# A.13.3 Measurement procedure

## A.13.3.1 Intra-frequency measurements

### A.13.3.1.1 Event-triggered reporting tests on SCC without gaps under non-DRX

#### A.13.3.1.1.1 Test purpose and environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clauses 9.2A.5.1 and 9.2A.5.2.

#### A.13.3.1.1.2 Test parameters

Three cells are deployed in the test, which are FR1 PCell (Cell 1), and two cells on the same carrier frequency with CCA and transmit SSBs in DBT windows according to DL CCA model: SCell (Cell 2) and a neighbour cell (Cell 3). The test parameters for the three cells are given in table A.13.3.1.1.2-1 and A.13.3.1.1.2-2 below. In the measurement control information, a measurement object is configured for the frequency of the SCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1 and T2, respectively. During time duration T1, the UE shall not have any timing information of Cell 3.

The same test is applicable for UE supporting any one or both semi-static channel access or dynamic channel access and for network configuring any of semi-static channel occupancy or dynamic channel occupancy.

#### A.13.3.1.1.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_intra_without_index_CCA}$ ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

$T_{identify_intra_cca_without_index} = (T_{PSS/SSS_sync_intra_cca} + T_{SSB_measurement_period_intra_cca})$ ms, where

$T_{PSS/SSS_sync_intra_cca}$: it is the time period used in PSS/SSS detection given in table 9.2A.5.1-1.

$T_{SSB_measurement_period_intra_cca}$: equal to a measurement period of SSB based measurement given in table 9.2A.5.2-1.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.13.3.1.2 Event-triggered reporting tests on SCC without gaps under DRX

#### A.13.3.1.2.1 Test purpose and environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clauses 9.2A.5.1 and 9.2A.5.2.

#### A.13.3.1.2.2 Test parameters

Three cells are deployed in the test, which are FR1 PCell (Cell 1), and two cells on the same carrier frequency with CCA and transmit SSBs in DBT windows according to DL CCA model: SCell (Cell 2) and a neighbour cell (Cell 3). The test parameters for the three cells are given in table A.13.3.1.2.2-1 and A.13.3.1.2.2-2 below. In the measurement control information, a measurement object is configured for the frequency of the SCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1 and T2, respectively. During time duration T1, the UE shall not have any timing information of Cell 3.

The same test is applicable for UE supporting any one or both semi-static channel access or dynamic channel access and for network configuring any of semi-static channel occupancy or dynamic channel occupancy.

UE needs to be provided at least once every 500 ms with new Timing Advance Command MAC control element to restart the Time alignment timer to keep UE uplink time alignment. Furhtermore UE is allocated with PUSCH resource at every DRX cycle.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. For cells with CCA model, OCNG is transmitted only in the slots with downlink transmission burst and is not transmitted during the muted slots or during DBT window.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: For UE supporting semi-static channel access and network configuring semi-static channel occupancy.
NOTE 6: For UE supporting dynamic channel access and network configuring dynamic channel occupancy.
NOTE 7: For UE supporting both semi-static and dynamic channel access, the UE must be tested under dynamic channel access configuration.

#### A.13.3.1.2.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_intra_without_index_CCA}$ ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

$T_{identify_intra_cca_without_index} = (T_{PSS/SSS_sync_intra_cca} + T_{SSB_measurement_period_intra_cca})$ ms, where

$T_{PSS/SSS_sync_intra_cca}$: it is the time period used in PSS/SSS detection given in table 9.2A.5.1-1.

$T_{SSB_measurement_period_intra_cca}$: equal to a measurement period of SSB based measurement given in table 9.2A.5.2-1.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.13.3.1.3 Event-triggered reporting tests on SCC with per-UE gaps under non-DRX

#### A.13.3.1.3.1 Test purpose and environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clauses 9.2A.6.1 and 9.2A.6.2.

#### A.13.3.1.3.2 Test parameters

Three cells are deployed in the test, which are FR1 PCell (Cell 1), and two cells on the same carrier frequency with CCA and transmit SSBs in DBT windows according to DL CCA model: SCell (Cell 2) and a neighbour cell (Cell 3). The test parameters for the three cells are given in table A.13.3.1.3.2-1 and A.13.3.1.3.2-2 below. In the measurement control information, a measurement object is configured for the frequency of the SCell, and it is indicated to the UE that

event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1 and T2, respectively. During time duration T1, the UE shall not have any timing information of Cell 3.

The same test is applicable for UE supporting any one or both semi-static channel access or dynamic channel access and for network configuring any of semi-static channel occupancy or dynamic channel occupancy.

There are two BWPs configured in Cell 1, BWP0 which contains the cell defining SSB, and BWP1 which does not contain any SSB of Cell 1. During the whole test, BWP1 is always scheduled as the active BWP for the UE.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. For cells with CCA model, OCNG is transmitted only in the slots with downlink transmission burst and is not transmitted during the muted slots or during DBT window.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: For UE supporting semi-static channel access and network configuring semi-static channel occupancy.
NOTE 6: For UE supporting dynamic channel access and network configuring dynamic channel occupancy.
NOTE 7: For UE supporting both semi-static and dynamic channel access, the UE must be tested under dynamic channel access configuration.

### A.13.3.1.3.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_intra_without_index_CCA}$ ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

$T_{identify_intra_cca_without_index} = (T_{PSS/SSS_sync_intra_cca} + T_{SSB_measurement_period_intra_cca})$ ms, where

$T_{PSS/SSS_sync_intra_cca}$: it is the time period used in PSS/SSS detection given in table 9.2A.6.1-1.

$T_{SSB_measurement_period_intra_cca}$: equal to a measurement period of SSB based measurement given in table 9.2A.6.2-1.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.13.3.1.4 Event-triggered reporting tests on SCC with per-UE gaps under DRX

#### A.13.3.1.4.1 Test purpose and environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clauses 9.2A.6.1 and 9.2A.6.2.

#### A.13.3.1.4.2 Test parameters

Three cells are deployed in the test, which are FR1 PCell (Cell 1), and two cells on the same carrier frequency with CCA and transmit SSBs in DBT windows according to DL CCA model: SCell (Cell 2) and a neighbour cell (Cell 3). The test parameters for the three cells are given in table A.13.3.1.4.2-1 and A.13.3.1.4.2-2 below. In the measurement control information, a measurement object is configured for the frequency of the SCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1 and T2, respectively. During time duration T1, the UE shall not have any timing information of Cell 3.

The same test is applicable for UE supporting any one or both semi-static channel access or dynamic channel access and for network configuring any of semi-static channel occupancy or dynamic channel occupancy.

There are two BWPs configured in Cell 1, BWP0 which contains the cell defining SSB, and BWP1 which does not contain any SSB of Cell 1. During the whole test, BWP1 is always scheduled as the active BWP for the UE.

UE needs to be provided at least once every 500 ms with new Timing Advance Command MAC control element to restart the Time alignment timer to keep UE uplink time alignment. Furhtermore UE is allocated with PUSCH resource at every DRX cycle.

#### A.13.3.1.4.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_intra_without_index_CCA}$ ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

$T_{identify_intra_cca_without_index} = (T_{PSS/SSS_sync_intra_cca} + T_{SSB_measurement_period_intra_cca})$ ms, where

$T_{PSS/SSS_sync_intra_cca}$: it is the time period used in PSS/SSS detection given in table 9.2A.6.1-1.

$T_{SSB_measurement_period_intra_cca}$: equal to a measurement period of SSB based measurement given in table 9.2A.6.2-1.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.13.3.2.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements for NR cell with CCA in clause 9.3A.4 and 9.3A.5.

In this test, there are three cells: NR Cell 1 as PCell in FR1 on NR RF channel 1, NR Cell 2 as SCell in FR1 with CCA on NR RF channel 2 and NR Cell 3 as neighbour cell in FR1 with CCA on NR RF channel 3. The test parameters are given in tables A.13.3.2.3.1-1, A.13.3.2.3.1-2 and A.13.3.2.3.1-3.

In this test, measurement gap pattern configuration # 0 as defined in table A.13.3.2.3.1-2 is provided

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 3.

### A.13.3.2.3.2 Test Requirements

In this test, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_inter_cca_without_index}$ from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

The UE is not required to report SSB time index.

$T_{identify_inter_cca_without_index} = (T_{PSS/SSS_sync_inter_cca} + T_{SSB_measurement_period_inter_cca})$ ms, where

$T_{PSS/SSS_sync_inter_cca}$: it is the time period used in PSS/SSS detection given in table 9.3A.4-1.

$T_{SSB_measurement_period_inter_cca}$: equal to a measurement period of SSB based measurement given in table 9.3A.5-1.

For test 1, MGRP = 40 ms and for test 2 MGRP = 20 ms.

SMTC period = 20 ms.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.13.3.2.4 Event triggered reporting tests for FR1 with CCA without SSB time index detection when DRX is used

#### A.13.3.2.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3A.4 and 9.3A.5.

In this test, there are three cells: NR Cell 1 as PCell in FR1 on NR RF channel 1, NR Cell 2 as SCell in FR1 with CCA on NR RF channel 2 and NR Cell 3 as neighbour cell in FR1 with CCA on NR RF channel 3. The test parameters are given in tables A.13.3.2.4.1-1, A.13.3.2.4.1-2 and A.13.3.2.4.1-3.

In test 1&2 measurement gap pattern configuration # 0 as defined in table A.13.3.2.4.1-2 is provided.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 3.

UE needs to be provided at least once every 500 ms with new Timing Advance Command MAC control element to restart the Time alignment timer to keep UE uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

### A.13.3.2.4.2 Test Requirements

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_inter_cca_without_index}$ from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test 2, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_inter_cca_without_index}$ from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test 1 and 2 UE is not required to report SSB time index.

$T_{identify_inter_cca_without_index} = (T_{PSS/SSS_sync_inter_cca} + T_{SSB_measurement_period_inter_cca})$ ms, where

$T_{PSS/SSS_sync_inter_cca}$: it is the time period used in PSS/SSS detection given in table 9.3A.4-1.

$T_{SSB_measurement_period_inter_cca}$: equal to a measurement period of SSB based measurement given in table 9.3A.5-1.

MGRP = 40 ms.

For test 1 DRX cycle = 40 ms and for test 2 DRX cycle = 640 ms.

SMTC period = 20 ms.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.13.3.2.5 Event triggered reporting tests for FR1 with CCA with SSB time index detection when DRX is not used

### A.13.3.2.5.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3A.4 and 9.3A.5.

In this test, there are three cells: NR Cell 1 as PCell in FR1 on NR RF channel 1, NR Cell 2 as SCell in FR1 with CCA on NR RF channel 2 and NR Cell 3 as neighbour cell in FR1 with CCA on NR RF channel 3. The test parameters are given in tables A.13.3.2.5.1-1, A.13.3.2.5.1-2 and A.13.3.2.5.1-3.

Measurement gap pattern configuration # 0 as defined in table A.13.3.2.5.1-2 is provided.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 3.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols. For cells with CCA model, OCNG is transmitted only in the slots with downlink transmission burst and is not transmitted during the muted slots or during DBT window.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: For UE supporting semi-static channel access and network configuring semi-static channel occupancy.
NOTE 6: For UE supporting dynamic channel access and network configuring dynamic channel occupancy.
NOTE 7: For UE supporting both semi-static and dynamic channel access, the UE must be tested under dynamic channel access configuration

#### A.13.3.2.5.2 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_inter_cca_with_index}$ from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In this test UE is required to report SSB time index.

$T_{identify_inter_cca_with_index} = (T_{PSS/SSS_sync_inter_cca} + T_{SSB_measurement_period_inter_cca} + T_{SSB_time_index_inter_cca})$ ms, where

$T_{PSS/SSS_sync_inter_cca}$: it is the time period used in PSS/SSS detection given in table 9.3A.4-1.

$T_{SSB_time_index_inter_cca}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3A.4-2.

$T_{SSB_measurement_period_inter_cca}$: equal to a measurement period of SSB based measurement given in table 9.3A.5-1.

MGRP = 40 ms.

SMTC period = 20 ms.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.13.3.2.6 Event triggered reporting tests for FR1 with CCA with SSB time index detection when DRX is used

#### A.13.3.2.6.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3A.4 and 9.3A.5.

In this test, there are three cells: NR Cell 1 as PCell in FR1 on NR RF channel 1, NR Cell 2 as SCell in FR1 with CCA on NR RF channel 2 and NR Cell 3 as neighbour cell in FR1 with CCA on NR RF channel 3. The test parameters are given in tables A.13.3.2.6.1-1, A.13.3.2.6.1-2 and A.13.3.2.6.1-3.

In test 1&2 measurement gap pattern configuration # 0 as defined in table A.13.3.2.6.1-2 is provided.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 3.

UE needs to be provided at least once every 500 ms with new Timing Advance Command MAC control element to restart the Time alignment timer to keep UE uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

### A.13.3.2.6.2 Test Requirements

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_inter_cca_with_index}$ from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.In test 2 with per-FR gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than $T_{identify_inter_cca_with_index}$ from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test 1 and 2 UE is required to report SSB time index.

$T_{identify_inter_cca_with_index} = (T_{PSS/SSS_sync_inter_cca} + T_{SSB_measurement_period_inter_cca} + T_{SSB_time_index_inter_cca})$ ms, where

$T_{PSS/SSS_sync_inter_cca}$: it is the time period used in PSS/SSS detection given in table 9.3A.4-1.

$T_{SSB_time_index_inter_cca}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3A.4-2.

$T_{SSB_measurement_period_inter_cca}$: equal to a measurement period of SSB based measurement given in table 9.3A.5-1.

MGRP = 40 ms.

For test 1 DRX cycle = 40 ms and for test 2 DRX cycle = 640 ms.

SMTC period = 20 ms.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

#### A.13.3.3.1.2 Test parameters

There are two cells in the tests, FR1 PCell (Cell 1) and FR1 SCell (Cell 2). Cell 2 operates on a carrier frequency with CCA and transmits SSBs in DBT window according to DL CCA model. The test parameters and applicability for Cell 1 and Cell 2 are given in table A.13.3.3.1.2-1 and table A.13.3.3.1.2-2 below.

In CSI measurement configuration, UE is indicated to perform L1-RSRP measurement on the SSBs and report periodically. The UE transmits the reporting according to UL CCA model. The test consists of two successive time periods, with time duration of T1 and T2 respectively. The test has higher layer parameter *timeRestrictionForChannelMeasurements* configured.

The same test is applicable for UE supporting any one or both semi-static channel access or dynamic channel access and for network configuring any of semi-static channel occupancy or dynamic channel occupancy.

There is no measurement gap configured in the test. Before the test, UE is configured to perform RLM, BFD and L1-RSRP measurement based on the SSBs.

### A.13.3.3.1.3 Test Requirements

The UE shall send L1-RSRP report every 80 slots. No later than 640 ms plus 80 slots from the beginning of time period T2, UE shall send L1-RSRP report including results of both SSB0 and SSB1 while meeting the absolute accuracy requirement in clause 10.1.19.1.1 and relative accuracy requirement in clause 10.1.19.1.2. The rate of correct events observed during repeated tests shall be at least 90 %.

The UE shall send L1-RSRP report of both SSB0 and SSB1 in Cell 2.

NOTE: The actual overall delays measured in the test may be up to 2xTTI DCCH higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

In all test cases, Cell 1 is the PCell, Cell 2 is the SCell with CCA, and Cell 3 is the target cell with CCA. Three sub-tests (Test 1, Test 2, and Test 3) are provided different $N_{oc}$ on Cells 1, 2, and 3.

## A.13.4.4 L1-RSRP measurement for beam reporting with CCA serving cell

### A.13.4.4.1 SSB based L1-RSRP measurement

#### A.13.4.4.1.1 Test Purpose and Environment

The purpose of this test is to verify that the L1-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in clause 10.1.33.1 for L1-RSRP measurements based on SSB with the testing configurations for NR cells in table A.13.4.4.1.1-1.

#### A.13.4.4.1.2 Test parameters

In this set of test cases there are two cells in the test, PCell (Cell 1) and a SCell under CCA (Cell 2). Cell 2 operates on a carrier frequency with CCA and transmits SSBs in DBT window according to DL CCA model.

Two sub-tests (Test 1 and Test 2) are provided with different $N_{oc}$ on Cell 2. The test parameters for the Cell 1 and Cell 2 are given in table A.13.4.4.1.2-1 below. The absolute and relative accuracy of L1-RSRP measurements are tested by using the parameters in table A.13.4.4.1.2-1.

The same test is applicable for UE supporting any one or both semi-static channel access or dynamic channel access and for network configuring any of semi-static channel occupancy or dynamic channel occupancy.

There is no measurement gap configured in the test. Before the test, UE is configured one SSB resource set with two SSB resources. On Cell 2, UE is configured to perform L1-RSRP measurement based on the SSB resources 0 and 1.

### A.14.1.1.3 Test Requirements

For test configuration 1, 2 and 3, the cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than:

34 s if $K_{multi_SMTC}$ is equal to 1 (see note on Table A.14.1.1.2-2); or

66 s if $K_{multi_SMTC}$ is equal to 2.

For test configuration 1 and 2, the cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to an already detected cell shall be less than:

8 s if $K_{multi_SMTC}$ is equal to 1 (see note on Table A.14.1.1.2-2); or

14.5 s if $K_{multi_SMTC}$ is equal to 2.

The rate of correct cell reselections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as: $K_{multi_SMTC} * T_{detect,\ NR_Intra} + T_{SI-NR}$, and to an already detected cell can be expressed as: $K_{multi_SMTC} * T_{evaluate,\ NR_intra} + T_{SI-NR}$,

Where:

$T_{detect, NR_Intra}$ See Table 4.2C.2.3-1 in clause 4.2C.2.3

$T_{evaluate, NR_intra}$ See Table 4.2C.2.3-1 in clause 4.2C.2.3

$K_{multi_SMTC}$ is described in clause 4.2C.2.3

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case provided that SIB1 and SIB19 are scheduled with 20 ms period and 80 ms period, respectively.

## A.14.1.2.3 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than:

11 s if $K_{multi_SMTC}$ is equal to 1 (see note on Table A.14.1.2.2-2); or

20 s if $K_{multi_SMTC}$ is equal to 2.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to an already detected cell shall be less than:

6 s if $K_{multi_SMTC}$ is equal to 1 (see note on Table A.14.1.2.2-2); or

### A.14.1.5.3 Test Requirements

The cell reselection delay to a higher priority cell is defined as the time from the beginning of time period T3, to the moment when the UE camps again on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a higher priority cell shall be less than 68 s.

The cell reselection delay to a lower priority cell is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to a lower priority cell shall be less than 8 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search} + T_{evaluate, NR_ inter} + T_{SI-NR}$, and to a lower priority cell can be expressed as: $T_{evaluate, NR_ inter} + T_{SI-NR}$,

Where:

$T_{higher_priority_search}$ See clause 4.2C.2.9

$T_{evaluate, NR_ inter}$ See tables 4.2C.2.4-1 in clause 4.2C.2.4

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s, allow 68 s for the cell re-selection delay to a higher priority

## A.14.1.9 Cell reselection to FR1 inter-frequency NR case for UE fulfilling low mobility relaxed measurement criterion

### A.14.1.9.1 Test Purpose and Environment

This test is to verify the requirement for the inter frequency NR cell reselection requirements specified in clause 4.2C.2.8, for UEs that support *Relaxed cell reselection on GSO feature*, as defined in clause 5.4 in 38.306 [14], and fulfilling low mobility relaxed measurement criterion.

### A.14.1.9.2 Test Parameters

The test scenario comprises of 2 cells on 2 different NR carriers respectively as given in tables A.14.1.9.2-1, A.14.1.9.2-2 and A.14.1.9.2-3. Cell 1 and Cell 2 belong to different tracking areas and Cell 2 is of higher priority than Cell 1.

As specified in the Test Purpose, the UE is configured with the relaxed measurement criterion for UE with low mobility defined in clause 5.2.4.9.1 in TS 38.304 [1]. So, Cell 2 and Cell 1 configure the UE as follows:

*lowMobilityEvalutation* TS 38.331 [2] criterion is configured according to the parameters listed in table A.14.1.9.2-3;

*cellEdgeEvaluation* TS 38.331 [2] criterion is not configured;

*combineRelaxedMeasCondition* TS 38.331 [2] is not configured;

### A.14.1.9.3 Test Requirements

The cell reselection delay to an already detected lower priority cell for UE fulfilling low mobility relaxed measurements is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to a lower priority cell for UE fulfilling low mobility relaxed measurements shall be less than 17 s.

The cell reselection delay to an already detected higher priority cell for UE fulfilling low mobility relaxed measurements is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRCSetupRequest message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to an already detected higher priority cell for UE fulfilling low mobility relaxed measurements shall be less than 17 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a known lower priority cell can be expressed as: $T_{evaluate, NR_ inter} + T_{SI-NR}$,

Where:

$T_{evaluate, NR_ inter}$ See Table 4.2.2.10.2-1 in clause 4.2.2.10.2

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 16.64 s, allow 17 s for the cell re-selection delay to an already detected lower priority cell and 16.64 s for the cell re-selection delay to an already detected higher priority cell, which we allow 17 s for UE fulfilling low mobility relaxed measurements in the test case.

# A.14.1.10 Cell reselection to FR1 inter-frequency NR case for UE fulfilling not-at-cell edge relaxed measurement criterion

## A.14.1.10.1 Test Purpose and Environment

This test is to verify the requirement for the inter frequency NR cell reselection requirements specified in clause 4.2C.2.8, for UEs that support *Relaxed cell reselection on GSO feature*, as defined in clause 5.4 in 38.306 [14], and fulfilling not-at-cell edge relaxed measurement criterion.

## A.14.1.10.2 Test Parameters

The test scenario comprises of 2 cells on 2 different NR carriers respectively as given in tables A.14.1.10.2-1, A.14.1.10.2-2 and A.14.1.10.2-3. Cell 1 and Cell 2 belong to different tracking areas and Cell 2 is of higher priority than Cell 1.

As specified in the Test Purpose, the UE is configured with the relaxed measurement criterion for UE not-at-cell edge as defined in clause 5.2.4.9.2 in TS 38.304 [1]. So, Cell 2 and Cell 1configures the UE as follows:

*cellEdgeEvaluation* TS 38.331 [2] criterion is configured according to the parameters listed in table A.14.1.9.2-3;

*lowMobilityEvalutation* TS 38.331 [2] criterion is not configured;

*combineRelaxedMeasCondition* TS 38.331 [2] is not configured;

### A.14.1.11.3 Test requirements

The cell reselection delay to a higher priority E-UTRAN cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a higher priority cell shall be less than 68 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search} + T_{evaluate, E-UTRAN} + T_{SI-E-UTRA}$,

Where:

$T_{higher_priority_search}$ See clause 4.2C.2.9

$T_{evaluate, NR_ inter}$ See clause 4.2C.2.11

$T_{SI-E-UTRA}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s, allow 68 s for the cell re-selection delay to a higher priority E-UTRAN cell.

### A.14.1.12.3 Test requirements

The cell reselection delay to a lower priority cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a higher priority cell shall be less than 68 s.

The rate of correct cell reselections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search} + T_{evaluate,\ NR_inter_TN} + T_{SI\text{-}NR}$

Where:

$T_{higher_priority_search}$ See clause 4.2C.2.9

$T_{evaluate,\ NR_inter_TN}$ See clause 4.2C.2.10

$T_{SI\text{-}NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s, allow 68 s for the cell re-selection delay to a higher priority

## A.14.1.13 Cell reselection to FR1 intra-frequency NR case for UE operating on a cell with less than 5 MHz BW

### A.14.1.13.1 Test Purpose and Environment

### A.14.1.13.3 Test Requirements

The cell reselection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than:

34 s if $K_{multi_SMTC}$ is equal to 1 (see note on Table A.14.1.13.2-2); or

66 s if $K_{multi_SMTC}$ is equal to 2.

The cell reselection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to an already detected cell shall be less than:

8 s if $K_{multi_SMTC}$ is equal to 1 (see note on Table A.14.1.13.2-2); or

14.5 s if $K_{multi_SMTC}$ is equal to 2.

The rate of correct cell reselections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as: $K_{multi_SMTC} * T_{detect,\ NR_Intra} + T_{SI-NR}$, and to an already detected cell can be expressed as: $K_{multi_SMTC} * T_{evaluate,\ NR_intra} + T_{SI-NR}$,

Where:

$T_{detect,\ NR_Intra}$ + 40ms See Table 4.2C.2.3-1 in clause 4.2C.2.3

$T_{evaluate,\ NR_intra}$ See Table 4.2C.2.3-1 in clause 4.2C.2.3

$K_{multi_SMTC}$ is described in clause 4.2C.2.3

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1320 ms is assumed in this test case provided that SIB1 and SIB19 are scheduled with 20 ms period and 80 ms period, respectively.

If $K_{multi_SMTC} = 1$, $K_{multi_SMTC} * T_{evaluate,\ NR_Intra} + T_{SI-NR} = 7.68$ s; allow 8 s. And $K_{multi_SMTC} * T_{detect,\ NR_intra} + T_{SI-NR} = 33.36$ s, allow 34 s.

