_{oc}$                                      | dBm/1.2288 MHz | -55           |    |    |
| CDMA2000 HRPD Pilot Strength                  | dB             | -infinity     | -3 | -3 |
| Propagation Condition                         |                | AWGN          |    |    |

### A.5.3.5.2 Test Requirements

The UE shall start transmission of the reverse control channel in HRPD to Cell 2 less than 127 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 50 ms, which is specified in clause 5.4.1.1.1.

$T_{\text{interrupt}}$  = 76.66 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.4.1.1.2.

This gives a total of 126.66 ms, allow 127 ms in the test.

### A.5.3.6 E-UTRAN TDD – cdma2000 1X Handover

#### A.5.3.6.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN TDD to cdma2000 1X handover requirements specified in clause 5.4.2.

The test parameters are given in Tables A.5.3.6.1-1, A.5.3.6.1-2 and A.5.3.6.1-3. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event B2. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain cell 2 as the target cell.

**Table A.5.3.6.1-1: General test parameters for E-UTRAN TDD to cdma2000 1X handover test case**

| Parameter                                         |                   | Unit | Value                                    | Comment                                                                            |
|---------------------------------------------------|-------------------|------|------------------------------------------|------------------------------------------------------------------------------------|

| Propagation Condition                  |                | AWGN                 |     |     |

### A.5.3.6.2 Test Requirements

The UE shall start transmission of the reverse control channel in cdma2000 1X to Cell 2 less than 300 ms from the beginning of time period T3.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 130 ms, which is specified in clause 5.4.2.1.1.

$T_{\text{interrupt}}$  = 170 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.4.2.1.2.

This gives a total of 300 ms.

## A.6 RRC Connection Control

### A.6.1 RRC Re-establishment

#### A.6.1.1 E-UTRAN FDD Intra-frequency RRC Re-establishment

##### A.6.1.1.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.1.2.

The test parameters are given in table A.6.1.1.1-1 and table A.6.1.1.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.1.1-1: General test parameters for E-UTRAN FDD intra-frequency RRC Re-establishment test case**

| Parameter                                   |                   | Unit | Value                                    | Comment                                                       |
|---------------------------------------------|-------------------|------|------------------------------------------|---------------------------------------------------------------|

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |           |           |          |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |           |           |          |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |           |           |          |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |           |           |          |          |          |

### A.6.1.1.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD intra frequency cell shall be less than 1.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 100 \text{ ms}$$

$T_{SI} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 1445 ms, allow 1.5 s in the test case.

## A.6.1.2 E-UTRAN FDD Inter-frequency RRC Re-establishment

### A.6.1.2.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.1.2.

The test parameters are given in table A.6.1.1.2-1 and table A.6.1.1.2-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of radio link failure. At the start of time period T3, cell 2, which is the neighbour cell, is activated.

**Table A.6.1.2.1-1: General test parameters for E-UTRAN FDD inter-frequency RRC Re-establishment test case**

| Parameter                                    |                   | Unit | Value                                    | Comment                                                                            |
|----------------------------------------------|-------------------|------|------------------------------------------|------------------------------------------------------------------------------------|
| PDSCH parameters                             |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                                                   |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |           |           |           |           |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |           |           |           |           |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |           |           |           |           |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |           |           |           |           |          |

### A.6.1.2.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to an unknown E-UTRA FDD inter frequency cell shall be less than 3 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 2$$

$$T_{\text{search}} = 800 \text{ ms}$$

$T_{SI} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 2945 ms, allow 3 s in the test case.

## A.6.1.3 E-UTRAN TDD Intra-frequency RRC Re-establishment

### A.6.1.3.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA TDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.1.2.

The test parameters are given in table A.6.1.3.1-1 and table A.6.1.3.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.3.1-1: General test parameters for E-UTRAN TDD intra-frequency RRC Re-establishment test case**

| Parameter                            |                   | Unit    | Value                                    | Comment                                                       |
|--------------------------------------|-------------------|---------|------------------------------------------|---------------------------------------------------------------|
| PDSCH parameters                     |                   |         | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2                              |
| PCFICH/PDCCH/PHICH parameters        |                   |         | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2                              |
| Initial conditions                   | Active cell       |         | Cell 1                                   |                                                               |
|                                      | Neighbouring cell |         | Cell 2                                   |                                                               |
| Final condition                      | Active cell       |         | Cell 2                                   |                                                               |
| E-UTRA RF Channel Number             |                   |         | 1                                        | Only one TDD carrier frequency is used.                       |
| Channel Bandwidth ( $BW_{channel}$ ) |                   | MHz     | 10                                       |                                                               |
| N310                                 |                   | -       | 1                                        | Maximum consecutive out-of-sync indications from lower layers |
| N311                                 |                   | -       | 1                                        | Minimum consecutive in-sync indications from lower layers     |
| T310                                 |                   | ms      | 0                                        | Radio link failure timer; T310 is disabled                    |
| T311                                 |                   | ms      | 3000                                     | RRC re-establishment timer                                    |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |           |           |          |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |           |           |          |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |           |           |          |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |           |           |          |          |          |

### A.6.1.3.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA TDD intra frequency cell shall be less than 1.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 100 \text{ ms}$$

$T_{SI} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN TDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 1445 ms, allow 1.5 s in the test case.

## A.6.1.4 E-UTRAN TDD Inter-frequency RRC Re-establishment

### A.6.1.4.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA TDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.1.2.

The test parameters are given in table A.6.1.4.1-1 and table A.6.1.4.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of radio link failure. At the start of time period T3, cell 2, which is the neighbour cell, is activated.

**Table A.6.1.4.1-1: General test parameters for E-UTRAN TDD inter-frequency RRC Re-establishment test case**

| Parameter                                    |                   | Unit    | Value                                    | Comment                                                                            |
|----------------------------------------------|-------------------|---------|------------------------------------------|------------------------------------------------------------------------------------|
| PDSCH parameters                             |                   |         | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2                                                   |
| PCFICH/PDCCH/PHICH parameters                |                   |         | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2                                                   |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |           |           |            |            |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |           |           |            |            |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |           |           |            |            |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |           |           |            |            |          |

### A.6.1.4.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to an unknown E-UTRA TDD inter frequency cell shall be less than 3 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 2$$

$$T_{\text{search}} = 800 \text{ ms}$$

$T_{SI} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN TDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 2945 ms, allow 3 s in the test case.

## A.6.1.5 E-UTRAN FDD Intra-frequency RRC Re-establishment for 5MHz bandwidth

### A.6.1.5.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.6.1.1.1.

The parameters of this test are the same as defined in Subclause A.6.1.1.1 except that the values of the parameters in the Table A.6.1.5.1-1 will replace the values of the corresponding parameters in A.6.1.1.1-1, and the values of the parameters in the Table A.6.1.5.1-2 will replace the values of the corresponding parameters in A.6.1.1.1-2.

**Table A.6.1.5.1-1: General test parameters for E-UTRAN FDD intra-frequency RRC Re-establishment test case for 5MHz bandwidth**

| Parameter                                                                   | Unit | Value                                     | Comment                          |
|-----------------------------------------------------------------------------|------|-------------------------------------------|----------------------------------|
| PDSCH parameters                                                            |      | DL Reference Measurement Channel R.5 FDD  | As specified in clause A.3.1.1.1 |
| PCFICH/PDCCH/PHICH parameters                                               |      | DL Reference Measurement Channel R.11 FDD | As specified in clause A.3.1.2.1 |
| Channel Bandwidth ( $BW_{channel}$ )                                        | MHz  | 5                                         |                                  |
| Note 1: See Table A.6.1.1.1-1 for the other parameters.                     |      |                                           |                                  |
| Note 2: This test is according to the principle defined in section A.3.7.2. |      |                                           |                                  |

**Table A.6.1.5.1-2: Cell specific test parameters for E-UTRAN FDD intra-frequency RRC Re-establishment test case for 5MHz bandwidth**

| Parameter                                                                                                                                                     | Unit | Cell 1    |           |           | Cell 2    |           |           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-----------|-----------|-----------|-----------|-----------|-----------|
|                                                                                                                                                               |      | T1        | T2        | T3        | T1        | T2        | T3        |
| $BW_{channel}$                                                                                                                                                | MHz  | 5         |           |           | 5         |           |           |
| OCNG Patterns defined in A.3.2.1.15 (OP.15 FDD) and A.3.2.1.16 (OP.16 FDD)                                                                                    |      | OP.15 FDD | OP.15 FDD | OP.16 FDD | OP.16 FDD | OP.16 FDD | OP.15 FDD |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. |      |           |           |           |           |           |           |
| Note 2: See Table A.6.1.5.1-2 for the other parameters.                                                                                                       |      |           |           |           |           |           |           |

### A.6.1.5.2 Test Requirements

The test requirements defined in section A.6.1.1.2 shall apply to this test case.

## A.6.1.6 E-UTRAN FD-FDD Intra-frequency RRC Re-establishment for UE category 0

### A.6.1.6.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.1.2.

The test parameters are given in table A.6.1.6.1-1 and table A.6.1.6.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.6.1-1: General test parameters for E-UTRAN FDD intra-frequency RRC Re-establishment test case**

| Parameter                                   |                   | Unit | Value                                     | Comment                                                       |
|---------------------------------------------|-------------------|------|-------------------------------------------|---------------------------------------------------------------|

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |           |           |          |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |           |           |          |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |           |           |          |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |           |           |          |          |          |

### A.6.1.6.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD intra frequency cell shall be less than 1.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 100 \text{ ms}$$

$T_{SI} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 1445 ms, allow 1.5 s in the test case.

## A.6.1.7 E-UTRAN HD-FDD Intra-frequency RRC Re-establishment for UE category 0

### A.6.1.7.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.1.2.

The test parameters are given in table A.6.1.7.1-1 and table A.6.1.7.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.7.1-1: General test parameters for E-UTRAN HD-FDD intra-frequency RRC Re-establishment test case**

| Parameter                            |                   | Unit | Value                                       | Comment                                                       |
|--------------------------------------|-------------------|------|---------------------------------------------|---------------------------------------------------------------|
| PDSCH parameters                     |                   |      | DL Reference Measurement Channel R.1 HD-FDD | As specified in clause A.3.1.1.4                              |
| PCFICH/PDCCH/PHICH parameters        |                   |      | DL Reference Measurement Channel R.3 HD-FDD | As specified in clause A.3.1.2.3                              |

| <div>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</div> <div>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</div> <div>Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</div> |            |          |           |           |          |          |          |

### A.6.1.7.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD intra frequency cell shall be less than 1.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 100 \text{ ms}$$

$T_{SI} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 1445 ms, allow 1.5 s in the test case.

## A.6.1.8 E-UTRAN TDD Intra-frequency RRC Re-establishment for UE category 0

### A.6.1.8.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA TDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.1.2.

The test parameters are given in table A.6.1.8.1-1 and table A.6.1.8.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.8.1-1: General test parameters for E-UTRAN TDD intra-frequency RRC Re-establishment test case**

| Parameter                            |                   | Unit    | Value                                     | Comment                                                       |
|--------------------------------------|-------------------|---------|-------------------------------------------|---------------------------------------------------------------|
| PDSCH parameters                     |                   |         | DL Reference Measurement Channel R.12 TDD | As specified in clause A.3.1.1.5                              |
| PCFICH/PDCCH/PHICH parameters        |                   |         | DL Reference Measurement Channel R.6 TDD  | As specified in clause A.3.1.2.2                              |
| Initial conditions                   | Active cell       |         | Cell 1                                    |                                                               |
|                                      | Neighbouring cell |         | Cell 2                                    |                                                               |
| Final condition                      | Active cell       |         | Cell 2                                    |                                                               |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |           |           |          |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |           |           |          |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |           |           |          |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |           |           |          |          |          |

### A.6.1.8.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA TDD intra frequency cell shall be less than 1.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 100 \text{ ms}$$

$T_{SI} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN TDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 1445 ms, allow 1.5 s in the test case.

## A.6.1.9 E-UTRAN FD-FDD Intra-frequency RRC Re-establishment for Cat-M1 UE in CEModeA

### A.6.1.9.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.9.1-1 and table A.6.1.9.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.9.1-1: General test parameters for E-UTRAN FDD intra-frequency RRC Re-establishment test case**

| Parameter                            |                   | Unit | Value     | Comment                                                       |
|--------------------------------------|-------------------|------|-----------|---------------------------------------------------------------|
| Initial conditions                   | Active cell       |      | Cell 1    |                                                               |
|                                      | Neighbouring cell |      | Cell 2    |                                                               |
| Final condition                      | Active cell       |      | Cell 2    |                                                               |
| E-UTRA RF Channel Number             |                   |      | 1         | Only one FDD carrier frequency is used.                       |
| Channel Bandwidth ( $BW_{channel}$ ) |                   | MHz  | 10        |                                                               |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |           |          |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |           |          |          |           |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |           |           |           |          |          |           |

### A.6.1.9.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD intra frequency cell shall be less than 1.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeA}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 0 \text{ ms}$$

$T_{SI-EUTRA-M1-CEModeA} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 1345 ms, allow 1.5 s in the test case.

## A.6.1.10 E-UTRAN HD-FDD Intra-frequency RRC Re-establishment for Cat-M1 UE in CEModeA

### A.6.1.10.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.10.1-1 and table A.6.1.10.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.10.1-1: General test parameters for E-UTRAN HD-FDD intra-frequency RRC Re-establishment test case**

| Parameter                            |                   | Unit | Value     | Comment                                                       |
|--------------------------------------|-------------------|------|-----------|---------------------------------------------------------------|
| Initial conditions                   | Active cell       |      | Cell 1    |                                                               |

| Antenna Configuration                                                                                                                                                                                                  |            | 2x1         |             |           | 2x1        |          |             |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |             |             |           |            |          |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |             |             |           |            |          |             |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |             |             |           |            |          |             |

### A.6.1.10.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD intra frequency cell shall be less than 1.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeA}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 0 \text{ ms}$$

$T_{\text{SI-EUTRA-M1-CEModeA}} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{\text{PRACH}} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 1345 ms, allow 1.5 s in the test case.

## A.6.1.11 E-UTRAN TDD Intra-frequency RRC Re-establishment for Cat-M1 UE in CEModeA

### A.6.1.11.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA TDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.11.1-1 and table A.6.1.11.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.11.1-1: General test parameters for E-UTRAN TDD intra-frequency RRC Re-establishment test case**

| Parameter                                   |                   | Unit          | Value     | Comment                                                       |
|---------------------------------------------|-------------------|---------------|-----------|---------------------------------------------------------------|
| Initial conditions                          | Active cell       |               | Cell 1    |                                                               |
|                                             | Neighbouring cell |               | Cell 2    |                                                               |
| Final condition                             | Active cell       |               | Cell 2    |                                                               |
| E-UTRA RF Channel Number                    |                   |               | 1         | Only one TDD carrier frequency is used.                       |
| Channel Bandwidth ( $BW_{\text{channel}}$ ) |                   | MHz           | 10        |                                                               |
| PRACH Configuration                         |                   |               | PRACH_2CE | As specified in A.3.16                                        |
| N310                                        |                   | -             | 1         | Maximum consecutive out-of-sync indications from lower layers |
| N311                                        |                   | -             | 1         | Minimum consecutive in-sync indications from lower layers     |
| T310                                        |                   | ms            | 0         | Radio link failure timer; T310 is disabled                    |
| T311                                        |                   | ms            | 3000      | RRC re-establishment timer                                    |
| DRX                                         |                   |               | OFF       |                                                               |

| Antenna Configuration                                                                                                                                                                                                  |            | 2x1       |           |           | 2x1      |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |           |          |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |           |          |          |           |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |           |           |           |          |          |           |

### A.6.1.11.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA TDD intra frequency cell shall be less than 1.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeA}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 0 \text{ ms}$$

$T_{SI-EUTRA-M1-CEModeA} = 1280$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN TDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 1345 ms, allow 1.5 s in the test case.

## A.6.1.12 E-UTRAN FD-FDD Intra-frequency RRC Re-establishment for Cat-M1 UE in CEModeB

### A.6.1.12.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.12.1-1 and table A.6.1.12.1-2 below. The test consists of 4 successive time periods, with time duration of T1, T2, T3 and T4 respectively. During T1, both cell 1 and cell 2 are in CEModeB. At the start of time period T3, cell 1, which is the active cell, is deactivated. The time period T4 starts after the occurrence of the radio link failure.

**Table A.6.1.12.1-1: General test parameters for E-UTRAN FDD intra-frequency RRC Re-establishment test case**

| Parameter                            |                   | Unit | Value     | Comment                                                       |
|--------------------------------------|-------------------|------|-----------|---------------------------------------------------------------|
| Initial conditions                   | Active cell       |      | Cell 1    |                                                               |
|                                      | Neighbouring cell |      | Cell 2    |                                                               |
| Final condition                      | Active cell       |      | Cell 2    |                                                               |
| E-UTRA RF Channel Number             |                   |      | 1         | Only one FDD carrier frequency is used.                       |
| Channel Bandwidth ( $BW_{channel}$ ) |                   | MHz  | 10        |                                                               |

| Antenna Configuration                                                                                                                                                                                                  |            | 2x1       |           |           |           | 2x1      |          |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |           |           |          |          |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |           |           |          |          |          |           |
| Note 3: Es/lot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |           |           |           |           |          |          |          |           |

### A.6.1.12.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T4, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD intra frequency cell shall be less than 7 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeB}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 0 \text{ ms}$$

$T_{SI-EUTRA-M1-CEModeB} = 6400$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 6485 ms, allow 7 s in the test case.

