| Note 1:                                           | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |                                                                                                 |                                       |                                       |                                                                                                 |                                       |                                       |                                                                                                 |                                       |                                       |
| Note 2:                                           | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |                                                                                                 |                                       |                                       |                                                                                                 |                                       |                                       |                                                                                                 |                                       |                                       |
| Note 3:                                           | $\hat{E}_s/I_{ot}$ , RSRP, $I_o$ and SCH_RP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                              |                                                                                                 |                                       |                                       |                                                                                                 |                                       |                                       |                                                                                                 |                                       |                                       |

### A.8.23.22.2 Test Requirements

The UE shall transmit a measurement report containing the cell global identifier of cell 3 within 170 milliseconds from the start of T3.

$$\begin{aligned}
 \text{Test requirement} &= \text{RRC Procedure delay} + T_{\text{identify\_CGI, inter}} + \text{reporting delay} \\
 &= 15 + 150 + 2\text{ms from the start of T3} \\
 &= 167 \text{ ms, allow 170 ms.}
 \end{aligned}$$

The UE shall be scheduled continuously throughout the test, and from the start of T3 until 170 ms at least 80 ACK/NACK shall be detected both on cells in MCG and SCG as being transmitted by the UE.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The overall 80 ACK/NACK number is caused by two parts. Firstly, at least 60 ACK/NACK shall be sent both on cells in MCG and SCG during identifying the cell global identifier of cell 3 according to the requirement in Clause 8.8.6.1. Secondly, given that continuous DL data allocation, and the measurement gaps have been deconfigured before the start of T3, additional 20 ACK/NACK shall be sent both on cells in MCG and SCG from the start of T3 until 170 ms excludes 150 ms for identifying the cell global identifier of cell 3.

## A.8.23.23 E-UTRAN TDD - TDD DC Inter-frequency identification of a new CGI of E-UTRA cell using autonomous gaps in synchronous DC

### A.8.23.23.1 Test Purpose and Environment

This test is to verify the requirement for identification of a new CGI of E-UTRA cell using autonomous gaps in synchronous DC in clause 8.8.6.1.

The test scenario comprises of three E-UTRA TDD cells, PCell (Cell 1), PSCell (Cell 2) and neighbour cell (Cell 3) and each cell on one carrier as given in tables A.8.23.23.1-1 and A.8.23.23.1-2. PDCCHs indicating new transmissions shall be sent continuously to ensure that the UE would have ACK/NACK sending during identifying a new CGI of E-UTRAN cell. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of cell 3. Starting T2, cell 3 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in Table 8.1.2.1-1 is configured before T2 begins to enable inter-frequency monitoring.

A RRC message implying SI reading shall be sent to the UE during period T2, after the UE has reported Event A3. The RRC message shall create a measurement report configuration with purpose *reportCGI* and *si-RequestForHO* set to TRUE. The start of T3 is the instant when the last TTI containing the RRC message implying SI reading is sent to the UE. Measurement gaps shall be deconfigured before the start of T3.

**Table A.8.23.23.1-1: General test parameters for E-UTRAN TDD - TDD Inter-frequency identification of a new CGI of E-UTRA cell using autonomous gaps in synchronous DC**

| Note 3:                                            | $\hat{E}_s/I_{ot}$ , RSRP, I <sub>o</sub> and SCH_RP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                            |                                                                                                 |                                                |                                                |                                                                                                 |                                                |                                                |                                                                                                 |                                                |                                                |

### A.8.23.23.2 Test Requirements

The UE shall transmit a measurement report containing the cell global identifier of cell 3 within 170 milliseconds from the start of T3.

Test requirement = RRC Procedure delay +  $T_{identify\_CGI\_inter}$  + reporting delay

= 15 + 150 + 2ms from the start of T3

= 167 ms, allow 170 ms.

The UE shall be scheduled continuously throughout the test, and from the start of T3 until 170 ms at least 42 ACK/NACK shall be detected both on cells in MCG and SCG as being transmitted by the UE.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The overall 42 ACK/NACK number is caused by two parts. Firstly, at least 30 ACK/NACK shall be sent both on cells in MCG and SCG during identifying the cell global identifier of cell 3 according to the requirement in Clause 8.8.6.1. Secondly, given that continuous DL data allocation and the measurement gaps have been deconfigured before the start of T3, additional 12 ACK/NACK shall be sent both on cells in MCG and SCG from the start of T3 until 170 ms excludes 150 ms for identifying the cell global identifier of cell 3.

## A.8.23.24 E-UTRAN FDD-FDD DC activation and deactivation of known SCell in Non-DRX in synchronous DC

### A.8.23.24.1 Test Purpose and Environment

The purpose of this test is to verify that SCell activation and deactivation requirements specified in clause 7.18 for Dual Connectivity, when the SCell is known by the UE at the time of activation.

The test parameters are given in Tables A.8.23.24-1 and cell-specific parameters in A.8.23.24-2 below. The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. There are three carriers, each with one cell. All cells have constant signal levels throughout the test. Before the test starts the UE is connected to Cell 1 (PCell) on radio channel 1 (PCC) and Cell 2 (PSCell) on radio channel 2, but is not aware of Cell 3 (SCell1 in MCG) on radio channel 3 (SCC1). The UE is only monitoring the PCC and the frequency of PSCell. The UE shall be continuously scheduled in the PCell and PSCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the SCell1 becomes configured on SCC1. The UE now starts monitoring also the SCC1. The test equipment sends a MAC message for activation of the SCell1.

The point in time at which a MAC message is received at the UE antenna connector, in a subframe # denoted  $m$  which is an even number, defines the start of time period T2. The UE shall be able to report valid CSI for the activated SCell1 at latest in subframe  $(m+24)$ . The UE shall start reporting CSI for SCell1 in subframe  $(m+8)$  and shall report CQI index 0 (out-of-range) until the SCell activation has been completed. Any PCell and PSCell interruption due to activation of SCell1 shall not occur outside subframes  $(m+5)$  to  $(m+9)$ .

Time period T3 starts when a MAC message for deactivation of SCell1, sent from the test equipment to the UE in a subframe # denoted  $n$ , is received at the UE antenna connector. The UE shall carry out deactivation of SCell1 at latest in subframe  $(n+8)$ , and any PCell and PSCell interruption due to the deactivation of SCell1 shall not occur outside subframes  $(n+5)$  to  $(n+9)$ .

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell and PSCell during activation and deactivation of the SCell1, respectively.

The test equipment verifies the activation time by counting the subframes from the time when the SCell1 activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the subframes from the time when the SCell1 deactivation command is sent until CQI reporting for SCell1 is discontinued.

**Table A.8.23.24-1: General test parameters for E-UTRAN FDD-FDD DC activation and deactivation of known SCell in non-DRX**

| Parameter                                               | Unit | Value   | Comment                                                                                      |
|---------------------------------------------------------|------|---------|----------------------------------------------------------------------------------------------|
| E-UTRA RF Channel Number                                |      | 1, 2, 3 | Three radio channels are used for this test                                                  |
| Active PCell                                            |      | Cell 1  | PCell on RF channel number 1.                                                                |
| Configured PSCell                                       |      | Cell 2  | PSCell on RF channel number 2.                                                               |
| Deconfigured SCell in MCG                               |      | Cell 3  | Deconfigured SCell in MCG on RF channel number 3.                                            |
| CP length                                               |      | Normal  |                                                                                              |
| DRX                                                     |      | OFF     | Continuous monitoring of primary cell                                                        |
| CQI/PMI periodicity and offset configuration index      |      | 0       | CQI reporting for SCells every second subframe                                               |
| Cell-individual offset for cells on RF channel number 1 | dB   | 0       | Individual offset for cells on PCC.                                                          |
| Cell-individual offset for cells on RF channel number 2 | dB   | 0       | Individual offset for cells on the frequency of PSCell.                                      |
| Cell-individual offset for cells on RF channel number 3 | dB   | 0       | Individual offset for cells on SCC1.                                                         |
| Filter coefficient                                      |      | 0       | L3 filtering is not used                                                                     |
| SCell measurement cycle (measCycleSCell)                | ms   | 320     |                                                                                              |
| T1                                                      | s    | 7       | During this time the PCell and PSCell shall be known and the SCell1 configured and detected. |
| T2                                                      | s    | 1       | During this time the UE shall activate the SCell1.                                           |
| T3                                                      | s    | 1       | During this time the UE shall deactivate the SCell1.                                         |

**Table A.8.23.24-2: Cell specific test parameters for E-UTRAN FDD-FDD DC activation and deactivation of known SCell in non-DRX**

| Parameter                                                                | Unit                                                                                                                                                                                                                  | Cell 1                                                                                          |    |    | Cell 2                                                                                          |    |    | Cell 3                                                                                          |    |    |

| Note 2:                                                                  | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |                                                                                                 |    |    |                                                                                                 |    |    |                                                                                                 |    |    |
| Note 3:                                                                  | E <sub>s</sub> /I <sub>ot</sub> , RSRP, SCH_RP and I <sub>o</sub> have been derived from other parameters for information purposes. They are not settable parameters themselves.                                      |                                                                                                 |    |    |                                                                                                 |    |    |                                                                                                 |    |    |
| Note 4:                                                                  | The uplink resources for CSI reporting are assigned to the UE prior to the start of time period T2.                                                                                                                   |                                                                                                 |    |    |                                                                                                 |    |    |                                                                                                 |    |    |
| Note 5:                                                                  | Receive time difference between subframe boundaries of signals received from the two cells at the UE antenna connector including time alignment error between the two cells.                                          |                                                                                                 |    |    |                                                                                                 |    |    |                                                                                                 |    |    |

### A.8.23.24.2 Test Requirements

During T2 the UE shall send the first CSI report for SCell1 in a subframe (m+8), or in a subframe (m+10) if the subframe (m+8) was subject to interruption. Whether CSI report in subframe (m+8) was interrupted or not is checked by monitoring ACK/NACK sent in PCell in subframe (m+8).

During T2 the UE shall start sending CSI reports for SCell1 with non-zero CQI index at latest in a subframe (m+24).

During T3 the UE shall stop sending CSI reports for SCell1 at latest in a subframe (n+8).

During T2 interruption of PCell during the SCell activation shall not happen outside the subframes (m+5) to (m+9).

During T2 interruption of PSCell during the SCell activation shall not happen outside the subframes (m+5) to (m+9).

During T3 interruption of PCell during the SCell deactivation shall not happen outside the subframes (n+5) to (n+9).

During T3 interruption of PSCell during the SCell deactivation shall not happen outside the subframes (n+5) to (n+9).

The interruption of PCell shall not be more than 1ms.

The interruption of PSCell shall not be more than 1ms.

All of the above test requirements shall be fulfilled in order for the observed SCell1 activation delay and SCell1 deactivation delay to be counted as correct. The rate of correct observed SCell1 activation delay and SCell1 deactivation delay during repeated tests shall be at least 90%.

NOTE: During T2 if there are no uplink resources for reporting the valid CSI in a subframe (m+24) then the UE shall use the next available uplink resource for reporting the corresponding valid CSI.

## A.8.23.25 E-UTRAN FDD-FDD DC activation and deactivation of known SCell in Non-DRX in asynchronous DC

### A.8.23.25.1 Test Purpose and Environment

The purpose of this test is to verify that SCell activation and deactivation requirements specified in clause 7.18 for Dual Connectivity, when the SCell is known by the UE at the time of activation.

The test parameters are given in Tables A.8.23.25-1 and cell-specific parameters in A.8.23.25-2 below. The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. There are three carriers, each with one cell. All cells have constant signal levels throughout the test. Before the test starts the UE is connected to Cell 1 (PCell) on radio channel 1 (PCC) and Cell 2 (PSCell) on radio channel 2, but is not aware of Cell 3 (SCell1 in MCG) on radio channel 3 (SCC1). The UE is only monitoring the PCC and the frequency of PSCell. The UE shall be continuously scheduled in the PCell and PSCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the SCell1 becomes configured on SCC1. The UE now starts monitoring also the SCC1. The test equipment sends a MAC message for activation of SCell1.

The point in time at which a MAC message is received at the UE antenna connector, in a subframe # denoted m which is an even number, defines the start of time period T2. The UE shall be able to report valid CSI for the activated SCell1 at latest in subframe (m+24). The UE shall start reporting CSI for SCell1 in subframe (m+8) and shall report CQI index 0 (out-of-range) until the SCell activation has been completed. Any PCell and PSCell interruption due to activation of SCell1 shall not occur outside subframes (m+5) to (m+9).

Time period T3 starts when a MAC message for deactivation of SCell1, sent from the test equipment to the UE in a subframe # denoted n, where n is 4 or 9, is received at the UE antenna connector. The UE shall carry out deactivation of SCell1 at latest in subframe (n+8), and any PCell and PSCell interruption due to the deactivation of the SCell shall not occur outside subframes (n+5) to (n+9).

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell and PSCell during activation and deactivation of SCell1, respectively.

The test equipment verifies the activation time by counting the subframes from the time when the SCell1 activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the subframes from the time when the SCell1 deactivation command is sent until CQI reporting for SCell1 is discontinued.

**Table A.8.23.25-1: General test parameters for E-UTRAN FDD-FDD DC activation and deactivation of known SCell in non-DRX**

| Parameter                                               | Unit | Value   | Comment                                                                                      |
|---------------------------------------------------------|------|---------|----------------------------------------------------------------------------------------------|
| E-UTRA RF Channel Number                                |      | 1, 2, 3 | Three radio channels are used for this test                                                  |
| Active PCell                                            |      | Cell 1  | PCell on RF channel number 1.                                                                |
| Configured PSCell                                       |      | Cell 2  | PSCell on RF channel number 2.                                                               |
| Deconfigured SCell in MCG                               |      | Cell 3  | Deconfigured SCell in MCG on RF channel number 3.                                            |
| CP length                                               |      | Normal  |                                                                                              |
| DRX                                                     |      | OFF     | Continuous monitoring of primary cell                                                        |
| CQI/PMI periodicity and offset configuration index      |      | 0       | CQI reporting for SCells every second subframe                                               |
| Cell-individual offset for cells on RF channel number 1 | dB   | 0       | Individual offset for cells on PCC.                                                          |
| Cell-individual offset for cells on RF channel number 2 | dB   | 0       | Individual offset for cells on the frequency of PSCell.                                      |
| Cell-individual offset for cells on RF channel number 3 | dB   | 0       | Individual offset for cells on SCC1.                                                         |
| Filter coefficient                                      |      | 0       | L3 filtering is not used                                                                     |
| SCell measurement cycle (measCycleSCell)                | ms   | 320     |                                                                                              |
| T1                                                      | s    | 7       | During this time the PCell and PSCell shall be known and the SCell1 configured and detected. |
| T2                                                      | s    | 1       | During this time the UE shall activate the SCell1.                                           |
| T3                                                      | s    | 1       | During this time the UE shall deactivate the SCell1.                                         |

**Table A.8.23.25-2: Cell specific test parameters for E-UTRAN FDD-FDD DC activation and deactivation of known SCell in non-DRX**

| Parameter                                                                | Unit                                                                                                                                                                                                                  | Cell 1                                                                                          |    |    | Cell 2                                                                                          |    |    | Cell 3                                                                                          |    |    |

| Note 5:                                                                  | Receive time difference between subframe boundaries of signals received from the two cells at the UE antenna connector including time alignment error between the two cells.                                          |                                                                                                 |    |    |                                                                                                 |    |    |                                                                                                 |    |    |

### A.8.23.25.2 Test Requirements

During T2 the UE shall send the first CSI report for SCell1 in a subframe (m+8), or in a subframe (m+10) if the subframe (m+8) was subject to interruption. Whether CSI report in subframe (m+8) was interrupted or not is checked by monitoring ACK/NACK sent in PCell in subframe (m+8).

During T2 the UE shall start sending CSI reports for SCell1 with non-zero CQI index at latest in a subframe (m+24).

During T3 the UE shall stop sending CSI reports for SCell1 at latest in a subframe (n+8).

During T2 interruption of PCell during the SCell activation shall not happen outside the subframes (m+5) to (m+9).

During T2 interruption of PSCell during the SCell activation shall not happen outside the subframes (m+5) to (m+9).

During T3 interruption of PCell during the SCell deactivation shall not happen outside the subframes (n+5) to (n+9).

During T3 interruption of PSCell during the SCell deactivation shall not happen outside the subframes (n+5) to (n+9).

The interruption of PCell shall not be more than 1ms.

The interruption of PSCell shall not be more than 2ms.

All of the above test requirements shall be fulfilled in order for the observed SCell1 activation delay and SCell1 deactivation delay to be counted as correct. The rate of correct observed SCell1 activation delay and SCell1 deactivation delay during repeated tests shall be at least 90%.

NOTE: During T2 if there are no uplink resources for reporting the valid CSI in a subframe (m+24) then the UE shall use the next available uplink resource for reporting the corresponding valid CSI.

## A.8.23.26 E-UTRAN TDD-TDD DC activation and deactivation of known SCell in Non-DRX in synchronous DC

### A.8.23.26.1 Test Purpose and Environment

The purpose of this test is to verify that SCell activation and deactivation requirements specified in clause 7.18 for Dual Connectivity, when the SCell is known by the UE at the time of activation.

The test parameters are given in Tables A.8.23.26-1 and cell-specific parameters in A.8.23.26-2 below. The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. There are three carriers, each with one cell. All cells have constant signal levels throughout the test. Before the test starts the UE is connected to Cell 1 (PCell) on radio channel 1 (PCC) and Cell 2 (PSCell) on radio channel 2, but is not aware of Cell 3 (SCell1 in MCG) on radio channel 3 (SCC1). The UE is only monitoring the PCC and the frequency of PSCell. The UE shall be continuously scheduled in the PCell and PSCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the SCell1 becomes configured on SCC1. The UE now starts monitoring also the SCC1. The test equipment sends a MAC message for activation of the SCell1.

The point in time at which a MAC message is received at the UE antenna connector, in a subframe # denoted m, where m is 4 or 9, defines the start of time period T2. The UE shall be able to report valid CSI for the activated SCell1 at latest in subframe (m+24). The UE shall start reporting CSI for SCell1 in subframe (m+8) and shall report CQI index 0 (out-of-range) until the SCell activation has been completed. Any PCell and PSCell interruption due to activation of the SCell shall not occur outside subframes (m+5) to (m+11).

Time period T3 starts when a MAC message for deactivation of SCell1, sent from the test equipment to the UE in a subframe # denoted n, is received at the UE antenna connector. The UE shall carry out deactivation of the SCell1 at latest in subframe (n+8), and any PCell and PSCell interruption due to the deactivation of the SCell shall not occur outside subframes (n+5) to (n+11).

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell and PSCell during activation and deactivation of SCell1, respectively.

The test equipment verifies the activation time by counting the subframes from the time when the SCell1 activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the subframes from the time when the SCell1 deactivation command is sent until CQI reporting for SCell1 is discontinued.

**Table A.8.23.26-1: General test parameters for E-UTRAN TDD-TDD DC activation and deactivation of known SCell in non-DRX**

| Parameter                                               | Unit | Value   | Comment                                                                                      |
|---------------------------------------------------------|------|---------|----------------------------------------------------------------------------------------------|
| E-UTRA RF Channel Number                                |      | 1, 2, 3 | Three radio channels are used for this test                                                  |
| Active PCell                                            |      | Cell 1  | PCell on RF channel number 1.                                                                |
| Configured PSCell                                       |      | Cell 2  | PSCell on RF channel number 2.                                                               |
| Deconfigured SCell in MCG                               |      | Cell 3  | Deconfigured SCell in MCG on RF channel number 3.                                            |
| CP length                                               |      | Normal  |                                                                                              |
| DRX                                                     |      | OFF     | Continuous monitoring of primary cell                                                        |
| CQI/PMI periodicity and offset configuration index      |      | 0       | CQI reporting for SCells every second subframe                                               |
| Cell-individual offset for cells on RF channel number 1 | dB   | 0       | Individual offset for cells on PCC.                                                          |
| Cell-individual offset for cells on RF channel number 2 | dB   | 0       | Individual offset for cells on the frequency of PSCell.                                      |
| Cell-individual offset for cells on RF channel number 3 | dB   | 0       | Individual offset for cells on SCC1.                                                         |
| Filter coefficient                                      |      | 0       | L3 filtering is not used                                                                     |
| SCell measurement cycle (measCycleSCell)                | ms   | 320     |                                                                                              |
| T1                                                      | s    | 7       | During this time the PCell and PSCell shall be known and the SCell1 configured and detected. |
| T2                                                      | s    | 1       | During this time the UE shall activate the SCell1.                                           |
| T3                                                      | s    | 1       | During this time the UE shall deactivate the SCell1.                                         |

**Table A.8.23.26-2: Cell specific test parameters for E-UTRAN TDD-TDD DC activation and deactivation of known SCell in non-DRX**

| Parameter                                                                | Unit                                                                                                                                                                                                                  | Cell 1                                                                                          |    |    | Cell 2                                                                                          |    |    | Cell 3                                                                                          |    |    |

### A.8.23.26.2 Test Requirements

During T2 the UE shall send the first CSI report for SCell1 in a subframe (m+8), or in a subframe (m+9) if the subframe (m+8) was subject to interruption. Whether CSI report in subframe (m+8) was interrupted or not is checked by monitoring ACK/NACK sent in PCell in subframe (m+8).

During T2 the UE shall start sending CSI reports for SCell1 with non-zero CQI index at latest in a subframe (m+24).

During T3 the UE shall stop sending CSI reports for SCell1 at latest in a subframe (n+8).

During T2 interruption of PCell during the SCell activation shall not happen outside the subframes (m+5) to (m+11).

During T2 interruption of PSCell during the SCell activation shall not happen outside the subframes (m+5) to (m+11).

During T3 interruption of PCell during the SCell deactivation shall not happen outside the subframes (n+5) to (n+11).

During T3 interruption of PSCell during the SCell deactivation shall not happen outside the subframes (n+5) to (n+11).

The interruption of PCell shall not be more than 1ms.

The interruption of PSCell shall not be more than 1ms.

