### A.3.1.6.6 Void

## A.3.2 OFDMA Channel Noise Generator (OCNG)

### A.3.2.1 OCNG Patterns for FDD

The following OCNG patterns are used for modelling allocations to virtual UEs (which are not under test) and/or allocations used for MBSFN. The OCNG pattern for each sub frame specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case the OCNG is expressed by parameters OCNG\_RA and OCNG\_RB which together with a relative power level ( $\gamma$ ) specifies the PDSCH EPRE-to-RS EPRE ratios in OFDM symbols without and with reference symbols, respectively. The relative power, which is used for modelling boosting per virtual UE allocation, is expressed by:

$$\gamma_i = PDSCH_i\_RA / OCNG\_RA = PDSCH_i\_RB / OCNG\_RB,$$

where  $\gamma_i$  denotes the relative power level of the  $i$ :th virtual UE. The parameter settings of OCNG\_RA, OCNG\_RB, and the set of relative power levels  $\gamma$  are chosen such that when also taking allocations to the UE under test into account, as given by a PDSCH reference channel, a constant transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

Moreover the OCNG pattern is accompanied by a PCFICH/PDCCH/PHICH reference channel which specifies the control region. The number of PDCCH OFDM symbols in the non-MBSFN subframes is the same as specified in the RMC used in the test. The number of PDCCH OFDM symbols in the MBSFN subframe is the maximal allowed according to TS 36.213 [16]. For any aggregation and PHICH allocation, the PDCCH and any unused PHICH groups are padded with resource element groups with a power level given by PDCCH\_RA/RB and PHICH\_RA/RB as specified in the test case such that a total power spectral density in the control region that is constant on an OFDM symbol basis is targeted.

For subframes configured as PRS subframes the PDSCH allocation defined in the OCNG pattern does not apply.

For subframes configured as ABS subframes the PDSCH and PMCH allocation defined in the OCNG pattern does not apply.

The system information is scheduled in the allocations reserved for the OCNG patterns, in the subframes not configured for MBSFN. For this purpose the number of the RB-s allocated with PDSCH defined in the OCNG pattern can be reduced as necessary.

## A.3.2.1.1 OCNG FDD pattern 1: outer resource blocks allocation in 10 MHz

| 0-49                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | N/A                                      | N/A | N/A | Note 4   | N/A        | Note 2    |
| Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                               |                                          |     |     |          |            |           |
| Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH symbols shall not contain cell-specific Reference Signals. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter $\gamma_{PRB}$ is used to scale the power of PMCH.                           |                                          |     |     |          |            |           |
| Note 3: If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213. |                                          |     |     |          |            |           |
| Note 4: 0dB for 1 transmit antenna with CRS, +3dB for 2 transmit antennas with CRS                                                                                                                                                                                                                                                                                                                                                                                                                    |                                          |     |     |          |            |           |

| 0 – 5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | N/A                                      | N/A | N/A | Note 4   | N/A           | Note 2       |
| Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                               |                                          |     |     |          |               |              |
| Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH symbols shall not contain cell-specific Reference Signals. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter $\gamma_{PRB}$ is used to scale the power of PMCH.                           |                                          |     |     |          |               |              |
| Note 3: If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213. |                                          |     |     |          |               |              |
| Note 4: 0dB for 1 transmit antenna with CRS, +3dB for 2 transmit antennas with CRS                                                                                                                                                                                                                                                                                                                                                                                                                    |                                          |     |     |          |               |              |
| N/A: Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                          |     |     |          |               |              |

| 0 – 5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | N/A                                      | N/A | N/A  | Note 4       | N/A        | Note 2    |
| Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                               |                                          |     |      |              |            |           |
| Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter $\gamma_{PRB}$ is used to scale the power of PMCH.                                                                                           |                                          |     |      |              |            |           |
| Note 3: If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213. |                                          |     |      |              |            |           |
| Note 4: 0dB for 1 transmit antenna with CRS, +3dB for 2 transmit antennas with CRS                                                                                                                                                                                                                                                                                                                                                                                                                    |                                          |     |      |              |            |           |
| N/A: Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                          |     |      |              |            |           |

### A.3.2.1.5 OCNG FDD pattern 5: outer resource blocks allocation in 10 MHz (without MBSFN)

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0                                        | 5 | 4, 9 | 1 – 3, 6 – 8 |               |
| 0 – 49                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 0                                        | 0 | 0    | 0            | Note 2        |
| Note 1: The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes.                                                                                                                                                                                                                                                                                                                                                                               |                                          |   |      |              |               |
| Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                               |                                          |   |      |              |               |
| Note 3: If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213. |                                          |   |      |              |               |
| N/A: Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                          |   |      |              |               |

## A.3.2.1.7 OCNG FDD pattern 7: full bandwidth allocation in 1.4 MHz (without MBSFN)

Table A.3.2.1.8-1: OP.7 FDD: OCNG FDD Pattern 7

| Allocation<br>$n_{PRB}$ | Relative power level $\gamma_{PRB}$ [dB]                                                                                                                                                                                                                                                                                                                                                                                                                                                      |   |      |              | PDSCH<br>Data |

| Note 1:                 | PDSCH allocation does not apply to subframes configured as PRS subframes.                                                                                                                                                                                                                                                                                                                                                                                                                            |     |     |                             |               |
| Note 2:                 | These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                      |     |     |                             |               |
| Note 3:                 | If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2.<br><br>The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213. |     |     |                             |               |
| Note 4:                 | The subframe(s) configured as MBSFN ABS in a test shall not contain any PMCH data and shall contain CRS only in the first symbol of the first time slot. The subframe(s) configured as MBSFN ABS depend upon the MBSFN ABS pattern used in the test.                                                                                                                                                                                                                                                 |     |     |                             |               |
| N/A:                    | Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |     |     |                             |               |

## A.3.2.1.9 OCNG FDD pattern 9: full bandwidth allocation in 10 MHz for MBSFN ABS

| Note 1:                 | PDSCH allocation applies only to subframes not configured as PRS subframes.                                                                                                                                                                                                                                                                                                                                                                                                                   |   |      |                             |            |
| Note 2:                 | These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                               |   |      |                             |            |
| Note 3:                 | If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213. |   |      |                             |            |
| Note 4:                 | The subframe(s) configured as MBSFN ABS in a test shall not contain any PMCH data and shall contain CRS only in the first symbol of the first time slot. The subframe(s) configured as MBSFN ABS depend upon the MBSFN ABS pattern used in the test.                                                                                                                                                                                                                                          |   |      |                             |            |
| N/A:                    | Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |   |      |                             |            |

## A.3.2.1.10 OCNG FDD pattern 10: outer resource blocks allocation in 10 MHz with user data in every subframe (without MBSFN)

Table A.3.2.1.10-1: OP.10 FDD: OCNG FDD Pattern 10

| Allocation<br>$n_{PRB}$ | Relative power level $\gamma_{PRB}$ [dB]                                                                                                                                                                                                                                                                                                                                                                                                                                                            |   |      |              | PDSCH Data |

| 0-99                    | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | N/A | N/A | Note 4   | N/A           | Note 2       |
| Note 1:                 | These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                     |     |     |          |               |              |
| Note 2:                 | Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH symbols shall not contain cell-specific Reference Signals. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter $\gamma_{PRB}$ is used to scale the power of PMCH.                                 |     |     |          |               |              |
| Note 3:                 | If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |     |     |          |               |              |
| Note 4:                 | 0dB for 1 transmit antenna with CRS, +3dB for 2 transmit antennas with CRS                                                                                                                                                                                                                                                                                                                                                                                                                          |     |     |          |               |              |
| N/A:                    | Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |     |     |          |               |              |

| 0 – 99                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | N/A                                      | N/A | N/A  | Note 4       | N/A           | Note 2       |
| Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                     |                                          |     |      |              |               |              |
| Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter $\gamma_{PRB}$ is used to scale the power of PMCH.                                                                                                 |                                          |     |      |              |               |              |
| Note 3: If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |                                          |     |      |              |               |              |
| Note 4: 0dB for 1 transmit antenna with CRS, +3dB for 2 transmit antennas with CRS                                                                                                                                                                                                                                                                                                                                                                                                                          |                                          |     |      |              |               |              |
| N/A: Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                          |     |      |              |               |              |

## A.3.2.1.13 OCNG FDD pattern 13: outer resource blocks allocation in 20 MHz (without MBSFN)

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0                                        | 5 | 4, 9 | 1 – 3, 6 – 8 |               |
| 0 – 99                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | 0                                        | 0 | 0    | 0            | Note 2        |
| Note 1: The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes.                                                                                                                                                                                                                                                                                                                                                                                     |                                          |   |      |              |               |
| Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                     |                                          |   |      |              |               |
| Note 3: If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |                                          |   |      |              |               |
| N/A: Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                          |   |      |              |               |

## A.3.2.1.15 OCNG FDD pattern 15: outer resource blocks allocation in 5 MHz

Table A.3.2.1.15-1: OP.15 FDD: OCNG FDD Pattern 15

| Allocation<br>$n_{PRB}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Relative power level $\gamma_{PRB}$ [dB] |     |     |          | PDSCH Data | PMCH Data |

| 0-24                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | N/A                                      | N/A | N/A | Note 4   | N/A        | Note 2    |
| Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                     |                                          |     |     |          |            |           |
| Note 2: Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH symbols shall not contain cell-specific Reference Signals. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot. The parameter $\gamma_{PRB}$ is used to scale the power of PMCH.                                 |                                          |     |     |          |            |           |
| Note 3: If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |                                          |     |     |          |            |           |
| Note 4: 0dB for 1 transmit antenna with CRS, +3dB for 2 transmit antennas with CRS                                                                                                                                                                                                                                                                                                                                                                                                                          |                                          |     |     |          |            |           |

| 0 – 24                  | N/A                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | N/A | N/A  | Note 4       | N/A           | Note 2       |
| Note 1:                 | These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                     |     |      |              |               |              |
| Note 2:                 | Each physical resource block (PRB) is assigned to MBSFN transmission. The data in each PRB shall be uncorrelated with data in other PRBs over the period of any measurement. The MBSFN data shall be QPSK modulated. PMCH subframes shall contain cell-specific Reference Signals only in the first symbol of the first time slot.<br><br>The parameter $\gamma_{PRB}$ is used to scale the power of PMCH.                                                                                          |     |      |              |               |              |
| Note 3:                 | If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |     |      |              |               |              |
| Note 4:                 | 0dB for 1 transmit antenna with CRS, +3dB for 2 transmit antennas with CRS                                                                                                                                                                                                                                                                                                                                                                                                                          |     |      |              |               |              |
| N/A: Not Applicable     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |     |      |              |               |              |

## A.3.2.1.17 OCNG FDD pattern 17: outer resource blocks allocation in 20 MHz with user data in every subframe (without MBSFN)

| Note 1:                 | The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes.                                                                                                                                                                                                                                                                                                                                                                                     |   |   |      |              |
| Note 2:                 | These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.                                                                                                                                                                                                                                                                       |   |   |      |              |
| Note 3:                 | The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |   |      |              |
|                         | If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |   |   |      |              |

| Note 1:                 | The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes.                                                                                                                                                                                                                                                                                                                                                                                     |   |      |              |            |
| Note 2:                 | These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated.                                                                                                                                                                                                                                                                       |   |      |              |            |
| Note 3:                 | The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                                                                                                                                                                                                                                                   |   |      |              |            |
|                         | If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213. |   |      |              |            |
| N/A:                    | Not Applicable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |   |      |              |            |

|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                            | Subframe                                 |   |      |              |            |
|                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                            | 0                                        | 5 | 4, 9 | 1 – 3, 6 – 8 |            |
| OP.22 FDD         | 5                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | 0 – 24 <sup>Note 1,2</sup> | 0                                        | 0 | 0    | 0            | Note 3     |
| Note 1:           | The OCNG pattern is used only for a serving cell of the UE under test.                                                                                                                                                                                                                                                                                                                                                                                                                        |                            |                                          |   |      |              |            |
| Note 2:           | The OCNG allocation applied to all downlink physical resource blocks (PRBs) except the REs that are allocated for the PDSCH for the UE under test.                                                                                                                                                                                                                                                                                                                                            |                            |                                          |   |      |              |            |
| Note 3:           | OCNG PRBs are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.                                                                                                                                                                                                                    |                            |                                          |   |      |              |            |
| Note 4:           | If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213. |                            |                                          |   |      |              |            |

### A.3.2.2 OCNG Patterns for TDD

The following OCNG patterns are used for modelling allocations to virtual UEs (which are not under test). The OCNG pattern for each sub frame specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case the OCNG is expressed by parameters OCNG\_RA and OCNG\_RB which together with a relative power level ( $\gamma$ ) specifies the PDSCH EPRE-to-RS EPRE ratios in OFDM symbols without and with reference symbols, respectively. The relative power, which is used for modelling boosting per virtual UE allocation, is expressed by:

$$\gamma_i = PDSCH_i\_RA / OCNG\_RA = PDSCH_i\_RB / OCNG\_RB,$$

where  $\gamma_i$  denotes the relative power level of the  $i$ :th virtual UE. The parameter settings of OCNG\_RA, OCNG\_RB, and the set of relative power levels  $\gamma$  are chosen such that when also taking allocations to the UE under test into account, as given by a PDSCH reference channel, a transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

Moreover the OCNG pattern is accompanied by a PCFICH/PDCCH/PHICH reference channel which specifies the control region. The number of PDCCH OFDM symbols in the non-MBSFN subframes is the same as specified in the RMC used in the test. The number of PDCCH OFDM symbols in the MBSFN subframe is the maximal allowed according to TS 36.213 [16]. For any aggregation and PHICH allocation, the PDCCH and any unused PHICH groups are padded with resource element groups with a power level given by PDCCH\_RA/RB and PHICH\_RA/RB as specified in the test case such that a total power spectral density in the control region that is constant on an OFDM symbol basis is targeted.

For subframes configured as PRS subframes the PDSCH allocation defined in the OCNG pattern does not apply.

For subframes configured as ABS subframes the PDSCH and PMCH allocation defined in the OCNG pattern does not apply.

The system information is scheduled in the allocations reserved for the OCNG patterns, in the subframes not configured for MBSFN. For this purpose the number of the RB-s allocated with PDSCH defined in the OCNG pattern can be reduced as necessary.

## A.3.2.2.1 OCNG TDD pattern 1: outer resource blocks allocation in 10 MHz

Table A.3.2.2.1-1: OP.1 TDD: OCNG TDD Pattern 1 for 5ms downlink-to-uplink switch-point periodicity

| Allocation<br>$n_{PRB}$ | Relative power level $\gamma_{PRB}$ [dB] |   |                                                                    |                                                        | PDSCH Data |
|-------------------------|------------------------------------------|---|--------------------------------------------------------------------|--------------------------------------------------------|------------|
|                         | Subframe (Note 1)                        |   |                                                                    |                                                        |            |
|                         | 0                                        | 5 | 3 , 4, 8, 9 and 6<br>(as normal subframe)<br><small>Note 3</small> | 1 and 6 (as special subframe)<br><small>Note 3</small> |            |
| 0 – 12                  | 0                                        | 0 | 0                                                                  | Table A.3.2.2.1-2                                      | Note 2     |
| 37 – 49                 | 0                                        | 0 | 0                                                                  |                                                        |            |

Note 1: The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes.

Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated The parameter  $\gamma_{PRB}$  is used to scale the power of PDSCH.

Note 3: Subframes available for DL transmission depends on the Uplink-Downlink configuration defined in Table 4.2-2 in TS 36.211 [16].

Note 4: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter  $\gamma_{PRB}$  applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.

| <p>Note 1: The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes.</p> <p>Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>Note 3: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in TS 36.211 [16].</p> <p>Note 4: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.</p> |   |   |   |   |        |

### A.3.2.2.3 OCNG TDD pattern 3: outer resource blocks allocation in 1.4 MHz

**Table A.3.2.2.3-1: OP.3 TDD: OCNG TDD Pattern 3 for 5 ms downlink-to-uplink switch-point periodicity**

| Allocation<br>$n_{PRB}$                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Relative power level $\gamma_{PRB}$ [dB] |   |                                                             |                                                    | PDSCH Data |

### A.3.2.2.5 OCNG TDD pattern 5: outer resource blocks allocation in 10 MHz for MBSFN ABS

**Table A.3.2.2.5-1: OP.5 TDD: OCNG TDD Pattern 5 for 5ms downlink-to-uplink switch-point periodicity**

| Allocation<br>$n_{PRB}$ | Relative power level $\gamma_{PRB}$ [dB] |   |                                                                    |                                                        | PDSCH Data |
|-------------------------|------------------------------------------|---|--------------------------------------------------------------------|--------------------------------------------------------|------------|
|                         | Subframe (Note 1)                        |   |                                                                    |                                                        |            |
|                         | 0                                        | 5 | 3 , 4, 8, 9 and 6<br>(as normal subframe)<br><small>Note 3</small> | 1 and 6 (as special subframe)<br><small>Note 3</small> |            |
| 0 – 12                  | 0                                        | 0 | 0                                                                  | Table A.3.2.2.1-2                                      | Note 2     |
| 37 – 49                 | 0                                        | 0 | 0                                                                  |                                                        |            |

Note 1: PDSCH allocation does not apply to subframes configured as PRS subframes.

Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated The parameter  $\gamma_{PRB}$  is used to scale the power of PDSCH.

Note 3: Subframes available for DL transmission depends on the Uplink-Downlink configuration defined in Table 4.2-2 in TS 36.211 [16]. Any of the subframes 3, 4, 8 and 9 configured as MBSFN ABS in a test shall not contain any PMCH data and shall contain CRS only in the first symbol of the first time slot. The subframe(s) configured as MBSFN ABS depend upon the MBSFN ABS pattern used in the test.

Note 4: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter  $\gamma_{PRB}$  applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.

**Table A.3.2.2.5-2: OP.5 TDD: OCNG TDD Pattern 5 for special subframe configuration with 5ms downlink-to-uplink switch-point periodicity**

| Allocation<br>$n_{PRB}$                                                               | Relative power level $\gamma_{PRB}$ [dB] |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|---------------------------------------------------------------------------------------|------------------------------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
|                                                                                       | Special subframe configuration           |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|                                                                                       | 0                                        |   | 1 |   | 2 |   | 3 |   | 4 |   | 5 |   | 6 |   | 7 |   | 8 |   |
|                                                                                       | Control region OFDM symbols              |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|                                                                                       | 1                                        | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 | 1 | 2 |
| 0 – 12                                                                                | 0                                        |   | 0 |   | 0 |   | 0 |   | 0 |   | 0 |   | 0 |   | 0 |   | 0 | 0 |
| 37 – 49                                                                               | 0                                        |   | 0 |   | 0 |   | 0 |   | 0 |   | 0 |   | 0 |   | 0 |   | 0 | 0 |
| Note 1: Special subframe configurations are defined in Table 4.2-1 in TS 36.211 [16]. |                                          |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

**A.3.2.2.6 OCNG TDD pattern 6: full bandwidth allocation in 10 MHz for MBSFN ABS****Table A.3.2.2.6-1: OP.6 TDD: OCNG TDD Pattern 6 for 5ms downlink-to-uplink switch-point periodicity**

| Allocation<br>$n_{PRB}$ | Relative power level $\gamma_{PRB}$ [dB] |   |                                                          |                                         | PDSCH Data |
|-------------------------|------------------------------------------|---|----------------------------------------------------------|-----------------------------------------|------------|
|                         | Subframe (Note 1)                        |   |                                                          |                                         |            |
|                         | 0                                        | 5 | 3 , 4, 8, 9 and 6 (as normal subframe) <sup>Note 3</sup> | 1 and 6 (as special subframe)<br>Note 3 |            |
| 0 – 49                  | 0                                        | 0 | 0                                                        | 0                                       | Note 2     |

Note 1:

PDSCH allocation does not apply to subframes configured as PRS subframes.

Note 2:

These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter  $\gamma_{PRB}$  is used to scale the power of PDSCH.

Note 3:

Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in TS 36.211 [16]. Any of the subframes 3, 4, 8 and 9 configured as MBSFN ABS in a test shall not contain any PMCH data and shall contain CRS only in the first symbol of the first time slot. The subframe(s) configured as MBSFN ABS depend upon the MBSFN ABS pattern used in the test.

Note 4:

If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter  $\gamma_{PRB}$  applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.

## A.3.2.2.7 OCNG TDD pattern 7: outer resource blocks allocation in 20 MHz

Table A.3.2.2.7-1: OP.7 TDD: OCNG TDD Pattern 7 for 5ms downlink-to-uplink switch-point periodicity

| Allocation<br>$n_{PRB}$ | Relative power level $\gamma_{PRB}$ [dB] |   |                                                                    |                                                        | PDSCH Data |
|-------------------------|------------------------------------------|---|--------------------------------------------------------------------|--------------------------------------------------------|------------|
|                         | Subframe (Note 1)                        |   |                                                                    |                                                        |            |
|                         | 0                                        | 5 | 3 , 4, 8, 9 and 6<br>(as normal subframe)<br><small>Note 3</small> | 1 and 6 (as special subframe)<br><small>Note 3</small> |            |
| 0 – 37                  | 0                                        | 0 | 0                                                                  | Table A.3.2.1.7-2                                      | Note 2     |
| 62 – 99                 | 0                                        | 0 | 0                                                                  |                                                        |            |

Note 1: The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes.

Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated The parameter  $\gamma_{PRB}$  is used to scale the power of PDSCH.

Note 3: Subframes available for DL transmission depends on the Uplink-Downlink configuration defined in Table 4.2-2 in 3GPP TS 36.211 [16].

Note 4: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter  $\gamma_{PRB}$  applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.

|-------------------------|------------------------------------------|---|----------------------------------------------------------|-----------------------------------------|------------|
|                         | Subframe (Note 1)                        |   |                                                          |                                         |            |
|                         | 0                                        | 5 | 3 , 4, 8, 9 and 6 (as normal subframe) <sup>Note 3</sup> | 1 and 6 (as special subframe)<br>Note 3 |            |
| 0 – 99                  | 0                                        | 0 | 0                                                        | 0                                       | Note 2     |

Note 1: The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes

Note 2: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter  $\gamma_{PRB}$  is used to scale the power of PDSCH.

Note 3: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in 3GPP TS 36.211 [16].

Note 4: If two or more transmit antennas with CRS are used in the test, the OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter  $\gamma_{PRB}$  applies to each antenna port separately, so the transmit power is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in section 7.1 in 3GPP TS 36.213.

## A.3.2.2.9 OCNG TDD pattern 9: outer resource blocks allocation in 5 MHz

Table A.3.2.2.9-1: OP.9 TDD: OCNG TDD Pattern 9 for 5ms downlink-to-uplink switch-point periodicity

| Allocation<br>$n_{PRB}$ | Relative power level $\gamma_{PRB}$ [dB] |   |                                                                    |                                                        | PDSCH Data |

| <div>Note 1: The OCNG pattern is used only for a serving cell of the UE under test.</div> <div>Note 2: The OCNG allocation applied to all downlink physical resource bloacks (PRBs) except the REs that are allocated for the PDSCH for the UE under test.</div> <div>Note 3: OCNG PRBs are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated pseudo random data, which is QPSK modulated. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</div> <div>Note 4: If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.</div> <div>Note 5: Subframes available for DL transmission depends on the Uplink-Downlink configuration in Table 4.2-2 in TS 36.211 [16].</div> <div>Note 6: The allocation of any PDSCH with or without SIB1 applies only to the subframes not configured as PRS subframes.</div> |                 |                            |                                          |   |                                                             |                                                    |            |

## A.3.2.3 OCNG Patterns for Narrowband IoT

The following Narrowband OCNG patterns (NOCNG) are used for modelling allocations to UEs not under test in a Narrowband IoT cell. Depending on scenario, allocations may be for UEs of category NB1 only, or for UEs of category NB1 as well as of other categories. The former is applicable to guard-band and stand-alone deployments of Narrowband IoT, whereas the latter is applicable to in-band deployment. In order to allow different power levels for the LTE cell and the Narrowband IoT cell, a distinction is made between OCNG and NOCNG where the latter is used for category NB1 UEs and the former is used for other UE categories.