### A.6.1.13 E-UTRAN HD-FDD Intra-frequency RRC Re-establishment for Cat-M1 UE in CEModeB

#### A.6.1.13.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.13.1-1 and table A.6.1.13.1-2 below. The test consists of 4 successive time periods, with time duration of T1, T2, T3 and T4 respectively. During T1, both cell 1 and cell 2 are in CEModeB. At the start of time period T3, cell 1, which is the active cell, is deactivated. The time period T4 starts after the occurrence of the radio link failure.

**Table A.6.1.13.1-1: General test parameters for E-UTRAN HD-FDD intra-frequency RRC Re-establishment test case**

| Parameter                            |                   | Unit | Value     | Comment                                                       |
|--------------------------------------|-------------------|------|-----------|---------------------------------------------------------------|
| Initial conditions                   | Active cell       |      | Cell 1    |                                                               |
|                                      | Neighbouring cell |      | Cell 2    |                                                               |

| Antenna Configuration                                                                                                                                                                                                  |            | 2x1         |             |             |           | 2x1        |          |          |             |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |             |             |             |           |            |          |          |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |             |             |             |           |            |          |          |             |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |             |             |             |           |            |          |          |             |

### A.6.1.13.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T4, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD intra frequency cell shall be less than 7 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeB}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 0 \text{ ms}$$

$T_{SI-EUTRA-M1-CEModeB} = 6400$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 6465 ms, allow 7 s in the test case.

## A.6.1.14 E-UTRAN TDD Intra-frequency RRC Re-establishment for Cat-M1 UE in CEModeB

### A.6.1.14.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA TDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.14.1-1 and table A.6.1.14.1-2 below. The test consists of 4 successive time periods, with time duration of T1, T2, T3 and T4 respectively. During T1, both cell 1 and cell 2 are in CEModeB. At the start of time period T3, cell 1, which is the active cell, is deactivated. The time period T4 starts after the occurrence of the radio link failure.

**Table A.6.1.14.1-1: General test parameters for E-UTRAN TDD intra-frequency RRC Re-establishment test case**

| Parameter                            |                   | Unit    | Value     | Comment                                                       |
|--------------------------------------|-------------------|---------|-----------|---------------------------------------------------------------|
| Initial conditions                   | Active cell       |         | Cell 1    |                                                               |
|                                      | Neighbouring cell |         | Cell 2    |                                                               |
| Final condition                      | Active cell       |         | Cell 2    |                                                               |
| E-UTRA RF Channel Number             |                   |         | 1         | Only one TDD carrier frequency is used.                       |
| Channel Bandwidth ( $BW_{channel}$ ) |                   | MHz     | 10        |                                                               |
| PRACH Configuration                  |                   |         | PRACH_3CE | As specified in A.3.16                                        |
| N310                                 |                   | -       | 1         | Maximum consecutive out-of-sync indications from lower layers |
| N311                                 |                   | -       | 1         | Minimum consecutive in-sync indications from lower layers     |
| T310                                 |                   | ms      | 0         | Radio link failure timer; T310 is disabled                    |
| T311                                 |                   | ms      | 3000      | RRC re-establishment timer                                    |
| DRX                                  |                   |         | OFF       |                                                               |
| CP length                            |                   |         | Normal    |                                                               |
| Access Barring Information           |                   | -       | Not Sent  | No additional delays in random access procedure.              |
| Special subframe configuration       |                   |         | 6         | As specified in table 4.2-1 in TS 36.211                      |
| Uplink-downlink configuration        |                   |         | 1         | As specified in table 4.2-2 in TS 36.211                      |
| PRACH configuration index            |                   |         | 53        | As specified in table 5.7.1-3 in TS 36.211                    |
| Time offset between cells            |                   | $\mu$ s | 3         | Synchronous cells                                             |
| T1                                   |                   | s       | 5         |                                                               |
| T2                                   |                   | s       | 5         |                                                               |

| Antenna Configuration                                                                                                                                                                                                  |            | 2x1       |           |           |           | 2x1      |          |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |           |           |          |          |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |           |           |          |          |          |           |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |           |           |           |           |          |          |          |           |

### A.6.1.14.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA TDD intra frequency cell shall be less than 7 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeB}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 1$$

$$T_{\text{search}} = 0 \text{ ms}$$

$T_{SI-EUTRA-MI-CEModeB} = 6400$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN TDD cell.

$T_{PRACH} = 15$  ms; it is the additional delay caused by the random access procedure.

This gives a total of 6465 ms, allow 7s in the test case.

## A.6.1.15 HD-FDD Intra-frequency RRC Re-establishment for UE category NB1 in In-Band mode under enhanced coverage

### A.6.1.15.1 Test Purpose and Environment

The purpose is to verify that the NB-IoT FDD intra-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements for Cat-NB1 UE in clause 6.5.

The test parameters are given in table A.6.1.15.1-1 and table A.6.1.15.1-2 below. nCell1 and nCell2 are NB-IoT cells with different physical cell ID on the same frequency carrier. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.15.1-1: General test parameters for HD-FDD Intra-frequency RRC Re-establishment for UE category NB1 in In-Band mode under enhanced coverage**

| Parameter                  |                 | Unit | Value                  | Comment                                                       |
|----------------------------|-----------------|------|------------------------|---------------------------------------------------------------|
| NB-IOT operational mode    |                 |      | In-band                |                                                               |
| Initial condition          | Active cell     |      | nCell1                 |                                                               |
|                            | Neighbour cells |      | eCell1, eCell2, nCell2 |                                                               |
| Final condition            | Active cell     |      | nCell2                 |                                                               |
| E-UTRA RF Channel Number   |                 |      | 1                      | One carrier frequency is used for eCell1 and eCell2.          |
| Access Barring Information |                 | -    | Not Sent               | No additional delays in random access procedure.              |

| Note 1: OCNG shall be used such that the eCell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                         |            |                                                                                 |       |       |                                                                                 |       |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power $N_{oc}$ . |            |                                                                                 |       |       |                                                                                 |       |       |
| Note 3: Es/lot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                       |            |                                                                                 |       |       |                                                                                 |       |       |

### A.6.1.15.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send NPRACH preambles to cell 2 for sending the *RRConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to an unknown NB-IoT FDD intra frequency cell shall be less than 58 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE-re-establish\_delay\_NB-IoT}}$$

Where:

- $T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The NPRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.
- $T_{\text{UE-re-establish\_delay\_NB-IoT}} = 100 \text{ ms} + N_{\text{NB-IoT-freq}} * T_{\text{search\_NB-IoT}} + T_{\text{SI\_NB-IoT}} + T_{\text{PRACH\_NB-IoT}}$
- $N_{\text{NB-IoT-freq}} = 1$
- $T_{\text{search\_NB-IoT}} = 14800 \text{ ms}$
- $T_{\text{SI\_NB-IoT}} = 41560 \text{ ms}$ ; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target NB-IoT FDD cell.
- $T_{\text{PRACH\_NB-IoT}} = 1280 \text{ ms}$ ; it is the additional delay caused by the random access procedure.

## A.6.1.16 HD-FDD Inter-frequency RRC Re-establishment for UE category NB1 in In-Band mode under normal coverage

### A.6.1.16.1 Test Purpose and Environment

The purpose is to verify that the NB-IoT FDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements for Cat-NB1 UE in clause 6.5.

The test parameters are given in table A.6.1.16.1-1 and table A.6.1.16.1-2 below. nCell1 and nCell2 are NB-IoT cells on different frequency carriers. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

**Table A.6.1.16.1-1: General test parameters for HD-FDD Inter-frequency RRC Re-establishment for UE category NB1 in In-Band mode under normal coverage**

| Parameter                  |                 | Unit | Value          | Comment                                                       |
|----------------------------|-----------------|------|----------------|---------------------------------------------------------------|

| Antenna Configuration                                                                                                                                                                               |            | 1x1                                                                             |     |     |
| Note 1: OCNG shall be used such that the eCell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                         |            |                                                                                 |     |     |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power $N_{oc}$ . |            |                                                                                 |     |     |
| Note 3: Es/lot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                       |            |                                                                                 |     |     |

### A.6.1.16.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send NPRACH preambles to cell 2 for sending the *RRConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to an unknown NB-IoT FDD inter frequency cell shall be less than 12 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE-re-establish\_delay\_NB-IoT}}.$$

Where:

- $T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The NPRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.
- $T_{\text{UE-re-establish\_delay\_NB-IoT}} = 100 \text{ ms} + N_{\text{NB-IoT-freq}} * T_{\text{search\_NB-IoT}} + T_{\text{SI\_NB-IoT}} + T_{\text{PRACH\_NB-IoT}}$
- $N_{\text{NB-IoT-freq}} = 2$
- $T_{\text{search\_NB-IoT}} = 1400 \text{ ms}$
- $T_{\text{SI\_NB-IoT}} = 8320 \text{ ms}$ ; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target NB-IoT FDD cell.
- $T_{\text{PRACH\_NB-IoT}} = 80 \text{ ms}$ ; it is the additional delay caused by the random access procedure.

## A.6.1.17 E-UTRAN FD-FDD Inter-frequency RRC Re-establishment for Cat-M1 UE in CEModeA

### A.6.1.17.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.17.1-1 and table A.6.1.17.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of radio link failure. At the start of time period T3, cell 2, which is the neighbour cell, is activated.

**Table A.6.1.17.1-1: General test parameters for E-UTRAN FDD inter-frequency RRC Re-establishment test case**

| Parameter                                    |                   | Unit | Value     | Comment                                                                            |
|----------------------------------------------|-------------------|------|-----------|------------------------------------------------------------------------------------|
| Initial conditions                           | Active cell       |      | Cell 1    |                                                                                    |
|                                              | Neighbouring cell |      | Cell 2    |                                                                                    |
| Final condition                              | Active cell       |      | Cell 2    |                                                                                    |
| E-UTRA RF Channel Number (cell 1)            |                   |      | 1         | Only one FDD carrier frequency is used.                                            |
| E-UTRA RF Channel Number (cell 2)            |                   |      | 2         |                                                                                    |
| E-UTRA FDD inter-frequency carrier list size |                   |      | 1         | 2 E-UTRA FDD carrier frequencies in total: 1 intra-frequency and 1 inter-frequency |
| Channel Bandwidth ( $BW_{\text{channel}}$ )  |                   | MHz  | 10        |                                                                                    |
| PRACH Configuration                          |                   |      | PRACH_2CE | As specified in A.3.16                                                             |
| N310                                         |                   | -    | 1         | Maximum consecutive out-of-sync indications from lower layers                      |
| N311                                         |                   | -    | 1         | Minimum consecutive in-sync indications from lower layers                          |
| T310                                         |                   | ms   | 0         | Radio link failure timer; T310 is disabled                                         |
| T311                                         |                   | ms   | 3000      | RRC re-establishment timer                                                         |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |                                           |           |           |                                           |           |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |                                           |           |           |                                           |           |           |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |                                           |           |           |                                           |           |           |

### A.6.1.17.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD inter frequency cell shall be less than 3.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeA}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 2$$

$$T_{\text{search}} = 1000 \text{ ms}$$

$T_{\text{SI-EUTRA-M1-CEModeA}} = 1280 \text{ ms}$ ; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{\text{PRACH}} = 15 \text{ ms}$ ; it is the additional delay caused by the random access procedure.

This gives a total of 3345 ms, allow 3.5 s in the test case.

## A.6.1.18 E-UTRAN HD-FDD Inter-frequency RRC Re-establishment for Cat-M1 UE in CEModeA

### A.6.1.18.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA HD-FDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.18.1-1 and table A.6.1.18.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of radio link failure. At the start of time period T3, cell 2, which is the neighbour cell, is activated.

**Table A.6.1.18.1-1: General test parameters for E-UTRAN HD-FDD inter-frequency RRC Re-establishment test case**

| Parameter                                    |                   | Unit | Value     | Comment                                                                            |
|----------------------------------------------|-------------------|------|-----------|------------------------------------------------------------------------------------|
| Initial conditions                           | Active cell       |      | Cell 1    |                                                                                    |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |                                              |           |           |                                              |           |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |                                              |           |           |                                              |           |           |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |                                              |           |           |                                              |           |           |

### A.6.1.18.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD inter frequency cell shall be less than 3.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeA}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 2$$

$$T_{\text{search}} = 1000 \text{ ms}$$

$T_{\text{SI-EUTRA-M1-CEModeA}} = 1280 \text{ ms}$ ; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{\text{PRACH}} = 15 \text{ ms}$ ; it is the additional delay caused by the random access procedure.

This gives a total of 3345 ms, allow 3.5 s in the test case.

## A.6.1.19 E-UTRAN TDD-TDD Inter-frequency RRC Re-establishment for Cat-M1 UE in CEModeA

### A.6.1.19.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA TDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test parameters are given in table A.6.1.19.1-1 and table A.6.1.19.1-2 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of radio link failure. At the start of time period T3, cell 2, which is the neighbour cell, is activated.

**Table A.6.1.19.1-1: General test parameters for E-UTRAN TDD inter-frequency RRC Re-establishment test case**

| Parameter                                    |                   | Unit | Value     | Comment                                                                            |
|----------------------------------------------|-------------------|------|-----------|------------------------------------------------------------------------------------|
| Initial conditions                           | Active cell       |      | Cell 1    |                                                                                    |
|                                              | Neighbouring cell |      | Cell 2    |                                                                                    |
| Final condition                              | Active cell       |      | Cell 2    |                                                                                    |
| E-UTRA RF Channel Number (cell 1)            |                   |      | 1         | Only one FDD carrier frequency is used.                                            |
| E-UTRA RF Channel Number (cell 2)            |                   |      | 2         |                                                                                    |
| E-UTRA TDD inter-frequency carrier list size |                   |      | 1         | 2 E-UTRA TDD carrier frequencies in total: 1 intra-frequency and 1 inter-frequency |
| Channel Bandwidth ( $BW_{\text{channel}}$ )  |                   | MHz  | 10        |                                                                                    |
| PRACH Configuration                          |                   |      | PRACH_2CE | As specified in A.3.16                                                             |
| N310                                         |                   | -    | 1         | Maximum consecutive out-of-sync indications from lower layers                      |

| Timing offset to Cell 1 (Synchronous cells)                                                                                                                                                                            | μs         | -                                         |           |           | 3                                         |           |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |                                           |           |           |                                           |           |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |                                           |           |           |                                           |           |           |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |                                           |           |           |                                           |           |           |

### A.6.1.19.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD inter frequency cell shall be less than 3.5 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeA}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 2$$

$$T_{\text{search}} = 1000 \text{ ms}$$

$T_{\text{SI-EUTRA-M1-CEModeA}} = 1280 \text{ ms}$ ; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{\text{PRACH}} = 15 \text{ ms}$ ; it is the additional delay caused by the random access procedure.

This gives a total of 3345 ms, allow 3.5 s in the test case.

## A.6.1.20 E-UTRAN FD-FDD Inter-frequency RRC Re-establishment for Cat-M1 UE in CEModeB

### A.6.1.20.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA FDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test consists of 4 successive time periods, with time duration of T1, T2, T3 and T4 respectively. During T1, both cell 1 and cell 2 are in CEModeB. At the start of time period T3, cell 1, which is the active cell, is deactivated. The time period T4 starts after the occurrence of the radio link failure.

**Table A.6.1.20.1-1: General test parameters for E-UTRAN FDD inter-frequency RRC Re-establishment test case**

| Parameter                                    |                   | Unit | Value     | Comment                                                                            |
|----------------------------------------------|-------------------|------|-----------|------------------------------------------------------------------------------------|
| Initial conditions                           | Active cell       |      | Cell 1    |                                                                                    |
|                                              | Neighbouring cell |      | Cell 2    |                                                                                    |
| Final condition                              | Active cell       |      | Cell 2    |                                                                                    |
| E-UTRA RF Channel Number (cell 1)            |                   |      | 1         |                                                                                    |
| E-UTRA RF Channel Number (cell 2)            |                   |      | 2         |                                                                                    |
| E-UTRA FDD inter-frequency carrier list size |                   |      | 1         | 2 E-UTRA FDD carrier frequencies in total: 1 intra-frequency and 1 inter-frequency |
| PRACH Configuration                          |                   |      | PRACH_3CE | As specified in A.3.16                                                             |
| N310                                         |                   | -    | 1         | Maximum consecutive out-of-sync indications from lower layers                      |
| N311                                         |                   | -    | 1         | Minimum consecutive in-sync indications from lower layers                          |
| T310                                         |                   | ms   | 0         | Radio link failure timer; T310 is disabled                                         |
| T311                                         |                   | ms   | 3000      | RRC re-establishment timer                                                         |
| DRX                                          |                   |      | OFF       |                                                                                    |
| CP length                                    |                   |      | Normal    |                                                                                    |
| Access Barring Information                   |                   | -    | Not Sent  | No additional delays in random access procedure.                                   |
| PRACH configuration index                    |                   |      | 4         | As specified in table 5.7.1-2 in TS 36.211                                         |
| T1                                           |                   | s    | 5         |                                                                                    |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |                                     |      |                                    |           |                                     |      |                                      |      |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |                                     |      |                                    |           |                                     |      |                                      |      |
| Note 3: Es/I <sub>ot</sub> and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                              |            |                                     |      |                                    |           |                                     |      |                                      |      |

### A.6.1.20.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T4, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD inter frequency cell shall be less than 7 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{UE\_re-establish\_delay} = 50 \text{ ms} + N_{freq} * T_{search} + T_{SI-EUTRA-M1-CEModeB} + T_{PRACH}$$

$$N_{freq} = 2$$

$$T_{search} = 100 \text{ ms}$$

$T_{SI-EUTRA-M1-CEModeB} = 6400 \text{ ms}$ ; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{PRACH} = 15 \text{ ms}$ ; it is the additional delay caused by the random access procedure.