All of the above test requirements shall be fulfilled in order for the observed SCell1 activation delay and SCell1 deactivation delay to be counted as correct. The rate of correct observed SCell1 activation delay and SCell1 deactivation delay during repeated tests shall be at least 90%.

NOTE: During T2 if there are no uplink resources for reporting the valid CSI in a subframe (m+24) then the UE shall use the next available uplink resource for reporting the corresponding valid CSI.

## A.8.23.27 E-UTRAN FDD-FDD DC event triggered reporting under deactivated SCell with PCell and PSCell interruption in non-DRX in synchronous DC

### A.8.23.27.1 Test Purpose and Environment

The purpose of this test is to verify that in FDD-FDD DC the UE correctly detects event A6 (Neighbour becomes better than SCell) defined in TS 36.331 [2] within the requirements stated in clause 8.8.8 while at the same time fulfilling the requirement on interruption rate stated in clause 7.12.

In this test case there are three cells: Cell1, Cell2, Cell3 and Cell4. Cell 1 is the PCell on the FDD primary component carrier, Cell 2 is the configured PSCell on the FDD carrier 2, Cell 3 is the configured deactivated SCell on the FDD carrier 3 in MCG, and Cell 4 is the neighbour cell on carrier 3. It is indicated to the UE in the measurement control information that event-triggered reporting with Event A6 is used. The test consists of two successive time periods, with duration of T1 and T2, respectively. During T1 the UE shall not have any information of Cell 4. Immediately at beginning of T2 the transmission power of cell 4 is increased to same level as for cell 3, and due to usage of an offset this shall result in reporting of Event A6. PDCCH indicating a new transmission on the PCell and PSCell shall be sent continuously to ensure that the UE sends ACK/NACKs throughout the test.

The test parameters are given in Table A.8.23.27.1-1 and Table A.8.23.27.1-2 below.

**Table A.8.23.27.1-1: General test parameters for E-UTRAN FDD-FDD CA Event triggered reporting on configured but deactivated SCell with PCell interruption in non-DRX with PCell in FDD**

| Parameter                                               |                 | Unit | Value   | Comment                                                                                                                             |

They are not settable parameters themselves.                                            |            |                                                                                                 |    |                                                                                                 |    |                                                                                                 |                                             |                                                                                                 |       |
| Note 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                                                                                                    |            |                                                                                                 |    |                                                                                                 |    |                                                                                                 |                                             |                                                                                                 |       |
| Note 5: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.                                                                                 |            |                                                                                                 |    |                                                                                                 |    |                                                                                                 |                                             |                                                                                                 |       |

### A.8.23.27.2 Test Requirements

The UE shall send one Event A6 triggered measurement report for cell 3, with a measurement reporting delay less than 25.6s from the beginning of time period T2.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The UE shall be scheduled on PCell and PSCell continuously throughout the test. From the start of T1 until the measurement report is received during T2, at least 99.5% of all expected ACK/NACKs on the PCell and at least 99.5% of all expected ACK/NACKs on the PSCell shall be transmitted by the UE. Each interruption length shall not exceed 1 subframe.

For a test to be considered successful requirements on both event detection and percentage of transmitted ACK/NACKs have to be fulfilled simultaneously.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times \text{TTIDCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.8.23.28 E-UTRAN FDD-FDD DC event triggered reporting under deactivated SCell with PCell and PSCell interruption in non-DRX in asynchronous DC

#### A.8.23.28.1 Test Purpose and Environment

The purpose of this test is to verify that in FDD-FDD DC the UE correctly detects event A6 (Neighbour becomes better than SCell) defined in TS 36.331 [2] within the requirements stated in clause 8.8.8 while at the same time fulfilling the requirement on interruption rate stated in clause 7.12.

In this test case there are three cells: Cell1, Cell2, Cell3 and Cell4. Cell 1 is the PCell on the FDD primary component carrier, Cell 2 is the configured PSCell on the FDD carrier 2, Cell 3 is the configured deactivated SCell on the FDD carrier 3 in MCG, and Cell 4 is the neighbour cell on carrier 3. It is indicated to the UE in the measurement control information that event-triggered reporting with Event A6 is used. The test consists of two successive time periods, with duration of T1 and T2, respectively. During T1 the UE shall not have any information of Cell 4. Immediately at beginning of T2 the transmission power of cell 4 is increased to same level as for cell 3, and due to usage of an offset this shall result in reporting of Event A6. PDCCH indicating a new transmission on the PCell and PSCell shall be sent continuously to ensure that the UE sends ACK/NACKs throughout the test.

The test parameters are given in Table A.8.23.28.1-1 and Table A.8.23.28.1-2 below.

|         |                                                                                                                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 1: | OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                           |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 3: | $E_s/I_{ot}$ , $RSRP$ , $SCH\_RP$ and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                              |
| Note 4: | The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                                                                                             |
| Note 5: | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.                                                                          |

## A.8.23.28.2 Test Requirements

The UE shall send one Event A6 triggered measurement report for cell 3, with a measurement reporting delay less than 25.6s from the beginning of time period T2.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The UE shall be scheduled on PCell and PSCell continuously throughout the test. From the start of T1 until the measurement report is received during T2, at least 99.5% of all expected ACK/NACKs on the PCell and at least 99.5% of all expected ACK/NACKs on the PSCell shall be transmitted by the UE. Each interruption length shall not exceed 1 subframes on PCell and 2 subframes on PSCell, respectively.

For a test to be considered successful requirements on both event detection and percentage of transmitted ACK/NACKs have to be fulfilled simultaneously.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times T_{TTIDCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.23.29 E-UTRAN TDD-TDD DC event triggered reporting under deactivated SCell with PCell and PSCell interruption in non-DRX in synchronous DC

### A.8.23.29.1 Test Purpose and Environment

The purpose of this test is to verify that in TDD-TDD DC the UE correctly detects event A6 (Neighbour becomes better than SCell) defined in TS 36.331 [2] within the requirements stated in clause 8.8.8 while at the same time fulfilling the requirement on interruption rate stated in clause 7.12.

In this test case there are three cells: Cell1, Cell2, Cell3 and Cell4. Cell 1 is the PCell on the TDD primary component carrier, Cell 2 is the configured PSCell on the TDD carrier 2, Cell 3 is the configured deactivated SCell on the TDD carrier 3 in MCG, and Cell 4 is the neighbour cell on carrier 3. It is indicated to the UE in the measurement control information that event-triggered reporting with Event A6 is used. The test consists of two successive time periods, with duration of T1 and T2, respectively. During T1 the UE shall not have any information of Cell 4. Immediately at beginning of T2 the transmission power of cell 4 is increased to same level as for cell 3, and due to usage of an offset this shall result in reporting of Event A6. PDCCH indicating a new transmission on the PCell and PSCell shall be sent continuously to ensure that the UE sends ACK/NACKs throughout the test.

The test parameters are given in Table A.8.23.29.1-1 and Table A.8.23.29.1-2 below.

**Table A.8.23.29.1-1: General test parameters for E-UTRAN TDD-TDD CA Event triggered reporting on configured but deactivated SCell with PCell interruption in non-DRX with PCell in FDD**

- Note 1: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
- Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for  $N_{oc}$  to be fulfilled.
- Note 3:  $E_s/I_{ot}$ , RSRP, SCH\_RP and  $I_o$  levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
- Note 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.
- Note 5: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.

## A.8.23.29.2 Test Requirements

The UE shall send one Event A6 triggered measurement report for cell 3, with a measurement reporting delay less than 25.6s from the beginning of time period T2.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The UE shall be scheduled on PCell and PSCell continuously throughout the test. From the start of T1 until the measurement report is received during T2, at least 99.5% of all expected ACK/NACKs on the PCell and at least 99.5% of all expected ACK/NACKs on the PSCell shall be transmitted by the UE. Each interruption length shall not exceed 1 subframe.

For a test to be considered successful requirements on both event detection and percentage of transmitted ACK/NACKs have to be fulfilled simultaneously.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times T_{TTIDCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.24 Proximity-based Services

### A.8.24.1 E-UTRAN FDD - Initiation/Cease of SLSS Transmission with ProSe Direct Discovery

The purpose of this test is to verify the requirements related to the maximum evaluation time allowed to initiate and cease SLSS transmissions defined in clause 8.10.2.1. In the test the UE under test is configured for ProSe operation only on PCell and also the UE is configured only for PCell for WAN. This test is applicable for a UE capable of ProSe Direct Discovery and also SLSS transmission and reception (indicated using *disc-SLSS*).

For this test, the UE is triggered by the test loop function or the upper layers to announce ProSe Direct Discovery.

The test parameters are given in Table A.8.24.1.1-1, Table A.8.24.1.1-2 and Table A.8.24.1.1-3 below. There is one active cell (PCell) in this test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. During T1, the RSRP of the PCell is above *syncTxThreshIC* and the UE is not expected to be transmitting SLSS. During T2, the RSRP of the PCell is lowered below *syncTxThreshIC* and the UE is expected to initiate SLSS transmissions. During T3, the RSRP of the PCell is increased back to be above *syncTxThreshIC* and the UE is expected to cease SLSS transmissions.

#### A.8.24.1.1 Test Purpose and Environment

**Table A.8.24.1.1-1: Test parameters for initiation/cease of SLSS transmissions test for E-UTRAN FDD**

| Parameter                            | Unit | Value    | Comment                                 |
|--------------------------------------|------|----------|-----------------------------------------|
| E-UTRA RF Channel Number             |      | 1        | Only one FDD carrier frequency is used. |
| Channel Bandwidth ( $BW_{channel}$ ) | MHz  | 5        |                                         |
| Active cell                          |      | Cell 1   | E-UTRA FDD Cell1 on RF channel number 1 |

| Note 1: OCNG shall be used such that cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                        |            |           |       |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |            |           |       |       |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                            |            |           |       |       |

### A.8.24.1.2 Test Requirements

The SLSS transmission initiation delay is defined as the time from the beginning of time period T2 up to the moment when the UE initiates the SLSS transmission.

The SLSS transmission initiation delay shall be less than 2.24 s.

The SLSS transmission cease delay is defined as the time from the beginning of time period T3 up to the moment when the UE ceases the SLSS transmission.

The SLSS transmission cease delay shall be less than 2.24 s.

The rate of correct initiation/cease delay of SLSS transmissions observed during repeated tests shall be at least 90%.

NOTE: The initiation/cease delay of SLSS transmissions can be expressed as:  $T_{\text{evaluate,SLSS}} + \text{discPeriod}$ ,

Where:

$T_{\text{evaluate,SLSS}}$  is the evaluation time for initiate/cease of SLSS, and is 1.92 sec (see Table 8.10.2.1-1 in clause 8.10.2.1) for the parameters in this test;

$discPeriod$  is the discovery period (set as 320ms in this test).

## A.8.24.2 E-UTRAN TDD - Initiation/Cease of SLSS Transmission with ProSe Direct Discovery

The purpose of this test is to verify the requirements related to the maximum evaluation time allowed to initiate and cease SLSS transmissions defined in clause 8.10.2.1. In the test the UE under test is configured for ProSe operation only on PCell and also the UE is configured only for PCell for WAN. This test is applicable for a UE capable of ProSe Direct Discovery and also SLSS transmission and reception (indicated using  $disc\text{-}SLSS$ ).

For this test, the UE is triggered by the test loop function or the upper layers to announce ProSe Direct Discovery.

The test parameters are given in Table A.8.24.2.1-1, Table A.8.24.2.1-2 and Table A.8.24.2.1-3 below. There is one active cell (PCell) in this test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. During T1, the RSRP of the PCell is above  $syncTxThreshIC$  and the UE is not expected to be transmitting SLSS. During T2, the RSRP of the PCell is lowered below  $syncTxThreshIC$  and the UE is expected to initiate SLSS transmissions. During T3, the RSRP of the PCell is increased back to be above  $syncTxThreshIC$  and the UE is expected to cease SLSS transmissions.

### A.8.24.2.1 Test Purpose and Environment

**Table A.8.24.2.1-1: Test parameters for initiation/cease of SLSS transmissions test for E-UTRAN TDD**

| Parameter                                   | Unit | Value    | Comment                                 |
|---------------------------------------------|------|----------|-----------------------------------------|
| E-UTRA RF Channel Number                    |      | 1        | Only one TDD carrier frequency is used. |
| Channel Bandwidth ( $BW_{\text{channel}}$ ) | MHz  | 5        |                                         |
| Active cell                                 |      | Cell 1   | E-UTRA TDD Cell1 on RF channel number 1 |
| Uplink/Downlink Configuration               |      | Config 0 |                                         |
| Special Subframe Configuration              |      | 6        |                                         |
| CP length of Cell 1                         |      | Normal   |                                         |
| Layer 3 filtering                           |      | Disabled | L3 filtering is not used                |
| drx-Configuration                           |      | DRX_P1   | As specified in Table A.3.12.2-1        |
| T1                                          | s    | 3        |                                         |
| T2                                          | s    | 5.24     |                                         |
| T3                                          | s    | 5.24     |                                         |

**Table A.8.24.1.1-2: ProSe Direct Discovery configuration for initiation/cease of SLSS transmissions test for E-UTRAN TDD**

| Parameter                                          | Unit       | Value                                               | Comment                                            |
|----------------------------------------------------|------------|-----------------------------------------------------|----------------------------------------------------|
| E-UTRA RF Channel Number                           |            | 1                                                   |                                                    |
| Channel Bandwidth ( $BW_{\text{channel}}$ )        | MHz        | 5                                                   |                                                    |
| ProSe Direct Discovery resource pool configuration |            | As specified in Table A.3.12.4-3 (Configuration #3) | IE values unless specified otherwise in this test. |
| networkControlledSyncTx                            |            | Not configured                                      |                                                    |
| syncTxThreshIC                                     | dBm/15 kHz | -95                                                 | In SIB19                                           |

**Table A.8.24.2.1-3: Cell specific test parameters for initiation/cease of SLSS transmissions test for E-UTRAN TDD**

| Parameter                                                                                                                                                                                                              | Unit       | Cell 1    |       |       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-----------|-------|-------|
|                                                                                                                                                                                                                        |            | T1        | T2    | T3    |
| E-UTRA RF Channel Number                                                                                                                                                                                               |            | 1         |       |       |
| BW <sub>channel</sub>                                                                                                                                                                                                  | MHz        | 5         |       |       |
| OCNG Pattern (defined in clause A.3.2)                                                                                                                                                                                 |            | OP.10 TDD |       |       |

| RSRP <sup>Note3</sup>                                                                                                                                                                                                  | dBm/15 kHz | -90.5     | -99.5 | -90.5 |
| SCH_RP <sup>Note 3</sup>                                                                                                                                                                                               | dBm/15 kHz | -90.5     | -99.5 | -90.5 |
| Propagation Condition                                                                                                                                                                                                  |            | AWGN      |       |       |
| Note 1: OCNG shall be used such that cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |           |       |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |           |       |       |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |           |       |       |

### A.8.24.2.2 Test Requirements

The SLSS transmission initiation delay is defined as the time from the beginning of time period T2 up to the moment when the UE initiates the SLSS transmission.

The SLSS transmission initiation delay shall be less than 2.24 s.

The SLSS transmission cease delay is defined as the time from the beginning of time period T3 up to the moment when the UE ceases the SLSS transmission.

The SLSS transmission cease delay shall be less than 2.24 s.

The rate of correct initiation/cease delay of SLSS transmissions observed during repeated tests shall be at least 90%.

NOTE: The initiation/cease delay of SLSS transmissions can be expressed as:  $T_{\text{evaluate,SLSS}} + \text{discPeriod}$ ,

Where:

$T_{\text{evaluate,SLSS}}$  is the evaluation time for initiate/cease of SLSS, and is 1.92 sec (see Table 8.10.2.1-1 in clause 8.10.2.1) for the parameters in this test;

$\text{discPeriod}$  is the discovery period (set as 320ms in this test).

### A.8.24.3 E-UTRAN FDD - Initiation/Cease of SLSS Transmission with ProSe Direct Communication

The purpose of this test is to verify that the ProSe UE meets the requirements related to the maximum evaluation time allowed to initiate and cease SLSS transmissions defined in clause 8.10.2.2. This test is applicable for a UE capable of ProSe Direct

Communication In the test the UE under test is configured for ProSe operation only on PCell and also the UE is configured only for PCell for WAN.

For this test, the UE is triggered by the test loop function or the upper layers to transmit for ProSe Direct Communication.

The test parameters are given in Table A.8.24.3.1-1, Table A.8.24.3.1-2 and Table A.8.24.3.1-3 below. There is one active cell (PCell) in this test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. During T1, the RSRP of the PCell is above *syncTxThreshIC* and the UE is not expected to be transmitting SLSS. During T2, the RSRP of the PCell is lowered below *syncTxThreshIC* and the UE is expected to initiate SLSS transmissions. During T3, the RSRP of the PCell is increased back to be above *syncTxThreshIC* and the UE is expected to cease SLSS transmissions.

### A.8.24.3.1 Test Purpose and Environment

**Table A.8.24.3.1-1: Test parameters for initiation/cease of SLSS transmissions test for E-UTRAN FDD**

| Parameter                                  | Unit | Value    | Comment                                           |
|--------------------------------------------|------|----------|---------------------------------------------------|
| E-UTRA RF Channel Number                   |      | 1        | Only one FDD carrier frequency is used.           |
| Channel Bandwidth (BW <sub>channel</sub> ) | MHz  | 5 or 10  | According to principle defined in clause A.3.12.3 |
| Active cell                                |      | Cell 1   | E-UTRA FDD Cell1 on RF channel number 1           |
| CP length of Cell 1                        |      | Normal   |                                                   |
| Layer 3 filtering                          |      | Disabled | L3 filtering is not used                          |
| drx-Configuration                          |      | DRX_P1   | As specified in Table A.3.12.2-1                  |
| T1                                         | s    | 3        |                                                   |
| T2                                         | s    | 5.24     |                                                   |
| T3                                         | s    | 5.24     |                                                   |

**Table A.8.24.3.1-2: ProSe Direct Communication configuration for initiation/cease of SLSS transmissions test for E-UTRAN FDD**

| Parameter                                  | Unit       | Value                                               | Comment                                            |
|--------------------------------------------|------------|-----------------------------------------------------|----------------------------------------------------|
| E-UTRA RF Channel Number                   |            | 1                                                   | UL carrier frequency                               |
| Channel Bandwidth (BW <sub>channel</sub> ) | MHz        | 5 or 10                                             | According to principle defined in clause A.3.12.3  |
| ProSe Direct Communication configuration   |            | As specified in Table A.3.12.5-1 (Configuration #1) | IE values unless specified otherwise in this test. |
| networkControlledSyncTx                    |            | Not configured                                      |                                                    |
| syncTxThreshIC                             | dBm/15 kHz | -95                                                 | In SIB18                                           |

**Table A.8.24.3.1-3: Cell specific test parameters for initiation/cease of SLSS transmissions test for E-UTRAN FDD**

| Parameter                                                                                                                                                                                                              | Unit       | Cell 1                              |       |       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-------------------------------------|-------|-------|
|                                                                                                                                                                                                                        |            | T1                                  | T2    | T3    |

| Propagation Condition                                                                                                                                                                                                  |            | AWGN                                |       |       |
| Note 1: OCNG shall be used such that cell is fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |            |                                     |       |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |            |                                     |       |       |
| Note 3: RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                     |            |                                     |       |       |
| Note 4: This test is according to the principle defined in section A.3.12.3.                                                                                                                                           |            |                                     |       |       |

### A.8.24.3.2 Test Requirements

The SLSS transmission initiation delay is defined as the time from the beginning of time period T2 up to the moment when the UE initiates the SLSS transmission.

The SLSS transmission initiation delay shall be less than 1.96 s.

The SLSS transmission cease delay is defined as the time from the beginning of time period T3 up to the moment when the UE ceases the SLSS transmission.

The SLSS transmission cease delay shall be less than 1.96 s.

The rate of correct initiation/cease delay of SLSS transmissions observed during repeated tests shall be at least 90%.

NOTE: The initiation/cease delay of SLSS transmissions can be expressed as:  $T_{\text{evaluate,SLSS}} + \text{SLSS period}$ ,

Where:

$T_{\text{evaluate,SLSS}}$  is the evaluation time for initiate/cease of SLSS, and is 1.92 sec (see Table 8.10.2.1-1 in clause 8.10.2.1) for the parameters in this test;

SLSS period is set to 40ms.

## A.8.25 E-UTRAN-WLAN Measurements

### A.8.25.1 E-UTRAN FDD-WLAN Event Triggered Reporting in non-DRX under AWGN

#### A.8.25.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE correctly detects event W1 (WLAN becomes better than a threshold) for unknown cell (unknown neighbour AP) and event W3 (All WLAN inside WLAN mobility set becomes worse than a threshold) for known cell (serving AP) defined in TS 36.331 [2] within the requirements stated in clause 8.1.2.4.19.

The test parameters are given in Tables A.8.25.1.1-1 and A.8.25.1.1-2 below. In the tests there are two cells, cell1 (E-UTRAN FDD) and cell2 (WLAN AP). It is indicated to the UE in the measurement control information that event-triggered reporting with Events W1 (for cell2) and W3 (for cell2) are used. The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. During T1 the UE shall not have any information on cell1. At the beginning of T2 the transmission power of cell 2 is increased to a level, which shall result in reporting of Event W1. At the beginning of T3 the transmission power of cell 2 is decreased to a level, which shall result in reporting of Event W3.

**Table A.8.25.1.1-1: General test parameters for E-UTRAN FDD-WLAN event triggered reporting under AWGN in non-DRX**

| Parameter                             |                     | Unit | Value       | Comment                                                                                                                       |
|---------------------------------------|---------------------|------|-------------|-------------------------------------------------------------------------------------------------------------------------------|

| Note 1: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                     |            |          |       |       |                  |      |      |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc1</sub> to be fulfilled.   |            |          |       |       |                  |      |      |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over the bandwidth and time and shall be modelled as AWGN of appropriate power for N <sub>oc2</sub> to be fulfilled. |            |          |       |       |                  |      |      |
| Note 4: Es/I <sub>ot</sub> , RSRP, SCH_RP, I <sub>o</sub> and WLAN RSSI have been derived from other parameters for information purposes. They are not settable parameters themselves.                                           |            |          |       |       |                  |      |      |
| Note 5: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                                                                                                       |            |          |       |       |                  |      |      |

### A.8.25.1.2 Test Requirements

The UE shall send one Event W1 triggered measurement report, with a measurement reporting delay less than 30 seconds from the beginning of time period T2.