If K_multi_SMTC = 2, $K_{multi_SMTC} * T_{evaluate,\ NR_Intra} + T_{SI-NR} = 14.08$ s; allow 14.5 s. And $K_{multi_SMTC} * T_{detect,\ NR_intra} + T_{SI-NR} = 65.4$ s, allow 66 s.

## A.14.2.1 Handover

### A.14.2.1.1 Intra-frequency SAN Handover from FR1 to FR1

#### A.14.2.1.1.1 Test Purpose and Environment

This test is to verify the requirement for Intra-frequency SAN Handover from FR1 to FR1 specified in clause 6.1C.1.

#### A.14.2.1.1.2 Test Parameters

The test scenario comprises of 1 NR FDD carrier and 2 cells as given in table A.14.2.1.1.2-1, A.14.2.1.1.2-2, and A.14.2.1.1.2-3. Both handover delay and interruption length are tested.

The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2. During T1, the UE is configured to measure intra-frequency neighbour cell with Event A3 report.

Starting T2, Cell 2 becomes detectable and offset better than Cell 1. The RRC message implying handover to Cell 2 shall be sent to the UE during period T2, after the UE has reported Event A3. The start of T3 is defined as the end of the last TTI containing the RRC message implying handover.

#### A.14.2.1.1.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 72 ms from the beginning of time period T3.
The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2]. $T_{interrupt}$ is defined in clause 6.1C.1.2.2.

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Here: $T_{search}$ = 0; $T_{IU}$ = 20 ms; $T_{processing}$ = 20 ms; $T_{\Delta}$ = 20 ms; $T_{margin}$ = 2 ms.

This gives a total of 72 ms.

#### A.14.2.1.2.1 Test Purpose and Environment

This test is to verify the requirement for Inter-frequency SAN Handover from FR1 to FR1 specified in clause 6.1C.1.

#### A.14.2.1.2.2 Test Parameters

The test scenario comprises of 2 NR FDD carriers and one cell on each carrier as given in table A.14.2.1.2.2-1, A.14.2.1.2.2-2 and A.14.2.1.2.2-3. Both handover delay and interruption length are tested.

The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2. #### A.14.2.1.2.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 72 ms from the beginning of time period T3.
The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2]. $T_{interrupt}$ is defined in clause 6.1C.1.2.2.

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Here: $T_{search}$ = 0; $T_{IU}$ = 20 ms; $T_{processing}$ = 20 ms; $T_{\Delta}$ = 20 ms; $T_{margin}$ = 2 ms.

This gives a total of 72 ms.

### A.14.2.1.5.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 872 ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay is defined in clause 6.1C.2, can be expressed as:

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

where:

RRC procedure delay $T_{RRC}$ = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{Event_DU}$ = start of T2

UE moving speed, v = (108km/h*1000/3600) = 30m/s.

At start of T2,

distance to source cell reference location is 30 m/s * 12 s – (-700)m = 1060m, and D1-1 = 1000m

distance to target cell reference location is 30 m/s * 12 s – 1300m = -940m, and D1-2 = 1000m

i.e. D1-1 and D1-2 conditions are fulfilled at start of T2 with >=50m location margin.

$T_{measure}$ = max(600 + 200 ms, 0) = 800 ms;

$T_{interrupt}$ = 62 ms; $T_{CHO_execution}$ = 10 ms.

This gives a total of 800 ms + 62 ms + 10 ms = 872 ms.

Starting T2, Cell 2 becomes detectable and offset better than Cell 1 and after 11670 ms of T2, location condition event condEventD1-r17 is fulfilled.

#### A.14.2.1.6.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 later than 11670ms and less than 11742 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay is defined in clause 6.1C.2, can be expressed as:

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

where:

RRC procedure delay $T_{RRC}$ = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{Event_DU}$ = start of T2

UE moving speed, v = (108km/h*1000/3600) = 30m/s.

At 11670 ms after start of T2,

distance to source cell reference location is 30 m/s * 11.67 s – (-700)m = 1050m, and D1-1 = 1000m

distance to target cell reference location is 30 m/s * 11.67 s – 1300m = -950m, and D1-2 = 1000m

i.e. D1-1 and D1-2 conditions are fulfilled at T2 + 11670 ms with >=50m location margin.

$T_{measure}$ = max(600 + 200 ms, 11670 ms) = 11670 ms;

$T_{interrupt}$ = 62 ms; $T_{CHO_execution}$ = 10 ms.

This gives a total of 11670ms + 62ms + 10ms = 11742 ms.

### A.14.2.1.7 Intra-frequency intra-satellite Handover from FR2-NTN to FR2-NTN

#### A.14.2.1.7.1 Test Purpose and Environment

This test is to verify the requirement for intra-frequency intra-satellite handover from FR2-NTN to FR2-NTN specified in clause 6.1C.3.

#### A.14.2.1.7.2 Test Parameters

The test scenario comprises of one NR FDD carrier and 2 cells as given in table A.14.2.1.7.2-1, A.14.2.1.7.2-2, and A.14.2.1.7.2-3. Both handover delay and interruption length are tested.

The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2. During T1, the UE is configured to measure intra-frequency neighbour cell with Event A3 report. Starting T2, Cell 2 becomes detectable and offset better than Cell 1. The RRC message implying handover to Cell 2 shall be sent to the UE during period T2, after the UE has reported Event A3. The start of T3 is defined as the end of the last TTI containing the RRC message implying handover.

### A.14.2.1.7.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 no later than 72 ms from the beginning of T3.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

$$T_{interrupt_inter_sat} = T_{search} + T_{IU} + T_{processing} + T_{sat_beam} + T_{\Delta} + T_{margin}\ \text{ms}$$

Here: $T_{search}$ = 0; $T_{IU}$ = 20 ms; $T_{processing}$ = 20 ms; $T_{sat_beam}$ = 0; $T_{\Delta}$ = 20 ms; $T_{margin}$ = 2 ms.

### A.14.2.1.8.3 Test Requirements

The UE shall start to transmit the PUSCH to Cell 2 less than 52 + $T_{IU}$ ms from the beginning of time period T3. The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2]. $T_{interrupt}$ is defined in clause 6.1C.1.2.2.2.

$$T_{interrupt} = T_{search} + T_{IU} + T_{processing} + T_{\Delta} + T_{margin} \text{ ms}$$

Here: $T_{search}$ = 0; $T_{IU}$ is the interruption uncertainty in acquiring the first UL transmission resource for PUSCH, which is scheduled by Cell 2 at the fist DL slot not earlier than 52 ms after the beginning of T3; $T_{processing}$ = 20 ms; $T_{\Delta}$ = 20 ms; $T_{margin}$ = 2 ms.

This gives a total of 52 + $T_{IU}$ ms.

## A.14.2.1.9 Intra-frequency inter-satellite handover from FR2-NTN to FR2-NTN

### A.14.2.1.9.1 Test Purpose and Environment

This test is to verify the requirement for the NR FR2-NTN – NR FR2-NTN intra-frequency handover requirements specified in clause 6.1C.1.3.

### A.14.2.1.9.2 Test Parameters

The test consists two sub-tests. Sub-test 1 is applicable for UE indicating 'electronic' via *ntn-VSAT-AntennaType-r18*, and sub-test 2 is applicable for UE indicating 'mechanical' via *ntn-VSAT-AntennaType-r18*. The test configurations are same for the two sub-tests unless specified otherwise.

Supported test configurations are shown in table A.14.2.1.9.2-1. Both handover delay and interruption length are tested by using the parameters in table A.14.2.1.9.2-2, and A.14.2.1.9.2-3.

The test scenario comprises of one carrier and two cells on the carrier. The test consists of two successive time periods, with time durations of T1, T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE receives a RRC handover command from the network to handover from Cell 1 to Cell 2. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

X = 152 ms for sub-test 1, and

X = TBD ms for sub-test 2, and

The rate of correct handovers observed during repeated tests shall be at least 90 %.

#### A.14.2.11.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 892 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay is defined in clause 6.1C.2, can be expressed as:

$$D_{CHO} = T_{RRC} + T_{Event_DU} + T_{measure} + T_{interrupt} + T_{CHO_execution}$$

where:

RRC procedure delay $T_{RRC}$ = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{Event_DU}$ = start of T2

$T_{measure}$ = 600 + 200 ms; $T_{interrupt}$ = 82 ms; $T_{CHO_execution}$ = 10 ms.

This gives a total of 892 ms.

#### A.14.2.2.1.1 Intra-frequency RRC Re-establishment in FR1

##### A.14.2.2.1.1.1 Test Purpose and Environment

The purpose is to verify that the NR intra-frequency RRC re-establishment delay in FR1 with known target cell is within the specified limits. These tests will verify the requirements in clause 6.2C.1.

The test parameters are given in table A.14.2.2.1.1.1-1, table A.14.2.2.1.1.1-2 and table A.14.2.2.1.1.1-3 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, Cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

The UE shall be provided with the valid information about the SAN serving the each cell in the test before the test.

#### A.14.2.2.1.1.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to a known NR intra frequency cell shall be less than 1.6 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90 %.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$$T_{UE_re-establish_delay} = 50 \text{ ms} + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq} = 1$

$T_{identify_intra_NR}$ = 200 ms

$T_{SI}$ = 1280 ms, provided that SIB1 and SIB19 are scheduled with 20 ms period; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target intra-frequency NR cell.

$T_{PRACH}$ = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 1545 ms, allow 1.6 s in the test case.

### A.14.2.2.1.2 Inter-frequency RRC Re-establishment in FR1

#### A.14.2.2.1.2.1 Test Purpose and Environment

The purpose is to verify that the NR inter-frequency RRC re-establishment delay in FR1 without known target cell is within the specified limits. These tests will verify the requirements in clause 6.2C.1.

The test parameters are given in table A.14.2.2.1.2.1-1, table A.14.2.2.1.2.1-2 and table A.14.2.2.1.2.1-3 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, Cell 1, which is the active cell, becomes inactive. The time period T3 starts after the occurrence of the radio link failure.

During T1, the UE shall be configured with the carrier frequency of Cell 2 (with RF Channel Number #2) to ensure that the UE has the context of the carrier frequency of Cell 2 by the end of T1.

The UE shall be provided with the valid information about the SAN serving the each cell in the test before the test.

$$T_{UE_re-establish_delay} = 50\ ms + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

### A.14.2.2.1.3.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to an unknown NR inter frequency cell shall be less than 6 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90 %.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$T_{UE_re-establish_delay} = 50\ ms + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$

$N_{freq}$ = 2

$T_{identify_intra_NR}$ = 800 ms

$T_{identify_inter_NR}$ = 3520 ms

$T_{SI}$ = 1280 ms, provided that SIB1 and SIB19 are scheduled with 160 ms period; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target inter-frequency NR cell.

$T_{PRACH}$ = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 5665 ms, allow 6 s in the test case.

#### A.14.2.2.2.1.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

##### A.14.2.2.2.1.2.1 Random Access Preamble Transmission

To test the UE behavior specified in clause 6.2C.2.2.1.1 the System Simulator shall receive the Random Access Preamble which belongs to one of the Random Access Preambles associated with the SSB with index 0, which has SS-RSRP above the configured *rsrp-ThresholdSSB*.

In addition, the power applied to all preambles shall be in accordance with what is specified in clause 6.2C.2.2. The power of the first preamble shall be 22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in clause 7.1C.2.

#### A.14.2.2.2.1.2.2 Random Access Response Reception

To test the UE behavior specified in clause 6.2C.2.2.1.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in clause 6.2C.2.2. The power of the first preamble shall be 22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18]. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

#### A.14.2.2.3.1.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2.
The rate of correct RRC connection release redirection to NR observed during repeated tests shall be at least 90 %.

NOTE: The redirection delay can be expressed as:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH},$$

Where:

$T_{RRC_procedure_delay}$ = 110 ms in the test.

$T_{identify\text{-}NR}$ = 680 ms in the test.

$T_{SI\text{-}NR}$ = 1280 ms, it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target NR cell.

$T_{RACH}$ = 170 ms in the test.

This gives a total of 2240 ms.

NOTE: The hard satellite switch with re-sync delay $D_{switch_unchangedPCI}$ can be expressed as: $T_{interrupt}$, where:

$T_{interrupt}$ is defined in clause 6.1C.3.2.2.

$$D_{switch_unchangedPCI} = T_{interrupt} = T_{search} + T_{processing} + T_{\Delta} + T_{margin}\ ms$$

Here: $T_{search} = T_{first_SSB} = 0.5ms$; $T_{processing} = 10ms$; $T_{\Delta} = 20ms$; $T_{margin} = 2ms$.

Besides, interruption uncertainty $T_{IU} = 20ms$ in acquiring the first PRACH transmission resource is needed.

This gives a total of 52.5 ms.

### A.14.2.2.5.3 Test Requirements

The UE shall start to transmit the PUSCH to Cell 2 less than 130 ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The satellite switch with re-sync delay $D_{switch_unchangedPCI}$ can be expressed as: $T_{soft_switch}$, where:

$$T_{soft_switch} = \max(t\text{-}service\text{-}t\text{-}seviceStart, T_{search} + T_{\Delta} + T_{margin}) + T_{IU} + T_{processing} \text{ ms}$$

Here: *t-service-t-seviceStart*= 100ms; $T_{search}$ = 10.5ms; $T_{\Delta}$ = 20ms; $T_{margin}$ = 2ms, $T_{processing}$ = 10ms.

| Propagation condition | | - | AWGN | | | | | |

NOTE 1: Cell 1 and Cell 2 have same PCI. Satellite serving for Cell 1 and Satellite serving for Cell 2 are two different NGSO satellites.

NOTE 2: SSB transmit timing from TE should fit the SSB-timeOffset and the nominal propagation delay difference between serving satellite and target satellite. The nominal propagation delay is counted from the SSB-TimeOffset reference point to UE, which based on satellite locations and UE location known to the TE in this test case.

NOTE 3: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

NOTE 4: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

NOTE 5: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

#### A.14.2.2.8.3 Test Requirements

The UE shall start to transmit the PUSCH to Cell 2 less than 190 ms or (130+1000* $O_{angle}$ / 22.5) ms from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The satellite switch with re-sync delay $D_{switch_unchangedPCI}$ can be expressed as: $T_{soft_switch}$, where:

$$T_{soft_switch} = \max(t\text{-}service\text{-}t\text{-}seviceStart, T_{search} + T_{\Delta} + T_{sat_beam} + T_{margin}) + T_{IU} + T_{processing} \text{ ms}$$

Here: *t-service-t-seviceStart*= 100ms*;* $T_{search}$ = 10.5ms; $T_{\Delta}$ = 20ms; $T_{margin}$ = 2ms, $T_{processing}$ = 10ms, $T_{sat_beam}$ =60ms or $O_{angle}$ / 22.5 s

Besides, interruption uncertainty $T_{IU}$ = 20ms in acquiring the first configured grant based PUSCH transmission resource is needed.

This gives a total of 190 ms or (130+1000* $O_{angle}$ / 22.5) ms.

## A.14.2.3 Intra-frequency SAN time-based conditional Handover without L3 measurement criteria from FR1 to FR1

### A.14.2.3.1 Test Purpose and Environment

This test is to verify the requirement for intra-frequency SAN time-based conditional handover without L3 measurement criteria from FR1 to FR1 specified in clause 6.1C.2.3.

### A.14.2.3.2 Test Parameters

The test scenario comprises of 1 NR FDD carrier and 2 cells as given in table A.14.2.3.2-1, and A.14.2.3.2-2. Both handover delay and interruption length are tested.

During T1, the UE is configured to measure intra-frequency neighbour cell. The RRC message implying time-based handover to Cell 2 with Event CondEvent T1 shall be sent to UE, at a time earlier than $T_{RRC}$ (10 ms) before the beginning of T2.

Starting T2, Cell 2 becomes detectable and time condition event *CondEvent T1* is fulfilled.

### A.14.3.1.1.2 Test requirements

The test sequence shall be carried out in RRC_CONNECTED for every test case.

Following will be the test sequence for this test

1) Set up PCell according to parameters given in table A.14.3.1.1.1-2.
2) After connection set up with the cell, the test equipment will verify that the timing of the NR cell is within $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\text{-}offset}} + N_{\mathrm{TA,adj}}^{\mathrm{common}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}} \pm \left(T_{\mathrm{e_NTN}} - T_{\mathrm{GNSS_margin}}\right)$ of the first detected path of DL SSB.
   a. The $N_{\mathrm{TA_offset}}$ value (in $T_c$ units) is 25600
   b. The $N_{\mathrm{TA,adj}}^{\mathrm{common}}$ value is derived from the higher-layer parameters *TACommon*, *TACommonDrift*, and *TACommonDriftVariation*.
   c. The $N_{\mathrm{TA,adj}}^{\mathrm{UE}}$ value is computed by the UE based on UE position and serving-satellite-ephemeris-related higher-layers parameters. For Config 3, $N_{\mathrm{TA,adj}}^{\mathrm{UE}}$ is calculated based on the generated UL channel with time varying Doppler and delay shifts.
   d. The $T_{\mathrm{e_NTN}}$ values depend on the DL and UL SCS for which the test is being run and are given in table 7.1C.2-1
   e. The $T_{\mathrm{GNSS_margin}}$ counts for the margin for the GNSS position definition error considered in the core requirement, which needs to be substracted for the test requirement, due to the usage of AT commands or any other pre-configured means in the test. $T_{\mathrm{GNSS_margin}} = 327{,}68 \times T_{\mathrm{c}}$
3) If the NTN parameters are configured as GSO scenario, the test system shall adjust the timing of the DL path by values given in table A.14.3.1.1.2-1. If the NTN parameters are configured as NGSO scenario, the test system shall adjust the timing of the DL path according to the serving-satellite-ephemeris-related higher-layers parameters.

**Table A.14.3.1.1.2-1: Adjustment Value for DL Timing**

| SCS of SSB signals (kHz) | Adjustment Value | |
|---|---|---|
| | Test1 | Test2 |
| 15 | +64*64$T_c$ | +32*64$T_c$ |

4) The test system shall verify that the adjustment step size and the adjustment rate shall be according to requirements specified in clause 7.1C.2 Table 7.1C.2.1-1 until the UE transmit timing offset is within $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\text{-}offset}} + N_{\mathrm{TA,adj}}^{\mathrm{common}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}} \pm \left(T_{\mathrm{e_NTN}} - T_{\mathrm{GNSS_margin}}\right)$ respective to the first detected path (in time) of DL SSB. Skip this step for test 2 with DRX configured.
5) The test system shall verify that the UE transmit timing offset stays within $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\text{-}offset}} + N_{\mathrm{TA,adj}}^{\mathrm{common}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}} \pm \left(T_{\mathrm{e_NTN}} - T_{\mathrm{GNSS_margin}}\right)$ of the first detected path of DL SSB. For Test 2 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

#### A.14.3.1.2.2 Test requirements

The test sequence shall be carried out in RRC_CONNECTED for every test case.

Following will be the test sequence for this test

1) Set up PCell according to parameters given in table A.14.3.1.2.1-2.
2) After connection set up with the cell, the test equipment will verify that the timing of the NR cell is within $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\text{-}offset}} + N_{\mathrm{TA,adj}}^{\mathrm{common}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}} \pm \left(T_{\mathrm{e_NTN}} - T_{\mathrm{GNSS_margin}}\right)$ of the first detected path of DL SSB.
   a. The $N_{\mathrm{TA_offset}}$ value (in $T_{\mathrm{c}}$ units) is 0
   b. The $N_{\mathrm{TA,adj}}^{\mathrm{common}}$ value is derived from the higher-layer parameters *TACommon*, *TACommonDrift*, and *TACommonDriftVariation*.
   c. The $N_{\mathrm{TA,adj}}^{\mathrm{UE}}$ value is computed by the UE based on UE position and serving-satellite-ephemeris-related higher-layers parameters.
   d. The $T_{\mathrm{e_NTN}}$ values depend on the DL and UL SCS for which the test is being run and are given in table 7.1C.2-2 and 7.1C.2-3
   e. The $T_{\mathrm{GNSS_margin}}$ counts for the margin for the GNSS position definition error considered in the core requirement, which needs to be subtracted for the test requirement, due to the usage of AT commands or any pre-configured means in the test. $T_{\mathrm{GNSS_margin}} = 98.304 \times T_{\mathrm{c}}$
3) If the NTN parameters are configured as GSO scenario, the test system shall adjust the timing of the DL path by values given in table A.14.3.1.2.2-1. If the NTN parameters are configured as NGSO scenario, the test system shall adjust the timing of the DL path according to the serving-satellite-ephemeris-related higher-layers parameters.

**Table A.14.3.1.2.2-1: Adjustment Value for DL Timing**

| SCS of SSB signals (kHz) | Adjustment Value | |
|---|---|---|
| | Test1 | Test2 |
| 120 | +[8]*64$T_c$ | +[4]*64$T_c$ |

4) The test system shall verify that the adjustment step size and the adjustment rate shall be according to requirements specified in clause 7.1C.2 Table 7.1C.2.1-1 until the UE transmit timing offset is within $\left(N_{\mathrm{TA}} + N_{\mathrm{TA\text{-}offset}} + N_{\mathrm{TA,adj}}^{\mathrm{common}} + N_{\mathrm{TA,adj}}^{\mathrm{UE}}\right) \times T_{\mathrm{c}} \pm \left(T_{\mathrm{e_NTN}} - T_{\mathrm{GNSS_margin}}\right)$ respective to the first detected path (in time) of DL SSB. For Test 2 the UE transmit timing offset shall be verified for the first transmission in the DRX cycle immediately after DL timing adjustment.

## A.14.3.2 Timing advance for satellite access

### A.14.3.2.1 SA FR1 timing advance adjustment accuracy

#### A.14.3.2.1.1 Test Purpose and Environment

The purpose of the test is to verify UE Timing Advance adjustment delay and accuracy requirement defined in clause 7.3C.

#### A.14.3.2.1.2 Test Parameters

Supported test configurations are shown in table A.14.3.2.1.2-1. Both timing advance adjustment delay and accuracy are tested by using the parameters in table A.14.3.2.1.2-2, A.14.3.2.1.2-3 and A.14.3.2.1.2-4.

In all test cases, single cell served by SAN is used. Each test consists of two successive time periods, with time duration of T1 and T2 respectively. In each time period, timing advance commands are sent to the UE and Sounding Reference Signals (SRS), as specified in table A.14.3.2.1.2-4, are sent from the UE and received by the test equipment. By measuring the reception of the SRS, the transmit timing, and hence the timing advance adjustment accuracy, can be measured.

The UE shall be provided with the valid information about the SAN serving cell before the test.During time period T1, the test equipment shall send one message with a Timing Advance Command MAC Control Element, as specified in clause 6.1.3.4 in TS 38.321 [7]. The Timing Advance Command value shall be set to 31, which according to clause 4.2 in TS 38.213 [3] results in zero adjustment of the Timing Advance. In this way, a reference value for the timing advance used by the UE is established.

During time period T2, the test equipment shall send a sequence of messages with Timing Advance Command MAC Control Elements, with Timing Advance Command value specified in table A.14.3.2.1.2-2. This value shall result in changes of the timing advance used by the UE, and the accuracy of the change shall then be measured, using the SRS sent from the UE.

As specified in clause 7.3C.2.1, the UE adjusts its uplink timing at slot n+k+$1+2^{\mu}\cdot K_{\text{offset}}$ for a timing advance command received in slot n. This delay must be taken into account when measuring the timing advance adjustment accuracy, via the SRS sent from the UE.

The UE Time Alignment Timer, described in clause 5.2 in TS 38.321 [7], shall be configured so that it does not expire in the duration of the test.

#### A.14.3.2.1.3 Test Requirements

The UE shall apply the signalled Timing Advance value to the transmission timing at the designated activation time i.e. k+$1+2^{\mu}\cdot K_{\text{offset}}$ slots after the reception of the timing advance command, where k=5.

The Timing Advance adjustment accuracy shall be within the limits specified in clause 7.3C.2.2.

The rate of correct Timing Advance adjustments observed during repeated tests shall be at least 90 %.

### A.14.3.2.3 SA FR2-NTN timing advance adjustment accuracy

#### A.14.3.2.3.1 Test Purpose and Environment

The purpose of the test is to verify UE Timing Advance adjustment delay and accuracy requirement defined in clause 7.3C.

#### A.14.3.2.3.2 Test Parameters

Supported test configurations are shown in table A.14.3.2.3.2-1. Both timing advance adjustment delay and accuracy are tested by using the parameters in table A.14.3.2.3.2-2, A.14.3.2.3.2-3 and A.14.3.2.3.2-4.

In all test cases, single cell served by SAN is used. Each test consists of two successive time periods, with time duration of T1 and T2 respectively. In each time period, timing advance commands are sent to the UE and Sounding Reference Signals (SRS), as specified in table A.14.3.2.3.2-4, are sent from the UE and received by the test equipment. By measuring the reception of the SRS, the transmit timing, and hence the timing advance adjustment accuracy, can be measured.

The UE shall be provided with the valid information about the SAN serving cell before the test. During time period T1, the test equipment shall send one message with a Timing Advance Command MAC Control Element, as specified in clause 6.1.3.4 in TS 38.321 [7]. The Timing Advance Command value shall be set to 31, which according to clause 4.2 in TS 38.213 [3] results in zero adjustment of the Timing Advance. In this way, a reference value for the timing advance used by the UE is established.