OCNG in the LTE cell is expressed by parameters OCNG\_RA and OCNG\_RB which together with a relative power level ( $\gamma$ ) specifies the PDSCH-to-RS EPRE ratio in OFDM symbols with and without LTE cell-specific reference symbols, respectively. The relative power, which is used for modelling boosting per virtual LTE UE allocation, is expressed by:

$$\gamma_i = PDSCH_i\_RA / OCNG\_RA = PDSCH_i\_RB / OCNG\_RB,$$

where  $\gamma_i$  denotes the relative power level of the  $i$ :th virtual LTE UE.

Moreover in each test case NOCNG is expressed by parameters NOCNG\_RA and NOCNG\_RB which together with a relative power level ( $\gamma$ ) specifies the <channel>-to-RS EPRE ratio in OFDM symbols with and without Narrowband reference symbols (NB-RS), respectively. The relative power, which is used for modelling boosting per virtual UE category NB1 allocation, is expressed by:

$$\gamma_k = \langle channel \rangle_k\_RA / NOCNG\_RA = \langle channel \rangle_k\_RB / NOCNG\_RB,$$

where  $\gamma_k$  denotes the relative power level of the  $k$ :th virtual NB-IoT UE, and channel may be either of NPDCCH and NPDSCH.

The parameter settings of OCNG\_RA, OCNG\_RB, NOCNG\_RA, NOCNG\_RB and the set of relative power levels  $\gamma$  are chosen such that when also taking allocations to the UE category NB1 under test into account, as given by a

NPDCCH and NPDSCH reference channels, a transmitted power spectral density that is constant on an OFDM symbol basis is targeted.

| 50                      | 0 (Note 3)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0 (Note 3) | 0        | N/A           | Note 2                          |
| Note 1:                 | These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated QPSK modulated pseudo random data. The parameter $\gamma_{PRB}$ is used to scale the power of PDSCH.<br>If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.                           |            |          |               |                                 |
| Note 2:                 | This physical resource block is assigned to a virtual UE for transmission of NPDCCH or NPDSCH; the data transmitted over the NOCNG NPDCCH or NPDSCH shall be uncorrelated QPSK modulated pseudo random data. The parameter $\gamma_{PRB}$ is used to scale the power of NPDCCH and NPDSCH.<br>If two transmit antennas with NBRS are used in the test, the NPDCCH and NPDSCH parts of NOCNG shall be transmitted to the virtual users by both transmit antennas with NBRS and according to the antenna transmission mode 2. The parameter $\gamma_{PRB}$ applies to each antenna port separately, so the transmit power of the NPDCCH and NPDSCH parts of NOCNG is equal between both the transmit antennas with NBRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213. |            |          |               |                                 |
| Note 3:                 | Value of $\gamma_{PRB}$ is applicable to PRBs not used for transmission of NPSS, NSSS and PBCH in anchor cell ( $n_{PRB} = 50$ ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |            |          |               |                                 |
| Note 4:                 | SI transmissions, and NPDCCH and NPDSCH for the UE under test, have precedence over OCNG and NOCNG.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |            |          |               |                                 |
| N/A:                    | Not Applicable                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |            |          |               |                                 |

| 0                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | 0 (Note 2) | 0 (Note 2) | 0 | Note 1 |
| <p>Note 1: This physical resource block is assigned to a virtual UE for transmission of NPDCCH or NPDSCH; the data transmitted over the NOCNG NPDCCH or NPDSCH shall be uncorrelated QPSK modulated pseudo random data. The parameter <math>\gamma_{PRB}</math> is used to scale the power of NPDCCH and NPDSCH.</p> <p>If two transmit antennas with NBRS are used in the test, the NPDCCH and NPDSCH parts of NOCNG shall be transmitted to the virtual users by both transmit antennas with NBRS and according to the antenna transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power of the NPDCCH and NPDSCH parts of NOCNG is equal between both the transmit antennas with NBRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.</p> <p>Note 2: Value of <math>\gamma_{PRB}</math> is applicable to PRBs not used for transmission of NPSS, NSSS and PBCH in anchor cell (<math>n_{PRB} = 0</math>).</p> <p>Note 3: SI transmissions, and NPDCCH and NPDSCH for the UE under test, have precedence over NOCNG.</p> |            |            |   |        |

A.3.2.3.4      Narrowband IoT OCNG FDD pattern 4: In-band NB-IoT in 5 MHz EUTRAN cell

| <p>Note 1: These physical resource blocks are assigned to an arbitrary number of virtual UEs with one PDSCH per virtual UE; the data transmitted over the OCNG PDSCHs shall be uncorrelated QPSK modulated pseudo random data. The parameter <math>\gamma_{PRB}</math> is used to scale the power of PDSCH.</p> <p>If two or more transmit antennas with CRS are used in the test, the PDSCH part of OCNG shall be transmitted to the virtual users by all the transmit antennas with CRS and according to the antenna transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power of the PDSCH part of OCNG is equal between all the transmit antennas with CRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.</p> <p>Note 2: This physical resource block is assigned to a virtual UE for transmission of NPDCCH or NPDSCH; the data transmitted over the NOCNG NPDCCH or NPDSCH shall be uncorrelated QPSK modulated pseudo random data. The parameter <math>\gamma_{PRB}</math> is used to scale the power of NPDCCH and NPDSCH.</p> <p>If two transmit antennas with NBRS are used in the test, the NPDCCH and NPDSCH parts of NOCNG shall be transmitted to the virtual users by both transmit antennas with NBRS and according to the antenna transmission mode 2. The parameter <math>\gamma_{PRB}</math> applies to each antenna port separately, so the transmit power of the NPDCCH and NPDSCH parts of NOCNG is equal between both the transmit antennas with NBRS used in the test. The antenna transmission modes are specified in clause 7.1 in TS 36.213.</p> <p>Note 3: Value of <math>\gamma_{PRB}</math> is applicable to PRBs not used for transmission of NPSS, NSSS and PBCH in anchor cell (<math>n_{PRB} = 25</math>).</p> <p>Note 4: SI transmissions, and NPDCCH and NPDSCH for the UE under test, have precedence over OCNG and NOCNG.</p> <p>N/A: Not Applicable</p> |            |            |   |        |        |

#### A.3.2.4 OCNG Patterns for V2X sidelink

The following V2X sidelink OCNG patterns (VOCNG) are used for modelling allocations to virtual V2X UEs (which are not under test). The OCNG pattern for each subframe specifies the allocations that shall be filled with OCNG, and furthermore, the relative power level of each such allocation.

In each test case VOCNG is expressed by parameters VOCNG\_RA and VOCNG\_RB which together with a relative power level ( $\gamma$ ) specifies the PSSCH EPRE-to-RS EPRE ratios in OFDM symbols without and with reference symbols, respectively. The relative power, which is used for modelling boosting per virtual V2X UE allocation, is expressed by:

$$\gamma_i = PSSCH_i\_RA / VOCNG\_RA = PSSCH_i\_RB / VOCNG\_RB,$$

where  $\gamma_i$  denotes the relative power level of the  $i$ :th virtual V2X UE. The parameter settings of VOCNG\_RA, VOCNG\_RB, and the set of relative power levels  $\gamma$  are chosen such that when also taking allocations to the UE under test into account, as given by a PSSCH reference channel.

Moreover the VOCNG pattern is accompanied by a PSCCH reference channel which specifies the control region. The number of PSCCH OFDM symbols in all subframes is the same as specified in the RMC used in the test.

#### A.3.2.4.1 V2X sidelink OCNG TDD pattern 1: outer resource blocks allocation in 10 MHz

**Table A.3.2.4.1-1: VOP.1 HD: OCNG TDD Pattern 1**

| Allocation<br>$n_{PRB}$                                                                                                                                                                                                                                                                                 | Relative power level $\gamma_{PRB}$ [dB] | PSCCH and PSSCH Data |

|                                            | OCNG_RB    | -3         | -Inf |
| NOTE: 2x2 antenna configuration is assumed |            |            |      |

## A.3.5 Impact of Reference Sensitivity Degradation with Carrier Aggregation on Test Cases

### A.3.5.1 Impact of Reference Sensitivity Degradation due to Insertion Loss

For a UE supporting inter-band carrier aggregation configuration with uplink in one E-UTRA band, if there is a relaxation of receiver sensitivity  $\Delta R_{IB,c} > 0$  dB as defined in TS 36.101 [5], 7.3.1-1A, there is no adjustment of test parameters in the tests specified in TS 36.133 when  $\Delta R_{IB,c} \leq 1$  dB.

## A.3.6 Carrier Aggregation Test Cases with Different Channel Bandwidth Combinations

### A.3.6.1 Introduction

In Annex A carrier aggregation test cases may be defined with different channel bandwidth combinations to verify the same RRM requirement.

If multiple carrier aggregation test cases with different channel bandwidth combinations are defined to verify the same RRM requirement that is channel bandwidth independent, then the UE needs to be tested only with one bandwidth combination out of the bandwidth combination sets supported by that UE.

## A.3.7 Test Cases with Different Channel Bandwidths

### A.3.7.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for single carrier operation.

### A.3.7.2 Principle of testing

Test cases defined for 5MHz channel bandwidth that reference this clause are applicable to UEs that support only Band 31.

## A.3.8 Antenna Configuration

Unless otherwise specified, E-UTRA FDD or E-UTRA TDD cells in all RRM Test cases in AWGN propagation condition are configured with Antenna Configuration 1x2.

### A.3.8.1 Antenna connection for 4 Rx capable UEs

#### A.3.8.1.1 Introduction

All tests in sections A.4 to A.9 are specified for UEs supporting either category 0 (1RX) or 2RX. In this section, the antenna connection method for applying 2RX tests to UEs supporting 4RX antenna ports is specified. No tests are currently specified in section A.4-A.9 which are applicable only to 4RX antenna ports, so 4RX capable UEs are always tested by reusing tests which were originally specified for 2RX UEs.

#### A.3.8.1.2 Principle of testing

##### A.3.8.1.2.1 Single carrier tests

For 4RX capable UEs supporting at least one 2RX band, the, all single carrier tests specified in section A.4 to A.8 shall be tested on any band where 2RX is supported with the antenna connection specified in A.3.8.1.2.3. For single carrier tests specified in section A.9, all tests shall be tested with the antenna connection specified in A.3.8.1.2.3 for bands where 2RX is supported, and the antenna connection specified in A.3.8.1.2.4 for bands where 4RX is supported.

For 4RX capable UEs which do not support any 2RX band, all tests specified in sections A.4 to A.9 shall be tested using the antenna connection specified in section A.3.8.1.2.4. For radio link monitoring tests, the SNR levels are modified according to table A.3.8.1.2.1-1 and table A.3.8.1.2.1-2.

**Table A.3.8.1.2.1-1 Modified parameters for RLM out of sync testing with 4 RX antenna connection**

| Test case         | SNR during T3 (dB) |        |        |        |
|-------------------|--------------------|--------|--------|--------|
|                   | Test 1             | Test 2 | Test 3 | Test 4 |
| A.7.3.1           | -17                | -17    | -15    | -15.7  |
| A.7.3.3           | -16.6              | -16.7  | -14.8  | -15.4  |

| <b>A.7.3.22 (cell 1)</b> | Note 1             | N/A    | Note 1             | N/A    |
| <b>A.7.3.24</b>          | -15.7              | N/A    | -10.8              | N/A    |
| <b>A.7.3.25</b>          | -15.7              | N/A    | -10.8              | N/A    |

Note 1: For 4Rx capable UEs without any 2Rx supported RF bands, this test can be skipped.

### A.3.8.1.2.2 Carrier aggregation and Dual connectivity tests

All carrier aggregation and dual connectivity tests are performed using the antenna connection in section A.3.8.1.2.3 for the PCell antenna connection if the PCell is on a band where 2RX is supported or the antenna connection in A.3.8.1.2.4 for the PCell antenna connection if the PCell is on a band where 4RX is supported.

All carrier aggregation and dual connectivity tests are performed using the antenna connection in section A.3.8.1.2.3 for the SCell or PSCell antenna connection if an SCell or PSCell is on band where 2RX is supported or the testing procedure in A.3.8.1.2.4 for the SCell or PSCell antenna connection if an SCell or PSCell is on a band where 4RX is supported.

For dual connectivity radio link monitoring tests with the PSCell on a band where 4RX is supported, the PSCell SNR levels are modified according to table A.3.8.1.2.2 -1 and table A.3.8.1.2.2 -2.

**Table A.3.8.1.2.1-1 Modified parameters for dual connectivity RLM out of sync testing with 4 RX antenna connection**

| Test case         | SNR during T3 (dB)                              |
|-------------------|-------------------------------------------------|
| A.7.3.38 (cell 2) | -15.7 (5MHz)<br>-15.7 (10MHz)<br>-16.3 (20 MHz) |
| A.7.3.39 (cell 2) | -15.7 (5MHz)<br>-15.7 (10MHz)<br>-16.3 (20 MHz) |
| A.7.3.40 (cell 2) | -15.4 (5MHz)<br>-15.4 (10MHz)<br>-16.1 (20MHz)  |

**Table A.3.8.1.2.1-1 Modified parameters for RLM out of sync testing with 4 RX antenna connection**

| Test case         | SNR during T3 (dB)                                | SNR during T4 (dB)                               |
|-------------------|---------------------------------------------------|--------------------------------------------------|
| A.7.3.41 (cell 2) | -15.7 (5 Mhz)<br>-17.0 (10 Mhz)<br>-17.0 (20 Mhz) | -10.8 (5MHz)<br>-12.2 (10MHz)<br>-12.2 (20 MHz)  |

#### A.3.8.1.2.3 Antenna connection for bands where 2RX is supported

For bands where 2RX is supported, it is left to the UE declaration and AP configuration to decide which 2 of the 4 Rx ports are connected with data source from system simulator. The remaining 2 Rx ports shall be connected with zero input. No test parameters or requirements are modified.

#### A.3.8.1.2.4 Antenna connection for bands where 4RX is supported

For bands where 4RX is supported, all 4 Rx are connected with data source from system simulator. The system simulator shall provide independent noise and fading (low correlation) for each antenna port. Except for the modifications to radio link monitoring thresholds described in sections A.3.8.1.2.1 and A.3.8.1.2.2, no test parameters or requirements are modified.

## A.3.9 Carrier Aggregation Test Cases with Different Duplex Modes

### A.3.9.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for carrier aggregation.

### A.3.9.2 Principle of testing

In Annex A carrier aggregation test cases may be defined for different duplex modes or combination of duplex modes (E-UTRA FDD, E-UTRA TDD and E-UTRA TDD-FDD) to verify the same RRM requirement.

If multiple carrier aggregation test cases are defined for different duplex modes (E-UTRA FDD or E-UTRA TDD) or for combination of duplex modes (E-UTRA TDD-FDD) to verify the same RRM requirement which is independent of the duplex mode and is identical for different duplex modes or combination of duplex modes, then from UE the performance point of view the test coverage can be considered fulfilled by executing only the corresponding test case(s) with one of the duplex modes supported by the UE.

## A.3.10 Carrier Aggregation Test Cases with Different CA Configurations

### A.3.10.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for carrier aggregation.

### A.3.10.2 Principle of testing

In Annex A carrier aggregation test cases may be defined for two CCs as well as for more than two CCs to verify the same RRM requirement.

If multiple carrier aggregation test cases are defined for two CCs as well as for more than two CCs to verify the same RRM requirement, then from the UE performance point of view the test coverage can be considered fulfilled by executing only the test cases with the maximum number of CCs supported by the UE.

*Editor's note:* whether it is sufficient to test for any one of the band combinations supported by the UE is FFS.

## A.3.11 Test Cases for Synchronous and Asynchronous Dual Connectivity

### A.3.11.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for dual connectivity (DC) operation in synchronous and asynchronous scenarios.

### A.3.11.2 Principle of Testing

In Annex A test cases may be defined in both synchronous DC and asynchronous DC scenarios to verify the same RRM requirement.

If test cases are defined in both synchronous and asynchronous DC scenarios to verify the same RRM requirement then the UE capable of both synchronous and asynchronous DC operations needs to be tested with one of the tests in either synchronous or asynchronous DC scenarios.

## A.3.12 Proximity-based Services

### A.3.12.1 Introduction

This clause also defines the principle and the reference configurations that are applicable to test cases verifying RRM core requirements for ProSe Direct Discovery and ProSe Direct Communication.

### A.3.12.2 Reference DRX configurations for ProSe tests

**Table A.3.12.2-1: Reference DRX Configurations**

| Parameter                                                    | Value    |
|--------------------------------------------------------------|----------|
| Reference configuration                                      | DRX_P1   |
| onDurationTimer                                              | psf1     |
| drx-InactivityTimer                                          | psf1     |
| drx-RetransmissionTimer                                      | psf1     |
| longDRX-CycleStartOffset                                     | sf320, 0 |
| shortDRX                                                     | Disabled |
| Note: For further information see clause 6.3.2 in TS 36.331. |          |

### A.3.12.3 Test Cases with Different Channel Bandwidths

#### A.3.12.3.1 Introduction

This clause defines a principle which is applicable to test cases verifying ProSe RRM requirements with different channel bandwidths.

#### A.3.12.3.2 Principle of testing

Some ProSe test cases are defined for different channel bandwidths to verify the same RRM requirement.

If test cases with different channel bandwidth are defined to verify the same RRM requirement then the UE is required to pass the test cases only with one of the channel bandwidths.

### A.3.12.4 Reference resource pool configurations for ProSe Direct Discovery

**Table A.3.12.4-1: ProSe Direct Discovery configuration for E-UTRA FDD (Configuration #1)**

| Information Element                              |                            |                                  |                      | Value                                                    |
|--------------------------------------------------|----------------------------|----------------------------------|----------------------|----------------------------------------------------------|
| <i>discRxPool</i>                                | <i>cp-Len</i>              |                                  |                      | Normal                                                   |
|                                                  | <i>discPeriod</i>          |                                  |                      | rf32                                                     |
|                                                  | <i>numRetx</i>             |                                  |                      | 0                                                        |
|                                                  | <i>numRepetition</i>       |                                  |                      | 1                                                        |
|                                                  | <i>tf-ResourceConfig</i>   | <i>prb-Num</i>                   |                      | 12                                                       |
|                                                  |                            | <i>prb-Start</i>                 |                      | 0                                                        |

|                                                      | RSRP                      | dBm/15kHz | -95                               |                                                              |

## A.3.13 Time Offset between Cells

### A.3.13.1 Introduction

In Annex A in some test cases a parameter called, ‘time offset between cells’ is used. The meaning of this parameter is defined in this clause.

### A.3.13.2 Definition

Unless explicitly stated otherwise, the time offset between cells for a pair of cells is defined as the difference between radio frame start timings of the pair of cells.

## A.3.14 Carrier Aggregation under operation with Frame Structure 3 Test Cases with Different Duplex Modes

### A.3.14.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for carrier aggregation with at least one Scell under operation with Frame Structure 3.

### A.3.14.2 Principle of testing

In Annex A, tests for carrier aggregation with at least one Scell under operation with frame structure 3 are specified with both an FDD and a TDD PCell to verify the same RRM requirement. If both types of tests are relevant to a UE considering supported CA bands, the test coverage can be considered fulfilled by executing either the tests with FDD PCell or the tests with TDD PCell and the UE is not required to pass both tests.

## A.3.15 Dual connectivity test cases with different combination of duplex mode

### A.3.15.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for dual connectivity (DC) operation with different combination of duplex modes.

### A.3.15.2 Principle of testing

If multiple dual connectivity test cases are defined for different combination of duplex modes (E-UTRA FDD-FDD, E-UTRA TDD-TDD and E-UTRA TDD-FDD) to verify the same RRM requirement which is independent of the combination of duplex modes and is identical for different combination of duplex modes, then from UE the performance point of view the test coverage can be considered fulfilled by executing only the corresponding test case(s) with one of the combination of duplex modes supported by the UE.

## A.3.16 Reference PRACH Configurations

**Table A.3.16-1: PRACH configuration parameters**

| Parameter                        | Value          |                 |                      | Comments                                                                 |
|----------------------------------|----------------|-----------------|----------------------|--------------------------------------------------------------------------|
| Reference configuration          | PRACH_2CE      | PRACH_3CE       | PRACH_4CE            |                                                                          |
| Rsrp-ThresholdsPRACH             | {-99} dBm      | {-107, -99} dBm | {-107, -99, -92} dBm | As defined in TS36.331                                                   |
| CE level 0:                      | Configured     | Configured      | Configured           | Up to 4 CE levels, each corresponding to a PRACH configuration           |

## A.3.17 Listen before talk model

### A.3.17.1 Introduction

In some RRM test cases for FS3, a listen before talk (LBT) model is specified. The intention of the LBT model is to emulate using test equipment the behaviour of an FS3 eNB which performs channel measurement to check that the channel is clear prior to performing downlink transmission.

### A.3.17.2 Definition

Prior to each DMTC window, the test equipment shall determine whether to transmit a discovery reference signal (DRS) during the DMTC window with probability  $P=0.75$ . In many cases the test requirement depends on the number of configured discovery signal occasions which are not available during the test, so the test equipment shall track how many DRS are not transmitted during the test period. If the test equipment determines that it shall transmit a DRS, then

the timing of the DRS transmission within the DMTC window is randomly selected from the set of possible DRS transmission signal timings, such that there is an equal probability of any valid DRS timing.

For non DRS downlink transmission bursts, if transmission occurred in the previous subframe, transmission is muted for a duration of one subframe. Additionally, if the start time of the candidate transmission burst is within 8 subframes of the start of the DMTC window, transmission is not performed. Otherwise

The length of the transmission burst in subframes is defined as N. The burst transmission format is determined according to the steps below:

1. Select N randomly from a given set of the number of subframes  $S_1=\{1,3,5,8\}$  with equal probability as the total length of burst transmission format.
2. A uniform random variable from 0 to 1 is generated. If the random variable is less than  $P=0.75$ , a burst of N fully occupied subframes is transmitted. Otherwise, the burst transmission is muted and the muting duration is the same as the number N of subframes for determined burst format.

### A.3.18 Reference NPRACH Configurations

Table A.3.18-1 defines the reference NB-IoT PRACH configurations for a NB-IoT RRM test case where the UE is required to transmit NPRACH during the testing procedure, but the testing purpose of the RRM test case does not include testing NPRACH performance.

**Table A.3.18-1: NPRACH.R-1: Reference NPRACH Configuration**

| Field                                                                                          | Value          |         |         | Comment                                                                                                 |

## A.3.19 Dual connectivity test cases with different bandwidth combinations

### A.3.19.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for dual connectivity (DC) operation with different bandwidth combinations.

### A.3.19.2 Principle of testing

If multiple dual connectivity test cases with different channel bandwidth combinations are defined to verify the same RRM requirement that is channel bandwidth independent, then the UE needs to be tested only with one bandwidth combination out of the bandwidth combination sets supported by that UE.

## A.3.20 Category M1 UE Test Cases

### A.3.20.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for Category M1 UE in both CEModeA and CEModeB.

### A.3.20.2 Principle of Cat-M1 UE Testing

In Annex A Cat-M1 UE test cases may be defined for both CEModeA and CEModeB to verify the same type of RRM requirement.

If test cases are defined in both CEModeA and CEModeB in order to verify the same type of RRM requirement then the UE capable of CEModeB needs to be tested for the corresponding test(s) defined in CEModeA and/or in CEModeB according to the applicability rules defined in Table A.3.20.2-1.

The UE which is not capable of CEModeB shall be tested for all CEModeA test cases defined in Annex A.

In test cases defined for CEModeB, test equipment shall transmit PBCH with 5 repetitions as specified in section 6.6.4 of TS 36.211 [16].

**Table A.3.20.2-1: Test case applicability rules for category M1 UE in CEModeA and CEModeB**

| Type of Test Cases                                                                                                                                                    | Coverage mode(s) Applicable for Testing |         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|---------|
|                                                                                                                                                                       | CEModeA                                 | CEModeB |

## A.3.21 V2V Sidelink Communication on Dedicated V2V Carrier

### A.3.21.1 Introduction

This clause also defines the principle and the reference configurations that are applicable to test cases verifying RRM core requirements for V2V sidelink communication on dedicated V2V carrier.