The UE shall send one Event W3 triggered measurement report, with a measurement reporting delay less than 500 ms from the beginning of time period T3.

The UE shall not send event triggered measurement reports as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90% for each of the events.

NOTE: The actual overall delays measured in the tests may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.25.2 E-UTRAN TDD-WLAN Event Triggered Reporting in non-DRX under AWGN

### A.8.25.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE correctly detects event W1 (WLAN becomes better than a threshold) for unknown cell (unknown neighbour AP) and event W3 (All WLAN inside WLAN mobility set becomes worse than a threshold) for known cell (serving AP) defined in TS 36.331 [2] within the requirements stated in clause 8.1.2.4.19.

The test parameters are given in Tables A.8.25.2.1-1 and A.8.25.2.1-2 below. In the tests there are two cells, cell1 (E-UTRAN TDD) and cell2 (WLAN AP). It is indicated to the UE in the measurement control information that event-triggered reporting with Events W1 (for cell2) and W3 (for cell2) are used. The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. During T1 the UE shall not have any information on cell1. At the beginning of T2 the transmission power of cell 2 is increased to a level, which shall result in reporting of Event W1. At the beginning of T3 the transmission power of cell 2 is decreased to a level, which shall result in reporting of Event W3.

**Table A.8.25.2.1-1: General test parameters for E-UTRAN TDD-WLAN event triggered reporting under AWGN in non-DRX**

| Parameter                             |                     | Unit | Value       | Comment                                                                                                                       |
|---------------------------------------|---------------------|------|-------------|-------------------------------------------------------------------------------------------------------------------------------|
| Active cell                           |                     |      | Cell 1      | Cell 1 is on E-UTRA RF channel number 1.                                                                                      |
| Neighbour cell                        |                     |      | Cell 2 (AP) | Cell 2 (WLAN AP) is on WLAN RF channel number 1.                                                                              |
| CP length                             |                     |      | Normal      | Applicable to cell 1                                                                                                          |
| E-UTRA RF Channel Number              |                     |      | 1           | One E-UTRA TDD carrier frequency is used.                                                                                     |
| WLAN Channel Number                   |                     |      | 1           | One WLAN carrier frequency is used.                                                                                           |
| WLAN measurement quantity             |                     |      | WLAN RSSI   |                                                                                                                               |
| WLAN beacon frame transmission period |                     | ms   | 102.5       |                                                                                                                               |
| DRX                                   |                     |      | OFF         |                                                                                                                               |
| Special subframe configuration        |                     |      | 6           | As specified in table 4.2-1 in TS 36.211 [16]. The same configuration applies to all cells.                                   |
| Uplink-downlink configuration         |                     |      | 1           | As specified in table 4.2-2 in TS 36.211 [16]. The same configuration applies to all cells                                    |
| W1                                    | Hysteresis          | dB   | 0           | Hysteresis for evaluation of event W1.                                                                                        |
|                                       | Threshold WLAN RSSI | dBm  | -70         | Actual WLAN RSSI threshold for event W1. Needs to take absolute accuracy tolerance in section 9.7.1 into account plus margin. |
|                                       | Time To Trigger     | s    | 0           |                                                                                                                               |
| W3                                    | Hysteresis          | dB   | 0           | Hysteresis for evaluation of event W3.                                                                                        |
|                                       | Threshold WLAN RSSI | dBm  | -65         | Actual WLAN RSSI threshold for event W3. Needs to take absolute accuracy tolerance in section 9.7.1 into account plus margin. |
|                                       | Time To Trigger     | s    | 0           |                                                                                                                               |
| T1                                    |                     | s    | 5           | During this time the cell1 shall be known to the UE; but cell2 shall be unknown to the UE.                                    |
| T2                                    |                     | s    | $\leq 40$   | UE should report Event W1 for cell2 within 30 s.                                                                              |
| T3                                    |                     | s    | 3           | UE should report Event W3 for cell2 within 0.5 s.                                                                             |

**Table A.8.25.2.1-2: Cell specific test parameters for E-UTRAN TDD-WLAN event triggered reporting under AWGN in non-DRX**

| Parameter                                                                                                                                                                                                                        | Unit       | Cell 1   |       |       | Cell 2 (WLAN AP) |      |      |

| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over the bandwidth and time and shall be modelled as AWGN of appropriate power for N <sub>oc2</sub> to be fulfilled. |            |          |       |       |                  |      |      |
| Note 4: Es/I <sub>ot</sub> , RSRP, SCH_RP, I <sub>o</sub> and WLAN RSSI have been derived from other parameters for information purposes. They are not settable parameters themselves.                                           |            |          |       |       |                  |      |      |
| Note 5: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                                                                                                       |            |          |       |       |                  |      |      |

### A.8.25.2.2 Test Requirements

The UE shall send one Event W1 triggered measurement report, with a measurement reporting delay less than 30 seconds from the beginning of time period T2.

The UE shall send one Event W3 triggered measurement report, with a measurement reporting delay less than 500 ms from the beginning of time period T3.

The UE shall not send event triggered measurement reports as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90% for each of the events.

NOTE: The actual overall delays measured in the tests may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.26 Frame Structure 3 (FS3)

### A.8.26.1 E-UTRAN FDD-FS3 Activation and deactivation of known FS3 SCell with FDD PCell in non-DRX

#### A.8.26.1.1 Test Purpose and Environment

The purpose of this test is to verify that the LAA SCell activation and deactivation times are within the requirements stated in section 7.7, when the SCell is known by the UE at the time of activation.

The test parameters are given in Tables A.8.26.1.1-1 and cell-specific parameters in A.8.26.1.1-2 below. In the test there are two cells: Cell1 and Cell2. Cell1 is PCell on the FDD primary component (RF Channel 1), Cell2 is deactivated SCell on the secondary component (RF Channel 2) for frame structure 3. Cell 1 has constant signal levels throughout the test, and Cell 2 transmits discovery signal with LBT model.

The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. Before the test starts the UE is connected to Cell1 on radio channel 1 (PCC) but is not aware of Cell 2 on radio channel 2. The UE is only monitoring the PCC. The UE shall be continuously scheduled in the PCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the SCell (Cell 2) becomes configured on radio channel 2 (SCC). The UE now starts monitoring also the SCC. The test equipment sends a MAC message for activation of the SCell.

The point in time at which the MAC message is received at the UE antenna connector, in a subframe # denoted m which is an even number, defines the start of time period T2. The UE shall be able to report valid CSI for the activated SCell at latest in subframe  $m + T_{\text{activate\_basic\_FS3}}$ , where  $T_{\text{activate\_basic\_FS3}}$  is specified in section 7.7.10. The UE shall start reporting CSI in subframe (m+8) and shall report CQI index 0 (out-of-range) until the SCell activation has been completed. Any PCell interruption due to activation of SCell shall occur in the subframes (m+5) to (m+9).

Time period T3 starts when a MAC message for deactivation of SCell, sent from the test equipment to the UE in a subframe # denoted n, is received at the UE antenna connector. The UE shall carry out deactivation of the SCell in a subframe (n+8), and any PCell interruption due to the deactivation shall occur in the subframes (n+5) to (n+9).

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell during activation and deactivation of SCell, respectively.

The test equipment verifies the activation time by counting the subframes from the time when the SCell activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the subframes from the time when the SCell deactivation command is sent until CQI reporting for SCell is discontinued.

**Table A.8.26.1.1-1: General test parameters for known LAA SCell activation case**

| Parameter                                          | Unit | Value                                | Comment                                                                                                           |

### A.8.26.1.2 Test Requirements

During T2 the UE shall send the first CSI report for SCell in a subframe (m+8), or in a subframe (m+10) if the subframe (m+8) was subject to interruption. Whether CSI report in subframe (m+8) was interrupted or not is checked by monitoring ACK/NACK sent in PCell in subframe (m+8).

During T2 the UE shall start sending CSI reports for SCell with non-zero CQI index at latest in a subframe (m+T<sub>activate\_basic\_FS3</sub>) ms, L is the number of times the discovery signal occasion is not available at the UE during the SCell activation time.

During T3 the UE shall stop sending CSI reports for SCell at latest in a subframe (n+8).

During T2 interruption of PCell during SCell activation shall not happen outside the subframes (m+5) to (m+9).

During T3 interruption of PCell during SCell deactivation shall not happen outside the subframes (n+5) to (n+9).

The interruption of PCell shall not be more than the values specified for intra-band CA and inter-band CA in Section 7.8.2.

All of the above test requirements shall be fulfilled in order for the observed SCell activation delay and SCell deactivation delay to be counted as correct. The rate of correct observed SCell activation delay and SCell deactivation delay during repeated tests shall be at least 90%.

NOTE: During T2 if there are no uplink resources for reporting the valid CSI in a subframe ( $m + T_{\text{activate\_basic\_FS3}}$ )ms,  $L$  is the number of times the discovery signal occasion is not available at the UE during the SCell activation time, then the UE shall use the next available uplink resource for reporting the corresponding valid CSI.

## A.8.26.2 E-UTRAN TDD-FS3 Activation and deactivation of known FS3 SCell with TDD PCell in non-DRX

### A.8.26.2.1 Test Purpose and Environment

The purpose of this test is to verify that the LAA SCell activation and deactivation times are within the requirements stated in section 7.7, when the SCell is known by the UE at the time of activation.

The test parameters are given in Tables A.8.26.2.1-1 and cell-specific parameters in A.8.26.2.1-2 below. In the test there are two cells: Cell1 and Cell2. Cell1 is PCell on the TDD primary component (RF Channel 1), Cell2 is deactivated SCell on the secondary component (RF Channel 2) for frame structure 3. Cell 1 has constant signal levels throughout the test, and Cell 2 transmits discovery signal with LBT model.

The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. Before the test starts the UE is connected to Cell1 on radio channel 1 (PCC) but is not aware of Cell 2 on radio channel 2. The UE is only monitoring the PCC. The UE shall be continuously scheduled in the PCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the SCell (Cell 2) becomes configured on radio channel 2 (SCC). The UE now starts monitoring also the SCC. The test equipment sends a MAC message for activation of the SCell.

The point in time at which the MAC message is received at the UE antenna connector, in a subframe # denoted  $m$ , where  $m$  is 4 or 9, defines the start of time period T2. The UE shall be able to report valid CSI for the activated SCell at latest in subframe  $m + T_{\text{activate\_basic\_FS3}}$ , where  $T_{\text{activate\_basic\_FS3}}$  is specified in section 7.7.10. The UE shall start reporting CSI in subframe ( $m+8$ ) and shall report CQI index 0 (out-of-range) until the SCell activation has been completed. Any PCell interruption due to activation of SCell shall occur in the subframes ( $m+5$ ) to ( $m+11$ ).

Time period T3 starts when a MAC message for deactivation of SCell, sent from the test equipment to the UE in a subframe # denoted  $n$ , is received at the UE antenna connector. The UE shall carry out deactivation of the SCell and any PCell interruption due to the deactivation shall occur in the subframes ( $n+5$ ) to ( $n+11$ ).

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell during activation and deactivation of SCell, respectively.

The test equipment verifies the activation time by counting the subframes from the time when the SCell activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the subframes from the time when the SCell deactivation command is sent until CQI reporting for SCell is discontinued.

**Table A.8.26.2.1-1: General test parameters for known LAA SCell activation case**

| Parameter                                          | Unit | Value                                  | Comment                                                                          |
|----------------------------------------------------|------|----------------------------------------|----------------------------------------------------------------------------------|
| E-UTRA RF Channel Number                           |      | 1, 2                                   | Two radio channels are used for this test                                        |
| Active PCell                                       |      | Cell 1                                 | Primary cell on RF channel number 1.                                             |
| Configured deactivated LAA FS3 SCell               |      | Cell 2                                 | Configured deactivated secondary cell on RF channel number 2.                    |
| CP length                                          |      | Normal                                 |                                                                                  |
| DRX                                                |      | OFF                                    | Continuous monitoring of primary cell                                            |
| CQI/PMI periodicity and offset configuration index |      | 0                                      | CQI reporting for SCell every UL subframe                                        |
| Discovery signal occasion duration                 | ms   | 1                                      | As specified in IE MeasDS-Config in TS 36.331                                    |

| Note 2:                                                   | For the special subframe configuration see table 4.2-1 in TS 36.211.                                                                                                                                                                                                                                                      |                                                                                                 |    |    |           |    |    |
| Note 3:                                                   | OCNG shall be used such that cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. For cells with LBT model, OCNG is transmitted only in subframes with downlink transmission bursts, and is not transmitted during muted subframes or during DMTC windows. |                                                                                                 |    |    |           |    |    |
| Note 4:                                                   | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled.                                                                                                     |                                                                                                 |    |    |           |    |    |
| Note 5:                                                   | Es/Iot, RSRP, SCH_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                                                                                                         |                                                                                                 |    |    |           |    |    |
| Note 6:                                                   | The uplink resources for CSI reporting are assigned to the UE prior to the start of time period T2.                                                                                                                                                                                                                       |                                                                                                 |    |    |           |    |    |
| Note 7:                                                   | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1.                                                                                                                                                                                                                                                 |                                                                                                 |    |    |           |    |    |

### A.8.26.2.2 Test Requirements

During T2 the UE shall send the first CSI report for SCell in a subframe (m+8), or in a subframe (m+9) if the subframe (m+8) was subject to interruption, or in a subframe (m+13) if the subframes (m+8) and (m+9) were subject to interruption when an intra-band SCell is activated. Whether first CSI report was interrupted or not is checked by monitoring ACK/NACK sent in PCell at the same time as the first CSI report.

During T2 the UE shall start sending CSI reports for SCell with non-zero CQI index at latest in a subframe ( $m + T_{\text{activate\_basic\_FS3}}$ )ms,  $L$  is the number of times the discovery signal occasion is not available at the UE during the SCell activation time.

During T3 the UE shall stop sending CSI reports for SCell at latest in a subframe ( $m+8$ ).

During T2 interruption of PCell during SCell activation shall not happen outside the subframes ( $m+5$ ) to ( $m+11$ ).

During T3 interruption of PCell during SCell deactivation shall not happen outside the subframes ( $n+5$ ) to ( $n+11$ ).

The interruption of PCell shall not be more than the values specified for intra-band CA and inter-band CA in Section 7.8.2.

All of the above test requirements shall be fulfilled in order for the observed SCell activation delay and SCell deactivation delay to be counted as correct. The rate of correct observed SCell activation delay and SCell deactivation delay during repeated tests shall be at least 90%.

NOTE: During T2 if there are no uplink resources for reporting the valid CSI in a subframe ( $m + T_{\text{activate\_basic\_FS3}}$ )ms,  $L$  is the number of times the discovery signal occasion is not available at the UE during the SCell activation time, then the UE shall use the next available uplink resource for reporting the corresponding valid CSI.

### A.8.26.3 E-UTRAN FDD-FS3 Event triggered reporting on deactivated FS3 SCell and FDD PCell interruption in non-DRX

#### A.8.26.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE correctly detects event A6 (Neighbour becomes better than SCell) defined in TS 36.331 [2] within the requirements stated in clause 8.12.2.4 while at the same time fulfilling the requirement on interruption rate. This test is applicable to UEs that support a maximum of 1 FS3 SCell, ie UEs that support a maximum of 2, 3, or 4 FS3 SCells are not required to pass this test.

The test parameters are given in Table A.8.26.3.1-1 and A.8.26.3.1-2. It is indicated to the UE in the measurement control information that event-triggered reporting with Event A6 is used.

In the test there are three synchronous cells: Cell1, Cell2 and Cell3. Cell1 is PCell on the FDD primary component (RF Channel 1), Cell2 is deactivated SCell on the secondary component (RF Channel 2) for frame structure 3, and Cell3 is the neighbour cell on the secondary component (RF Channel 3) for frame structure 3. Cell 2 and Cell 3 transmit discovery signal in every discovery signal occasion.

The test consists of two successive time periods, with duration of T1 and T2, respectively. During T1 the UE shall not have any information of cell 3. Immediately at beginning of T2 the transmission power of cell 3 is increased to same level as for cell 2, and due to usage of an offset this shall result in reporting of Event A6. PCell is indicated by the network using IE allowInterruptions and PDCCH indicating a new transmission on the PCell shall be sent continuously to ensure that the UE sends ACK/ NACKs throughout the test.

**Table A.8.26.3.1-1: General test parameters for Event triggered reporting on LAA deactivated SCell with E-UTRAN FDD PCell interruption in non-DRX**

| Parameter                          |                 | Unit | Value    | Comment                                                                                                                             |
|------------------------------------|-----------------|------|----------|-------------------------------------------------------------------------------------------------------------------------------------|
| E-UTRA RF Channel Number           |                 |      | 1, 2     | Two radio channels are used for this test                                                                                           |
| Active PCell                       |                 |      | Cell 1   | Primary cell on RF channel number 1.                                                                                                |
| Configured deactivated SCell       |                 |      | Cell 2   | Configured deactivated secondary cell on RF channel number 2 for frame structure 3.                                                 |
| Neighbour cell                     |                 |      | Cell 3   | Neighbor cell to be identified on RF channel number 2 for frame structure 3.                                                        |
| CP length                          |                 |      | Normal   |                                                                                                                                     |
| DRX                                |                 |      | OFF      | Continuous monitoring of primary cell                                                                                               |
| A6                                 | Hysteresis      | dB   | 0        | Hysteresis for evaluation of event A6.                                                                                              |
|                                    | Offset          | dB   | -3       | Offset parameter for evaluation of event A6. Needs to take relative accuracy tolerance in clause 9.1.18.2 into account plus margin. |
|                                    | Report on leave |      | False    |                                                                                                                                     |
|                                    | Time To Trigger | s    | 0        |                                                                                                                                     |
| Discovery signal occasion duration |                 | ms   | 1        | As specified in IE MeasDS-Config in TS 36.331                                                                                       |
| Filter coefficient                 |                 |      | 0        | L3 filtering is not used                                                                                                            |

### A.8.26.3.2 Test Requirements

The UE shall send one Event A6 triggered measurement report, with a measurement reporting delay less than 4s from the beginning of time period T2.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The UE shall be scheduled on PCell continuously throughout the test. From the start of T1 until the measurement report is received during T2, at least 99.5% of all expected ACK/NACKs shall be transmitted by the UE.

For a test to be considered successful requirements on both event detection and percentage of transmitted ACK/NACKs have to be fulfilled simultaneously.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.26.3A E-UTRAN FDD-TDD 3DL Event triggered reporting on deactivated FS3 SCell and FDD PCell interruption in non-DRX

### A.8.26.3A.1 Test Purpose and Environment

The purpose of this test is to verify that the UE correctly detects event A6 (Neighbour becomes better than SCell) defined in TS 36.331 [2] within the requirements stated in clause 8.12.2.4 while at the same time fulfilling the requirement on interruption rate. This test is applicable to UEs that support a 2, 3 or 4 FS3 SCells, ie UEs that support a maximum of 1 FS3 SCell are not required to pass this test.

The test parameters are given in Table A.8.26.3A.1-1 and A.8.26.3A.1-2. It is indicated to the UE in the measurement control information that event-triggered reporting with Event A6 is used.

In the test there are three synchronous cells: Cell1, Cell2, Cell3 and Cell4. Cell1 is PCell on the FDD primary component (RF Channel 1), Cell2 is activated SCell on the secondary component (RF Channel 2) for frame structure 3, Cell3 is deactivated SCell on the secondary component (RF Channel 3) for frame structure 3, and Cell4 is the neighbour cell on the secondary component (RF Channel 3) for frame structure 3. Cell 2, Cell 3 and Cell 4 transmit discovery signal in every discovery signal occasion.

The test consists of two successive time periods, with duration of T1 and T2, respectively. During T1 the UE shall not have any information of cell 4. Immediately at beginning of T2 the transmission power of cell 4 is increased to same level as for cell 3, and due to usage of an offset this shall result in reporting of Event A6. PCell is indicated by the network using IE allowInterruptions and PDCCH indicating a new transmission on the PCell shall be sent continuously to ensure that the UE sends ACK/ NACKs throughout the test.

### A.8.26.3A.2 Test Requirements

The UE shall send one Event A6 triggered measurement report, with a measurement reporting delay less than 8s from the beginning of time period T2.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The UE shall be scheduled on PCell continuously throughout the test. From the start of T1 until the measurement report is received during T2, at least 99.5% of all expected ACK/NACKs shall be transmitted by the UE.

For a test to be considered successful requirements on both event detection and percentage of transmitted ACK/NACKs have to be fulfilled simultaneously.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.8.26.4 E-UTRAN TDD-FS3 Event triggered reporting on deactivated FS3 SCell and TDD PCell interruption in non-DRX

#### A.8.26.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE correctly detects event A6 (Neighbour becomes better than SCell) defined in TS 36.331 [2] within the requirements stated in clause 8.12.2.4 while at the same time fulfilling the requirement on interruption rate. This test is applicable to UEs that support a maximum of 1 FS3 SCell, ie UEs that support a maximum of 2, 3, or 4 FS3 SCells are not required to pass this test.

The test parameters are given in Table A.8.26.4.1-1 and A.8.26.4.1-2. It is indicated to the UE in the measurement control information that event-triggered reporting with Event A6 is used.

In the test there are three synchronous cells: Cell1, Cell2 and Cell3. Cell1 is PCell on the TDD primary component (RF Channel 1), Cell2 is deactivated SCell on the secondary component (RF Channel 2) for frame structure 3, and Cell3 is the neighbour cell on the secondary component (RF Channel 3) for frame structure 3. Cell 2 and Cell 3 transmit discovery signal in every discovery signal occasion.