During time period T2, the test equipment shall send a sequence of messages with Timing Advance Command MAC Control Elements, with Timing Advance Command value specified in table A.14.3.2.3.2-2. This value shall result in changes of the timing advance used by the UE, and the accuracy of the change shall then be measured, using the SRS sent from the UE.

As specified in clause 7.3C.2.1, the UE adjusts its uplink timing at slot n+k+$1+2^{\mu}\cdot K_{\text{offset}}$ for a timing advance command received in slot n. This delay must be taken into account when measuring the timing advance adjustment accuracy, via the SRS sent from the UE.

The UE Time Alignment Timer, described in clause 5.2 in TS 38.321 [7], shall be configured so that it does not expire in the duration of the test.

### A.14.4.1.1 Radio Link Monitoring Out-of-sync Test for FR1 SAN PCell configured with SSB-based RLM RS in non-DRX mode

#### A.14.4.1.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the SAN PCell. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1C.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to '*rlf*'. Supported test configurations are shown in table A.14.4.1.1.1-1. The test parameters are given in tables A.14.4.1.1.1-2, A.14.4.1.1.1-3, and A.14.4.1.1.1-4 below. There is one cell (Cell 1), which is the active NR cell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.14.4.1.1.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. The UE is configured to perform inter-frequency measurements using Gap Pattern ID #0 (40 ms) in test 1.

The UE shall be provided with the valid information about the SAN serving the each cell in the test before the test.

## A.14.4.1.3 Radio Link Monitoring Out-of-sync Test for FR1 SAN PCell configured with SSB-based RLM RS in DRX mode

### A.14.4.1.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the SAN PCell when DRX is used. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1C.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to '*rlf*'. Supported test configurations are shown in table A.14.4.1.3.1-1. The test parameters are given in tables A.14.4.1.3.1-2, and A.14.4.1.3.1-3. There is one cell (Cell 1), which is the active NR cell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.14.4.1.3.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CSI during the period when On-duration timer is running. Time alignment timers shall be set to "infinity" so that UL timing alignment is maintained during the test.

The UE shall be provided with the valid information about the SAN serving the each cell in the test before the test.

### A.14.4.1.4 Radio Link Monitoring In-sync Test for FR1 SAN PCell configured with SSB-based RLM RS in DRX mode

#### A.14.4.1.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the SAN PCell when DRX is used. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1C.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to '*rlf*'. Supported test configurations are shown in table A.14.4.1.4.1-1. The test parameters are given in tables A.14.4.1.4.1-2, and A.14.4.1.4.1-3. There is one cell (Cell 1), which is the active NR cell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.14.4.1.4.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CSI during the period when On-duration timer is running. Time alignment timers shall be set to "infinity" so that UL timing alignment is maintained during the test.

The UE shall be provided with the valid information about the SAN serving the each cell in the test before the test.

## A.14.4.1.7 Radio Link Monitoring Out-of-sync Test for FR1 SAN PCell configured with CSI-RS-based RLM in DRX mode

### A.14.4.1.7.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the SAN PCell when DRX is used. This test will partly verify the FR1 PCell CSI-RS Out-of-sync radio link monitoring requirements in clause 8.1C.

The test parameters are given in tables A.14.4.1.7.1-1, A.14.4.1.7.1-2, and A.6.5.1.7C.1-3 below. There is one cell, Cell 1 is the PCell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.14.4.1.7.1-1 shows the variation of the downlink SNR in the PCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled in PCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test. In the test, SSB0 is configured as the BFD-RS.

The UE shall be provided with the valid information about the SAN serving cells before the test.

### A.14.4.2.1 Beam Failure Detection and Link Recovery Test for FR1 PCell for satellite access configured with SSB-based BFD and LR in non-DRX mode

#### A.14.4.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set q0 configured for a serving cell which is served by satellite access node (SAN) and that the UE performs correct SSB-based link recovery based on beam candidate set $q_1$. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the SSB based beam failure detection and link recovery for an FR1 serving cell requirements in clause 8.5.

The test parameters are given in tables A.14.4.2.1.1-1, A.14.4.2.1.1-2, A.14.4.2.1.1-3 and A.14.4.2.1.1-4 below. There is one cell, Cell 1 which is the active cell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.14.4.2.1.1-1 shows the variation of the downlink SNR of the SSB in set $q_0$ in the active cell to emulate SSB based beam failure. Figure A.14.4.2.1.1-1 additionally shows the variation of the downlink L1-RSRP of the SSB in set $q_1$ of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40 ms) in test 1.

## A.14.4.2.2 Beam Failure Detection and Link Recovery Test for FR1 PCell for satellite access configured with SSB-based BFD and LR in DRX mode

### A.14.4.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set $q_0$ configured for a serving cell which is served by satellite access node (SAN) and that the UE performs correct SSB-based link recovery based on beam candidate set $q_1$. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when DRX is used. This test will partly verify the SSB based beam failure detection and link recovery for an FR1 serving cell requirements in clause 8.5.

The test parameters are given in tables A.14.4.2.2.1-1, A.14.4.2.2.1-2, A.14.4.2.2.1-3, A.14.4.2.2.1-4 and A.14.4.2.2.1-5 below. There is one cell, Cell 1 which is the active cell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.14.4.2.2.1-1 shows the variation of the downlink SNR of the SSB in set $q_0$ in the active cell to emulate SSB based beam failure. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled in PCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test.

The purpose of this test is to verify that the UE properly detects CSI-RS-based beam failure in the set $q_0$ configured for a serving cell which is served by satellite access node (SAN) and that the UE performs correct CSI-RS-based link recovery based on beam candicate set $q_1$. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the CSI-RS based beam failure detection and link recovery for an FR1 serving cell requirements in clause 8.5.

The test parameters are given in tables A.14.4.2.3.1-1, A.14.4.2.3.1-2, and below. There is one cell, Cell 1 which is the active cell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.14.4.2.3.1-1 shows the variation of the downlink SNR of the CSI-RS in set $q_0$ in the active cell to emulate CSI-RS based beam failure. Figure A.14.4.2.3.1-1 additionally shows the variation of the downlink L1-RSRP of the CSI-RS in set $q_1$ of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is not enabled.

### A.14.4.2.3.2 Test Requirements

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the shall detect beam failure and initiat link recovery. During T4 and T5 the UE measures and evaluate beam candidate from beam candidate set $q_1$.

No later than time point F occurring no later than D1 = 30+10 ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set $q_1$. The UE shall not transmit preamble on a beam associated with the candidate beam set $q_1$ earlier than time point B.

## A.14.4.2.4 Beam Failure Detection and Link Recovery Test for FR1 PCell for satellite access configured with CSI-RS-based BFD and LR in DRX mode

### A.14.4.2.4.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects CSI-RS-based beam failure in the set $q_0$ configured for a serving cell which is served by satellite access node (SAN) and that the UE performs correct CSI-RS-based link recovery based on beam candicate set $q_1$. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when DRX is used. This test will partly verify the CSI-RS based beam failure detection and link recovery for an FR1 serving cell requirements in clause 8.5.

The test parameters are given in tables A.14.4.2.4.1-1, A.14.4.2.4.1-2, A.14.4.2.4.1-3, and A.14.4.2.4.1-4 below. There is one cell, Cell 1 which is the active cell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.14.4.2.4.1-1 shows the variation of the downlink SNR of the CSI-RS in set $q_0$ in the active cell to emulate CSI-RS based beam failure. Figure A.14.4.2.4.1-1 additionally shows the variation of the downlink L1-RSRP of the CSI-RS in set $q_1$ of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled in PCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test.

### A.14.4.2.7.2 Test Requirements

Test requirements specified in clause A.14.4.2.2.1 apply to this test.

## A.14.4.3 Active BWP switch for satellite access

### A.14.4.3.1 DCI-based and Timer-based Active BWP Switch

#### A.14.4.3.1.1 NR FR1 DL active BWP switch with non-DRX in SA

#### A.14.4.3.1.1.1 Test Purpose and Environment

The purpose of this test is to verify the DL BWP switch delay requirement defined in clause 8.6C.

The supported test configurations are shown in table A.14.4.3.1.1.1-1. The test scenario comprises of one cell (Cell 1) as given in table A.14.4.3.1.1.1-2. Cell-specific parameters of the cell are specified in table A.14.4.3.1.1.1-3 below.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE will have ACK/NACK sending.

Before the test starts,

- UE is connected to Cell 1 on radio channel 1.
- UE is configured with 2 different UE-specific downlink bandwidth parts, BWP-1 and BWP-2 before starting the test. BWP-1 and BWP-2 always include bandwidth of the initial DL BWP and SSB.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1.
- UE is configured with a *bwp-InactivityTimer* timer value for Cell 1.

The cell has constant signal levels throughout the test.

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

During T1,

> Time period T1 starts when a DCI format 1_1 command for DL BWP switch, sent from the test equipment to the UE, is received at the UE side in Cell 1's slot # denoted *i*. The UE shall switch its bandwidth part from BWP-1 to BWP-2.
>
> The UE shall be able to receive PDSCH on the first DL slot that occurs after the beginning of Cell 1's DL slot ($i+T_{BWPswitchDelay}$) as defined in clause 8.6C and starts to report valid ACK/NACK for the Cell 1 no later than the first UL slot that occurs after the beginning of slot ($i + T_{BWPswitchDelay} + k1 + 2^{\mu-\mu_{K_{offset}}} K_{offset}$). The UE shall be continuously scheduled on Cell 1's BWP-2 starting from the first DL slot that occurs after the beginning of slot ($i+T_{BWPswitchDelay}$).

During T2, the test equipment won't transmit DCI format for PDSCH reception on Cell 1.

During T3,

> The time period T3 starts from the slot #*j*, where j is the first slot of the subframe immediately after *bwp-InactivityTimer* timer expires. The UE shall switch its bandwidth part from BWP-2 back to the default bandwidth part – BWP-1.
>
> The UE shall be able to receive PDSCH on the first DL slot that occurs after the beginning of Cell 1's slot ($j+T_{BWPswitchDelay}$) as defined in clause 8.6C and starts to report valid ACK/NACK for the Cell 1 at latest on the first UL slot that occurs after the beginning of slot ($j + T_{BWPswitchDelay} + k1 + 2^{\mu-\mu_{K_{offset}}} K_{offset}$). The UE shall be continuously scheduled on Cell 1's BWP-1 starting from the first DL slot that occurs after the beginning of slot ($j+T_{BWPswitchDelay}$).

The test equipment verifies the DL BWP switch time by counting the slots from the time when the BWP switch command is received or *bwp-InactivityTimer* timer expires till an ACK/NACK is received.

## A.14.4.3.2 RRC-based Active BWP Switch

### A.14.4.3.2.1 NR FR1 DL active BWP switch of Cell with non-DRX in SA

#### A.14.4.3.2.1.1 Test Purpose and Environment

The supported test configurations are shown in table A.14.4.3.2.1.1-1. The test scenario comprises of one Cell (Cell 1) as given in table A.14.4.3.2.1.1-2. Cell-specific parameters of Cell are specified in table A.14.4.3.2.1.1-3 below.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE will have ACK/NACK sending.

Before the test starts,

- UE is connected to Cell 1 on radio channel 1.
- UE has bandwidth part BWP-1 in its RRC-configuration for Cell 1.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 of initial condition in Cell 1.

All cells have constant signal levels throughout the test.

The test consists of 1 time period, with duration of T1.

During T1,

> Time period T1 starts when a *RRCReconfiguration* with updated bandwidth part configuration, sent from the test equipment to the UE, is completely received at the UE side in PCell's slot # denoted *i*. The UE shall reconfigure its bandwidth part with the updated bandwidth part BWP-1 of final condition.
>
> The UE shall be able to receive PDSCH on PCell from the first DL slot that occurs after the beginning of DL slot ($i + \frac{T_{\text{RRCprocessingDelay}} + T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}}$) as defined in clause 8.6C.3 and starts to report valid ACK/NACK for the PCell from the first UL slot that occurs after the beginning of DL slot ($i + \frac{T_{\text{RRCprocessingDelay}} + T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}} + k1 + 2^{\mu-\mu_{K_{offset}}} K_{offset}$) on BWP-1 of final condition. The UE shall be continuously scheduled on PCell's BWP-1 of final condition starting from the first DL slot right after slot ($i + \frac{T_{\text{RRCprocessingDelay}} + T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}}$).
>
> $T_{\text{RRCprocessingDelay}}$ and $T_{\text{BWPswitchDelayRRC}}$ are defined in clause 8.6C.3.

The test equipment verifies the DL BWP switch time in Cell by counting the time from the time when the RRC Reconfiguration message including updated BWP configuration is sent till the time when a vaild ACK/NACK is received is received.

## A.14.4.4 UE specific CBW change for satellite access

### A.14.4.4.1 UE specific CBW change on PCell in FR1 in non-DRX

#### A.14.4.4.1.1 Test Purpose and Environment

The purpose of this test is to verify the UE specific CBW change delay requirement defined in clause 8.13C.

The supported test configurations are shown in table A.14.4.4.1.1-1. The test scenario comprises of one Cell (Cell 1), which is PCell as given in table A.14.4.4.1.1-2. Cell-specific parameters are specified in table A.14.4.4.1.1-3.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE sends ACK/NACK during the test.

Before the test starts:

UE is connected to Cell 1 (PCell) on radio channel 1.

UE has bandwidth part BWP-1 in its RRC-configuration for Cell 1 (PCell).

UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 of initial condition in PCell.

UE has been configured with UE specific CBW (CBW-1).

UE is indicated in *SCS-SpecificCarrier* [2] that the UE specific CBW is CBW-1 as the initial condition in Cell 1 (PCell).

Cell 1 (PCell) has constant signal levels throughout the test.

The test consists of 1 time period, with duration of T1.

During T1,

Time period T1 starts when a *RRCReconfiguration* containing *SCS-SpecificCarrier* with updated UE specific CBW, sent from the test equipment to the UE, is completely received at the UE side in PCell's slot # denoted *i*. The UE shall reconfigure its UE specific CBW with the updated CBW-2 for the final condition.

The UE shall be able to receive PDSCH on PCell from the first DL slot that occurs after the beginning of DL slot ($i + \frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$) as defined in clause 8.13C and starts to report valid ACK/NACK for

PCell from the first UL slot that occurs after the beginning of DL slot ($i + \frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length} + k1 + 2^{\mu-\mu_{K_{offset}}}K_{offset}$) on the PCell's BWP-1 on CBW-2 for the final condition. The UE shall be continuously scheduled on the PCell's BWP-1 on CBW-2 for the final condition starting from the first DL slot right after slot ($i + \frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$).

$T_{RRCprocessingDelay}$ and $T_{CBWchangeDelayRRC}$ are defined in clause 8.13C.

The test equipment verifies the UE specific CBW switching delay in PCell by estimating the time from the moment the RRC Reconfiguration message including updated UE specific CBW configuration is sent until the moment a vaild ACK/NACK is received.

# A.14.5 Measurement procedure

## A.14.5.1 Intra-frequency Measurements

### A.14.5.1.1 SA event triggered reporting tests without gap under non-DRX

#### A.14.5.1.1.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clauses 9.2C.5.1 and 9.2C.5.2.

#### A.14.5.1.1.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell and neighbour cell are given in table A.14.5.1.1.2-1 and A.14.5.1.1.2-2 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. ### A.14.5.1.1.3 Test Requirements

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.14.5.1.2 SA event triggered reporting tests without gap under DRX

### A.14.5.1.2.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clauses 9.2C.5.1 and 9.2C.5.2.

### A.14.5.1.2.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell are given in table A.14.5.1.2.2-1, A.14.5.1.2.2-2 and A.14.5.1.2.2-3 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

The UE shall be provided with the valid information about the SAN serving cell in the test before the test.

UE is configured with 1 SMTC for the intra-frequency measurement. Both Cell 1 and Cell 2 are associated with the configured SMTC.

There are two BWPs configured in Cell 1, BWP0 which contains the cell defining SSB, and BWP1 which does not contain any SSB of Cell 1. During the whole test, BWP1 is always scheduled as the active BWP for the UE.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furhtermore UE is allocated with PUSCH resource at every DRX cycle.

The UE shall be provided with the valid information about the SAN serving each cell before the test.

The UE is configured with 2 FNO concurrent measurement gaps for the intra-frequency measurement. Serving Cell 1 is expected to be measured within MeasGapId #0 and Neighbour Cell 2 is expected to be measured within MeasGapId #1.

### A.15.5.1.5.3 Test Requirements

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.14.5.1.8.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than X ms from the beginning of time period T2. The UE is required to read the neighbour cell SSB index and report the acquired SSB index in this test. X=1000 for test configuration 2 and if UE indicates 'n1' for *maxNumber-NGSO-SatellitesWithinOneSMTC*, otherwise X=880.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.14.5.1.9 SA event triggered reporting tests without gap under non-DRX

### A.14.5.1.9.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event when configured with two different SMTC configurations. This test will partly verify the intra-frequency cell search requirements in clauses 9.2C.5.1 and 9.2C.5.2 for UEs that support the configuration of different SMTC periodicities for different cells.

### A.14.5.1.9.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell and neighbour cell are given in table A.14.5.1.9.2-1 and A.14.5.1.9.2-2 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

The UE shall be provided with the valid information about the SAN serving the each cell in the test before the test.

UE is configured with 2 non-overlapping SMTCs for the intra-frequency measurement. The SMTC periodicity is 20 ms, for Cell 1 (serving cell at the beginning of the test case) with SMTC Config.1 is associated with Cell 1 with offset 0, and the SMTC periodicity for the neighbor cell is 160 ms, with SMTC Config.2 is associated with Cell 2 with offset 10 ms. The two cells are associated to the same satellite

#### A.14.5.1.9.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1800 ms from the beginning of the period T2. The UE is not required to read the neighbour cell SSB index in this test. The test requirement was obtained from:

$T_{identify_intra_without_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra})$ ms

Where:

- $T_{PSS/SSS_sync_intra}$ = max( 600 ms, ceil( 5 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x SMTC period ) x $CSSF_{intra}$ =

  max(600 ms, ceil(5x 1 x x 1) x 1 x 160) x 1

  = 900 ms.

- max(200 ms, ceil( 5 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x SMTC period) x $CSSF_{intra}$

  = 900 ms

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to 2x$TTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

In test 1 measurement gap pattern configuration # 0 as defined in table A.14.5.2.1.1-2 is provided.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

#### A.14.5.2.1.2 Test Requirements

In test 1 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

#### A.14.5.2.2.1 Test Purpose and Environment

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

### A.14.5.2.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3C.4.

In this test, there are two cells: NR Cell 1 as PCell in FR1 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR1 on NR RF channel 2. The test parameters are given in tables A.14.5.2.3.1-1, A.14.5.2.3.1-2 and A.14.5.2.3.1-3.

In test 1 measurement gap pattern configuration # 0 as defined in table A.14.5.2.3.1-2 is provided.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

#### A.14.5.2.3.2 Test Requirements

In test 1 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1040 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test 1 UE is required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.14.5.2.6.2 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1280 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

The UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.14.5.2.7 Event triggered reporting test without gap under non-DRX

### A.14.5.2.7.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the inter-frequency cell search requirements in clauses 9.3C.7.

### A.14.5.2.7.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) on NR RF channel 1 and a FR1 neighbour cell (Cell 2) on NR RF channel 2. The test parameters for PCell and neighbour cell are given in table A.14.5.2.7.2-1, A.14.5.2.7.2-2 and A.14.5.2.7.2-3 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

The UE shall be provided with the valid information about the SAN serving each cell in the test before the test.

UE is configured with 2 non-overlapping SMTCs. The SMTC periodicity is 20 ms, and SMTC1 is associated with Cell 1 with offset 0, and SMTC2 is associated with Cell 2 with offset 10 ms.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

#### A.14.5.2.7.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 800 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.14.5.2.8 Event triggered reporting tests without gap under DRX

#### A.14.5.2.8.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the inter-frequency cell search requirements in clauses 9.3C.7.

#### A.14.5.2.8.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) on NR RF channel 1 and a FR1 neighbour cell (Cell 2) on NR RF channel 2. The test parameters for PCell and neighbour cell are given in table A.14.5.2.8.2-1, A.14.5.2.8.2-2 and A.14.5.2.8.2-3 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

The UE shall be provided with the valid information about the SAN serving each cell in the test before the test.

UE is configured with 2 non-overlapping SMTCs. The SMTC periodicity is 20 ms, and SMTC1 is associated with Cell 1 with offset 0, and SMTC2 is associated with Cell 2 with offset 10 ms.

### A.15.1.1.1.3 Test Requirements

The cell re-selection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration updateon Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 386 s.

The cell re-selection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration updateon Cell 1.

The cell re-selection delay to an already detected cell shall be less than 78 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as: $T_{detect, NR_Intra} + T_{SI\text{-}NR}$, and to an already detected cell can be expressed as: $T_{evaluate, NR_ intra} + T_{SI\text{-}NR}$,

Where:

$T_{detect, NR_Intra}$ See table 4.2.2.3-1 in clause 4.2.2.3

$T_{evaluate, NR_ intra}$ See table 4.2.2.3-1 in clause 4.2.2.3

$T_{SI\text{-}NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 385.28 s, allow 386 s for the cell re-selection delay to a newly detectable cell and 78.08 s for the cell re-selection delay to an already detected cell in the test case, which we allow 78 s.

#### A.15.1.2.3 Test Requirements

The cell re-selection delay to a higher priority cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration updateon Cell 2.

The cell re-selection delay to a higher priority cell shall be less than 138 s.

The cell re-selection delay to a lower priority cell is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to a lower priority cell shall be less than 78 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search} + T_{evaluate,\ NR_\ inter} + T_{SI\text{-}NR}$, and to a lower priority cell can be expressed as: $T_{evaluate,\ NR_\ inter} + T_{SI\text{-}NR}$,

Where:

$T_{higher_priority_search}$ See clause 4.2.2.7

$T_{evaluate,\ NR_\ inter}$ See table 4.2.2.4-1 in clause 4.2.2.4

$T_{SI\text{-}NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 138.08 s, allow 138 s for the cell re-selection delay to a higher priority cell and 78.08 s for the cell re-selection delay to a lower priority cell in the test case, which we allow 78 s.

### A.15.1.5.3 Test Requirements

The cell re-selection delay to an already detected low priority cell (Cell 1) for UE fulfilling low mobility criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to an already detected low priority cell, Cell 1, shall be less than 232 s.

The cell re-selection delay to an already detected high priority cell (Cell 2) for UE fulfilling low mobility criterion is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to an already detected high priority cell, Cell 2, shall be less than 232 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE 1: The cell re-selection delay to an already detected low priority cell can be expressed as: $T_{evaluate,\ NR_\ inter}$ + $T_{SI\text{-}NR}$

NOTE 2: The cell re-selection delay to an already detected higher priority cell can be expressed as: $T_{evaluate,\ NR_\ inter}$ + $T_{SI\text{-}NR}$

Where:

$T_{evaluate,\ NR_\ inter}$ See table 4.2.2.10.2-1 in clause 4.2.2.10.2

$T_{SI\text{-}NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 231.68 s, allow 232 s for the cell re-selection delay to an already detected low priority cell for UE fulfilling low mobility criterion in the test case.

This gives a total of 231.68 s, allow 232 s for the cell re-selection delay to an already detected high priority cell for UE fulfilling low mobility criterion in the test case.

## A.15.1.6 Cell re-selection to FR2-2 inter-frequency NR case for UE fulfilling not-at-cell edge relaxed measurement criterion

### A.15.1.6.1 Test Purpose and Environment

This test is to verify the requirement for the inter-frequency NR cell re-selection requirements for UE fulfilling not-at-cell edge criterion specified in clause 4.2.2.10.3.

### A.15.1.6.2 Test Parameters

The test scenario comprises of 2 cells (Cell 1 and Cell 2) on 2 different NR carriers respectively as given in tables A.15.1.6.2-1, A.15.1.6.2-2 and A.15.1.6.2-3. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both Cell 1 and Cell 2 are already identified by the UE prior to the start of the test. Cell 1 and Cell

2 belong to different tracking areas. Furthermore, UE has not registered with network for the tracking area containing Cell 2. Cell 2 is of higher priority than Cell 1. The UE is configured with *cellEdgeEvaluation* criterion [2].

#### A.15.2.1.1.2 Test Requirements

The test requirements defined in clause A.6.5.3.1.2 shall apply to this test case, except $T_{activation_time}$ will be replaced with the value $T_{FirstSSB}$ + 5 ms as defined in clause 8.3.

### A.15.2.1.2 SCell Activation and deactivation for FR1+FR2-2 inter-band with target SCell in FR2-2

#### A.15.2.1.2.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in clause A.15.2.1.1.1 except the PCell is in FR1 and SCell is in FR2-2.

The supported test configurations are defined in table A.15.2.1.2.1-1. The general test parameters are the same as defined in table A.15.2.1.1.1-2 except that the length of T2 is 2 s. And cell specific test parameters are described in table A.15.2.1.2.1-2. OTA related test parameters are defined in table A.15.2.1.2.1-3.

At the beginning of T1 the UE receives an RRC message by which the SCell (Cell 2) becomes configured on NR. During T1 the SCell is powered off and UE is not aware of SCell.