### A.3.21.2 Reference resource pool configurations for V2V Sidelink Communication

**Table A.3.21.2-1: Pre-configuration for V2V Sidelink Communication**

| Number of PSSCH HARQ retransmissions                                                                                                       |  |      | 0     |
| Binary Channel Bits (see Note 2)                                                                                                           |  | Bits | 648   |
| Note1: PSSCH transmissions are rate-matched for 10 DFT-OFDM symbols per subframe, and the last symbol shall be punctured as per TS 36.211. |  |      |       |
| Note 2: Binary channel bits calculated under assumption of 9 DFT-OFDM symbols per subframe.                                                |  |      |       |

## A.3.22 Category 1bis UE Test Cases

### A.3.22.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for Category 1bis UE.

### A.3.22.2 Principle of Category 1bis UE Testing

In Annex A, tests in table A.3.22.2-1 defined for Category  $\geq 1$  UE with 2 Rx antenna are applicable to Category 1bis UE with 1 Rx antenna. Unless otherwise specified, same test configurations are used except for propagation channel change to 1x1 or 2x1 according to number of Tx antennas. For RSRP and RSRQ measurement accuracy test, corresponding measurement accuracy requirement for Category 1bis UE is specified in the table. For band dependent RRM tests defined in section A.9, only subset of bands that are defined for Cat.1bis UE are applicable.

**Table A.3.22.2-1: Test cases applicable to category 1bis UE**

| Test category                                 | Test case | Test case name                                                                                                                        |
|-----------------------------------------------|-----------|---------------------------------------------------------------------------------------------------------------------------------------|
| Cell re-selection tests                       | A.4.2.20  | E-UTRAN FDD – FDD Intra frequency case for UE Category 1bis                                                                           |

## A.3.23 Category NB2 UE Test Cases

### A.3.23.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for Category NB2 UE in both normal and enhanced coverage.

### A.3.23.2 Principle of Category NB2 UE Testing

In Annex A, test cases in table A.3.23.2-1 defined for Category NB1 UE are applicable to Category NB2 UE.

**Table A.3.23.2-1: Test cases applicable to Category NB2 UE**

| Test category         | Section  | Test case                                                                                                                   |
|-----------------------|----------|-----------------------------------------------------------------------------------------------------------------------------|
| Cell re-selection     | A.4.2.18 | HD – FDD Intra frequency case for UE Category NB1 In-Band mode in normal coverage                                           |
|                       | A.4.2.19 | HD – FDD Intra frequency case for UE Category NB1 In-Band mode in enhanced coverage                                         |
| RRC re-establishment  | A.6.1.15 | HD-FDD Intra-frequency RRC Re-establishment for UE category NB1 in In-Band mode under enhancednormal coverage               |
|                       | A.6.1.16 | HD-FDD Inter-frequency RRC Re-establishment for UE category NB1 in In-Band mode under normalenhanced coverage               |
| Random access         | A.6.2.16 | HD-FDD Random Access Test for UE category NB1 in In-band Mode under Normal Coverage                                         |
|                       | A.6.2.17 | HD-FDD Contention Based Random Access Test for UE category NB1s in In-band Mode in Enhanced Coverage                        |
| UE transmit timing    | A.7.1.17 | E-UTRAN HD-FDD – UE Transmit Timing Accuracy Tests for Category NB1 UE In-Band mode under normal coverage                   |
|                       | A.7.1.18 | E-UTRAN HD-FDD – UE Transmit Timing Accuracy Tests for Category NB1 UE In-band mode under enhanced coverage                 |
| UE timing advance     | A7.2.9   | HD-FDD UE Timing Advance Adjustment Accuracy Test for UE Category NB1 in Standalone Mode under Enhance Coverage             |
| Radio link monitoring | A.7.3.60 | HD-FDD Radio Link Monitoring Test for Out-of-sync in DRX for UE category NB1 In-band mode in normal coverage                |
|                       | A.7.3.61 | HD-FDD Radio Link Monitoring Test for Out-of-sync in DRX for UE category NB1 In-band mode in enhanced coverage              |
|                       | A.7.3.62 | HD-FDD Radio Link Monitoring Test for In-sync with DRX for UE Category NB1 In-Band mode in Enhanced Coverage                |
|                       | A.7.3.63 | HD-FDD Radio Link Monitoring Test for In-sync with DRX for UE Category NB1 In-Band mode in Normal Coverage                  |
|                       | A.7.3.64 | HD-FDD Radio Link Monitoring Test for In-sync without DRX for UE Category NB1 In-Band mode in Normal Coverage               |
|                       | A.7.3.65 | HD-FDD Radio Link Monitoring Test for In-sync without DRX for UE Category NB1 In-Band mode in Enhanced Coverage             |
|                       | A.7.3.66 | HD-FDD Radio Link Monitoring Test for Out-of-sync without DRX for UE category NB1 in Standalone Mode in Normal Coverage     |
|                       | A.7.3.67 | HD-FDD Radio Link Monitoring Test for Out-of-sync without DRX for UE category NB1 in Guardband Mode under Enhanced Coverage |

## A.3.24 V2X sidelink communication

### A.3.24.1 Introduction

This clause also defines the principle and the reference configurations that are applicable to test cases verifying RRM core requirements for V2X sidelink communication.

### A.3.24.2 Reference resource pool configurations for V2X Sidelink Communication

**Table A.3.24.2-1: Pre-configuration for V2X Sidelink Communication (Configuration #1)**

## A.3.25 Category M2 UE Test Cases

### A.3.25.1 Introduction

This clause defines a principle which is applicable to test cases verifying RRM requirements for Category M2 UE in both CEModeA and CEModeB.

### A.3.25.2 Principle of Cat-M2 UE Testing

In Annex A Cat-M2 UE test cases may be defined for both CEModeA and CEModeB to verify the same type of RRM requirement.

If test cases are defined in both CEModeA and CEModeB in order to verify the same type of RRM requirement then the UE capable of CEModeB needs to be tested for the corresponding test(s) defined in CEModeA and/or in CEModeB according to the applicability rules defined in Table A.3.25.2-1.

The UE which is not capable of CEModeB shall be tested for all CEModeA test cases defined in Annex A.

**Table A.3.25.2-1: Test case applicability rules for category M2 UE in CEModeA and CEModeB**

| Type of Test Cases                                                                                                                                                    | Coverage mode(s) Applicable for Testing |         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|---------|
|                                                                                                                                                                       | CEModeA                                 | CEModeB |
| A.4 E-UTRAN RRC IDLE State: Intra-frequency Cell Re-Selection Tests for Category M1 UE                                                                                | X                                       | X       |

## A.4 E-UTRAN RRC\_IDLE state

### A.4.2 Cell Re-Selection

#### A.4.2.1 E-UTRAN FDD – FDD Intra frequency case

##### A.4.2.1.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency cell reselection requirements specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.4.2.1.1-1 and A.4.2.1.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

**Table A.4.2.1.1-1: General test parameters for FDD intra frequency cell reselection test case**

|                                            | Parameter       | Unit | Value    | Comment                                                                                                                                                                                                             |

| Propagation Condition                              |                                                                                                                                                                                                                | AWGN     |       |      |           |      |       |
| Note 1:                                            | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |          |       |      |           |      |       |
| Note 2:                                            | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |          |       |      |           |      |       |
| Note 3:                                            | RSRP levels have been derived from other parameters for information purposes. They are not setttable parameters themselves.                                                                                    |          |       |      |           |      |       |

### A.4.2.1.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluateFDD,intra}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{evaluateFDD,intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s, allow 8 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.2 E-UTRAN TDD – TDD Intra frequency case

### A.4.2.2.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency cell reselection requirements specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.4.2.2.1-1 and A.4.2.2.1-2. The test consists of three successive time periods, with time duration of T1, T2, and T3 respectively. Only cell 1 is already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.2.1-1: General test parameters for TDD intra frequency cell re-selection test case**

|                                             | Parameter       | Unit          | Value    | Comment                                                                                                                                                                                                             |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |       |      |           |      |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |       |      |           |      |       |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |       |      |           |      |       |

#### A.4.2.2.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI-EUTRA}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate, E-UTRAN\_intra}} + T_{\text{SI-EUTRA}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{evaluate,E-UTRAN\_intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s, allow 8 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.3 E-UTRAN FDD – FDD Inter frequency case

### A.4.2.3.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD inter-frequency cell reselection requirements specified in clause 4.2.2.4.

The test scenario comprises of 2 E-UTRA FDD cells on 2 different carriers as given in tables A.4.2.3.1-1 and A.4.2.3.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.3.1-1: General test parameters for FDD-FDD inter frequency cell re-selection test case**

| Parameter                  |                | Unit | Value    | Comment                                                                                                                                                                                                              |
|----------------------------|----------------|------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition          | Active cell    |      | Cell2    | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition           | Active cell    |      | Cell1    | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                            | Neighbour cell |      | Cell2    |                                                                                                                                                                                                                      |
| Final condition            | Active cell    |      | Cell2    | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| E-UTRA RF Channel Number   |                |      | 1, 2     | Two FDD carrier frequencies are used.                                                                                                                                                                                |
| Time offset between cells  |                |      | 3 ms     | Asynchronous cells                                                                                                                                                                                                   |
| PRACH configuration        |                |      | 4        | As specified in table 5.7.1-2 in TS 36.211                                                                                                                                                                           |
| Access Barring Information |                | -    | Not Sent | No additional delays in random access procedure.                                                                                                                                                                     |
| DRX cycle length           |                | s    | 1.28     | The value shall be used for all cells in the test.                                                                                                                                                                   |
| T1                         |                | s    | 15       | T1 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |
| T2                         |                | s    | >7       | During T2, cell 2 shall be powered off, and during the off time the physical cell identity shall be changed, The intention is to ensure that cell 2 has not been detected by the UE prior to the start of period T3. |
| T3                         |                | s    | 75       | T3 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |

| Propagation Condition                         |                                                                                                                                                                                                                | AWGN     |     |     |          |           |     |
| Note 1:                                       | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |          |     |     |          |           |     |
| Note 2:                                       | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |          |     |     |          |           |     |
| Note 3:                                       | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |          |     |     |          |           |     |

### A.4.2.3.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ ,

Where:

|                                       |                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| $T_{\text{higher\_priority\_search}}$ | See clause 4.2.2                                                                                                                                      |
| $T_{\text{evaluateFDD,inter}}$        | See Table 4.2.2.4-1 in clause 4.2.2.4                                                                                                                 |
| $T_{\text{SI}}$                       | Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case. |

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.4 E-UTRAN FDD – TDD Inter frequency case

### A.4.2.4.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-TDD inter-frequency cell reselection requirements specified in clause 4.2.2.4.

The test scenario comprises of 1 E-UTRA FDD cell and 1 E-UTRA TDD cell as given in tables A.4.2.4.1-1 and A.4.2.4.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.4.1-1: General test parameters for FDD-TDD inter frequency cell re-selection test case**

| Parameter                             |                | Unit | Value    | Comment                                                                                                                                                                                                              |
|---------------------------------------|----------------|------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition                     | Active cell    |      | Cell2    | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition                      | Active cell    |      | Cell1    | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                                       | Neighbour cell |      | Cell2    |                                                                                                                                                                                                                      |
| Final condition                       | Active cell    |      | Cell2    | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| Cell 1 E-UTRA RF Channel Number       |                |      | 1        | One FDD carrier frequency is used. And Cell 1 is on RF channel number 1.                                                                                                                                             |
| Cell 2 E-UTRA RF Channel Number       |                |      | 2        | One TDD carrier frequencies is used. And Cell 2 is on RF channel number 2.                                                                                                                                           |

They are not settable parameters themselves.                                                                                            |          |     |     |          |           |     |

#### A.4.2.4.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluate,E-UTRAN\_inter}} + T_{\text{SI-EUTRA}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluate,E-UTRAN\_inter}} + T_{\text{SI-EUTRA}}$ .

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.2.2

$T_{\text{evaluate,E-UTRAN\_inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.5 E-UTRAN TDD – FDD Inter frequency case

### A.4.2.5.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-FDD inter-frequency cell reselection requirements specified in clause 4.2.2.4.

The test scenario comprises of 1 E-UTRA TDD cell and 1 E-UTRA FDD cell as given in tables A.4.2.5.1-1 and A.4.2.5.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.5.1-1: General test parameters for TDD-FDD inter frequency cell re-selection test case**

| Parameter                             |                | Unit | Value    | Comment                                                                                                                                                                                                              |
|---------------------------------------|----------------|------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition                     | Active cell    |      | Cell2    | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition                      | Active cell    |      | Cell1    | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                                       | Neighbour cell |      | Cell2    |                                                                                                                                                                                                                      |
| Final condition                       | Active cell    |      | Cell2    | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| Cell 1 E-UTRA RF Channel Number       |                |      | 1        | One TDD carrier frequency is used. And Cell 1 is on RF channel number 1.                                                                                                                                             |
| Cell 2 E-UTRA RF Channel Number       |                |      | 2        | One FDD carrier frequencies is used. And Cell 2 is on RF channel number 2.                                                                                                                                           |
| Time offset between cells             |                |      | 3 ms     | Asynchronous cells                                                                                                                                                                                                   |

| Note 3:                                                                | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |          |     |     |          |           |     |

### A.4.2.5.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluate,E-UTRAN\_inter}} + T_{\text{SI-EUTRA}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluate,E-UTRAN\_inter}} + T_{\text{SI-EUTRA}}$ .

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.2.2

$T_{\text{evaluate,E-UTRAN\_inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.6 E-UTRAN TDD – TDD: Inter frequency case

### A.4.2.6.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD inter-frequency cell reselection requirements specified in clause 4.2.2.4.

The test scenario comprises of 2 E-UTRA TDD cells on 2 different carriers as given in tables A.4.2.6.1-1 and A.4.2.6.1-2. The test consists of three successive time periods, with time duration of T1, T2, and T2 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.6.1-1: General test parameters for TDD-TDD inter frequency cell reselection test case**

| Parameter                      |                | Unit | Value     | Comment                                                                                                                                                                                                              |
|--------------------------------|----------------|------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition              | Active cell    |      | Cell2     | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition               | Active cells   |      | Cell1     | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                                | Neighbour cell |      | Cell2     |                                                                                                                                                                                                                      |
| Final condition                | Active cell    |      | Cell2     | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| E-UTRA RF Channel Number       |                |      | 1, 2      | Two TDD carrier frequencies are used.                                                                                                                                                                                |
| Time offset between cells      |                |      | 3 $\mu$ s | Synchronous cells                                                                                                                                                                                                    |
| Access Barring Information     |                | -    | Not Sent  | No additional delays in random access procedure.                                                                                                                                                                     |
| Special subframe configuration |                |      | 6         | As specified in table 4.2-1 in TS 36.211                                                                                                                                                                             |
| Uplink-downlink configuration  |                |      | 1         | As specified in table 4.2-2 in TS 36.211                                                                                                                                                                             |
| PRACH configuration index      |                |      | 53        | As specified in table 5.7.1-3 in TS 36.211                                                                                                                                                                           |
| DRX cycle length               |                | s    | 1.28      | The value shall be used for all cells in the test.                                                                                                                                                                   |
| T1                             |                | s    | 15        | T1 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |
| T2                             |                | s    | >7        | During T2, cell 2 shall be powered off, and during the off time the physical cell identity shall be changed, The intention is to ensure that cell 2 has not been detected by the UE prior to the start of period T3. |
| T3                             |                | s    | 75        | T3 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |

**Table A.4.2.6.1-2: Cell specific test parameters for TDD-TDD inter-frequency cell reselection test case in AWGN**

| Parameter                                    | Unit                                                                                                                                                                                                                  | Cell 1   |     |     | Cell 2   |           |     |

| Propagation Condition                        |                                                                                                                                                                                                                       | AWGN     |     |     |          |           |     |
| Note 1:                                      | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |          |     |     |          |           |     |
| Note 2:                                      | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |          |     |     |          |           |     |
| Note 3:                                      | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |          |     |     |          |           |     |

### A.4.2.6.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as: T<sub>higher\_priority\_search</sub> + T<sub>evaluate,E-UTRAN\_inter</sub> + T<sub>SI-EUTRA</sub>, and to lower priority cell can be expressed as: T<sub>evaluate,E-UTRAN\_inter</sub> + T<sub>SI-EUTRA</sub>,

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.2.2

$T_{\text{evaluate,E-UTRAN\_inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.7 E-UTRAN FDD – FDD Inter frequency case in the existence of non-allowed CSG cell

### A.4.2.7.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD inter-frequency cell reselection requirements specified in clause 4.2.2.4 when there is the interference from non-allowed CSG cell and the layers have equal priority.

The test scenario comprises of 2 E-UTRA FDD cells on 2 different carriers and 1 non-allowed E-UTRA FDD CSG cell as given in tables A.4.2.7.1-1 and A.4.2.7.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Cell 1 is already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 3 is a non-allowed CSG cell. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.7.1-1: General test parameters for FDD-FDD inter frequency cell re-selection test case with non-allowed CSG cell**

| Parameter                  |             | Unit | Value    | Comment                                                                              |
|----------------------------|-------------|------|----------|--------------------------------------------------------------------------------------|
| Initial condition          | Active cell |      | Cell1    | UE shall be forced to cell 1 in the initialisation phase                             |
| Final condition            | Active cell |      | Cell2    | UE shall perform reselection to cell 2 during T2                                     |
| E-UTRA RF Channel Number   |             |      | 1, 2     | Two FDD carrier frequencies are used.                                                |
| Time offset between cells  |             |      | 3 ms     | Asynchronous cells                                                                   |
| PRACH configuration        |             |      | 4        | As specified in table 5.7.1-2 in TS 36.211                                           |
| Access Barring Information |             | -    | Not Sent | No additional delays in random access procedure.                                     |
| DRX cycle length           |             | s    | 1.28     | The value shall be used for all cells in the test.                                   |
| T1                         |             | s    | 15       | T1 need to be defined so that the non-allowed CSG cell is identified.                |
| T2                         |             | s    | 40       | T2 need to be defined so that cell re-selection reaction time is taken into account. |
| T3                         |             | s    | 15       | T3 need to be defined so that whether cell re-selection would not occur is insured.  |

**Table A.4.2.7.1-2: Cell specific test parameters for FDD-FDD inter frequency cell re-selection test case with non-allowed CSG cell**

| Parameter                                                                                                                                                                                                              | Unit       | Cell 1   |       |       | Cell 2    |     |     | Cell 3(Non-allowed CSG cell) |       |       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------|-------|-------|-----------|-----|-----|------------------------------|-------|-------|
|                                                                                                                                                                                                                        |            | T1       | T2    | T3    | T1        | T2  | T3  | T1                           | T2    | T3    |
| E-UTRA RF Channel Number                                                                                                                                                                                               |            | 1        |       |       | 2         |     |     | 1                            |       |       |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |       |       |           |     |     |                              |       |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |       |       |           |     |     |                              |       |       |
| Note 3: RSRP and RSRQ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                            |            |          |       |       |           |     |     |                              |       |       |

### A.4.2.7.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

The probability of reselection from Cell 2 to Cell 1 during T3 observed during testing shall be less than 10%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Inter}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell in the test case.

## A.4.2.8 E-UTRAN TDD – TDD Inter frequency case in the existence of non-allowed CSG cell

### A.4.2.8.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD inter-frequency cell reselection requirements specified in clause 4.2.2.4 when there is the interference from non-allowed CSG cell and the layers have equal priority.

The test scenario comprises of 2 E-UTRA TDD cells on 2 different carriers and 1 non-allowed E-UTRA TDD CSG cell as given in tables A.4.2.8.1-1 and A.4.2.8.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Cell 1 is already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 3 is a non-allowed CSG cell. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.8.1-1: General test parameters for TDD-TDD inter frequency cell re-selection test case with non-allowed CSG cell**

| Parameter                      |             | Unit | Value    | Comment                                                                              |
|--------------------------------|-------------|------|----------|--------------------------------------------------------------------------------------|
| Initial condition              | Active cell |      | Cell1    | UE shall be forced to cell 1 in the initialisation phase                             |
| Final condition                | Active cell |      | Cell2    | UE shall perform reselection to cell 2 during T2                                     |
| E-UTRA RF Channel Number       |             |      | 1, 2     | Two TDD carrier frequencies are used.                                                |
| Time offset between cells      |             | μs   | 3        | Synchronous cells                                                                    |
| Uplink-downlink configuration  |             |      | 1        | As specified in table 4.2-2 in TS 36.211                                             |
| Special subframe configuration |             |      | 6        | As specified in table 4.2-1 in TS 36.211                                             |
| PRACH configuration            |             |      | 53       | As specified in table 5.7.1-3 in TS 36.211                                           |
| Access Barring Information     |             | -    | Not Sent | No additional delays in random access procedure.                                     |
| DRX cycle length               |             | s    | 1.28     | The value shall be used for all cells in the test.                                   |
| T1                             |             | s    | 15       | T1 need to be defined so that the non-allowed CSG cell is identified.                |
| T2                             |             | s    | 40       | T2 need to be defined so that cell re-selection reaction time is taken into account. |
| T3                             |             | s    | 15       | T3 need to be defined so that whether cell re-selection would not occur is insured.  |

**Table A.4.2.8.1-2: Cell specific test parameters for TDD-TDD inter frequency cell re-selection test case with non-allowed CSG cell**

| Parameter                                    | Unit                                                                                                                                                                                                                  | Cell 1   |       |       | Cell 2    |     |     | Cell 3<br>(Non-allowed CSG cell) |       |       |

| Note 1:                                      | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |          |       |       |           |     |     |                                  |       |       |
| Note 2:                                      | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |          |       |       |           |     |     |                                  |       |       |
| Note 3:                                      | RSRP and RSRQ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                   |          |       |       |           |     |     |                                  |       |       |

### A.4.2.8.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

The probability of reselection from Cell 2 to Cell 1 during T3 observed during testing shall be less than 10%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Inter}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell in the test case.

## A.4.2.9 E-UTRAN FDD – FDD Intra frequency case for 5MHz bandwidth

### A.4.2.9.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.4.2.1.1.

The parameters of this test are the same as defined in Subclause A.4.2.1.1 except that the values of the parameters in the Table A.4.2.9.1-1 will replace the values of the corresponding parameters in A.4.2.1.1-1, and the values of the parameters in the Table A.4.2.9.1-2 will replace the values of the corresponding parameters in A.4.2.1.1-2.

**Table A.4.2.9.1-1: General test parameters for FDD intra frequency cell reselection test case for 5MHz bandwidth**

| Parameter                                                              | Unit | Value | Comment |
|------------------------------------------------------------------------|------|-------|---------|
| Channel Bandwidth ( $BW_{channel}$ )                                   | MHz  | 5     |         |
| Note 1: See Table A.4.2.1.1-1 for the other parameters.                |      |       |         |
| Note 2: This is according to the principle defined in section A.3.7.2. |      |       |         |

**Table A.4.2.9.1-2: Cell specific test parameters for FDD intra frequency cell reselection test case in AWGN for 5MHz**

### A.4.2.9.2 Test Requirements

The test requirements defined in section A.4.2.1.2 shall apply to this test case.

## A.4.2.10 E-UTRAN FDD – FDD reselection using an increased number of carriers

### A.4.2.10.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD inter-frequency cell reselection requirements for increased UE carrier monitoring specified in clause 4.2.2.4.

The test scenario comprises of indicating 8 E-UTRA FDD interfrequency cells on 8 different carriers in the neighbour list of cell 1 as given in tables A.4.2.10.1-1 and A.4.2.10.1-2. Each repetition of the test consists of five successive time periods, with time duration of T0, T1, T2, T3 and T4 respectively. In the initialisation phase and at the start of each repetition of T0, the test equipment provides signals for cell 1 (serving cell), and selects frequencies for cells 2, 3 and 4 which are chosen from the 8 interfrequency layers which are configured in the UE neighbour cell list as described in general and cell specific parameters. The neighbour lists of cells 2, 3 and 4 shall include the frequency of cell 1 in the normal performance group as well as the other frequencies configured to the UE in the test.

Cell 1, 2, 3 and 4 are identified by the UE during time phase T0. Cell 1, cell 2, cell 3 and cell 4 all belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2, 3 or 4. Cells 1, 2, 3 and 4 all have equal absolute priority.