The test consists of two successive time periods, with duration of T1 and T2, respectively. During T1 the UE shall not have any information of cell 3. Immediately at beginning of T2 the transmission power of cell 3 is increased to same level as for cell 2, and due to usage of an offset this shall result in reporting of Event A6. PCell is indicated by the network using IE `allowInterruptions` and PDCCH indicating a new transmission on the PCell shall be sent continuously to ensure that the UE sends ACK/ NACKs throughout the test.

**Table A.8.26.4.1-1: General test parameters for Event triggered reporting on LAA deactivated SCell with E-UTRAN TDD PCell interruption in non-DRX**

| Note 6:                                                        | Es/lot, RSRP, SCH_RP and Io levels have been derived from other parameters for information purposes.                                                                                                                        |                                                                                                 |     |           |        |                                 |       |

They are not settable parameters themselves.  
Note 7: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1.

#### A.8.26.4.2 Test Requirements

The UE shall send one Event A6 triggered measurement report, with a measurement reporting delay less than 4s from the beginning of time period T2.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The UE shall be scheduled on PCell continuously throughout the test. From the start of T1 until the measurement report is received during T2, at least 99.5% of all expected ACK/NACKs shall be transmitted by the UE.

For a test to be considered successful requirements on both event detection and percentage of transmitted ACK/NACKs have to be fulfilled simultaneously.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.8.26.4A E-UTRAN TDD-TDD 3DL Event triggered reporting on deactivated FS3 SCell and FDD PCell interruption in non-DRX

#### A.8.26.4A.1 Test Purpose and Environment

The purpose of this test is to verify that the UE correctly detects event A6 (Neighbour becomes better than SCell) defined in TS 36.331 [2] within the requirements stated in clause 8.12.2.4 while at the same time fulfilling the requirement on interruption rate. This test is applicable to UEs that support a maximum of 1 FS3 SCell, ie UEs that support a maximum of 2, 3, or 4 FS3 SCells are not required to pass this test.

The test parameters are given in Table A.8.26.4A.1-1 and A.8.26.4A.1-2. It is indicated to the UE in the measurement control information that event-triggered reporting with Event A6 is used.

In the test there are three synchronous cells: Cell1, Cell2, Cell3 and Cell4. Cell1 is PCell on the TDD primary component (RF Channel 1), Cell2 is activated SCell on the secondary component (RF Channel 2) for frame structure 3, Cell3 is deactivated SCell on the secondary component (RF Channel 3) for frame structure 3, and Cell4 is the neighbour cell on the secondary component (RF Channel 3) for frame structure 3. Cell 2, Cell 3 and Cell 4 transmit discovery signal in every discovery signal occasion.

The test consists of two successive time periods, with duration of T1 and T2, respectively. During T1 the UE shall not have any information of cell 4. Immediately at beginning of T2 the transmission power of cell 4 is increased to same level as for cell 3, and due to usage of an offset this shall result in reporting of Event A6. PCell is indicated by the network using IE allowInterruptions and PDCCH indicating a new transmission on the PCell shall be sent continuously to ensure that the UE sends ACK/ NACKs throughout the test.

**Table A.8.26.4A.1-1: General test parameters for TDD-TDD 3DL Event triggered reporting on LAA deactivated SCell with E-UTRAN FDD PCell interruption in non-DRX**

| Parameter                          |                 | Unit | Value    | Comment                                                                                                                             |

Note 5: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1.

### A.8.26.4A.2 Test Requirements

The UE shall send one Event A6 triggered measurement report, with a measurement reporting delay less than 8s from the beginning of time period T2.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The UE shall be scheduled on PCell continuously throughout the test. From the start of T1 until the measurement report is received during T2, at least 99.5% of all expected ACK/NACKs shall be transmitted by the UE.

For a test to be considered successful requirements on both event detection and percentage of transmitted ACK/NACKs have to be fulfilled simultaneously.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.26.5 E-UTRAN FDD-FS3 Intra-frequency event triggered reporting in non-DRX for CRS based discovery signal

### A.8.26.5.1 Test Purpose and Environment

The purpose of the test is to verify that the UE makes correct reporting of an event under operation with frame structure 3. The test will partly verify new intra-frequency FS3 cells in non-DRX requirements in clause 8.11.2. This test is applicable to UEs that support a maximum of 1 FS3 SCell, ie UEs that support a maximum of 2, 3, or 4 FS3 SCells are not required to pass this test.

The test parameters are given in Tables A.8.26.5.1-1 and A.8.26.5.1-2. In the measurement control information, it is indicated to the UE performing CRS based discovery signals measurement and event-triggered reporting with Event A6 is configured.

There are three cells: Cell 1, Cell 2, and Cell 3. Cell 1 is PCell on the FDD primary component (RF Channel 1), Cell 2 is activated SCell on the secondary component (RF Channel 2) for Frame Structure 3, and Cell 3 is the neighbour cell on the secondary component (RF Channel 2) frame structure 3. LBT model is applied on cell 3.

The test consists of two successive time periods, with time duration of T1 and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3. Immediately at beginning of T2 the transmission power of cell 3 is increased, and due to usage of an offset this shall result in reporting of Event A6.

**Table A.8.26.5.1-1: General test parameters for E-UTRAN FDD-TDD intra-frequency event triggered reporting in non-DRX for CRS based discovery signal measurement under Operation with Frame Structure 3**

| Parameter                          | Unit | Value  | Comment                                                     |
|------------------------------------|------|--------|-------------------------------------------------------------|
| E-UTRA RF Channel Number           |      | 1, 2   | Two radio channels are used for this test                   |
| Active PCell                       |      | Cell 1 | Primary cell on RF channel number 1.                        |
| Active SCell                       |      | Cell 2 | Configured activated secondary cell on RF channel number 2. |
| Neighbour cell                     |      | Cell 3 | Neighbor cell to be identified on RF channel number 2.      |
| DMTC period                        | ms   | 40     | As specified in IE MeasDS-Config in TS 36.331               |
| dmtc-PeriodOffset                  | ms   | 10     | As specified in IE MeasDS-Config in TS 36.331               |
| Discovery signal occasion duration | ms   | 1      | As specified in IE MeasDS-Config in TS 36.331               |
| CP length                          |      | Normal |                                                             |
| A6-Offset                          | dB   | -6     |                                                             |
| Time To Trigger                    | s    | 0      |                                                             |
| Filter coefficient                 |      | 0      | L3 filtering is not used                                    |
| DRX                                |      | OFF    |                                                             |

| <p>Note 1: OCNG shall be used such that cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. For cells with LBT model, OCNG is transmitted only in subframes with downlink transmission bursts, and is not transmitted during muted subframes or during DMTC windows.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: RSRP, SCH_RP, <math>E_s/I_{ot}</math> and <math>I_o</math> levels have been derived from other parameters for information purposes.</p> |                |                                                             |                                 |           |        |                                    |        |

They are not settable parameters themselves.

Note 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.

Note 5: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1.

### A.8.26.5.2 Test Requirements

In the test, the UE shall send one Event A6 triggered measurement report, with a measurement reporting delay less than  $(24+L)*40\text{ms}$  from the beginning of time period T2, where L is the number of configured discovery signal occasions which are not available due to the absence of the necessary radio signals from cell3.

The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE send the measurement report on PUSCH.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times \text{TTI}_{\text{DCCH}}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.26.5A E-UTRAN FDD-FS3 Intra-frequency event triggered reporting in non-DRX for CRS based discovery signal with 2 SCells

### A.8.26.5A.1 Test Purpose and Environment

The purpose of the test is to verify that the UE makes correct reporting of an event under operation with frame structure 3. The test will partly verify new intra-frequency FS3 cells in non-DRX requirements in clause 8.11.2. This test is applicable to UEs that support a 2,3 or 4 FS3 SCells, ie UEs that support a maximum of 1 FS3 Scell are not required to pass this test.

The test parameters are given in Tables A.8.26.5A.1-1 and A.8.26.5A.1-2. In the measurement control information, it is indicated to the UE performing CRS based discovery signals measurement and event-triggered reporting with Event A6 is configured.

There are five cells: Cell 1 is PCell on the FDD primary component (RF Channel 1), Cell 2 is activated SCell on the secondary component (RF Channel 2) for Frame Structure 3, and Cell 3 is the neighbour cell on the secondary component (RF Channel 2) frame structure 3 and Cell 4 is the activated SCell on the secondary component (RF Channel 3) for Frame Structure 3.

The test consists of two successive time periods, with time duration of T1 and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3 and 5. Immediately at beginning of T2 the transmission power of cell 3 and 5 is increased, and due to usage of an offset this shall result in reporting of Event A6.

**Table A.8.26.5A.1-1: General test parameters for E-UTRAN FDD-TDD intra-frequency event triggered reporting in non-DRX for CRS based discovery signal measurement under Operation with Frame Structure 3**

| Parameter                          | Unit | Value  | Comment                                                                   |
|------------------------------------|------|--------|---------------------------------------------------------------------------|
| E-UTRA RF Channel Number           |      | 1, 2,3 | Three radio channels are used for this test                               |
| Active PCell                       |      | Cell 1 | Primary cell on RF channel number 1.                                      |
| Active SCell                       |      | Cell 2 | Configured activated secondary cell on RF channel number 2.               |
| Neighbour cell                     |      | Cell 3 | Neighbour cell to be identified on RF channel number 2.                   |
| Active SCell                       |      | Cell 4 | Configured activated secondary cell on RF channel number 3.               |
| DMTC period                        | ms   | 40     | Applies for cell 2,3 and 4 as specified in IE MeasDS-Config in TS 36.331  |
| dmtc-PeriodOffset                  | ms   | 10     | Applies for cell 2,3 and 4 as specified in IE MeasDS-Config in TS 36.331  |
| Discovery signal occasion duration | ms   | 1      | Applies for cell 2,3, and 4 as specified in IE MeasDS-Config in TS 36.331 |
| LBT modelling                      |      |        | Not applied for any cell in the test                                      |
| CP length                          |      | Normal |                                                                           |
| A6-Offset                          | dB   | -6     |                                                                           |
| Time To Trigger                    | s    | 0      |                                                                           |
| Filter coefficient                 |      | 0      | L3 filtering is not used                                                  |
| DRX                                |      | OFF    |                                                                           |
| T1                                 | s    | 5      |                                                                           |
| T2                                 | s    | 5      |                                                                           |
|                                    |      |        |                                                                           |

**Table A.8.26.5A.1-2: Cell specific test parameters for E-UTRAN FDD-TDD intra-frequency event triggered reporting in non-DRX for CRS based discovery signal measurement under Operation with Frame Structure 3**

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Unit           | Cell1                                                       |                                 | Cell2     |        | Cell3     |        | Cell4     |    |

| <p>Note 1: OCNG shall be used such that cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. For cells with LBT model, OCNG is transmitted only in subframes with downlink transmission bursts, and is not transmitted during muted subframes or during DMTC windows.</p> <p>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{oc}</math> to be fulfilled.</p> <p>Note 3: RSRP SCH_RP and <math>E_s/I_{ot}</math> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 4: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.</p> <p>Note 5: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.</p> |                |                                                             |                                 |           |        |           |        |           |    |

### A.8.26.5A.2 Test Requirements

In the test, the UE shall send one Event A6 triggered measurement report for cell 3, with a measurement reporting delay less than 1920ms from the beginning of time period T2.

The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE send the measurement report on PUSCH.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.8.26.6 E-UTRAN TDD-FS3 Intra-frequency event triggered reporting in non-DRX for CRS based discovery signal

#### A.8.26.6.1 Test Purpose and Environment

The purpose of the test is to verify that the UE makes correct reporting of an event under operation with frame structure 3. The test will partly verify new intra-frequency FS3 cells in non-DRX requirements in clause 8.11.2. This test is applicable to UEs that support a maximum of 1 FS3 SCell, ie UEs that support a maximum of 2, 3, or 4 FS3 Scells are not required to pass this test.

The test parameters are given in Tables A.8.26.6.1-1 and A.8.26.6.1-2. In the measurement control information, it is indicated to the UE performing CRS based discovery signals measurement and event-triggered reporting with Event A6 is configured.

There are three cells: Cell 1, Cell 2, and Cell 3. Cell 1 is PCell on the TDD primary component (RF Channel 1), Cell 2 is activated SCell on the secondary component (RF Channel 2) for Frame Structure 3, and Cell 3 is the neighbour cell on the secondary component (RF Channel 2) frame structure 3. LBT model is applied on cell 3.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3. Immediately at beginning of T2 the transmission power of cell 3 is increased, and due to usage of an offset this shall result in reporting of Event A6.

**Table A.8.26.6.1-1: General test parameters for E-UTRAN TDD-TDD intra-frequency event triggered reporting in non-DRX for CRS based discovery signal measurement under Operation with Frame Structure 3**

| Parameter                          | Unit | Value  | Comment                                                     |
|------------------------------------|------|--------|-------------------------------------------------------------|
| E-UTRA RF Channel Number           |      | 1, 2   | Two radio channels are used for this test                   |
| Active PCell                       |      | Cell 1 | Primary cell on RF channel number 1.                        |
| Active SCell                       |      | Cell 2 | Configured activated secondary cell on RF channel number 2. |
| Neighbour cell                     |      | Cell 3 | Neighbor cell to be identified on RF channel number 2.      |
| DMTC period                        | ms   | 40     | As specified in IE MeasDS-Config in TS 36.331               |

### A.8.26.6.2 Test Requirements

In the test, the UE shall send one Event A6 triggered measurement report, with a measurement reporting delay less than  $(24+L)*40\text{ms}$  from the beginning of time period T2, where L is the number of configured discovery signal occasions which are not available due to the absence of the necessary radio signals from cell3.

The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE send the measurement report on PUSCH.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2xTTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.26.6A E-UTRAN TDD-FS3 Intra-frequency event triggered reporting in non-DRX for CRS based discovery signal with 2 SCells

### A.8.26.6A.1 Test Purpose and Environment

The purpose of the test is to verify that the UE makes correct reporting of an event under operation with frame structure 3. The test will partly verify new intra-frequency FS3 cells in non-DRX requirements in clause 8.11.2. This test is applicable to UEs that support a 2,3 or 4 FS3 SCells, ie UEs that support a maximum of 1 FS3 SCell are not required to pass this test.

The test parameters are given in Tables A.8.26.6A.1-1 and A.8.26.6A.1-2. In the measurement control information, it is indicated to the UE performing CRS based discovery signals measurement and event-triggered reporting with Event A6 is configured.

There are five cells. Cell 1 is PCell on the TDD primary component (RF Channel 1), Cell 2 is activated SCell on the secondary component (RF Channel 2) for Frame Structure 3, and Cell 3 is the neighbour cell on the secondary component (RF Channel 2) frame structure 3. and Cell 4 is activated SCell on the secondary component (RF Channel 3) for Frame Structure 3.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 3. Immediately at beginning of T2 the transmission power of cell 3 is increased, and due to usage of an offset this shall result in reporting of Event A6.

**Table A.8.26.6A.1-1: General test parameters for E-UTRAN TDD-TDD intra-frequency event triggered reporting in non-DRX for CRS based discovery signal measurement under Operation with Frame Structure 3**

| Parameter                          | Unit | Value   | Comment                                                                  |
|------------------------------------|------|---------|--------------------------------------------------------------------------|
| E-UTRA RF Channel Number           |      | 1, 2, 3 | Three radio channels are used for this test                              |
| Active PCell                       |      | Cell 1  | Primary cell on RF channel number 1.                                     |
| Active SCell                       |      | Cell 2  | Configured activated secondary cell on RF channel number 2.              |
| Neighbour cell                     |      | Cell 3  | Neighbor cell to be identified on RF channel number 2.                   |
| Active SCell                       |      | Cell 4  | Configured activated secondary cell on RF channel number 3.              |
| DMTC period                        | ms   | 40      | Applies for cell 2,3 and 4 as specified in IE MeasDS-Config in TS 36.331 |
| dmtc-PeriodOffset                  | ms   | 10      | Applies for cell 2,3 and 4 as specified in IE MeasDS-Config in TS 36.331 |
| Discovery signal occasion duration | ms   | 1       | Applies for cell 2,3 and 4 as specified in IE MeasDS-Config in TS 36.331 |
| LBT modelling                      |      |         | Not applied for any cell in the test                                     |
| CP length                          |      | Normal  |                                                                          |

| Note 4: | The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                    |
| Note 5: | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation. |

## A.8.26.6A.2 Test Requirements

In the test, the UE shall send one Event A6 triggered measurement report for cell 3, with a measurement reporting delay less than 1920ms from the beginning of time period T2.

The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE send the measurement report on PUSCH.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.26.7 E-UTRAN FDD-FS3 Intra-frequency event triggered reporting in DRX for CRS based discovery signal

### A.8.26.7.1 Test Purpose and Environment

The purpose of the test is to verify that the UE makes correct reporting of an event under operation with frame structure 3. The test will partly verify new intra-frequency FS3 cells in DRX requirements in clause 8.11.2.

The test parameters are given in Tables A.8.26.7.1-1 and A.8.26.7.1-2. In the measurement control information, it is indicated to the UE performing CRS based discovery signals measurement and event-triggered reporting with Event A6 is configured.

There are three cells: Cell 1, Cell 2, and Cell 3. Cell 1 is PCell on the FDD primary component (RF Channel 1), Cell 2 is activated SCell on the secondary component (RF Channel 2) for Frame Structure 3, and Cell 3 is the neighbour cell on the secondary component (RF Channel 2) frame structure 3. LBT model is applied on cell 3.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. Immediately at beginning of T2 the transmission power of cell 3 is increased, and due to usage of an offset this shall result in reporting of Event A6.

**Table A.8.26.7.1-1: General test parameters for E-UTRAN FDD-TDD intra-frequency event triggered reporting in DRX for CRS based discovery signal under Operation with Frame Structure 3**

| Parameter                          | Unit | Value  | Comment                                                     |
|------------------------------------|------|--------|-------------------------------------------------------------|
| E-UTRA RF Channel Number           |      | 1, 2   | Two radio channels are used for this test                   |

### A.8.26.7.2 Test Requirements

In the test, the UE shall send one Event A6 triggered measurement report, with a measurement reporting delay less than  $(24+L)*320\text{ms}$  from the beginning of time period T2, where L is the number of configured discovery signal occasions which are not available due to the absence of the necessary radio signals from cell3.

The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE send the measurement report on PUSCH.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times \text{TTI}_{\text{DCCCH}}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCCH.

## A.8.26.8 E-UTRAN TDD-FS3 Intra-frequency event triggered reporting in DRX for CRS based discovery signal

### A.8.26.8.1 Test Purpose and Environment

The purpose of the test is to verify that the UE makes correct reporting of an event under operation with frame structure 3. The test will partly verify new intra-frequency FS3 cells in DRX requirements in clause 8.11.2.

The test parameters are given in Tables A.8.26.8.1-1 and A.8.26.8.1-2. In the measurement control information, it is indicated to the UE performing CRS based discovery signals measurement and event-triggered reporting with Event A6 is configured.

There are three cells: Cell 1, Cell 2, and Cell 3. Cell 1 is PCell on the TDD primary component (RF Channel 1), Cell 2 is activated SCell on the secondary component (RF Channel 2) for Frame Structure 3, and Cell 3 is the neighbour cell on the secondary component (RF Channel 2) frame structure 3. LBT model is applied on cell 3.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of cell 2. Immediately at beginning of T2 the transmission power of cell 3 is increased, and due to usage of an offset this shall result in reporting of Event A6.

**Table A.8.26.8.1-1: General test parameters for E-UTRAN TDD-TDD intra-frequency event triggered reporting in DRX for CRS based discovery signal under Operation with Frame Structure 3**

| Parameter                          | Unit | Value  | Comment                                                     |
|------------------------------------|------|--------|-------------------------------------------------------------|
| E-UTRA RF Channel Number           |      | 1, 2   | Two radio channels are used for this test                   |
| Active PCell                       |      | Cell 1 | Primary cell on RF channel number 1.                        |
| Active SCell                       |      | Cell 2 | Configured activated secondary cell on RF channel number 2. |
| Neighbour cell                     |      | Cell 3 | Neighbor cell to be identified on RF channel number 2.      |
| DMTC period                        | ms   | 40     | As specified in IE MeasDS-Config in TS 36.331               |
| dmtc-PeriodOffset                  | ms   | 10     | As specified in IE MeasDS-Config in TS 36.331               |
| Discovery signal occasion duration | ms   | 1      | As specified in IE MeasDS-Config in TS 36.331               |
| CP length                          |      | Normal |                                                             |
| A6-Offset                          | dB   | -6     |                                                             |
| Time To Trigger                    | s    | 0      |                                                             |
| Filter coefficient                 |      | 0      | L3 filtering is not used                                    |
| DRX                                |      | ON     | DRX related parameters are defined in Table A.8.26.8.1-3    |
| T1                                 | s    | 5      |                                                             |
| T2                                 | s    | 15     |                                                             |

### A.8.26.8.2 Test Requirements

In the test, the UE shall send one Event A6 triggered measurement report, with a measurement reporting delay less than  $(24+L)*320\text{ms}$  from the beginning of time period T2, where L is the number of configured discovery signal occasions which are not available due to the absence of the necessary radio signals from cell3.

The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE send the measurement report on PUSCH.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times \text{TTI}_{\text{DCCH}}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.26.9 E-UTRAN FDD-FS3 Inter-frequency event triggered reporting under fading propagation conditions in synchronous cells

### A.8.26.9.1 Test Purpose and Environment

The purpose of this test is to verify that the UE correctly detects event A4 (Neighbour becomes better than threshold) defined in TS 36.331 [2] within the requirements stated in clause 8.11.2.2.1.1.

The test parameters are given in Tables A.8.26.9.1-1 and A.8.26.9.1-2 below. In this test, there are two cells on different carrier frequencies. Cell 1 is an FDD cell and neighbouring Cell 2 is an FS3 cell.