A MAC message for activation of SCell is sent by the test equipment 100 ms after the RRC message, in a slot # denoted m. The point in time at which the MAC message for activation of SCell is received at the UE antenna connector defines the start of time period T2.

During T2, the test equipment monitors the L1-RSRP measurement reporting for the SCell. The time when test equipment receives a valid L1-RSRP report is denoted as slot $m+T_{L1\text{-}RSRP}$. In the next DL slot after slot $m+T_{L1\text{-}RSRP}$, the test equipment sends a MAC message for the activation of the TCI state of the RMC CORESET of the SCell. In the same slot, the test equipment also sends an RRC message to configure the CSI-RS resources for SCell.

Time period T3 starts when a MAC message for deactivation of the SCell, sent from the test equipment to the UE in a slot # denoted n, is received at the UE antenna connector.

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell and PCell during activation of SCell, respectively.

The test equipment verifies the activation time by counting the slots from the time when the SCell activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the slots from the time when the SCell 1 deactivation command is sent until CSI reporting for SCell 1 is discontinued.

#### A.15.2.1.2.2 Test Requirements

During T2 the UE shall send the first CSI report for SCell in the first available uplink resource after at least one CSI-RS transmission occasion for channel measurement and reporting after slot (m+k). UE is allowed to postpone CSI report to next available UL resource if an available uplink resource is subject to interruption. Whether CSI report in a slot was interrupted is checked by monitoring ACK/NACK sent in PCell in the slot.

During T2 the UE shall start sending valid L1-RSRP report for the SCell in the configured slots for CSI reporting after slot (m+$T_{L1\text{-}RSRP}$), where $T_{L1\text{-}RSRP}$ is no larger than

3 ms + $T_{FirstSSB_MAX}$ + 23*$T_{SMTC_MAX}$ + 12*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$

as defined in clause 8.3.2. For this test case, $T_{FirstSSB_MAX}$=$T_{SMTC_MAX}$=$T_{rs}$=20 ms; $T_{L1\text{-}RSRP,\ measure}$=240 ms and $T_{L1\text{-}RSRP,\ report}$=5 ms, which allows $T_{L1\text{-}RSRP}$ [980] ms.

During T2 the UE shall start sending CSI reports for the SCell with non-zero CQI index in the configured slots for CSI reporting no later than slot m + $\frac{T_{HARQ}+T_{activtion_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where

- $T_{HARQ}$ is defined in table A.5.5.3.1.1-2
- $T_{activation_time}$ = 3 ms + $T_{FirstSSB_MAX}$ + 23*$T_{SMTC_MAX}$ + 12*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ + max {($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$), ($T_{uncertainty_RRC}$ + $T_{RRC_delay}$)}, which allows [1100] ms
- $T_{CSI_Reporting}$ = 10 ms
- NR slot length is 0.125 ms for this test case.

During T3 the UE shall stop sending CSI reports for both SCells no later than slot n + $\frac{T_{HARQ}+3\ ms}{NR\ slot\ length}$, as defined in clause 8.3.

During T2 interruption of PCell during SCell activation shall not happen outside the slot $m + 1 + \frac{T_{HARQ}}{\text{NR slot length}}$ to $m + 1 + \frac{T_{HARQ}+3\ ms+T_X}{\text{NR slot length}}$, as defined in clause 8.3, where $T_X$ =20 ms.

During T3 the starting point of interruption of PCell during SCell deactivation shall not happen outside the slot n + 1 + $\frac{T_{HARQ}}{NR\ slot\ length}$ to n + 1 + $\frac{T_{HARQ}+3\ ms}{NR\ slot\ length}$, as defined in clause 8.3.

The interruption of PCell due to activation of SCell shall not be more than the values specified for SA in clause 8.2.2.2.7.

### A.15.2.1.3 SCell Activation and deactivation for SCell in FR2-2 inter-band in non-DRX

#### A.15.2.1.3.1 Test Purpose and Environment

The purpose of this test case is the same as for the test defined in clause A.15.2.1.1.1 except the PCell and SCell are in FR2-2 inter-band.

The supported test configurations are shown in table A.15.2.1.3.1-1 below. The general test parameters are described in tables A.15.2.1.3.1-2, and cell specific test parameters are described in tables A.15.2.1.3.1-3. OTA related test parameters are shown in table A.15.2.1.3.1-4 below.

At the beginning of T1 the UE receives an RRC message by which the SCell (Cell 2) becomes configured on NR. During T1 the SCell is powered off and UE is not aware of SCell. A MAC message for activation of SCell is sent by the test equipment 100 ms after the RRC message, in a slot # denoted m.

The point in time at which the MAC message for activation of SCell is received at the UE antenna connector defines the start of time period T2. Immediately at beginning of T2 the transmission power of Cell 2 is increased to same level as for Cell 2. During T2, the test equipment monitors the L1-RSRP measurement reporting for the SCell. The time when test equipment receives a valid L1-RSRP report is denoted as slot $m+T_{L1\text{-}RSRP}$. In the next DL slot after slot $m+T_{L1\text{-}RSRP}$, the test equipment sends a MAC message for the activation of the TCI state of the RMC CORESET of the SCell. In the same slot, the test equipment also sends an RRC message to configure the CSI-RS resources for SCell.

Time period T3 starts when a MAC message for deactivation of the SCell, sent from the test equipment to the UE in a slot # denoted n, is received at the UE antenna connector.

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell and PSCell during activation of SCell, respectively.

The test equipment verifies the activation time by counting the slots from the time when the SCell activation command is sent until a CSI report with other than CQI index 0 is received.

The test equipment verifies the deactivation time by counting the slots from the time when the SCell 1 deactivation command is sent until CSI reporting for SCell 1 is discontinued.

### A.15.2.1.3.2 Test Requirements

During T2 the UE shall start sending CSI report for the SCell in the configured slots for CSI reporting after at least one CSI-RS transmission occasion for channel measurement and reporting after slot (m+k). UE shall send the first CSI report for SCell after receiving at least one CSI-RS transmission occasion for channel measurement and reporting after slot (m+k), or in the next available uplink resource for CSI reporting if the slot was subject to interruption. Whether CSI report in a slot was interrupted is checked by monitoring ACK/NACK sent in PCell in the slot.

During T2, the UE shall start sending valid L1-RSRP report for the SCell in the configured slots for CSI reporting after slot (m+$T_{L1\text{-}RSRP}$), where $T_{L1\text{-}RSRP}$ is no larger than 3 ms + $T_{FirstSSB_MAX}$ + 23*$T_{SMTC_MAX}$ +12*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ as defined in clause 8.3.2. For this test case, $T_{FirstSSB_MAX}$=$T_{SMTC_MAX}$=$T_{rs}$=20 ms; $T_{L1\text{-}RSRP,\ measure}$=480 ms and $T_{L1\text{-}RSRP,\ report}$=5 ms, which allows $T_{L1\text{-}RSRP}$ =1480 ms.

During T2, the UE shall start sending CSI reports for the SCell with non-zero CQI index in the configured slots for CSI reporting no later than slot m + $\frac{T_{HARQ}+T_{activtion_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where

- $T_{HARQ}$ is defined in table A.14.X.3.3.1-2
- $T_{activation_time}$ = 3 ms + $T_{FirstSSB_MAX}$ + 23*$T_{SMTC_MAX}$ + 12*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ + max {($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$), ($T_{uncertainty_RRC}$ + $T_{RRC_delay}$)}, which allows 1510 ms
- $T_{CSI_Reporting}$ = 10 ms
- NR slot length is 0.125 ms for this test case.

During T2, the interruption of PCell during SCell activation shall not happen outside the slot $m + 1 + \frac{T_{\text{HARQ}}}{\text{NR slot length}}$ to $m + 1 + \frac{T_{\text{HARQ}}+3\ ms+T_{\text{X}}}{\text{NR slot length}}$, where $T_X$ =20 ms.

During T3, the UE shall stop sending CSI reports for SCell no later than slot n + $\frac{T_{\text{HARQ}}+3\ ms}{NR\ slot\ length}$, as defined in clause 8.3.

During T3, the starting point of interruption of PCell during SCell deactivation shall not happen outside the slot n + 1 + $\frac{T_{\text{HARQ}}}{NR\ slot\ length}$ to n + 1 + $\frac{T_{\text{HARQ}}+3\ ms}{NR\ slot\ length}$ as defined in clause 8.3.

The supported test configurations are shown in table A.15.2.1.4.1-1 below. The general test parameters are given in table A.15.2.1.4.1-2 and cell-specific test parameters in table A.15.2.1.4.1-3. OTA related test parameters are shown in table A.15.2.1.4.1-4.

The test consists of three successive time periods, with duration of T1, T2 and T3, respectively. There are two FR2-2 carriers and two NR cells. Before the test starts the UE is connected to Cell 1 (PCell) on carrier #1, but is not aware of Cell 2 on NR carrier #2. Cell 1 and Cell 2 have constant signal levels throughout the test. The UE is monitoring the PCell. The UE shall be continuously scheduled in the PCell throughout the whole test.

At the beginning of T1 the UE receives an RRC message by which the Cell 2 is monitored by the UE. During T1, Cell 2 should be detected and measured by the UE such that it meets the condition for known cell defined in clause 8.3.4 for direct SCell activation.

Time period T2 starts when the *RRCReconfiguration* message for the configuration and activation of Cell 2 (the SCell), which is sent from the test equipment, is received at the UE antenna connector in a slot # denoted m. The test equipment shall set the parameter *sCellState* to *activated* for the SCell, which causes Cell 2 to become configured and activated.

Time period T3 starts at (m + $N_{direct}$), at which point UE shall be reporting a valid CQI for both PCell and SCell.

The test equipment verifies that potential interruption is carried out in the correct time span by monitoring ACK/NACK sent in PCell during the activation of SCell. The test equipment verifies the activation time by counting the slots from the time when the SCell activation message is sent until a CQI report with other than CQI index 0 is received.

### A.15.2.1.4.2 Test Requirements

During T2 the UE shall send the first CSI report for SCell in the first available uplink resource after slot (m+k). UE is allowed to postpone CSI report to next available UL resource if an available uplink resource is subject to interruption. Whether CSI report in a slot was interrupted is checked by monitoring ACK/NACK sent in PCell in the slot.

During T2 the UE shall start sending CSI reports for SCell with non-zero CQI index in the configured slots for CSI reporting no later than slot m + $\frac{N_{direct}}{NR\ slot\ length}$, where

$$N_{direct} = T_{RRC_Process} + T_1 + T_{activation_time} + T_{CSI_Reporting} - 3\ ms,$$

- $T_{RRC_Process}$ = 16 ms, which is the RRC procedure delay defined for SCell addition in clause 12 of TS 38.331 [2],

- $T_1$ is the delay from slot m + $T_{RRC_Process}$ until the transmission of *RRCReconfigurationComplete* message,

- $T_{activation_time} = T_{FirstSSB}$ + 5 ms = 25 ms,

- $T_{CSI_Reporting}$ = 10 ms

This gives a total of $N_{direct}$ = 16 + $T_1$ + 25 + 10 - 3 = (48 + $T_1$) ms, and NR slot length is 0.125 ms.

During T3 the UE shall send CSI reports for SCell with non-zero CQI index and continue to send CSI reports for SCell with non-zero CQI index until the end of T3.

During T2 interruption of PSCell during SCell activation shall not happen outside the window from slot *m*+1 to slot $m+1+\frac{T_{RRC_Process}+T_1+T_X}{NR\ slot\ length}$ as defined in clause 8.3.4, where $T_X$ =20 ms.

The interruption of PCell due to activation of SCell shall not be more than the values specified for NR SA in clause 8.2.2.2.11.

All of the above test requirements shall be fulfilled in order for the observed SCell activation delay to be counted as correct. The rate of correct observed SCell activation delay and SCell deactivation delay during repeated tests shall be at least 90 %.

NOTE: During T2 if there are no uplink resources for reporting the valid CSI in a slot m + $\frac{N_{direct}}{NR\ slot\ length}$ as defined in clause 8.3.4 then the UE shall use the next available uplink resource for reporting the corresponding valid CSI.

### A.15.2.1.5 Direct SCell activation at handover with known SCell in FR2-2

#### A.15.2.1.5.1 Test Purpose and Environment

This test is to verify the requirements specified in sub clause 8.3.5 for the FR2-2 handover with direct SCell activation.

The test scenario comprises of three FR2-2 cells, one source PCell (Cell 1), one target PCell (Cell 2) and one SCell (Cell 3). The test consists of three successive time periods, with time durations of T1, T2, and T3 respectively.

At the start of time duration T1, the UE is in connected mode with PCell (Cell 1). Both Cell 2 and Cell 3 are known to UE and UE is reporting CQI for all Cell 1.

Time period T2 starts when UE receives a handover command that initiate handover of UE to Cell 2 and also activates Cell 3. This is done using an *RRCConnectionReconfiguration* message with parameter *sCellState* set to *activated* for the Cell 3. The message is sent from the test equipment to the UE and is received in a slot number n at the UE antenna connector. The UE shall accomplish the handover, addition and activation of the SCell no later than slot (n + $\frac{N_{direct}}{NR\ slot\ length}$).

Time period T3 starts at (n + $\frac{N_{direct}}{NR\ slot\ length}$), at which point UE shall be reporting a valid CSI for both Cell 2 and Cell 3 as given in tables A.15.2.1.5.1-1 and A.15.2.1.5.1-2.

### A.15.2.1.5.2 Test Requirements

The UE shall be capable to transmit valid CSI report for PCell (Cell 2) and to the directly activated SCell 1 no later than in slot n+ $N_{direct}$.

The SCell activation delay, $N_{direct}$, can be expressed as: $N_{direct} = T_{RRC_process} + T_{interrupt} + T_2 + T_3 + T_{activation_time} + T_{CSI_Reporting}$ - 3 ms; Where:

- $T_{RRC_Process}$: RRC procedure delay defined in clause 12 of TS 38.331 and it is equal to 16 ms,
- $T_{interrupt}$: Interruption time during handover as specified in clause 6.1.1. The value to be verified in the test is 52 ms ($T_{interrupt}$ = 0 ms for $T_{search}$ + 10 ms for $T_{IU}$ + 20 ms for $T_{processing}$ + 20 ms for $T_{\Delta}$ + 2 ms for $T_{margin}$ ms) by assuming known SCell and SMTC.1 configuration.

- $T_2$: Delay from slot $n + \frac{T_{RRC_Process} + T_{Interrupt}}{\text{NR slot length}}$ until UE has obtained a valid TA command for the target PCell,

- $T_3$: Delay for applying the received TA for uplink transmission in the target PCell, and greater than or equal to k+1 slot, where k is defined in clause 4.2 in TS 38.213,

- $T_{activation_time}$ and $T_{CSI_Reporting}$ are specified in clause 8.3.2, where the following definitions of $T_{FirstSSB}$ and $T_{FirstSSB_MAX}$ as defined in clause 8.3.5 shall apply:

During time period T2 of the test, the UE shall start sending CSI reports for SCell with non-zero CQI index at latest in a slot n + $\frac{T_{HARQ} + T_{activtion_time} + T_{CSI_Reporting}}{NR\ slot\ length}$, $T_{activation_time} = T_{SMTC_SCell}$ + 5 ms, as defined in clause 8.3.

During time period T3 of the test, the UE shall stop sending CSI reports for SCell at latest in a slot m + $\frac{T_{HARQ} + 3\ ms}{NR\ slot\ length}$, as defined in clause 8.3.

During time period T2 of the test, interruption of PCell / PSCell during SCell activation shall not happen outside the slot $n + 1 + \frac{T_{HARQ}}{\text{NR slot length}}$ to $n + 1 + \frac{T_{HARQ} + 3\ ms + T_X}{\text{NR slot length}} + N_{interruption}$, as defined in clause 8.3.

During time period T3 of the test, the starting point of interruption of PCell during SCell deactivation shall not happen outside the slot m + 1 + $\frac{T_{HARQ}}{NR\ slot\ length}$ to m + 1 + $\frac{T_{HARQ} + 3\ ms}{NR\ slot\ length}$, as defined in clause 8.3.

The interruption on any activated serving cell shall not be more than the values specified for SA in clause 8.2.2.2.2.

All of the above test requirements shall be fulfilled in order for the observed SCell activation delay and SCell deactivation delay to be counted as correct. The rate of correct observed SCell activation delay and SCell deactivation delay during repeated tests shall be at least 90 %.

NOTE: During time period T2 of the test, if there are no uplink resources for reporting the valid CSI in a slot $\frac{T_{HARQ} + T_{activtion_time} + T_{CSI_Reporting}}{NR\ slot\ length}$ as defined in clause 8.3 then the UE shall use the next available uplink resource for reporting the corresponding valid CSI.

## A.15.3.1 Handover

### A.15.3.1.1 Intra-frequency handover from FR2-2 carrier with CCA to FR2-2 carrier with CCA; unknown target cell

#### A.15.3.1.1.1 Test Purpose and Environment

This test is to verify the requirement for the NR FR2-2-NR FR2-2 intra-frequency handover on carrier with CCA requirements specified in clause 6.1.1.4.

#### A.15.3.1.1.2 Test Parameters

Supported test configurations are shown in table A.15.3.1.1.2-1. Both handover delay and interruption length are tested by using the parameters in tables A.15.3.1.1.2-2, and A.15.3.1.1.2-3.

The test scenario comprises of 1 carrier and two cells on the carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE receives a RRC handover command from the network. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

### A.15.3.1.1.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than RRC procedure delay + $T_{interrupt}$ from the beginning of time period T2.
The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{interrupt}$ is defined in clause 6.1B.1.3.2.

### A.15.3.1.2 Inter-frequency handover from FR1 to FR2-2 carrier with CCA; unknown target cell

#### A.15.3.1.2.1 Test Purpose and Environment

This test is to verify the requirement for the NR FR1-NR FR2-2 inter frequency handover on carrier with CCA requirements specified in clause 6.1.1.4.

#### A.15.3.1.2.2 Test Parameters

Supported test configurations are shown in table A.15.3.1.2.2-1. Both handover delay and interruption length are tested by using the parameters in table A.15.3.1.2.2-2, and A.15.3.1.2.2-3.

The test scenario comprises of 2 carriers and one cell on each carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE receives a RRC handover command from the network. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

## A.15.4 Measurement procedure

## A.15.4.1 Intra-frequency Measurements

### A.15.4.1.1 SA event triggered reporting test without gap under non-DRX for FR2-2 with CCA

#### A.15.4.1.1.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the TDD intra-frequency cell search requirements in clause 9.2A.5.1 and 9.2A.5.2. Supported test configurations are shown in table A.15.4.1.1.1-1.

**Table A.15.4.1.1.1-1: supported test configurations**

| Configuration | Description |
|---|---|
| 1 | 120 kHz SSB SCS, 100 MHz bandwidth, TDD duplex mode |
| 2 | 480 kHz SSB SCS, 400 MHz bandwidth, TDD duplex mode |
| 3 | 960 kHz SSB SCS, 400 MHz bandwidth, TDD duplex mode |
| NOTE: The UE is only required to be tested in one of the supported test configurations. | |

There are two cells in the test, PCell (Cell 1) and a FR2-2 neighbour cell (Cell 2) on the same frequency as the PCell with CCA transmitting SSBs according to DL CCA model. The test parameters for the Cell 1 and Cell 2 are given in table A.15.4.1.1.1-2, A.15.4.1.1.1-3 and A.15.4.1.1.1-4 below.

In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

# A.15.4.2 Inter-frequency Measurements

## A.15.4.2.1 SA event triggered reporting tests for FR2-2 with CCA without SSB time index detection when DRX is not used (PCell in FR2-2)

### A.15.4.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3A.4.

In this test, there are two cells: NR Cell 1 as PCell in FR2-2 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR2-2 on NR RF channel 2 with CCA transmitting SSBs according to DL CCA model. The test parameters and configurations are given in tables A.15.4.2.1.1-1, A.15.4.2.1.1-2, and A.15.4.2.1.1-3.

Measurement gap pattern configuration # 13 as defined in table A.15.4.2.1.1-2 is provided for UE that does not support per-FR gap and for UE that supports per-FR gap.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

Supported test configurations are shown in table A.15.4.2.1.1-1.

### A.15.4.2.1.2 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than X ms from the beginning of time period T2, where X is

For Configuration 1,

TBD for UE supporting power class 1, or

TBD for UE supporting other power class.

#### A.16.1.1.1.3 Test Requirements

The cell re-selection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell re-selection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 8 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as: $T_{detect,NR_Intra_RedCap} + T_{SI\text{-}NR}$, and to an already detected cell can be expressed as: $T_{evaluate,NR_Intra_RedCap} + T_{SI\text{-}NR}$,

Where:

$T_{detect,NR_Intra_RedCap}$ See table 4.2B.2.3-1 in clause 4.2B.2.3

$T_{evaluate,NR_Intra_RedCap}$ See table 4.2B.2.3-1 in clause 4.2B.2.3

$T_{SI\text{-}NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s for the cell re-selection delay to an already detected cell in the test case, which we allow 8 s.

### A.16.1.1.2.3 Test Requirements

The cell re-selection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 34 s.

The cell re-selection delay to an already detected cell is defined as the time from the beginning of time period T3, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to an already detected cell shall be less than 8 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as: $T_{detect, NR_Intra} + T_{SI\text{-}NR}$, and to an already detected cell can be expressed as: $T_{evaluate, NR_ intra} + T_{SI\text{-}NR}$,

Where:

$T_{detect, NR_Intra}$ See table 4.2.2.3-1 in clause 4.2.2.3

$T_{evaluate, NR_ intra}$ See table 4.2.2.3-1 in clause 4.2.2.3

$T_{SI\text{-}NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 33.28 s, allow 34 s for the cell re-selection delay to a newly detectable cell and 7.68 s for the cell re-selection delay to an already detected cell in the test case, which we allow 8 s.

## A.16.1.1.3 Cell re-selection to FR1 inter-frequency NR case for 1 Rx UE

### A.16.1.1.3.1 Test Purpose and Environment

This test is to verify the requirement for the inter-frequency NR cell re-selection requirements specified in clause 4.2B.2.4.

### A.16.1.1.3.3 Test Requirements

The cell re-selection delay to a higher priority cell is defined as the time from the beginning of time period T3, to the moment when the UE camps again on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a higher priority cell shall be less than 68 s.

The cell re-selection delay to a lower priority cell is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to a lower priority cell shall be less than 8 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search}$ + $T_{evaluate,NR_Inter_RedCap}$ + $T_{SI-NR}$, and to a lower priority cell can be expressed as: $T_{evaluate,NR_Inter_RedCap}$ + $T_{SI-NR}$,

Where:

$T_{higher_priority_search}$ See clause 4.2B.2.7

$T_{evaluate,NR_Inter_RedCap}$ See table 4.2B.2.4-1 in clause 4.2B.2.4

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s, allow 68 s for the cell re-selection delay to a higher priority cell and 7.68 s for the cell re-selection delay to a lower priority cell in the test case, which we allow 8 s.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

### A.16.1.1.4.3 Test Requirements

The cell re-selection delay to a higher priority cell is defined as the time from the beginning of time period T3, to the moment when the UE camps again on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a higher priority cell shall be less than 68 s.

The cell re-selection delay to a lower priority cell is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 1.

The cell re-selection delay to a lower priority cell shall be less than 8 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search}$ + $T_{evaluate,NR_Inter_RedCap}$ + $T_{SI-NR}$, and to a lower priority cell can be expressed as: $T_{evaluate,NR_Inter_RedCap}$ + $T_{SI-NR}$,

Where:

$T_{higher_priority_search}$ See clause 4.2B.2.7

$T_{evaluate,NR_Inter_RedCap}$ See table 4.2B.2.4-1 in clause 4.2B.2.4

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s, allow 68 s for the cell re-selection delay to a higher priority cell and 7.68 s for the cell re-selection delay to a lower priority cell in the test case, which we allow 8 s.

### A.16.1.1.7.2 Test Parameters

The test scenario comprises of 2 cells on 2 different NR carriers respectively as given in tables A.16.1.1.7.2-1, A.16.1.1.7.2-2 and A.16.1.1.7.2-3. ### A.16.1.1.7.3 Test Requirements

The cell re-selection delay to an already detected lower priority cell for UE fulfilling stationary relaxed measurements is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to a lower priority cell for UE fulfilling stationary relaxed measurements shall be less than 32 s.

The cell re-selection delay to an already detected higher priority cell for UE fulfilling stationary relaxed measurements is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRCSetupRequest message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to an already detected higher priority cell for UE fulfilling stationary relaxed measurements shall be less than 32 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a known lower priority cell can be expressed as: $T_{evaluate,NR_Inter_RedCap_Relax}$ + $T_{SI-NR}$,

Where:

$T_{evaluate,NR_Inter_RedCap_Relax}$ See table 4.2B.2.10.2-1 in clause 4.2B.2.10.2

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 32 s for the cell re-selection delay to an already detected lower priority cell and 32 s for the cell re-selection delay to an already detected higher priority cell, for UE fulfilling stationary relaxed measurements in the test case.

## A.16.1.1.8 Cell re-selection to FR1 inter-frequency NR case for UE fulfilling stationary relaxed measurement criterion for 2 Rx UE

### A.16.1.1.8.1 Test Purpose and Environment

This test is to verify the requirement for the inter-frequency NR cell re-selection requirements specified in clause 4.2B.2.10.2, for UE fulfilling stationary relaxed measurement criterion.