**Table A.4.2.10.1-1: General test parameters for FDD-FDD inter frequency cell re-selection test case**

| Parameter                              |                | Unit | Value                                                                                                                                            | Comment                                                                                                                                                                                                                               |
|----------------------------------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T0                                     | Active cell    |      | Cell1                                                                                                                                            | T0 is repeated on each repetition of the test. In T0 the test equipment selects frequencies for cell 2, 3, 4 and then time is allowed for the UE to identify the neighbour cells. See cell specific parameters for detailed settings. |
| T1 start condition                     | Active cell    |      | Cell 1                                                                                                                                           |                                                                                                                                                                                                                                       |
| T1 end condition                       | Active cell    |      | Cell 2                                                                                                                                           | UE shall perform reselection to cell 2 during T1                                                                                                                                                                                      |
|                                        | Neighbour cell |      | Cell 1, cell 3, cell 4                                                                                                                           |                                                                                                                                                                                                                                       |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                 |            |                                                           |     |     |     |     |                                                                                  |     |     |     |     |                                                                                       |     |     |     |                                                                                       |     |     |     |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for to be fulfilled. |            |                                                           |     |     |     |     |                                                                                  |     |     |     |     |                                                                                       |     |     |     |                                                                                       |     |     |     |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                 |            |                                                           |     |     |     |     |                                                                                  |     |     |     |     |                                                                                       |     |     |     |                                                                                       |     |     |     |

### A.4.2.10.2 Test Requirements

The cell reselection delay is defined as the time from the beginning of a relevant time period, to the moment when the UE camps on the target cell, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the target cell.

The reselection delays shall meet the requirements in table A.4.2.10.2-1.

**Table A.4.2.10.2-1 : Reselection delay requirements**

| Time phase | Target cell                        | Requirement for reselection delay (seconds) |
|------------|------------------------------------|---------------------------------------------|
| T1         | Cell 2 (normal performance group)  | 20.5                                        |
| T2         | Cell 3 (reduced performance group) | 193.3                                       |
| T3         | Cell 4 (reduced performance group) | 193.3                                       |
| T4         | Cell 1 (normal performance group)  | 20.5                                        |

NOTE: The cell re-selection delay to a normal performance group cell can be expressed as:  $K_{\text{carrier,normal}} * T_{\text{evaluate,E-UTRAN\_Inter}} + T_{\text{SI}}$ , and to a reduced performance group cell can be expressed as:  $6 * K_{\text{carrier,reduced}} * T_{\text{evaluate,E-UTRAN\_Inter}} + T_{\text{SI}}$ .

This gives a total of 20.48 s for normal performance group reselection and 193.28 s for reduced performance group reselection, allow 20.5 s for normal performance group and 193.3 s for reduced performance group in the test case. At least 90% of reselections to the reduced performance group shall be within the required time, and at least 90% of reselections to the normal performance group shall be within the required time, with a successful reselection counted if it is within the required time regardless of the carrier frequencies involved.

### A.4.2.11 E-UTRAN TDD – TDD reselection using an increased number of carriers

#### A.4.2.11.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD inter-frequency cell reselection requirements for increased UE carrier monitoring specified in clause 4.2.2.4.

The test scenario comprises of indicating 8 E-UTRA TDD interfrequency cells on 8 different carriers in the neighbour list of cell 1 as given in tables A.4.2.11.1-1 and A.4.2.11.1-2. Each repetition of the test consists of five successive time periods, with time duration of T0, T1, T2, T3 and T4 respectively. In the initialisation phase and at the start of each repetition of T0, the test equipment provides signals for cell 1 (serving cell), and selects frequencies for cells 2, 3 and 4 which are chosen from the 8 interfrequency layers which are configured in the UE neighbour cell list as described in general and cell specific parameters. The neighbour lists of cells 2, 3 and 4 shall include the frequency of cell 1 in the normal performance group as well as the other frequencies configured to the UE in the test.

Cell 1, 2, 3 and 4 are identified by the UE during time phase T0. Cell 1, cell 2, cell 3 and cell 4 all belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2, 3 or 4. Cells 1, 2, 3 and 4 all have equal absolute priority.

**Table A.4.2.11.1-1: General test parameters for TDD-TDD inter frequency cell re-selection test case**

| Parameter                              |                | Unit | Value                                                                                                                                            | Comment                                                                                                                                                                                                                             |
|----------------------------------------|----------------|------|--------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T0                                     | Active cell    |      | Cell1                                                                                                                                            | T0 is repeated on each repetition of the test. In T0 the test equipment selects frequencies for cell 2,3,4 and then time is allowed for the UE to identify the neighbour cells. See cell specific parameters for detailed settings. |
| T1 start condition                     | Active cell    |      | Cell 1                                                                                                                                           |                                                                                                                                                                                                                                     |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                 |            |                                                           |     |     |     |     |                                                                                  |     |     |     |     |                                                                                       |     |     |     |                                                                                       |     |     |     |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for to be fulfilled. |            |                                                           |     |     |     |     |                                                                                  |     |     |     |     |                                                                                       |     |     |     |                                                                                       |     |     |     |
| Note 3: Es/I <sub>ot</sub> and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                     |            |                                                           |     |     |     |     |                                                                                  |     |     |     |     |                                                                                       |     |     |     |                                                                                       |     |     |     |

#### A.4.2.11.2 Test Requirements

The cell reselection delay is defined as the time from the beginning of a relevant time period, to the moment when the UE camps on the target cell, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the target cell.

The reselection delays shall meet the requirements in table A.4.2.11.2-1

**Table A.4.2.11.2-1 : Reselection delay requirements**

| Time phase | Target cell                        | Requirement for reselection delay (seconds) |
|------------|------------------------------------|---------------------------------------------|
| T1         | Cell 2 (normal performance group)  | 20.5                                        |
| T2         | Cell 3 (reduced performance group) | 193.3                                       |
| T3         | Cell 4 (reduced performance group) | 193.3                                       |
| T4         | Cell 1 (normal performance group)  | 20.5                                        |

NOTE: The cell re-selection delay to a normal performance group cell can be expressed as:  $K_{\text{carrier,normal}} * T_{\text{evaluate,E-UTRAN\_Inter}} + T_{\text{SI}}$ , and to a reduced performance group cell can be expressed as:  $6 * K_{\text{carrier,reduced}} * T_{\text{evaluate,E-UTRAN\_Inter}} + T_{\text{SI}}$ .

This gives a total of 20.48 s for normal performance group reselection and 193.28 s for reduced performance group reselection, allow 20.5 s for normal performance group and 193.3 s for reduced performance group in the test case. At least 90% of reselections to the reduced performance group shall be within the required time, and at least 90% of reselections to the normal performance group shall be within the required time, with a successful reselection counted if it is within the required time regardless of the carrier frequencies involved.

#### A.4.2.12 E-UTRAN FDD – FDD Intra frequency case for Cat-M1 UE in normal coverage

##### A.4.2.12.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency cell reselection requirements for category M1 UE in normal coverage specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.4.2.12.1-1 and A.4.2.12.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

**Table A.4.2.12.1-1: General test parameters for FDD intra frequency cell reselection test case for Cat-M1 UE in normal coverage**

|                            | Parameter       | Unit | Value     | Comment                                                                                                                                                                                                             |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |          |       |      |           |      |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |          |       |      |           |      |       |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |          |       |      |           |      |       |

### A.4.2.12.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI-EUTRA-M1-NC}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate,EUTRAN\_Intra}} + T_{\text{SI-EUTRA-M1-NC}}$ .

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{evaluate,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{SI-EUTRA-M1-NC}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s, allow 8 s for the cell re-selection delay to an already detected cell in the test case.

### A.4.2.13 E-UTRAN HD – FDD Intra frequency case for Cat-M1 UE in normal coverage

#### A.4.2.13.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency cell reselection requirements for Cat-M1 UE specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA carrier and 2 cells as given in tables A.4.2.13.1-1 and A.4.2.13.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |          |       |      |           |      |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |          |       |      |           |      |       |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |          |       |      |           |      |       |

### A.4.2.13.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect}, \text{EUTRAN\_Intra}} + T_{\text{SI-EUTRA-M1-NC}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate}, \text{EUTRAN\_Intra}} + T_{\text{SI-EUTRA-M1-NC}}$ .

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{evaluate,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{SI-EUTRA-M1-NC}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s, allow 8 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.14 E-UTRAN TDD – TDD Intra frequency case for Cat-M1 UE in normal coverage

### A.4.2.14.1 Test Purpose and Environment

This test is to verify the requirement for the TDD intra frequency cell reselection requirements for Cat-M1 UE specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.4.2.14.1-1 and A.4.2.14.1-2. The test consists of three successive time periods, with time duration of T1, T2, and T3 respectively. Only cell 1 is already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.14.1-1: General test parameters for TDD intra frequency cell re-selection test case for Cat-M1 UE**

| Parameter                      |                 | Unit | Value     | Comment                                                                                                                                                                                                             |
|--------------------------------|-----------------|------|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |          |       |      |           |      |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |          |       |      |           |      |       |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |          |       |      |           |      |       |

#### A.4.2.14.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect, E-UTRAN\_Intra}} + T_{\text{SI-EUTRA-M1-NC}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate, E-UTRAN\_intra}} + T_{\text{SI-EUTRA-M1-NC}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{evaluate,EUTRAN\_intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{SI-EUTRA-M1-NC}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s, allow 8 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.15 E-UTRAN FDD – FDD Intra frequency case for Cat-M1 UE in enhanced coverage

### A.4.2.15.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency cell reselection requirements for category M1 UE in enhanced coverage specified in clause 4.2.2.11.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.4.2.15.1-1 and A.4.2.15.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

**Table A.4.2.15.1-1: General test parameters for FDD intra frequency cell reselection test case for Cat-M1 UE in enhanced coverage**

| Timing offset to Cell 1                                                                                                                                                                                                       | ms         | -        |        |       | 3         |       |        |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |          |        |       |           |       |        |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |          |        |       |           |       |        |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |          |        |       |           |       |        |

### A.4.2.15.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 338 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 18 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate,EUTRAN\_Intra}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.11-1 in clause 4.2.2.11

$T_{\text{evaluate,EUTRAN\_Intra}}$  See Table 4.2.2.11-1 in clause 4.2.2.11

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 6400 ms is assumed in this test case.

This gives a total of 337.36 s, allow 338 s for the cell re-selection delay to a newly detectable cell and 17.36 s, allow 18 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.16 E-UTRAN HD – FDD Intra frequency case for Cat-M1 UE in enhanced coverage

### A.4.2.16.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency cell reselection requirements for Cat-M1 UE specified in clause 4.2.2.11.

The test scenario comprises of 1 E-UTRA carrier and 2 cells as given in tables A.4.2.16.1-1 and A.4.2.16.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |          |        |       |           |       |        |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |          |        |       |           |       |        |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |          |        |       |           |       |        |

### A.4.2.16.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 338 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 18 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate,EUTRAN\_Intra}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.11-1 in clause 4.2.2.11

$T_{\text{evaluate,EUTRAN\_Intra}}$  See Table 4.2.2.11-1 in clause 4.2.2.11

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 6400 ms is assumed in this test case.

This gives a total of 337.36 s, allow 338 s for the cell re-selection delay to a newly detectable cell and 17.36 s, allow 18 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.17 E-UTRAN TDD – TDD Intra frequency case for Cat-M1 UE in enhanced coverage

### A.4.2.17.1 Test Purpose and Environment

This test is to verify the requirement for the TDD intra frequency cell reselection requirements for Cat-M1 UE specified in clause 4.2.2.11.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.4.2.17.1-1 and A.4.2.17.1-2. The test consists of three successive time periods, with time duration of T1, T2, and T3 respectively. Only cell 1 is already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.17.1-1: General test parameters for TDD intra frequency cell re-selection test case for Cat-M1 UE**

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |          |        |       |           |       |        |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |          |        |       |           |       |        |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |          |        |       |           |       |        |

### A.4.2.17.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 338 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 18 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate,EUTRAN\_Intra}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.11-1 in clause 4.2.2.11

$T_{\text{evaluate,EUTRAN\_Intra}}$  See Table 4.2.2.11-1 in clause 4.2.2.11

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 6400 ms is assumed in this test case.

This gives a total of 337.36 s, allow 338 s for the cell re-selection delay to a newly detectable cell and 17.36 s, allow 18 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.18 HD – FDD Intra frequency case for UE Category NB1 In-Band mode in normal coverage

### A.4.2.18.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency cell reselection requirements for Cat-NB1 UE specified in clause 4.6.2.2.

The test scenario comprises of 1 E-UTRA carrier with two ecells of different cell ID and one NB-IoT carrier with 2 ncells of different physical cell ID, as given in tables A.4.2.18.1-1, A.4.2.18.1-2 and A.4.2.18.1-3. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only nCell1 is already identified by the UE prior to the start of the test, i.e. nCell 2 is not identified. nCell 1 and nCell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing nCell 2.

**Table A.4.2.18.1-1: General test parameters for HD-FDD intra frequency cell reselection test case for Cat-NB1 UE in normal coverage**

### A.4.2.18.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on nCell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on nCell 2.

The cell re-selection delay to a newly detectable cell shall be less than 59.32 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on nCell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on nCell 1.

The cell re-selection delay to an already detected cell shall be less than 14.82 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect, NB\_Intra\_NB-IoT-NC}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate, NB\_intra\_NB-IoT-NC}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect, NB\_Intra\_NB-IoT-NC}}$  See Table 4.6.2.2-1 in clause 4.6.2.2

$T_{\text{evaluate, NB\_intra\_NB-IoT-NC}}$  See Table 4.6.2.2-1 in clause 4.6.2.2

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 8.32 s is assumed in this test case.

This gives a total of 59.32 s, allow 60 s for the cell re-selection delay to a newly detectable cell and 14.82 s, allow 15s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.19 HD – FDD Intra frequency case for UE Category NB1 In-Band mode in enhanced coverage

### A.4.2.19.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency cell reselection requirements for Cat-NB1 UE specified in clause 4.6.2.4.

The test scenario comprises of 1 E-UTRA carrier and a total of 4 cells as given in tables A.4.2.19.1-1, A.4.2.19.1-2 and A.4.2.19.1-3. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only nCell1 is already identified by the UE prior to the start of the test, i.e. nCell 2 is not identified. nCell 1 and nCell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing nCell 2.

**Table A.4.2.19.1-1: General test parameters for HD-FDD intra frequency cell reselection test case for Cat-NB1 UE in enhanced coverage**

| Parameter                  |                 | Unit | Value                  | Comment                                                                                                                                                                                                             |
|----------------------------|-----------------|------|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### A.4.2.19.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on nCell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on nCell 2.

The cell re-selection delay to a newly detectable cell shall be less than 66.32 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on nCell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on nCell 1.

The cell re-selection delay to an already detected cell shall be less than 21.12 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect, NB\_Intra\_NB-IoT-EC}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate, NB\_intra\_NB-IoT-EC}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect, NB\_Intra\_NB-IoT-EC}}$  See Table 4.6.2.4-1 in clause 4.6.2.4

$T_{\text{evaluate, NB\_intra\_NB-IoT-EC}}$  See Table 4.6.2.4-1 in clause 4.6.2.4

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 8.32s is assumed in this test case.

This gives a total of 66.32 s, allow 67 s for the cell re-selection delay to a newly detectable cell and 21.12s, allow 22s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.20 E-UTRAN FDD – FDD Intra frequency case for UE Category 1bis

### A.4.2.20.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency cell reselection requirements for UE category 1bis specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.4.2.20.1-1 and A.4.2.20.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

### A.4.2.20.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluateFDD,intra}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{evaluateFDD,intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s, allow 8 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.21 E-UTRAN TDD – TDD Intra frequency case for UE Category 1bis

### A.4.2.21.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency cell reselection requirements for UE category 1bis specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.4.2.21.1-1 and A.4.2.21.1-2. The test consists of three successive time periods, with time duration of T1, T2, and T3 respectively. Only cell 1 is already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.21.1-1: General test parameters for TDD intra frequency cell re-selection test case**

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |          |       |      |           |      |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |          |       |      |           |      |       |
| Note 3: Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                 |            |          |       |      |           |      |       |

### A.4.2.21.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI-EUTRA}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate, E-UTRAN\_intra}} + T_{\text{SI-EUTRA}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{evaluate,E-UTRAN\_intra}}$  See Table 4.2.2.3-1 in clause 4.2.2.3

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s, allow 8 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.22 E-UTRAN FDD – FDD Intra frequency case for UE configured with highSpeedEnhancedMeasFlag

### A.4.2.22.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency cell reselection requirements for UE configured with *highSpeedEnhancedMeasFlag* specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.4.2.22.1-1 and A.4.2.22.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively.

*highSpeedEnhancedMeasFlag* is broadcasted to UE. Only Cell 1 is already identified by the UE prior to the start of the test, i.e., Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

**Table A.4.2.22.1-1: General test parameters for E-UTRAN FDD – FDD Intra frequency case for UE configured with highSpeedEnhancedMeasFlag**

| Note 1:                                            | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |                                                             |       |      |                                                             |      |       |
| Note 2:                                            | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |                                                             |       |      |                                                             |      |       |
| Note 3:                                            | Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                 |                                                             |       |      |                                                             |      |       |
| Note 4:                                            | The AWGN 1750Hz condition is a non fading propagation channel with one tap. Doppler shift is a constant 1750Hz.                                                                                                       |                                                             |       |      |                                                             |      |       |

#### A.4.2.22.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 15 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 6 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluateFDD,intra}} + T_{\text{SI}}$ ,

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-3 in clause 4.2.2.3

$T_{\text{evaluateFDD,intra}}$  See Table 4.2.2.3-3 in clause 4.2.2.3

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 14.08 s, allow 15 s for the cell re-selection delay to a newly detectable cell and 5.12 s, allow 6 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.23 E-UTRAN TDD – TDD Intra frequency case for UE configured with highSpeedEnhancedMeasFlag

### A.4.2.23.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency cell reselection requirements for UE configured with *highSpeedEnhancedMeasFlag* specified in clause 4.2.2.3.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.4.2.23.1-1 and A.4.2.23.1-2. The test consists of three successive time periods, with time duration of T1, T2, and T3 respectively.

*highSpeedEnhancedMeasFlag* is broadcasted to UE. Only cell 1 is already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.23.1-1: General test parameters for E-UTRAN TDD – TDD Intra frequency case for UE configured with highSpeedEnhancedMeasFlag**

| Parameter                      |                 | Unit | Value    | Comment                                                                                                                                                                                                             |
|--------------------------------|-----------------|------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition              | Active cell     |      | Cell1    |                                                                                                                                                                                                                     |

| Propagation Condition                              |                                                                                                                                                                                                                       | AWGN                                                        |       |      | AWGN 1750Hz <sup>Note4</sup>                                |      |       |
| Antenna Configuration                              |                                                                                                                                                                                                                       | 2x2                                                         |       |      | 2x2                                                         |      |       |
| Timing offset to Cell 1 Synchronous cells          | us                                                                                                                                                                                                                    | -                                                           |       |      | 3                                                           |      |       |
| Note 1:                                            | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |                                                             |       |      |                                                             |      |       |
| Note 2:                                            | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |                                                             |       |      |                                                             |      |       |
| Note 3:                                            | Es/Iot and RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                 |                                                             |       |      |                                                             |      |       |
| Note 4:                                            | The AWGN 1750Hz condition is a non fading propagation channel with one tap. Doppler shift is a constant 1750Hz.                                                                                                       |                                                             |       |      |                                                             |      |       |

### A.4.2.23.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 15 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay shall be less than 6 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Intra}} + T_{\text{SI-EUTRA}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate, E-UTRAN\_intra}} + T_{\text{SI-EUTRA}}$ .

Where:

$T_{\text{detect,EUTRAN\_Intra}}$  See Table 4.2.2.3-3 in clause 4.2.2.3

$T_{\text{evaluate,E-UTRAN\_intra}}$  See Table 4.2.2.3-3 in clause 4.2.2.3

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 14.08 s, allow 15 s for the cell re-selection delay to a newly detectable cell and 5.12 s, allow 6 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.24 HD – FDD Inter frequency case for UE Category NB1 In-Band mode in enhanced coverage

### A.4.2.24.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD inter frequency cell reselection requirements for Cat-NB1 UE specified in clause 4.6.2.6.

The test scenario comprises of 1 E-UTRA carrier and a total of 3 cells as given in tables A.4.2.24.1-1, A.4.2.24.1-2 and A.4.2.24.1-3. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only nCell1 is already identified by the UE prior to the start of the test, i.e. nCell 2 is not identified. nCell 1 and nCell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing nCell 2.

**Table A.4.2.24.1-1: General test parameters for HD-FDD inter frequency cell reselection test case for Cat-NB1 UE in enhanced coverage**

| Parameter                  |                 | Unit | Value          | Comment                                                                                                                                                                                                             |
|----------------------------|-----------------|------|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NB-IOT operational mode    |                 |      | In-band        |                                                                                                                                                                                                                     |

| Note 1: OCNG shall be used such that the eCell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                         |            |                                                                                 |    |    |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power $N_{oc}$ . |            |                                                                                 |    |    |

#### A.4.2.24.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on nCell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on nCell 2.

The cell re-selection delay to a newly detectable cell shall be less than 66.32 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on nCell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on nCell 1.

The cell re-selection delay to an already detected cell shall be less than 21.12 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,NB\_Inter\_EC}} + T_{\text{SI}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate, NB\_Inter\_EC}} + T_{\text{SI}}$ .

Where:

$T_{\text{detect,NB\_Inter\_EC}}$  See Table 4.6.2.6-1 in clause 4.6.2.6

$T_{\text{evaluate, NB\_Inter\_EC}}$  See Table 4.6.2.6-1 in clause 4.6.2.6

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 8.32 s is assumed in this test case.

This gives a total of 66.32 s, allow 67 s for the cell re-selection delay to a newly detectable cell and 21.12 s, allow 22 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.25 E-UTRAN FDD – FDD Inter frequency case for Cat-M1 UE in normal coverage

### A.4.2.25.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD inter frequency cell reselection requirements for category M1 UE in normal coverage specified in clause 4.7.2.1.3.

The test scenario comprises of 2 E-UTRA FDD cells on 2 different carriers as given in tables A.4.2.25.1-1 and A.4.2.25.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.25.1-1: General test parameters for FD-FDD inter frequency cell reselection test case for Cat-M1 UE in normal coverage**

|                            | Parameter      | Unit | Value     | Comment                                                                                                                                                                                                              |
|----------------------------|----------------|------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition          | Active cell    |      | Cell2     | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition           | Active cell    |      | Cell1     | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                            | Neighbour cell |      | Cell2     |                                                                                                                                                                                                                      |
| Final condition            | Active cell    |      | Cell2     | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| E-UTRA RF Channel Number   |                |      | 1, 2      | Two FDD carrier frequencies are used.                                                                                                                                                                                |
| PRACH configuration        |                |      | PRACH_2CE | See table in A.3.16                                                                                                                                                                                                  |
| Access Barring Information |                | -    | Not Sent  | No additional delays in random access procedure.                                                                                                                                                                     |
| DRX cycle length           |                | s    | 1.28      | The value shall be used for all cells in the test.                                                                                                                                                                   |
| T1                         |                | s    | 15        | T1 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |
| T2                         |                | s    | >7        | During T2, cell 2 shall be powered off, and during the off time the physical cell identity shall be changed, The intention is to ensure that cell 2 has not been detected by the UE prior to the start of period T3. |
| T3                         |                | s    | 75        | T3 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |

| Note 1:                            | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |          |     |     |          |           |     |
| Note 2:                            | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |          |     |     |          |           |     |
| Note 3:                            | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |          |     |     |          |           |     |

### A.4.2.25.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ ,

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.7.2.1.3

$T_{\text{evaluate, E-UTRAN\_Inter\_NC}}$  See Table 4.7.2.1.3-1 in clause 4.7.2.1.3

$T_{\text{SI-EUTRA-M1-NC}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.26 E-UTRAN HD – FDD Inter frequency case for Cat-M1 UE in normal coverage

### A.4.2.26.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD inter frequency cell reselection requirements for category M1 UE in normal coverage specified in clause 4.7.2.1.3.