In the measurement control information it is indicated to the UE that event-triggered reporting with Event A4 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

**Table A.8.26.9.1-1: General test parameters for E-UTRAN FDD-FS3 inter-frequency event triggered reporting in fading propagation conditions**

| Parameter                          |                 | Unit | Value  | Comment                                                                                                                     |
|------------------------------------|-----------------|------|--------|-----------------------------------------------------------------------------------------------------------------------------|
| E-UTRA RF Channel Number           |                 |      | 1, 2   | One FDD carrier frequency is used for active cell and one FS3 carrier frequency is used for neighbour cell.                 |
| Active cell                        |                 |      | Cell 1 | Cell 1 is on RF channel number 1                                                                                            |
| Neighbour cell                     |                 |      | Cell 2 | Cell 2 is on RF channel number 2                                                                                            |

| Note 1: OCNG shall be used such that cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. For cells with LBT model, OCNG is transmitted only in subframes with downlink transmission bursts, and is not transmitted during muted subframes or during DMTC windows. |                  |                                                                                                    |                                             |                                 |        |
| Note 2: The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                                                                                                                                                                                                        |                  |                                                                                                    |                                             |                                 |        |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled.                                                                                                     |                  |                                                                                                    |                                             |                                 |        |
| Note 4: Es/Iot, RSRP, SCH_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                                                                                                         |                  |                                                                                                    |                                             |                                 |        |
| Note 5: Void                                                                                                                                                                                                                                                                                                                      |                  |                                                                                                    |                                             |                                 |        |

### A.8.26.9.2 Test Requirements

The UE shall send one Event A4 triggered measurement report, with a measurement reporting delay less than  $(3 + L) \cdot 40$  ms from the beginning of time period T2. L is the number of configured discovery signal occasions which are not available during the time for cell identification at the UE during measurement gaps due to the absence of the necessary radio signals from the measured cell,

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times TTI_{DCCH}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.8.26.10 E-UTRAN TDD-FS3 inter-frequency event triggered reporting under fading propagation conditions in synchronous cells

### A.8.26.10.1 Test Purpose and Environment

The purpose of this test is to verify that the UE correctly detects event A4 (Neighbour becomes better than threshold) defined in TS 36.331 [2] within the requirements stated in clause 8.11.2.2.2.1.

The test parameters are given in Tables A.8.26.10.1-1 and A.8.26.10.1-2 below. In this test, there are two cells on different carrier frequencies. Cell 1 is an TDD cell and neighbouring Cell 2 is an FS3 cell.

In the measurement control information it is indicated to the UE that event-triggered reporting with Event A4 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

**Table A.8.26.10.1-1: General test parameters for E-UTRAN TDD-FS3 inter-frequency event triggered reporting in fading propagation conditions**

| Parameter                          |                 | Unit | Value  | Comment                                                                                                                     |

|         |                                                                                                                                                                                                                                                                                                                           |
|---------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 1: | OCNG shall be used such that cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. For cells with LBT model, OCNG is transmitted only in subframes with downlink transmission bursts, and is not transmitted during muted subframes or during DMTC windows. |
| Note 2: | The resources for uplink transmission are assigned to the UE prior to the start of time period T2.                                                                                                                                                                                                                        |
| Note 3: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.                                                                                                            |
| Note 4: | Es/lot, RSRP, SCH_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                                                                                                                         |
| Note 5: | Void                                                                                                                                                                                                                                                                                                                      |

### A.8.26.10.2 Test Requirements

The UE shall send one Event A4 triggered measurement report, with a measurement reporting delay less than  $(3+L)*40\text{ms}$  from the beginning of time period T2. L is the number of configured discovery signal occasions which are not available during the time for cell identification at the UE during measurement gaps due to the absence of the necessary radio signals from the measured cell.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90%.

NOTE: The actual overall delays measured in the test may be up to  $2 \times \text{TTI}_{\text{DCCH}}$  higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

---

## A.9 Measurement Performance Requirements

Unless explicitly stated otherwise:

- Reported measurements shall be within defined range of accuracy limits defined in Clause 9 for at least 90 % of the reported cases. If multiple measurement performance requirements are verified in the same test, the reported measurements for each requirement shall be within defined range of accuracy limits of the corresponding requirement defined in Clause 9 for at least 90% of the reported cases.
- Cell 1 is the PCell.
- Measurements are performed in RRC\_CONNECTED state.
- The reference channels assume transmission of PDSCH with a maximum number of 5 HARQ transmissions unless otherwise specified.

### A.9.1 RSRP

#### A.9.1.1 FDD Intra frequency case

##### A.9.1.1.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.1 and 9.1.2.2 for FDD intra frequency measurements.

##### A.9.1.1.2 Test parameters

In this set of test cases all cells are on the same carrier frequency. Both absolute and relative accuracy of RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.1.2-1. In all test cases, Cell 1 is the PCell and Cell 2 the target cell.

Table A.9.1.1.2-1: RSRP FDD Intra frequency test parameters

| Parameter                                                              |                                      | Unit             | Test 1   |          | Test 2   |          | Test 3   |          |

|         |                                                                                                                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 1: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 3: | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                           |
| Note 4: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |
| Note 5: | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                              |
| Note 6: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |
| Note 7: | Except Band 29.                                                                                                                                                                                                |
| Note 8: | Except Band 32.                                                                                                                                                                                                |

### A.9.1.1.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.2.1 and 9.1.2.2. The RSRP measurement accuracy for UE Category 1bis shall fulfil the requirements in sections 9.1.2.7 and 9.1.2.8.

## A.9.1.2 TDD Intra frequency case

### A.9.1.2.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.1 and 9.1.2.2 for TDD intra frequency measurements.

### A.9.1.2.2 Test parameters

In this set of test cases all cells are on the same carrier frequency. Both absolute and relative accuracy of RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.2.2-1. In all test cases, Cell 1 is the PCell and Cell 2 the target cell.

Table A.9.1.2.2-1: RSRP TDD Intra frequency test parameters

| Parameter                                                              | Unit                                                                                                                                                                                                           | Test 1     |          | Test 2   |          | Test 3   |          |             |

| Note 4:                                                                | RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                  |            |          |          |          |          |          |             |
| Note 5:                                                                | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |            |          |          |          |          |          |             |
| Note 6:                                                                | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |            |          |          |          |          |          |             |

### A.9.1.2.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.2.1 and 9.1.2.2. The RSRP measurement accuracy for UE Category 1bis shall fulfil the requirements in sections 9.1.2.7 and 9.1.2.8.

### A.9.1.3 FDD—FDD Inter frequency case

#### A.9.1.3.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.3.1 and 9.1.3.2 for FDD—FDD inter frequency measurements.

#### A.9.1.3.2 Test parameters

In this set of test cases the cells are on different carrier frequencies. Both absolute and relative accuracy of RSRP inter-frequency measurements are tested by using the parameters in Table A.9.1.3.2-1 In all test cases, Cell 1 is the PCell and Cell 2 the target cell. The inter frequency measurements are supported by a measurement gap.

Table A.9.1.3.2-1: RSRP FDD—FDD Inter frequency test parameters

| Parameter                                                                                                                                                                                                                     |                                      | Unit             | Test 1   |          | Test 2                                  |          |            |        |        |                                      |        |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |                                      |                  |          |          |                                         |          |            |        |        |                                      |        |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |                                      |                  |          |          |                                         |          |            |        |        |                                      |        |
| Note 3: RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                         |                                      |                  |          |          |                                         |          |            |        |        |                                      |        |

|         |                                                                                                                               |
|---------|-------------------------------------------------------------------------------------------------------------------------------|
| Note 4: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.            |
| Note 5: | For Band 26, the tests shall be performed with the carrier frequency of assigned E-UTRA channel bandwidth within 865-894 MHz. |
| Note 6: | E-UTRA operating band groups are as defined in Section 3.5.                                                                   |
| Note 7: | Except Band 29.                                                                                                               |
| Note 8: | Except Band 32.                                                                                                               |

### A.9.1.3.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.3.1 and 9.1.3.2. The RSRP measurement accuracy for UE Category 1bis shall fulfil the requirements in sections 9.1.3.3 and 9.1.3.4.

### A.9.1.4 TDD—TDD Inter frequency case

#### A.9.1.4.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.3.1 and 9.1.3.2 for TDD—TDD inter frequency measurements.

#### A.9.1.4.2 Test parameters

In this set of test cases the cells are on different carrier frequencies. Both absolute and relative accuracy of RSRP inter-frequency measurements are tested by using the parameters in Table A.9.1.4.2-1 for TDD configuration 1 and in Table A.9.1.4.2-2 for TDD configuration 0. In all test cases, Cell 1 is the PCell and Cell 2 the target cell. The inter frequency measurements are supported by a measurement gap.

Table A.9.1.4.2-1: RSRP TDD—TDD Inter frequency test parameters for TDD configuration 1

| Parameter                                                              |                                                                                                                                                                                                                | Unit       | Test 1   |          | Test 2                                  |          |

| Note 6:                                                                | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |            |          |          |                                         |          |

### A.9.1.4.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.3.1 and 9.1.3.2. The RSRP measurement accuracy for UE Category 1bis shall fulfil the requirements in sections 9.1.3.3 and 9.1.3.4.

## A.9.1.5 FDD—TDD Inter frequency case

### A.9.1.5.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.3.1 and 9.1.3.2 for FDD—TDD inter frequency measurements.

### A.9.1.5.2 Test parameters

In this set of test cases the cells are on different carrier frequencies. Both absolute and relative accuracy of RSRP inter frequency measurements are tested by using the parameters in Table A.9.1.5.2-1 and Table A.9.1.5.2-2. In all test cases, Cell 1 is the serving cell and Cell 2 the target cell. Cell 1 is FDD cell and Cell 2 is TDD cell. The inter frequency measurements are supported by a measurement gap.

**Table A.9.1.5.2-1: RSRP FDD—TDD Inter frequency test parameters (FDD Cell1)**

| Parameter                                                              | Unit                                                                                                                                                                                                           | Test 1   |   | Test 2   |   |

| <p>Note 1: For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.</p> <p>Note 2: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.</p> <p>Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <math>N_{\text{oc}}</math> to be fulfilled.</p> <p>Note 4: RSRP and <math>I_0</math> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.</p> <p>Note 5: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.</p> |                  |          |          |

### A.9.1.5.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.3.1 and 9.1.3.2. The RSRP measurement accuracy for UE Category 1bis shall fulfil the requirements in sections 9.1.3.3 and 9.1.3.4.

## A.9.1.6 FDD RSRP for E-UTRAN Carrier Aggregation

### A.9.1.6.1 Test Purpose and Environment

The purpose of this test is to verify that the FDD RSRP absolute and relative accuracy requirements in carrier aggregation are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.11.2. The test will also verify the primary and secondary component carrier relative RSRP accuracy requirement defined in Clause 9.1.11.3.

### A.9.1.6.2 Test parameters

In this set of cases cell1 is PCell on the primary component carrier, cell2 is SCell on the secondary component carrier and activated, and cell3 is the neighboring cell on the secondary component carrier. The test parameters are given in Table A.9.1.6.2-1.

Table A.9.1.6.2-1: RSRP FDD carrier aggregation test parameters

| Parameter                                                              |                                      | Unit       | Test 1   |                                                                            |                        |
|------------------------------------------------------------------------|--------------------------------------|------------|----------|----------------------------------------------------------------------------|------------------------|

|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|---|----|
| Propagation condition | -                                                                                                                                                                                                              | AWGN |   |    |
| Note 1:               | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |      |   |    |
| Note 2:               | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |      |   |    |
| Note 3:               | RSRP and lo levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                              |      |   |    |
| Note 4:               | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |      |   |    |
| Note 5:               | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                           |      |   |    |
| Note 6:               | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                              |      |   |    |
| Note 7:               | This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1.                                                       |      |   |    |
| Note 8:               | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |      |   |    |

### A.9.1.6.3 Test Requirements

In the test, the performance of RSRP measurements is verified from following four perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between the primary and secondary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

### A.9.1.7 TDD RSRP for E-UTRAN Carrier Aggregation

The test case in this clause are applicable to carrier aggregation capable UEs which have been configured with a downlink SCell.

#### A.9.1.7.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the absolute RSRP accuracy on PCell defined in clause 9.1.11.1, the absolute RSRP accuracy on SCell defined in clause 9.1.11.2, the relative RSRP accuracy between SCell and Cell 3 defined in clause 9.1.11.2, and the relative RSRP accuracy between PCell and SCell defined in clause 9.1.11.3.

#### A.9.1.7.2 Test parameters

In this set of test cases there are three cells on two carrier frequencies. Cell 1 is PCell on channel 1, Cell 2 is activated SCell on channel 2, and Cell 3 is neighbour cell which is also on channel 2. The parameters for the test are listed in Table A.9.1.7.2-1.

Table A.9.1.7.2-1: Carrier aggregation RSRP test parameters for TDD

| Note 1: For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.                                                                                                               |             |            |          |                                                                           |                        |
| Note 2: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |             |            |          |                                                                           |                        |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |             |            |          |                                                                           |                        |
| Note 4: RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                  |             |            |          |                                                                           |                        |
| Note 5: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |             |            |          |                                                                           |                        |

|         |                                                                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 6: | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                     |
| Note 7: | This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1. |
| Note 8: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                              |

### A.9.1.7.3 Test Requirements

In the test, the performance of RSRP measurements is verified from following four perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between the primary and secondary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3

## A.9.1.8 FDD RSRP under Time-Domain Measurement Resource Restriction with Non-MBSFN ABS

### A.9.1.8.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.3 and 9.1.2.4 for FDD intra-frequency RSRP measurements under time-domain measurement resource restriction with non-MBSFN ABS configured in the aggressor cell.

### A.9.1.8.2 Test parameters

In this set of test cases all cells are on the same carrier frequency as PCell. Both absolute and relative accuracy of RSRP intra-frequency measurements are tested, with test parameters specified in Tables A.9.1.8.2-1 and A.9.1.8.2-2.

In the tests there are two synchronous cells, Cell 1 and Cell 2, on the same RF channel. In all test cases, Cell 1 is the serving cell (PCell) and also the aggressor cell to Cell 2. Cell 2 is the cell to be measured for RSRP absolute accuracy, whilst both Cell 1 and Cell 2 are measured for RSRP relative accuracy. Non-MBSFN ABS pattern is configured for Cell 1 during the test. The UE is configured by higher layers via Cell 1 with a time-domain measurement resource restriction pattern for performing E-UTRAN FDD intra-frequency measurements on neighbour cells and provided with a neighbour cell list associated with the pattern, where the cell list includes Cell 2. The UE is also configured with a time-domain measurement resource restriction pattern for the serving cell measurements. The information for both patterns shall be provided to the UE before the measurements start.

**Table A.9.1.8.2-1: General test parameters for E-UTRAN FDD RSRP intra frequency test parameters under time-domain measurement resource restriction with non-MBSFN ABS**

| Parameter                                                                                            | Unit | Value                                          | Comment                                                                                                                                                                                                                                                                                                                                         |

| Propagation condition                                                  |                                      |            | AWGN     |          | AWGN     |          | AWGN     |          |

|          |                                                                                                                                                                                                                                          |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 1:  | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                                    |
| Note 2:  | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. Applies to all subframes. |
| Note 3:  | RSRP and $I_0$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves. $I_0$ levels are calculated in CRS symbols of measurement restricted subframes.                     |
| Note 4:  | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                                       |
| Note 5:  | Applies to restricted measurement subframes of the respective cell.                                                                                                                                                                      |
| Note 6:  | Non-ABS and ABS subframe channel powers defined in Table A.3.4.1.1-1.                                                                                                                                                                    |
| Note 7:  | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                                                        |
| Note 8:  | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                                              |
| Note 9:  | Except Band 29.                                                                                                                                                                                                                          |
| Note 10: | Except Band 32.                                                                                                                                                                                                                          |

### A.9.1.8.3 Test Requirements

The absolute RSRP measurement accuracy and relative RSRP measurement accuracy shall fulfill the requirements in Sections 9.1.2.3 and 9.1.2.4, respectively.

## A.9.1.9 TDD RSRP under Time-Domain Measurement Resource Restriction with Non-MBSFN ABS

### A.9.1.9.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.3 and 9.1.2.4 for TDD intra-frequency RSRP measurements under time-domain measurement resource restriction with non-MBSFN ABS configured in the aggressor cell.

### A.9.1.9.2 Test parameters

In this set of test cases all cells are on the same carrier frequency as PCell. Both absolute and relative accuracy of RSRP intra-frequency measurements are tested, with test parameters specified in Tables A.9.1.9.2-1 and A.9.1.9.2-2.

In the tests there are two synchronous cells, Cell 1 and Cell 2, on the same RF channel. In all test cases, Cell 1 is the serving cell (PCell) and also the aggressor cell to Cell 2. Cell 2 is the cell to be measured for RSRP absolute accuracy, whilst both Cell 1 and Cell 2 are measured for RSRP relative accuracy. Non-MBSFN ABS pattern is configured for Cell 1 during the test. The UE is configured by higher layers via Cell 1 with a time-domain measurement resource restriction pattern for performing E-UTRAN TDD intra-frequency measurements on neighbour cells and provided with a neighbour cell list associated with the pattern, where the cell list includes Cell 2. The UE is also configured with a time-domain measurement resource restriction pattern for the serving cell measurements. The information for both patterns shall be provided to the UE before the measurements start.

**Table A.9.1.9.2-1: General test parameters for E-UTRAN TDD RSRP intra frequency test parameters under time-domain measurement resource restriction with non-MBSFN ABS**

| Parameter                                                                                            | Unit | Value                                        | Comment                                                                                                                                                                                                                                                                                                                                         |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                |             |            |          |          |          |          |          |          |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.       |             |            |          |          |          |          |          |          |
| Applies to all subframes.                                                                                                                                                                                                    |             |            |          |          |          |          |          |          |
| Note 3: RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves. $I_o$ levels are calculated in CRS symbols of measurement restricted subframes. |             |            |          |          |          |          |          |          |
| Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                   |             |            |          |          |          |          |          |          |
| Applies to restricted measurement subframes of the respective cell.                                                                                                                                                          |             |            |          |          |          |          |          |          |
| Note 5: Non-ABS and ABS subframe channel powers defined in Table A.3.4.1.1-1.                                                                                                                                                |             |            |          |          |          |          |          |          |
| Note 7: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                          |             |            |          |          |          |          |          |          |

### A.9.1.9.3 Test Requirements

The absolute RSRP measurement accuracy and relative RSRP measurement accuracy shall fulfill the requirements in Sections 9.1.2.3 and 9.1.2.4, respectively.

## A.9.1.10 FDD RSRP under Time-Domain Measurement Resource Restriction with MBSFN ABS

### A.9.1.10.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.3 and 9.1.2.4 for FDD intra-frequency RSRP measurements under time-domain measurement resource restriction with MBSFN ABS configured in the aggressor cell.

### A.9.1.10.2 Test parameters

In this set of test cases all cells are on the same carrier frequency as PCell. Both absolute and relative accuracy of RSRP intra-frequency measurements are tested, with test parameters specified in Tables A.9.1.10.2-1 and A.9.1.10.2-2.

In the tests there are two synchronous cells, Cell 1 and Cell 2, on the same RF channel. In all test cases, Cell 1 is the serving cell (PCell) and also the aggressor cell to Cell 2. Cell 2 is the cell to be measured for RSRP absolute accuracy, whilst both Cell 1 and Cell 2 are measured for RSRP relative accuracy. MBSFN ABS pattern is configured in Cell 1 during the test. The UE is configured by higher layers via Cell 1 with a time-domain measurement resource restriction pattern for performing E-UTRAN FDD intra-frequency measurements on neighbour cells and provided with a neighbour cell list associated with the pattern, where the cell list includes Cell 2. The UE is also configured with a time-domain measurement resource restriction pattern for the serving cell measurements. The information for both patterns shall be provided to the UE before the measurements start.

**Table A.9.1.10.2-1: General test parameters for E-UTRAN FDD RSRP intra-frequency test parameters under time-domain measurement resource restriction with MBSFN ABS**

| Parameter                                                                                            | Unit | Value                                                                                | Comment                                                                                                                                                                                                                                                                                                               |

| Propagation condition                                                                                                                                                                                                                          |                                             |           | AWGN   |        | AWGN   |        | AWGN   |        |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                                  |                                             |           |        |        |        |        |        |        |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.                         |                                             |           |        |        |        |        |        |        |
| Applies to all subframes.                                                                                                                                                                                                                      |                                             |           |        |        |        |        |        |        |
| Note 3: RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves. I <sub>o</sub> levels are calculated in CRS symbols of measurement restricted subframes. |                                             |           |        |        |        |        |        |        |
| Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                                     |                                             |           |        |        |        |        |        |        |
| Note 5: Applies to restricted measurement subframes of the respective cell.                                                                                                                                                                    |                                             |           |        |        |        |        |        |        |
| Note 6: Non-ABS and ABS subframe channel powers defined in Table A.3.4.2.1-1.                                                                                                                                                                  |                                             |           |        |        |        |        |        |        |
| Note 7: In the 1 <sup>st</sup> OFDM symbol, Cell 2 is not expected to meet the E <sub>s</sub> /I <sub>ot</sub> side condition in 9.1.2.3 and 9.1.2.4.                                                                                          |                                             |           |        |        |        |        |        |        |
| Note 8: For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                                                      |                                             |           |        |        |        |        |        |        |
| Note 9: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                                            |                                             |           |        |        |        |        |        |        |
| Note 10: Except Band 29.                                                                                                                                                                                                                       |                                             |           |        |        |        |        |        |        |
| Note 11: Except Band 32.                                                                                                                                                                                                                       |                                             |           |        |        |        |        |        |        |

### A.9.1.10.3 Test Requirements

The absolute RSRP measurement accuracy and relative RSRP measurement accuracy shall fulfill the requirements in Sections 9.1.2.3 and 9.1.2.4, respectively.

## A.9.1.11 TDD RSRP under Time-Domain Measurement Resource Restriction with MBSFN ABS

### A.9.1.11.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.3 and 9.1.2.4 for TDD intra-frequency RSRP measurements under time-domain measurement resource restriction with MBSFN ABS configured in the aggressor cell.

### A.9.1.11.2 Test parameters

In this set of test cases all cells are on the same carrier frequency as PCell. Both absolute and relative accuracy of RSRP intra-frequency measurements are tested, with test parameters specified in Tables A.9.1.11.2-1 and A.9.1.11.2-2.