This gives a total of 6665 ms, allow 7 s in the test case.

## A.6.1.21 E-UTRAN HD-FDD Inter-frequency RRC Re-establishment for Cat-M1 UE in CEModeB

### A.6.1.21.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA HD-FDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test consists of 4 successive time periods, with time duration of T1, T2, T3 and T4 respectively. During T1, both cell 1 and cell 2 are in CEModeB. At the start of time period T3, cell 1, which is the active cell, is deactivated. The time period T4 starts after the occurrence of the radio link failure.

**Table A.6.1.21.1-1: General test parameters for E-UTRAN HD-FDD inter-frequency RRC Re-establishment test case**

| Parameter                                    |                   | Unit | Value     | Comment                                                                            |
|----------------------------------------------|-------------------|------|-----------|------------------------------------------------------------------------------------|
| Initial conditions                           | Active cell       |      | Cell 1    |                                                                                    |
|                                              | Neighbouring cell |      | Cell 2    |                                                                                    |
| Final condition                              | Active cell       |      | Cell 2    |                                                                                    |
| E-UTRA RF Channel Number (cell 1)            |                   |      | 1         | Only one FDD carrier frequency is used.                                            |
| E-UTRA RF Channel Number (cell 2)            |                   |      | 2         |                                                                                    |
| E-UTRA FDD inter-frequency carrier list size |                   |      | 1         | 2 E-UTRA FDD carrier frequencies in total: 1 intra-frequency and 1 inter-frequency |
| Channel Bandwidth (BW <sub>channel</sub> )   |                   | MHz  | 10        |                                                                                    |
| PRACH Configuration                          |                   |      | PRACH_3CE | As specified in A.3.16                                                             |
| N310                                         |                   | -    | 1         | Maximum consecutive out-of-sync indications from lower layers                      |
| N311                                         |                   | -    | 1         | Minimum consecutive in-sync indications from lower layers                          |
| T310                                         |                   | ms   | 0         | Radio link failure timer; T310 is disabled                                         |
| T311                                         |                   | ms   | 3000      | RRC re-establishment timer                                                         |
| DRX                                          |                   |      | OFF       |                                                                                    |
| CP length                                    |                   |      | Normal    |                                                                                    |
| Access Barring Information                   |                   | -    | Not Sent  | No additional delays in random access procedure.                                   |
| PRACH configuration index                    |                   |      | 4         | As specified in table 5.7.1-2 in TS 36.211                                         |

| Timing offset to Cell 1 (Asynchronous cells)                                                                                                                                                                           | ms         | -           |        |           |           | 3        |        |      |             |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |             |        |           |           |          |        |      |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |             |        |           |           |          |        |      |             |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |             |        |           |           |          |        |      |             |

### A.6.1.21.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T4, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRCConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA FDD inter frequency cell shall be less than 7 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeB}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 2$$

$$T_{\text{search}} = 100 \text{ ms}$$

$T_{\text{SI-EUTRA-M1-CEModeB}} = 6400 \text{ ms}$ ; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN FDD cell.

$T_{\text{PRACH}} = 15 \text{ ms}$ ; it is the additional delay caused by the random access procedure.

This gives a total of 6665 ms, allow 7 s in the test case.

## A.6.1.22 E-UTRAN TDD Inter-frequency RRC Re-establishment for Cat-M1 UE in CEModeB

### A.6.1.22.1 Test Purpose and Environment

The purpose is to verify that the E-UTRA TDD inter-frequency RRC re-establishment delay is within the specified limits. These tests will verify the requirements in clause 6.7.2.

The test consists of 4 successive time periods, with time duration of T1, T2, T3 and T4 respectively. During T1, both cell 1 and cell 2 are in CEModeB. At the start of time period T3, cell 1, which is the active cell, is deactivated. The time period T4 starts after the occurrence of the radio link failure.

**Table A.6.1.22.1-1: General test parameters for E-UTRAN TDD inter-frequency RRC Re-establishment test case**

| Parameter                                    |                   | Unit | Value     | Comment                                                                            |
|----------------------------------------------|-------------------|------|-----------|------------------------------------------------------------------------------------|
| Initial conditions                           | Active cell       |      | Cell 1    |                                                                                    |
|                                              | Neighbouring cell |      | Cell 2    |                                                                                    |
| Final condition                              | Active cell       |      | Cell 2    |                                                                                    |
| E-UTRA RF Channel Number (cell 1)            |                   |      | 1         | Only one FDD carrier frequency is used.                                            |
| E-UTRA RF Channel Number (cell 2)            |                   |      | 2         |                                                                                    |
| E-UTRA FDD inter-frequency carrier list size |                   |      | 1         | 2 E-UTRA FDD carrier frequencies in total: 1 intra-frequency and 1 inter-frequency |
| Channel Bandwidth ( $BW_{\text{channel}}$ )  |                   | MHz  | 10        |                                                                                    |
| PRACH Configuration                          |                   |      | PRACH_3CE | As specified in A.3.16                                                             |
| N310                                         |                   | -    | 1         | Maximum consecutive out-of-sync indications from lower layers                      |
| N311                                         |                   | -    | 1         | Minimum consecutive in-sync indications from lower layers                          |

| Timing offset to Cell 1 (Synchronous cells)                                                                                                                                                                            | μs         | -         |        |           |           | 3        |        |      |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |        |           |           |          |        |      |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |        |           |           |          |        |      |           |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |           |        |           |           |          |        |      |           |

### A.6.1.22.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T4, to the moment when the UE starts to send PRACH preambles to cell 2 for sending the *RRConnectionReestablishmentRequest* message to cell 2.

The RRC re-establishment delay to a known E-UTRA TDD inter frequency cell shall be less than 7 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90%.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{\text{re-establish\_delay}} = T_{\text{UL\_grant}} + T_{\text{UE\_re-establish\_delay}}$$

Where:

$T_{\text{UL\_grant}}$  = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence  $T_{\text{UL\_grant}}$  is not used.

$$T_{\text{UE\_re-establish\_delay}} = 50 \text{ ms} + N_{\text{freq}} * T_{\text{search}} + T_{\text{SI-EUTRA-M1-CEModeB}} + T_{\text{PRACH}}$$

$$N_{\text{freq}} = 2$$

$T_{\text{search}} = 100 \text{ ms}$

$T_{\text{SI-EUTRA-M1-CEModeB}} = 6400 \text{ ms}$ ; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRAN TDD cell.

$T_{\text{PRACH}} = 15 \text{ ms}$ ; it is the additional delay caused by the random access procedure.

This gives a total of 6665 ms, allow 7 s in the test case.

## A.6.2 Random Access

### A.6.2.1 E-UTRAN FDD – Contention Based Random Access Test

#### A.6.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in Clause 6.2.2 and Clause 7.1.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.1.1-1 and A.6.2.1.1-2.

**Table A.6.2.1.1-1: General test parameters for FDD contention based random access test**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Unit       | Value                                                      | Comments                                  |

### A.6.2.1.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

#### A.6.2.1.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2.1.1 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

#### A.6.2.1.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.1.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

#### A.6.2.1.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.2.2.1.3 the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.1.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5 the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.1.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5 the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.1.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.2.2.1.6 the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

### A.6.2.2 E-UTRAN FDD – Non-Contention Based Random Access Test

#### A.6.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in Clause 6.2.2 and Clause 7.1.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.2.1-1 and A.6.2.2.1-2.

**Table A.6.2.2.1-1: General test parameters for FDD non-contention based random access test**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                | Unit       | Value                                    | Comments                                  |

### A.6.2.2.2 Test Requirements

Non-Contention based random access is triggered by explicitly assigning a random access preamble via dedicated signalling in the downlink.

#### A.6.2.2.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2.2.1 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-transmit the preamble with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

#### A.6.2.2.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.2.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

### A.6.2.3 E-UTRAN TDD – Contention Based Random Access Test

#### A.6.2.3.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in Clause 6.2.2 and Clause 7.1.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.3.1-1 and A.6.2.3.1-2.

**Table A.6.2.3.1-1: General test parameters for TDD contention based random access test**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Unit       | Value                                                      | Comments                                  |

### A.6.2.3.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

#### A.6.2.3.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2.1.1 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

#### A.6.2.3.2.2 No Random Access Response reception

To test the UE behavior specified in Subclause 6.2.2.1.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

#### A.6.2.3.2.3 Receiving a NACK on msg3

To test the UE behavior specified in Subclause 6.2.2.1.3 the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.3.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5 the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.3.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5 the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.3.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.2.2.1.6 the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

### A.6.2.4 E-UTRAN TDD – Non-Contention Based Random Access Test

#### A.6.2.4.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure is according to the requirements and that the PRACH power settings and timing are within specified limits. This test will verify the requirements in Clause 6.2.2 and Clause 7.1.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.4.1-1 and A.6.2.4.1-2.

**Table A.6.2.4.1-1: General test parameters for TDD non-contention based random access test**

| Note: For further information see Clause 6.3.2 in TS 36.331. |         |               |

## A.6.2.4.2 Test Requirements

Non-Contention based random access is triggered by explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.4.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2.2.1 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-transmit the preamble with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

### A.6.2.4.2.2 No Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2.2.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

## A.6.2.5 E-UTRAN FDD – Contention Based Random Access Test for 5MHz bandwidth

### A.6.2.5.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.6.2.1.1.

The parameters of this test are the same as defined in Subclause A.6.2.1.1 except that the values of the parameters in the Table A.6.2.5.1-1 will replace the values of the corresponding parameters in A.6.2.1.1-1

**Table A.6.2.5.1-1: General test parameters for FDD contention based random access test for 5MHz bandwidth**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Unit        | Value                                                      | Comments                     |

### A.6.2.5.2 Test Requirements

The test requirements defined in section A.6.2.1.2 shall apply to this test case.

## A.6.2.6 E-UTRAN FDD – Non-contention Based Random Access Test for 5MHz bandwidth

### A.6.2.6.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.6.2.2.1.

The parameters of this test are the same as defined in Subclause A.6.2.2.1 except that the values of the parameters in the Table A.6.2.6.1-1 will replace the values of the corresponding parameters in A.6.2.2.1-1

**Table A.6.2.6.1-1: General test parameters for FDD non-contention based random access test for 5MHz bandwidth**

| <p>Note 1: OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 2: I<sub>0</sub> level has been derived from other parameters for information purpose. It is not a settable parameter</p> <p>Note 3: See Table A.6.2.2.1-1 for the other parameters.</p> <p>Note 4: This test is according to the principle defined in section A.3.7.2.</p> |             |                                                            |                           |

### A.6.2.6.2 Test Requirements

The test requirements defined in section A.6.2.2.2 shall apply to this test case.

## A.6.2.7 E-UTRAN FDD – Non-Contention Based Random Access Test For SCell

### A.6.2.7.1 Test Purpose and Environment

The purpose of this test is to verify that the behavior of the random access procedure, for the SCell, is according to the requirements and that the PRACH power settings and timing, for the SCell, are within specified limits. This test will verify the requirements in Clause 6.2.2 and Clause 7.1.2 in an AWGN model.

For this test two cells are used. Cell 1 is PCell and Cell 2 is SCell. PCell and SCell are different timing advance group. Cell 1 is in the primary Timing Advance Group (pTAG) and Cell 2 is in the secondary Timing Advance Group (sTAG). The purpose of the PCell is to allow the SCell to be configured and to handle the Random Access Response which takes place on PCell. The test parameters are given in tables A.6.2.7.1-1 and A.6.2.7.1-2.

Table A.6.2.7.1-1: General test parameters for FDD non-contention based random access test

| Parameter                                                                                                                                                  | Unit       | Cell 1                                   | Cell 2                                   | Comments                                                |

## A.6.2.7.2 Test Requirements

Non-Contention based random access is triggered by explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.7.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2.2.1 the System Simulator shall transmit, on Cell 1, the PCell, a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator, on Cell 2. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-transmit the preamble with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

### A.6.2.7.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.2.2 the System Simulator shall transmit, on Cell 1, the PCell, a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator on Cell 2. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

### A.6.2.7.2.3 Stop Preamble transmission if maximum number of preamble transmission counter has been reached

To test the UE behavior specified in Subclause 6.2.2 the System Simulator shall transmit, in response to the first 6 preambles, a Random Access Response *not* corresponding to the transmitted Random Access Preamble on Cell 1, the PCell. The UE shall stop transmitting preambles after 6 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

## A.6.2.8 E-UTRAN TDD – Non-Contention Based Random Access Test For SCell

### A.6.2.8.1 Test Purpose and Environment

This test is applicable for UE supporting the optional capability of Multiple Timing Advance.

The purpose of this test is to verify that the behavior of the random access procedure, for the SCell, is according to the requirements and that the PRACH power settings and timing, for the SCell, are within specified limits. This test will verify the requirements in Clause 6.2.2 and Clause 7.1.2 in an AWGN model.

For this test two cells are used. Cell 1 is PCell and Cell 2 is SCell. PCell and SCell are different timing advance group. Cell 1 is in the primary Timing Advance Group (pTAG) and Cell 2 is in the secondary Timing Advance Group (sTAG). The purpose of the PCell is to allow the SCell to be configured and to handle the Random Access Response which takes place on PCell. The test parameters are given in tables A.6.2.8.1-1 and A.6.2.8.1-2.

Table A.6.2.8.1-1: General test parameters for TDD non-contention based random access test

| Parameter                                                                                                                                                  | Unit       | Cell 1                                   | Cell 2                                   | Comments                                                |

## A.6.2.8.2 Test Requirements

Non-Contention based random access is triggered by explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.8.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2.2.1 the System Simulator shall transmit, on Cell 1, the PCell, a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator, on Cell 2. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-transmit the preamble with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

### A.6.2.8.2.2 No Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2.2.2 the System Simulator shall transmit, on Cell 1, the PCell, a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator, on Cell 2. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

### A.6.2.8.2.3 Stop Preamble transmission if maximum number of preamble transmission counter has been reached

To test the UE behavior specified in Subclause 6.2.2 the System Simulator shall transmit, in response to the first 6 preambles, a Random Access Response *not* corresponding to the transmitted Random Access Preamble on Cell 1, the PCell. The UE shall stop transmitting preambles after 6 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.1.2.

## A.6.2.9 3DL/3UL TDD CA Non-Contention Based Random Access Test for 2 SCells

### A.6.2.9.1 Test Purpose and Environment

This test is applicable for UE supporting the optional capability of Multiple Timing Advance.

The purpose of this test is to verify that the behavior of the random access procedure, for the two SCells, is according to the requirements and that the PRACH power settings and timing, for the SCell, are within specified limits. This test will verify the requirements in Clause 6.2.2 and Clause 7.1.2 in an AWGN model.

For this test three cells are used. Cell 1 is PCell, Cell 2 is SCell1 and Cell 3 is SCell2. Cell 1 and Cell 2/Cell 3 belong to different timing advance groups. Cell 1 is in the primary Timing Advance Group (pTAG). Cell 2 and Cell3 are in the same secondary Timing Advance Group (sTAG). The purpose of the Cell 1 is to allow Cell 2 and Cell 3 to be configured and to handle the Random Access Response which takes place on Cell 1. The test parameters are given in tables A.6.2.9.1-1 and A.6.2.9.1-2.

| Time alignment error relative to cell 1 <small>Note 4</small> | $\mu\text{s}$ | -    | $\leq \text{TAE}$ | $\leq \text{TAE}$ |  |
| Time alignment error relative to cell 2 <small>Note 4</small> | $\mu\text{s}$ | -    | -                 | $\leq \text{TAE}$ |  |

Note 1: OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

Note 2:  $I_0$  level has been derived from other parameters for information purpose. It is not a settable parameter.

Note 3: RSRP level has been derived from other parameters for information purposes. It is not a settable parameter.

Note 4: The time alignment error (TAE) between two cells specified in TS36.104 [30] clause 6.5.3.1 (value depends upon the type of carrier aggregation).

Note 5: This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1.

## A.6.2.9.2 Test Requirements

Non-Contention based random access is triggered by explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.9.2.1 Random Access Response Reception

#### A.6.2.9.2.1.1 Test Requirements for Cell 2

To test the UE behavior specified in Subclause 6.2.2.2.1 the System Simulator shall transmit, on cell 1 a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator, on cell 2. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-transmit the preamble with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions on cell 2 shall be within the accuracy specified in Subclause 7.1.2.