### A.16.1.1.8.2 Test Parameters

The test scenario comprises of 2 cells on 2 different NR carriers respectively as given in tables A.16.1.1.8.2-1, A.16.1.1.8.2-2 and A.16.1.1.8.2-3. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both Cell 1 and Cell 2 are already identified by the UE prior to the start of the test. Cell 1 and Cell 2 belong to different tracking areas and Cell 2 is of higher priority than Cell 1.

As specified in the Test Purpose, the UE is configured with the stationary relaxed measurement criterion for UE defined in clause 5.2.4.9.1 in [1]. So, Cell 2 and Cell 1 configure the UE as follows:

- *stationaryMobilityEvaluation* [2] criterion is configured according to the parameters listed in table A.16.1.1.8.2-3;
- *cellEdgeEvaluationWhileStationary* [2] criterion is not configured;
- *combineRelaxedMeasCondition2* [2] is not configured;

### A.16.1.1.8.3 Test Requirements

The cell re-selection delay to an already detected lower priority cell for UE fulfilling stationary relaxed measurements is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 1, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 1.

The cell re-selection delay to a lower priority cell for UE fulfilling stationary relaxed measurements shall be less than 32 s.

The cell re-selection delay to an already detected higher priority cell for UE fulfilling stationary relaxed measurements is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the RRCSetupRequest message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to an already detected higher priority cell for UE fulfilling stationary relaxed measurements shall be less than 32 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a known lower priority cell can be expressed as: $T_{evaluate,NR_Inter_RedCap_Relax}$ + $T_{SI-NR}$,

Where:

$T_{evaluate,NR_Inter_RedCap_Relax}$ See table 4.2B.2.10.2-2 in clause 4.2B.2.10.2

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 32 s for the cell re-selection delay to an already detected lower priority cell and 32 s for the cell re-selection delay to an already detected higher priority cell, for UE fulfilling stationary relaxed measurements in the test case.

#### A.16.1.2.1.3 Test Requirements

The cell re-selection delay to a higher priority E-UTRAN cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a higher priority cell shall be less than 68 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a higher priority cell can be expressed as: $T_{higher_priority_search_RedCap} + T_{evaluate, E-UTRAN_RedCap} + T_{SI-E-UTRA}$,

Where:

$T_{higher_priority_search_RedCap}$ See clause 4.2B.2.7

$T_{evaluate, E-UTRAN_RedCap}$ See table 4.2B.2.5-1 in clause 4.2B.2.5

$T_{SI-E-UTRA_}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 67.68 s, allow 68 s for the cell re-selection delay to a higher priority E-UTRAN cell.

### A.16.1.2.2 Cell re-selection to higher priority E-UTRAN for 2 RX

#### A.16.1.2.2.1 Test Purpose and Environment

This test is to verify the requirement for the NR to E-UTRAN inter-RAT cell re-selection requirements specified in clause 4.2.2.5 when the E-UTRAN cell is of higher priority.

#### A.16.1.2.2.2 Test Parameters

The test scenario comprises of one NR cell and one E-UTRAN cell as given in tables A.16.1.2.2.2-1, A. 16.1.2.2.2-2, A. 16.1.2.2.2-3 and A. 16.1.2.2.2-4. The test consists of three successive time periods, with time duration of T1, T2, and T3 respectively. NR Cell 1 is already identified by the UE prior to the start of the test. E-UTRAN Cell 2 is of higher priority than Cell 1.

### A.16.1.2.3.3 Test Requirements

The cell re-selection delay to a lower priority E-UTRAN cell is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a lower priority cell shall be less than 8 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a lower priority cell can be expressed as: $T_{evaluate, E-UTRAN} + T_{SI-E-UTRA}$,

Where:

$T_{higher_priority_search_RedCap}$ See clause 4.2B.2.7

$T_{evaluate, E-UTRAN_RedCap}$ See table 4.2B.2.5-1 in clause 4.2B.2.5

$T_{SI-E-UTRA}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 7.68 s, allow 8 s for the cell re-selection delay to a lower priority E-UTRAN cell.

## A.16.1.2.4 Cell re-selection to lower priority E-UTRAN for 2 RX

### A.16.1.2.4.1 Test Purpose and Environment

This test is to verify the requirement for the NR to E-UTRAN inter-RAT cell re-selection requirements specified in clause 4.2B.2.5 when the E-UTRAN cell is of lower priority.

### A.16.1.2.4.2 Test Parameters

The test scenario comprises of one NR cell and one E-UTRAN cell as given in tables A16.1.2.4.2-1, A16.1.2.4.2-2, A16.1.2.4.2-3 and A16.1.2.4.2-4. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both NR Cell 1 and E-UTRAN Cell 2 are already identified by the UE prior to the start of the test. E-UTRAN Cell 2 is of lower priority than Cell 1.

#### A.16.1.3.1.3 Test Requirements

The cell re-selection delay to a lower priority E-UTRAN cell is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a lower priority cell shall be less than 8 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a lower priority cell can be expressed as: $T_{evaluate, E-UTRAN} + T_{SI-E-UTRA}$,

Where:

$T_{higher_priority_search_RedCap}$ See clause 4.2B.2.7

$T_{evaluate, E-UTRAN_RedCap}$ See table 4.2B.2.5-1 in clause 4.2B.2.5

$T_{SI-E-UTRA}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 7.68 s, allow 8 s for the cell re-selection delay to a lower priority E-UTRAN cell.

### A.16.1.2.5 Cell re-selection to lower priority E-UTRAN for UE fulfilling stationary relaxed measurement criterion for 1 Rx UE

#### A.16.1.2.5.1 Test Purpose and Environment

This test is to verify the requirement for the NR to E-UTRAN inter-RAT cell re-selection when UE fulfills the stationary relaxed measurement criterion specified in clause 4.2B.2.11.2 and the E-UTRAN cell is of lower priority.

### A.16.1.2.5.2 Test Parameters

The test scenario comprises of one NR cell and one E-UTRAN cell as given in tables A.16.1.2.5.2-1, A.16.1.2.5.2-2, A.16.1.2.5.2-3 and A.16.1.2.5.2-4. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both NR Cell 1 and E-UTRAN Cell 2 are already identified by the UE prior to the start of the test. E-UTRAN Cell 2 is of lower priority than Cell 1.

As specified in the Test Purpose, the UE is configured with the stationary relaxed measurement criterion defined in clause 5.2.4.9.1 in [1]. So, Cell 1 configures the UE as follows:

- *stationaryMobilityEvaluation* [2] criterion is configured according to the parameters listed in table A.16.1.1.8.2-3;
- *cellEdgeEvaluationWhileStationary* [2] criterion is not configured;
- *combineRelaxedMeasCondition2* [2] is not configured;

### A.16.1.2.5.3 Test Requirements

The cell re-selection delay to a lower priority E-UTRAN cell with UE fulfilling stationary relaxed measurement criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCConnectionRequest* message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a lower priority cell shall be less than 32 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a lower priority cell can be expressed as: $T_{evaluate,EUTRAN_Relax} + T_{SI\text{-}E\text{-}UTRA}$,

Where:

$T_{evaluate,EUTRAN_Relax}$ See table 4.2B.2.11.2-1 in clause 4.2B.2.11.2

$T_{SI-E-UTRA}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 30.72 ($T_{evaluate,EUTRAN_Relax}$) + 1.28 ($T_{SI-E-UTRA}$) = 32 s for the cell re-selection delay to a lower priority E-UTRAN cell for stationary relaxed measurement criterion.

### A.16.1.2.6 Cell re-selection to lower priority E-UTRAN for UE fulfilling stationary relaxed measurement criterion for 2 Rx UE

#### A.16.1.2.6.1 Test Purpose and Environment

This test is to verify the requirement for the NR to E-UTRAN inter-RAT cell re-selection when UE fulfills the stationary relaxed measurement criterion specified in clause 4.2B.2.11.2 and the E-UTRAN cell is of lower priority.

#### A.16.1.2.6.2 Test Parameters

The test scenario comprises of one NR cell and one E-UTRAN cell as given in tables A.16.1.2.6.2-1, A.16.1.2.6.2-2, A.16.1.2.6.2-3 and A.16.1.2.6.2-4. The test consists of two successive time periods, with time duration of T1 and T2 respectively. Both NR Cell 1 and E-UTRAN Cell 2 are already identified by the UE prior to the start of the test. E-UTRAN Cell 2 is of lower priority than Cell 1.

As specified in the Test Purpose, the UE is configured with the stationary relaxed measurement criterion defined in clause 5.2.4.9.1 in [1]. So, Cell 1 configures the UE as follows:

- *stationaryMobilityEvaluation* [2] criterion is configured according to the parameters listed in table A.16.1.1.8.2-3;
- *cellEdgeEvaluationWhileStationary* [2] criterion is not configured;
- *combineRelaxedMeasCondition2* [2] is not configured;

### A.16.1.2.6.3 Test Requirements

The cell re-selection delay to a lower priority E-UTRAN cell with UE fulfilling stationary relaxed measurement criterion is defined as the time from the beginning of time period T1, to the moment when the UE camps on Cell 2, and starts to send preambles on the PRACH for sending the *RRCConnectionRequest* message to perform a Tracking Area Update procedure on Cell 2.

The cell re-selection delay to a lower priority cell shall be less than 32 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90 %.

NOTE: The cell re-selection delay to a lower priority cell can be expressed as: $T_{evaluate,EUTRAN_Relax} + T_{SI\text{-}E\text{-}UTRA}$,

Where:

$T_{evaluate,EUTRAN_Relax}$ See table 4.2B.2.11.2-1 in clause 4.2B.2.11.2

$T_{SI\text{-}E\text{-}UTRA}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280 ms is assumed in this test case.

This gives a total of 30.72 ($T_{evaluate,EUTRAN_Relax}$) + 1.28 ($T_{SI\text{-}E\text{-}UTRA}$) = 32 s for the cell re-selection delay to a lower priority E-UTRAN cell for stationary relaxed measurement criterion.

## A.16.2.1 Configured Grant based Small Data Transmissions (CG-SDT) for RedCap

### A.16.2.1.1 NR UE CG-SDT Test in FR1 for 1 Rx RedCap UE

#### A.16.2.1.1.1 Test purpose and Environment

The purpose of this test is to verify that the UE properly perform TA validation for CG-SDT transmission in clause 5.2B.3. The test includes two sub-tests, Sub-test#1 for testing valid TA where UE can initiate CG-SDT transmission, and Sub-test#2 for testing invalid TA where UE does not initiate CG-SDT transmission. Subtest#2 is only tested if Sub-test#1 is passed. For each sub-test, UE is configured with CG-SDT configurations when entering RRC Inactive state. Sub-test#1 consists of four successive time periods, with time duration of T1, T2, T3 and T4 respectively. Sub-test#2 consists of two successive time periods, with time duration of T5 and T6 respectively. There is one cell, which is the active NR cell in FR1. Figure A.16.2.1.1.1-1 shows the variation of the RSRP over the duration of Sub-test#1 and Figure A.16.2.1.1.1-2 shows the variation of the RSRP over the duration of Sub-test#2.

In Sub-test#1:

- Prior to the time point TA, the UE shall be fully synchronized to PCell (Cell 1), be registered to the cell and have entered RRC connected mode.
- Before starting the test at time point TA, test equipment configures RSRP to P0.
- At time point TB, RSRP is changed from P0 to P1.
- At time point TC, which is W1 after time point TB, UE expect to receive RRC release with CG-SDT configuration and RRC status is changed to INACTIVE status.
- At time point TD, RSRP is changed from P1 to P0.
- At time point TE, RSRP is changed from P0 to P2. TE must be W2 before TF.
- Test equipment triggers UL data arrival at UE lower layer at time point TF. After time point TF, test equipment observes whether UE transmits with CG-SDT no later than TG which is W3 after TF.
- After time point TG, RRC status is changed from RRC INACTIVE to RRC CONNECTED.

In Sub-test#2:

- Prior to the time point TA, the UE shall pass Sub-test#1 and have entered RRC connected mode. Otherwise, Sub-test#2 shall not be executed.
- From time point TA to time point TD, RSRP is set to P2.
- At time point TC, which is W1 after time point TB, UE expect to receive RRC release with CG SDT configuration and RRC status is changed to INACTIVE status.
- At time point TD, RSRP is changed from P2 to P0.
- Test equipment triggers UL data arrival at UE lower layer at time point TF. TF is 3360 ms after TD. After time point TF, test equipment observes whether UE transmits with CG-SDT no later than TG which is W3 after TF.

W1 equals to 640 ms and W2 equals to 640 ms based on requirements in clause 5.2B.2.1. W3 is 860 ms.

During Sub-test#1, UE shall transmit PUSCH at CG-SDT resource within 860 ms after time point TF.

During Sub-test#2, after passing Sub-test#1, UE shall not transmit PUSCH at CG-SDT resources after TF until the end of the test at time point TG.

### A.16.2.1.2.1 Test purpose and Environment

The purpose of this test is to verify that the UE properly perform TA validation for CG-SDT transmission in clause 5.2B.3. The test includes two sub-tests, Sub-test#1 for testing valid TA where UE can initiat CG-SDT transmission, and Sub-test#2 for testing invalid TA where UE does not initiate CG-SDT transmission. Subtest#2 is only tested if Sub-test#1 is passed. For each sub-test, UE is configured with CG-SDT configurations when entering RRC Inactive state. Sub-test#1 consists of four successive time periods, with time duration of T1, T2, T3 and T4 respectively. Sub-test#2 consists of two successive time periods, with time duration of T5 and T6 respectively. There is one cell, which is the active NR cell in FR1. Figure A.16.2.1.2.1-1 shows the variation of the RSRP over the duration of Sub-test#1 and Figure A.16.2.1.2.1-2 shows the variation of the RSRP over the duration of Sub-test#2.

In Sub-test#1:

- Prior to the time point TA, the UE shall be fully synchronized to PCell (Cell 1), be registered to the cell and have entered RRC connected mode.
- Before starting the test at time point TA, test equipment configures RSRP to P0.
- At time point TB, RSRP is changed from P0 to P1.
- At time point TC which is W1 after time point TB, UE expect to receive RRC release with CG-SDT configuration and RRC status is changed to INACTIVE status.
- At time point TD, RSRP is changed from P1 to P0.
- At time point TE, RSRP is changed from P0 to P2. TE must be W2 before TF.

  Test equipment triggers UL data arrival at UE lower layer at time point TF. After time point TF, test equipment observes whether UE transmits with CG-SDT no later than TG which is W3 after TF.
- After time point TG, RRC status is changed from RRC INACTIVE to RRC CONNECTED.

In Sub-test#2:

- Prior to the time point TA, the UE shall pass Sub-test#1 and have entered RRC connected mode. Otherwise, Sub-test#2 shall not be executed.
- From time point TA to time point TD, RSRP is set to P2.
- At time point TC, which is W1 after time point TB, UE expect to receive RRC release with CG SDT configuration and RRC status is changed to INACTIVE status.
- At time point TD, RSRP is changed from P2 to P0.
- Test equipment triggers UL data arrival at UE lower layer at time point TF. TF is 3360 ms after TD. After time point TF, test equipment observes whether UE transmits with CG-SDT no later than TG which is W3 after TF.

W1 equals to 640 ms and W2 equals to 640 ms based on requirements in clause 5.2B.2.1. W3 is 860 ms.

The rate of correct events observed during repeated tests shall be at least 90 %.

## A.16.2.2 Cell Reselection for Positioning

### A.16.2.2.1 Cell re-selection to FR1 intra-frequency NR case with RRC_INACTIVE eDRX and positioning SRS

#### A.16.2.2.1.1 Test Purpose and Environment

This test is to verify the requirement for the intra-frequency NR cell re-selection requirements specified in clause 5.6A.2.2, when a RedCap UE is in RRC_INACTIVE and configured with eDRX and to transmit SRS for positioning.

#### A.16.2.2.1.2 Test Parameters

The test scenario comprises of 1 NR carrier and 2 cells as given in tables A.16.2.2.1.2-1, A.16.2.2.1.2-2 and A.16.2.2.1.2-3. #### A.16.2.2.1.3 Test Requirements

The cell re-selection delay to a newly detectable cell is defined as the time from the beginning of time period T2, to the moment when the UE camps on Cell 2 and starts to send preambles on the PRACH for sending the *RRCSetupRequest* message to perform a registration procedure for mobility and periodic registration update on Cell 2.

The cell re-selection delay to a newly detectable cell shall be less than 119 s.

The rate of correct cell re-selections observed during repeated tests shall be at least 90%.

NOTE: The cell re-selection delay to a newly detectable cell can be expressed as: $T_{detect, NR_Intra} + T_{SI-NR}$,

where:

$T_{detect, NR_Intra}$ See table 5.6.1A.2-1 in clause 5.6.1A.2,

$T_{SI-NR}$ Maximum repetition period of relevant system info blocks that needs to be received by the UE to camp on a cell; 1280ms is assumed in this test case.

This gives a total of 119.04 s, allow 120 s for the cell re-selection delay to a newly detectable cell.

## A.16.3 RRC_CONNECTED state mobility for RedCap

### A.16.3.1 Handover

#### A.16.3.1.1 Intra-frequency handover from FR1 to FR1; known target cell for 1 Rx UE

#### A.16.3.1.1.1 Test Purpose and Environment

This test is to verify the requirement for the NR FR1-NR FR1 intra-frequency handover requirements for 1 Rx RedCap UE as specified in clause 6.1D.1.2.

#### A.16.3.1.1.2 Test Parameters

Supported test configurations are shown in table A.16.3.1.1.2-1. Both handover delay and interruption length are tested by using the parameters in table A.16.3.1.1.2-2, and A.16.3.1.1.2-3.

The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

NR shall send an RRC message implying handover to Cell 2, then UE handover to Cell 2's initial BWP associated with CD-SSB. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

NOTE 3: Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

#### A.16.3.1.1.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 72 ms from the beginning of time period T3.
The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 10 ms and is specified in clause 12 in TS 38.331 [2].

$T_{interrupt}$ = 62 ms in the test. $T_{interrupt}$ is defined in clause 6.1D.1.2.

This gives a total of 72 ms.

### A.16.3.1.2 Intra-frequency handover from FR1 to FR1; known target cell for 2 Rx UE

### A.16.3.1.2.1 Test Purpose and Environment

This test is to verify the requirement for the NR FR1-NR FR1 intra-frequency handover requirements for 2 Rx RedCap UE as specified in clause 6.1D.1.2.

### A.16.3.1.2.2 Test Parameters

Supported test configurations are shown in table A.16.3.1.2.2-1. Both handover delay and interruption length are tested by using the parameters in table A.16.3.1.2.2-2, and A.16.3.1.2.2-3.

The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE may not have any timing information of Cell 2.

NR shall send an RRC message implying handover to Cell 2, then UE handover to Cell 2's initial BWP associated with CD-SSB. The RRC message implying handover shall be sent to the UE during period T2, after the UE has reported Event A3. T3 is defined as the end of the last TTI containing the RRC message implying handover.

### A.16.3.1.3 Intra-frequency handover from FR1 to FR1; unknown target cell for 1 Rx UE

#### A.16.3.1.3.1 Test Purpose and Environment

This test is to verify the requirement for the NR FR1-NR FR1 intra-frequency handover requirements for 1 Rx RedCap UE as specified in clause 6.1D.1.2.

#### A.16.3.1.3.2 Test Parameters

Supported test configurations are shown in table A.16.3.1.3.2-1. Both handover delay and interruption length are tested by using the parameters in table A.16.3.1.3.2-2, and A.16.3.1.3.2-3.

Before the test starts,

- UE is connected to Cell 1 with active DL BWP and active UL BWP;
- UE is configured with *nonCellDefiningSSB-r17* under *BWP-DownlinkDedicated* which serves as the reference SSB for the serving cell. The *nonCellDefiningSSB-r17* corresponds to the NCD-SSB within the active DL BWP.

The test scenario comprises of two carriers and one cell on each carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE receives a RRC handover command from the network indicating the UE to handover to Cell 2 with *firstActiveDownlinkBWP-Id* configured to DL BWP and *firstActiveUplinkBWP-Id* configured to UL BWP. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

### A.16.3.1.5 Inter-frequency handover from FR1 to FR1; unknown target cell for 1 Rx UE

### A.16.3.1.5.1 Test Purpose and Environment

This test is to verify the requirement for the NR FR1-NR FR1 inter-frequency handover requirements for 1 Rx RedCap UE as specified in clause 6.1D.1.2.

### A.16.3.1.5.2 Test Parameters

Supported test configurations are shown in table A.16.3.1.5.2-1. Both handover delay and interruption length are tested by using the parameters in table A.16.3.1.5.2-2, and A.16.3.1.5.2-3.

Before the test starts,

- UE is connected to Cell 1 with active DL BWP and active UL BWP;
- UE is not configured with *nonCellDefiningSSB-r17* under *BWP-DownlinkDedicated*, and CD-SSB serves as the reference SSB for the serving cell.

The test scenario comprises of two carriers and one cell on each carrier. No gap patterns are configured in the test case. The test consists of two successive time periods, with time durations of T1, T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE receives a RRC handover command from the network indicating the UE to handover to Cell 2 with *firstActiveDownlinkBWP-Id* configured to DL BWP and *firstActiveUplinkBWP-Id* configured to UL BWP, where Cell 2's DL BWP is the Redcap specific BWP associated with NCD-SSB. The UE then performs handover from Cell 1's active DL BWP associated with the CD-SSB to Cell 2's Redcap specific BWP associated with NCD-SSB. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE.

## A.16.3.1.7 SA NR - E-UTRAN handover for 1 Rx UE

### A.16.3.1.7.1 Test Purpose and Environment

The purpose of this set of tests is to verify that the UE can make correct inter-RAT E-UTRAN handover when operating in standalone (SA) operation with PCell in FR1. This test shall verify the NR to E-UTRAN handover requirements as specified in clause 6.1D.2.1.

The test comprises of one NR carrier and one E-UTRA carrier. There are two cells and one cell on each carrier. Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN neighbour cell. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in table 9.1.2-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2 after the UE has reported Event B2. The start of T3 is the next instant after the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain Cell 2 as the target cell.

Supported test configurations are shown in table A.16.3.1.7.1-1. General test parameters are provided in table A.16.3.1.7.1-2. Cell specific test parameters for Cell 1 and Cell 2 are provided in tables A.16.3.1.7.1-3 and A.16.3.1.7.1-4 respectively.

### A.16.3.1.7.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 85 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 50 ms and $T_{interrupt}$ = 35 ms in the test based on requirements specified in clause 6.1D.2.1.

This gives a total of 85 ms.

## A.16.3.1.8 SA NR - E-UTRAN handover for 2 Rx UE

### A.16.3.1.8.1 Test Purpose and Environment

The purpose of this set of tests is to verify that the UE can make correct inter-RAT E-UTRAN handover when operating in standalone (SA) operation with PCell in FR1. This test shall verify the NR to E-UTRAN handover requirements as specified in clause 6.1D.2.1.

The test comprises of one NR carrier and one E-UTRA carrier. There are two cells and one cell on each carrier. Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN neighbour cell. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report. Gap pattern configuration with id #0 as specified in table 9.1.2-1 is configured before T2 begins to enable inter-RAT frequency monitoring.

A RRC message implying handover shall be sent to the UE during period T2 after the UE has reported Event B2. The start of T3 is the next instant after the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain Cell 2 as the target cell.

Supported test configurations are shown in table A.16.3.1.8.1-1. General test parameters are provided in table A.16.3.1.8.1-2. Cell specific test parameters for Cell 1 and Cell 2 are provided in tables A.16.3.1.8.1-3 and A.16.3.1.8.1-4 respectively.

### A.16.3.1.8.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 85 ms from the beginning of time period T3.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 50 ms and is specified in clause 6.1.2.1.

This gives a total of 85 ms.

## A.16.3.1.9 SA NR - E-UTRAN handover with unknown target cell for 1 Rx UE

### A.16.3.1.9.1 Test Purpose and Environment

The purpose of this set of tests is to verify that the UE can make correct inter-RAT E-UTRAN handover when operating in standalone (SA) operation with PCell in FR1. This test shall verify the NR to E-UTRAN handover requirements for the case when the target E-UTRAN cell is unknown as specified in clause 6.1D.2.1.

The test comprises of one NR carrier and one E-UTRA carrier. There are two cells and one cell on each carrier. Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN neighbour cell. The test consists of two successive time periods, with time durations of T1 and T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable. No Gap pattern shall be configured.

A RRC message implying handover shall be sent to the UE during period T1. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain Cell 2 as the target cell.

Supported test configurations are shown in table A.16.3.1.9-1. General test parameters are provided in table A.16.3.1.9.1-2. Cell specific test parameters for Cell 1 and Cell 2 are provided in tables A.16.3.1.9.1-3 and A.16.3.1.9.1-4 respectively.

### A.16.3.1.9.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 165 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 50 ms and $T_{interrupt}$ = 115 ms in the test based on requirements specified in clause 6.1D.2.1.

This gives a total of 165 ms.