In the tests there are two synchronous cells, Cell 1 and Cell 2, on the same RF channel. In all test cases, Cell 1 is the serving cell (PCell) and also the aggressor cell to Cell 2. Cell 2 is the cell to be measured for RSRP absolute accuracy, whilst both Cell 1 and Cell 2 are measured for RSRP relative accuracy. MBSFN ABS pattern is configured in Cell 1 during the test. The UE is configured by higher layers via Cell 1 with a time-domain measurement resource restriction pattern for performing E-UTRAN TDD intra-frequency measurements on neighbour cells and provided with a neighbour cell list associated with the pattern, where the cell list includes Cell 2. The UE is also configured with a time-domain measurement resource restriction pattern for the serving cell measurements. The information for both patterns shall be provided to the UE before the measurements start.

**Table A.9.1.11.2-1: General test parameters for E-UTRAN TDD RSRP intra-frequency test parameters under time-domain measurement resource restriction with MBSFN ABS**

| Parameter                                                                                            | Unit | Value                                                                                   | Comment                                                                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------|------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Serving cell (PCell)                                                                                 |      | Cell 1                                                                                  | The aggressor cell to Cell 2                                                                                                                                                                                                                                                                                             |
| Neighbour cell                                                                                       |      | Cell 2                                                                                  | Cell to be measured                                                                                                                                                                                                                                                                                                      |
| PCell ABS configuration                                                                              |      | MBSFN ABS                                                                               | As defined in Table A.3.4.2.1-1                                                                                                                                                                                                                                                                                          |
| Special subframe configuration                                                                       |      | 6                                                                                       | For Cell 1 and Cell 2. For special subframe configurations see Table 4.2-1 in [16].                                                                                                                                                                                                                                      |
| Uplink/downlink subframe configuration                                                               |      | 1                                                                                       | For Cell 1 and Cell 2. For uplink-downlink subframe configurations see Table 4.2-2 in [16].                                                                                                                                                                                                                              |

- Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
- Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for  $N_{oc}$  to be fulfilled. Applies to all subframes.
- Note 3: RSRP and  $I_o$  levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  $I_o$  levels are calculated in CRS symbols of measurement restricted subframes.
- Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port
- Note 5: Applies to restricted measurement subframes of the respective cell.
- Note 6: Non-ABS and ABS subframe channel powers defined in Table A.3.4.2.1-1.
- Note 7: In the 1<sup>st</sup> OFDM symbol, Cell 2 is not expected to meet the  $E_s/I_{ot}$  side condition in 9.1.2.3 and 9.1.2.4.
- Note 8: E-UTRA operating band groups are as defined in Section 3.5.

### A.9.1.11.3 Test Requirements

The absolute RSRP measurement accuracy and relative RSRP measurement accuracy shall fulfill the requirements in Sections 9.1.2.3 and 9.1.2.4, respectively.

### A.9.1.12 FDD RSRP for E-UTRAN Carrier Aggregation for 20MHz

The test case in this section are applicable to carrier aggregation capable UEs which have been configured with a downlink Scell.

#### A.9.1.12.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.9.1.6.1.

#### A.9.1.12.2 Test parameters

The test parameters are the same except those described in the following section. The listed parameter values in Tables A.9.1.12.2-1 will replace the values of corresponding parameters in Tables A.9.1.6.2-1.

**Table A.9.1.12.2-1: RSRP FDD carrier aggregation test parameters**

| Parameter                                                                                                                                                        |                                  | Unit       | Test 1    |                            |           |

| Note 2: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                 |                                  |            |           |                            |           |
| Note 3: See Table A.9.1.6.2-1 for the other parameters.                                                                                                          |                                  |            |           |                            |           |
| Note 4: E-UTRA operating band groups are as defined in Section 3.5.                                                                                              |                                  |            |           |                            |           |
| Note 5: The test applies for E-UTRA operating bands in this band group which are supporting 20 MHz channel bandwidth.                                            |                                  |            |           |                            |           |

### A.9.1.12.3 Test Requirements

The test requirements defined in section A.9.1.6.3 shall apply to this test case.

### A.9.1.13 TDD RSRP for E-UTRAN Carrier Aggregation for 20MHz

The test case in this section are applicable to carrier aggregation capable UEs which have been configured with a downlink Scell.

#### A.9.1.13.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.9.1.7.1.

#### A.9.1.13.2 Test parameters

The test parameters are the same except those described in the following section. The listed parameter values in Tables A.9.1.13.2-1 will replace the values of corresponding parameters in Tables A.9.1.7.2-1.

**Table A.9.1.13.2-1: Carrier aggregation RSRP test parameters for TDD**

| Parameter                                                                                                                                                        |                                      | Unit                    | Test 1   |                                        |          |

### A.9.1.13.3 Test Requirements

The test requirements defined in section A.9.1.7.3 shall apply to this test case.

## A.9.1.14 FDD RSRP under Time-Domain Measurement Resource Restriction with CRS Assistance Information and Non-MBSFN ABS

### A.9.1.14.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.5 and 9.1.2.6 for FDD intra-frequency RSRP measurements under time-domain measurement resource restriction with CRS Assistance Information and non-MBSFN ABS configured in the aggressor cells.

### A.9.1.14.2 Test parameters

In this set of test cases all cells are on the same carrier frequency as PCell. Both absolute and relative accuracy of RSRP intra-frequency measurements are tested, with test parameters specified in Tables A.9.1.14.2-1 and A.9.1.14.2-2.

In the tests there are three synchronous cells, Cell 1, Cell2 and Cell 3, on the same RF channel. In all test cases, Cell 1 is the serving cell (PCell) and also the aggressor cell to Cell 3. Cell 2 is the neighbour aggressor cell without CRS colliding to Cell 3. Cell 3 is the cell to be measured for RSRP absolute accuracy, whilst both Cell 1 and Cell 3 are measured for RSRP relative accuracy. Non-MBSFN ABS pattern is configured for Cell 1 and Cell 2 during the test.

The UE is configured by higher layers with a time domain measurement resource restriction pattern for performing E-UTRAN FDD intra-frequency measurements on neighbour cells, namely Cell 3 measurements. The UE is also provided via higher layers with the CRS assistance information for Cell 2. The information for both measurement pattern and the CRS assistance information shall be provided via RRC to the UE before the measurements start.

**Note:** It's up to eNB's implementation whether the time domain measurement resource restriction pattern for PCell measurements is configured or not.

**Table A.9.1.14.2-1: General test parameters for FDD RSRP under Time-Domain Measurement Resource Restriction with CRS Assistance Information and Non-MBSFN ABS**

| Parameter                                                                                            |                          | Unit | Value                                                                                                                                                                        | Comment                                                                                                                                                                                                                                                                                                                                               |

| Propagation condition |                                                                                                                                                                                                                                                                                   |  | AWGN |  | AWGN |  | AWGN   |        |
| Note 1:               | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                                                                             |  |      |  |      |  |        |        |
| Note 2:               | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. Applies to all subframes.                                          |  |      |  |      |  |        |        |
| Note 3:               | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves. $I_o$ levels are calculated in CRS symbols of measurement restricted subframes.                                                              |  |      |  |      |  |        |        |
| Note 4:               | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                                                                                |  |      |  |      |  |        |        |
| Note 5:               | Applies to restricted measurement subframes for only Cell 2 and Cell 3. For Cell 1, the corresponding value is derived from the normal subframes other than the subframes indicated in the time domain measurement resource restriction pattern for intra-frequency measurements. |  |      |  |      |  |        |        |
| Note 6:               | Non-ABS and ABS subframe channel powers defined in Table A.3.4.1.1-1.                                                                                                                                                                                                             |  |      |  |      |  |        |        |
| Note 7:               | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                                                                                                 |  |      |  |      |  |        |        |
| Note 8:               | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                                                                                       |  |      |  |      |  |        |        |
| Note 9:               | Except Band 29.                                                                                                                                                                                                                                                                   |  |      |  |      |  |        |        |
| Note 10:              | Except Band 32.                                                                                                                                                                                                                                                                   |  |      |  |      |  |        |        |

### A.9.1.14.3 Test Requirements

The absolute RSRP measurement accuracy and relative RSRP measurement accuracy shall fulfill the requirements in Sections 9.1.2.5 and 9.1.2.6, respectively.

### A.9.1.15 TDD RSRP under Time-Domain Measurement Resource Restriction with CRS Assistance Information and Non-MBSFN ABS

#### A.9.1.15.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.5 and 9.1.2.6 for TDD intra-frequency RSRP measurements under time-domain measurement resource restriction with CRS Assistance Information and non-MBSFN ABS configured in the aggressor cells.

#### A.9.1.15.2 Test parameters

In this set of test cases all cells are on the same carrier frequency as PCell. Both absolute and relative accuracy of RSRP intra-frequency measurements are tested, with test parameters specified in Tables A.9.1.15.2-1 and A.9.1.15.2-2.

In the tests there are three synchronous cells, Cell 1, Cell2 and Cell 3, on the same RF channel. In all test cases, Cell 1 is the serving cell (PCell) and also the aggressor cell to Cell 3. Cell 2 is the neighbour aggressor cell without CRS colliding to Cell 3. Cell 3 is the cell to be measured for RSRP absolute accuracy, whilst both Cell 1 and Cell 3 are measured for RSRP relative accuracy. Non-MBSFN ABS pattern is configured for Cell 1 and Cell 2 during the test.

The UE is configured by higher layers with a time domain measurement resource restriction pattern for performing E-UTRAN TDD intra-frequency measurements on neighbour cells, namely Cell 3 measurements. The UE is also provided via higher layers with the CRS assistance information for Cell 2. The information for both measurement pattern and the CRS assistance information shall be provided via RRC to the UE before the measurements start.

**Note:** It's up to eNB's implementation whether the time domain measurement resource restriction pattern for PCell measurements is configured or not.

**Table A.9.1.15.2-1: General test parameters for TDD RSRP under Time-Domain Measurement Resource Restriction with CRS Assistance Information and Non-MBSFN ABS**

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.<br>Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. Applies to all subframes.<br>Note 3: RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves. I <sub>o</sub> levels are calculated in CRS symbols of measurement restricted subframes.<br>Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.<br>Note 5: Applies to restricted measurement subframes for only Cell 2 and Cell 3. For Cell 1, the corresponding value is derived from the normal subframes other than the subframes indicated in the time domain measurement resource restriction pattern for intra-frequency measurements.<br>Note 6: Non-ABS and ABS subframe channel powers defined in Table A.3.4.1.1-1.<br>Note 7: E-UTRA operating band groups are as defined in Section 3.5. |                  |            |          |          |          |          |          |          |          |          |      |

### A.9.1.15.3 Test Requirements

The absolute RSRP measurement accuracy and relative RSRP measurement accuracy shall fulfill the requirements in Sections 9.1.2.5 and 9.1.2.6, respectively.

## A.9.1.16 FDD Intra frequency case for 5MHz Bandwidth

### A.9.1.16.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.2.1 and 9.1.2.2 for FDD intra frequency measurements.

### A.9.1.16.2 Test parameters

In this set of test cases all cells are on the same carrier frequency. Both absolute and relative accuracy of RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.16.2-1. In all test cases, Cell 1 is the PCell and Cell 2 the target cell.

**Table A.9.1.16.2-1: RSRP FDD Intra frequency test parameters for 5MHz Bandwidth**

| Parameter                                                                                                                                                                                                              |             | Unit        | Test 1    |           | Test 2    |           | Test 3    |           |

| Propagation condition                                                                                                                                                                                                  |             | -           | AWGN      |           | AWGN      |           | AWGN      |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |             |             |           |           |           |           |           |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |             |             |           |           |           |           |           |           |
| Note 3: RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                           |             |             |           |           |           |           |           |           |
| Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |             |             |           |           |           |           |           |           |

### A.9.1.16.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.2.1 and 9.1.2.2.

## A.9.1.17 FDD—FDD Inter frequency case for 5MHz Bandwidth

### A.9.1.17.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.3.1 and 9.1.3.2 for FDD—FDD inter frequency measurements.

### A.9.1.17.2 Test parameters

In this set of test cases the cells are on different carrier frequencies. Both absolute and relative accuracy of RSRP inter-frequency measurements are tested by using the parameters in Table A.9.1.17.2-1. In all test cases, Cell 1 is the PCell and Cell 2 the target cell. The inter frequency measurements are supported by a measurement gap.

**Table A.9.1.17.2-1: RSRP FDD—FDD Inter frequency test parameters for 5MHz Bandwidth**

| Parameter                                                                                                                                                                                                                     |                     | Unit             | Test 1    |           | Test 2    |           |

| Propagation condition                                                                                                                                                                                                         |                     | -                | AWGN      |           | AWGN      |           |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                 |                     |                  |           |           |           |           |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for N <sub>oc</sub> to be fulfilled. |                     |                  |           |           |           |           |
| Note 3: RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                         |                     |                  |           |           |           |           |
| Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                    |                     |                  |           |           |           |           |
| Note 5: For Band 26, the tests shall be performed with the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                                                              |                     |                  |           |           |           |           |
| Note 6: This test is only applicable for testing inter-frequency requirements for Bands FDD_N. Cell 2 is on the Band under test, and Cell 1 is on another band supported by the UE.                                           |                     |                  |           |           |           |           |

**Table A.9.1.17.2-1: Void**

### A.9.1.17.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.3.1 and 9.1.3.2.

### A.9.1.18 FDD RSRP for E-UTRAN Carrier Aggregation for 10MHz + 5MHz

The test case in this section are applicable to carrier aggregation capable UEs which have been configured with a downlink Scell.

#### A.9.1.18.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.9.1.6.1.

#### A.9.1.18.2 Test parameters

The test parameters are the same except those described in the following section. The listed parameter values in Tables A.9.1.18.2-1 will replace the values of corresponding parameters in Tables A.9.1.6.2-1.

Table A.9.1.18.2-1: RSRP FDD carrier aggregation test parameters

| Parameter                                                                                                                                                        |                    | Unit        | Test 1   |                               |                        |

|                                                                                                                                                                  | Bands FDD_H        |             |          |                               |                        |
| Bands FDD_N                                                                                                                                                      |                    |             | -80.94   |                               |                        |
| Note 1: This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1. |                    |             |          |                               |                        |
| Note 2: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                        |                    |             |          |                               |                        |
| Note 3: See Table A.9.1.6.2-1 for the other parameters.                                                                                                          |                    |             |          |                               |                        |

### A.9.1.18.3 Test Requirements

The test requirements defined in section A.9.1.6.3 shall apply to this test case.

### A.9.1.19 TDD RSRP for E-UTRAN Carrier Aggregation for 10MHz + 5MHz

The test case in this section are applicable to carrier aggregation capable UEs which have been configured with a downlink Scell.

### A.9.1.19.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.9.1.7.1.

### A.9.1.19.2 Test parameters

The test parameters are the same except those described in the following section. The listed parameter values in Tables A.9.1.19.2-1 will replace the values of corresponding parameters in Tables A.9.1.7.2-1.

**Table A.9.1.19.2-1: Carrier aggregation RSRP test parameters for TDD**

| Parameter                                                                                                                                                        |             | Unit       | Test 1   |                            |           |

|                                                                                                                                                                  | Bands TDD_E |            |          |                            |           |
| Note 1: This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1. |             |            |          |                            |           |
| Note 2: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                 |             |            |          |                            |           |
| Note 3: See Table A.9.1.7.2-1 for the other parameters.                                                                                                          |             |            |          |                            |           |

### A.9.1.19.3 Test Requirements

The test requirements defined in section A.9.1.7.3 shall apply to this test case.

## A.9.1.20 FDD RSRP for E-UTRAN Carrier Aggregation for 5MHz + 5MHz bandwidth

The test case in this section are applicable to carrier aggregation capable UEs which have been configured with a downlink Scell.

### A.9.1.20.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.9.1.6.1.

### A.9.1.20.2 Test parameters

The test parameters are the same except those described in the following section. The listed parameter values in Tables A.9.1.20.2-1 will replace the values of corresponding parameters in Tables A.9.1.6.2-1.

Table A.9.1.20.2-1: RSRP FDD carrier aggregation test parameters

| Parameter                                                                                                                                                        |                                      | Unit        | Test 1    |                                |                        |

| Note 1: This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1. |                                      |             |           |                                |                        |
| Note 2: RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                        |                                      |             |           |                                |                        |
| Note 3: See Table A.9.1.6.2-1 for the other parameters.                                                                                                          |                                      |             |           |                                |                        |
| Note 4: E-UTRA operating band groups are as defined in Section 3.5.                                                                                              |                                      |             |           |                                |                        |
| Note 5: The test applies for E-UTRA operating bands in this band group which are supporting 5MHz + 5MHz channel bandwidth.                                       |                                      |             |           |                                |                        |

### A.9.1.20.3 Test Requirements

The test requirements defined in section A.9.1.6.3 shall apply to this test case.

### A.9.1.21 TDD RSRP for E-UTRAN Carrier Aggregation for 5MHz + 5MHz bandwidth

The test case in this section are applicable to carrier aggregation capable UEs which have been configured with a downlink SCell.

#### A.9.1.21.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.9.1.7.1.

#### A.9.1.21.2 Test parameters

The test parameters are the same except those described in the following section. The listed parameter values in Tables A.9.1.21.2-1 will replace the values of corresponding parameters in Tables A.9.1.7.2-1.

**Table A.9.1.21.2-1: Carrier aggregation RSRP test parameters for TDD**

| Parameter                                                                                                                                                        |                                      | Unit       | Test 1   |                            |           |

| Note 4: E-UTRA operating band groups are as defined in Section 3.5.                                                                                              |                                      |            |          |                            |           |
| Note 5: The test applies for E-UTRA operating bands in this band group which are supporting 5MHz + 5MHz channel bandwidth.                                       |                                      |            |          |                            |           |

#### A.9.1.21.3 Test Requirements

The test requirements defined in section A.9.1.7.3 shall apply to this test case.

### A.9.1.22 RSRP for E-UTRAN TDD-FDD Carrier Aggregation with PCell in FDD

#### A.9.1.22.1 Test Purpose and Environment

The test case is applicable for TDD-FDD carrier aggregation capable UEs which have been configured with a downlink PCell in FDD and a downlink SCell in TDD.

The purpose of this test is to verify that the RSRP absolute and relative measurements accuracy in TDD-FDD carrier aggregation is within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.11.2, the relative RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.11.2 between the SCell and a neighbour cell, and the relative RSRP accuracy requirements of the PCell compared to the SCell defined in Clause 9.1.11.3.

#### A.9.1.22.2 Test parameters

In this test case, Cell 1 is the PCell on the FDD primary component carrier, Cell 2 is the configured and activated SCell on the TDD secondary component carrier, and Cell 3 is the neighboring cell on the TDD secondary component carrier. The test parameters are given in Table A.9.1.22.2-1.

Table A.9.1.22.2-1: RSRP TDD-FDD carrier aggregation test parameters

| Parameter                                                                                     | Unit                                 | Test 1                                                                                                   |                                                                                                          |                                                                                                          |

| Note 4:                                                   | Es/Iot, RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                             |                            |                                       |                                                                                                       |                                      |       |
| Note 5:                                                   | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                    |                            |                                       |                                                                                                       |                                      |       |
| Note 6:                                                   | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                  |                            |                                       |                                                                                                       |                                      |       |
| Note 7:                                                   | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                     |                            |                                       |                                                                                                       |                                      |       |
| Note 8:                                                   | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.                                                                 |                            |                                       |                                                                                                       |                                      |       |
| Note 9:                                                   | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                           |                            |                                       |                                                                                                       |                                      |       |

### A.9.1.22.3 Test Requirements

In the test, the performance of RSRP measurements is verified from following four perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between the primary and secondary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

## A.9.1.23 RSRP for E-UTRAN TDD-FDD Carrier Aggregation with PCell in TDD

### A.9.1.23.1 Test Purpose and Environment

The test case is applicable for TDD-FDD carrier aggregation capable UEs which have been configured with a downlink PCell in TDD and a downlink SCell in FDD.

The purpose of this test is to verify that the RSRP absolute and relative measurements accuracy in TDD-FDD carrier aggregation is within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.11.2, the relative RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.11.2 between the SCell and a neighbour cell, and the relative RSRP accuracy requirements of the PCell compared to the SCell defined in Clause 9.1.11.3.

### A.9.1.23.2 Test parameters

In this test case, Cell 1 is the PCell on the TDD primary component carrier, Cell 2 is the configured and activated SCell on the FDD secondary component carrier, and Cell 3 is the neighboring cell on the FDD secondary component carrier. The test parameters are given in Table A.9.1.23.2-1.

Table A.9.1.23.2-1: RSRP TDD-FDD carrier aggregation test parameters

| Parameter                                                                                     |                                      | Unit             | Test 1                                                                                                   |                                                                                                          |                                                                                                          |

| Time alignment error relative to cell 1 Note 8                                                                                                                                                                         |                           | -                          | -                                     | ≤ TAE                                                                                    | -                      |       |
| Note 1: For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.                                                                                                               |                           |                            |                                       |                                                                                          |                        |       |
| Note 2: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                           |                           |                            |                                       |                                                                                          |                        |       |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |                           |                            |                                       |                                                                                          |                        |       |
| Note 4: Es/Iot, RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                      |                           |                            |                                       |                                                                                          |                        |       |
| Note 5: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |                           |                            |                                       |                                                                                          |                        |       |
| Note 6: The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                           |                           |                            |                                       |                                                                                          |                        |       |
| Note 7: For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                              |                           |                            |                                       |                                                                                          |                        |       |
| Note 8: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.                                                                          |                           |                            |                                       |                                                                                          |                        |       |
| Note 9: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |                           |                            |                                       |                                                                                          |                        |       |

### A.9.1.23.3 Test Requirements

In the test, the performance of RSRP measurements is verified from following four perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between the primary and secondary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

### A.9.1.24 TDD RSRP for E-UTRAN Carrier Aggregation for 20MHz + 10MHz

The test case in this section are applicable to carrier aggregation capable UEs which have been configured with a downlink Scell.