The test scenario comprises of 2 E-UTRA FDD cells on 2 different carriers as given in tables A.4.2.26.1-1 and A.4.2.26.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.26.1-1: General test parameters for HD-FDD inter frequency cell reselection test case for Cat-M1 UE in normal coverage**

| Note 1:                            | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |          |     |     |          |           |     |
| Note 2:                            | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |          |     |     |          |           |     |
| Note 3:                            | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |          |     |     |          |           |     |

#### A.4.2.26.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ ,

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.7.2.1.3

$T_{\text{evaluate, E-UTRAN\_Inter\_NC}}$  See Table 4.7.2.1.3-1 in clause 4.7.2.1.3

$T_{\text{SI-EUTRA-M1-NC}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.27 E-UTRAN TDD – FDD Inter frequency case for Cat-M1 UE in normal coverage

### A.4.2.27.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD inter frequency cell reselection requirements for category M1 UE in normal coverage specified in clause 4.7.2.1.3.

The test scenario comprises of 2 E-UTRA TDD cells on 2 different carriers as given in tables A.4.2.27.1-1 and A.4.2.27.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.27.1-1: General test parameters for TDD-TDD inter frequency cell reselection test case for Cat-M1 UE in normal coverage**

|                                | Parameter      | Unit | Value     | Comment                                                                                                                                                                                                              |
|--------------------------------|----------------|------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition              | Active cell    |      | Cell2     | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition               | Active cell    |      | Cell1     | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                                | Neighbour cell |      | Cell2     |                                                                                                                                                                                                                      |
| Final condition                | Active cell    |      | Cell2     | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| E-UTRA RF Channel Number       |                |      | 1, 2      | Two FDD carrier frequencies are used.                                                                                                                                                                                |
| PRACH configuration            |                |      | PRACH 2CE | See table in A.3.16                                                                                                                                                                                                  |
| Access Barring Information     |                | -    | Not Sent  | No additional delays in random access procedure.                                                                                                                                                                     |
| Special subframe configuration |                |      | 6         | As specified in table 4.2-1 in TS 36.211                                                                                                                                                                             |
| Uplink-downlink configuration  |                |      | 1         | As specified in table 4.2-1 in TS 36.211                                                                                                                                                                             |
| DRX cycle length               |                | s    | 1.28      | The value shall be used for all cells in the test.                                                                                                                                                                   |
| T1                             |                | s    | 15        | T1 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |
| T2                             |                | s    | >7        | During T2, cell 2 shall be powered off, and during the off time the physical cell identity shall be changed, The intention is to ensure that cell 2 has not been detected by the UE prior to the start of period T3. |
| T3                             |                | s    | 75        | T3 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |

**Table A.4.2.27.1-2: Cell specific test parameters for TDD-TDD inter frequency cell reselection test case for Cat-M1 UE in normal coverage**

| Parameter                                     | Unit                                                                                                                                                                                                                  | Cell 1   |     |     | Cell 2   |           |     |

| Timing offset to Cell 1                       | μs                                                                                                                                                                                                                    | -        |     |     | 3        |           |     |
| Note 1:                                       | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |          |     |     |          |           |     |
| Note 2:                                       | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |          |     |     |          |           |     |
| Note 3:                                       | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |          |     |     |          |           |     |

#### A.4.2.27.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ ,

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.7.2.1.3

$T_{\text{evaluate, E-UTRAN\_Inter\_NC}}$  See Table 4.7.2.1.3-1 in clause 4.7.2.1.3

$T_{\text{SI-EUTRA-M1-NC}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.28 E-UTRAN FDD – FDD Inter frequency case for Cat-M1 UE in enhanced coverage

### A.4.2.28.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD inter frequency cell reselection requirements for category M1 UE in enhanced coverage specified in clause 4.7.2.2.3.

The test scenario comprises of 2 E-UTRA FDD cells on 2 different carriers as given in tables A.4.2.28.1-1 and A.4.2.28.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

**Table A.4.2.28.1-1: General test parameters for FD-FDD inter frequency cell reselection test case for Cat-M1 UE in enhanced coverage**

| Parameter                  |                 | Unit | Value     | Comment                                                                                                                                                                                                             |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |                                                             |      |      |                                                             |      |      |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |                                                             |      |      |                                                             |      |      |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |                                                             |      |      |                                                             |      |      |

### A.4.2.28.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 337 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 17 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Inter\_EC}} + T_{\text{SI-EUTRA-M1-EC}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate,EUTRAN\_Inter\_EC}} + T_{\text{SI-M1-EC}}$ .

Where:

$T_{\text{detect,EUTRAN\_Inter\_EC}}$  See Table 4.7.2.2.3-1 in clause 4.7.2.2.3

$T_{\text{evaluate,EUTRAN\_Inter\_EC}}$  See Table 4.7.2.2.3-1 in clause 4.7.2.2.3

$T_{SI-EUTRA-M1-EC}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 6400 ms is assumed in this test case.

This gives a total of 336.64 s, allow 337 s for the cell re-selection delay to a newly detectable cell and 16.64 s, allow 17 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.29 E-UTRAN HD – FDD Inter frequency case for Cat-M1 UE in enhanced coverage

### A.4.2.29.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD inter frequency cell reselection requirements for category M1 UE in enhanced coverage specified in clause 4.7.2.2.3.

The test scenario comprises of 2 E-UTRA FDD cells on 2 different carriers as given in tables A.4.2.29.1-1 and A.4.2.29.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

**Table A.4.2.29.1-1: General test parameters for HD-FDD inter frequency cell reselection test case for Cat-M1 UE in enhanced coverage**

| Parameter                  |                 | Unit | Value     | Comment                                                                                                                                                                                                             |

| Note 1:                            | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |                                                             |      |      |                                                             |      |      |
| Note 2:                            | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |                                                             |      |      |                                                             |      |      |
| Note 3:                            | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |                                                             |      |      |                                                             |      |      |

### A.4.2.29.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 337 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 17 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Inter\_EC}} + T_{\text{SI-EUTRA-M1-EC}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate,EUTRAN\_Inter\_EC}} + T_{\text{SI-M1\_EC}}$ .

Where:

$T_{\text{detect,EUTRAN\_Inter\_EC}}$  See Table 4.7.2.2.3-1 in clause 4.7.2.2.3

$T_{\text{evaluate,EUTRAN\_Inter\_EC}}$  See Table 4.7.2.2.3-1 in clause 4.7.2.2.3

$T_{SI-EUTRA-M1-EC}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 6400 ms is assumed in this test case.

This gives a total of 336.64 s, allow 337 s for the cell re-selection delay to a newly detectable cell and 16.64 s, allow 17 s for the cell re-selection delay to an already detected cell in the test case.

### A.4.2.30 E-UTRAN TDD Inter frequency case for Cat-M1 UE in enhanced coverage

#### A.4.2.30.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD inter frequency cell reselection requirements for category M1 UE in enhanced coverage specified in clause 4.7.2.2.3.

The test scenario comprises of 2 E-UTRA TDD cells on 2 different carriers as given in tables A.4.2.30.1-1 and A.4.2.30.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Only Cell 1 is already identified by the UE prior to the start of the test, i.e. Cell 2 is not identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2.

**Table A.4.2.30.1-1: General test parameters for TDD-TDD inter frequency cell reselection test case for Cat-M1 UE in enhanced coverage**

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |                                                             |      |      |                                                             |      |      |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |                                                             |      |      |                                                             |      |      |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |                                                             |      |      |                                                             |      |      |

### A.4.2.30.2 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 337 s.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 17 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as:  $T_{\text{detect,EUTRAN\_Inter\_EC}} + T_{\text{SI-EUTRA-M1-EC}}$ , and to an already detected cell can be expressed as:  $T_{\text{evaluate,EUTRAN\_Inter\_EC}} + T_{\text{SI-M1-EC}}$ .

Where:

$T_{\text{detect,EUTRAN\_Inter\_EC}}$  See Table 4.7.2.2.3-1 in clause 4.7.2.2.3

$T_{\text{evaluate,EUTRAN\_Inter\_EC}}$  See Table 4.7.2.2.3-1 in clause 4.7.2.2.3

$T_{SI-EUTRA-M1-EC}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 6400 ms is assumed in this test case.

This gives a total of 336.64 s, allow 337 s for the cell re-selection delay to a newly detectable cell and 16.64 s, allow 17 s for the cell re-selection delay to an already detected cell in the test case.

## A.4.2.31 E-UTRAN FDD – FDD Inter frequency case for UE Category 1bis

### A.4.2.31.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD inter-frequency cell reselection requirements for UE category 1bis specified in clause 4.2.2.4.

The test scenario comprises of 2 E-UTRA FDD cells on 2 different carriers as given in tables A.4.2.31.1-1 and A.4.2.31.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.31.1-1: General test parameters for FDD-FDD inter frequency cell re-selection test case for UE Category 1bis**

| Note 1:                                       | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |          |       |       |          |           |       |
| Note 2:                                       | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |          |       |       |          |           |       |
| Note 3:                                       | RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |          |       |       |          |           |       |

#### A.4.2.31.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluateFDD,inter}} + T_{\text{SI}}$ ,

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.2.2

$T_{\text{evaluateFDD,inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.32 E-UTRAN FDD – TDD Inter frequency case for UE Category 1bis

### A.4.2.32.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-TDD inter-frequency cell reselection requirements for UE Category 1bis specified in clause 4.2.2.4.

The test scenario comprises of 1 E-UTRA FDD cell and 1 E-UTRA TDD cell as given in tables A.4.2.32.1-1 and A.4.2.32.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.32.1-1: General test parameters for FDD-TDD inter frequency cell re-selection test case for UE Category 1bis**

| Parameter                             |                | Unit | Value    | Comment                                                                                                                                                                                                              |
|---------------------------------------|----------------|------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition                     | Active cell    |      | Cell2    | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition                      | Active cell    |      | Cell1    | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                                       | Neighbour cell |      | Cell2    |                                                                                                                                                                                                                      |
| Final condition                       | Active cell    |      | Cell2    | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| Cell 1 E-UTRA RF Channel Number       |                |      | 1        | One FDD carrier frequency is used. And Cell 1 is on RF channel number 1.                                                                                                                                             |
| Cell 2 E-UTRA RF Channel Number       |                |      | 2        | One TDD carrier frequencies is used. And Cell 2 is on RF channel number 2.                                                                                                                                           |

They are not settable parameters themselves.                                                                                            |          |       |       |          |           |       |

### A.4.2.32.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluate,E-UTRAN\_inter}} + T_{\text{SI-EUTRA}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluate,E-UTRAN\_inter}} + T_{\text{SI-EUTRA}}$ .

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.2.2

$T_{\text{evaluate,E-UTRAN\_inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.33 E-UTRAN TDD – FDD Inter frequency case for UE Category 1bis

### A.4.2.33.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-FDD inter-frequency cell reselection requirements for UE Category 1bis specified in clause 4.2.2.4.

The test scenario comprises of 1 E-UTRA TDD cell and 1 E-UTRA FDD cell as given in tables A.4.2.33.1-1 and A.4.2.33.1-2. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.33.1-1: General test parameters for TDD-FDD inter frequency cell re-selection test case for UE Category 1bis**

| Parameter                             | Unit           | Value    | Comment                                                                                                                                                                                                              |
|---------------------------------------|----------------|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition                     | Active cell    | Cell2    | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition                      | Active cell    | Cell1    | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                                       | Neighbour cell | Cell2    |                                                                                                                                                                                                                      |
| Final condition                       | Active cell    | Cell2    | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| Cell 1 E-UTRA RF Channel Number       |                | 1        | One TDD carrier frequency is used. And Cell 1 is on RF channel number 1.                                                                                                                                             |
| Cell 2 E-UTRA RF Channel Number       |                | 2        | One FDD carrier frequencies is used. And Cell 2 is on RF channel number 2.                                                                                                                                           |
| Time offset between cells             |                | 3 ms     | Asynchronous cells                                                                                                                                                                                                   |

They are not settable parameters themselves.                                                                                            |          |       |       |          |           |       |

### A.4.2.33.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluate,E-UTRAN\_inter}} + T_{\text{SI-EUTRA}}$ , and to lower priority cell can be expressed as:  $T_{\text{evaluate,E-UTRAN\_inter}} + T_{\text{SI-EUTRA}}$ .

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.2.2

$T_{\text{evaluate,E-UTRAN\_inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.2.34 E-UTRAN TDD – TDD: Inter frequency case for UE Category 1bis

### A.4.2.34.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD inter-frequency cell reselection requirements for UE Category 1bis specified in clause 4.2.2.4.

The test scenario comprises of 2 E-UTRA TDD cells on 2 different carriers as given in tables A.4.2.34.1-1 and A.4.2.34.1-2. The test consists of three successive time periods, with time duration of T1, T2, and T2 respectively. Both cell 1 and cell 2 are already identified by the UE prior to the start of the test. Cell 1 and cell 2 belong to different tracking areas and cell 2 is of higher priority than cell 1. Furthermore, UE has not registered with network for the tracking area containing cell 2.

**Table A.4.2.34.1-1: General test parameters for TDD-TDD inter frequency cell reselection test case for UE Category 1bis**

| Parameter                      |                | Unit | Value     | Comment                                                                                                                                                                                                              |
|--------------------------------|----------------|------|-----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition              | Active cell    |      | Cell2     | UE shall be forced to cell 2 in the initialisation phase, so that reselection to cell 1 occurs during the first T1 phase                                                                                             |
| T1 end condition               | Active cells   |      | Cell1     | UE shall perform reselection to cell 1 during T1                                                                                                                                                                     |
|                                | Neighbour cell |      | Cell2     |                                                                                                                                                                                                                      |
| Final condition                | Active cell    |      | Cell2     | UE shall perform reselection to cell 2 during T3                                                                                                                                                                     |
| E-UTRA RF Channel Number       |                |      | 1, 2      | Two TDD carrier frequencies are used.                                                                                                                                                                                |
| Time offset between cells      |                |      | 3 $\mu$ s | Synchronous cells                                                                                                                                                                                                    |
| Access Barring Information     |                | -    | Not Sent  | No additional delays in random access procedure.                                                                                                                                                                     |
| Special subframe configuration |                |      | 6         | As specified in table 4.2-1 in TS 36.211                                                                                                                                                                             |
| Uplink-downlink configuration  |                |      | 1         | As specified in table 4.2-2 in TS 36.211                                                                                                                                                                             |
| PRACH configuration index      |                |      | 53        | As specified in table 5.7.1-3 in TS 36.211                                                                                                                                                                           |
| DRX cycle length               |                | s    | 1.28      | The value shall be used for all cells in the test.                                                                                                                                                                   |
| T1                             |                | s    | 15        | T1 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |
| T2                             |                | s    | >7        | During T2, cell 2 shall be powered off, and during the off time the physical cell identity shall be changed, The intention is to ensure that cell 2 has not been detected by the UE prior to the start of period T3. |
| T3                             |                | s    | 75        | T3 need to be defined so that cell re-selection reaction time is taken into account.                                                                                                                                 |

**Table A.4.2.34.1-2: Cell specific test parameters for TDD-TDD inter-frequency cell reselection test case in AWGN for UE Category 1bis**

| Antenna Configuration                        |                                                                                                                                                                                                                | 1x1      |       |       | 1x1      |           |       |
| Note 1:                                      | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |          |       |       |          |           |       |
| Note 2:                                      | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |          |       |       |          |           |       |
| Note 3:                                      | RSRP levels have been derived from other parameters for information purposes. They are not setttable parameters themselves.                                                                                    |          |       |       |          |           |       |

#### A.4.2.34.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 2.

The cell re-selection delay to higher priority shall be less than 68 s.

The cell reselection delay to lower priority is defined as the time from the beginning of time period T1, to the moment when the UE camps on cell 1, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on cell 1.

The cell re-selection delay to lower priority shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{higher\_priority\_search} + T_{evaluate,E-UTRAN\_inter} + T_{SI-EUTRA}$ , and to lower priority cell can be expressed as:  $T_{evaluate,E-UTRAN\_inter} + T_{SI-EUTRA}$ .

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.2.2

$T_{\text{evaluate,E-UTRAN\_inter}}$  See Table 4.2.2.4-1 in clause 4.2.2.4

$T_{\text{SI-EUTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s for higher priority cell search and 7.68 s for lower priority cell search, allow 68 s for higher priority cell and 8 s for lower priority cell in the test case.

## A.4.3 E-UTRAN to UTRAN Cell Re-Selection

### A.4.3.1 E-UTRAN FDD – UTRAN FDD:

#### A.4.3.1.1 EUTRA FDD-UTRA FDD cell reselection: UTRA FDD is of higher priority

##### A.4.3.1.1.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRA FDD- UTRA FDD inter-RAT cell reselection requirements specified in clause 4.2.2.5 when the UTRA cell is of higher priority.

The test scenario comprises of one E-UTRA FDD and one UTRA FDD cells as given in tables A.4.3.1.1.1-1, A.4.3.1.1.1-2 and A.4.3.1.1.1-3. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. E-UTRA cell 1 is already identified by the UE prior to the start of the test. Cell 2 is of higher priority than cell 1.

**Table A.4.3.1.1.1-1: General test parameters for E-UTRA FDD- higher priority UTRA FDD inter RAT cell re-selection test case**

|                                   | Parameter      | Unit | Value    | Comment                                                                                                                                                                                                               |

| Note 1 : his refers to the value of Thresh <sub>x, low</sub> which is included in UTRA system information, and is a threshold for the E-UTRA target cell |              |               |        |        |

#### A.4.3.1.1.2 Test Requirements

The cell reselection delay to higher priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message on cell 2.

The cell re-selection delay to higher priority shall be less than 81 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluateUTRA\_FDD}} + T_{\text{SI-UTRA}}$

Where:

$T_{\text{higher\_priority\_search}}$  See clause 4.2.2; 60s is assumed in this test case

$T_{\text{evaluateUTRA-FDD}}$  See Table 4.2.2.5.1-1

$T_{\text{SI-UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 80.48 s for higher priority cell search, allow 81 s for higher priority cell reselection in the test case.

#### A.4.3.1.2 EUTRA FDD-UTRA FDD cell reselection: UTRA FDD is of lower priority

##### A.4.3.1.2.1 Test Purpose and Environment

This test is to verify the requirement for the EUTRA FDD- UTRA FDD inter-RAT cell reselection requirements specified in clause 4.2.2.5.1 when the UTRA cell is of lower priority.

The test scenario comprises of one UTRA FDD and one E-UTRA FDD cells as given in tables A.4.3.1.2.1-1, A.4.3.1.2.1-2 and A.4.3.1.2.1-3. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both E-UTRA cell 1 and UTRA cell 2 are already identified by the UE prior to the start of the test. Cell 2 is of lower priority than cell 1.

**Table A.4.3.1.2.1-1: General test parameters for EUTRA FDD- lower priority UTRA FDD inter RAT cell re-selection test case**

|                                   | Parameter      | Unit | Value    | Comment                                                                                |
|-----------------------------------|----------------|------|----------|----------------------------------------------------------------------------------------|
| Initial condition                 | Active cell    |      | Cell1    | E-UTRAN cell                                                                           |
| T1 end condition                  | Active cells   |      | Cell1    | UE shall perform reselection to cell 1 during T1 for subsequent iterations of the test |
|                                   | Neighbour cell |      | Cell2    |                                                                                        |
| T2 end condition                  | Active cell    |      | Cell2    | UE shall perform reselection to cell 2 during T2                                       |
|                                   | Neighbour cell |      | Cell1    |                                                                                        |
| E-UTRA PRACH configuration        |                |      | 4        | As specified in table 5.7.1-2 in TS 36.211                                             |
| E_UTRA Access Barring Information |                | -    | Not Sent | No additional delays in random access procedure.                                       |
| DRX cycle length                  |                | s    | 1.28     | The value shall be used for all cells in the test.                                     |
| T1                                |                | s    | 85       | T1 need to be defined so that cell re-selection reaction time is taken into account.   |
| T2                                |                | s    | 25       | T2 need to be defined so that cell re-selection reaction time is taken into account.   |

Table A.4.3.1.2.1-2: Cell specific test parameters for cell 1 (E-UTRA)

| Parameter                                                                                                                                                     | Unit       | Cell 1   |      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|----------|------|
|                                                                                                                                                               |            | T1       | T2   |
| E-UTRA RF Channel number                                                                                                                                      |            | 1        |      |
| BW <sub>channel</sub>                                                                                                                                         | MHz        | 10       |      |
| OCNG Patterns defined in A.3.2.1.2 (OP.2 FDD)                                                                                                                 |            | OP.2 FDD |      |

| Note 1 : This refers to the value of Thresh <sub>x, high</sub> which is included in UTRA system information, and is a threshold for the E-UTRA target cell |              |               |        |

#### A.4.3.1.2.2 Test Requirements

The cell reselection delay to lower priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message on cell 2.

The cell re-selection delay to lower priority shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluateUTRA\_FDD}} + T_{\text{SI-UTRA}}$

Where:

$T_{\text{evaluateUTRA-FDD}}$  See Table 4.2.2.5.1-1

$T_{\text{SI-UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s for lower priority cell reselection, allow 21 s.

#### A.4.3.1.3 EUTRA FDD-UTRA FDD cell reselection in fading propagation conditions: UTRA FDD is of lower priority

##### A.4.3.1.3.1 Test Purpose and Environment

This test is to verify the requirement for the EUTRA FDD- UTRA FDD inter-RAT cell reselection requirements specified in clause 4.2.2.5.1 when the UTRA cell is of lower priority, and to verify the robustness of the UE measurement filtering in a fading environment. The E-UTRA cell is in fading propagation conditions and the UTRA cell is in AWGN propagation conditions.

The test scenario comprises of one UTRA FDD and one E-UTRA FDD cells as given in tables A.4.3.1.3.1-1, A.4.3.1.3.1-2 and A.4.3.1.3.1-3. The test consists of four successive time periods, with time duration of T1 T2, T3 and T4 respectively. Both E-UTRA cell 1 and UTRA cell 2 are already identified by the UE prior to the start of the test. Cell 2 is of lower priority than cell 1.

**Table A.4.3.1.3.1-1: General test parameters for EUTRA FDD- lower priority UTRA FDD inter RAT cell re-selection test case**

|                                   | Parameter      | Unit | Value    | Comment                                                                                                                                              |

#### A.4.3.1.3.2 Test Requirements

The probability of reselection from cell 1 to cell 2 during T2 observed during testing shall be less than 10%

The probability of reselection from cell 2 to cell 1 during T4 observed during testing shall be less than 10%

The cell reselection delay to lower priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message on cell 2. In order to evaluate reselection delay, the system simulator first needs to verify that the UE is camped on cell 1 at the start of T3

The cell re-selection delay to lower priority shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluateUTRA\_FDD}} + T_{\text{SI-UTRA}}$

Where:

$T_{\text{evaluateUTRA-FDD}}$  See Table 4.2.2.5.1-1

$T_{\text{SI-UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s for lower priority cell reselection, allow 21 s.

#### A.4.3.1.4 EUTRA FDD-UTRA FDD cell reselection: UTRA FDD is of lower priority for 5MHz bandwidth

##### A.4.3.1.4.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.4.3.1.2.1

The parameters of this test are the same as defined in Subclause A.4.3.1.2.1 except that the values of the parameters in the Table A.4.3.1.4.1-2 will replace the values of the corresponding parameters in A.4.3.1.2.1-2.

This is according to the principle defined in section A.3.7.2.

**Table A.4.3.1.4.1-2: Cell specific test parameters for cell 1 (E-UTRA) for 5MHz bandwidth**

| Parameter                                                 | Unit | Cell 1    |    |
|-----------------------------------------------------------|------|-----------|----|
|                                                           |      | T1        | T2 |
| BW <sub>channel</sub>                                     | MHz  | 5         |    |
| OCNG Patterns defined in A.3.2.1.16 (OP.16 FDD)           |      | OP.16 FDD |    |
| Note 1: See Table A.4.3.1.2.1-2 for the other parameters. |      |           |    |

#### A.4.3.1.4.2 Test Requirements

The test requirements defined in section A.4.3.1.2.1 shall apply to this test case.

#### A.4.3.1.5 Idle mode FDD to UTRA FDD interRAT reselection

##### A.4.3.1.5.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRA FDD-UTRA FDD inter-RAT cell reselection requirements for increased UE carrier monitoring specified in clause 4.2.2.4.

