For E-UTRA FDD-NR FDD inter-band EN-DC with overlapping DL bands, only synchronized operation is assumed if UE does not indicate that it is capable of asynchronous FDD-FDD EN-DC operation. The UE shall be capable of handling a maximum uplink transmission timing difference (MTTD) between E-UTRA PCell and PSCell as shown in table 7.5.2.1-1 provided that UE not supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* or UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r16* and not provided with *nonCollocatedTypeMRDC-r18*, and in table 7.5.3-1 provided that UE does not indicate it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* or UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r16* and provided with *nonCollocatedTypeMRDC-r18*.

For E-UTRA TDD-NR TDD inter-band EN-DC with overlapping or partially overlapping DL bands, or E-UTRA FDD-NR FDD inter-band EN-DC with overlapping DL bands, if UE indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r19,*

1> when UE is configured with *maxMIMO-Layers* with value equal to 4,

2> if *nonCollocatedTypeMRDC-v1900* is present with *"type 4"*,

3> the UE shall be capable of handling a maximum uplink transmission timing difference (MTTD) between E-UTRA PCell and PSCell as shown in table 7.5.2.1-1.

2> otherwise, if *nonCollocatedTypeMRDC-v1900* is present with *"type 1"* or absent,

3> the UE shall be capable of handling a maximum uplink transmission timing difference (MTTD) between E-UTRA PCell and PSCell as shown in table 7.5.3-1.

1> when UE is configured with *maxMIMO-Layers* with value equal to 2,

2> if *nonCollocatedTypeMRDC-r18* is not provided,

3> the UE shall be capable of handling a maximum uplink transmission timing difference (MTTD) between E-UTRA PCell and PSCell as shown in table 7.5.2.1-1.

2> otherwise

3> the UE shall be capable of handling a maximum uplink transmission timing difference (MTTD) between E-UTRA PCell and PSCell as shown in table 7.5.3-1.

**Table 7.5.2.1-1 Maximum uplink transmission timing difference requirement for inter-band synchronous EN-DC**

| Sub-carrier spacing in E-UTRA PCell (kHz) | UL Sub-carrier spacing for data in PSCell (kHz) | Maximum uplink transmission timing difference (μs) |
|---|---|---|
| 15 | 15 | 35.21 |
| 15 | 30 | 35.21 |
| 15 | 60 | 35.21 |
| 15 | 120 | 35.21 |

## 7.5.3 Minimum requirements for intra-band EN-DC

For intra-band EN-DC, only co-located deployment is applied.

The UE shall be capable of handling a maximum uplink transmission timing difference between E-UTRA PCell and PSCell as shown in table 7.5.2-1 for E-UTRA FDD-NR FDD intra-band EN-DC provided the UE indicates that it is capable of asynchronous EN-DC operation [2].

The UE shall be capable of handling a maximum uplink transmission timing difference between E-UTRA PCell and PSCell as shown in table 7.5.3-1 for E-UTRA TDD-NR TDD and E-UTRA FDD-NR FDD intra-band EN-DC provided the UE does not indicate that it is capable of asynchronous FDD-FDD EN-DC operation [16].

**Table 7.5.3-1: Maximum uplink transmission timing difference requirement for intra-band synchronous EN-DC**

| Sub-carrier spacing in E-UTRA PCell (kHz) | UL Sub-carrier spacing for data in PSCell (kHz) | Maximum uplink transmission timing difference (μs) |
|---|---|---|
| 15 | 15 | 5.21 Note1,Note 2 |
| 15 | 30 | 5.21 Note 2 |
| 15 | 60 | 5.21 Note 2 |
| NOTE 1: This is not applicable for a UE which indicates the capability of only supporting single UL timing (*ul-TimingAlignmentEUTRA-NR* is signalled). Single UL timing for E-UTRA and NR cell is assumed for this UE. | | |
| NOTE 2: If the transmission timing difference exceeds the cyclic prefix length of the UL Sub-carrier spacing for data in PSCell, NR UE Tx EVM degradation is expected for the symbol that is overlapping the LTE subframe boundary | | |
| NOTE 3: The requirement in this table is also applicable for intra-band synchronous NE-DC. | | |

## 7.5.4 Minimum requirements for NR Carrier Aggregation

The UE shall be capable of handling at least a relative transmission timing difference between slot timing of all pairs of TAGs in FR1 and/or FR2-1 as shown in table 7.5.4-1, provided that the UE is:

- configured with the pTAG and the sTAG for inter-band NR carrier aggregation in SA or NR-DC mode, or
- configured with more than one sTAG for inter-band NR carrier aggregation in EN-DC or NE-DC mode.