#### A.6.2.9.2.1.2 Test Requirements for Cell 3

To test the UE behavior specified in Subclause 6.2.2.2.1 the System Simulator shall transmit, on cell 1 a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator, on cell 3. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-transmit the preamble with the calculated PRACH transmission power if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions on cell 3 shall be within the accuracy specified in Subclause 7.1.2.

#### A.6.2.9.2.2 No Random Access Response Reception

##### A.6.2.9.2.2.1 Test Requirements for Cell 2

To test the UE behavior specified in Subclause 6.2.2.2.2 the System Simulator shall transmit, on cell 1, a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator, on cell 2. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power on cell 2.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions on cell 2 shall be within the accuracy specified in Subclause 7.1.2.

##### A.6.2.9.2.2.2 Test Requirements for Cell 3

To test the UE behavior specified in Subclause 6.2.2.2.2 the System Simulator shall transmit, on cell 1, a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator, on cell 3. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power on cell 3.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions on cell 3 shall be within the accuracy specified in Subclause 7.1.2.

#### A.6.2.9.2.3 Stop Preamble transmission if maximum number of preamble transmission counter has been reached

##### A.6.2.9.2.3.1 Test Requirements for Cell 2

To test the UE behavior specified in Subclause 6.2.2 the System Simulator shall transmit, in response to the first 6 preambles, a Random Access Response *not* corresponding to the transmitted Random Access Preamble on cell 1. The UE shall stop transmitting preambles after 6 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power on cell 2.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions on cell 2 shall be within the accuracy specified in Subclause 7.1.2.

##### A.6.2.9.2.3.2 Test Requirements for Cell 3

To test the UE behavior specified in Subclause 6.2.2 the System Simulator shall transmit, in response to the first 6 preambles, a Random Access Response *not* corresponding to the transmitted Random Access Preamble on cell 1. The UE shall stop transmitting preambles after 6 preambles.

The UE shall re-transmit the preamble with the calculated PRACH transmission power on cell 3.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions on cell 3 shall be within the accuracy specified in Subclause 7.1.2.

## **A.6.2.10 E-UTRAN FDD Contention Based Random Access Test for Cat-M1 UEs in Normal Coverage**

### **A.6.2.10.1 Test Purpose and Environment**

The purpose of this test is to verify whether the behavior of the random access procedure of a Cat-M1 UE in Normal Coverage is according to the requirements, whether the PRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the RSRP measurement and the configured criterion in RSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 6.2.2, Clause 6.2.3 and Clause 7.24.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.10.1-1 and A.6.2.10.1-2.

Table A.6.2.10.1-1: General test parameters for FDD contention based random access test

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Unit       | Value                                    | Comments                  |

## A.6.2.10.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.10.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 4 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -25 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

### A.6.2.10.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.1.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -25 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.10.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.2.2.1.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.10.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.10.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.10.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.2.2.1.6, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.10.2.7 PRACH Resource Selection

The UE shall select PRACH resources and transmits or re-transmits PRACH preambles using the PRACH resources and PRACH configuration corresponding to the coverage enhancement level 0.

Note: The PRACH Resource Selection requirement is already assumed for testing the other PRACH requirements.

### A.6.2.11 E-UTRAN HD-FDD Contention Based Random Access Test for Cat-M1 UEs in Normal Coverage

#### A.6.2.11.1 Test Purpose and Environment

The purpose of this test is to verify whether the behavior of the random access procedure of a Cat-M1 UE in Normal Coverage is according to the requirements, whether the PRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the RSRP measurement and the configured criterion in RSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 6.2.2, Clause 6.2.3 and Clause 7.24.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.11.1-1 and A.6.2.11.1-2.

Table A.6.2.11.1-1: General test parameters for HD-FDD contention based random access test

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Unit       | Value                                       | Comments                  |

## A.6.2.11.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.11.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 4 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -25 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.11.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.1.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -25 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.11.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.2.2.1.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.11.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.11.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.11.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.2.2.1.6, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.11.2.7 PRACH Resource Selection

The UE shall select PRACH resources and transmits or re- transmits PRACH preambles using the PRACH resources and PRACH configuration corresponding to the coverage enhancement level 0.

Note: The PRACH Resource Selection requirement is already assumed for testing the other PRACH requirements.

### A.6.2.12 E-UTRAN TDD Contention Based Random Access Test for Cat-M1 UEs in Normal Coverage

#### A.6.2.12.1 Test Purpose and Environment

The purpose of this test is to verify whether the behavior of the random access procedure of a Cat-M1 UE in Normal Coverage is according to the requirements, whether the PRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the RSRP measurement and the configured criterion in RSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 6.2.2, Clause 6.2.3 and Clause 7.24.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.12.1-1 and A.6.2.12.1-2.

Table A.6.2.12.1-1: General test parameters for TDD contention based random access test

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Unit       | Value                                    | Comments                                  |

## A.6.2.12.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.12.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 4 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.12.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.1.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -30 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.12.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.2.2.1.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.12.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.12.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.12.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.2.2.1.6, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.12.2.7 PRACH Resource Selection

The UE shall select PRACH resources and transmits or re- transmits PRACH preambles using the PRACH resources and PRACH configuration corresponding to the coverage enhancement level 0.

Note: The PRACH Resource Selection requirement is already assumed for testing the other PRACH requirements.

### A.6.2.13 E-UTRAN FDD Contention Based Random Access Test for Cat-M1 UEs in Enhanced Coverage

#### A.6.2.13.1 Test Purpose and Environment

The purpose of this test is to verify whether the behavior of the random access procedure of a Cat-M1 UE in Enhanced Coverage is according to the requirements, whether the PRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the RSRP measurement and the configured criterion in RSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 7.24.2, Clause 6.2.3 and Clause 7.1.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.13.1-1 and A.6.2.13.1-2.

Table A.6.2.13.1-1: General test parameters for FDD contention based random access test

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Unit       | Value                                    | Comments                  |

### A.6.2.13.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

#### A.6.2.13.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 4 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -27 dBm. The power of the first preamble shall be -27 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.13.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.1.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble

after 5 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -27 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.13.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.2.2.1.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.13.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.13.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.13.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.2.2.1.6, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.13.2.7 PRACH Resource Selection

The UE shall select PRACH resources and transmits or re-transmits PRACH preambles using the PRACH resources and PRACH configuration corresponding to the coverage enhancement level 2.

Note: The PRACH Resource Selection requirement is already assumed for testing the other PRACH requirements.

### A.6.2.14 E-UTRAN HD-FDD Contention Based Random Access Test for Cat-M1 UEs in Enhanced Coverage

#### A.6.2.14.1 Test Purpose and Environment

The purpose of this test is to verify whether the behavior of the random access procedure of a Cat-M1 UE in Enhanced Coverage is according to the requirements, whether the PRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the RSRP measurement and the configured criterion in RSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 6.2.2, Clause 6.2.3 and Clause 7.24.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.14.1-1 and A.6.2.14.1-2.

**Table A.6.2.14.1-1: General test parameters for HD-FDD contention based random access test**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Unit       | Value                                       | Comments                  |

## A.6.2.14.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.14.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 4 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -27 dBm. The power of the first preamble shall be -27 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.14.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.1.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -27 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.14.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.2.2.1.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.14.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.14.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.14.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.2.2.1.6, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.14.2.7 PRACH Resource Selection

The UE shall select PRACH resources and transmits or re- transmits PRACH preambles using the PRACH resources and PRACH configuration corresponding to the coverage enhancement level 2.

Note: The PRACH Resource Selection requirement is already assumed for testing the other PRACH requirements.

### A.6.2.15 E-UTRAN TDD Contention Based Random Access Test for Cat-M1 UEs in Enhanced Coverage

#### A.6.2.15.1 Test Purpose and Environment

The purpose of this test is to verify whether the behavior of the random access procedure of a Cat-M1 UE in Enhanced Coverage is according to the requirements, whether the PRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the RSRP measurement and the configured criterion in RSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 6.2.2, Clause 6.2.3 and Clause 7.24.2 in an AWGN model.

For this test a single cell is used. The test parameters are given in tables A.6.2.15.1-1 and A.6.2.15.1-2.

Table A.6.2.15.1-1: General test parameters for TDD contention based random access test

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Unit       | Value                                    | Comments                                  |

## A.6.2.15.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.15.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 4 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -27 dBm. The power of the first preamble shall be -27 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.15.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.2.2.1.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be -27 dBm with an accuracy specified in clause 6.3.5.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5.2.1 of TS 36.101 [5].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in Subclause 7.24.2.

#### A.6.2.15.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.2.2.1.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.15.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.15.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.2.2.1.5, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.15.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.2.2.1.6, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated PRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.15.2.7 PRACH Resource Selection

The UE shall select PRACH resources and transmits or re- transmits PRACH preambles using the PRACH resources and PRACH configuration corresponding to the coverage enhancement level 2.

Note: The PRACH Resource Selection requirement is already assumed for testing the other PRACH requirements.

### A.6.2.16 Contention Based Random Access Test for UE category NB1 UEs In-band mode in normal coverage

#### A.6.2.16.1 Test Purpose and Environment

The purpose of this test is to verify whether the behavior of the random access procedure of a category NB1 UE in Normal Coverage is according to the requirements, whether the NPRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the NRSRP measurement and the configured criterion in NRSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 6.6.2, Clause 6.6.3 and Clause 7.20.2 in an AWGN model.

For this test a single NB-IoT cell and a single LTE cell are used. The test parameters are given in tables A.6.2.16.1-1, A.6.2.16.1-2 and A.6.2.16.1-4.

**Table A.6.2.16.1-1: nCell specific test parameters for HD-FDD contention based random access test for UE category NB1 In-Band mode in Normal Coverage**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Unit           | Value                                                                                                         | Comments                   |

## A.6.2.16.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.16.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.6.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 3 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 2 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.6.2. The power of the first preamble shall be -25 dBm with an accuracy specified in clause 6.3.5F.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5F.2 of TS 36.101 [5].

The transmit timing of all NPRACH transmissions shall be within the accuracy specified in Subclause 7.20.2.

#### A.6.2.16.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 3 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 2 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.6.2. The power of the first preamble shall be -25 dBm with an accuracy specified in clause 6.3.5F.1.1 of TS 36.101 [5]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.5F.2 of TS 36.101 [5].

The transmit timing of all NPRACH transmissions shall be within the accuracy specified in Subclause 7.20.2.

#### A.6.2.16.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.6.2.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.16.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.6.2.4, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.16.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.6.2.4, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.16.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.6.2.5, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.16.2.7 NPRACH Resource Selection

The UE shall select NPRACH resources and transmits or re-transmits NPRACH preambles using the NPRACH resources and NPRACH configuration corresponding to the coverage enhancement level 0. The rate of correct coverage enhancement level selection during repeated tests shall be at least 90%.

Note: Correct coverage enhancement level selection is a prerequisite for testing the other NPRACH requirements.

## A.6.2.17 Contention Based Random Access Test for UE category NB1 UEs In-band mode in Enhanced Coverage

### A.6.2.17.1 Test Purpose and Environment

The purpose of this test is to verify whether the behavior of the random access procedure of a category NB1 UE in Enhanced Coverage is according to the requirements, whether the NPRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the NRSRP measurement and the configured criterion in NRSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 6.6.2, Clause 6.6.3 and Clause 7.20.2 in an AWGN model.

For this test a single NB-IoT cell and a single LTE cell are used. The test parameters are given in tables A.6.2.17.1-1, A.6.2.17.1-2 and A.6.2.17.1-4.

**Table A.6.2.17.1-1: nCell specific test parameters for HD-FDD contention based random access test for UE category NB1 In-Band mode in Enhanced Coverage**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Unit           | Value                                                                                                         | Comments                   |

## A.6.2.17.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.17.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.6.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 4 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.6.2. The power of the first preamble shall be 23 dBm for power class 3, 20 dBm for power class 5 and 14 dBm for power class 6 with an accuracy specified in clause 6.3.5F.1.1 of TS 36.101 [5].

The transmit timing of all NPRACH transmissions shall be within the accuracy specified in Subclause 7.20.2.

#### A.6.2.17.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.2.2. The power of the first preamble shall be 23 dBm for power class 3, 20 dBm for power class 5 and 14 dBm for power class 6 with an accuracy specified in clause 6.3.5F.1.1 of TS 36.101 [5].

The transmit timing of all NPRACH transmissions shall be within the accuracy specified in Subclause 7.20.2.

#### A.6.2.17.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.6.2.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.17.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.6.2.4, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.17.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.6.2.4, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.17.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.6.2.5, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.17.2.7 NPRACH Resource Selection

The UE shall select NPRACH resources and transmits or re-transmits NPRACH preambles using the NPRACH resources and NPRACH configuration corresponding to the coverage enhancement level 1. The rate of correct coverage enhancement level selection during repeated tests shall be at least 90%.

Note: Correct coverage enhancement level Sselection requirement is a prerequisite already assumed for testing the other NPRACH requirements.

## A.6.2.18 Contention Based Random Access on Non-anchor Carrier Test for UE category NB1 UEs In-band mode in Enhanced Coverage

### A.6.2.18.1 Test Purpose and Environment

The purpose of this test is to verify whether the behavior of the random access procedure of a category NB1 UE in Enhanced Coverage is according to the requirements, whether the NPRACH power settings and timing are within specified limits, and whether the UE determines properly the enhanced coverage level based on the NRSRP measurement and the configured criterion in NRSRP-ThresholdsPrach [2]. This test will verify the requirements in Clause 6.6.2, Clause 6.6.3 and Clause 7.20.2 in an AWGN model.

For this test a single NB-IoT cell and a single LTE cell are used. The test parameters are given in tables A.6.2.18.1-1, A.6.2.18.1-2 and A.6.2.18.1-3.

**Table A.6.2.18.1-1: nCell specific test parameters for HD-FDD contention based random access on non-anchor carrier test for UE category NB1 In-Band mode in Enhanced Coverage**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Unit        | Value                                                                                                         | Comments                |

## A.6.2.18.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

### A.6.2.18.2.1 Random Access Response Reception

To test the UE behavior specified in Subclause 6.6.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts (the preamble may be transmitted multiple times in each attempt) have been received by the System Simulator. In response to the first 4 preamble transmission attempts, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.6.2. The power of the first preamble shall be 23 dBm for power class 3, 20 dBm for power class 5 and 14 dBm for power class 6 with an accuracy specified in clause 6.3.5F.1.1 of TS 36.101 [5].

The transmit timing of all NPRACH transmissions shall be within the accuracy specified in Subclause 7.20.2.

#### A.6.2.18.2.2 No Random Access Response Reception

To test the UE behavior specified in subclause 6.6.2.2, the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preamble transmission attempts have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preamble transmission attempts.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in Subclause 6.6.2. The power of the first preamble shall be 23 dBm for power class 3, 20 dBm for power class 5 and 14 dBm for power class 6 with an accuracy specified in clause 6.3.5F.1.1 of TS 36.101 [5].

The transmit timing of all NPRACH transmissions shall be within the accuracy specified in Subclause 7.20.2.

#### A.6.2.18.2.3 Receiving a NACK on msg3

To test the UE behavior specified in subclause 6.6.2.3, the System Simulator shall NACK *all* UE msg3 following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of a NACK on msg3 until the maximum number of HARQ re-transmissions is reached.

#### A.6.2.18.2.4 Reception of an Incorrect Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.6.2.4, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element *not* matching the CCCH SDU transmitted in msg3 uplink message.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires unless the received message includes a UE Contention Resolution Identity MAC control element and the UE Contention Resolution Identity included in the MAC control element matches the CCCH SDU transmitted in the uplink message.

#### A.6.2.18.2.5 Reception of a Correct Message over Temporary C-RNTI

To test the UE behavior specified in Subclause 6.6.2.4, the System Simulator shall send a message addressed to the temporary C-RNTI with a UE Contention Resolution Identity included in the MAC control element matching the CCCH SDU transmitted in the msg3 uplink message.

The UE shall send ACK if the Contention Resolution is successful.

#### A.6.2.18.2.6 Contention Resolution Timer expiry

To test the UE behavior specified in Subclause 6.6.2.5, the System Simulator shall *not* send a response to a msg3.

The UE shall re-select a preamble and transmit with the calculated NPRACH transmission power when the backoff time expires if the Contention Resolution Timer expires.

#### A.6.2.18.2.7 NPRACH Resource Selection

The UE shall select NPRACH resources in non-anchor carrier and transmits or re-transmits NPRACH preambles using the NPRACH resources and NPRACH configuration corresponding to the coverage enhancement level 1. The rate of correct coverage enhancement level selection during repeated tests shall be at least 90%.

Note: Correct coverage enhancement level selection is a prerequisite for testing the other NPRACH requirements.

## A.6.3 RRC Connection Release with Redirection

### A.6.3.1 Redirection from E-UTRAN FDD to UTRAN FDD

#### A.6.3.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct performing the RRC connection release with redirection to the target UTRAN FDD cell. This test will partly verify the RRC connection release with redirection to UTRAN FDD cell requirements in clause 6.3.2.1.