The test scenario comprises of indicating 8 UTRA FDD interfrequency cells on 6 different carriers in the neighbour list of cell 1 as given in table A.4.3.1.5-1 and cells 2 and 3 as given in table A.4.3.1.5-2. Each repetition of the test consists of five successive time periods, with time duration of T0, T1, T2, T3 and T4 respectively. In the initialisation phase and at the start of each repetition of T0, the test equipment provides signals for cell 1 (serving cell), and selects frequencies for cells 2 and 3 which are chosen from the 6 inter-RAT layers which are configured in the UE neighbour cell list as described in general and cell specific parameters. The neighbour lists of cells 2 and 3 shall include the frequency of cell 1 in the normal performance group as well as the other frequencies configured to the UE in the test.

Cell 1, 2 and 3 are identified by the UE during time period T0. Cell 1, cell 2 and cell 3 all belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2 or 3. Cells 2 and 3 all have lower absolute priority than cell 1.

**Table A.4.3.1.5-1: General test parameters for E-UTRAN FDD- UTRAN FDD inter frequency cell re-selection test case**

| Parameter                              |                | Unit | Value                                                                                                                                          | Comment                                                                                                                                                                                                                                |

## A.4.3.1.5.2 Test Requirements

The cell reselection delay is defined as the time from the beginning of a relevant time period, to the moment when the UE camps on the target cell, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the target cell.

The reselection delays shall meet the requirements in table A.4.3.1.5.2-1

Table A.4.3.1.5.2-1

| Time phase | Target cell                        | Requirement for reselection delay (seconds) |
|------------|------------------------------------|---------------------------------------------|
| T0         | Cell 1                             |                                             |
| T1         | Cell 2 (normal performance group)  | 21                                          |
| T2         | Cell 1 (normal performance group)  | 8                                           |
| T3         | Cell 3 (reduced performance group) | 148                                         |
| T4         | Cell 1 (normal performance group)  | 8                                           |

NOTE: The cell re-selection delay to a normal performance group cell can be expressed as:  $(N_{UTRA\_carrier,normal}) * T_{evaluateUTRA\_FDD} + T_{SI-UTRA}$  and to a reduced performance group cell can be expressed as:  $6 * N_{UTRA\_carrier,reduced} * T_{evaluateUTRA\_FDD} + T_{SI-UTRA}$ .

Where:

$T_{evaluateUTRA\_FDD}$  See Table 4.2.2.5.1-1

$T_{SI-UTRA}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s for normal performance group reselection, allow 21 s, and gives a total of 147.6 s for reduced performance group reselection, allow 148 s for reduced performance group in the test case. For reselections back to cell 1 since only one frequency is configured, the requirement is  $T_{evaluate,E-UTRAN\_Inter} + T_{SI} = 7.68s$ , allow 8s.

### A.4.3.2 E-UTRAN FDD – UTRAN TDD:

#### A.4.3.2.1 Test Purpose and Environment

##### A.4.3.2.1.1 Void

##### A.4.3.2.1.2 1.28Mcps TDD option

This test is to verify the requirement for the E-UTRA FDD to UTRA TDD inter-RAT cell reselection requirements specified in clause 4.2.2.5.2 when the UTRA cell is of lower priority.

This test scenario comprised of 1 E-UTRA FDD serving cell (Cell 1), and 1 UTRA TDD cell (Cell 2) to be re-selected. Test parameters are given in table A.4.3.2.1.2-1, A.4.3.2.1.2-2, and A.4.3.2.1.2-3. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Cell 2 is of lower priority than cell 1.

The ranking of the cells shall be made according to the cell reselection criteria specified in TS36.304.

## A.4.3.2.1.3 Void

## A.4.3.2.2 Test Requirements

## A.4.3.2.2.1 1.28Mcps TDD option

The cell reselection delay to lower priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2, and starts to send the SYNCH-UL sequence in the UpPTS for sending the RRC CONNECTION REQUEST message on cell 2.

The cell re-selection delay to lower priority shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluateUTRA\_TDD}} + T_{\text{SI-UTRA}}$

Where:

$T_{\text{evaluateUTRA\_TDD}}$  19.2s, See table 4.2.2.5.2-1

$T_{\text{SI-UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s, allow 21 s for lower priority cell reselection in the test case.

## A.4.3.2.2.2.3 Void

## A.4.3.2A E-UTRA FDD to UTRA TDD cell re-selection for IncMon

## A.4.3.2A.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRA FDD to UTRA TDD inter-RAT cell reselection requirements for increased UE carrier monitoring specified in clause 4.2.2.4. UTRA TDD cells are of lower priority than E-UTRA serving cell.

The test scenario comprises of indicating 7 UTRA TDD inter-RAT cells on 7 different carriers in the neighbour list of cell 1 as given in tables A.4.3.2A.1-1, A.4.3.2A.1-2 and A.4.3.2A.1-3. Each repetition of the test consists of five successive time periods, with time duration of T0, T1, T2, T3, and T4 respectively. In the initialisation phase and at the start of each repetition of T0, the test equipment provides signals for cell 1 (E-UTRA serving cell), and selects frequencies for cells 2 and 3 which are chosen from the 7 inter-RAT layers which are configured in the UE neighbour cell list as described in general and cell specific parameters. The neighbour lists of cells 2 and 3 shall include the frequency of cell 1 in the normal performance group as well as the other UTRA TDD frequencies configured to the UE in the test.

Cell 1, 2 and 3 are identified by the UE during time phase T0. Cell 1, cell 2 and cell 3 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2 or 3.

**Table A.4.3.2A.1-1: General test parameters for E-UTRA FDD to UTRA TDD inter-RAT cell re-selection test case**

| Parameter                            |                | Unit | Value                                                             | Comment                                                                                                                                                                                                                                             |
|--------------------------------------|----------------|------|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T0                                   | Active cell    |      | Cell1                                                             | T0 is repeated on each repetition of the test. In T0 the test equipment selects frequencies for cell 2, 3 and then time is allowed for the UE to identify the neighbour cells. See cell specific parameters for detailed settings.                  |
| T1 start condition                   | Active cell    |      | Cell 1                                                            |                                                                                                                                                                                                                                                     |
| T1 end condition                     | Active cell    |      | Cell2                                                             | UE shall perform reselection to cell 2 during T1                                                                                                                                                                                                    |

| NOTE 1: In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                                 |                  |                                                                                        |     |     |     |     |       |    |    |    |    |
| NOTE 2: This refers to the value of $Thresh_{x, high}$ which is included in UTRA system information, and is a threshold for the E-UTRA target cell |                  |                                                                                        |     |     |     |     |       |    |    |    |    |

### A.4.3.2A.2 Test Requirements

The cell reselection delay is defined as the time from the beginning of a relevant time period, to the moment when the UE camps on the target cell, and starts to send the SYNCH-UL sequence in the UpPTS on cell 2, 3 for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the target cell.

The reselection delays shall meet the requirements in table A.4.3.2A.2-1

**Table A.4.3.2A.2-1: Test requirements for E-UTRA FDD to UTRA TDD inter-RAT cell reselection**

| Time phase | Target cell                        | Requirement for reselection delay (seconds) |
|------------|------------------------------------|---------------------------------------------|
| T1         | Cell 2 (normal performance group)  | 58.9                                        |
| T3         | Cell 3 (reduced performance group) | 462.1                                       |

The rate of correct cell reselections observed during repeated tests shall be at least 90%, with a successful reselection counted if it is within the required time regardless of the carrier frequencies involved. At least 90% of reselections to the reduced performance group shall be within the required time, and at least 90% of reselections to the normal performance group shall be within the required time.

NOTE: The cell re-selection delay to a normal performance group cell can be expressed as:  $N_{\text{UTRA\_carrier\_TDD,normal}} * T_{\text{evaluateUTRA\_TDD}} + T_{\text{SI\_UTRA}}$ , and to a reduced performance group cell can be expressed as:  $6 * N_{\text{UTRA\_carrier\_TDD,reduced}} * T_{\text{evaluateUTRA\_TDD}} + T_{\text{SI\_UTRA}}$ ,

Where:

$T_{\text{evaluateUTRA\_TDD}}$  19.2s, See Table 4.2.2.5.2-1

$T_{\text{SI\_UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of  $3 * 19.2 + 1.28 = 58.88$  s for normal performance group reselection and  $6 * 4 * 19.2 + 1.28 = 462.08$ s for reduced performance group reselection, allow 58.9s for normal performance group and 462.1s for reduced performance group in the test case.

Since only one E-UTRA frequency is configured and signal level of UTRA cell is lower than threshold of  $S_{\text{prioritysearch}}$ , the UE shall select back to cell 1 (E-UTRA cell) within  $K_{\text{carrier}} * T_{\text{evaluateEUTRA}} + T_{\text{SI}} = 19.2 + 1.28 = 20.48$ s.

### A.4.3.3 E-UTRAN TDD – UTRAN FDD:

#### A.4.3.3.1 Test Purpose and Environment

This test is to verify the requirement for the EUTRA TDD- UTRA FDD inter-RAT cell reselection requirements specified in clause 4.2.2.5.1 when the UTRA cell is of lower priority.

The test scenario comprises of one UTRA FDD and one E-UTRA TDD cells as given in tables A.4.3.3.1-1, A.4.3.3.1-2 and A.4.3.3.1-3. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both E-UTRA cell 1 and UTRA cell 2 are already identified by the UE prior to the start of the test. Cell 2 is of lower priority than cell 1.

**Table A.4.3.3.1-1: General test parameters for EUTRA TDD- lower priority UTRA FDD inter RAT cell re-selection test case**

### A.4.3.3.2 Test Requirements

The cell reselection delay to lower priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message on cell 2.

The cell re-selection delay to lower priority shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluateUTRA\_FDD}} + T_{\text{SI-UTRA}}$

Where:

$T_{\text{evaluateUTRA-FDD}}$  See Table 4.2.2.5.1-1

$T_{\text{SI-UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s for lower priority cell reselection, allow 21 s.

## A.4.3.3A Idle mode TDD to UTRA FDD interRAT reselection

### A.4.3.3A.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRA TDD-UTRA FDD inter-RAT cell reselection requirements for increased UE carrier monitoring specified in clause 4.2.2.4.

The test scenario comprises of indicating 8 UTRA FDD interfrequency cells on 6 different carriers in the neighbour list of cell 1 as given in table A.4.3.3A.1-2 and table A.4.3.3A.1-3 and cells 2 and 3 as given in table A.4.3.3A.1-4. Each repetition of the test consists of five successive time periods, with time duration of T0, T1, T2, T3 and T4 respectively. In the initialisation phase and at the start of each repetition of T0, the test equipment provides signals for cell 1 (serving cell), and selects frequencies for cells 2 and 3 which are chosen from the 6 inter-RAT layers which are configured in the UE neighbour cell list as described in general and cell specific parameters. The neighbour lists of cells 2 and 3 shall

include the frequency of cell 1 in the normal performance group as well as the other frequencies configured to the UE in the test.

Cell 1, 2 and 3 4 are identified by the UE during time period T0. Cell 1, cell 2 and cell 3 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2 or 3. Cells 1, 2 and 3 4 all have lower absolute priority than cell 1.

**Table A.4.3.3A.1-1: General test parameters for E-UTRAN TDD- UTRAN FDD inter frequency cell re-selection test case**

| Parameter                              |                | Unit | Value                                                                                                                                          | Comment                                                                                                                                                                                                                            |
|----------------------------------------|----------------|------|------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T0                                     | Active cell    |      | Cell 1                                                                                                                                         | T0 is repeated on each repetition of the test. In T0 the test equipment selects frequencies for cell 2, 3 and then time is allowed for the UE to identify the neighbour cells. See cell specific parameters for detailed settings. |

### A.4.3.3A.2 Test Requirements

The cell reselection delay is defined as the time from the beginning of a relevant time period, to the moment when the UE camps on the target cell, and starts to send preambles on the PRACH for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the target cell.

The reselection delays shall meet the requirements in table A.4.3.1.5-1

Table A.4.3.3A.2-1

| Time phase | Target cell                        | Requirement for reselection delay (seconds) |
|------------|------------------------------------|---------------------------------------------|
| T0         | Cell 1                             |                                             |
| T1         | Cell 2 (normal performance group)  | 21                                          |
| T2         | Cell 1 (normal performance group)  | 8                                           |
| T3         | Cell 3 (reduced performance group) | 148                                         |
| T4         | Cell 1 (normal performance group)  | 8                                           |

NOTE: The cell re-selection delay to a normal performance group cell can be expressed as:  $(N_{UTRA\_carrier,normal}) * T_{evaluateUTRA\_FDD} + T_{SI-UTRA}$  and to a reduced performance group cell can be expressed as:  $6 * N_{UTRA\_carrier,reduced} * T_{evaluateUTRA\_FDD} + T_{SI-UTRA}$ .

Where:

$T_{evaluateUTRA\_FDD}$  See Table 4.2.2.5.1-1

$T_{SI-UTRA}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s for normal performance group reselection, allow 21 s, and gives a total of 147.6 s for reduced performance group reselection, allow 148 s for reduced performance group in the test case. For reselections back to cell 1 since only one frequency is configured, the requirement is  $T_{evaluate,E-UTRAN\_Inter} + T_{SI} = 7.68s$ , allow 8s.

### A.4.3.4 E-UTRAN TDD – UTRAN TDD:

#### A.4.3.4.1 E-UTRA to UTRA TDD cell re-selection: UTRA is of higher priority

##### A.4.3.4.1.1 Test Purpose and Environment

###### A.4.3.4.1.1.1 Void

###### A.4.3.4.1.1.2 1.28 Mcps TDD option

This test is to verify the requirement for the E-UTRA TDD to UTRA TDD inter-RAT cell re-selection requirements specified in clause 4.2.2.5 when the UTRA cell is of higher priority.

This test scenario comprised of 1 E-UTRA TDD serving cell, and 1 UTRA TDD cell to be re-selected. Test parameters are given in table A.4.3.4.1.1.2-1, A.4.3.4.1.1.2-2, and A.4.3.4.1.1.2-3. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. E-UTRA cell 1 is already identified by the UE prior to the start of the test. Cell 2 is of higher priority than cell 1.

The ranking of the cells shall be made according to the cell reselection criteria specified in TS36.304.

**Table A.4.3.4.1.1.2-1: General test parameters for E-UTRAN to UTRAN (1.28 Mcps TDD OPTION) Cell Re-selection**

| Parameter                                |                | Unit | Value    | Comment                                                                                                                                                                                                               |
|------------------------------------------|----------------|------|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition                        | Active cell    |      | Cell 1   | UE is on cell 1 in the initialisation phase, so that reselection to cell 2 occurs during T2                                                                                                                           |
| T2 end condition                         | Active cell    |      | Cell 2   | UE shall perform reselection to cell 2 during T2                                                                                                                                                                      |

| NOTE 1: In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                                |              |               |     |     |       |    |    |
| NOTE 2: This refers to the value of $Thresh_{x, low}$ which is included in UTRA system information, and is a threshold for the E-UTRA target cell |              |               |     |     |       |    |    |

A.4.3.4.1.1.3 Void

A.4.3.4.1.2 Test Requirements

A.4.3.4.1.2.1 Void

A.4.3.4.1.2.2 1.28 Mcps TDD option

The cell reselection delay to higher priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2, and starts to send the SYNCH-UL sequence in the UpPTS for sending the RRC CONNECTION REQUEST message on cell 2.

The cell re-selection delay to higher priority shall be less than 81 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to higher priority cell can be expressed as:  $T_{\text{higher\_priority\_search}} + T_{\text{evaluateUTRA\_TDD}} + T_{\text{SI\_UTRA}}$ ,

Where:

$T_{\text{higher\_priority\_search}}$  60s, See clause 4.2.2

$T_{\text{evaluateUTRA\_TDD}}$  19.2s, See Table 4.2.2.5.2-1

$T_{\text{SI\_UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 80.48 s, allow 81 s for higher priority cell reselection in the test case.

A.4.3.4.1.2.3 Void

A.4.3.4.2 E-UTRA to UTRA TDD cell re-selection: UTRA is of lower priority

A.4.3.4.2.1 Test Purpose and Environment

A.4.3.4.2.1.1 Void

A.4.3.4.2.1.2 1.28 Mcps TDD option

This test is to verify the requirement for the E-UTRA TDD to UTRA TDD inter-RAT cell re-selection requirements specified in clause 4.2.2.5 when the UTRA cell is of lower priority.

This test scenario comprised of 1 E-UTRA TDD serving cell (Cell 1), and 1 UTRA TDD cell (Cell 2) to be re-selected. Test parameters are given in table A.4.3.4.2.1.2-1, A.4.3.4.2.1.2-2, and A.4.3.4.2.1.2-3. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Cell 2 is of lower priority than cell 1.

The ranking of the cells shall be made according to the cell reselection criteria specified in TS36.304.

| Note1:                            | In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                                        |               |     |       |      |
| Note2:                            | This refers to the value of Thresh <sub>x, high</sub> which is included in UTRA system information, and is a threshold for the E-UTRA target cell |               |     |       |      |

A.4.3.4.2.1.3 Void

A.4.3.4.2.2 Test Requirements

A.4.3.4.2.2.1 Void

A.4.3.4.2.2.2 1.28 Mpcs TDD option

The cell reselection delay to lower priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2, and starts to send the SYNCH-UL sequence in the UpPTS for sending the RRC CONNECTION REQUEST message on cell 2.

The cell re-selection delay to lower priority shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluateUTRA\_TDD}} + T_{\text{SL\_UTRA}}$ ,

Where:

$T_{\text{evaluateUTRA\_TDD}}$  19.2s, See Table 4.2.2.5.2-1

$T_{\text{SL\_UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s, allow 21 s for lower priority cell reselection in the test case.

A.4.3.4.2.2.3 Void

**A.4.3.4.3 EUTRA TDD-UTRA TDD cell reselection in fading propagation conditions: UTRA TDD is of lower priority**

A.4.3.4.3.1 Test Purpose and Environment

This test is to verify the requirement for the EUTRA TDD- UTRA TDD inter-RAT cell reselection requirements specified in clause 4.2.2.5.2 when the UTRA cell is of lower priority, and to verify the robustness of the UE measurement filtering in a fading environment. The E-UTRA cell is in fading propagation conditions and the UTRA cell is in AWGN propagation conditions.

The test scenario comprises of one UTRA TDD and one E-UTRA TDD cells as given in tables A.4.3.4.3.1-1, A.4.3.4.3.1-2 and A.4.3.4.3.1-3. The test consists of four successive time periods, with time duration of T1 T2, T3 and T4 respectively. Both E-UTRA cell 1 and UTRA cell 2 are already identified by the UE prior to the start of the test. Cell 2 is of lower priority than cell 1.

**Table A.4.3.4.3.1-1: General test parameters for EUTRA TDD- lower priority UTRA TDD inter RAT cell re-selection test case**

#### A.4.3.4.3.2 Test Requirements

The probability of reselection from cell 1 to cell 2 during T2 observed during testing shall be less than 10%

The probability of reselection from cell 2 to cell 1 during T4 observed during testing shall be less than 10%

The cell reselection delay to lower priority is defined as the time from the beginning of time period T3, to the moment when the UE camps on cell 2, and starts to send the SYNCH-UL sequene in the UpPTS for sending the RRC CONNECTION REQUEST message on cell 2. In order to evaluate reselection delay, the system simulator first needs to verify that the UE is camped on cell 1 at the start of T3

The cell re-selection delay to lower priority shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluateUTRA\_TDD}} + T_{\text{SI-UTRA}}$

Where:

$T_{\text{evaluateUTRA\_TDD}}$  19.2s, See Table 4.2.2.5.2-1

$T_{\text{SI-UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 20.48 s for lower priority cell reselection, allow 21 s.

#### A.4.3.4.4 E-UTRA TDD to UTRA TDD cell re-selection for IncMon

##### A.4.3.4.4.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRA TDD to UTRA TDD inter-RAT cell reselection requirements for increased UE carrier monitoring specified in clause 4.2.2.4. UTRA TDD cells are of lower priority than E-UTRA serving cell.

The test scenario comprises of indicating 7 UTRA TDD inter-RAT cells on 7 different carriers in the neighbour list of cell 1 as given in tables A.4.3.4.4.1-1, A.4.3.4.4.1-2 and A.4.3.4.4.1-3. Each repetition of the test consists of five successive time periods, with time duration of T0, T1, T2, T3, and T4 respectively. In the initialisation phase and at the start of each repetition of T0, the test equipment provides signals for cell 1 (E-UTRA serving cell), and selects frequencies for cells 2 and 3 which are chosen from the 7 inter-RAT layers which are configured in the UE neighbour cell list as described in general and cell specific parameters. The neighbour lists of cells 2 and 3 shall include the

frequency of cell 1 in the normal performance group as well as the other UTRA TDD frequencies configured to the UE in the test.

Cell 1, 2, and 3 are identified by the UE during time phase T0. Cell 1, cell 2, and cell 3 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing cell 2 or 3.

**Table A.4.3.4.4.1-1: General test parameters for E-UTRA TDD to UTRA TDD inter-RAT cell re-selection test case**

| Parameter                                |                | Unit | Value                                                             | Comment                                                                                                                                                                                                                                             |
|------------------------------------------|----------------|------|-------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| T0                                       | Active cell    |      | Cell1                                                             | T0 is repeated on each repetition of the test. In T0 the test equipment selects frequencies for cell 2, 3 and then time is allowed for the UE to identify the neighbour cells. See cell specific parameters for detailed settings.                  |
| T1 start condition                       | Active cell    |      | Cell 1                                                            |                                                                                                                                                                                                                                                     |
| T1 end condition                         | Active cell    |      | Cell2                                                             | UE shall perform reselection to cell 2 during T1                                                                                                                                                                                                    |
|                                          | Neighbour cell |      | Cell1                                                             |                                                                                                                                                                                                                                                     |

| Note1:                                  | In the case of multi-frequency cell, the UTRA RF Channel Number is the primary frequency's channel number.                                 |                                                                                        |     |     |     |     |       |    |    |    |    |
| Note2:                                  | This refers to the value of $Thresh_{x, high}$ which is included in UTRA system information, and is a threshold for the E-UTRA target cell |                                                                                        |     |     |     |     |       |    |    |    |    |

#### A.4.3.4.4.2 Test Requirements

The cell reselection delay is defined as the time from the beginning of a relevant time period, to the moment when the UE camps on the target cell, and starts to send the SYNCH-UL sequence in the UpPTS on cell 2, 3 for sending the RRC CONNECTION REQUEST message to perform a Tracking Area Update procedure on the target cell.

The reselection delays shall meet the requirements in table A.4.3.4.4.2-1

**Table A.4.3.4.4.2-1: Test requirements for E-UTRA TDD to UTRA TDD inter-RAT cell reselection**

| Time phase | Target cell                        | Requirement for reselection delay (seconds) |
|------------|------------------------------------|---------------------------------------------|
| T1         | Cell 2 (normal performance group)  | 58.9                                        |
| T3         | Cell 3 (reduced performance group) | 462.1                                       |

The rate of correct cell reselections observed during repeated tests shall be at least 90%, with a successful reselection counted if it is within the required time regardless of the carrier frequencies involved. At least 90% of reselections to the reduced performance group shall be within the required time, and at least 90% of reselections to the normal performance group shall be within the required time.

NOTE: The cell re-selection delay to a normal performance group cell can be expressed as:  $N_{\text{UTRA\_carrier\_TDD,normal}} * T_{\text{evaluateUTRA\_TDD}} + T_{\text{SI\_UTRA}}$ , and to a reduced performance group cell can be expressed as:  $6 * N_{\text{UTRA\_carrier\_TDD,reduced}} * T_{\text{evaluateUTRA\_TDD}} + T_{\text{SI\_UTRA}}$ ,

Where:

$T_{\text{evaluateUTRA\_TDD}}$  19.2s, See Table 4.2.2.5.2-1

$T_{\text{SI\_UTRA}}$  Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of  $3 * 19.2 + 1.28 = 58.88$  s for normal performance group reselection and  $6 * 4 * 19.2 + 1.28 = 462.08$ s for reduced performance group reselection, allow 58.9s for normal performance group and 462.1s for reduced performance group in the test case.

Since only one E-UTRA frequency is configured and signal level of UTRA cell is lower than threshold of  $S_{\text{prioritysearch}}$ , the UE shall select back to cell 1 (E-UTRA cell) within  $K_{\text{carrier}} * T_{\text{evaluateEUTRA}} + T_{\text{SI}} = 19.2 + 1.28 = 20.48$ s.