The UE shall be capable of handling at least a relative transmission timing difference between subframe timing of all pairs of TAGs between FR1 and FR2-2 as shown in table 7.5.4-1, provided that the UE is:

- configured with the pTAG and the sTAG for inter-band NR carrier aggregation in SA or NR-DC mode.

For FR1 intra-band non-contiguous NR carrier aggregation, the UE shall be capable of handling at least a relative transmission timing difference as shown in table 7.5.4-1, between slot timing of all FR1 pairs of TAGs provided that UE indicates that it is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided.

For FR1 intra-band non-contiguous NR carrier aggregation and UE supporting *intraBandNR-CA-non-collocated-r19,*

1> when UE is configured with *maxMIMO-Layers* with value equal to 4,

2> if nonCollocatedTypeNR-CA-v1900 is present with “type 4”,

3> the UE shall be capable of handling at least a relative transmission timing difference between slot timing of all FR1 pairs of TAGs as shown in table 7.5.4-1.

1> when UE is configured with *maxMIMO-Layers* with value equal to 2,

2> if *nonCollocatedTypeNR-CA-r18* is not provided,

3> the UE shall be capable of handling at least a relative transmission timing difference between slot timing of all FR1 pairs of TAGs as shown in table 7.5.4-1.

**Table 7.5.4-1: Maximum uplink transmission timing difference requirement for inter-band NR carrier aggregation**

| Frequency Range of the pair of TAGs | Maximum uplink transmission timing difference (μs) |
|---|---|
| FR1 | 34.6 |
| FR2-1 | 8.5 Note1 |
| Between FR1 and FR2-1 | 26.1 |
| Between FR1 and FR2-2 | 26.1 |
| NOTE1: This requirement applies to the UE capable of independent beam management for FR2-1 inter-band CA. | |

## 7.5.5 Minimum requirements for inter-band NE-DC

The UE shall be capable of handling a maximum uplink transmission timing difference between PCell and E-UTRA PSCell as shown in table 7.5.5-1 for inter-band asynchronous NE-DC.

**Table 7.5.5-1: Maximum uplink transmission timing difference requirement for inter-band asynchronous NE-DC**

| Sub-carrier spacing in PCell (kHz) | UL Sub-carrier spacing for data in E-UTRA PSCell (kHz) | Maximum uplink transmission timing difference (μs) |
|---|---|---|
| 15 | 15 | 500 |
| 30 | 15 | 250 |
| 60 | 15 | 125 |
| 120 | 15 | 62.5 |
| NOTE 1: Void | | |

**Table 7.5.5-2 Void**

### 7.5.5.1 Minimum requirements for inter-band synchronous NE-DC

The requirements in this clause apply as a reference for inter-band synchronous NE-DC.

The UE shall be capable of handling a maximum uplink transmission timing difference (MTTD) between PCell and E-UTRA PSCell for inter-band synchronous NE-DC as shown in table 7.5.5.1-1. The requirements for synchronous NE-DC are applicable for NR TDD- E-UTRA TDD, NR FDD- E-UTRA FDD, NR TDD- E-UTRA FDD and NR FDD- E-UTRA TDD inter-band NE-DC.

For NR FDD-E-UTRA FDD inter-band NE-DC with overlapping DL bands, only synchronized operation is assumed if UE does not indicate that it is capable of asynchronous FDD-FDD NE-DC operation. The UE shall be capable of handling a maximum uplink transmission timing difference (MTTD) between NR PCell and PSCell as shown in table 7.5.5.1-1 if UE indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16*, and the same requirement as in table 7.5.3-1 apply provided that UE does not indicate it is capable of *interBandMRDC-WithOverlapDL-Bands-r16*.

**Table 7.5.5.1-1: Maximum uplink transmission timing difference requirement for inter-band synchronous NE-DC**

| Sub-carrier spacing in PCell (kHz) | UL Sub-carrier spacing for data in E-UTRA PSCell (kHz) | Maximum uplink transmission timing difference (μs) |
|---|---|---|
| 15 | 15 | 35.21 |
| 30 | 15 | 35.21 |
| 60 | 15 | 35.21 |
| 120 | 15 | 35.21 |

## 7.5.6 Minimum requirements for inter-band NR-DC

The UE shall be capable of handling a maximum uplink transmission timing difference between PCell and PSCell as shown in table 7.5.6-1 provided that the UE indicates that it is capable of synchronous NR-DC only [14].