## A.16.3.1.10 SA NR - E-UTRAN handover with unknown target cell for 2 Rx UE

### A.16.3.1.10.1 Test Purpose and Environment

The purpose of this set of tests is to verify that the UE can make correct inter-RAT E-UTRAN handover when operating in standalone (SA) operation with PCell in FR1. This test shall verify the NR to E-UTRAN handover requirements for the case when the target E-UTRAN cell is unknown as specified in clause 6.1D.2.1.

The test comprises of one NR carrier and one E-UTRA carrier. There are two cells and one cell on each carrier. Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN neighbour cell. The test consists of two successive time periods, with time durations of T1 and T2 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable. No Gap pattern shall be configured.

A RRC message implying handover shall be sent to the UE during period T1. The start of T2 is the instant when the last TTI containing the RRC message implying handover is sent to the UE. The handover message shall contain Cell 2 as the target cell.

#### A.16.3.1.10.2 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 165 ms from the beginning of time period T2.

The rate of correct handovers observed during repeated tests shall be at least 90 %.

NOTE: The handover delay can be expressed as: RRC procedure delay + $T_{interrupt}$, where:

RRC procedure delay = 50 ms and is specified in clause 6.1.2.1.

$T_{interrupt}$ = 115 ms in the test; $T_{interrupt}$ is defined in clause 6.1.2.1.

This gives a total of 165 ms.

#### A.16.3.2.1.1 Intra-frequency RRC Re-establishment in FR1 for 1 Rx UE

##### A.16.3.2.1.1.1 Test Purpose and Environment

The purpose is to verify that the NR intra-frequency RRC re-establishment delay in FR1 with known target cell is within the specified limits. These tests will verify the requirements in clause 6.2.1B.

The test parameters are given in table A.16.3.2.1.1.1-1, table A.16.3.2.1.1.1-2 and table A.16.3.2.1.1.1-3 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, Cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

#### A.16.3.2.1.1.2 Test Requirements

The RRC re-establishment delay is defined as the time from the moment UE declares RLF, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to a known NR intra-frequency cell shall be less than 1.6 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90 %.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$$T_{UE_re-establish_delay} = 50 \text{ ms} + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq} = 1$

$T_{identify_intra_NR} = 200$ ms

$T_{SI}$ = 1280 ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target intra-frequency NR cell.

$T_{PRACH}$ = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 1545 ms for RRC re-establishment delay, allow 440 ms + 1.6 s from the beginning of T2 in the test case.

#### A.16.3.2.1.2.2 Test Requirements

The RRC re-establishment delay is defined as the time from the moment UE declares RLF, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to a known NR intra-frequency cell shall be less than 1.6 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90 %.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$$T_{UE_re-establish_delay} = 50 \text{ ms} + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq} = 1$

$T_{identify_intra_NR}$ = 200 ms

$T_{SI}$ = 1280 ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target intra-frequency NR cell.

$T_{PRACH}$ = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 1545 ms for RRC re-establishment delay, allow 240 ms + 1.6 s from the beginning of T2 in the test case.

### A.16.3.2.1.3 Inter-frequency RRC Re-establishment in FR1 for 1 Rx UE

#### A.16.3.2.1.3.1 Test Purpose and Environment

The purpose is to verify that the NR inter-frequency RRC re-establishment delay in FR1 without known target cell is within the specified limits. These tests will verify the requirements in clause 6.2.1B.

The test parameters are given in table A.16.3.2.1.3.1-1, table A.16.3.2.1.3.1-2 and table A.16.3.2.1.3.1-3 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, Cell 1, which is the active cell, becomes inactive. The time period T3 starts after the occurrence of the radio link failure. During T1, the UE shall be configured with the carrier frequency of Cell 2 (with RF Channel Number #2) to ensure that the UE has the context of the carrier frequency of Cell 2 by the end of T1.

NOTE 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

#### A.16.3.2.1.3.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to an unknown NR inter-frequency cell shall be less than 3 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90 %.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$$T_{UE_re-establish_delay} = 50\ ms + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq} = 2$

$T_{identify_intra_NR}$ = 800 ms

$T_{identify_inter_NR}$ = 800 ms

$T_{SI}$ = 1280 ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target inter-frequency NR cell.

$T_{PRACH}$ = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 2945 ms, allow 3 s in the test case.

### A.16.3.2.1.4 Inter-frequency RRC Re-establishment in FR1 for 2 Rx UE

#### A.16.3.2.1.4.1 Test Purpose and Environment

The purpose is to verify that the NR inter-frequency RRC re-establishment delay in FR1 without known target cell is within the specified limits. These tests will verify the requirements in clause 6.2.1B.

The test parameters are given in table A.16.3.2.1.4.1-1, table A.16.3.2.1.4.1-2 and table A.16.3.2.1.4.1-3 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, Cell 1, which is the active cell, becomes inactive. The time period T3 starts after the occurrence of the radio link failure. During T1, the UE shall be configured with the carrier frequency of Cell 2 (with RF Channel Number #2) to ensure that the UE has the context of the carrier frequency of Cell 2 by the end of T1.

**Table A.16.3.2.1.4.1-1: Supported test configurations**

### A.16.3.2.1.5.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to an unknown NR intra-frequency cell without serving cell timing shall be less than 2.2 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90 %.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$$T_{UE_re-establish_delay} = 50 \text{ ms} + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq}$ = 1

$T_{identify_intra_NR}$ = 800 ms

$T_{SI}$ = 1280 ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 [2] for the target intra-frequency NR cell.

$T_{PRACH}$ = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 2145 ms, allow 2.2 s in the test case.

### A.16.3.2.1.6 Intra-frequency RRC Re-establishment in FR1 for 2 Rx UE without serving cell timing

#### A.16.3.2.1.6.1 Test Purpose and Environment

The purpose is to verify that the NR intra-frequency RRC re-establishment delay in FR1 without serving cell timing is within the specified limits. These tests will verify the requirements in clause 6.2.1B.

The test parameters are given in table A.16.3.2.1.6.1-1, table A.16.3.2.1.6.1-2 and table A.16.3.2.1.6.1-3 below. The test consists of 3 successive time periods, with time duration of T1, T2 and T3 respectively. At the start of time period T2, Cell 1, which is the active cell, is deactivated. The time period T3 starts after the occurrence of the radio link failure.

### A.16.3.2.1.6.2 Test Requirements

The RRC re-establishment delay is defined as the time from the start of time period T3, to the moment when the UE starts to send PRACH preambles to Cell 2 for sending the *RRCReestablishmentRequest* message to Cell 2.

The RRC re-establishment delay to an unknown NR intra-frequency cell without serving cell timing shall be less than 2.2 s.

The rate of correct RRC re-establishments observed during repeated tests shall be at least 90 %.

NOTE: The RRC re-establishment delay in the test is derived from the following expression:

$$T_{re\text{-}establish_delay} = T_{UL_grant} + T_{UE_re\text{-}establish_delay}.$$

Where:

$T_{UL_grant}$ = It is the time required to acquire and process uplink grant from the target cell. The PRACH reception at the system simulator is used as a trigger for the completion of the test; hence $T_{UL_grant}$ is not used.

$$T_{UE_re-establish_delay} = 50 \text{ ms} + T_{identify_intra_NR} + \sum_{i=1}^{Nfreq-1} T_{identify_inter_NR,i} + T_{SI-NR} + T_{PRACH}$$

$N_{freq} = 1$

$T_{identify_intra_NR}$ = 800 ms

$T_{SI}$ = 1280 ms; it is the time required for receiving all the relevant system information as defined in TS 38.331 [2] for the target intra-frequency NR cell.

$T_{PRACH}$ = 15 ms; it is the additional delay caused by the random access procedure.

This gives a total of 2145 ms, allow 2.2 s in the test case.

### A.16.3.2.2.1.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

#### A.16.3.2.2.1.2.1 Random Access Preamble Transmission

To test the UE behavior specified in clause 6.2.2.2.1.1 the System Simulator shall receive the Random Access Preamble which belongs to one of the Random Access Preambles associated with the SSB with index 0, which has SS-RSRP above the configured *rsrp-ThresholdSSB*+1 dB.

In addition, the power applied to all preambles shall be in accordance with what is specified in clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18] for test configuration 1,3 and 4, and be -25 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18] for test

configuration 2. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in clause 7.1A.2.

#### A.16.3.2.2.1.2.2 Random Access Response Reception

To test the UE behavior specified in clause 6.2.2.2.1.2 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. In response to the first 4 preambles, the System Simulator shall transmit a Random Access Response *not* corresponding to the transmitted Random Access Preamble.

The UE may stop monitoring for Random Access Response(s) and shall transmit the msg3 if the Random Access Response contains a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS 38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if all received Random Access Responses contain Random Access Preamble identifiers that do not match the transmitted Random Access Preamble.

In addition, the power applied to all preambles shall be in accordance with what is specified in clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18] for test configuration 1,3 and 4, and be -25 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18] for test configuration 2. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in clause 7.1A.2.

#### A.16.3.2.2.1.2.3 No Random Access Response Reception

To test the UE behavior specified in clause 6.2.2.2.1.3 the System Simulator shall transmit a Random Access Response containing a Random Access Preamble identifier corresponding to the transmitted Random Access Preamble after 5 preambles have been received by the System Simulator. The System Simulator shall *not* respond to the first 4 preambles.

The UE shall again perform the Random Access Resource selection procedure specified in clause 5.1.2 in TS 38.321 [7], and transmit with the calculated PRACH transmission power when the backoff time expires if no Random Access Response is received within the RA Response window.

In addition, the power applied to all preambles shall be in accordance with what is specified in clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18] for test configuration 1,3 and 4, and be -25 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18] for test configuration 2. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

The transmit timing of all PRACH transmissions shall be within the accuracy specified in clause 7.1A.2.

#### A.16.3.2.2.1.2.4 Receiving an UL grant for msg3 retransmission

To test the UE behavior specified in clause 6.2.2.2.1.4 the System Simulator shall provide an UL grant for msg3 retransmission following a successful Random Access Response.

The UE shall re-transmit the msg3 upon the reception of an UL grant for msg3 retransmission.

NOTE 4: The DL PDSCH reference measurement channel is used in the test only when a downlink transmission dedicated to the UE under test is required.

### A.16.3.2.2.4.2 Test Requirements

Non-Contention based random access is triggered by explicitly assigning a random access preamble via dedicated signalling in the downlink. In the test, the non-contention based random access procedure is not initialized for Other SI requested from UE or beam failure recovery.

#### A.16.3.2.2.4.2.1 SSB-based Random Access Preamble Transmission

In Test-1, to test the UE behavior specified in clause 6.2.2.2.2.1 for SSB-based Random Access Preamble transmsision, with the contention-free Random Access Resources and the contention-free PRACH occasions associated with SSBs configured, the System Simulator shall receive the Random Access Preamble which has the Preamble Index associated with the SSB with index 0.

In addition, the System Simulator shall receive the Random Access Preamble on the PRACH occasion which belongs to the PRACH occasions corresponding to the SSB with index 0, and the selected PRACH occasion shall belongs to the PRACH occasions permitted by the restrictions given by the *ra-ssb-OccasionMaskIndex*.

In addition, the power applied to all preambles shall be in accordance with what is specified in clause 6.2.2.2. The power of the first preamble shall be -22 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18] for test configuration 1,3 and 4, and be -25 dBm with an accuracy specified in clause 6.3.4.2 of TS 38.101-1 [18] for test configuration 2. The relative power applied to additional preambles shall have an accuracy specified in clause 6.3.4.3 of TS 38.101-1 [18].

### A.16.3.2.2.6.2 Test Requirements

Contention based random access is triggered by *not* explicitly assigning a random access preamble via dedicated signalling in the downlink.

#### A.16.3.2.2.6.2.1 MsgA Transmission

To test the UE behavior specified in clause 6.2.2.3.1.1 the System Simulator shall receive the MsgA with a preamble which belongs to one of the Random Access Preambles associated with the SSB with index 0, which has SS-RSRP above the configured *msgA-RSRP-ThresholdSSB.*

The test consists of two successive time periods, with time duration of T1, and T2 respectively. The *RRCRelease* message shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of Cell 2. Cell 2 is powered up at the beginning of the T2. Cell 1 and Cell 2 belong to different tracking areas.

#### A.16.3.2.3.1.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 2240 ms from the beginning of time period T2.
The rate of correct RRC connection release redirection to NR observed during repeated tests shall be at least 90 %.

NOTE: The redirection delay can be expressed as:

$$T_{connection_release_redirect_NR} = T_{RRC_procedure_delay} + T_{identify\text{-}NR} + T_{SI\text{-}NR} + T_{RACH},$$

where:

$T_{RRC_procedure_delay}$ = 110 ms in the test.

$T_{identify\text{-}NR}$ = 680 ms in the test.

$T_{SI\text{-}NR}$ = 1280 ms, it is the time required for receiving all the relevant system information as defined in TS 38.331 for the target NR cell.

$T_{RACH}$ = 170 ms in the test.

This gives a total of 2240 ms.

NOTE 4: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 5: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.

#### A.16.3.2.3.3.3 Test Requirements

The UE shall start to transmit the PRACH to Cell 2 less than 2205 ms from the beginning of time period T2.
The rate of correct RRC connection release redirection to E-UTRAN observed during repeated tests shall be at least 90 %.

NOTE: The redirection delay can be expressed as:

$$T_{connection_release_redirect_E\text{-}UTRA} = T_{RRC_procedure_delay} + T_{identify\text{-}E\text{-}UTRA} + T_{SI\text{-}E\text{-}UTRA} + T_{RACH},$$

where:

$T_{RRC_procedure_delay}$ = 110 ms in the test.

$T_{identify\text{-}E\text{-}UTRA}$ = 800 ms in the test.

$T_{SI\text{-}E\text{-}UTRA}$ = 1280 ms, it is the time required for receiving all the relevant system information as defined in TS 36.331 for the target E-UTRA cell.

$T_{RACH}$ = 15 ms in the test.

This gives a total of 2205 ms.

### A.16.3.2.3.4 Redirection from NR in FR1 to E-UTRAN for 2 Rx UE

#### A.16.3.2.3.4.1 Test Purpose and Environment

This test is to verify RRC connection release with redirection from NR to E-UTRAN requirements specified in clause 6.2.3A.2.2.

#### A.16.3.2.3.4.2 Test Parameters

Supported test configurations are shown in table A.16.3.2.3.4.2-1. The time delay is tested by using the parameters in table A.16.3.2.3.4.2-2, A.16.3.2.3.4.2-3 and A.16.3.2.3.4.2-4.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. The *RRCRelease* message shall be sent to the UE during period T1 and the start of T2 is the instant when the last TTI containing the RRC message is sent to the UE. Prior to time duration T2, the UE shall not have any timing information of Cell 2. Cell 2 is powered up at the beginning of the T2.

### A.16.4.1.2.2 Test requirements

The test requirements are the same as in clause A.6.4.1.1.2.

## A.16.4.2 Void

## A.16.4.3 Timing advance

### A.16.4.3.1 SA FR1 timing advance adjustment accuracy for 1 Rx UE

#### A.16.4.3.1.1 Test Purpose and Environment

The purpose of the test is to verify UE Timing Advance adjustment delay and accuracy requirement defined in clause 7.3A.

#### A.16.4.3.1.2 Test Parameters

Supported test configurations are shown in table A.16.4.3.1.2-1. Both timing advance adjustment delay and accuracy are tested by using the parameters in table A.16.4.3.1.2-2, A.16.4.3.1.2-3 and A.16.4.3.1.2-4.

In all test cases, single cell is used. Each test consists of two successive time periods, with time duration of T1 and T2 respectively. In each time period, timing advance commands are sent to the UE and Sounding Reference Signals (SRS), as specified in table A.16.4.3.1.2-3, are sent from the UE and received by the test equipment. By measuring the reception of the SRS, the transmit timing, and hence the timing advance adjustment accuracy, can be measured.

During time period T1, the test equipment shall send one message with a Timing Advance Command MAC Control Element, as specified in clause 6.1.3.4 in TS 38.321 [7]. The Timing Advance Command value shall be set to 31, which according to clause 4.2 in TS 38.213 [3] results in zero adjustment of the Timing Advance. In this way, a reference value for the timing advance used by the UE is established.

During time period T2, the test equipment shall send a sequence of messages with Timing Advance Command MAC Control Elements, with Timing Advance Command value specified in table A.16.4.3.1.2-2. This value shall result in changes of the timing advance used by the UE, and the accuracy of the change shall then be measured, using the SRS sent from the UE.

As specified in clause 7.3.2.1, the UE adjusts its uplink timing at slot n+k for a timing advance command received in slot n. This delay must be taken into account when measuring the timing advance adjustment accuracy, via the SRS sent from the UE.

The UE Time Alignment Timer, described in clause 5.2 in TS 38.321 [7], shall be configured so that it does not expire in the duration of the test.

## A.16.5.1 Radio link Monitoring

### A.16.5.1.1 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with SSB-based RLM RS in non-DRX mode for 1 Rx UE

#### A.16.5.1.1.1 Test Purpose and Environment

The purpose of this test is to verify that the 1 Rx RedCap UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PCell for 1 Rx RedCap UE. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1B.2.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to '*rlf*'. Supported test configurations are shown in table A.16.5.1.1.1-1. The test parameters are given in tables A.16.5.1.1.1-2, A.16.5.1.1.1-3, and A.16.5.1.1.1-4 below. There is one cell (Cell 1), which is the active NR cell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3

respectively. Figure A.16.5.1.1 .1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. The UE is configured to perform inter-frequency measurements using Gap Pattern ID #0 (40 ms) in test 1.

## A.16.5.1.2 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with SSB-based RLM RS in non-DRX mode for 2 Rx UE

### A.16.5.1.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PCell for 2 Rx RedCap UE. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1B.2.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to '*rlf*'. Supported test configurations are shown in table A.16.5.1.2.1-1. The test parameters are given in tables A.16.5.1.2.1-2, A.16.5.1.2.1-3, and A.16.5.1.2.1-4 below. There is one cell (Cell 1), which is the active NR cell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.16.5.1.2.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. The UE is configured to perform inter-frequency measurements using Gap Pattern ID #0 (40 ms) in test 1.

Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms.

During the period from time point A to time point F (D1 second after the start of time duration T5) the UE shall transmit uplink signal at least in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting.

## A.16.5.1.5 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with SSB-based RLM RS in DRX mode for 1 Rx UE

### A.16.5.1.5.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PCell when DRX is used. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1B.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to '*rlf*'. Supported test configurations are shown in table A.16.5.1.5.1-1. The test parameters are given in tables A.16.5.1.5.1-2, and A.16.5.1.5.1-3. There is one cell (Cell 1), which is the active NR cell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.16.5.1.5.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CSI during the period when On-duration timer is running. Time alignment timers shall be set to "infinity" so that UL timing alignment is maintained during the test.

Figure A.16.5.1.7.1-1 shows the variation of the downlink SNR in the active cell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CSI during the period when On-duration timer is running. Time alignment timers shall be set to "infinity" so that UL timing alignment is maintained during the test.

## A.16.5.1.8 Radio Link Monitoring In-sync Test for FR1 PCell configured with SSB-based RLM RS in DRX mode for 2 Rx UE

### A.16.5.1.8.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync and in sync for the purpose of monitoring downlink radio link quality of the PCell when DRX is used. This test will partly verify the FR1 radio link monitoring requirements in clause 8.1B.

In the test, UE is configured to perform RLM on SSB, with *detectionResource* included in *RadioLinkMonitoringRS* set to SSB#0, and *purpose* set to '*rlf*'. Supported test configurations are shown in table A.16.5.1.8.1-1. The test parameters are given in tables A.16.5.1.8.1-2, and A.16.5.1.8.1-3. This test will partly verify the FR1 PCell CSI-RS Out-of-sync radio link monitoring requirements in clause 8.1B.3.

The test parameters are given in tables A.16.5.1.9.1-1, A.16.5.1.9.1-2, A.16.5.1.9.1-3, and A.16.5.1.9.1-3A below. There is one cell, Cell 1 which is the PCell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.16.5.1.9.1-1 shows the variation of the downlink SNR in the PCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting of 5 ms. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40 ms) in test. In the test, SSB0 is configured as the BFD-RS.

## A.16.5.1.10 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with CSI-RS-based RLM in non-DRX mode for 2 Rx UE

### A.16.5.1.10.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PCell when no DRX is used for 2 Rx RedCap UE. This test will partly verify the FR1 PCell CSI-RS Out-of-sync radio link monitoring requirements in clause 8.1B.3.

The test parameters are given in tables A.16.5.1.10.1-1, A.16.5.1.10.1-2, A.16.5.1.10.1-3, and A.16.5.1.10.1-3A below. There is one cell, Cell 1 which is the PCell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.16.5.1.10.1-1 shows the variation of the downlink SNR in the PCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting of 5 ms. In the test, DRX configuration is not enabled. The UE is configured to perform inter-frequency measurements using GP ID #0 (40 ms) in test. In the test, SSB0 is configured as the BFD-RS and is not same as RLM-RS to avoid triggering the beam failure during the RLM test.

## A.16.5.1.13 Radio Link Monitoring Out-of-sync Test for FR1 PCell configured with CSI-RS-based RLM in DRX mode for 1 Rx UE

### A.16.5.1.13.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects the out of sync for the purpose of monitoring downlink CSI-RS based radio link quality of the PCell when DRX is used. This test will partly verify the FR1 PCell CSI-RS Out-of-sync radio link monitoring requirements in clause 8.1B.3.

The test parameters are given in tables A.16.5.1.13.1-1, A.16.5.1.13.1-2, and A.16.5.1.13.1-3 below. There is one cell, Cell 1 is the PCell, in the test. The test consists of three successive time periods, with time duration of T1, T2 and T3 respectively. Figure A.16.5.1.13.1-1 shows the variation of the downlink SNR in the PCell to emulate out-of-sync and in-sync states. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be

configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled in PCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to "infinity" so that UL timing alignment is maintained during the test. In the test, SSB0 is configured as the BFD-RS.

The test parameters are given in tables A.16.5.1.15.1-1, A.16.5.1.151-2, A.16.5.1.15.1-3 and A.16.5.1.15.1-3A below. There is one cells, Cell 1which is the PCell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. ### A.16.5.2.2.2 Test Requirements

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the UE shall detect beam failure and initiate link recovery. During T4 and T5 the UE measures and evaluate beam candidate from beam candidate set $q_1$.

No later than time point F occurring no later than D1 = 120+20 ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set $q_1$. The UE shall not transmit preamble on a beam associated with the candidate beam set $q_1$ earlier than time point B.

Test is concluded once the test equipment has received the initial preamble transmission from the UE. The rate of correct events observed during repeated tests shall be at least 90 %.

## A.16.5.2.3 Beam Failure Detection and Link Recovery Test for FR1 PCell configured with SSB-based BFD and LR in DRX mode for 1 Rx UE

### A.16.5.2.3.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects SSB-based beam failure in the set $q_0$ configured for a serving cell and that the UE performs correct SSB-based link recovery based on beam candidate set $q_1$. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when DRX is used. This test will partly verify the SSB based beam failure detection and link recovery requirements for an FR1 serving cell in clause 8.5B.2.

The test parameters are given in tables A.16.5.2.3.1-1, A.16.5.2.3.1-2, and A.16.5.2.3.1-3 below. There is one cell, Cell 1 which is the active cell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.16.5.2.3.1-1 shows the variation of the downlink SNR of the SSB in set $q_0$ in the active cell to emulate SSB based beam failure. Figure A.16.5.2.3.1-1 additionally shows the variation of the downlink L1-RSRP of the SSB in set $q_1$ of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled in PCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test.

### A.16.5.2.4.2 Test Requirements

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the UE shall detect beam failure and initiate link recovery. During T4 and T5 the UE measures and evaluate beam candidate from beam candidate set $q_1$.

No later than time point F occurring no later than D1 = 1920+20 ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set $q_1$. The UE shall not transmit preamble on a beam associated with the candidate beam set $q_1$ earlier than time point B.

Test is concluded once the test equipment has received the initial preamble transmission from the UE. The rate of correct events observed during repeated tests shall be at least 90 %.

## A.16.5.2.5 Beam Failure Detection and Link Recovery Test for FR1 PCell configured with CSI-RS-based BFD and LR in non-DRX mode for 1 Rx UE

### A.16.5.2.5.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects CSI-RS-based beam failure in the set $q_0$ configured for a serving cell and that the UE performs correct CSI-RS-based link recovery based on beam candidate set $q_1$. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when no DRX is used. This test will partly verify the CSI-RS based beam failure detection and link recovery requirements for an FR1 serving cell in clause 8.5B.3.

The test parameters are given in tables A.16.5.2.5.1-1, A.16.5.2.5.1-2, and below. There is one cell, Cell 1 which is the active cell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.16.5.2.5.1-1 shows the variation of the downlink SNR of the CSI-RS in set $q_0$ in the active cell to emulate CSI-RS based beam failure. Figure A.16.5.2.5.1-1 additionally shows the variation of the downlink L1-RSRP of the CSI-RS in set $q_1$ of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is not enabled.

### A.16.5.2.6.2 Test Requirements

The UE behaviour during time durations T1, T2, T3, T4 and T5 shall be as follows:

During the time duration T1 and T2, the UE shall transmit uplink signal at least in all subframes configured for CSI transmission on Cell 1.

During the period from time point A to time point B the UE shall transmit uplink signal in Cell 1 in all uplink slots configured for CSI transmission according to the configured periodic CSI reporting for Cell 1.