### A.4.4 E-UTRAN to GSM Cell Re-Selection

#### A.4.4.1 E-UTRAN FDD – GSM:

##### A.4.4.1.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD to GSM cell re-selection delay reported in clause 4.2.2.5.

This scenario implies the presence of 1 E-UTRAN serving cell, and 1 GSM cell to be re-selected. The UE is requested to monitor neighbouring cells on 1 E-UTRA carrier and 12 GSM cells. Test parameters are given in Table, A.4.4.1-1, A.4.4.1-2, A.4.4.1-3. E-UTRA FDD cell (Cell 1) and GSM cell (cell 2) shall belong to different Location Areas. The test comprises two successive time periods, T1 and T2. During initialization before the start of the test, the UE is camped on cell 1. By the end of T1, the UE has identified BSIC on the GSM BCCH carrier of cell 2 but the signal levels do not meet the reselection criterion during T1. At the start of T2, the signal levels change such that cell 2 satisfies reselection criterion. The GSM layer is configured at a lower priority than the serving E-UTRA FDD layer.

**Table A.4.4.1-1: General test parameters for E-UTRA FDD GSM cell re-selection test case**

| Parameter                  | Unit           | Value    | Comment                                                                                                                                                                  |
|----------------------------|----------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition          | Active cell    | Cell1    | UE shall be forced to cell 1 in the initialisation phase and shall be able to detect and monitor the 4 strongest GSM BCCH carriers in T1 . Cell 1 is an E-UTRA FDD cell. |
| Final condition            | Neighbour cell | Cell2    | UE shall perform reselection to cell 2 during T2. Cell 2 is a GSM cell.                                                                                                  |
| E-UTRA RF Channel Number   |                | 1        | 1 E-UTRA FDD carrier frequency                                                                                                                                           |
| GSM ARFCN                  |                | 1        | 12 GSM BCCH carriers are used                                                                                                                                            |
| PRACH configuration        |                | 4        | As specified in table 5.7.1-2 in TS 36.211                                                                                                                               |
| Access Barring Information | -              | Not Sent | No additional delays in random access procedure.                                                                                                                         |
| CP length of cell 1        |                | Normal   |                                                                                                                                                                          |
| DRX cycle length           | s              | 1.28     | The value shall be used for all cells in the test.                                                                                                                       |
| T1                         | s              | 35       | T1 need to be defined so that cell re-selection reaction time is taken into account.                                                                                     |
| T2                         | s              | 35       | T2 need to be defined so that the higher layer search periodicity and cell re-selection reaction time are taken into account.                                            |

| MS_TXPWR_MAX_CCH           | dBm  | 24           |     |

#### A.4.4.1.2 Test Requirements

The cell re-selection delay is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send the RR Channel Request message for location update to Cell 2.

The cell re-selection delay shall be less than  $26\text{ s} + T_{\text{BCCH}}$ , where  $T_{\text{BCCH}}$  is the maximum time allowed to read BCCH data from GSM cell [8].

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay can be expressed as:  $4 * T_{\text{measureGSM}} + T_{\text{BCCH}}$ , where:

$T_{\text{measureGSM}}$  See Table 4.2.2.5.3-1 in clause 4.2.2.5.3.

$T_{\text{BCCH}}$  Maximum time allowed to read BCCH data from GSM cell [8].  
According to [8], the maximum time allowed to read the BCCH data, when being synchronized to a BCCH carrier, is 1.9 s.

This gives a total of  $25.6\text{ s} + T_{\text{BCCH}}$ , allow  $26\text{ s} + T_{\text{BCCH}}$  in the test case.

#### A.4.4.2 E-UTRAN TDD – GSM:

##### A.4.4.2.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN TDD to GSM cell re-selection delay reported in clause 4.2.2.5.

This scenario implies the presence of 1 E-UTRAN serving cell, and 1 GSM cell to be re-selected. The UE is requested to monitor neighbouring cells on 1 E-UTRA carrier and 12 GSM cells. Test parameters are given in Table, A.4.4.2-1, A.4.4.2-2, A.4.4.2-3. E-UTRA TDD cell (Cell 1) and GSM cell (cell 2) shall belong to different Location Areas. The test comprises two successive time periods, T1 and T2. During initialization before the start of the test, the UE is camped on cell 1. By the end of T1, the UE has identified BSIC on the GSM BCCH carrier of cell 2 but the signal levels do not meet the reselection criterion during T1. At the start of T2, the signal levels change such that cell 2 satisfies reselection criterion. The GSM layer is configured at a lower priority than the serving E-UTRA TDD layer.

**Table A.4.4.2-1: General test parameters for E-UTRA TDD GSM cell re-selection test case**

| Parameter                                 |                | Unit | Value    | Comment                                                                                                                                                                 |
|-------------------------------------------|----------------|------|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial condition                         | Active cell    |      | Cell1    | UE shall be forced to cell 1 in the initialisation phase and shall be able to detect and monitor the 4 strongest GSM BCCH carriers in T1. Cell 1 is an E-UTRA TDD cell. |
| Final condition                           | Neighbour cell |      | Cell2    | UE shall perform reselection to cell 2 during T2. Cell 2 is a GSM cell.                                                                                                 |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. |            |          |      |
| Note 2: This refers to Thresh <sub>x, low</sub> which is included in E-UTRA system information, and is a threshold for GSM target cell.                       |            |          |      |

**Table A.4.4.2-3: Cell-specific test parameters for Cell 2 – GSM cell**

| Parameter                  | Unit | Cell 2 (GSM) |     |
|----------------------------|------|--------------|-----|
|                            |      | T1           | T2  |
| Absolute RF Channel Number |      | ARFCN 1      |     |
| RXLEV                      | dBm  | -90          | -75 |
| RXLEV_ACCESS_MIN           | dBm  | -105         |     |
| MS_TXPWR_MAX_CCH           | dBm  | 24           |     |

#### A.4.4.2.2 Test Requirements

The cell re-selection delay is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send the RR Channel Request message for location update to Cell 2.

The cell re-selection delay shall be less than  $26 \text{ s} + T_{\text{BCCH}}$ , where  $T_{\text{BCCH}}$  is the maximum time allowed to read BCCH data from GSM cell [8].

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay can be expressed as:  $4 * T_{\text{measureGSM}} + T_{\text{BCCH}}$ , where:

$T_{\text{measureGSM}}$  See Table 4.2.2.5.3-1 in clause 4.2.2.5.3.

$T_{\text{BCCH}}$  Maximum time allowed to read BCCH data from GSM cell [8].  
According to [8], the maximum time allowed to read the BCCH data, when being synchronized to a BCCH carrier, is 1.9 s.

This gives a total of  $25.6 \text{ s} + T_{\text{BCCH}}$ , allow  $26 \text{ s} + T_{\text{BCCH}}$  in the test case.

## A.4.5 E-UTRAN to HRPD Cell Re-Selection

### A.4.5.1 E-UTRAN FDD – HRPD

#### A.4.5.1.1 E-UTRAN FDD – HRPD Cell Reselection: HRPD is of Lower Priority

##### A.4.5.1.1.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD- HRPD inter-RAT cell reselection requirements specified in clause 4.2.2.5.4 when the HRPD cell is of lower priority.

The test scenario comprises of one HRPD and one E-UTRAN FDD cells as given in tables A.4.5.1.1.1-1, A.4.5.1.1.1-2 and A.4.5.1.1.1-3.

The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both E-UTRAN FDD cell 1 and HRPD cell 2 are already identified by the UE prior to the start of the test. At T1 the UE is camped on to cell 1. Cell 2 is of lower priority than cell 1. Cell 1 and cell 2 shall belong to different tracking areas.

**Table A.4.5.1.1.1-1: General Test Parameters for E-UTRAN FDD - lower priority HRPD Cell Re-selection**

|                                                        | Parameter      | Unit | Value    | Comment                                          |
|--------------------------------------------------------|----------------|------|----------|--------------------------------------------------|
| Initial condition                                      | Active cell    |      | Cell 1   | E-UTRAN FDD cell                                 |

#### A.4.5.1.1.2 Test Requirements

The cell reselection delay to lower priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2 and starts to send access probe preambles on the Access Channel on cell 2.

The cell re-selection delay to the lower priority cell 2 shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluateHRPD}} + T_{\text{SI-HRPD}}$

Where:

$T_{\text{evaluateHRPD}}$  See Table 4.2.2.5.4-1

$T_{\text{SI-HRPD}}$  Maximum repetition period of relevant system information blocks that need to be received by the UE to camp on cell 2; 1704 ms is assumed in this test case.

This gives a total of 20.904 s for the lower priority cell reselection, allow 21 s in the test case.

### A.4.5.2 E-UTRAN TDD – HRPD

#### A.4.5.2.1 E-UTRAN TDD – HRPD Cell Reselection: HRPD is of Lower Priority

##### A.4.5.2.1.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN TDD- HRPD inter-RAT cell reselection requirements specified in clause 4.2.2.5.4 when the HRPD cell is of lower priority.

The test scenario comprises of one HRPD and one E-UTRAN TDD cells as given in tables A.4.5.2.1.1-1, A.4.5.2.1.1-2 and A.4.5.2.1.1-3.

The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both E-UTRAN TDD cell 1 and HRPD cell 2 are already identified by the UE prior to the start of the test. At T1 the UE is camped on to cell 1. Cell 2 is of lower priority than cell 1. Cell 1 and cell 2 shall belong to different tracking areas.

**Table A.4.5.2.1.1-1: General Test Parameters for E-UTRAN TDD - lower priority HRPD Cell Reselection**

| Thresh <sub>x, low</sub>                      |                 | -14    |    |

#### A.4.5.2.1.2 Test Requirements

The cell reselection delay to lower priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2 and starts to send access probe preambles on the Access Channel on cell 2.

The cell re-selection delay to the lower priority cell 2 shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluateHRPD}} + T_{\text{SI-HRPD}}$

Where:

$T_{\text{evaluateHRPD}}$  See Table 4.2.2.5.4-1

$T_{\text{SI-HRPD}}$  Maximum repetition period of relevant system information blocks that need to be received by the UE to camp on cell 2; 1704 ms is assumed in this test case.

This gives a total of 20.904 s for the lower priority cell reselection, allow 21 s in the test case.

## A.4.6 E-UTRAN to cdma2000 1X Cell Re-Selection

### A.4.6.1 E-UTRAN FDD – cdma2000 1X

#### A.4.6.1.1 E-UTRAN FDD – cdma2000 1X Cell Reselection: cdma2000 1X is of Lower Priority

##### A.4.6.1.1.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN FDD- cdma2000 1X inter-RAT cell reselection requirements specified in clause 4.2.2.5.5 when the cdma2000 1X cell is of lower priority.

The test scenario comprises of one cdma2000 1X and one E-UTRAN FDD cells as given in tables A.4.6.1.1.1-1, A.4.6.1.1.1-2 and A.4.6.1.1.1-3.

The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both E-UTRAN FDD cell 1 and cdma2000 1X cell 2 are already identified by the UE prior to the start of the test. At T1 the UE is camped on to cell 1. Cell 2 is of lower priority than cell 1. Cell 1 and cell 2 shall belong to different tracking areas.

**Table A.4.6.1.1.1-1: General Test Parameters for E-UTRAN FDD - lower priority cdma2000 1X Cell Re-selection**

| Parameter         | Unit        | Value  | Comment          |
|-------------------|-------------|--------|------------------|
| Initial condition | Active cell | Cell 1 | E-UTRAN FDD cell |

|                                                        |                |   |          |                                                  |
|--------------------------------------------------------|----------------|---|----------|--------------------------------------------------|
|                                                        | Neighbour cell |   | Cell 2   | cdma2000 1X cell                                 |
| Final condition                                        | Active cell    |   | Cell 2   | cdma2000 1X cell is selecting during T2          |
| DRX cycle length                                       |                | s | 1.28     |                                                  |
| E-UTRA FDD RF Channel Number                           |                |   | 1        | Only one FDD carrier frequency is used.          |
| E-UTRA FDD Channel Bandwidth ( $BW_{\text{channel}}$ ) | MHz            |   | 10       |                                                  |
| cdma2000 1X RF Channel Number                          |                |   | 1        | Only one cdma2000 1X carrier frequency is used.  |
| E-UTRA FDD PRACH configuration                         |                |   | 4        | As specified in table 5.7.1-2 in TS 36.211       |
| E-UTRA FDD Access Barring Information                  | -              |   | Not Sent | No additional delays in random access procedure. |
| T1                                                     | s              |   | 30       |                                                  |
| T2                                                     | s              |   | 30       |                                                  |

#### A.4.6.1.1.2 Test Requirements

The cell reselection delay to lower priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2 and starts to send access probe preambles on the Access Channel on cell 2.

The cell re-selection delay to the lower priority cell 2 shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluatecdma2000 1X}} + T_{\text{SI-cdma2000 1X}}$

Where:

$T_{\text{evaluatecdma2000 1X}}$  See Table 4.2.2.5.5-1

$T_{\text{SI-cdma2000 1X}}$  Maximum repetition period of relevant system information blocks that need to be received by the UE to camp on cell 2; 1280 ms is assumed in this test case.

This gives a total of 20.48 s for the lower priority cell reselection, allow 21 s in the test case.

### A.4.6.2 E-UTRAN TDD – cdma2000 1X

#### A.4.6.2.1 E-UTRAN TDD –cdma2000 1X Cell Reselection: cdma2000 1X is of Lower Priority

##### A.4.6.2.1.1 Test Purpose and Environment

This test is to verify the requirement for the E-UTRAN TDD- cdma2000 1X inter-RAT cell reselection requirements specified in clause 4.2.2.5.5 when the cdma2000 1X cell is of lower priority.

The test scenario comprises of one cdma2000 1X and one E-UTRAN TDD cells as given in tables A.4.6.2.1.1-1, A.4.6.2.1.1-2 and A.4.6.2.1.1-3.

The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both E-UTRAN TDD cell 1 and cdma2000 1X cell 2 are already identified by the UE prior to the start of the test. At T1 the UE is camped on to cell 1. Cell 2 is of lower priority than cell 1. Cell 1 and cell 2 shall belong to different tracking areas.

**Table A.4.6.2.1.1-1: General Test Parameters for E-UTRAN TDD - lower priority cdma2000 1X Cell Reselection**

| Parameter         | Unit        | Value  | Comment          |
|-------------------|-------------|--------|------------------|
| Initial condition | Active cell | Cell 1 | E-UTRAN TDD cell |

|                                                        |                |   |          |                                                  |
|--------------------------------------------------------|----------------|---|----------|--------------------------------------------------|
|                                                        | Neighbour cell |   | Cell 2   | cdma2000 1X cell                                 |

#### A.4.6.2.1.2 Test Requirements

The cell reselection delay to lower priority is defined as the time from the beginning of time period T2, to the moment when the UE camps on cell 2 and starts to send access probe preambles on the Access Channel on cell 2.

The cell re-selection delay to the lower priority cell 2 shall be less than 21 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to lower priority cell can be expressed as:  $T_{\text{evaluatecdma2000 1X}} + T_{\text{SI-cdma2000 1X}}$

Where:

$T_{\text{evaluatecdma2000 1X}}$  See Table 4.2.2.5.5-1

$T_{\text{SI-cdma2000 1X}}$  Maximum repetition period of relevant system information blocks that need to be received by the UE to camp on cell 2; 1280 ms is assumed in this test case.

This gives a total of 20.48 s for the lower priority cell reselection, allow 21 s in the test case.

## A.4.7 Idle State Positioning Measurement for UE category NB1

### A.4.7.1 HD – FDD Intra frequency case for UE Category NB1 standalone mode in enhanced coverage

#### A.4.7.1.1 Test Purpose and Environment

The purpose of the test is to verify that the intra frequency RSTD measurement for HD-FDD category NB1 UE meets the requirements specified in Clause 4.8.2 in an environment with fading propagation conditions.

In the test there are three synchronous cells: nCell 1, nCell 2 and nCell 3. nCell 1 is the reference as well as the PCell. nCell 2 and nCell 3 are the neighbour cells. All cells are on the same RF channel.

The test consists of four consecutive time intervals, with duration of T1, T2, T3, T4, T5, and T6. nCell 1 is active throughout T1, T2, T3, T4, T5, and T6, whilst nCell 2 and nCell 3 is activated only in the beginning of T2. nCell 2 is active until the end of T5, and nCell 3 is active until the end of T4. nCell 1 transmits NPRS in T2 and T4, while nCell 2 transmits NPRS in T3 and T5, and nCell 3 transmits NPRS only in T2 and T4. Note: The information on when NPRS is muted is conveyed to the UE using PRS muting information.

Prior to the start of the time duration T1, the UE shall be fully synchronized to nCell1.

At the start of the time duration T1, the OTDOA assistance data and *OTDOA-RequestLocationInformation* as defined in TS 36.355, shall be provided to the UE.

After the receipt of the OTDOA assistance data and *OTDOA-RequestLocationInformation* has been successfully acknowledged, the UE is provided with a RRC connection release command during the time duration T1 or T2. The UE is expected to enter idle state before T4. The last TTI containing the RRC connection release command shall be provided to the UE  $\Delta T$  second before the start of T4, where  $\Delta T = 10$ s is the maximum delay for NB-IOT UE to perform RRC connection release as define in TS36.331 [2].

The test parameters are given in Tables A.4.7.1.1-1 A.4.7.1.1-2 and A.4.7.1.1-3.

Table A.4.7.1.1-1: General test parameters

| Parameter                                                                     | Unit | Value                                                                                             | Comment                                                                                                                                                                                                             |
|-------------------------------------------------------------------------------|------|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NB-IoT operational mode                                                       |      | <b>Standalone</b>                                                                                 |                                                                                                                                                                                                                     |
| Reference cell                                                                |      | nCell 1                                                                                           | Reference cell is the cell in the OTDOA assistance data with respect to which the RSTD measurement is defined, as specified in TS 36.214 [4] and TS 36.355 [24]. The reference cell is the PCell in this test case. |
| Neighbor cells                                                                |      | nCell 2 and nCell 3                                                                               | Cell 2 and Cell 3 appear at random places in the neighbour cell list in the OTDOA assistance data, but Cell 2 always appears in the first half of the list, whilst Cell 3 appears in the second half of the list.   |
| nprsID                                                                        |      | (nprsID of Cell 1 – nprsID of Cell 2)mod6=1<br>and<br>(nprsID of Cell 1 – nprsID of Cell 3)mod6=2 | As defined in TS36.366 [24]                                                                                                                                                                                         |

| Timing offset to nCell 1                                                                                                                                                                                                                                               | μs             | N/A         | 1         | -1        |
| Note 1: OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. The OCNG pattern is chosen during the test according to the presence of a DL reference measurement channel. |                |             |           |           |
| Note 2: The NPDSCH and NPDCCH reference measurement channels are used in the test only when a downlink transmission dedicated to the UE under test is required.                                                                                                        |                |             |           |           |
| Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.                                                |                |             |           |           |

| Note 1:                                     | OCNG shall be used such that active cells (all, except Cell 3 in T3) are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted NPRS.                                                                                                                                                                                                           |           |           |           |           |           |           |
| Note 3:                                     | Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.                                                                                                                                                                                                                                      |           |           |           |           |           |           |
| Note 4:                                     | If NPRS_RA is not “N/A”, $\hat{E}_s / N_{oc}$ , $NPRS \hat{E}_s / I_{ot}$ , $I_o$ , NRSRP and NPRP levels have been derived from other parameters and are given for information purpose. If NPRS_RA is “N/A”, $I_o$ and NRSRP levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. Interference conditions shall be applied to all PRS symbols of DL positioning subframes. |           |           |           |           |           |           |

### A.4.7.1.2 Test Requirements

The RSTD measurement time fulfils the requirements specified in Clause 4.8.2.

The UE shall perform and report the RSTD measurements for nCell 2 and nCell 3 with respect to the reference cell in the OTDOA assistance data, nCell 1, within  $T_{RSTD\_intra\_NB-IoT-EC} + T_{RandomAccess\_NB-IoT-EC} = [67.16]$  s starting from the beginning of time interval T2, to the moment when the UE starts to send preambles on the PRACH for sending the positioning measurement report message to nCell1.

The RSTD measurement time  $T_{\text{RSTD\_intra\_NB-IoT-EC}}$  in the test is derived according to section 4.8.2. This gives the total RSTD measurement time of 11.52s for Cell 2 and Cell 3 with respect to the reference Cell 1

The random access to an already detected cell  $T_{\text{RandomAccess\_NB-IoT-EC}}$  can be expressed as:  $T_{\text{evaluate, NB\_intra\_NB-IoT-EC}} + T_{\text{SI}} + T_{\text{PRACH\_NB-IoT}}$ ,

Where:

$T_{\text{evaluate, NB\_intra\_NB-IoT-EC}}$  See Table 4.6.2.4-1 in clause 4.6.2.4

$T_{\text{SI}} = 41560$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target NB-IoT FDD cell.

$T_{\text{PRACH\_NB-IoT}} = 1280$  ms; it is the additional delay caused by the random access procedure.

This gives  $T_{\text{RandomAccess\_NB-IoT-EC}} = 55.64$  s for the random access delay to an already detected cell in the test case.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in Clause 9.1.10.3, i.e., between RSTD\_0000 and RSTD\_12711.

## A.4.7.2 HD – FDD Inter frequency case for UE Category NB1 standalone mode in enhanced coverage

### A.4.7.2.1 Test Purpose and Environment

The purpose of the test is to verify that the RSTD measurement for HD-FDD category NB1 UE meets the requirements specified in Clause 4.8.4 in an environment with fading propagation conditions.

In the test there are three synchronous cells: nCell 1, nCell 2 and nCell 3. nCell 1 is the reference as well as the PCell. nCell 2 and nCell 3 are the neighbour cells.

The test consists of four consecutive time intervals, with duration of T1, T2, T3, T4, T5, and T6. nCell 1 is active throughout T1, T2, T3, T4, T5, and T6, whilst nCell 2 and nCell 3 is activated only in the beginning of T2. nCell 2 is active until the end of T5, and nCell 3 is active until the end of T4. nCell 1 transmits NPRS in T2 and T4, while nCell 2 transmits NPRS in T3 and T5, and nCell 3 transmits NPRS only in T2 and T4. Note: The information on when NPRS is muted is conveyed to the UE using PRS muting information.

Prior to the start of the time duration T1, the UE shall be fully synchronized to nCell1

At the start of the time duration T1, the OTDOA assistance data and *OTDOA-RequestLocationInformation* as defined in TS 36.355, shall be provided to the UE.

After the receipt of the OTDOA assistance data and *OTDOA-RequestLocationInformation* has been successfully acknowledged, the UE is provided with a RRC connection release command during the time duration T1 or T2. The UE is expected to enter idle state before T4. The last TTI containing the RRC connection release command shall be provided to the UE  $\Delta T$  second before the start of T4, where  $\Delta T = 10$ s is the maximum delay for NB-IOT UE to perform RRC connection release as defined in TS36.331 [2].

The test parameters are given in Tables A.4.7.2.1-1 A.4.7.2.1-2 and A.4.7.2.1-3.

Table A.4.7.2.1-1: General test parameters

| Parameter                                                                     | Unit | Value                                                                                             | Comment                                                                                                                                                                                                             |

| Timing offset to nCell 1                                                                                                                                                                                                                                               | μs             | N/A         | 1         | -1        |
| Note 1: OCNG shall be used such that the cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. The OCNG pattern is chosen during the test according to the presence of a DL reference measurement channel. |                |             |           |           |
| Note 2: The NPDSCH and NPDCCH reference measurement channels are used in the test only when a downlink transmission dedicated to the UE under test is required.                                                                                                        |                |             |           |           |
| Note 3: Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.                                                |                |             |           |           |

| Timing offset to nCell 1                               | µs                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | N/A         |           | 1         |           | -1        |           |
| Note 1:                                                | OCNG shall be used such that active cells (all, except Cell 3 in T3) are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols other than those in the subframes with transmitted NPRS.                                                                                                                                                                                                                                                   |             |           |           |           |           |           |
| Note 3:                                                | Interference from other cells and noise sources not specified in the test are assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled.                                                                                                                                                                                                                                                                       |             |           |           |           |           |           |
| Note 4:                                                | If NPRS_RA is not “N/A”, Ê <sub>s</sub> /N <sub>oc</sub> , NPRS Ê <sub>s</sub> /I <sub>ot</sub> , I <sub>o</sub> , NRSRP and NPRP levels have been derived from other parameters and are given for information purpose. If NPRS_RA is “N/A”, I <sub>o</sub> and NRSRP levels have been derived from other parameters and are given for information purpose. These are not settable test parameters. Interference conditions shall be applied to all PRS symbols of DL positioning subframes. |             |           |           |           |           |           |

#### A.4.7.4.2 Test Requirements

The RSTD measurement time fulfils the requirements specified in Clause 4.8.4.