#### A.9.1.24.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in subclause A.9.1.7.1.

#### A.9.1.24.2 Test parameters

The test parameters are the same except those described in the following section. The listed parameter values in Tables A.9.1.24.2-1 will replace the values of corresponding parameters in Tables A.9.1.7.2-1.

**Table A.9.1.24.2-1: Carrier aggregation RSRP test parameters for TDD**

| Parameter                                                                                                                                                        |             | Unit                       | Combination | Test 1                                |                                                                                                        |          |

| Note 1: This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1. |             |                            |             |                                       |                                                                                                        |          |
| Note 2: I <sub>0</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                     |             |                            |             |                                       |                                                                                                        |          |
| Note 3: See Table A.9.1.7.2-1 for the other parameters.                                                                                                          |             |                            |             |                                       |                                                                                                        |          |
| Note 4: For each parameter, the allowed combinations are shown in separate rows.                                                                                 |             |                            |             |                                       |                                                                                                        |          |

#### A.9.1.24.3 Test Requirements

The test requirements defined in section A.9.1.7.3 shall apply to this test case.

## A.9.1.25 FDD intra-frequency absolute and relative RSRP accuracies in CRS based discovery signal

### A.9.1.25.1 Test Purpose and Environment

The purpose of this test is to verify that the FDD RSRP absolute and relative measurement accuracies in CRS based discovery signal are within the specified limits. This test will verify the requirements in Sections 9.1.14.2.

### A.9.1.25.2 Test parameters

In this test case, all cells are on the same carrier frequency. Both absolute and relative accuracies of RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.25.2-1. In this test case, Cell 1 is the PCell and Cell 2 is the target cell. The Cell 2 DMTC configuration is provided to the UE in the *measDS-Config* before the start of the test.

Table A.9.1.25.2-1: RSRP FDD Intra frequency test parameters

| Parameter                                                              |                                      | Unit          | Test 1   |          |
|------------------------------------------------------------------------|--------------------------------------|---------------|----------|----------|
|                                                                        |                                      |               | Cell 1   | Cell 2   |
| E-UTRA RF Channel Number                                               |                                      |               | 1        |          |
| $BW_{\text{channel}}$                                                  |                                      | MHz           | 10       |          |

| $\hat{E}_s/N_{oc}$                                                     |                                      | dB            | 6        | 1        |
| Propagation condition                                                  |                                      | -             | AWGN     |          |

|         |                                                                                                                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 1: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |
| Note 2: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 3: | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                           |
| Note 4: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |
| Note 5: | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                              |
| Note 6: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |
| Note 7: | Except Band 29.                                                                                                                                                                                                |
| Note 8: | Except Band 32.                                                                                                                                                                                                |

### A.9.1.25.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.14.2.

## A.9.1.26 TDD intra-frequency absolute and relative RSRP accuracies in CRS based discovery signal

### A.9.1.26.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP absolute and relative measurement accuracies in CRS based discovery signal are within the specified limits. This test will verify the requirements in Sections 9.1.14.2.

### A.9.1.26.2 Test parameters

In this test case all cells are on the same carrier frequency. Both absolute and relative accuracies of RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.26.2-1. In this test case, Cell 1 is the PCell and Cell 2 is the target cell. The Cell 2 DMTC configuration is provided to the UE in the *measDS-Config* before the start of the test.

Table A.9.1.26.2-1: RSRP TDD Intra frequency test parameters

| Parameter                                                              | Unit             | Test 1     |          |
|------------------------------------------------------------------------|------------------|------------|----------|
|                                                                        |                  | Cell 1     | Cell 2   |

|         |                                                                                                                                                                                                                   |
|---------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 1: | For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.                                                                                                                  |
| Note 2: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                             |
| Note 3: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time<br>and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 4: | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                              |
| Note 5: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                |
| Note 6: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                       |

### A.9.1.26.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.14. 2.

### A.9.1.27 FDD—FDD inter-frequency absolute and relative RSRP accuracies in CRS based discovery signal

#### A.9.1.27.1 Test Purpose and Environment

The purpose of this test is to verify that the CRS RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.14.2 for FDD—FDD inter frequency measurements.

#### A.9.1.27.2 Test parameters

In this set of test case the cells are on different carrier frequencies. Both absolute and relative accuracy of CRS RSRP inter-frequency measurements are tested by using the parameters in Table A.9.1.27.2-1. In this test case, Cell 1 is the PCell and Cell 2 the target cell. The inter frequency measurements are supported by a measurement gap and a DMTC configuration.

Table A.9.1.27.2-1: CRS RSRP FDD—FDD Inter frequency test parameters

| Parameter                                                              |                                      | Unit             | Test 1                                  |          |
|------------------------------------------------------------------------|--------------------------------------|------------------|-----------------------------------------|----------|
|                                                                        |                                      |                  | Cell 1                                  | Cell 2   |

| Propagation condition |                                                                                                                                                                                                                | -  | AWGN |        |
| Note 1:               | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |    |      |        |
| Note 2:               | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |    |      |        |
| Note 3:               | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                           |    |      |        |
| Note 4:               | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |    |      |        |
| Note 5:               | For Band 26, the tests shall be performed with the carrier frequency of assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                                  |    |      |        |
| Note 6:               | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |    |      |        |
| Note 7:               | Except Band 29.                                                                                                                                                                                                |    |      |        |
| Note 8:               | DMTC is provided to the UE in the <i>measDS-Config</i> (in TS36.331) before the beginning of the test.                                                                                                         |    |      |        |
| Note 9:               | Except Band 32.                                                                                                                                                                                                |    |      |        |

### A.9.1.27.3 Test Requirements

The CRS RSRP measurement accuracy shall fulfil the requirements in sections 9.1.14.2.

## A.9.1.28 TDD—TDD inter-frequency absolute and relative RSRP accuracies in CRS based discovery signal

### A.9.1.28.1 Test Purpose and Environment

The purpose of this test is to verify that the CRS RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.14.2 for TDD—TDD inter frequency measurements.

### A.9.1.28.2 Test parameters

In this set of test case the cells are on different carrier frequencies. Both absolute and relative accuracy of CRS RSRP inter-frequency measurements are tested by using the parameters in Table A.9.1.28.2-1. In this test case, Cell 1 is the PCell and Cell 2 the target cell. The inter frequency measurements are supported by a measurement gap and a DMTC configuration.

Table A.9.1.28.2-1: CRS RSRP TDD—TDD Inter frequency test parameters

| Parameter                                                              |                                                                                                                                                                                                                              | Unit                    | Test 1                                       |          |

| Note 3:                                                                | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for <i>N</i> <sub>oc</sub> to be fulfilled. |                         |                                              |          |

|         |                                                                                                                                   |
|---------|-----------------------------------------------------------------------------------------------------------------------------------|
| Note 4: | RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |
| Note 5: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                |
| Note 6: | E-UTRA operating band groups are as defined in Section 3.5.                                                                       |
| Note 7: | DMTC is provided to the UE in the measDS-Config (in TS36.331) before the beginning of test                                        |

### A.9.1.28.3 Test Requirements

The CRS RSRP measurement accuracy shall fulfil the requirements in sections 9.1.14.2.

## A.9.1.29 FDD intra frequency absolute and relative CSI-RSRP accuracies in CSI-RS based discovery signal

### A.9.1.29.1 Test Purpose and Environment

The purpose of this test is to verify that the CSI- RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.14.3 for FDD intra frequency measurements.

### A.9.1.29.2 Test parameters

In this set of test case all cells are on the same carrier frequencies. Both absolute and relative accuracy of CSI- RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.29.2-1. In this test case, Cell 1 is the PCell and Cell 2 the target cell. The intra frequency measurements are supported by a DMTC configuration.

Table A.9.1.29.2-1: CSI-RSRP FDD Intra frequency test parameters

| Parameter                                                              |                                      | Unit             | Test 1            |                   |

| CSI-RS $\hat{E}_s/N_{oc}$                                                                                                                                                                                                  |                                             | dB        |  | 9      | 5     |
| Propagation condition                                                                                                                                                                                                      |                                             | -         |  | AWGN   |       |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                              |                                             |           |  |        |       |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.     |                                             |           |  |        |       |
| Note 3: RSRP, CSI-RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves. $I_o$ levels are calculated in CRS symbols of measurement subframe. |                                             |           |  |        |       |
| Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                 |                                             |           |  |        |       |
| Note 5: For Band 26, the tests shall be performed with the carrier frequency of assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                                      |                                             |           |  |        |       |
| Note 6: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                        |                                             |           |  |        |       |
| Note 7: Except Band 29.                                                                                                                                                                                                    |                                             |           |  |        |       |
| Note 8: DMTC is provided to the UE in the <i>measDS-Config</i> (in TS36.331) before the beginning of the test.                                                                                                             |                                             |           |  |        |       |
| Note 9: Except Band 32.                                                                                                                                                                                                    |                                             |           |  |        |       |

### A.9.1.29.3 Test Requirements

The CSI- RSRP measurement accuracy shall fulfil the requirements in sections 9.1.14.3.

## A.9.1.30 TDD intra frequency absolute and relative CSI-RSRP accuracies in CSI-RS based discovery signal

### A.9.1.30.1 Test Purpose and Environment

The purpose of this test is to verify that the CSI- RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.14.3 for TDD intra frequency measurements.

### A.9.1.30.2 Test parameters

In this set of test case all cells are on the same carrier frequencies. Both absolute and relative accuracy of CSI- RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.30.2-1. In this test case, Cell 1 is the PCell and Cell 2 the target cell. The intra frequency measurements are supported by a DMTC configuration.

Table A.9.1.30.2-1: CSI-RSRP TDD Intra frequency test parameters

| Parameter                                                                                                |             | Unit       | Test 1                 |                        |

|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                                                                                |
| Note 3: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.     |
| Note 4: | RSRP, CSI-RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves. $I_o$ levels are calculated in CRS symbols of measurement subframe. |
| Note 5: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                 |
| Note 6: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                        |
| Note 7: | DMTC is provided to the UE in the <i>measDS-Config</i> (in TS36.331) before the beginning of the test.                                                                                                             |

### A.9.1.30.3 Test Requirements

The CSI- RSRP measurement accuracy shall fulfil the requirements in sections 9.1.14.3.

### A.9.1.31 FDD—FDD inter-frequency absolute and relative CSI-RSRP accuracies in CSI-RS based discovery signal

#### A.9.1.31.1 Test Purpose and Environment

The purpose of this test is to verify that the CSI-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.14.3 for FDD—FDD inter frequency measurements.

#### A.9.1.31.2 Test parameters

In this set of test case the cells are on different carrier frequencies. Both absolute and relative accuracy of CSI-RSRP inter-frequency measurements are tested by using the parameters in Table A.9.1.31.2-1. In this test case, Cell 1 is the PCell and Cell 2 the target cell. The inter frequency measurements are supported by a measurement gap and two DMTC configurations which one is for cell1 and the other is for cell2.

Table A.9.1.31.2-1: CSI-RSRP FDD—FDD Inter frequency test parameters

| Parameter                                                              |                                      | Unit             | Test 1                               |          |
|------------------------------------------------------------------------|--------------------------------------|------------------|--------------------------------------|----------|
|                                                                        |                                      |                  | Cell 1                               | Cell 2   |

| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                                |                                             |            |                                               |                              |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.                       |                                             |            |                                               |                              |
| Note 3: RSRP, CSI-RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves. I <sub>o</sub> levels are calculated in CRS symbols of measurement subframe. |                                             |            |                                               |                              |
| Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                                   |                                             |            |                                               |                              |
| Note 5: For Band 26, the tests shall be performed with the carrier frequency of assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                                                        |                                             |            |                                               |                              |
| Note 6: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                                          |                                             |            |                                               |                              |
| Note 7: Except Band 29.                                                                                                                                                                                                                      |                                             |            |                                               |                              |
| Note 8: DMTC is provided to the UE in the <i>measDS-Config</i> (in TS36.331) before the beginning of the test.                                                                                                                               |                                             |            |                                               |                              |
| Note 9: Except Band 32.                                                                                                                                                                                                                      |                                             |            |                                               |                              |

### A.9.1.31.3 Test Requirements

The CSI-RSRP measurement accuracy shall fulfil the requirements in sections 9.1.14.3.

## A.9.1.32 TDD—TDD inter-frequency absolute and relative CSI-RSRP accuracies in CSI-RS based discovery signal

### A.9.1.32.1 Test Purpose and Environment

The purpose of this test is to verify that the CSI-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.14.3 for TDD—TDD inter frequency measurements.

### A.9.1.32.2 Test parameters

In this set of test case the cells are on different carrier frequencies. Both absolute and relative accuracy of CSI-RSRP inter-frequency measurements are tested by using the parameters in Table A.9.1.32.2-1. In this test case, Cell 1 is the PCell and Cell 2 the target cell. The inter frequency measurements are supported by a measurement gap and two DMTC configurations which one is for cell 1 and the other is for cell2.

Table A.9.1.32.2-1: CSI-RSRP TDD—TDD Inter frequency test parameters

| Parameter                                                              |             | Unit                    | Test 1                                  |                        |            |                                              |      |

| CSI-RS $\hat{E}_s / N_{oc}$ |                                                                                                                                                                                                                | dB | 13   | 0      |
| Propagation condition       |                                                                                                                                                                                                                | -  | AWGN |        |
| Note 1:                     | For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.                                                                                                               |    |      |        |
| Note 2:                     | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |    |      |        |
| Note 3:                     | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |    |      |        |
| Note 4:                     | RSRP, CSI-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves. Io levels are calculated in CRS symbols of measurement subframe.   |    |      |        |
| Note 5:                     | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |    |      |        |
| Note 6:                     | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |    |      |        |
| Note 7:                     | DMTC is provided to the UE in the measDS-Config (in TS36.331) before the beginning of test.                                                                                                                    |    |      |        |

### A.9.1.32.3 Test Requirements

The CSI-RSRP measurement accuracy shall fulfil the requirements in sections 9.1.14.3.

## A.9.1.33 FDD absolute and relative RSRP accuracies for E-UTRAN Carrier Aggregation in CRS based discovery signal

### A.9.1.33.1 Test Purpose and Environment

The purpose of this test is to verify that the FDD RSRP absolute and relative measurement accuracies in carrier aggregation in CRS based discovery signal are within the specified limits. This test will verify the absolute RSRP accuracy requirement of the secondary component carrier defined in clause 9.1.15.1.2, and the relative RSRP accuracy requirement of the secondary component carrier defined in clause 9.1.15.1.2. The test will also verify the primary and secondary component carrier relative RSRP accuracy requirement defined in Clause 9.1.15.1.3.

### A.9.1.33.2 Test parameters

In this test case, Cell1 is PCell on the primary component carrier, Cell2 is SCell on the secondary component carrier and activated, and Cell3 is the neighboring cell on the secondary component carrier. The test parameters are given in Table A.9.1.33.2-1. The Cell 3 DMTC configuration is provided to the UE in the *measDS-Config* before the start of the test.

Table A.9.1.33.2-1: RSRP FDD carrier aggregation test parameters

| Parameter                                                              |                                      | Unit       | Test 1   |                                                                            |                        |        |                               |  |  |

| $\hat{E}_s/N_{oc}$    |                                                                                                                                                                                                                | dB | -4     | 3    |
| Propagation condition |                                                                                                                                                                                                                | -  |        | AWGN |
| Note 1:               | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |    |        |      |
| Note 2:               | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |    |        |      |
| Note 3:               | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                           |    |        |      |
| Note 4:               | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |    |        |      |
| Note 5:               | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                           |    |        |      |
| Note 6:               | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                              |    |        |      |
| Note 7:               | This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1.                                                       |    |        |      |
| Note 8:               | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |    |        |      |

### A.9.1.33.3 Test Requirements

In the test, the performance of RSRP measurements is verified from following three perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 3 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.15.1.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.15.1.2
- The relative accuracy of inter-frequency RSRP measurements between the primary and secondary component carriers for Cell 3 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.15.1.3.

### A.9.1.34 TDD absolute and relative RSRP accuracies for E-UTRAN Carrier Aggregation in CRS based discovery signal

#### A.9.1.34.1 Test Purpose and Environment

The purpose of this test is to verify that the TDD RSRP absolute and relative measurement accuracies in carrier aggregation in CRS based discovery signal are within the specified limits. This test will verify the absolute RSRP accuracy requirement of the secondary component carrier defined in clause 9.1.15.1.2, and the relative RSRP accuracy requirement of the secondary component carrier defined in clause 9.1.15.1.2. The test will also verify the primary and secondary component carrier relative RSRP accuracy requirement defined in Clause 9.1.15.1.3.

#### A.9.1.34.2 Test parameters

In this test case, Cell1 is PCell on the primary component carrier, Cell2 is SCell on the secondary component carrier and activated, and Cell3 is the neighboring cell on the secondary component carrier. The test parameters are given in Table A.9.1.34.2-1. The Cell 3 DMTC configuration is provided to the UE in the *measDS-Config* before the start of the test.

Table A.9.1.34.2-1: Carrier aggregation RSRP test parameters for TDD

| Parameter                                                                                                                                                                                                              |             | Unit       | Test 1   |                                                                           |                        |

| Note 1: For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.                                                                                                               |             |            |          |                                                                           |                        |
| Note 2: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |             |            |          |                                                                           |                        |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |             |            |          |                                                                           |                        |
| Note 4: RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes.                                                                                                               |             |            |          |                                                                           |                        |

|         |                                                                                                                                                          |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
|         | They are not settable parameters themselves.                                                                                                             |
| Note 5: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                       |
| Note 6: | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                     |
| Note 7: | This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1. |
| Note 8: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                              |

### A.9.1.34.3 Test Requirements

In the test, the performance of RSRP measurements is verified from following three perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 3 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.15.1.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.15.1.2
- The relative accuracy of inter-frequency RSRP measurements between the primary and secondary component carriers for Cell 3 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.15.1.3.

## A.9.1.35 FDD absolute and relative CSI-RSRP accuracies for E-UTRAN Carrier Aggregation in CSI-RS based discovery signal

### A.9.1.35.1 Test Purpose and Environment

The purpose of this test is to verify that the FDD CSI-RSRP absolute and relative accuracy requirements in carrier aggregation are within the specified limits. This test will verify the absolute CSI-RSRP accuracy requirements of the primary component carrier defined in clause 9.1.15.2.1, the absolute CSI-RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.15.2.2, and the relative CSI-RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.15.2.2. The test will also verify the primary and secondary component carrier relative CSI-RSRP accuracy requirement defined in Clause 9.1.15.2.3.

### A.9.1.35.2 Test parameters

In this set of cases cell1 is PCell on the primary component carrier, cell2 is SCell on the secondary component carrier and activated, and cell3 is the neighboring cell on the secondary component carrier. The test parameters are given in Table A.9.1.35.2-1. This set is supported by two DMTC configurations which one is for cell1 and the other is for cell2 and cell3.

Table A.9.1.35.2-1: CSI-RSRP FDD carrier aggregation test parameters

| Parameter                                                              |                           | Unit             | Test 1   |                                                                                 |                        |
|------------------------------------------------------------------------|---------------------------|------------------|----------|---------------------------------------------------------------------------------|------------------------|
|                                                                        |                           |                  | Cell 1   | Cell 2                                                                          | Cell 3                 |

| CSI-RS $\hat{E}_s/N_{oc}$                                                                                                                                                                                                                    |                                      | dB         | 2      | 9                                      | 5                          |
| Propagation condition                                                                                                                                                                                                                        |                                      | -          | AWGN   |                                        |                            |
| Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                                                |                                      |            |        |                                        |                            |
| Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.                       |                                      |            |        |                                        |                            |
| Note 3: RSRP, CSI-RSRP and I <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves. I <sub>o</sub> levels are calculated in CRS symbols of measurement subframe. |                                      |            |        |                                        |                            |
| Note 4: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                                   |                                      |            |        |                                        |                            |
| Note 5: The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                                                 |                                      |            |        |                                        |                            |
| Note 6: For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                                                    |                                      |            |        |                                        |                            |
| Note 7: This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1.                                                                             |                                      |            |        |                                        |                            |
| Note 8: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                                          |                                      |            |        |                                        |                            |
| Note 9: DMTC configurations are provided to the UE in the <i>measDS-Config</i> (in TS36.331) before the beginning of the test.                                                                                                               |                                      |            |        |                                        |                            |

### A.9.1.35.3 Test Requirements

In the test, the performance of CSI-RSRP measurements is verified from following four perspectives:

- The absolute accuracy of intra-frequency CSI-RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.15.2.1.
- The absolute accuracy of intra-frequency CSI-RSRP measurements for Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.15.2.2.
- The relative accuracy of intra-frequency CSI-RSRP measurements for Cell 3 relative to Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.15.2.2.
- The relative accuracy of inter-frequency CSI-RSRP measurements between the primary and secondary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.15.2.3.

## A.9.1.36 TDD absolute and relative CSI-RSRP accuracies for E-UTRAN Carrier Aggregation in CSI-RS based discovery signal

### A.9.1.36.1 Test Purpose and Environment

The purpose of this test is to verify that the TDD CSI-RSRP absolute and relative accuracy requirements in carrier aggregation are within the specified limits. This test will verify the absolute CSI-RSRP accuracy requirements of the primary component carrier defined in clause 9.1.15.2.1, the absolute CSI-RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.15.2.2, and the relative CSI-RSRP accuracy requirements of the secondary component carrier defined in clause 9.1.15.2.2. The test will also verify the primary and secondary component carrier relative CSI-RSRP accuracy requirement defined in Clause 9.1.15.2.3.

### A.9.1.36.2 Test parameters

In this set of cases cell1 is PCell on the primary component carrier, cell2 is SCell on the secondary component carrier and activated, and cell3 is the neighboring cell on the secondary component carrier. The test parameters are given in Table A.9.1.36.2-1. This set is supported by two DMTC configurations which one is for cell1 and the other is for cell2 and cell3.