**Table 7.5.6-1: Maximum uplink transmission timing difference requirement for inter-band synchronous NR-DC**

| Frequency Range | | Maximum uplink transmission timing difference (μs) |
|---|---|---|
| Cell in MCG | Cell in SCG | |
| FR1 | FR1 | 34.6 |
| FR2-1 | FR2-1 | 8.5 |
| FR1 | FR2-1 | 34.1 |
| FR1 | FR2-2 | 34.1 |

The UE shall be capable of handling a maximum uplink transmission timing difference between PCell and PSCell as shown in table 7.5.6-2 provided that the UE indicates that it is capable of asynchronous NR-DC [14].

**Table 7.5.6-2 Maximum uplink transmission timing difference requirement for inter-band asynchronous NR-DC**

| Max {Sub-carrier spacing in PCell (kHz), Sub-carrier spacing in PSCell (kHz)} | Maximum uplink transmission timing difference (μs) |
|---|---|
| 15 | 500 |
| 30 | 250 |
| 60 | 125 |
| 120 | 62.5 |
| 480 | 15.625 |
| 960 | 7.8125 |

### 7.5.7 Minimum requirements for multi-TRP

A UE supporting *multiDCI-IntraCellMultiTRP-TwoTA-r18* or *multiDCI-InterCellMultiTRP-TwoTA-r18* shall be capable of handling at least a relative transmission timing difference between slot timing of a pair of TAGs configured on the same carrier as shown in tables 7.5.7-1, if the UE does not indicate support of *rxTimingDiff-r18*.

A UE supporting *multiDCI-IntraCellMultiTRP-TwoTA-r18* or *multiDCI-InterCellMultiTRP-TwoTA-r18* shall be capable of handling at least a relative transmission timing difference between slot timing of the pair of TAGs configured on the same carrier as shown in table 7.5.7-2, provided that the UE indicates that it is capable of *rxTimingDiff-r18*.

A UE supporting *twoTA-InterCellBM-r19* or *twoTA-IntraCellBM-r19* shall be capable of handling at least a relative transmission timing difference between slot timing of a pair of TAGs configured on the same carrier with single DCI as shown in Table 7.5.7-1, if the UE is configured with PL_offset or if the UE does not indicate support of *twoTA-RxTimeDiff-r19*, and in Table 7.5.7-2, if the UE indicates that it is capable of *twoTA-RxTimeDiff-r19* and PL_offset is not configured.

**Table 7.5.7-1: Maximum uplink transmission timing difference requirement for multi-TRP for UE not supporting *rxTimingDiff-r18* and not supporting *twoTA-RxTimeDiff-r19***

| Frequency Range of the pair of TAGs | Maximum uplink transmission timing difference (μs) |
|---|---|
| FR1 | CP length[note 1]+1.6us |
| FR2-1 | CP length[note 1]+0.5us |
| NOTE 1: CP length of the maximum SCS on the carrier.<br>NOTE 2: This requirement applies to the UE capable of [STxMP]. | |

**Table 7.5.7-2: Maximum uplink transmission timing difference requirement for multi-TRP for UE supporting *rxTimingDiff-r18* or supporting *twoTA-RxTimeDiff-r19***

| Frequency Range of the pair of TAGs | Maximum uplink transmission timing difference (μs) |
|---|---|
| FR1 | 34.6 |
| FR2-1 | 8.5 |

## 7.6 Maximum Receive Timing Difference

### 7.6.1 Introduction

A UE shall be capable of handling a relative receive timing difference between subframe timing boundary of an E-UTRA cell belonging to the MCG and the closest slot timing boundary of a cell belonging to SCG to be aggregated for EN-DC operation.

A UE shall be capable of handling a relative receive timing difference between subframe timing boundary of an E-UTRA cell belonging to the SCG to be aggregated for NE-DC operation and the closest slot timing boundary of a cell belonging to MCG.