The UE shall perform and report the RSTD measurements for nCell 2 and nCell 3 with respect to the reference cell in the OTDOA assistance data, nCell 1, within  $T_{\text{RSTD\_inter\_NB-IoT-EC}} + T_{\text{RandomAccess\_NB-IoT-EC}} = [67.16]$  s starting from the beginning of time interval T2, to the moment when the UE starts to send preambles on the PRACH for sending the positioning measurement report message to nCell1.

The RSTD measurement time  $T_{\text{RSTD\_inter\_NB-IoT-EC}}$  in the test is derived according to section 4.8.4. This gives the total RSTD measurement time of 11.52 s for Cell 2 and Cell 3 with respect to the reference Cell 1.

The random access to an already detected cell  $T_{\text{RandomAccess\_NB-IoT-EC}}$  can be expressed as:  $T_{\text{evaluate, NB\_inter\_NB-IoT-EC}} + T_{\text{SI}} + T_{\text{PRACH\_NB-IoT}}$ ,

Where:

$T_{\text{evaluate, NB\_inter\_NB-IoT-EC}}$  See Table 4.6.2.4-1 in clause 4.6.2.4

$T_{\text{SI}} = 41560$  ms; it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target NB-IoT FDD cell.

$T_{\text{PRACH\_NB-IoT}} = 1280$  ms; it is the additional delay caused by the random access procedure.

This gives  $T_{\text{RandomAccess\_NB-IoT}} = 55.64$  s for the random access delay to an already detected cell in the test case.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in Clause 9.1.10.3, i.e., between RSTD\_0000 and RSTD\_12711.

---

## A.5 E-UTRAN RRC CONNECTED Mode Mobility

### A.5.1 E-UTRAN Handover

#### A.5.1.1 E-UTRAN FDD - FDD Intra frequency handover

##### A.5.1.1.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency handover requirements specified in clause 5.1.2.1.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.5.1.1.1-1 and A.5.1.1.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

**Table A.5.1.1.1-1: General test parameters for E-UTRAN FDD-FDD intra frequency handover test case**

| Parameter                                   |                   | Unit | Value                                    | Comment                                          |
|---------------------------------------------|-------------------|------|------------------------------------------|--------------------------------------------------|
| PDSCH parameters                            |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                 |
| PCFICH/PDCCH/PHICH parameters               |                   |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                 |
| Initial conditions                          | Active cell       |      | Cell 1                                   |                                                  |
|                                             | Neighbouring cell |      | Cell 2                                   |                                                  |
| Final condition                             | Active cell       |      | Cell 2                                   |                                                  |
| E-UTRA RF Channel Number                    |                   |      | 1                                        | Only one FDD carrier frequency is used.          |
| Channel Bandwidth ( $BW_{\text{channel}}$ ) |                   | MHz  | 10                                       |                                                  |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |          |            |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |            |          |          |

### A.5.1.1.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.1.2.1.2.1.

This gives a total of 50 ms.

### A.5.1.2 E-UTRAN TDD - TDD Intra frequency handover

#### A.5.1.2.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency handover requirements specified in clause 5.2.2.4.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.5.1.2.1-1 and A.5.1.2.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

**Table A.5.1.2.1-1: General test parameters for E-UTRAN TDD-TDD Intra frequency handover test case**

| Parameter                                   |                   | Unit | Value                                    | Comment                                          |
|---------------------------------------------|-------------------|------|------------------------------------------|--------------------------------------------------|

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |          |            |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |            |          |          |

### A.5.1.2.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.4.2.1.

This gives a total of 50 ms.

### A.5.1.3 E-UTRAN FDD – FDD Inter frequency handover

#### A.5.1.3.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD inter-frequency handover requirements specified in clause 5.1.2.1.

The test scenario comprises of two E-UTRA FDD carriers and one cell on each carrier as given in tables A.5.1.3.1-1 and A.5.1.3.1-2. PDCCHs indicating new transmissions shall be sent continuously to ensure that the UE would not enter the DRX state. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of cell 2. Starting T2, cell 2 becomes

detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

**Table A.5.1.3.1-1: General test parameters for E-UTRAN FDD-FDD Inter frequency handover test case**

| Parameter                                  |                   | Unit | Value                                    | Comment                                                  |
|--------------------------------------------|-------------------|------|------------------------------------------|----------------------------------------------------------|
| PDSCH parameters                           |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                         |
| PCFICH/PDCCH/PHICH parameters              |                   |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                         |
| Initial conditions                         | Active cell       |      | Cell 1                                   | Cell 1 is on RF channel number 1                         |
|                                            | Neighbouring cell |      | Cell 2                                   | Cell 2 is on RF channel number 2                         |
| Final condition                            | Active cell       |      | Cell 2                                   |                                                          |

| <div>Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</div> <div>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</div> <div>Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</div> |            |          |          |          |           |          |          |

### A.5.1.3.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.1.2.1.2.1.

This gives a total of 50 ms.

### A.5.1.4 E-UTRAN TDD – TDD Inter frequency handover

#### A.5.1.4.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD inter frequency handover requirements specified in clause 5.2.2.4.

The test scenario comprises of two E-UTRA TDD carriers and one cell on each carrier as given in tables Table A.5.1.4.1-1 and Table A.5.1.4.1-2. PDCCHs indicating new transmissions shall be sent continuously to ensure that the UE would not enter the DRX state. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3.

**Table A.5.1.4.1-1: General test parameters for E-UTRAN TDD-TDD Inter frequency handover test case**

| Parameter                                  |                | Unit | Value                                    | Comment                                          |

They are not settable parameters themselves.</div> |            |          |          |          |           |          |          |

### A.5.1.4.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.4.2.1.

This gives a total of 50 ms.

### A.5.1.5 E-UTRAN FDD – FDD Inter frequency handover: unknown target cell

#### A.5.1.5.1 Test Purpose and Environment

This test is to verify the FDD-FDD inter-frequency handover requirements for the case when the target cell is unknown as specified in clause 5.1.2.1.

The test scenario comprises of two E-UTRA FDD carriers and one cell on each carrier as given in tables A.5.1.5.1-1 and A.5.1.5.1-2. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1 and T2 respectively. At the start of time duration T1, the UE does not have any timing information

of cell 2. Starting T2, cell 2 becomes detectable and the UE is expected to detect and start to transmit the PRACH to Cell 2.

A RRC message implying handover shall be sent to the UE during period T1. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |           |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |           |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |           |          |

### A.5.1.5.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 130 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms, which is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 115 ms in the test. See clause 5.1.2.1.2.1.

This gives a total of 130 ms.

## A.5.1.6 E-UTRAN TDD – TDD Inter frequency handover; unknown Target Cell

### A.5.1.6.1 Test Purpose and Environment

This test is to verify the TDD-TDD inter-frequency handover requirements for the case when the target cell is unknown as specified in clause 5.2.2.4.

The test scenario comprises of two E-UTRA TDD carriers and one cell on each carrier as given in tables A.5.1.6.1-1 and A.5.1.6.1-2. No gap patterns are configured in the test case. The test consists of two successive time periods, with

time durations of T1, T2 respectively. At the start of time duration T1, the UE does not have any timing information of cell 2. Starting T2, cell 2 becomes detectable and the UE receives a RRC handover command from the network. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

**Table A.5.1.6.1-1: General test parameters for the E-UTRAN TDD-TDD Inter-Frequency handover test case when the target cell is unknown**

| Parameter                      |                   | Unit | Value                                    | Comment                                         |
|--------------------------------|-------------------|------|------------------------------------------|-------------------------------------------------|
| PDSCH parameters               |                   |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2                |
| PCFICH/PDCCH/PHICH parameters  |                   |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2                |
| Initial conditions             | Active cell       |      | Cell 1                                   | Cell 1 is on RF channel number 1                |
|                                | Neighbouring cell |      | Cell 2                                   | Cell 2 is on RF channel number 2                |
| Final condition                | Active cell       |      | Cell 2                                   |                                                 |
| E-UTRA RF channel number       |                   |      | 1, 2                                     | Two TDD carriers                                |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |           |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |           |          |
| Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                                                                                             |            |          |          |           |          |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |           |          |
| Note 4: RSRP and SCH_RP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                          |            |          |          |           |          |

### A.5.1.6.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 130 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms, which is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 115 ms in the test. See clause 5.2.2.4.2.1.

This gives a total of 130 ms.

### A.5.1.7 E-UTRAN FDD – TDD Inter frequency handover

#### A.5.1.7.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-TDD inter frequency handover requirements specified in clause 5.2.2.2.

The test scenario comprises of one E-UTRA FDD cell and one E-UTRA TDD cell as given in tables Table A.5.1.7.1-1 , Table A.5.1.7.1-2 and Table A.5.1.7.1-3. PDCCHs indicating new transmissions shall be sent continuously to ensure that the UE would not enter the DRX state. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3.

**Table A.5.1.7.1-1: General test parameters for E-UTRAN FDD-TDD Inter frequency handover test case**

| Parameter                                  |                | Unit | Value                                    | Comment                                                         |
|--------------------------------------------|----------------|------|------------------------------------------|-----------------------------------------------------------------|
| Cell 1 PDSCH parameters                    |                |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                                |
| Cell 1 PCFICH/PDCCH/PHICH parameters       |                |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                                |

| Note 3:                                                                   | RSRP levels have been derived from other parameters for information purposes. They are not settable parameter themselves.                                                                                      |           |          |          |

### A.5.1.7.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.4.2.1.

This gives a total of 50 ms.

## A.5.1.8 E-UTRAN TDD – FDD Inter frequency handover

### A.5.1.8.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-FDD inter-frequency handover requirements specified in clause 5.2.2.3.

The test scenario comprises of one E-UTRA TDD cell and one E-UTRA FDD cell as given in tables Table A.5.1.8.1-1, Table A.5.1.8.1-2 and Table A.5.1.8.1-3. PDCCHs indicating new transmissions should be sent continuously to ensure that the UE would not enter the DRX state. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of cell 2. Starting T2, cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern

configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. The start of T3 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

**Table A.5.1.8.1-1: General test parameters for E-UTRAN TDD-FDD Inter frequency handover test case**

| Parameter                                  |                   | Unit | Value                                    | Comment                                                  |
|--------------------------------------------|-------------------|------|------------------------------------------|----------------------------------------------------------|
| Cell 1 PDSCH parameters                    |                   |      | DL Reference Measurement Channel R.0 TDD | As specified in clause A.3.1.1.2                         |
| Cell 1 PCFICH/PDCCH/PHICH parameters       |                   |      | DL Reference Measurement Channel R.6 TDD | As specified in clause A.3.1.2.2                         |
| Cell 2 PDSCH parameters                    |                   |      | DL Reference Measurement Channel R.0 FDD | As specified in clause A.3.1.1.1                         |
| Cell 2 PCFICH/PDCCH/PHICH parameters       |                   |      | DL Reference Measurement Channel R.6 FDD | As specified in clause A.3.1.2.1                         |
| Initial conditions                         | Active cell       |      | Cell 1                                   | Cell 1 is on RF channel number 1                         |
|                                            | Neighbouring cell |      | Cell 2                                   | Cell 2 is on RF channel number 2                         |
| Final condition                            | Active cell       |      | Cell 2                                   |                                                          |
| Cell 1 E-UTRA RF channel number            |                   |      | 1                                        | One TDD carrier is used                                  |
| Cell 2 E-UTRA RF channel number            |                   |      | 2                                        | One FDD carrier is used                                  |
| Channel Bandwidth (BW <sub>channel</sub> ) |                   | MHz  | 10                                       |                                                          |

They are not settable parameter themselves.                                                                                      |           |          |          |

### A.5.1.8.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{\text{interrupt}}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}}$  = 35 ms in the test;  $T_{\text{interrupt}}$  is defined in clause 5.1.2.1.2.1.

This gives a total of 50 ms.

## A.5.1.9 E-UTRAN FDD - FDD Intra frequency handover for 5MHz bandwidth

### A.5.1.9.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.5.1.1. The test parameters are the same except those described in the following section. The listed parameter values in Tables A.5.1.9.1-1 and A.5.1.9.1-2 will replace the values of corresponding parameters in Tables A.5.1.1.1-1 and A.5.1.1.1-2.

## A.5.1.9.2 Test Requirements

The requirements defined in section A.5.1.1.2 shall apply to this test case.

## A.5.1.10 E-UTRAN FDD - FDD Intra frequency handover for UE category 0

### A.5.1.10.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency handover requirements specified in clause 5.1.2.1.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.5.1.10.1-1 and A.5.1.10.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

**Table A.5.1.10.1-1: General test parameters for E-UTRAN FDD-FDD intra frequency handover test case**

| Parameter                                   |                   | Unit | Value                                     | Comment                                          |
|---------------------------------------------|-------------------|------|-------------------------------------------|--------------------------------------------------|
| PDSCH parameters                            |                   |      | DL Reference Measurement Channel R.13 FDD | As specified in clause A.3.1.1.3                 |
| PCFICH/PDCCH/PHICH parameters               |                   |      | DL Reference Measurement Channel R.6 FDD  | As specified in clause A.3.1.2.1                 |
| Initial conditions                          | Active cell       |      | Cell 1                                    |                                                  |
|                                             | Neighbouring cell |      | Cell 2                                    |                                                  |
| Final condition                             | Active cell       |      | Cell 2                                    |                                                  |
| E-UTRA RF Channel Number                    |                   |      | 1                                         | Only one FDD carrier frequency is used.          |
| Channel Bandwidth ( $BW_{\text{channel}}$ ) |                   | MHz  | 10                                        |                                                  |
| A3-Offset                                   |                   | dB   | 0                                         |                                                  |
| Hysteresis                                  |                   | dB   | 0                                         |                                                  |
| Time To Trigger                             |                   | s    | 0                                         |                                                  |
| Filter coefficient                          |                   |      | 0                                         | L3 filtering is not used                         |
| DRX                                         |                   |      |                                           | OFF                                              |
| CP length                                   |                   |      | Normal                                    |                                                  |
| Access Barring Information                  |                   | -    | Not Sent                                  | No additional delays in random access procedure. |
| PRACH configuration                         |                   |      | 4                                         | As specified in table 5.7.1-2 in TS 36.211       |
| Time offset between cells                   |                   |      | 3 ms                                      | Asynchronous cells                               |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |          |            |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |            |          |          |

### A.5.1.10.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.1.2.1.2.1.

This gives a total of 50 ms.

### A.5.1.11 E-UTRAN HD - FDD Intra frequency handover for UE category 0

#### A.5.1.11.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency handover requirements specified in clause 5.2.2.5.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.5.1.11.1-1 and A.5.1.11.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

They are not settable parameters themselves.</div> |            |          |          |          |            |          |          |

### A.5.1.11.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.5.2.1.

This gives a total of 50 ms.

## A.5.1.12 E-UTRAN TDD - TDD Intra frequency handover for UE category 0

### A.5.1.12.1 Test Purpose and Environment

This test is to verify the requirement for the TDD-TDD intra frequency handover requirements specified in clause 5.2.2.4.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.5.1.12.1-1 and A.5.1.12.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of cell 2.

E-UTRAN shall send a RRC message implying handover to cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

| Propagation Condition                                                                                                                                                                                                  |            | AWGN     |          |          |            |          |          |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |          |          |          |            |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |          |          |          |            |          |          |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |          |          |          |            |          |          |

### A.5.1.12.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 50 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 35 ms in the test;  $T_{interrupt}$  is defined in clause 5.2.2.4.2.1.

This gives a total of 50 ms.

### A.5.1.13 E-UTRAN FDD-FDD Intra frequency handover for Cat-M1 UEs in CEModeA

#### A.5.1.13.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency handover requirements specified in clause 5.5.2.1.

The test scenario comprises of one E-UTRA FDD carrier and two cells as given in tables A.5.1.13.1-1 and A.5.1.13.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

E-UTRAN shall send a RRC message implying handover to Cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

During the test, UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.13.1-1: General test parameters for E-UTRAN FDD-FDD intra frequency handover for Cat-M1 UEs in CEModeA test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    |                                                  |
|                            | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1         | Only one FDD carrier frequency is used.          |
| A3-Offset                  |                   | dB   | 0         |                                                  |
| Hysteresis                 |                   | dB   | 0         |                                                  |
| Time To Trigger            |                   | s    | 0         |                                                  |
| Filter coefficient         |                   |      | 0         | L3 filtering is not used                         |
| DRX                        |                   |      |           | OFF                                              |
| CP length                  |                   |      | Normal    |                                                  |
| Access Barring Information |                   | -    | Not Sent  | No additional delays in random access procedure. |
| PRACH configuration        |                   |      | PRACH_4CE | As specified in A.3.16                           |
| PRACH initial CE level     |                   |      | 0         | Specified in the handover message                |
| T1                         |                   | s    | 5         |                                                  |
| T2                         |                   | s    | ≤5        |                                                  |
| T3                         |                   | s    | 1         |                                                  |

| Timing offset to Cell 1 Asynchronous cells                                                                                                                                                                                    | ms         | -         |           |          | 3                               |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |           |           |          |                                 |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |           |           |          |                                 |          |           |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                                                |            |           |           |          |                                 |          |           |

### A.5.1.13.2 Test Requirements

The UE shall finish the transmission of all repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 170 ms.

## A.5.1.14 E-UTRAN HD-FDD Intra frequency handover for Cat-M1 UEs in CEModeA

### A.5.1.14.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency handover requirements specified in clause 5.5.2.2.

The test scenario comprises of 1 E-UTRA FDD carrier and 2 cells as given in tables A.5.1.14.1-1 and A.5.1.14.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

E-UTRAN shall send a RRC message implying handover to Cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

During the test, UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.14.1-1: General test parameters for E-UTRAN HD-FDD intra frequency handover for Cat-M1 UEs in CEModeA test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    |                                                  |
|                            | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1         | Only one FDD carrier frequency is used.          |

| Timing offset to Cell 1 Asynchronous cells                                                                                                                                                                                    | ms         | -           |             |          | 3                               |          |             |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |             |             |          |                                 |          |             |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |             |             |          |                                 |          |             |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves                                                                                 |            |             |             |          |                                 |          |             |

### A.5.1.14.2 Test Requirements

The UE shall finish the transmission of all the repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.1.2.

This gives a total of 170 ms.

## A.5.1.15 E-UTRAN TDD Intra frequency handover for Cat-M1 UEs in CEModeA

### A.5.1.15.1 Test Purpose and Environment

This test is to verify the requirement for the TDD intra frequency handover requirements specified in clause 5.5.2.3.

The test scenario comprises of 1 E-UTRA TDD carrier and 2 cells as given in tables A.5.1.15.1-1 and A.5.1.15.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

E-UTRAN shall send a RRC message implying handover to Cell 2. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

During the test, UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.15.1-1: General test parameters for E-UTRAN TDD Intra frequency handover for Cat-M1 UEs in CEModeA test case**

| Parameter                      |                   | Unit | Value     | Comment                                          |
|--------------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions             | Active cell       |      | Cell 1    |                                                  |
|                                | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition                | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number       |                   |      | 1         | Only one TDD carrier frequency is used.          |

| Timing offset to Cell 1 Synchronous cells                                                                                                                                                                              | μs         | -         |           |          | 3                               |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |                                 |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |                                 |          |           |
| Note 3: Es/Iot, RSRP and Io level has been derived from other parameters for information purpose. They are not settable parameters themselves                                                                          |            |           |           |          |                                 |          |           |

### A.5.1.15.2 Test Requirements

The UE shall finish the transmission of all the repetitions of the PRACH to Cell 2 less than 170 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{\text{interrupt}} = 120 + 35 \text{ ms}$  in the test;  $T_{\text{interrupt}}$  is defined in clause 5.5.2.3.2.

This gives a total of 170 ms.

## A.5.1.16 E-UTRAN FDD-FDD Intra frequency handover for Cat-M1 UEs in CEModeB

### A.5.1.16.1 Test Purpose and Environment

This test is to verify the requirement for the FDD-FDD intra frequency handover requirements specified in clause 5.6.2.1.

The test scenario comprises of one E-UTRA FDD carrier and two cells as given in tables A.5.1.16.1-1 and A.5.1.16.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

During period T2, the UE should report Event A3, and afterwards E-UTRAN shall send a RRC message to the UE implying handover to Cell 2. T3 is defined as the end of the last TTI containing the RRC message from UE implying handover.

During the test, the UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.16.1-1: General test parameters for E-UTRAN FDD-FDD intra frequency handover for Cat-M1 UEs in CEModeB test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    |                                                  |
|                            | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| E-UTRA RF Channel Number   |                   |      | 1         | Only one FDD carrier frequency is used.          |
| A3-Offset                  |                   | dB   | 0         |                                                  |
| Hysteresis                 |                   | dB   | 0         |                                                  |
| Time To Trigger            |                   | s    | 0         |                                                  |
| Filter coefficient         |                   |      | 0         | L3 filtering is not used                         |
| DRX                        |                   |      |           | OFF                                              |
| CP length                  |                   |      | Normal    |                                                  |
| Access Barring Information |                   | -    | Not Sent  | No additional delays in random access procedure. |
| PRACH configuration        |                   |      | PRACH_4CE | As specified in A.3.16                           |
| PRACH initial CE level     |                   |      | 0         | Specified in handover message                    |
| T1                         |                   | s    | 5         |                                                  |
| T2                         |                   | s    | ≤5        |                                                  |
| T3                         |                   | s    | 5         |                                                  |
| Gap pattern ID             |                   |      | 1         |                                                  |

| Timing offset to Cell 1 Asynchronous cells                                                                                                                                                                             | ms         | -         |           |          | 3                               |          |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |            |           |           |          |                                 |          |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |           |          |                                 |          |           |
| Note 3: Es/I <sub>ot</sub> , RSRP and I <sub>0</sub> level has been derived from other parameters for information purpose. They are not settable parameters themselves.                                                |            |           |           |          |                                 |          |           |

### A.5.1.16.2 Test Requirements

The UE shall finish transmission of all repetitions of the PRACH to Cell 2 less than 2610ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90%.

NOTE: The handover delay can be expressed as: RRC procedure delay +  $T_{interrupt}$ , where:

RRC procedure delay = 15 ms and is specified in clause 11.2 in TS 36.331 [2].

$T_{interrupt}$  = 2560ms + 35ms = 2595ms is defined in clause 5.6.2.1.2.

This gives a total of 2610ms.

## A.5.1.17 E-UTRAN HD-FDD Intra frequency handover for Cat-M1 UEs in CEModeB

### A.5.1.17.1 Test Purpose and Environment

This test is to verify the requirement for the HD-FDD intra frequency handover requirements specified in clause 5.6.2.2.

The test scenario comprises of one E-UTRA FDD carrier and two cells as given in tables A.5.1.17.1-1 and A.5.1.17.1-2. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

During period T2, the UE should report Event A3, and afterwards E-UTRAN shall send a RRC message to the UE implying handover to Cell 2. During T3 is defined as the end of the last TTI containing the RRC message from UE implying handover.

During the test, UE is configured with measurement gap for cell search, because the narrowband of the PDSCH Reference Measurement Channel does not overlap with the centre 6 PRBs of the carrier bandwidth.

**Table A.5.1.17.1-1: General test parameters for E-UTRAN HD-FDD intra frequency handover for Cat-M1 UEs in CEModeB test case**

| Parameter                  |                   | Unit | Value     | Comment                                          |
|----------------------------|-------------------|------|-----------|--------------------------------------------------|
| Initial conditions         | Active cell       |      | Cell 1    |                                                  |
|                            | Neighbouring cell |      | Cell 2    |                                                  |
| Final condition            | Active cell       |      | Cell 2    |                                                  |
| A3-Offset                  |                   | dB   | 0         |                                                  |