The test parameters are given in Tables A.6.3.1.1-1, A.6.3.1.1-2 and A.6.3.1.1-3 below. The test consists of two successive time periods, with time duration of T1, and T2 respectively. The “*RRConnectionRelease*” message containing the relevant system information of Cell 2 shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of Cell 2. Cell 2 is powered up at the beginning of the T2.

**Table A.6.3.1.1-1: General test parameters for RRC Connection Release with Redirection from E-UTRAN FDD to UTRAN FDD under AWGN propagation conditions**

| Parameter                                         | Unit | Value                                    | Comment                                                                                                 |
|---------------------------------------------------|------|------------------------------------------|---------------------------------------------------------------------------------------------------------|
| PDSCH parameters (E-UTRAN FDD)                    |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1.                                                                       |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN FDD)       |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1.                                                                       |
| Active cell                                       |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.                                                                |
| Neighbour cell                                    |      | Cell 2                                   | Cell 2 is on UTRA RF channel number 1.                                                                  |
| CP length                                         |      | Normal                                   | Applicable to cell 1                                                                                    |
| E-UTRA RF Channel Number                          |      | 1                                        | One E-UTRA FDD carrier frequency is used.                                                               |
| E-UTRA Channel Bandwidth (BW <sub>channel</sub> ) | MHz  | 10                                       |                                                                                                         |

| CPICH Ec/Ior                                                                                                     | dB           | -10       |      |
| PCCPCH Ec/Ior                                                                                                    | dB           | -12       |      |
| SCH Ec/Ior                                                                                                       | dB           | -12       |      |
| PICH Ec/Ior                                                                                                      | dB           | -15       |      |
| DPCH Ec/Ior                                                                                                      | dB           | N/A       |      |
| OCNS                                                                                                             |              | -0.941    |      |
| $\hat{I}_{or}/I_{oc}$                                                                                            | dB           | $-\infty$ | 0.02 |
| $I_{oc}$                                                                                                         | dBm/3.84 MHz | -70       |      |
| CPICH Ec/Io <sup>Note 3</sup>                                                                                    | dB           | $-\infty$ | -13  |
| Propagation Condition                                                                                            |              | AWGN      |      |
| Note 1: The DPCH level is controlled by the power control loop.                                                  |              |           |      |
| Note 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to Ior. |              |           |      |
| Note 3: This gives an SCH Ec/Io of -15dB                                                                         |              |           |      |

### A.6.3.1.2 Test Requirements

The UE shall start to transmit random access to Cell 2 less than 650 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to UTRAN FDD observed during repeated tests shall be at least 90%.

NOTE: The Re-establishment delay in this case can be expressed as

$$T_{\text{connection\_release\_redirect\_UTRA FDD}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-UTRA FDD}} + T_{\text{SI-UTRA FDD}} + T_{\text{RA}}$$

where

$$T_{\text{RRC\_procedure\_delay}} = 110 \text{ ms}$$

$$T_{\text{identify-UTRA FDD}} = 500 \text{ ms}$$

$T_{\text{SI-UTRA FDD}}$  = the time required for acquiring all the relevant system information of the target UTRA FDD cell. This time depends upon whether the UE is provided with the relevant system information of the target UTRA FDD cell or not by the E-UTRAN before the RRC connection is released. 0 ms is assumed in this test case.

$T_{\text{RA}}$  = The additional delay caused by the random access procedure. 40 ms is assumed in this test case.

This gives a total of 650 ms.

## A.6.3.2 Redirection from E-UTRAN TDD to UTRAN FDD

### A.6.3.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct performing the RRC connection release with redirection to the target UTRAN FDD cell. This test will partly verify the RRC connection release with redirection to UTRAN FDD cell requirements in clause 6.3.2.1.

The test parameters are given in Tables A.6.3.2.1-1, A.6.3.2.1-2 and A.6.3.2.1-3 below. The test consists of two successive time periods, with time duration of T1, and T2 respectively. The “*RRConnectionRelease*” message containing the relevant system information of Cell 2 shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of cell 2. Cell 2 is powered up at the beginning of the T2,

**Table A.6.3.2.1-1: General test parameters for RRC Connection Release with Redirection from E-UTRAN TDD to UTRAN FDD under AWGN propagation conditions**

| Parameter                                         | Unit | Value                                    | Comment                                                                                                 |
|---------------------------------------------------|------|------------------------------------------|---------------------------------------------------------------------------------------------------------|
| PDSCH parameters (E-UTRAN TDD)                    |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2.                                                                       |

| Propagation Condition                                                                                            |              | AWGN   |      |
| Note 1: The DPCH level is controlled by the power control loop.                                                  |              |        |      |
| Note 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to Ior. |              |        |      |
| Note 3: This gives an SCH Ec/Io of -15dB                                                                         |              |        |      |

### A.6.3.2.2 Test Requirements

The UE shall start to transmit random access to Cell 2 less than 650 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to UTRA FDD observed during repeated tests shall be at least 90%.

NOTE: The Re-establishment delay in this case can be expressed as

$$T_{\text{connection\_release\_redirect\_UTRA FDD}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-UTRA FDD}} + T_{\text{SI-UTRA FDD}} + T_{\text{RA}}$$

where

$$T_{\text{RRC\_procedure\_delay}} = 110 \text{ ms}$$

$$T_{\text{identify-UTRA FDD}} = 500 \text{ ms}$$

$T_{\text{SI-UTRA FDD}}$  = the time required for acquiring all the relevant system information of the target UTRA FDD cell. This time depends upon whether the UE is provided with the relevant system information of the target UTRA FDD cell or not by the E-UTRAN before the RRC connection is released. 0 ms is assumed in this test case.

$T_{\text{RA}}$  = The additional delay caused by the random access procedure. 40 ms is assumed in this test case.

This gives a total of 650 ms.

### A.6.3.3 Redirection from E-UTRAN FDD to GERAN when System Information is provided

#### A.6.3.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRA FDD to the target GERAN cell within  $T_{\text{connection\_release\_redirect\_GERAN}}$ . This test will partly verify the RRC connection release with redirection to GERAN requirements in clause 6.3.2.2.

The test parameters are given in Tables A.6.3.3.1-1, A.6.3.3.1-2 and A.6.3.3.1-3 below. No measurement gaps are configured. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The start of T2 is the instant when the last TTI containing the RRC message, “*RRCCConnectionRelease*”, is received by the UE from cell 1. The “*RRCCConnectionRelease*” message shall contain all the relevant system information of cell 2.

**Table A.6.3.3.1-1: General test parameters for RRC connection release with redirection from E-UTRAN FDD to GERAN in AWGN**

| Parameter                                         | Unit | Value                                    | Comment                                                                 |
|---------------------------------------------------|------|------------------------------------------|-------------------------------------------------------------------------|
| PDSCH parameters (E-UTRAN FDD)                    |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1.                                       |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN FDD)       |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1.                                       |
| Active cell                                       |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.                                |
| Neighbour cell                                    |      | Cell 2                                   | Cell 2 is on Absolute RF Channel Number 1 (GSM cell)                    |
| CP length                                         |      | Normal                                   | Applicable to cell 1                                                    |
| E-UTRA RF Channel Number                          |      | 1                                        | One E-UTRA FDD carrier frequency is used.                               |
| E-UTRA Channel Bandwidth (BW <sub>channel</sub> ) | MHz  | 10                                       |                                                                         |
| DRX                                               |      | OFF                                      |                                                                         |
| Monitored GSM cell list size                      |      | 6 GSM neighbour including ARFCN 1        | GSM cells are provided in the “ <i>RRCCConnectionRelease</i> ” message. |
| T1                                                | s    | 5                                        |                                                                         |
| T2                                                | s    | 2                                        |                                                                         |

**Table A.6.3.3.1-2: Cell specific test parameters for E-UTRA FDD cell (cell #1) for RRC connection release with redirection from E-UTRAN FDD to GERAN in AWGN**

| Parameter                                    | Unit                                                                                                                                                                                                           | Cell 1   |     |

| Propagation Condition                        |                                                                                                                                                                                                                | AWGN     |     |
| Note 1:                                      | OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                             |          |     |
| Note 2:                                      | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |          |     |
| Note 3:                                      | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |          |     |

**Table A.6.3.3.1-3: Cell specific test parameters for GERAN cell (cell #2) for RRC connection release with redirection from E-UTRAN FDD to GERAN in AWGN**

| Parameter                  | Unit | Cell 2    |       |
|----------------------------|------|-----------|-------|
|                            |      | T1        | T2    |
| Absolute RF Channel Number |      | ARFNC 1   |       |
| RXLEV                      | dBm  | -Infinity | -75   |
| GSM BSIC                   |      | N/A       | Valid |

### A.6.3.3.2 Test Requirements

The UE shall begin to send access bursts on RACH of the target GERAN cell (cell #2) less than 1120 ms from the beginning of time period T2.

The rate of correct “RRC connection release with redirection to GERAN” observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this test case is expressed as:

$$T_{\text{connection\_release\_redirect\_GERAN}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-GERAN}} + T_{\text{SI-GERAN}} + T_{\text{RA}}$$

$T_{\text{RRC\_procedure\_delay}} = 110$  ms, which is the time for processing the received message “*RRCConnectionRelease*”.

$T_{\text{identify-GERAN}} = 1000$  ms, which is the time for identifying the target GERAN cell.

$T_{\text{SI-GERAN}} = 0$ ; UE does not have to read the system information of the GERAN cell since all relevant SI is provided to the UE in the “*RRCConnectionRelease*” message.

$T_{\text{RA}} = 10$  ms, which is about 2 GSM frames ( $2 \times 4.65$  ms) to account for the GSM timing uncertainty.

### A.6.3.4 Redirection from E-UTRAN TDD to GERAN when System Information is provided

#### A.6.3.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRA TDD to the target GERAN cell within  $T_{\text{connection\_release\_redirect\_GERAN}}$ . This test will partly verify the RRC connection release with redirection to GERAN requirements in clause 6.3.2.2.

The test parameters are given in Tables A.6.3.4.1-1, A.6.3.4.1-2 and A.6.3.4.1-3 below. No measurement gaps are configured. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The start of T2 is the instant when the last TTI containing the RRC message, “*RRCConnectionRelease*”, is received by the UE from cell 1. The “*RRCConnectionRelease*” message shall contain all the relevant system information of cell 2.

**Table A.6.3.4.1-1: General test parameters for RRC connection release with redirection from E-UTRAN TDD to GERAN in AWGN**

| Parameter                                         | Unit | Value                                    | Comment                                                                                |
|---------------------------------------------------|------|------------------------------------------|----------------------------------------------------------------------------------------|
| PDSCH parameters (E-UTRAN TDD)                    |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2.                                                      |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN TDD)       |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2.                                                      |
| Active                                            |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.                                               |
| Neighbour cell                                    |      | Cell 2                                   | Cell 2 is on Absolute RF Channel Number 1 (GSM cell)                                   |
| CP length                                         |      | Normal                                   | Applicable to cell 1                                                                   |
| Special subframe configuration                    |      | 6                                        | As specified in table 4.2.1 in TS 36.211. The same configuration applies to all cells. |
| Uplink-downlink configuration                     |      | 1                                        |                                                                                        |

| Note 1:                                      | OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                             |          |     |
| Note 2:                                      | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |          |     |
| Note 3:                                      | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |          |     |

**Table A.6.3.4.1-3: Cell specific test parameters for GERAN cell (cell #2) for RRC connection release with redirection from E-UTRAN TDD to GERAN in AWGN**

| Parameter                  | Unit | Cell 2    |       |
|----------------------------|------|-----------|-------|
|                            |      | T1        | T2    |
| Absolute RF Channel Number |      | ARFNC 1   |       |
| RXLEV                      | dBm  | -Infinity | -75   |
| GSM BSIC                   |      | N/A       | Valid |

### A.6.3.4.2 Test Requirements

The UE shall begin to send access bursts on RACH of the target GERAN cell (cell #2) less than 1120 ms from the beginning of time period T2.

The rate of correct “RRC connection release with redirection to GERAN” observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this test case is expressed as:

$$T_{\text{connection\_release\_redirect\_GERAN}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify\_GERAN}} + T_{\text{SI\_GERAN}} + T_{\text{RA}}$$

$T_{\text{RRC\_procedure\_delay}} = 110$  ms, which is the time for processing the received message “*RRCConnectionRelease*”.

$T_{\text{identify\_GERAN}} = 1000$  ms, which is the time for identifying the target GERAN cell.

## A.6.3.5 E-UTRA TDD RRC connection release redirection to UTRA TDD

### A.6.3.5.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRA TDD to the target UTRA TDD cell within  $T_{\text{connection\_release\_redirect\_UTRA TDD}}$ . This test will partly verify the RRC connection release with redirection to UTRA TDD requirements in clause 6.3.2.3.

The test parameters are given in table A.6.3.5.1-1, table A.6.3.5.1-2, and table A.6.3.5.1-3. No measurement gaps are configured. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The “*RRCConnectionRelease*” message containing the relevant system information of Cell 2 shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message, “*RRCConnectionRelease*”, is received by the UE from cell 1. The “*RRCConnectionRelease*” message shall contain all the relevant system information of Cell 2.

**Table A.6.3.5.1-1: General test parameters for E-UTRA TDD RRC connection release redirection to UTRA TDD**

| Parameter                                          | Unit | Value                                    | Comment                                                                                                  |

| Note 3:                                 | P-CCPCH RSRP, PCCPCH_Ec/Io and DwPCH_Ec/Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |                   |        |       |       |

### A.6.3.5.2 Test Requirements

The UE shall start to transmit the SYNCH-UL sequence in the UpPTS to Cell 2 less than 650 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to UTRA TDD observed during repeated tests shall be at least 90%.

NOTE: The time delay can be expressed as:  $T_{RRC\_procedure\_delay} + T_{identify-UTRA\ TDD} + T_{SI-UTRA\ TDD} + T_{RA}$ , where:

$T_{RRC\_procedure\_delay} = 110$  ms, which is specified in clause 6.3.2.3.

$T_{identify-UTRA\ TDD} = 500$  ms; which is defined in clause 6.3.2.3.

$T_{SI-UTRA\ TDD} = 0$  ms, UE does not have to read the system information of the UTRAN TDD since all relevant SI is provided to the UE in the “*RRCConnectionRelease*” message.

$T_{RA} = 40$ ms. This is the additional delay caused by the random access procedure

It gives a total delay of 650 ms.

### A.6.3.6 E-UTRA FDD RRC connection release redirection to UTRA TDD

#### A.6.3.6.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRA FDD to the target UTRA TDD cell within  $T_{connection\_release\_redirect\_UTRA\ TDD}$ . This test will partly verify the RRC connection release with redirection to UTRA TDD requirements in clause 6.3.2.3.

The test parameters are given in table A.6.3.6.1-1, table A.6.3.6.1-2, and table A.6.3.6.1-3. No measurement gaps are configured. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The “*RRCConnectionRelease*” message containing the relevant system information of Cell 2 shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message, “*RRCConnectionRelease*”, is received by the UE from cell 1. The “*RRCConnectionRelease*” message shall contain all the relevant system information of Cell 2.

**Table A.6.3.6.1-1: General test parameters for E-UTRA FDD RRC connection release redirection to UTRA TDD**

| Parameter                                          | Unit | Value                                    | Comment                                                                                         |
|----------------------------------------------------|------|------------------------------------------|-------------------------------------------------------------------------------------------------|
| PDSCH parameters (E-UTRAN FDD)                     |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1.                                                               |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN FDD)        |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1.                                                               |
| Active cell                                        |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.                                                        |
| Neighbour cell                                     |      | Cell 2                                   | Cell 2 is on UTRA RF channel number 1.                                                          |
| CP length                                          |      | Normal                                   | Applicable to cell 1                                                                            |
| Time offset between cells                          | ms   | 3                                        | Asynchronous cells                                                                              |
| E-UTRA RF Channel Number                           |      | 1                                        | One E-UTRA FDD carrier frequency is used.                                                       |
| E-UTRA Channel Bandwidth ( $BW_{\text{channel}}$ ) | MHz  | 10                                       |                                                                                                 |
| Filter coefficient                                 |      | 0                                        | L3 filtering is not used.                                                                       |

| Note 1:                                 | In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                                                       |                   |        |       |       |
| Note 2:                                 | The power of the OCNS channel that is added shall make the total power from the cell to be equal to Ior.                                                         |                   |        |       |       |
| Note 3:                                 | P-CCPCH RSRP, PCCPCH_Ec/Io and DwPCH_Ec/Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |                   |        |       |       |

### A. 6.3.6.2 Test Requirements

The UE shall start to transmit the SYNCH-UL sequence in the UpPTS to Cell 2 less than 650 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to UTRA TDD observed during repeated tests shall be at least 90%.

NOTE: The time delay can be expressed as:  $T_{RRC\_procedure\_delay} + T_{identify-UTRA\ TDD} + T_{SI-UTRA\ TDD} + T_{RA}$ , where:

$T_{RRC\_procedure\_delay} = 110$  ms, which is specified in clause 6.3.2.3.

$T_{identify-UTRA\ TDD} = 500$  ms; which is defined in clause 6.3.2.3.