Table A.9.1.36.2-1: CSI-RSRP TDD carrier aggregation test parameters

| Parameter                                                              |             | Unit       | Test 1   |                                                                           |                            |
|------------------------------------------------------------------------|-------------|------------|----------|---------------------------------------------------------------------------|----------------------------|
|                                                                        |             |            | Cell 1   | Cell 2                                                                    | Cell 3                     |
| E-UTRA RF Channel Number                                               |             |            | 1        | 2                                                                         |                            |
| BW <sub>channel</sub>                                                  |             | MHz        | 10       |                                                                           |                            |

| Propagation condition       | -                                                                                                                                                                                                                  | AWGN |   |    |
| Note 1:                     | For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.                                                                                                                   |      |   |    |
| Note 2:                     | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                              |      |   |    |
| Note 3:                     | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.     |      |   |    |
| Note 4:                     | RSRP, CSI-RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves. $I_o$ levels are calculated in CRS symbols of measurement subframe. |      |   |    |
| Note 5:                     | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                                 |      |   |    |
| Note 6:                     | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                               |      |   |    |
| Note 7:                     | This test verifies the RRM requirement which is independent of channel bandwidth and is performed according to the principle defined in section A.3.6.1.                                                           |      |   |    |
| Note 8:                     | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                        |      |   |    |
| Note 9:                     | DMTC configurations are provided to the UE in the <i>measDS-Config</i> (in TS36.331) before the beginning of the test                                                                                              |      |   |    |

### A.9.1.36.3 Test Requirements

In the test, the performance of CSI-RSRP measurements is verified from following four perspectives:

- The absolute accuracy of intra-frequency CSI-RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.15.2.1.
- The absolute accuracy of intra-frequency CSI-RSRP measurements for Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.15.2.2.
- The relative accuracy of intra-frequency CSI-RSRP measurements for Cell 3 relative to Cell 2 on the secondary component carrier shall fulfil the requirements defined in clause 9.1.15.2.2.
- The relative accuracy of inter-frequency CSI-RSRP measurements between the primary and secondary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.15.2.3.

### A.9.1.37 3 DL PCell in FDD RSRP for E-UTRAN in Carrier Aggregation

#### A.9.1.37.1 Test Purpose and Environment

The purpose of this test is to verify that the TDD-FDD RSRP absolute and relative accuracy requirements in carrier aggregation with PCell in FDD are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

#### A.9.1.37.2 Test parameters

In this set of cases cell 1 is PCell on the primary component carrier, and cell 2 and cell 4 are activated SCells on secondary component carriers SCC1 and SCC2 respectively. Cell 3 and cell 5 are neighbouring cells on secondary component carriers SCC1 and SCC2 respectively. The test parameters are given in Table A.9.1.37.2-1.

Table A.9.1.37.2-1: 3 Downlink PCell in FDD RSRP carrier aggregation test parameters

| Parameter                                                            |                                      | Unit             | Cell 1                                                                                                   | Cell 2                                                                                          | Cell 3                                                         | Cell 4                                                                                          | Cell 5                                                         |            |   |                                       |  |                                       |  |

### A.9.1.37.3 Test Requirements

In the test, the performance of RSRP measurements is verified from the following 7 perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 5 relative to Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between SCC1 and the primary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC2 and the primary component carriers for Cell 4 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

## A.9.1.38 3 DL PCell in TDD RSRP for E-UTRAN in Carrier Aggregation

### A.9.1.38.1 Test Purpose and Environment

The purpose of this test is to verify that the TDD-FDD RSRP absolute and relative accuracy requirements in carrier aggregation with PCell in TDD are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

### A.9.1.38.2 Test parameters

In this set of cases cell 1 is PCell on the primary component carrier, and cell 2 and cell 4 are activated SCells on secondary component carriers SCC1 and SCC2 respectively. Cell 3 and cell 5 are neighbouring cells on secondary component carriers SCC1 and SCC2 respectively. The test parameters are given in Table A.9.1.38.2-1.

Table A.9.1.38.2-1: 3 Downlink PCell in TDD RSRP carrier aggregation test parameters

| Parameter                                                            |                                         | Unit             | Cell 1                                                                                                   | Cell 2                                                                                          | Cell 3                                                          | Cell 4                                                                                          | Cell 5                                                          |

### A.9.1.38.3 Test Requirements

In the test, the performance of RSRP measurements is verified from the following 7 perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 5 relative to Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between SCC1 and the primary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3. The relative accuracy

of inter-frequency RSRP measurements between SCC2 and the primary component carriers for Cell 4 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

### A.9.1.39 3 DL FDD RSRP for E-UTRAN in Carrier Aggregation

#### A.9.1.39.1 Test Purpose and Environment

The purpose of this test is to verify that the FDD RSRP absolute and relative accuracy requirements in carrier aggregation are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

#### A.9.1.39.2 Test parameters

In this set of test cases there are five cells on three carrier frequencies. Cell 1 is PCell on channel 1, and cell 2 and cell 4 are activated SCells on secondary component carriers SCC1 and SCC2 respectively. Cell 3 and cell 5 are neighbouring cells on secondary component carriers SCC1 and SCC2 respectively. The parameters for the test are listed in Table A.9.1.39.2-1.

**Table A.9.1.39.2-1: 3 DL FDD RSRP test parameters for E-UTRAN Carrier aggregation (cell #1, cell #2 and cell #3)**

### A.9.1.39.3 Test Requirements

In the test, the performance of RSRP measurements is verified from following four perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 5 relative to Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between SCC1 and the primary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC2 and the primary component carriers for Cell 4 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

### A.9.1.40 3 DL TDD RSRP for E-UTRAN in Carrier Aggregation

#### A.9.1.40.1 Test Purpose and Environment

The purpose of this test is to verify that the FDD RSRP absolute and relative accuracy requirements in carrier aggregation are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

#### A.9.1.40.2 Test parameters

In this set of test cases there are five cells on three carrier frequencies. Cell 1 is PCell on channel 1, and cell 2 and cell 4 are activated SCells on secondary component carriers SCC1 and SCC2 respectively. Cell 3 and cell 5 are neighbouring

cells on secondary component carriers SCC1 and SCC2 respectively. The parameters for the test are listed in Table A.9.1.40.2-1.

**Table A.9.1.40.2-1: 3 DL TDD RSRP test parameters for E-UTRAN Carrier aggregation (cell #1, cell #2 and cell #3)**

| Parameter                                                             |                                                                                                                                                       | Unit                          | Cell 1                                                                                          | Cell 2                                                                                                   | Cell 3                                                |

over subcarriers and time and shall be modelled as AWGN of appropriate power for  $N_{oc}$  to be fulfilled.

Note 4: RSRP and  $I_o$  levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 5: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 6: The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.

Note 7: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.

Note 8: E-UTRA operating band groups are as defined in Section 3.5.

**Table A.9.1.40.2-2: 3 DL TDD RSRP test parameters for E-UTRAN Carrier aggregation (cell #4 and cell #5)**

|         |                                                                                                                                       |
|---------|---------------------------------------------------------------------------------------------------------------------------------------|
|         | as AWGN of appropriate power for $N_{oc}$ to be fulfilled.                                                                            |
| Note 4: | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |
| Note 5: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                    |
| Note 6: | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                  |
| Note 7: | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation. |
| Note 8: | E-UTRA operating band groups are as defined in Section 3.5.                                                                           |

### A.9.1.40.3 Test Requirements

In the test, the performance of RSRP measurements is verified from following four perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 5 relative to Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between SCC1 and the primary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC2 and the primary component carriers for Cell 4 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

### A.9.1.41 FD-FDD RSRP Intra frequency case for UE category 0

#### A.9.1.41.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.13.1 and 9.1.13.2 for FD-FDD intra frequency RSRP measurements for UE category 0.

#### A.9.1.41.2 Test parameters

In this set of test cases all cells are on the same carrier frequency. Both absolute and relative accuracy of RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.41.2-1. In all test cases, Cell 1 is the PCell and Cell 2 the target cell.

Table A.9.1.41.2-1: FD-FDD RSRP Intra frequency test parameters for UE category 0

| Parameter                                                             |                                          | Unit       | Test 1   |          | Test 2   |          | Test 3   |          |
|-----------------------------------------------------------------------|------------------------------------------|------------|----------|----------|----------|----------|----------|----------|
|                                                                       |                                          |            | Cell 1   | Cell 2   | Cell 1   | Cell 2   | Cell 1   | Cell 2   |
| E-UTRA RF Channel Number                                              |                                          |            | 1        |          | 1        |          | 1        |          |

- Note 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
- Note 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for  $N_{oc}$  to be fulfilled.
- Note 3: Es/lot, RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
- Note 4: For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.
- Note 5: E-UTRA operating band groups are as defined in Section 3.5.
- Note 6: Except Band 29.
- Note 7: Except Band 32.

### A.9.1.41.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.13.1 and 9.1.13.2.

## A.9.1.42 HD-FDD RSRP Intra frequency case for UE category 0

### A.9.1.42.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.13.1 and 9.1.13.2 for HD-FDD intra frequency RSRP measurements for UE category 0.

### A.9.1.42.2 Test parameters

In this set of test cases all cells are on the same carrier frequency. Both absolute and relative accuracy of RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.42.2-1. In all test cases, Cell 1 is the PCell and Cell 2 the target cell.

Table A.9.1.42.2-1: HD-FDD RSRP Intra frequency test parameters for UE category 0

| Parameter                                                             |                                          | Unit             | Test 1     |          | Test 2     |          | Test 3     |          |

|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|--|--|
| Note 1:       | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |  |  |  |
| Note 2:       | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |  |  |  |
| Note 3:       | Es/lot, RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                      |  |  |  |
| Note 4:       | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                              |  |  |  |
| Note 5:       | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |  |  |  |
| Note 6:       | Except Band 29.                                                                                                                                                                                                |  |  |  |
| Note 7:       | Except Band 32.                                                                                                                                                                                                |  |  |  |

### A.9.1.42.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.13.1 and 9.1.13.2.

### A.9.1.43 TDD RSRP Intra frequency case for UE category 0

#### A.9.1.43.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP measurement accuracy is within the specified limits. This test will verify the requirements in Sections 9.1.13.1 and 9.1.13.2 for TDD intra frequency RSRP measurements for UE category 0.

#### A.9.1.43.2 Test parameters

In this set of test cases all cells are on the same carrier frequency. Both absolute and relative accuracy of RSRP intra frequency measurements are tested by using the parameters in Table A.9.1.43.2-1. In all test cases, Cell 1 is the PCell and Cell 2 the target cell.

Table A.9.1.43.2-1: TDD RSRP Intra frequency test parameters for UE category 0

| Parameter                                                                                                                                                                                                     | Unit                    | Test 1     |          | Test 2   |          | Test 3   |          |      |

| Note 1: For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.                                                                                                      |                         |            |          |          |          |          |          |      |
| Note 2: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                 |                         |            |          |          |          |          |          |      |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over                                                                                              |                         |            |          |          |          |          |          |      |
| subcarriers and time and shall be modelled as AWGN of appropriate power for <i>N</i> <sub>oc</sub> to be fulfilled.                                                                                           |                         |            |          |          |          |          |          |      |
| Note 4: <i>E</i> <sub>s</sub> / <i>I</i> <sub>ot</sub> , RSRP and <i>I</i> <sub>o</sub> levels have been derived from other parameters for information purposes. They are not settable parameters themselves. |                         |            |          |          |          |          |          |      |
| Note 5: E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                           |                         |            |          |          |          |          |          |      |

### A.9.1.43.3 Test Requirements

The RSRP measurement accuracy shall fulfil the requirements in sections 9.1.13.1 and 9.1.13.2.

## A.9.1.44 4 DL CA PCell in FDD FDD-TDD RSRP for E-UTRAN in Carrier Aggregation

### A.9.1.44.1 Test Purpose and Environment

The purpose of this test is to verify that the FDD-TDD RSRP absolute and relative accuracy requirements in carrier aggregation with PCell in FDD are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

### A.9.1.44.2 Test parameters

In this set of cases cell 1 is PCell on the primary component carrier, and cell 2, cell 4 and cell 6 are activated SCells on secondary component carriers SCC1, SCC2 and SCC3 respectively. Cell 3, cell 5 and cell 7 are neighbouring cells on secondary component carriers SCC1, SCC2 and SCC3 respectively. The test parameters are given in Table A.9.1.44.2-1.

Table A.9.1.44.2-1: 4 Downlink PCell in FDD-TDD RSRP carrier aggregation test parameters

| Parameter                                        | Unit      | Cell 1                                                                                                   | Cell 2                                                                                          | Cell 3                                                         | Cell 4                                                                                          | Cell 5                                                         | Cell 6                                                                                          | Cell 7                                                         |

Note 1: For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.

- Note 2: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
- Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for  $N_{oc}$  to be fulfilled.
- Note 4: RSRP and  $I_o$  levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
- Note 5: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
- Note 6: The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.
- Note 7: For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.
- Note 8: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.
- Note 9: E-UTRA operating band groups are as defined in Section 3.5.

### A.9.1.44.3 Test Requirements

In the test, the performance of RSRP measurements is verified from the following 10 perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 6 on SCC3 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 5 relative to Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 7 relative to Cell 6 on SCC3 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between SCC1 and the primary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC2 and the primary component carriers for Cell 4 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC3 and the primary component carriers for Cell 6 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

### A.9.1.45 4 DL CA PCell in TDD FDD-TDD RSRP for E-UTRAN in Carrier Aggregation

#### A.9.1.45.1 Test Purpose and Environment

The purpose of this test is to verify that the TDD-FDD RSRP absolute and relative accuracy requirements in carrier aggregation with PCell in TDD are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

#### A.9.1.45.2 Test parameters

In this set of cases cell 1 is PCell on the primary component carrier, and cell 2, cell 4 and cell 6 are activated SCells on secondary component carriers SCC1, SCC2 and SCC3 respectively. Cell 3, cell 5 and cell 7 are neighbouring cells on secondary component carriers SCC1, SCC2 and SCC3 respectively. The test parameters are given in Table A.9.1.45.2-1.

Table A.9.1.45.2-1: 4 Downlink PCell in TDD-FDD RSRP carrier aggregation test parameters

| Parameter                                                            | Unit      | Cell 1                                                                              | Cell 2                                                                     | Cell 3                                                                     | Cell 4                                                                     | Cell 5                                                                     | Cell 6                                                                     | Cell 7                                                                     |

| Note 2: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.           |                                      |                               |     |                                                                                   |                        |                                                                                   |                        |                                                                                   |                               |
| Note 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of |                                      |                               |     |                                                                                   |                        |                                                                                   |                        |                                                                                   |                               |

appropriate power for  $N_{oc}$  to be fulfilled.

Note 4: RSRP and  $I_o$  levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

Note 5: RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

Note 6: The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.

Note 7: For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.

Note 8: Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.

Note 9: E-UTRA operating band groups are as defined in Section 3.5.

### A.9.1.45.3 Test Requirements

In the test, the performance of RSRP measurements is verified from the following perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 6 on SCC3 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 5 relative to Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 7 relative to Cell 6 on SCC3 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between SCC1 and the primary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC2 and the primary component carriers for Cell 4 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC3 and the primary component carriers for Cell 6 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

## A.9.1.46 4 DL FDD RSRP for E-UTRAN in Carrier Aggregation

### A.9.1.46.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP absolute and relative accuracy requirements in FDD-FDD carrier aggregation are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

### A.9.1.46.2 Test parameters

In this set of test cases cell 1 is PCell on the primary component carrier, and cell 2, cell 4 and cell 6 are activated SCells on secondary component carriers SCC1, SCC2 and SCC3 respectively. Cell 3, cell 5 and cell 7 are neighbouring cells on secondary component carriers SCC1, SCC2 and SCC3 respectively. The test parameters are given in Table A.9.1.46.2-1, Table A.9.1.46.2-2 and Table A.9.1.46.2-3.

Table A.9.1.46.2-1: 4 DL FDD RSRP carrier aggregation test parameters for cell 1, cell 2 and cell 3

| Parameter                                                             |                                      | Unit                                    | Cell 1                                                                                          | Cell 2                                                                                          | Cell 3                                                 |

| Time alignment error relative to cell 1 <sup>Note 7</sup> |                                                                                                                                                                                                                |               | -                                | $\leq \text{TAE}$ |      |
| Note 1:                                                   | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |               |                                  |                   |      |
| Note 2:                                                   | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |               |                                  |                   |      |
| Note 3:                                                   | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                           |               |                                  |                   |      |
| Note 4:                                                   | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |               |                                  |                   |      |
| Note 5:                                                   | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                           |               |                                  |                   |      |
| Note 6:                                                   | For Band 26, the tests shall be performed with the carrier frequency of the assigned E-UTRA channel bandwidth within 865-894 MHz.                                                                              |               |                                  |                   |      |
| Note 7:                                                   | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.                                                                          |               |                                  |                   |      |
| Note 8:                                                   | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |               |                                  |                   |      |

Table A.9.1.46.2-2: 4 DL FDD RSRP carrier aggregation test parameters for cell 4 and cell 5

### A.9.1.46.3 Test Requirements

In the test, the performance of RSRP measurements is verified from the following 10 perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 6 on SCC3 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 5 relative to Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 7 relative to Cell 6 on SCC3 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between SCC1 and the primary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC2 and the primary component carriers for Cell 4 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC3 and the primary component carriers for Cell 6 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

## A.9.1.47 4 DL TDD RSRP for E-UTRAN in Carrier Aggregation

### A.9.1.47.1 Test Purpose and Environment

The purpose of this test is to verify that the RSRP absolute and relative accuracy requirements in TDD-TDD carrier aggregation are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

### A.9.1.47.2 Test parameters

In this set of test cases cell 1 is PCell on the primary component carrier, and cell 2, cell 4 and cell 6 are activated SCells on secondary component carriers SCC1, SCC2 and SCC3 respectively. Cell 3, cell 5 and cell 7 are neighbouring cells on secondary component carriers SCC1, SCC2 and SCC3 respectively. The test parameters are given in Table A.9.1.47.2-1, Table A.9.1.47.2-2 and Table A.9.1.47.2-3.

Table A.9.1.47.2-1: 4 DL TDD RSRP carrier aggregation test parameters for cell 1, cell 2 and cell 3

| Parameter                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Unit             | Cell 1                                                                                          | Cell 2                                                                                                   | Cell 3                                                |

|         | fulfilled.                                                                                                                            |
| Note 4: | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.  |
| Note 5: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                    |
| Note 6: | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                  |
| Note 7: | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation. |
| Note 8: | E-UTRA operating band groups are as defined in Section 3.5.                                                                           |

| Note 1: For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211.                                                      |             |                               |                                                                                                          |                                                       |               |                                       |  |
| Note 2: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. |             |                               |                                                                                                          |                                                       |               |                                       |  |

- |         |                                                                                                                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 3: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 4: | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                           |
| Note 5: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |
| Note 6: | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                           |
| Note 7: | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.                                                                          |
| Note 8: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |

| Note 1: For special subframe and uplink-downlink configurations see Tables 4.2-1 and 4.2-2 in TS 36.211. |             |                               |                                                                                                       |                                                       |

|         |                                                                                                                                                                                                                |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Note 2: | OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.                                                          |
| Note 3: | Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled. |
| Note 4: | RSRP and $I_o$ levels have been derived from other parameters for information purposes. They are not settable parameters themselves.                                                                           |
| Note 5: | RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.                                                                                             |
| Note 6: | The selection of the bands for testing depends on the configuration of the carrier aggregation supported by the UEs.                                                                                           |
| Note 7: | Time alignment error (TAE) as specified in TS 36.104 [30] clause 6.5.3.1. The TAE value depends upon the type of carrier aggregation.                                                                          |
| Note 8: | E-UTRA operating band groups are as defined in Section 3.5.                                                                                                                                                    |

### A.9.1.47.3 Test Requirements

In the test, the performance of RSRP measurements is verified from the following 10 perspectives:

- The absolute accuracy of intra-frequency RSRP measurements for Cell 1 on the primary component carrier shall fulfil the requirements defined in clause 9.1.11.1.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The absolute accuracy of intra-frequency RSRP measurements for Cell 6 on SCC3 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 3 relative to Cell 2 on SCC1 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 5 relative to Cell 4 on SCC2 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of intra-frequency RSRP measurements for Cell 7 relative to Cell 6 on SCC3 shall fulfil the requirements defined in clause 9.1.11.2.
- The relative accuracy of inter-frequency RSRP measurements between SCC1 and the primary component carriers for Cell 2 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC2 and the primary component carriers for Cell 4 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.
- The relative accuracy of inter-frequency RSRP measurements between SCC3 and the primary component carriers for Cell 6 relative to Cell 1 shall fulfil the requirements defined in clause 9.1.11.3.

## A.9.1.48 5 DL FDD-TDD with PCell in FDD RSRP for E-UTRAN in Carrier Aggregation

### A.9.1.48.1 Test Purpose and Environment

The purpose of this test is to verify that the TDD-FDD RSRP absolute and relative accuracy requirements in carrier aggregation with PCell in FDD are within the specified limits. This test will verify the absolute RSRP accuracy requirements of the primary component carrier defined in clause 9.1.11.1, the absolute RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2, and the relative RSRP accuracy requirements of the secondary component carriers defined in clause 9.1.11.2. The test will also verify the primary and secondary component carriers' relative RSRP accuracy requirement defined in Clause 9.1.11.3.

### A.9.1.48.2 Test parameters

In this set of test cases cell 1 is PCell on the primary component carrier, and cell 2, cell 4, cell 6 and cell 8 are activated SCells on secondary component carriers SCC1, SCC2, SCC3 and SCC4 respectively. Cell 3, cell 5, cell 7 and cell 9 are neighbouring cells on secondary component carriers SCC1, SCC2, SCC3 and SCC4 respectively. The test parameters are given in Table A.9.1.48.2-1, Table A.9.1.48.2-2 and Table A.9.1.48.2-3.

**Table A.9.1.48.2-1: 5 Downlink PCell in FDD RSRP carrier aggregation test parameters for cell 1, cell 2, cell 3, cell 4 and cell 5**

| Parameter                                                            |             | Unit             | Cell 1                                                                                                   | Cell 2                                                                                          | Cell 3                                                         | Cell 4                                                                                          | Cell 5                                                         |