During T3 the UE shall detect beam failure and initiate link recovery. During T4 and T5 the UE measures and evaluate beam candidate from beam candidate set $q_1$.

No later than time point F occurring no later than D1 = 30+20 ms after the start of T5, the UE shall transmit preamble on a beam associated with the candidate beam set $q_1$. The UE shall not transmit preamble on a beam associated with the candidate beam set $q_1$ earlier than time point B.

Test is concluded once the test equipment has received the initial preamble transmission from the UE. The rate of correct events observed during repeated tests shall be at least 90 %.

## A.16.5.2.7 Beam Failure Detection and Link Recovery Test for FR1 PCell configured with CSI-RS-based BFD and LR in DRX mode for 1 Rx UE

### A.16.5.2.7.1 Test Purpose and Environment

The purpose of this test is to verify that the UE properly detects CSI-RS-based beam failure in the set $q_0$ configured for a serving cell and that the UE performs correct CSI-RS-based link recovery based on beam candidate set $q_1$. The purpose is to test the downlink monitoring for beam failure detection within the UEs active DL BWP, during the evaluation period, and link recovery, when DRX is used. This test will partly verify the CSI-RS based beam failure detection and link recovery requirements for an FR1 serving cell in clause 8.5B.3.

The test parameters are given in tables A.16.5.2.7.1-1, A.16.5.2.7.1-2, and A.16.5.2.7.1-3 below. There is one cell, Cell 1 which is the active cell, in the test. The test consists of five successive time periods, with time duration of T1, T2, T3, T4 and T5 respectively. Figure A.16.5.2.7.1-1 shows the variation of the downlink SNR of the CSI-RS in set $q_0$ in the active cell to emulate CSI-RS based beam failure. Figure A.16.5.2.7.1-1 additionally shows the variation of the downlink L1-RSRP of the CSI-RS in set $q_1$ of the candidate beam used for link recovery. Prior to the start of the time duration T1, the UE shall be fully synchronized to Cell 1. The UE shall be configured for periodic CSI reporting with a reporting periodicity of 5 ms. In the test, DRX configuration is enabled in PCell and DRX inactivity timer has already been expired, i.e. UE tries to decode PDCCH and to send periodic CQI during the period when On-duration timer is running. Time alignment timers shall be set to “infinity” so that UL timing alignment is maintained during the test.

## A.16.5.3 Active BWP switch

### A.16.5.3.1 DCI-based and Timer-based Active BWP Switch

#### A.16.5.3.1.1 NR FR1 DL active BWP switch with non-DRX in SA for 1 Rx UE

##### A.16.5.3.1.1.1 Test Purpose and Environment

The purpose of this test is to verify the DL BWP switch delay requirement for 1 Rx RedCap defined in clause 8.6A.

The supported test configurations are shown in table A.16.5.3.1.1.1-1. The test scenario comprises of one cell (Cell 1) as given in table A.16.5.3.1.1.1-2. Cell-specific parameters of the cell are specified in table A.16.5.3.1.1.1-3 below.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE will have ACK/NACK sending.

Before the test starts,

- UE is connected to Cell 1 on radio channel 1.
- UE is configured with 2 different UE-specific downlink bandwidth parts, BWP-1 and BWP-2 before starting the test.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1.

- UE is configured with a *bwp-InactivityTimer* timer value for Cell 1.

The cell has constant signal levels throughout the test.

The test consists of 3 successive time periods, with durations of T1, T2, and T3, respectively.

During T1,

Time period T1 starts when a DCI format 1_1 command for DL BWP switch, sent from the test equipment to the UE, is received at the UE side in Cell 1's slot # denoted *i*. The UE shall switch its bandwidth part from BWP-1 to BWP-2.

The UE shall be able to receive PDSCH on the first DL slot that occurs after the beginning of Cell 1's DL slot ($i+T_{BWPswitchDelay}$) as defined in clause 8.6A and starts to report valid ACK/NACK for the Cell 1 no later than the first UL slot that occurs after the beginning of slot ($i+T_{BWPswitchDelay}+k1$). The UE shall be continuously scheduled on Cell 1's BWP-2 starting from the first DL slot that occurs after the beginning of slot ($i+T_{BWPswitchDelay}$).

During T2, the test equipment won't transmit DCI format for PDSCH reception on Cell 1.

During T3,

The time period T3 starts from the slot #*j*, where j is the first slot of the subframe immediately after *bwp-InactivityTimer* timer expires. The UE shall switch its bandwidth part from BWP-2 back to the default bandwidth part – BWP-1.

The UE shall be able to receive PDSCH on the first DL slot that occurs after the beginning of Cell 1's slot ($j+T_{BWPswitchDelay}$) as defined in clause 8.6A and starts to report valid ACK/NACK for the Cell 1 at latest on the first UL slot that occurs after the beginning of slot ($j+T_{BWPswitchDelay}+k1$). The UE shall be continuously scheduled on Cell 1's BWP-1 starting from the first DL slot that occurs after the beginning of slot ($j+T_{BWPswitchDelay}$).

The test equipment verifies the DL BWP switch time by counting the slots from the time when the BWP switch command is received or *bwp-InactivityTimer* timer expires till an ACK/NACK is received.

## A.16.5.3.2 RRC-based Active BWP Switch

### A.16.5.3.2.1 NR FR1 DL active BWP switch of Cell with non-DRX in SA for 1 Rx UE

#### A.16.5.3.2.1.1 Test Purpose and Environment

The purpose of this test is to verify the DL BWP switch delay requirement for RRC-based BWP switch defined in clause 8.6A.

The supported test configurations are shown in table A.16.5.3.2.1.1-1. The test scenario comprises of one Cell (Cell 1) as given in table A.16.5.3.2.1.1-2. Cell-specific parameters of Cell are specified in table A.16.5.3.2.1.1-3 below.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE will have ACK/NACK sending.

Before the test starts,

- UE is connected to Cell 1 on radio channel 1.
- UE has bandwidth part BWP-1 in its *RRCReconfiguration* for Cell 1.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 of initial condition in Cell 1.

All cells have constant signal levels throughout the test.

The test consists of 1 time period, with duration of T1.

During T1,

Time period T1 starts when a *RRCReconfiguration* with updated bandwidth part configuration, sent from the test equipment to the UE, is completely received at the UE side in PCell's slot # denoted *i*. The UE shall reconfigure its bandwidth part with the updated bandwidth part BWP-1 of final condition.

The UE shall be able to receive PDSCH on PCell from the first DL slot that occurs after the beginning of DL slot $i + \frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}}{\text{NR Slot length}}$ as defined in clause 8.6A.3 and starts to report valid ACK/NACK for the PCell from the first UL slot that occurs after the beginning of DL slot $i + \frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}}{\text{NR Slot length}} + k1$ on BWP-1 of final condition. The UE shall be continuously scheduled on PCell's BWP-1 of final condition starting from the first DL slot right after slot $i + \frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}}{\text{NR Slot length}}$.

$T_{RRCprocessingDelay}$ and $T_{BWPswitchDelayRRC}$ are defined in clause 8.6A.3.

The test equipment verifies the DL BWP switch time in Cell by counting the time from the time when the *RRCReconfiguration* message including updated BWP configuration is sent till the time when a valid ACK/NACK is received is received.

#### A.16.5.3.2.1.2 Test Requirements

During T1, the UE shall be ready for the reception of uplink grant for the Cell from the first DL slot that occurs right after the beginning of slot i + $\frac{T_{\text{RRCprocessingDelay}}+T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}}$ and starts to report valid ACK/NACK for PCell from the first UL slot that occurs after the beginning of DL slot i + $\frac{T_{\text{RRCprocessingDelay}}+T_{\text{BWPswitchDelayRRC}}}{\text{NR Slot length}}$ + k1.

Where, *k1* is the timing between DL data receiving and acknowledgement as specified in [7].

All of the above test requirements shall be fulfilled in order for the observed Cell active BWP switch delay to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90 %.

### A.16.5.3.2.2 NR FR1 DL active BWP switch of Cell with non-DRX in SA for 2 Rx UE

#### A.16.5.3.2.2.1 Test Purpose and Environment

The purpose of this test is to verify the DL BWP switch delay requirement for RRC-based BWP switch defined in clause 8.6A.

The supported test configurations are shown in table A.16.5.3.2.2.1-1. The test scenario comprises of one Cell (Cell 1) as given in table A.16.5.3.2.2.1-2. Cell-specific parameters of Cell are specified in table A.16.5.3.2.2.1-3 below.

PDCCHs indicating new transmissions shall be sent continuously on Cell 1 to ensure that the UE will have ACK/NACK sending.

Before the test starts,

- UE is connected to Cell 1 on radio channel 1.
- UE has bandwidth part BWP-1 in its *RRCReconfiguration* for Cell 1.
- UE is indicated in *firstActiveDownlinkBWP-Id* that the active DL BWP is BWP-1 of initial condition in Cell 1.

All cells have constant signal levels throughout the test.

The test consists of 1 time period, with duration of T1.

During T1,

> Time period T1 starts when a *RRCReconfiguration* with updated bandwidth part configuration, sent from the test equipment to the UE, is completely received at the UE side in PCell's slot # denoted *i*. The UE shall reconfigure its bandwidth part with the updated bandwidth part BWP-1 of final condition.

The UE shall be able to receive PDSCH on PCell from the first DL slot that occurs after the beginning of DL slot $i + \frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}}{\text{NR Slot length}}$ as defined in clause 8.6A.3 and starts to report valid ACK/NACK for the PCell from the first UL slot that occurs after the beginning of DL slot $i + \frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}}{\text{NR Slot length}} + k1$ on BWP-1 of final condition. The UE shall be continuously scheduled on PCell's BWP-1 of final condition starting from the first DL slot right after slot $i + \frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}}{\text{NR Slot length}}$.

$T_{RRCprocessingDelay}$ and $T_{BWPswitchDelayRRC}$ are defined in clause 8.6A.3.

The test equipment verifies the DL BWP switch time in Cell by counting the time from the time when the *RRCReconfiguration* message including updated BWP configuration is sent till the time when a valid ACK/NACK is received is received.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: For unpaired spectrum, a DL BWP is linked with an UL BWP. DLBWP.0.1 is linked with ULBWP.0.1; DLBWP.1.1 is linked with ULBWP.1.1; as defined in clause 12 of TS 38.213 [3].

### A.16.5.4.2.2 Test Requirements

During T1, the UE shall be ready for the reception of uplink grant for the Cell 1 from the first DL slot that occurs right after the beginning of slot $i + \frac{T_{RRCprocessingDelay} + T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ and starts to report valid ACK/NACK for Cell 1 from the first UL slot that occurs after the beginning of DL slot $i + \frac{T_{RRCprocessingDelay} + T_{CBWchangeDelayRRC}}{NR\ Slot\ length} + k1$.

Where, *k1* is the timing between DL data receiving and acknowledgement as specified in [7].

All of the above test requirements shall be fulfilled in order for the observed UE specific CBW change delay on the Cell 1 to be counted as correct.

The rate of correct events observed during repeated tests shall be at least 90 %.

## A.16.6.1 Intra-frequency Measurements

### A.16.6.1.1 SA event triggered reporting tests without gap under non-DRX for 1 Rx UE

#### A.16.6.1.1.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clauses 9.2B.5.1 and 9.2B.5.2.

#### A.16.6.1.1.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell and neighbour cell are given in table A.16.6.1.1.1-1 and A.16.6.1.1.1-2 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

#### A.16.6.1.1.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1000 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.1.3 SA event triggered reporting tests without gap under DRX for 1 Rx UE

### A.16.6.1.3.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell identification and measurement period requirements in clauses 9.2B.5.1 and 9.2B.5.2.

### A.16.6.1.3.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell are given in table A.16.6.1.3.2-1, A.16.6.1.3.2-2 and A.16.6.1.3.2-3 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: SS-RSRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

#### A.16.6.1.3.3 Test Requirements

In test 1, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

In test 2, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 7680 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.16.6.1.4 SA event triggered reporting tests without gap under DRX for 2 Rx UE

#### A.16.6.1.4.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell identification and measurement period requirements in clauses 9.2B.5.1 and 9.2B.5.2.

#### A.16.6.1.4.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell are given in table A.16.6.1.4.2-1, A.16.6.1.4.2-2 and A.16.6.1.4.2-3 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

### A.16.6.1.5.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell search requirements in clause 9.2B.6.1 and 9.2B.6.2.

### A.16.6.1.5.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell are given in table A.16.6.1.5.2-1 and A.16.6.1.5.2-2 below. The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 800 ms from the beginning of time period T2. The UE is not required to read the neighbour cell SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to 2xTTIDCCH higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.1.7 SA event triggered reporting tests with per-UE gaps under DRX for 1 Rx UE

### A.16.6.1.7.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell identification and measurement period requirements in clauses 9.2B.6.1 and 9.2B.6.2.

### A.16.6.1.7.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell are given in table A.16.6.1.7.2-1, A.16.6.1.7.2-2 and A.16.6.1.7.2-3 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

There are two BWPs configured in Cell 1, BWP1 which contains the cell defining SSB, and BWP2 which does not contain any SSB of Cell 1. During the whole test, BWP2 is always scheduled as the active BWP for the UE.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.1.10.3 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1240 ms from the beginning of time period T2. The UE is required to read the neighbour cell SSB index and report the acquired SSB index in this test.

The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.1.11 SA event triggered reporting tests with per-UE gaps under non-DRX with SSB index reading for 1 Rx UE

### A.16.6.1.11.1 Test purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the intra-frequency cell identification and measurement period requirements in clauses 9.2B.6.1 and 9.2B.6.2.

### A.16.6.1.11.2 Test parameters

Two cells are deployed in the test, which are FR1 PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on the same frequency as the PCell. The test parameters for PCell are given in table A.16.6.1.11.2-1, A.16.6.1.11.2-2 and A.16.6.1.11.2-3 below. In the measurement control information, a measurement object is configured for the frequency of the PCell, and it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of Cell 2.

There are two BWPs configured in Cell 1, BWP1 which contains the cell defining SSB, and BWP2 which does not contain any SSB of Cell 1. During the whole test, BWP2 is always scheduled as the active BWP for the UE.

## A.16.6.2 Inter-frequency Measurements

### A.16.6.2.1 SA event triggered reporting tests for FR1 without SSB time index detection when DRX is used for 1 Rx UE

#### A.16.6.2.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3B.4.

In this test, there are two cells: NR Cell 1 as PCell in FR1 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR1 on NR RF channel 2. The test parameters are given in tables A.16.6.2.1.1-1, A.16.6.2.1.1-2 and A.16.6.2.1.1-3.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

NOTE 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

### A.16.6.2.1.2 Test Requirements

In test 1 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1080 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test 2 with per-UE gap, the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 11520 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test 1and 2 UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.2.2 SA event triggered reporting tests for FR1 without SSB time index detection when DRX is used for 2 Rx UE

### A.16.6.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3B.4.

In this test, there are two cells: NR Cell 1 as PCell in FR1 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR1 on NR RF channel 2. The test parameters are given in tables A.16.6.2.22.2.1-1, A.16.6.2.2.1-2 and A.16.6.2.2.1-3.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

### A.16.6.2.4.2 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 800 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.2.5 SA event triggered reporting tests for FR1 with SSB time index detection when DRX is not used for 1 Rx UE

### A.16.6.2.5.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3B.4.

In this test, there are two cells: NR Cell 1 as PCell in FR1 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR1 on NR RF channel 2. The test parameters are given in tables A.16.6.2.5.1-1, A.16.6.2.5.1-2 and A.16.6.2.5.1-3.7

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

### A.16.6.2.7.1 Test Purpose and Environment

The purpose of this test is to verify that 1 Rx RedCap UE makes correct reporting of an event in FR1. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3B.4.

In this test, there are two cells: NR Cell 1 as PCell in FR1 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR1 on NR RF channel 2. The test parameters are given in tables A.16.6.2.7.1-1, A.16.6.2.7.1-2 and A.16.6.2.7.1-3.

The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.

### A.16.6.2.7.2 Test Requirements

In test 1 the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1440 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test 2 the UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 15360 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test 1and 2 UE is required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.2.8 SA event triggered reporting tests for FR1 with SSB time index detection when DRX is used for 2 Rx UE

### A.16.6.2.8.1 Test Purpose and Environment

The purpose of this test is to verify that 2 Rx RedCap UE makes correct reporting of an event in FR1. This test will partly verify the SA inter-frequency NR cell search requirements in clause 9.3.4.

In this test, there are two cells: NR Cell 1 as PCell in FR1 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR1 on NR RF channel 2. The test parameters are given in tables A.16.6.2.8.1-1, A.16.6.2.8.1-2 and A.16.6.2.8.1-3.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

UE needs to be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

### A.16.6.2.10.2 Test Requirements

The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1440 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

UE is not required to report SSB time index.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.2.11 SA event triggered reporting tests for FR1 when DRX is used for 1 Rx UE

### A.16.6.2.11.1 Test Purpose and Environment

The purpose of this test is to verify that the UE which supports interFrequencyMeas-Nogap-r16 makes correct reporting of an event. This test will partly verify the SA inter-frequency NR cell search without measurement gap requirements in clause 9.3B.7.

In this test, there are two cells: NR Cell 1 as PCell in FR1 on NR RF channel 1 and NR Cell 2 as neighbour cell in FR1 on RF channel 2. The SSB of Cell 2 is completely within UE's active BWP BW. The PRBs containing SSB from Cell 1 and Cell 2 should be different in frequency location within the cell bandwidth. The test parameters are given in tables A.16.6.2.11.1-1, A.16.6.2.11.1-2 and A.16.6.2.11.1-3.

In the measurement control information, it is indicated to the UE that event-triggered reporting with Event A3 is used. The test consists of two successive time periods, with time duration of T1, and T2 respectively. During time duration T1, the UE shall not have any timing information of NR Cell 2.

UE needs to be provided at least once every 500 ms with new Timing Advance Command MAC control element to restart the Time alignment timer to keep UE uplink time alignment. Furthermore, UE is allocated with PUSCH resource at every DRX cycle.

In test config 1 and 4, UE is required to report SSB time index. The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 1120 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

In test config 2 and 3, UE is not required to report SSB time index. The UE shall send one Event A3 triggered measurement report, with a measurement reporting delay less than 920 ms from the beginning of time period T2. The UE shall not send event triggered measurement reports, as long as the reporting criteria are not fulfilled. The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.3.1 SA NR - E-UTRAN event-triggered reporting in non-DRX in FR1 for 1 Rx UE

### A.16.6.3.1.1 Test purpose and Environment

The purpose of this set of tests is to verify that the 1 Rx redcap UE makes correct event-triggered reporting of inter-RAT E-UTRAN measurements when operating in standalone (SA) operation with PCell in FR1. This test shall partly verify the cell search and measurement requirements in clauses 9.4A.2 and 9.4A.3.

In each test there are two cells: Cell 1 and Cell 2. Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN neighbour cell. In the measurement control information from the PCell it is indicated to the UE that event-triggered reporting with Event B2 (PCell becomes worse than threshold1 and inter RAT neighbour becomes better than threshold2) is to be used. Each test consists of two consecutive time periods, with durations T1 and T2, respectively. Prior to the start of time duration T1, the UE shall be fully synchronized to Cell 1. During T1, the UE shall not have any information on Cell 2.

Supported test configurations are shown in table A.16.6.3.1.1-1. General test parameters are provided in table A.16.6.3.1.1-2 below. Test parameters for Cell 1 and Cell 2, valid for both time duration T1 and T2, are provided in tables A.16.6.3.1.1-3 and A.16.6.3.1.1-4, respectively.

### A.16.6.3.1.2 Test Requirements

The UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 3.84 s from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

The UE shall not send event-triggered measurement reports as long as the reporting criteria is not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

## A.16.6.3.2 SA NR - E-UTRAN event-triggered reporting in non-DRX in FR1 for 2 Rx UE

### A.16.6.3.2.1 Test purpose and Environment

The purpose of this set of tests is to verify that the 2 Rx redcap UE makes correct event-triggered reporting of inter-RAT E-UTRAN measurements when operating in standalone (SA) operation with PCell in FR1. This test shall partly verify the cell search and measurement requirements in clauses 9.4A.2 and 9.4A.3.

In each test there are two cells: Cell 1 and Cell 2. Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN neighbour cell. In the measurement control information from the PCell it is indicated to the UE that event-triggered reporting with Event B2 (PCell becomes worse than threshold1 and inter RAT neighbour becomes better than threshold2) is to be used. Each test consists of two consecutive time periods, with durations T1 and T2, respectively. Prior to the start of time duration T1, the UE shall be fully synchronized to Cell 1. During T1, the UE shall not have any information on Cell 2.

Supported test configurations are shown in table A.16.6.3.2.1-1. General test parameters are provided in table A.16.6.3.2.1-2 below. Test parameters for Cell 1 and Cell 2, valid for both time duration T1 and T2, are provided in tables A.16.6.3.2.1-3 and A.16.6.3.2.1-4, respectively.

NOTE 1: Special subframe and uplink-downlink configurations are specified in table 4.2-1 in TS 36.211 [23].
NOTE 2: DL RMCs and OCNG patterns are specified in clauses A 3.1 and A 3.2 of TS 36.133 [15] respectively.
NOTE 3: OCNG shall be used such that all cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 4: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 5: $\hat{E}_s/I_{ot}$, RSRP, SCH_RP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

#### A.16.6.3.2.2 Test Requirements

The UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 3.84 s from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

The UE shall not send event-triggered measurement reports as long as the reporting criteria is not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.16.6.3.3 SA NR - E-UTRAN event-triggered reporting in DRX in FR1 for 1 Rx UE

#### A.16.6.3.3.1 Test purpose and Environment

The purpose of this set of tests is to verify that the 1 Rx redcap UE makes correct event-triggered reporting of inter-RAT E-UTRAN measurements when operating in standalone (SA) operation with PCell in FR1 when DRX is used. This test shall partly verify the cell search and measurement requirements in clauses 9.4A.2 and 9.4A.3. There are two test cases. In test 1 the UE shall be configured with DRX cycle of 40 ms. In test 2 the UE shall be configured with DRX cycle of 640 ms.

In each test there are two cells: Cell 1 and Cell 2. Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN neighbour cell. In the measurement control information from the PCell it is indicated to the UE that event-triggered reporting with Event B2 (PCell becomes worse than threshold1 and inter RAT neighbour becomes better than threshold2) is to be used. Each test consists of two consecutive time periods, with durations T1 and T2, respectively. Prior to the start of time duration T1, the UE shall be fully synchronized to Cell 1. During T1, the UE shall not have any information on Cell 2..

In each test the UE shall be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore the UE shall be allocated with PUSCH resource at every DRX cycle.

Supported test configurations are shown in table A.16.6.3.3.1-1. General test parameters are provided in table A.16.6.3.3.1-2 below. Test parameters for Cell 1 and Cell 2, valid for both time duration T1 and T2, are provided in tables A.16.6.3.3.1-3 and A.16.6.3.3.1-4, respectively.

#### A.16.6.3.3.2 Test Requirements

In test 1, the UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 3.84 s from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

In test 2, the UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 12.8 s from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

The UE shall not send event-triggered measurement reports as long as the reporting criteria is not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

### A.16.6.3.4 SA NR - E-UTRAN event-triggered reporting in DRX in FR1 for 2 Rx UE

#### A.16.6.3.4.1 Test purpose and Environment

The purpose of this set of tests is to verify that the 2 Rx redcap UE makes correct event-triggered reporting of inter-RAT E-UTRAN measurements when operating in standalone (SA) operation with PCell in FR1 when DRX is used. This test shall partly verify the cell search and measurement requirements in clauses 9.4A.2 and 9.4A.3. There are two test cases. In test 1 the UE shall be configured with DRX cycle of 40 ms. In test 2 the UE shall be configured with DRX cycle of 640 ms.

In each test there are two cells: Cell 1 and Cell 2. Cell 1 is the NR PCell and Cell 2 is an inter-RAT E-UTRAN inter-RAT neighbour cell. In the measurement control information from the PCell it is indicated to the UE that event-triggered reporting with Event B2 (PCell becomes worse than threshold1 and inter RAT neighbour becomes better than threshold2) is to be used. Each test consists of two consecutive time periods, with durations T1 and T2, respectively. Prior to the start of time duration T1, the UE shall be fully synchronized to Cell 1. During T1, the UE shall not have any information on Cell 2.

In each test the UE shall be provided with new Timing Advance Command MAC control element at least once during each time alignment timer period to maintain uplink time alignment. Furthermore the UE shall be allocated with PUSCH resource at every DRX cycle.

Supported test configurations are shown in table A.16.6.3.4.1-1. General test parameters are provided in table A.16.6.3.4.1-2 below. Test parameters for Cell 1 and Cell 2, valid for both time duration T1 and T2, are provided in tables A.16.6.3.4.1-3 and A.16.6.3.4.1-4, respectively.

### A.16.6.3.4.2 Test Requirements

In test 1, the UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 3.84 s from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

In test 2, the UE shall send one Event B2 triggered measurement report for Cell 2 to the PCell, with a measurement reporting delay less than 12.8 s from the start of period T2. The measurement reporting delay is defined as the time from the beginning of time period T2 to the moment when the UE sends the measurement report on PUSCH.