$T_{SI-UTRA\ TDD} = 0$  ms, UE does not have to read the system information of the UTRAN TDD since all relevant SI is provided to the UE in the “*RRCConnectionRelease*” message.

$T_{RA} = 40$ ms. This is the additional delay caused by the random access procedure.

This gives a total delay of 650 ms.

### A.6.3.7 E-UTRA TDD RRC connection release redirection to UTRA TDD without SI provided

#### A.6.3.7.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRA TDD to the target UTRA TDD cell within  $T_{connection\_release\_redirect\_UTRA\ TDD}$ . This test will partly verify the RRC connection release with redirection to UTRA TDD requirements in clause 6.3.2.3.

The test parameters are given in table A.6.3.7.1-1, table A.6.3.7.1-2, and table A.6.3.7.1-3. No measurement gaps are configured. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The “*RRCConnectionRelease*” message not containing the relevant system information of Cell 2 shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message, “*RRCConnectionRelease*”, is received by the UE from Cell 1.

**Table A.6.3.7.1-1: General test parameters for E-UTRA TDD RRC connection release redirection to UTRA TDD without SI provided**

| Parameter                                         | Unit | Value                                    | Comment                                          |
|---------------------------------------------------|------|------------------------------------------|--------------------------------------------------|
| PDSCH parameters (E-UTRAN TDD)                    |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2.                |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN TDD)       |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2.                |
| Active cell                                       |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.         |
| Neighbour cell                                    |      | Cell 2                                   | Cell 2 is on UTRA RF channel number 1.           |
| Time offset between cells                         | ms   | 3                                        | Asynchronous cells                               |

| Note 1:                                 | In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                                                       |                   |        |       |       |
| Note 2:                                 | The power of the OCNS channel that is added shall make the total power from the cell to be equal to I <sub>or</sub> .                                            |                   |        |       |       |
| Note 3:                                 | P-CCPCH RSRP, PCCPCH_Ec/Io and DwPCH_Ec/Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |                   |        |       |       |

### A.6.3.7.2 Test Requirements

The UE shall start to transmit the SYNCH-UL sequence in the UpPTS to Cell 2 less than 1930 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to UTRA TDD observed during repeated tests shall be at least 90%.

NOTE: The time delay can be expressed as:  $T_{RRC\_procedure\_delay} + T_{identify-UTRA\ TDD} + T_{SI-UTRA\ TDD} + T_{RA}$ , where:

$T_{RRC\_procedure\_delay} = 110$  ms, which is specified in clause 6.3.2.3.

$T_{identify-UTRA\ TDD} = 500$  ms; which is defined in clause 6.3.2.3.

$T_{SI-UTRA\ TDD}$ : Maximum repetition period of relevant system info blocks that need to be received by the UE during RRC connection release redirection to UTRA TDD cell. 1280 ms is assumed in this test case.

$T_{RA} = 40$ ms, this is the additional delay caused by the random access procedure.

This gives a total delay of 1930 ms.

### A.6.3.8 E-UTRA FDD RRC connection release redirection to UTRA TDD without SI provided

#### A.6.3.8.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRA FDD to the target UTRA TDD cell within  $T_{connection\_release\_redirect\_UTRA\ TDD}$ . This test will partly verify the RRC connection release with redirection to UTRA TDD requirements in clause 6.3.2.3.

The test parameters are given in table A.6.3.8.1-1, table A.6.3.8.1-2, and table A.6.3.8.1-3. No measurement gaps are configured. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The "RRCConnectionRelease" message not containing the relevant system information of Cell 2 shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message, "RRCConnectionRelease", is received by the UE from Cell 1.

**Table A.6.3.8.1-1: General test parameters for E-UTRA FDD RRC connection release redirection to UTRA TDD without SI provided**

| Parameter                                         | Unit | Value                                    | Comment                                          |
|---------------------------------------------------|------|------------------------------------------|--------------------------------------------------|
| PDSCH parameters (E-UTRAN FDD)                    |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1.                |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN FDD)       |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1.                |
| Active cell                                       |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.         |
| Neighbour cell                                    |      | Cell 2                                   | Cell 2 is on UTRA RF channel number 1.           |
| Time offset between cells                         | ms   | 3                                        | Asynchronous cells                               |
| E-UTRA RF Channel Number                          |      | 1                                        | One E-UTRA TDD carrier frequency is used.        |
| E-UTRA Channel Bandwidth (BW <sub>channel</sub> ) | MHz  | 10                                       |                                                  |
| CP length                                         |      | Normal                                   | Applicable to cell 1                             |
| UTRA RF Channel Number                            |      | 1                                        | One UTRA TDD carrier frequency is used.          |
| Filter coefficient                                |      | 0                                        | L3 filtering is not used.                        |
| DRX                                               |      | OFF                                      |                                                  |
| Monitored UTRA TDD cell list size                 |      | none                                     | No explicit neighbour list is provided to the UE |

| Note 1:                                 | In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                                                       |                   |        |       |       |
| Note 2:                                 | The power of the OCNS channel that is added shall make the total power from the cell to be equal to I <sub>or</sub> .                                            |                   |        |       |       |
| Note 3:                                 | P-CCPCH RSRP, PCCPCH_Ec/Io and DwPCH_Ec/Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |                   |        |       |       |

### A.6.3.8.2 Test Requirements

The UE shall start to transmit the SYNCH-UL sequence in the UpPTS to Cell 2 less than 1930 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to UTRA TDD observed during repeated tests shall be at least 90%.

NOTE: The time delay can be expressed as:  $T_{RRC\_procedure\_delay} + T_{identify-UTRA\ TDD} + T_{SI-UTRA\ TDD} + T_{RA}$ , where:

$T_{RRC\_procedure\_delay} = 110$  ms, which is specified in clause 6.3.2.3.

$T_{identify-UTRA\ TDD} = 500$  ms; which is defined in clause 6.3.2.3.

$T_{SI-UTRA\ TDD}$ : Maximum repetition period of relevant system info blocks that need to be received by the UE during RRC connection release redirection to UTRA TDD cell. 1280 ms is assumed in this test case.

$T_{RA} = 40$ ms, this is the additional delay caused by the random access procedure.

This gives a total delay of 1930 ms.

### A.6.3.9 Redirection from E-UTRAN FDD to UTRAN FDD without System Information

#### A.6.3.9.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct performing the RRC connection release with redirection to the target UTRAN FDD cell. This test will partly verify the RRC connection release with redirection to UTRAN FDD cell requirements in clause 6.3.2.1.

The test parameters are given in Tables A.6.3.9.1-1, A.6.3.9.1-2 and A.6.3.9.1-3 below. The test consists of two successive time periods, with time duration of T1, and T2 respectively. The “*RRCConnectionRelease*” message not containing any system information of Cell 2 shall be sent to the UE during period T1. The start of T2 is the instant when the last TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of Cell 2. Cell 2 is powered up at the beginning of the T2.

**Table A.6.3.9.1-1: General test parameters for RRC Connection Release with Redirection from E-UTRAN FDD to UTRAN FDD under AWGN propagation conditions**

| Parameter                                          | Unit | Value                                    | Comment                                          |
|----------------------------------------------------|------|------------------------------------------|--------------------------------------------------|
| PDSCH parameters (E-UTRAN FDD)                     |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1.                |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN FDD)        |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1.                |
| Active cell                                        |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.         |
| Neighbour cell                                     |      | Cell 2                                   | Cell 2 is on UTRA RF channel number 1.           |
| CP length                                          |      | Normal                                   | Applicable to cell 1                             |
| E-UTRA RF Channel Number                           |      | 1                                        | One E-UTRA FDD carrier frequency is used.        |
| E-UTRA Channel Bandwidth ( $BW_{\text{channel}}$ ) | MHz  | 10                                       |                                                  |
| UTRA RF Channel Number                             |      | 1                                        | One UTRA FDD carrier frequency is used.          |
| Inter-RAT (UTRA FDD) measurement quantity          |      | CPICH Ec/Io                              |                                                  |
| Filter coefficient                                 |      | 0                                        | L3 filtering is not used.                        |
| DRX                                                |      | OFF                                      |                                                  |
| UTRA FDD cell list size                            |      | None                                     | No explicit neighbour list is provided to the UE |
| T1                                                 | s    | $\leq 5$                                 |                                                  |
| T2                                                 | s    | 2                                        |                                                  |

**Table A.6.3.9.1-2: Cell specific test parameters for cell #1 E-UTRAN FDD to UTRAN FDD RRC release with redirection under AWGN propagation conditions**

| Parameter                                                                                                                                                                                                              | Unit       | Cell 1   |     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------|-----|

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |     |
| Note 1: OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                             |            |          |     |
| Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                                                                                             |            |          |     |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |     |
| Note 4: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |     |

**Table A.6.3.9.1-3: Cell specific test parameters for cell #2 E-UTRAN FDD to UTRAN FDD RRC release with redirection under AWGN propagation conditions**

| Parameter                                                                                                                     | Unit         | Cell 2    |      |
|-------------------------------------------------------------------------------------------------------------------------------|--------------|-----------|------|
|                                                                                                                               |              | T1        | T1   |
| UTRA RF Channel Number                                                                                                        |              | 1         |      |
| CPICH Ec/Ior                                                                                                                  | dB           | -10       |      |
| PCCPCH Ec/Ior                                                                                                                 | dB           | -12       |      |
| SCH Ec/Ior                                                                                                                    | dB           | -12       |      |
| PICH Ec/Ior                                                                                                                   | dB           | -15       |      |
| DPCH Ec/Ior                                                                                                                   | dB           | N/A       |      |
| OCNS                                                                                                                          |              | -0.941    |      |
| $\hat{I}_{or}/I_{oc}$                                                                                                         | dB           | $-\infty$ | 0.02 |
| $I_{oc}$                                                                                                                      | dBm/3.84 MHz | -70       |      |
| CPICH Ec/Io <sup>Note 3</sup>                                                                                                 | dB           | $-\infty$ | -13  |
| Propagation Condition                                                                                                         |              | AWGN      |      |
| Note 1: The DPCH level is controlled by the power control loop.                                                               |              |           |      |
| Note 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to I <sub>or</sub> . |              |           |      |
| Note 3: This gives an SCH Ec/Io of -15dB                                                                                      |              |           |      |

### A.6.3.9.2 Test Requirements

The UE shall start to send random access to the target UTRA FDD cell (Cell 2) less than 1930 ms from the beginning of time period T2.

The rate of correct “RRC connection release with redirection to UTRAN” observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this case can be expressed as

$$T_{\text{connection\_release\_redirect\_UTRA FDD}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-UTRA FDD}} + T_{\text{SI-UTRA FDD}} + T_{\text{RA}}$$

where

$$T_{\text{RRC\_procedure\_delay}} = 110 \text{ ms}$$

$$T_{\text{identify-UTRA FDD}} = 500 \text{ ms}$$

$T_{\text{SI-UTRA FDD}}$  = the time required for acquiring all the relevant system information of the target UTRA FDD cell. This time depends upon whether the UE is provided with the relevant system information of the target UTRA FDD cell or not by the E-UTRAN before the RRC connection is released. Since no SI is provided, 1280 ms is assumed in this test case.

$T_{\text{RA}}$  = The additional delay caused by the random access procedure. 40 ms is assumed in this test case.

This gives a total of 1930 ms.

### A.6.3.10 Redirection from E-UTRAN FDD to GERAN when System Information is not provided

#### A.6.3.10.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRA FDD to the target GERAN cell within  $T_{\text{connection\_release\_redirect\_GERAN}}$ . This test will partly verify the RRC connection release with redirection to GERAN requirements in clause 6.3.2.2.

The test parameters are given in Tables A.6.3.10.1-1, A.6.3.10.1-2 and A.6.3.10.1-3 below. No measurement gaps are configured. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The start of T2 is the instant when the last TTI containing the RRC message, “*RRCConnectionRelease*”, is received by the UE from cell 1. The “*RRCConnectionRelease*” message shall not contain any system information of cell 2.

**Table A.6.3.10.1-1: General test parameters for RRC connection release with redirection from E-UTRAN FDD to GERAN in AWGN**

| Parameter                                         | Unit | Value                                    | Comment                                                                                       |
|---------------------------------------------------|------|------------------------------------------|-----------------------------------------------------------------------------------------------|
| PDSCH parameters (E-UTRAN FDD)                    |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1.                                                             |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN FDD)       |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1.                                                             |
| Active cell                                       |      | Cell 1                                   | Cell 1 is on E-UTRA RF channel number 1.                                                      |
| Neighbour cell                                    |      | Cell 2                                   | Cell 2 is on Absolute RF Channel Number 1 (GSM cell)                                          |
| CP length                                         |      | Normal                                   | Applicable to cell 1                                                                          |
| E-UTRA RF Channel Number                          |      | 1                                        | One E-UTRA FDD carrier frequency is used.                                                     |
| E-UTRA Channel Bandwidth (BW <sub>channel</sub> ) | MHz  | 10                                       |                                                                                               |
| DRX                                               |      | OFF                                      |                                                                                               |
| Monitored GSM cell list size                      |      | 6 GSM neighbour including ARFCN 1        | Only the list of GERAN carrier frequencies is provided in the "RRCConnectionRelease" message. |
| T1                                                | s    | ≤5                                       |                                                                                               |
| T2                                                | s    | 4                                        |                                                                                               |

**Table A.6.3.10.1-2: Cell specific test parameters for E-UTRA FDD cell (cell #1) for RRC connection release with redirection from E-UTRAN FDD to GERAN in AWGN**

| Parameter                                    | Unit                                                                                                                                                                                                           | Cell 1   |     |
|----------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|-----|
|                                              |                                                                                                                                                                                                                | T1       | T2  |

| Propagation Condition                        |                                                                                                                                                                                                                | AWGN     |     |
| Note 1:                                      | OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                             |          |     |
| Note 2:                                      | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |          |     |
| Note 3:                                      | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |          |     |

**Table A.6.3.10.1-3: Cell specific test parameters for GERAN cell (cell #2) for RRC connection release with redirection from E-UTRAN FDD to GERAN in AWGN**

| Parameter                  | Unit | Cell 2    |       |
|----------------------------|------|-----------|-------|
|                            |      | T1        | T2    |
| Absolute RF Channel Number |      | ARFNC 1   |       |
| RXLEV                      | dBm  | -Infinity | -75   |
| GSM BSIC                   |      | N/A       | Valid |

### A.6.3.10.2 Test Requirements

The UE shall begin to send access bursts on RACH of the target GERAN cell (cell #2) less than 3020 ms from the beginning of time period T2.

The rate of correct “RRC connection release with redirection to GERAN” observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this test case is expressed as:

$$T_{\text{connection\_release\_redirect\_GERAN}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-GERAN}} + T_{\text{SI-GERAN}} + T_{\text{RA}}$$

$T_{\text{RRC\_procedure\_delay}} = 110$  ms, which is the time for processing the received message “*RRCConnectionRelease*”.

$T_{\text{identify-GERAN}} = 1000$  ms, which is the time for identifying the target GERAN cell.

$T_{\text{SI-GERAN}} = 1900$  ms, which is the maximum time allowed to read BCCH data from the target GERAN cell.

$T_{\text{RA}} = 10$  ms, which is about 2 GSM frames ( $2 \times 4.65$  ms) to account for the GSM timing uncertainty.

### A.6.3.11 Redirection from E-UTRAN TDD to GERAN when System Information is not provided

#### A.6.3.11.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRA TDD to the target GERAN cell within  $T_{\text{connection\_release\_redirect\_GERAN}}$ . This test will partly verify the RRC connection release with redirection to GERAN requirements in clause 6.3.2.2.

The test parameters are given in Tables A.6.3.11.1-1, A.6.3.11.1-2 and A.6.3.11.1-3 below. No measurement gaps are configured. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The start of T2 is the instant when the last TTI containing the RRC message, “*RRCConnectionRelease*”, is received by the UE from cell 1. The “*RRCConnectionRelease*” message shall not contain any system information of cell 2.

**Table A.6.3.11.1-1: General test parameters for RRC connection release with redirection from E-UTRAN TDD to GERAN in AWGN**

| Parameter                                         | Unit | Value                                    | Comment                                                                                       |
|---------------------------------------------------|------|------------------------------------------|-----------------------------------------------------------------------------------------------|

| Note 1:                                      | OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                             |          |     |
| Note 2:                                      | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |          |     |
| Note 3:                                      | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |          |     |

**Table A.6.3.11.1-3: Cell specific test parameters for GERAN cell (cell #2) for RRC connection release with redirection from E-UTRAN TDD to GERAN in AWGN**

| Parameter                  | Unit | Cell 2    |       |
|----------------------------|------|-----------|-------|
|                            |      | T1        | T2    |
| Absolute RF Channel Number |      | ARFNC 1   |       |
| RXLEV                      | dBm  | -Infinity | -75   |
| GSM BSIC                   |      | N/A       | Valid |

### A.6.3.11.2 Test Requirements

The UE shall begin to send access bursts on RACH of the target GERAN cell (cell #2) less than 3020 ms from the beginning of time period T2.

The rate of correct “RRC connection release with redirection to GERAN” observed during repeated tests shall be at least 90%.