A UE shall be capable of handling a relative receive timing difference between slot timing boundary of a cell belonging to MCG in FR1 or FR2-1 and the closest slot timing boundary of a cell belonging to the SCG FR1 or FR2-1 to be aggregated for NR-DC operation.

A UE shall be capable of handling a relative receive timing difference between subframe timing boundary of a cell belonging to MCG in FR1 and the closest subframe timing boundary of a cell belonging to the SCG in FR2-2 to be aggregated for NR-DC operation.

A UE shall be capable of handling a relative receive timing difference among the closest slot timing boundaries of different carriers in FR1 and/or FR2-1 to be aggregated in NR carrier aggregation.

A UE shall be capable of handling a relative receive timing difference among the closest subframe timing boundaries of different carriers to be aggregated in FR1 and FR2-2 NR inter-band carrier aggregation.

An FR2-1 PC6 UE supporting *simultaneousReceptionTwoQCL-r18* shall be capable of handling a relative receive timing difference between the subframe boundaries of signals on the same CC received using two different Rx chains simultaneously in HST FR2 bidirectional deployment.

A UE supporting *multiDCI-IntraCellMultiTRP-TwoTA-r18 or multiDCI-InterCellMultiTRP-TwoTA-r18* shall be capable of handling a relative receive timing difference between the slot boundaries of signals on the same CC received from two TRPs.

A UE supporting *schedulingMeasurementRelaxation-r18 or fastBeamSweepingMultiRx-r18* shall be capable of handling a relative receive timing difference among the subframe timing boundary of different TCI states indicated for simultaneous reception on a single carrier.

The requirements defined in clause 7.6 are also applicable when UE is configured to receive multiple PDSCH transmission occasions from one or more QCL sources on any one of the aggregated NR carriers.

The requirements defined in clause 7.6 are also applicable for the UE capable of 2 TA enhancement with single DCI, provided the UE is configured with 2 TAs and not configured with PL offset in joint/UL TCI state(s). In this scenario, when UE is configured with *SSB-MTC-additionalPCI*, the UE may expect to receive SSB from UL TRP(s).

## 7.6.2 Minimum requirements for inter-band EN-DC

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to SCG at the UE receiver as shown in table 7.6.2-1.

**Table 7.6.2-1: Maximum receive timing difference requirement for asynchronous EN-DC**

| Sub-carrier spacing of E-UTRA cell in MCG (kHz) | DL Sub-carrier spacing of cell in SCG (kHz) (Note 1) | Maximum receive timing difference (μs) |
|---|---|---|
| 15 | 15 | 500 |
| 15 | 30 | 250 |
| 15 | 60 | 125 |
| 15 | 120[Note2] | 62.5 |
| NOTE 1: DL Sub-carrier spacing is min{$SCS_{SS}$, $SCS_{DATA}$}.<br>NOTE 2: For E-UTRA FDD-NR FDD intra-band EN-DC, for which the requirement is defined in clause 7.6.3 and this table 7.6.2-1 is also applicable, the scenario with 120 kHz does not exit. | | |

**Table 7.6.2-2 Void**

**Table 7.6.2-3 Void**

### 7.6.2.1 Minimum requirements for inter-band synchronous EN-DC

The requirements in this clause apply as a reference for inter-band synchronous EN-DC.

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from an E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to SCG at the UE receiver for inter-band synchronous EN-DC as shown in table 7.6.2.1-1. The requirements for synchronous EN-DC are applicable for E-UTRA TDD-NR TDD, E-UTRA FDD-NR FDD, E-UTRA TDD-NR FDD and E-UTRA FDD-NR TDD inter-band EN-DC.

For E-UTRA TDD-NR TDD inter-band EN-DC with overlapping or partially overlapping DL bands, only synchronized operation is assumed. The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG at the UE receiver as shown in table 7.6.2.1-1 provided that UE not supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* or UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r16* and not provided with *nonCollocatedTypeMRDC-r18*, and in table 7.6.3-1 provided that UE is not capable of *interBandMRDC-*

*WithOverlapDL-Bands-r16* or UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r16* and provided with *nonCollocatedTypeMRDC-r18*.

For E-UTRA FDD-NR FDD inter-band EN-DC with overlapping DL bands, only synchronized operation is assumed if UE does not indicate that it is capable of asynchronous FDD-FDD EN-DC operation. The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG at the UE receiver as shown in table 7.6.2.1-1 provided that UE not supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* or UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r16* and not provided with *nonCollocatedTypeMRDC-r18*, and in table 7.6.3-1 provided that UE is not capable of *interBandMRDC-WithOverlapDL-Bands-r16* or UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r16* and provided with *nonCollocatedTypeMRDC-r18*.