The UE shall not send event-triggered measurement reports as long as the reporting criteria is not fulfilled.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

In CSI measurement configuration, UE is indicated to perform L1-RSRP measurement on the CSI-RS and report aperiodically. The test consists of a single time period T1, during which the UE is triggered via DCI to report L1-RSRP on aperiodic CSI-RS resources. UE is also configured to measure L1-RSRP based on SSB. After 80 ms from the beginning of the test, the DCI trigger comes in slot n (0 for Config 1,2 and 8 for Config 3) of a frame and UE provides the report back based on the reporting configuration as defined in table A.16.6.4.7.2-1.

There is no measurement gap configured in the test. Before the test, UE is configured to perform RLM and BFD based on the SSBs.

# A.16.6.5 NR measurements with autonomous gaps

## A.16.6.5.1 SA intra-frequency CGI identification of NR neighbor cell in FR1 for 1 Rx UE

### A.16.6.5.1.1 Test Purpose and Environment

The purpose of this test is to verify that the UE makes correct reporting of intra-frequency CGI identification of an NR neighbour cell in FR1 with autonomous gaps. This test shall partly verify the measurement requirements in clause 9.11A.

### A.16.6.5.1.2 Test Parameters

In each test there are two cells: Cell 1 and Cell 2. Cell 1 is the FR1 PCell and Cell 2 is an FR1 neighbour cell on the same frequency as the PCell. The test parameters for PCell and neighbour cell are given in table A.16.6.5.1.2-1, A.16.6.5.1.2-2 and A.16.6.5.1.2-3 below. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable. A measurement object is configured for the frequency of the PCell and it is indicated to the UE that event-triggered reporting with Event A3 is used. The UE is expected to detect and send a measurement report with Event A3.

A new RRC message triggering CGI identification shall be sent to the UE during period T2, after the UE has reported Event A3. The RRC message shall create a measurement report configuration with purpose *reportCGI* and *useAutonomousGaps* set to *setup*. The start of T3 is the instant when the last TTI containing the RRC message implying CGI identification is sent to the UE.

The test equipment verifies that potential interruption is carried out correctly by monitoring ACK/NACK sent in PCell during T3 until a measurement report with CGI is sent.

### A.16.6.5.2.3 Test Requirements

The UE shall send a measurement report containing the CGI of Cell 2 within 255 ms from the start of time period T3.

Test requirement = RRC Procedure delay + $T_{identify_CGI}$ + reporting delay

- = 10 + 240 + 2 ms from the start of T3
- = 252 ms, allow 255 ms

The UE shall be scheduled continuously throughout the test. From the start of T3 until 252 ms, the interruption on PCell shall not be more than the values specified for SA in clause 9.11A.4.

The rate of correct events observed during repeated tests shall be at least 90 %.

## A.16.6.5.3 Identification of a new CGI of inter-RAT E-UTRA cell using autonomous gaps in NR SA for 1 Rx UE

### A.16.6.5.3.1 Test Purpose and Environment

This test is to verify the requirement for identification of a new CGI of E-UTRA cell with autonomous gaps in NR SA in clause 9.4A.4.

The test scenario comprises of one NR carrier and an E-UTRA carrier and two cells as given in tables A.16.6.5.3.1-1, A.16.6.5.3.1-2, A.16.6.5.3.1-3 and A.16.6.5.3.1-4. PDCCHs indicating new transmissions shall be sent continuously to ensure that the UE would have ACK/NACK sending during identifying a new CGI of E-UTRAN cell. The test consists of three successive time periods, with time durations of T1, T2 and T3 respectively. At the start of time duration T1, the UE does not have any timing information of Cell 2. Starting T2, Cell 2 becomes detectable and the UE is expected to detect and send a measurement report.

A RRC message implying SI reading shall be sent to the UE during period T2, after the UE has reported Event B2. The RRC message shall create a measurement report configuration with purpose *reportCGI* and *useAutonomousGaps* set to *setup*. The start of T3 is the instant when the last TTI containing the RRC message implying SI reading is sent to the UE.

### A.16.6.5.3.2 Test Requirements

The UE shall transmit a measurement report containing the cell global identifier of Cell 2 within 240 milliseconds from the start of T3.

Test requirement = RRC Procedure delay with additional margin + $T_{identify_CGI_LC\text{-}UE}$ + TTI insertion uncertainty

= 15 + 30 + 190 + 2 ms from the start of T3

= 237 ms, allow 240 ms.

- The UE shall be scheduled continuously throughout the test, and from the start of T3 until 240 ms at least the number of ACK/NACK specified in NOTE 2 shall be detected as being transmitted by the UE.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE 1: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

NOTE 2: The overall ACK/NACK number is caused by two parts. Firstly, at least X ACK/NACK shall be sent during identifying the cell global identifier of Cell 2, where X is defined in table 9.4A.4.3-1. Secondly, given that continuous DL data allocation, additional 43, 14 and 34 ACK/NACK shall be sent for FDD 15 kHz, TDD 15 kHz and TDD 30 kHz, respectively, from the start of T3 until 240 ms excludes 190 ms for identifying the cell global identifier of Cell 2.

The RRC message shall create a measurement report configuration with purpose *reportCGI* and *useAutonomousGaps* set to *setup*. The start of T3 is the instant when the last TTI containing the RRC message implying SI reading is sent to the UE.

#### A.16.6.5.4.2 Test Requirements

The UE shall transmit a measurement report containing the cell global identifier of Cell 2 within 200 milliseconds from the start of T3.

Test requirement = RRC Procedure delay with additional margin + $T_{identify_CGI,E\text{-}UTRAN}$ + TTI insertion uncertainty

= 15 + 30 + 150 + 2 ms from the start of T3

= 197 ms, allow 200 ms.

- The UE shall be scheduled continuously throughout the test, and from the start of T3 until 200 ms at least the number of ACK/NACK specified in NOTE 2 shall be detected as being transmitted by the UE.

The rate of correct events observed during repeated tests shall be at least 90 %.

NOTE 1: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the measurement reporting delays above because of TTI insertion uncertainty of the measurement report in DCCH.

NOTE 2: The overall ACK/NACK number is caused by two parts. Firstly, at least X ACK/NACK shall be sent during identifying the cell global identifier of Cell 2, where X is defined in table 9.4A.4.3-1. Secondly, given that continuous DL data allocation, additional 43, 14 and 34 ACK/NACK shall be sent for FDD 15 kHz, TDD 15 kHz and TDD 30 kHz, respectively, from the start of T3 until 200 ms excludes 150 ms for identifying the cell global identifier of Cell 2.

## A.16.6.6 RSTD Measurements

### A.16.6.6.1 NR RSTD measurement reporting delay test case for RedCap UE without FH in FR1 SA

#### A.16.6.6.1.1 Test Purpose and Environment

The purpose of the test is to verify that the RSTD measurement for RedCap UE without FH in RRC CONNECTED state meets the requirements specified in clause 9.9A.2 in an environment with AWGN propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

The supported test configurations are specified in table A.16.6.6.1.1-1.

**Table A.16.6.6.1.1-1: Supported test configurations**

| Configuration | Description |
|---|---|
| 1 | 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |

| | |
|---|---|
| 2 | 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3 | 30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode |
| 4 | 15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode |
| NOTE: The UE is only required to be tested in one of the supported test configurations. | |

In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2 and Cell 3. All three cells transmit PRS during T2.

NOTE: The information on when PRS is muted is conveyed to the UE using PRS muting information.

The *NR-DL-TDOA-ProvideAssistanceData* and *NR-DL-TDOA-RequestLocationInformation* as defined in TS 37.355 [34], clause 6.5.12.1, shall be provided to the RedCap UE during T1. The measurement reporting delay test in this clause is valid for the cases where the RedCap UE is either not configured by the LMF to perform RSTD measurement with RX FH via *NR-DL-TDOA-RequestLocationInformation* or the RedCap UE is configured by the LMF to perform RSTD measurement with RX FH via *NR-DL-TDOA-RequestLocationInformation* but reports the RSTD measurement based on the single hop in *NR-DL-TDOA-SignalMeasurementInformation* as specified in TS 37.355 [34], clause 6.5.12.

The last TTI containing the two messages shall be provided to the UE $\Delta T$ ms before the start of T2, where $\Delta T = 50$ ms is the maximum processing time of the *DL-TDOA assistance* data and location information request. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources.

The UE is configured with measurement gap pattern ID # 24 or #0 before T2.

The general test parameters are listed in table A.16.6.6.1.1-2, and cell specific test parameters are listed in table A.16.6.6.1.1-3.

### A.16.6.6.1.2 Test Requirements

The RSTD measurement time without FH for RedCap fulfils the requirements specified in clause 9.9A.2.5.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 9.9A.2.5 starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in clause 10.1A.16.3, i.e., between RSTD_0000000 and RSTD1970049.

## A.16.6.6.2 NR RSTD measurement reporting delay test case with PRS frequency hopping

### A.16.6.6.2.1 Test Purpose and Environment

The purpose of the test is to verify that the RSTD measurement meets the requirements specified in clause 9.9A.2.6 in an environment with AWGN propagation conditions in FR1 in standalone scenario when frequency hopping is configured.

The supported test configurations are specified in table A.16.6.6.2.1-1.

**Table A.16.6.6.2.1-1: Supported test configurations**

| Configuration | Description |
|---|---|
| 1 | 15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode |
| 2 | 15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode |
| 3 | 30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode |
| 4 | 15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode |
| NOTE 1: The UE is only required to be tested in one of the supported test configurations.<br>NOTE 2: UE with 1 Rx or 2 Rx is required to meet the same requirements specified in this clause.<br>NOTE 3: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz.<br>NOTE 4: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz. | |

In the test there are three synchronous cells: Cell 1, Cell 2 and Cell 3. Cell 1 is the reference as well as the PCell. Cell 2 and Cell 3 are the neighbour cells. All 3 cells are on the same RF channel in FR1.

The test consists of two consecutive time intervals, with duration of T1 and T2. During time duration T1, the UE shall not have any timing information of Cell 2 and Cell 3. All three cells transmit PRS during T2.

NOTE: The information on when PRS is muted is conveyed to the UE using PRS muting information.

The *NR-DL-TDOA-ProvideAssistanceData* and *nr-DL-TDOA-RequestLocationInformation* as defined in TS 37.355 [34], clause 6.5.12.1, shall be provided to the UE during T1. The last TTI containing the two messages shall be provided to the UE $\Delta T$ ms before the start of T2, where $\Delta T = 50$ ms is the maximum processing time of the *DL-TDOA assistance* data and location information request.

The test requirements apply when *frequencyHopping* is configured to UE.

The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources.

The UE is configured with measurement gap pattern ID # 24 or #0 before T2.

The general test parameters are listed in table A.16.6.6.2.1-2, and cell specific test parameters are listed in table A.16.6.6.2.1-3.

#### A.16.6.6.2.2 Test Requirements

The RSTD measurement time fulfils the requirements specified in clause 9.9A.2.6.

The UE shall perform and report the RSTD measurements for Cell 2 and Cell 3 with respect to the reference cell in the DL-TDOA assistance data, Cell 1, within the time duration specified in clause 9.9A.2.6 starting from the beginning of time interval T2.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported RSTD measurement for each correct event shall be within the RSTD reporting range specified in clause 10.1A.16.3, i.e., between RSTD_0000000 and RSTD1970049.

## A.16.6.7 UE Rx-Tx Measurements

### A.16.6.7.1 UE Rx-Tx measurement reporting delay test case for single positioning frequency layer in FR1 SA for RedCap UE without RX FH in RRC_CONNECTED mode

#### A.16.6.7.1.1 Test purpose and environment

The purpose of the test is to verify that the UE Rx-Tx measurement without RX FH reported by the RedCap UE meets the requirements specified in clause 9.9A.4.5 in AWGN propagation condition in FR1 in standalone scenario when single positioning frequency layer is configured. The measurement reporting delay test defined in this clause is valid for both 1 Rx and 2 Rx RedCap UEs.

The supported test configurations are listed in table A.16.6.7.1.1-1.

**Table A.16.6.7.1.1-1: Supported test configurations**

| Configuration | Description |
|---|---|
| 1 | 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |
| 2 | 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3 | 30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode |
| 4 | 15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode |
| NOTE: The UE is only required to be tested in one of the supported test configurations. | |

There are two cells in the test: PCell (Cell 1) and a neighbour cell (Cell 2). Both cells are on the same RF channel in FR1.

The test consists of two consecutive time intervals, with duration of T1 and T2. Cell 1 and Cell 2 mute PRS transmission during T1 and transmit PRS during T2.

The *NR-Multi-RTT-ProvideAssistanceData* and *NR-Multi-RTT-RequestLocationInformation* as defined in TS 37.355 [34], clause 6.5.12, shall be provided to the UE during T1. The measurement reporting delay test in this clause is valid for the cases where the RedCap UE is either not configured by the LMF to perform UE Rx-Tx time difference measurement with RX FH via *NR-Multi-RTT-RequestLocationInformation* or the UE is configured by the LMF to perform UE Rx-Tx time difference measurement with RX FH via *NR-Multi-RTT-RequestLocationInformation* but reports the UE Rx-Tx time difference measurement based on the single hop in *NR-Multi-RTT-SignalMeasurementInformation* as specified in TS 37.355 [34], clause 6.5.12.

The last TTI containing the two messages shall be provided to the RedCap UE ΔT ms before the start of T2, where ΔT = 50 ms is the maximum processing time of the multi-RTT assistance data and location information request. The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources.

The RedCap UE is configured with measurement gap pattern ID #0 or ID #24 before T2.

The RedCap UE is configured to transmit positioning SRS during T2.

The general test parameters and cell specific test parameters are as given in table A.16.6.7.1.1-2 and table A.16.6.7.1.1-3, respectively.

The UE shall perform and report the UE Rx-Tx time difference measurements without RX FH for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause 10.1A.18.3.

NOTE 1: The resources for uplink transmission are assigned to the RedCap UE prior to the start of time period T2.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: PRP levels have been derived from other parameters for information purposes. They are not settable parameters themselves.

#### A.16.6.7.2.2 Test requirements

The UE Rx-Tx time difference measurement time in RRC_CONNECTED state fulfils the requirements specified in clause 9.9A.4.8.

The RedCap UE shall perform and report the UE Rx-Tx time difference measurements for Cell 1 and Cell 2 within the specified UE Rx-Tx time difference measurement time starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of the correct events for each neighbour cell observed during repeated tests shall be at least 90%, where the reported UE Rx-Tx measurement for each correct event shall be within the UE Rx-Tx reporting range specified in clause 10.1A.18.3.

## A.16.6.8 PRS-RSRP measurements

### A.16.6.8.1 PRS-RSRP measurement delay test case for single positioning frequency layer

#### A.16.6.8.1.1 Test purpose and Environment

The purpose of the test is to verify that the PRS-RSRP measurement meets the delay requirements specified in clause 9.9A.3.5 in an environment with AWGN propagation conditions. The test is applicable to 1 Rx or 2 Rx RedCap UE.

The supported test configurations are specified in table A.16.6.8.1.1-1.

**Table A.16.6.8.1.1-1: Supported test configurations**

| Configuration | Description |
|---|---|
| 1 | 15 kHz SSB SCS, 10 MHz bandwidth, FDD duplex mode |

| | |
|---|---|
| 2 | 15 kHz SSB SCS, 10 MHz bandwidth, TDD duplex mode |
| 3 | 30 kHz SSB SCS, 20 MHz bandwidth, TDD duplex mode |
| 4 | 15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode |
| NOTE: The UE is only required to be tested in one of the supported test configurations. | |

In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1. The test consists of two consecutive time intervals, with duration of T1 and T2. Both cells transmit PRS during T2.

The *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message as defined in TS 37.355 [34] shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n. The measurement reporting delay test in this clause is valid for the cases where the RedCap UE is either not configured by the LMF to perform PRS-RSRP measurement with RX FH via *NR-DL-AoD-RequestLocationInformation* or the UE is configured by the LMF to perform PRS-RSRP measurement with RX FH but reports the PRS-RSRP measurement based on the single hop in *NR-DL-AoD-SignalMeasurementInformation* as specified in TS 37.355 [34], clause 6.5.12.

The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is $\Delta T$ after slot #n, where $\Delta T$ = 50 ms is the maximum processing time of the assistance data and location information request.

The general test parameters are listed in table A.16.6.8.1.1-2, and cell specific test parameters are listed in table A.16.6.8.1.1-3.

### A.16.6.9.1.2 Test Requirements

The UE shall perform and report the PRS-RSRPP measurements for Cell 1 and Cell 2, within the time limit specified in clause 9.9A.5.5, starting from the beginning of time interval T2.

NOTE: The actual overall delays measured in the test may be up to $2xTTI_{DCCH}$ higher than the time duration above because of TTI insertion uncertainty of the measurement report in DCCH.

The rate of correct events observed during repeated tests shall be at least 90%, where the reported PRS-RSRPP measurement for each correct event shall be within the reporting range specified in clause 10.1A.19.3.

## A.16.6.9.2 PRS-RSRPP measurement with Rx FH reporting delay test case for single positioning frequency layer in FR1 SA in RRC_CONNECTED state

### A.16.6.9.2.1 Test purpose and Environment

The purpose of the test is to verify that the PRS-RSRPP measurement with Rx FH in RRC_CONNECTED state meets the delay requirements specified in clause 9.9A.5.8 in an environment with two-tap channel propagation conditions in FR1 in standalone scenario when single positioning frequency layer is configured.

The supported test configurations are specified in table A.16.6.9.2.1-1.

**Table A.16.6.9.2.1-1: Supported test configurations**

| Configuration | Description |
|---|---|
| 1 | 15 kHz SSB SCS, cell bandwidth 50 MHz, FDD duplex mode |
| 2 | 15 kHz SSB SCS, cell bandwidth 50 MHz, TDD duplex mode |
| 3 | 30 kHz SSB SCS, cell bandwidth 100 MHz, TDD duplex mode |
| 4 | 15 kHz SSB SCS, cell bandwidth 50 MHz, HD-FDD duplex mode |
| NOTE 1: The RedCap UE is only required to be tested in one of the supported test configurations.<br>NOTE 2: This test case is applicable to the UE supporting per hop bandwidth ≥ 10 MHz for SCS 15 kHz.<br>NOTE 3: This test case is applicable to the UE supporting per hop bandwidth = 20 MHz for SCS 30 kHz. | |

In the test there are two synchronous cells: Cell 1 and Cell 2. Cell 1 is the reference as well as the PCell. Cell 2 is a neighbour cell. Both cells are on the same NR RF channel in FR1. The test consists of two consecutive time intervals, with duration of T1 and T2. Both cells transmit PRS during T2.

The *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message as defined in TS 37.355 shall be provided to the UE during T1. The last slot containing the two messages for the assistance data and location information request is denoted as #n.

The beginning of the time interval T2 shall be aligned with the beginning of the first MG instance containing the PRS resources that is ΔT after slot #n, where ΔT = 50 ms is the maximum processing time of the assistance data and location information request.

The general test parameters are listed in table A.16.6.9.2.1-2, and cell specific test parameters are listed in table A.16.6.9.2.1-3.

### A.16.7.1.1 SA: intra-frequency case measurement accuracy with FR1 serving cell and FR1 target cell for 1 Rx UE

#### A.16.7.1.1.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in clauses 10.1A.2.1 and 10.1A.2.2 for intra-frequency measurements for 1 RX RedCap UE.

### A.16.7.1.1.2 Test parameters

In this set of test cases all cells are on the same carrier frequency. Supported test configurations are shown in table A.16.7.1.1.2-1. NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: SS-RSRP and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: Subtest 1 is not used when testing with 30 kHz SSB SCS.
NOTE 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification

#### A.16.7.1.1.3 Test Requirements

The SS-RSRP measurement accuracy for Cell 1 and Cell 2 shall fulfil absolute requirement in clause 10.1A.2.1 and relative requirement in clause 10.1A.2.2 for 1 RX RedCap UE.

### A.16.7.1.2 SA: intra-frequency case measurement accuracy with FR1 serving cell and FR1 target cell for 2 RX UE

#### A.16.7.1.2.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in clauses 10.1A.2.1 and 10.1A.2.2 for intra-frequency measurements for 2 RX RedCap UE.

#### A.16.7.1.2.2 Test parameters

In this set of test cases all cells are on the same carrier frequency. Supported test configurations are shown in table A.16.7.1.2.2-1. Both absolute and relative accuracy of SS-RSRP intra-frequency measurements are tested by using the parameters in A.16.7.1.2.2-2. In all test cases, Cell 1 is the PCell, and Cell 2 is the target cell.

### A.16.7.1.3 SA inter-frequency case measurement accuracy with FR1 serving cell and FR1 target cell for 1 Rx UE

#### A.16.7.1.3.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in clauses 10.1A.4.1.1 and 10.1A.4.1.2 for inter-frequency measurements with the testing configurations for NR cells in table A.16.7.1.3.1-1.

**Table A.16.7.1.3.1-1: Applicable NR configurations for FR1 inter-frequency SS-RSRP accuracy test**

### A.16.7.1.3.2 Test parameters

In this set of test cases there are two cells in the test, PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on a different frequency than the PCell. The test parameters for the Cell 1 and Cell 2 are given in table A.16.7.1.3.2-1 below. Both absolute and relative accuracy of RSRP inter-frequency measurements is tested by using the parameters in table A.16.7.1.3.2-1. The inter-frequency measurements are supported by a measurement gap.

## A.16.7.1.4 SA inter-frequency case measurement accuracy with FR1 serving cell and FR1 target cell for 2 Rx UE

### A.16.7.1.4.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRP measurement accuracy is within the specified limits. This test will verify the requirements in clauses 10.1A.4.1.1 and 10.1A.4.1.2 for inter-frequency measurements with the testing configurations for NR cells in table A.16.7.1.4.1-1.

**Table A.16.7.1.4.1-1: Applicable NR configurations for FR1 inter-frequency SS-RSRP accuracy test**

| 4 | NR 15 kHz SSB SCS, 10 MHz bandwidth, HD-FDD duplex mode |
| NOTE: The UE is only required to be tested in one of the supported test configurations in each supported band | |

### A.16.7.1.4.2 Test parameters

In this set of test cases there are two cells in the test, PCell (Cell 1) and a FR1 neighbour cell (Cell 2) on a different frequency than the PCell. The test parameters for the Cell 1 and Cell 2 are given in table A.16.7.1.4.2-1 below. Both absolute and relative accuracy of RSRP inter-frequency measurements is tested by using the parameters in table A.16.7.1.4.1-1. The inter-frequency measurements are supported by a measurement gap.

NOTE 1: OCNG shall be used such that both cells are fully allocated and a constant total transmitted power spectral density is achieved for all OFDM symbols.
NOTE 2: Interference from other cells and noise sources not specified in the test is assumed to be constant over subcarriers and time and shall be modelled as AWGN of appropriate power for $N_{oc}$ to be fulfilled.
NOTE 3: SS-RSRQ, SS-RSRP, and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: SS-RSRQ, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: NR operating band groups are as defined in clause 3.5.2.
NOTE 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

#### A.16.7.2.1.3 Test Requirements

The SS-RSRQ measurement accuracy shall fulfil the requirements in clause 10.1A.6.

### A.16.7.2.2 SA: Intra-frequency measurement accuracy with FR1 serving cell and FR1 target cell for 2 Rx UE

#### A.16.7.2.2.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRQ measurement accuracy is within the specified limits. This test will verify the requirements in clause 10.1A.6.

#### A.16.7.2.2.2 Test Parameters

In this test case all cells are on the same carrier frequency. Supported test configuration are shown in table A.16.7.2.2.2-1. The absolute accuracy of SS-RSRQ intra-frequency measurement is tested by using the parameters in table A.16.7.2.2.2-2. In all test cases, Cell 1 is the PCell and Cell 2 is the target cell.

NOTE 3: SS-RSRQ, SS-RSRP, and Io levels have been derived from other parameters for information purposes. They are not settable parameters themselves.
NOTE 4: SS-RSRQ, SS-RSRP minimum requirements are specified assuming independent interference and noise at each receiver antenna port.
NOTE 5: NR operating band groups are as defined in clause 3.5.2.
NOTE 6: The test configuration excludes support for band n51 and it is not required to run this test on band n51 in this release of the specification.

### A.16.7.2.2.3 Test Requirements

The SS-RSRQ measurement accuracy shall fulfil the requirements in clause 10.1A.6.

### A.16.7.2.3 SA Inter-frequency measurement accuracy with FR1 serving cell and FR1 target cell for 1 Rx UE

#### A.16.7.2.3.1 Test Purpose and Environment

The purpose of this test is to verify that the SS-RSRQ measurement accuracy is within the specified limits. This test will verify the requirements in clause 10.1A.8.1.1 and 10.1A.8.1.2.

#### A.16.7.2.3.2 Test parameters

In this test case the two cells (i.e., Cell 1 and Cell 2) are on different carrier frequencies and measurement gaps are provided. Supported test configurations are shown in table A.16.7.2.3.2-1. Both absolute accuracy and relative accuracy requirements of SS-RSRQ inter-frequency measurement are tested by using test parameters in table A.16.7.2.3.2-2. In all test cases, Cell 1 is the PCell and Cell 2 is target cell.