NOTE: The test requirement in this test case is expressed as:

$$T_{\text{connection\_release\_redirect\_GERAN}} = T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-GERAN}} + T_{\text{SI-GERAN}} + T_{\text{RA}}$$

$T_{\text{RRC\_procedure\_delay}} = 110$  ms, which is the time for processing the received message “*RRCConnectionRelease*”.

$T_{\text{identify-GERAN}} = 1000$  ms, which is the time for identifying the target GERAN cell.

$T_{\text{SI-GERAN}} = 1900$  ms, which is the maximum time allowed to read BCCH data from the target GERAN cell.

$T_{\text{RA}} = 10$  ms, which is about 2 GSM frames ( $2 \times 4.65$  ms) to account for the GSM timing uncertainty.

### A.6.3.12 E-UTRAN TDD RRC connection release redirection to UTRAN FDD without SI provided

#### A.6.3.12.1 Test Purpose and Environment

The purpose of this test is to verify that the UE performs the RRC connection release with redirection from the E-UTRAN TDD to the target UTRAN FDD cell within  $T_{\text{connection\_release\_redirect\_UTRAN FDD}}$ . This test will partly verify the RRC connection release with redirection to UTRAN FDD requirements in clause 6.3.2.1.

The test parameters are given in table A.6.3.12.1-1, table A.6.3.12.1-2, and table A.6.3.12.1-3. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. The “*RRCConnectionRelease*” message not containing any system information of Cell 2 shall be sent to the UE during period T1. The start of T2 is the instant when the last TTI containing the RRC message, “*RRCConnectionRelease*”, is received by the UE from Cell 1.

**Table A.6.3.12.1-1: General test parameters for E-UTRAN TDD RRC connection release redirection to UTRAN FDD without SI provided**

| Parameter                                          | Unit | Value                                    | Comment                                          |
|----------------------------------------------------|------|------------------------------------------|--------------------------------------------------|
| PDSCH parameters (E-UTRAN TDD)                     |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2.                |
| PCFICH/PDCCH/PHICH parameters (E-UTRAN TDD)        |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2.                |
| Active cell                                        |      | Cell 1                                   | Cell 1 is on E-UTRAN RF channel number 1.        |
| Neighbour cell                                     |      | Cell 2                                   | Cell 2 is on UTRAN RF channel number 1.          |
| E-UTRAN RF Channel Number                          |      | 1                                        | One E-UTRAN TDD carrier frequency is used.       |
| E-UTRAN Channel Bandwidth (BW <sub>channel</sub> ) | MHz  | 10                                       |                                                  |

| Note 1: The DPCH level is controlled by the power control loop.                                                  |              |        |      |
| Note 2: The power of the OCNS channel that is added shall make the total power from the cell to be equal to Ior. |              |        |      |
| Note 3: This gives an SCH Ec/Io of -15dB                                                                         |              |        |      |

### A.6.3.12.2 Test Requirements

The UE shall start to send random access to the target UTRAN FDD cell (Cell 2) less than 1930 ms from the beginning of time period T2.

The rate of correct RRC connection release redirection to UTRAN FDD observed during repeated tests shall be at least 90%.

NOTE: The time delay can be expressed as:  $T_{\text{RRC\_procedure\_delay}} + T_{\text{identify-UTRAN FDD}} + T_{\text{SI-UTRAN FDD}} + T_{\text{RA}}$ , where:

$T_{\text{RRC\_procedure\_delay}} = 110$  ms, which is specified in clause 6.3.2.1.

$T_{\text{identify-UTRAN FDD}} = 500$  ms; which is defined in clause 6.3.2.1.

$T_{\text{SI-UTRAN FDD}}$ : Maximum repetition period of relevant system info blocks that need to be received by the UE during RRC connection release redirection to UTRAN FDD cell. 1280 ms is assumed in this test case.

$T_{\text{RA}} = 40$ ms, this is the additional delay caused by the random access procedure.

This gives a total delay of 1930 ms.

## A.7 Timing and Signalling Characteristics

### A.7.1 UE Transmit Timing

#### A.7.1.1 E-UTRAN FDD – UE Transmit Timing Accuracy Tests

##### A.7.1.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.1.2.

For this test a single cell is used. Table A.7.1.1.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.1.1-2.

**Table A.7.1.1.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN FDD**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Unit         | Value    |                     |          |                      |

### A.7.1.1.2 Test Requirements

For parameters specified in Tables A.7.1.1.1-1 and A.7.1.1.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.1.2.

The following sequence of events shall be used to verify that the requirements are met.

For the 10MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Tests 2 and 4, respectively):

- After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- The test system adjusts the downlink transmit timing for the cell by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 4) compared to that in (a).
- The test system shall verify that for Test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.1.2 until the UE transmit timing offset is within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. Skip this step for Test 2 and Test 4.
- The test system shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. For test 2 and test 4 the UE transmit

timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

For the 1.4MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for non-DRX (Test 3):

- a) After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- b) The test system adjusts the downlink transmit timing for the cell by  $+128 \times T_S$  (approximately  $+4\mu s$ ) compared to that in (a).
- c) The test system shall verify that the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.1.2 until the UE transmit timing offset is within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- d) The test system shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.

## A.7.1.2 E-UTRAN TDD - UE Transmit Timing Accuracy Tests

### A.7.1.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.1.2.

For this test a single cell is used. Table A.7.1.2.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.2.1-2.

Table A.7.1.2.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN TDD

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Unit         | Value    |                     |          |                      |

### A.7.1.2.2 Test Requirements

For parameters specified in Tables A.7.1.2.1-1 and A.7.1.2.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.1.2.

The following sequence of events shall be used to verify that the requirements are met.

For the 10MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Tests 2 and 4, respectively):

- After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- The test system adjusts the downlink transmit timing for the cell by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 4) compared to that in (a).
- The test system shall verify that for test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.1.2 until the UE transmit timing offset is within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. Skip this step for test 2 and test 4.
- The test system shall verify that the UE transmit timing offset stays within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. For test 2 and test 4 the UE

transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

For the 1.4MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for non-DRX (Test 3):

- a) After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $(N_{TA} + 624) \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- b) The test system adjusts the downlink transmit timing for the cell by  $+128 \times T_S$  (approximately  $+4\mu s$ ) compared to that in (a).
- c) The test system shall verify that the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.1.2 until the UE transmit timing offset is within  $(N_{TA} + 624) \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- d) The test system shall verify that the UE transmit timing offset stays within  $(N_{TA} + 624) \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.

### A.7.1.3 E-UTRAN FDD – UE Transmit Timing Accuracy Tests for SCell

#### A.7.1.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.1.2.

For this test two cells are used. Cell 1 is PCell and Cell 2 is SCell. Both PCell and SCell are in the primary Timing Advance Group (pTAG). Table A.7.1.3.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.3.1-2.

Table A.7.1.3.1-1: General test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN FDD

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Unit       | Cell 1    |                     |                      | Cell 2    |                     |                      |

### A.7.1.3.2 Test Requirements

For parameters specified in Tables A.7.1.3.1-1, and A.7.1.3.1-2 the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.1.2.

The following sequence of events shall be used to verify that the requirements are met.

The test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test 1) and DRX with a cycle length of 80 ms or a cycle length of 640 mss (Test 2 and 3, respectively):

- After the SCell (Cell 2) is activated, the test system shall verify that the UE transmit timing offsets of both PCell and SCell are within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of PCell (Cell 1).
- The test system adjusts the downlink transmit timing for the PCell (Cell 1) by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 3) compared to that in (a).
- The test system shall verify that for Test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.1.2 until the UE transmit timing offsets of both PCell and SCell are within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of PCell (Cell 1). Skip this step for Test 2 and Test 3.

- d) The test system shall verify that the UE transmit timing offsets of both PCell and SCell stay within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of PCell (Cell 1). For test 2 and test 3 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

#### A.7.1.4 E-UTRAN TDD - UE Transmit Timing Accuracy Tests for SCell

##### A.7.1.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.1.2.

For this test two cells are used. Cell 1 is PCell and Cell 2 is SCell. Both PCell and SCell are in the primary Timing Advance Group (pTAG). Table A.7.1.4.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.4.1-2.

Table A.7.1.4.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN TDD

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Unit       | Cell 1   |                     |                      | Cell 2   |                     |                      |

### A.7.1.4.2 Test Requirements

For parameters specified in Tables A.7.1.4.1-1 and A.7.1.4.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.1.2.

The following sequence of events shall be used to verify that the requirements are met.

The test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test 1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Test 2 and 3, respectively):

- After the SCell (Cell 2) is activated, the test system shall verify that the UE transmit timing offsets of both PCell and SCell are within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of PCell (Cell 1).
- The test system adjusts the downlink transmit timing for the PCell (Cell 1) by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 3) compared to that in (a).
- The test system shall verify that for test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.1.2 until the UE transmit timing offsets of both PCell and SCell are within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of PCell (Cell 1). Skip this step for test 2 and test 3.

- d) The test system shall verify that the UE transmit timing offsets of both PCell and SCell stay within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of PCell (Cell 1). For test 2 and test 3 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

### A.7.1.4A E-UTRAN TDD - UE Transmit Timing Accuracy Tests for SCell for 20 MHz + 10 MHz

#### A.7.1.4A.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.7.1.4.1.

The parameters of this test are the same as defined in Subclause A.7.1.4.1 except that the values of the parameters in the Table A.7.1.4A.1-1 will replace the values of the corresponding parameters in A.7.1.4.1-1. Parameters used for the sounding reference symbol configuration and DRX configuration are unchanged from table A.7.1.4.1-2 and table A.7.1.4.1-3.

**Table A.7.1.4A.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN TDD for 20 MHz +10 MHz**

| Parameter                                                         | Unit       | Cell 1   |          |          | Cell 2   |          |          |
|-------------------------------------------------------------------|------------|----------|----------|----------|----------|----------|----------|
|                                                                   |            | Test 1   | Test 2   | Test 3   | Test 1   | Test 2   | Test 3   |
| Channel Bandwidth ( $BW_{channel}$ )                              | MHz        | 20       | 20       | 20       | 10       | 10       | 10       |

#### A.7.1.4A.2 Test Requirements

The test requirements defined in section A.7.1.4.2 shall apply to this test case.

### A.7.1.5 E-UTRAN FDD – UE Transmit Timing Accuracy Tests for 5MHz Bandwidth

#### A.7.1.5.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.7.1.1.1.

The parameters of this test are the same as defined in Subclause A.7.1.1.1 except that the values of the parameters in Test 1 in the Table A.7.1.5.1-1 will replace the values of the corresponding parameters in A.7.1.1.1-1. Only Test 1 is defined for the 5MHz bandwidth.

**Table A.7.1.5.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN FDD for 5MHz bandwidth**

| Parameter                                                                                                                                                                                                                                                      | Unit           | Value     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|-----------|
|                                                                                                                                                                                                                                                                |                | Test 1    |
| Channel Bandwidth ( $BW_{\text{channel}}$ )                                                                                                                                                                                                                    | MHz            | 5         |

| Note 1: For the reference measurement channels, see clause A.3.1.<br>Note 2: For the OCNG pattern, see clause A.3.2.<br>Note 3: See Table A.7.1.1.1-1 for the other parameters.<br>Note 4: This test is according to the principle defined in section A.3.7.2. |                |           |

### A.7.1.5.2 Test Requirements

The test requirements defined in section A.7.1.1.2 shall apply to this test case.

## A.7.1.6 E-UTRAN FDD – UE Transmit Timing Accuracy Tests for SCell in sTAG

### A.7.1.6.1 Test Purpose and Environment

The purpose of this test is to verify that the UE is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits for SCell in sTAG. This test will verify the requirements in clause 7.1.2.

For this test two cells are used. Cell 1 is PCell and Cell 2 is SCell. PCell is in the Primary Timing Advance Group (pTAG) and SCell is in the secondary Timing Advance Group (sTAG). Table A.7.1.6.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing for SCell in sTAG is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.6.1-2.

**Table A.7.1.6.1-1: General test Parameters for UE Transmit Timing Accuracy Tests for Scell in sTAG for E-UTRAN FDD**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Unit       | Cell 1   |                     | Cell 2   |                     |

### A.7.1.6.2 Test Requirements

For parameters specified in Tables A.7.1.6.1-1, and A.7.1.6.1-2 the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate for SCell in sTAG shall be within the limits defined in clause 7.1.2.

The following sequence of events shall be used to verify that the requirements are met.

For Test1 and Test2, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX and DRX with a cycle length of 80 ms:

- After the SCell (Cell 2) is activated, the test system shall verify that the UE transmit timing offsets for SCell in sTAG are within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell.
- The test system adjusts the downlink transmit timing for the activated SCell (Cell 2) by  $+64 \times T_S$  (approximately  $+2\mu s$ ) compared to that in (a).
- The test system shall verify that for Test 1 the adjustment step size and the adjustment rate for SCell in sTAG shall be according to the requirements in clause 7.1.2 until the UE transmit timing offsets of SCell within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell (Cell 2). Skip this step for Test 2.
- The test system shall verify that the UE transmit timing offsets of the SCell in sTAG stay within  $N_{TA} \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell (Cell 2).

## A.7.1.7 E-UTRAN TDD - UE Transmit Timing Accuracy Tests for SCell in sTAG

### A.7.1.7.1 Test Purpose and Environment

The purpose of this test is to verify that the UE is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits for SCell in sTAG. This test will verify the requirements in clause 7.1.2.

For this test two cells are used. Cell 1 is PCell and Cell 2 is SCell. PCell is in the Primary Timing Advance Group (pTAG) and SCell is in the secondary Timing Advance Group (sTAG). Table A.7.1.7.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing for SCell in sTAG is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.7.1-2.

**Table A.7.1.7.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for SCell in sTAG for E-UTRAN TDD**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Unit       | Cell 1   |                     | Cell 2   |                     |

### A.7.1.7.2 Test Requirements

For parameters specified in Tables A.7.1.7.1-1 and A.7.1.7.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate for SCell in sTAG shall be within the limits defined in clause 7.1.2.

The following sequence of events shall be used to verify that the requirements are met.

For Test 1 and Test 2, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX and DRX with a cycle length of 80 ms:

- After the SCell (Cell 2) is activated, the test system shall verify that the UE transmit timing offsets for SCell in sTAG are within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell (Cell 2).
- The test system adjusts the downlink transmit timing for the activated SCell (Cell 2) by  $+64 \times T_S$  (approximately  $+2\mu s$ ) compared to that in (a).
- The test system shall verify that for test 1 the adjustment step size and the adjustment rate for SCell in sTAG shall be according to the requirements in clause 7.1.2 until the UE transmit timing offsets of SCell are within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell (Cell 2). Skip this step for test 2.

- d) The test system shall verify that the UE transmit timing offsets of the SCell in sTAG stay within  $(N_{TA} + 624) \times T_S \pm 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell (Cell 2).

### A.7.1.7A E-UTRAN TDD - UE Transmit Timing Accuracy Tests for SCell in sTAG for 20MHz +20MHz

#### A.7.1.7A.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.7.1.7. The test parameters are the same except those described in the following section. The listed parameter values in Tables A.7.1.7B.1.1-1 will replace the values of corresponding parameters in Tables A.7.1.7.1-1.

**Table A.7.1.7A.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for SCell in sTAG for E-UTRAN TDD with 20MHz +20MHz bandwidth**

| Parameter                                                                                                           | Unit       | Cell 1   |          | Cell 2   |          |

#### A.7.1.7B.2 Test Requirements

The test requirements defined in section A.7.1.7.2 shall apply to these test cases.

## A.7.1.8 Void

### A.7.1.8.1 Void

**Table A.7.1.8.1-1: Void**

### A.7.1.8.2 Void

## A.7.1.9 Void

### A.7.1.9.1 Void

**Table A.7.1.9.1-1: Void**

### A.7.1.9.2 Void

## A.7.1.10 E-UTRAN FDD – UE Transmit Timing Accuracy Tests for Cat-M1 UE in CEModeA

### A.7.1.10.1 Test Purpose and Environment

The purpose of this test is to verify that the Cat-M1 UE in CEModeA is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.24.2.

For this test a single cell is used. Table A.7.1.10.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.10.1-2.

**Table A.7.1.10.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN FDD Cat-M1 UE under CEModeA**

### A.7.1.10.2 Test Requirements

For parameters specified in Tables A.7.1.10.1-1 and A.7.1.10.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.24.2.

The following sequence of events shall be used to verify that the requirements are met.

For the 10MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Tests 2 and 4, respectively):

- After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- The test system adjusts the downlink transmit timing for the cell by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 3) compared to that in (a).
- The test system shall verify that for Test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.24.2 until the UE transmit timing offset is within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. Skip this step for Test 2 and Test 3.
- The test system shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. For test 2 and test 3 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

### A.7.1.11 E-UTRAN HD-FDD – UE Transmit Timing Accuracy Tests for Cat-M1 UE in CEModeA

#### A.7.1.11.1 Test Purpose and Environment

The purpose of this test is to verify that the Cat-M1 UE in CEModeA is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.24.2.

For this test a single cell is used. Table A.7.1.11.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.11.1-2.

**Table A.7.1.11.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN HD-FDD Cat-M1 UE under CEModeA**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Unit         | Value                            |                     |                      |

### A.7.1.11.2 Test Requirements

For parameters specified in Tables A.7.1.11.1-1 and A.7.1.11.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.24.2.