For E-UTRA TDD-NR TDD inter-band EN-DC with overlapping or partially overlapping DL bands, or E-UTRA FDD-NR FDD inter-band EN-DC with overlapping DL bands, if UE indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r19,*

1> when UE is configured with *maxMIMO-Layers* with value equal to 4,

2> if nonCollocatedTypeMRDC-v1900 is present with “type 4”,

3> the UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG at the UE receiver as shown in table 7.6.2.1-1.

2> otherwise, if *nonCollocatedTypeMRDC-v1900* is present with *“type 1”* or absent,

3> the UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG at the UE receiver as shown in table 7.6.3-1.

1> when UE is configured with *maxMIMO-Layers* with value equal to 2,

2> if *nonCollocatedTypeMRDC-r18* is not provided,

3> the UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG at the UE receiver as shown in table 7.6.2.1-1.

2> otherwise

3> the UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG at the UE receiver as shown in table 7.6.3-1.

**Table 7.6.2.1-1: Maximum receive timing difference requirement for inter-band synchronous EN-DC**

| Sub-carrier spacing of E-UTRA cell in MCG (kHz) | DL Sub-carrier spacing of cell in SCG (kHz) (Note1) | Maximum receive timing difference (μs) |
|---|---|---|
| 15 | 15 | 33 |
| 15 | 30 | |
| 15 | 60 | |
| 15 | 120 | |
| NOTE 1: DL Sub-carrier spacing is min{$SCS_{SS}$, $SCS_{DATA}$}. | | |

## 7.6.3 Minimum requirements for intra-band EN-DC

For intra-band EN-DC, only co-located deployment is applied.

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG as shown in table 7.6.2-1 for E-UTRA FDD-NR FDD intra-band EN-DC provided the UE indicates that it is capable of asynchronous EN-DC operation [2].

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a E-UTRA cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG as shown in table 7.6.3-1 for E-UTRA FDD-NR FDD and E-UTRA TDD-NR TDD intra-band EN-DC provided the UE does not indicate that it is capable of asynchronous FDD-FDD EN-DC operation [16].

**Table 7.6.3-1 Maximum receive timing difference requirement for intra-band synchronous EN-DC**

| Sub-carrier spacing of E-UTRA cell in MCG (kHz) | DL Sub-carrier spacing of cell in SCG (kHz) Note1 | Maximum receive timing difference (μs) |
|---|---|---|
| 15 | 15 | 3 |
| 15 | 30 | 3 |
| 15 | 60 | 3 |
| NOTE 1: DL Sub-carrier spacing is min{$SCS_{SS}$, $SCS_{DATA}$}.<br>NOTE 2: The requirement in this table is also applicable for intra-band synchronous NE-DC. | | |

**Table 7.6.3-2: Void**

## 7.6.4 Minimum requirements for NR Carrier Aggregation

For intra-band contiguous CA, only co-located deployment is applied. For intra-band non-contiguous NR carrier aggregation, the UE not capable of *intraBandNR-CA-non-collocated-r18* shall be capable of handling at least a relative receive timing difference between slot timing of different carriers to be aggregated at the UE receiver as shown in table 7.6.4-1 below.

For FR1 intra-band non-contiguous NR carrier aggregation, the UE shall be capable of handling at least a relative receive timing difference as shown in table 7.6.4-2, between slot timing of different FR1 carriers to be aggregated at the UE receiver provided that UE indicates that it is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided. Otherwise, the UE shall be capable of handling at least a relative receive timing difference between slot timing of different carriers to be aggregated at the UE receiver as shown in table 7.6.4-1 below if UE indicates that it is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided.

For FR1 intra-band non-contiguous NR carrier aggregation and UE supporting *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with *maxMIMO-Layers* with value equal to 4,

2> if nonCollocatedTypeNR-CA-v1900 is present with “type 4”,

3> the UE shall be capable of handling at least a relative receive timing difference between slot timing of different FR1 carriers to be aggregated at the UE receiver as shown in table 7.6.4-2.