The following sequence of events shall be used to verify that the requirements are met.

For the 10MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Tests 2 and 4, respectively):

- After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- The test system adjusts the downlink transmit timing for the cell by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 3) compared to that in (a).
- The test system shall verify that for Test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.24.2 until the UE transmit timing offset is within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. Skip this step for Test 2 and Test 3.
- The test system shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. For test 2 and test 3 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

## A.7.1.12 E-UTRAN TDD - UE Transmit Timing Accuracy Tests for Cat-M1 UE in CEModeA

### A.7.1.12.1 Test Purpose and Environment

The purpose of this test is to verify that the UE is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.24.2.

For this test a single cell is used. Table A.7.1.12.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.12.1-2.

**Table A.7.1.12.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN TDD Cat-M1 UE under CEModeA**

### A.7.1.12.2 Test Requirements

For parameters specified in Tables A.7.1.12.1-1 and A.7.1.12.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.24.2.

The following sequence of events shall be used to verify that the requirements are met.

For the 10MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Tests 2 and 4, respectively):

- After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $(N_{TA} + 624) \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- The test system adjusts the downlink transmit timing for the cell by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 3) compared to that in (a).
- The test system shall verify that for test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.24.2 until the UE transmit timing offset is within  $(N_{TA} + 624) \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. Skip this step for test 2 and test 3.
- The test system shall verify that the UE transmit timing offset stays within  $(N_{TA} + 624) \times T_S \pm 24 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. For test 2 and test 3 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

## A.7.1.13 3DL/3UL TDD CA UE Transmit Timing Accuracy Tests for 2 SCells

### A.7.1.13.1 Test Purpose and Environment

The purpose of this test is to verify that the UE is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits for SCell in sTAG. This test will verify the requirements in clause 7.1.2.

For this test three cells are used. Cell 1 is PCell, Cell 2 is SCell1 and Cell 3 is SCell2. PCell is in the Primary Timing Advance Group (pTAG) and SCell1 and SCell2 are in the secondary Timing Advance Group (sTAG). Table A.7.1.13.1-1 defines the strength of the transmitted signals and the propagation condition. The transmit timing for SCell1 and SCell2 in sTAG is verified by the UE transmitting SRS using the configuration defined in Table A.7.1.13.1-2.

**Table A.7.1.13.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for SCell1 and SCell2 in sTAG for 3DL/3UL TDD CAE-UTRAN TDD**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Unit        | Cell 1                        |                               | Cell 2                        |                               | Cell 3                        |                               |

### A.7.1.13.2 Test Requirements

For parameters specified in Tables A.7.1.13.1-1, 7.1.8.1-2 and A.7.1.13.1-3, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate for SCell1 and SCell2 in sTAG shall be within the limits defined in clause 7.1.2.

The following sequence of events shall be used to verify that the requirements are met.

For Test 1 and Test 2, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX and DRX with a cycle length of 80 ms:

- After the SCell1 (Cell 2) and SCell2 (Cell3) are activated, the test system shall verify that the UE transmit timing offsets for SCell1 and SCell2 in sTAG are within  $(N_{TA} + 624) \times T_{S \pm} 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell1 (Cell 2) or SCell2 (Cell3).
- The test system adjusts the downlink transmit timing for the activated SCell1 (Cell 2) and SCell2 (Cell3) by  $+64 \times T_S$  (approximately  $+2\mu s$ ) compared to that in (a).
- The test system shall verify that for test 1 the adjustment step size and the adjustment rate for SCell1 and SCell2 in sTAG shall be according to the requirements in clause 7.1.2 until the UE transmit timing offsets of SCell1 and SCell2 are within  $(N_{TA} + 624) \times T_{S \pm} 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell1 (Cell 2) or SCell2 (Cell3). Skip this step for test 2.
- The test system shall verify that the UE transmit timing offsets of the SCell1 and SCell2 in sTAG stay within  $(N_{TA} + 624) \times T_{S \pm} 12 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of the activated SCell1 (Cell 2) or SCell2 (Cell3).

## A.7.1.14 E-UTRAN FDD – UE Transmit Timing Accuracy Tests for Cat-M1 UE in CEModeB

### A.7.1.14.1 Test Purpose and Environment

The purpose of this test is to verify that the Cat-M1 UE in CEModeB is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.24.2.

As specified in Clause 7.24.2 the UE adjusts its uplink timing at the end of of repetition period when configured with repetitions. By measuring the reception of the PUSCH, the transmit timing accuracy can be measured and the requirements can be verified. For this test a single cell is used. Table A.7.1.14.1-1 defines the strength of the transmitted signals and the propagation condition.

**Table A.7.1.14.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN FDD Cat-M1 UE under CEModeB**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Unit         | Value     |                     |                      |

### A.7.1.14.2 Test Requirements

For parameters specified in Tables A.7.1.14.1-1 and A.7.1.14.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.24.2. The UE shall not adjust the the transmission timing autonomously during an ongoing repetition period. Adjustments can only be done at the end of a last subframe in a repetition period.

The following sequence of events shall be used to verify that the requirements are met.

For the 10MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Tests 2 and 3, respectively):

- After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- The test system adjusts the downlink transmit timing for the cell by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 3) compared to that in (a).
- The test system shall verify that for Test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.24.2 until the UE transmit timing offset is within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. Skip this step for Test 2 and Test 3.
- The test system shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. For test 2 and test 3 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

## A.7.1.15 E-UTRAN HD-FDD – UE Transmit Timing Accuracy Tests for Cat-M1 UE in CEModeB

### A.7.1.15.1 Test Purpose and Environment

The purpose of this test is to verify that the Cat-M1 UE in CEModeB is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.24.2.

As specified in Clause 7.24.2 the UE adjusts its uplink timing at the end of of repetition period when configured with repetitions. By measuring the reception of the PUSCH, the transmit timing accuracy can be measured and the requirements can be verified. For this test a single cell is used. Table A.7.1.15.1-1 defines the strength of the transmitted signals and the propagation condition.

**Table A.7.1.15.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN HD-FDD Cat-M1 UE under CEModeB**

| Parameter                                                                                                                                                     |        | Unit         | Value      |                     |                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|--------------|------------|---------------------|----------------------|
|                                                                                                                                                               |        |              | Test 1     | Test 2              | Test 3               |
| E-UTRA RF Channel Number                                                                                                                                      |        |              | 1          | 1                   | 1                    |
| Channel Bandwidth (BW <sub>channel</sub> )                                                                                                                    |        | MHz          | 10         | 10                  | 10                   |
| DRX cycle                                                                                                                                                     |        | ms           | N/A        | 80 <sup>Note5</sup> | 640 <sup>Note5</sup> |

### A.7.1.15.2 Test Requirements

For parameters specified in Tables A.7.1.15.1-1 and A.7.1.15.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.24.2. The UE shall not adjust the the transmission timing autonomously during an ongoing repetition period. Adjustments can only be done at the end of a last subframe in a repetition period.

The following sequence of events shall be used to verify that the requirements are met.

For the 10MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Tests 2 and 3, respectively):

- a) After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- b) The test system adjusts the downlink transmit timing for the cell by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 3) compared to that in (a).
- c) The test system shall verify that for Test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.24.2 until the UE transmit timing offset is within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. Skip this step for Test 2 and Test 3.
- d) The test system shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. For test 2 and test 3 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

### A.7.1.16 E-UTRAN TDD - UE Transmit Timing Accuracy Tests for Cat-M1 UE in CEModeB

#### A.7.1.16.1 Test Purpose and Environment

The purpose of this test is to verify that the Cat-M1 UE in CEModeB is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.24.2.

As specified in Clause 7.24.2 the UE adjusts its uplink timing at the end of of repetition period when configured with repetitions. By measuring the reception of the PUSCH, the transmit timing accuracy can be measured and the requirements can be verified. For this test a single cell is used. Table A.7.1.16.1-1 defines the strength of the transmitted signals and the propagation condition.

**Table A.7.1.16.1-1: Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN TDD Cat-M1 UE under CEModeB**

| Parameter                                                                                                                                                     |              | Unit       | Value     |                     |                      |

### A.7.1.16.2 Test Requirements

For parameters specified in Tables A.7.1.16.1-1 and A.7.1.16.1-2, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.24.2. The UE shall not adjust the the transmission timing autonomously during an ongoing repetition period. Adjustments can only be done at the end of a last subframe in a repetition period.

The following sequence of events shall be used to verify that the requirements are met.

For the 10MHz channel bandwidth, the test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 80 ms or a cycle length of 640 ms (Tests 2 and 3, respectively):

- a) After a connection is set up with the cell, the test system shall verify that the UE transmit timing offset is within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.
- b) The test system adjusts the downlink transmit timing for the cell by  $+64 \times T_S$  (for Test 1 and Test 2) or  $+32 \times T_S$  (for Test 3) compared to that in (a).
- c) The test system shall verify that for Test 1 the adjustment step size and the adjustment rate shall be according to the requirements in clause 7.24.2 until the UE transmit timing offset is within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. Skip this step for Test 2 and Test 3.
- d) The test system shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 48 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. For test 2 and test 3 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

### A.7.1.17 E-UTRAN HD-FDD – UE Transmit Timing Accuracy Tests for Category NB1 UE In-Band mode under normal coverage

#### A.7.1.17.1 Test Purpose and Environment

The purpose of this test is to verify that the Category NB1 UE under normal coverage is capable of following the frame timing change of the connected eNode B and that the UE initial transmit timing accuracy, maximum amount of timing change in one adjustment, minimum and maximum adjustment rate are within the specified limits. This test will verify the requirements in clause 7.20.

For this test a single NB-IoT cell and a single LTE cell are used. Test parameters are given in Table A.7.1.17.1-1, Table A.7.1.17.1-2, and Table A.7.1.17.1-3. The transmit timing is verified by the UE transmitting NPUSCH.

**Table A.7.1.17.1-1: General Test Parameters for UE Transmit Timing Accuracy Tests for E-UTRAN HD-FDD Category NB1 UE in In-Band mode under normal coverage**

| Parameter                                                            | Unit | Value                  |
|----------------------------------------------------------------------|------|------------------------|
|                                                                      |      | Test 1                 |
| NB-IoT Operation mode                                                |      | In-band                |
| DRX                                                                  |      | OFF                    |
| NPRACH configuration                                                 |      | As specified in A.3.18 |

### A.7.1.17.2 Test Requirements

For parameters specified in Tables A.7.1.17.1-1, A.7.1.17.1-2, and A.7.1.17.1-3, the initial transmit timing accuracy, the maximum amount of timing change in one adjustment, the minimum and the maximum adjustment rate shall be within the limits defined in clause 7.20.2.

The following sequence of events shall be used to verify that the requirements are met.

The test sequence shall be carried out in RRC\_CONNECTED:

- After a connection is set up with the cell, the test system sends NPDCCH including uplink grant for NPUSCH transmission and the test system shall measure the UE transmit timing offset ( $n \times T_s$ ) and verify that it is within  $T_e$  ( $n \times T_s \leq N_{TA} \times T_s \pm 80 \times T_s$ ) with respect to the first detected path (in time) of the corresponding downlink frame of NB-IoT cell 1.
- Using the value of  $n$  measured in a), the test system adjusts the downlink transmit timing for the cell:
  - if  $n < 0$ , by  $+(144 - |n|) \times T_s$  compared to that in (a).
  - if  $n \geq 0$ , by  $-(144 - |n|) \times T_s$  compared to that in (a).

The timing adjustment is performed monotonically in multiple steps of  $|\Delta T| \leq 9 \times T_s$  per NPDCCH period ( $\Delta T$  is to be defined in the test procedure) until the above required total timing change is achieved, during which no grant is transmitted for the UE.

- Immediately after (b), the test system sends NPDCCH including uplink grant for NPUSCH transmission and immediately after receiving NPUSCH the test system repeatedly sends NPDCCH including uplink grant for NPUSCH transmission until the UE transmit timing offset is within  $N_{TA} \times T_s \pm 80 \times T_s$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1. The test system shall verify that the difference in timing between the first NPUSCH transmission in step c) and the NPUSCH transmission in step a) shall be not greater than the maximum amount of the magnitude of the timing change in one adjustment requirement in clause 7.20.2. Using the first NPUSCH transmission in step c) and subsequent NPUSCH transmissions. The test system shall verify that the adjustment step size and the adjustment rate shall be

according to the requirements in clause 7.20.2 until the UE transmit timing offset is within  $N_{TA} \times T_S \pm 80 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of cell 1.

- d) The test system the test system sends NPDCCH including uplink grant for NPUSCH transmission and shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 80 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of NB-IoT cell 1.

### A.7.1.18 E-UTRAN HD-FDD – UE Transmit Timing Accuracy Tests for Category NB1 UE In-band mode under enhanced coverage

#### A.7.1.18.1 Test Purpose and Environment

The purpose of this test is to verify that the Category NB1 UE under enhanced coverage is capable of following the frame timing change of the connected eNode B, that the UE initial transmit timing accuracy is within the specified limits and that the UE shall not adjust the uplink transmission timing autonomously during an ongoing repetition period other than at initial transmission. This test will verify the requirements in clause 7.20.

For this test a single NB-IoT cell and a single LTE cell are used. Test parameters are given in Table A.7.1.18.1-1, Table A.7.1.18.1-2, Table A.7.1.18.1-3, and Table A.7.1.18.1-4. The transmit timing is verified by the UE transmitting NPUSCH.

### A.7.1.18.2 Test Requirements

For parameters specified in Tables A.7.1.18.1-1, Tables A.7.1.18.1-2, Tables A.7.1.18.1-3 and Tables A.7.1.18.1-4, the initial transmit timing accuracy shall be within the limits defined in clause 7.20.2 and the UE shall not adjust the uplink transmission timing autonomously during an ongoing repetition period other than at initial transmission.

The following sequence of events shall be used to verify that the requirements are met.

The test sequence shall be carried out in RRC\_CONNECTED for both non-DRX (for Test1) and DRX with a cycle length of 2048 ms (Tests 2):

- After a connection is set up with the cell, the test system sends NPDCCH including uplink grant for NPUSCH transmission and the test system shall measure the UE transmit timing offset ( $n \times T_s$ ) and verify that it is within  $T_e$  ( $n \times T_s \leq N_{TA} \times T_s \pm 80 \times T_s$ ) with respect to the first detected path (in time) of the corresponding downlink frame of NB-IoT cell 1.
- The test system sends NPDCCH including uplink grant for NPUSCH transmission. After 16ms from the initial NPUSCH transmission, the test system adjusts the downlink transmit timing for the cell, using the value of  $n$  measured in a),

- if  $n < 0$ , by  $+(144 - |n|) \times T_S$  compared to that in (a).
- if  $n \geq 0$ , by  $-(144 - |n|) \times T_S$  compared to that in (a).

The timing adjustment is performed monotonically in multiple steps of  $|\Delta T| \leq 9 \times T_S$  per NPDCCH period ( $\Delta T$  is to be defined in the test procedure) until the above required total timing change is achieved, during which no grant is transmitted for the UE.

- c) The test system shall verify that for Test 1 the UE shall not adjust the uplink transmission timing autonomously during an ongoing repetition period. Skip this step for Test 2.
- d) For test 2, the test system sends NPDCCH including uplink grant for NPUSCH transmission and shall verify that the UE transmit timing offset stays within  $N_{TA} \times T_S \pm 80 \times T_S$  with respect to the first detected path (in time) of the corresponding downlink frame of NB-IoT cell 1. The UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

## A.7.1.19 E-UTRAN FDD - UE Transmit Timing Accuracy Test for RACH-less Handover

### A.7.1.19.1 Test Purpose and Environment

This test is to verify the requirement for the UE initial transmit timing after RACH-less handover specified in clause 7.1.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.7.1.19.1-1 and A.7.1.19.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

A RRC message implying RACH-less handover with  $targetTa = ta0$  shall be sent to the UE during period T2, after the UE has reported Event A3, and the PUSCH transmission in the cell2 is configured in the RRC message from cell1. T3 is defined as the end of the last TTI containing the RRC message implying handover.

The transmit timing is verified by the PUSCH transmitted by the UE

**Table A.7.1.19.1-1: General test parameters for E-UTRAN FDD - UE Transmit Timing Accuracy Test for RACH-less Handover**

| Parameter                            |                   | Unit | Value                                    | Comment                                    |
|--------------------------------------|-------------------|------|------------------------------------------|--------------------------------------------|
| PDSCH parameters                     |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1           |
| PCFICH/PDCCH/PHICH parameters        |                   |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1           |
| Initial conditions                   | Active cell       |      | Cell 1                                   |                                            |
|                                      | Neighbouring cell |      | Cell 2                                   |                                            |
| Final condition                      | Active cell       |      | Cell 2                                   |                                            |
| E-UTRA RF Channel Number             |                   |      | 1                                        | Only one FDD carrier frequency is used.    |
| Channel Bandwidth ( $BW_{channel}$ ) |                   | MHz  | 10                                       |                                            |
| A3-Offset                            |                   | dB   | 0                                        |                                            |
| Hysteresis                           |                   | dB   | 0                                        |                                            |
| Time To Trigger                      |                   | s    | 0                                        |                                            |