2> otherwise, if nonCollocatedTypeNR-CA-v1900 is present with “type 1” or absent,

3> the UE shall be capable of handling at least a relative receive timing difference between slot timing of different carriers to be aggregated at the UE receiver as shown in table 7.6.4-1.

1> when UE is configured with *maxMIMO-Layers* with value equal to 2,

2> if *nonCollocatedTypeNR-CA-r18* is not provided,

3> the UE shall be capable of handling at least a relative receive timing difference between slot timing of different FR1 carriers to be aggregated at the UE receiver as shown in table 7.6.4-2.

2> otherwise,

3> the UE shall be capable of handling at least a relative receive timing difference between slot timing of different carriers to be aggregated at the UE receiver as shown in table 7.6.4-1.

**Table 7.6.4-1: Maximum receive timing difference requirement for intra-band non-contiguous NR carrier aggregation**

| Frequency Range | Maximum receive timing difference (μs) |
|---|---|

| | |
|---|---|
| FR1 | 3[1] |
| FR2-1 | 0.26 |
| NOTE 1: In the case of different SCS on different CCs, if the receive time difference exceeds the cyclic prefix length of that SCS, demodulation performance degradation is expected for the first symbol of the slot. | |

For inter-band NR carrier aggregation,

- the UE shall be capable of handling at least a relative receive timing difference between slot timing of all pairs of carriers in FR1 and FR2-1 to be aggregated at the UE receiver as shown in table 7.6.4-2 below.
- the UE shall be capable of handling at least a relative receive timing difference between subframe timing of all pairs of carriers in FR1 and FR2-2 to be aggregated at the UE receiver as shown in table 7.6.4-2 below.

**Table 7.6.4-2: Maximum receive timing difference requirement for inter-band NR carrier aggregation**

| Frequency Range of the pair of carriers | Maximum receive timing difference (μs) |
|---|---|
| FR1 | 33 |
| FR2-1 | 8 note1 |
| Between FR1 and FR2-1 | 25 |
| Between FR1 and FR2-2 | 25 |
| NOTE1: This requirement applies to the UE capable of independent beam management for FR2-1 inter-band CA. | |

## 7.6.5 Minimum requirements for inter-band NE-DC

The UE shall be capable of handling at least a relative receive timing difference between slot timing of signal from a cell belonging to the MCG and subframe timing of signal from an E-UTRA cell belonging to the SCG at the UE receiver for asynchronous NE-DC as shown in table 7.6.5-1.

**Table 7.6.5-1: Maximum receive timing difference requirement for asynchronous NE-DC**

| Sub-carrier spacing of cell in MCG (kHz) | DL Sub-carrier spacing of EUTRA cell in SCG (kHz) (Note 1) | Maximum receive timing difference (μs) |
|---|---|---|
| 15 | 15 | 500 |
| 30 | 15 | 250 |
| 60 | 15 | 125 |
| 120 | 15 | 62.5 |
| NOTE 1: DL Sub-carrier spacing is min{$SCS_{SS}$, $SCS_{DATA}$}.<br>NOTE 2: Void | | |

**Table 7.6.5-2: Void**

### 7.6.5.1 Minimum requirements for inter-band synchronous NE-DC

The requirements in this clause apply as a reference for inter-band synchronous NE-DC.

The UE shall be capable of handling at least a relative receive timing difference between slot timing of signal from a cell belonging to the MCG and subframe timing of signal from a E-UTRA cell belonging to the SCG at the UE receiver for inter-band synchronous NE-DC as shown in table 7.6.5.1-1. The requirements for synchronous NE-DC are applicable for NR TDD- E-UTRA TDD, NR FDD- E-UTRA FDD, NR TDD- E-UTRA FDD and NR FDD- E-UTRA TDD inter-band NE-DC.

For NR FDD-E-UTRA FDD inter-band NE-DC with overlapping DL bands, only synchronized operation is assumed if UE does not indicate that it is capable of asynchronous FDD-FDD NE-DC operation. The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a cell belonging to the MCG and slot timing of signal from a cell belonging to the SCG at the UE receiver as shown in table 7.6.2.1-1 provided that UE indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16*, and the same requirement as in table 7.6.3-1 apply provided that UE does not indicate it is capable of *interBandMRDC-WithOverlapDL-Bands-r16*.

**Table 7.6.5.1-1: Maximum receive timing difference requirement for inter-band synchronous NE-DC**

| Sub-carrier spacing of cell in MCG (kHz) | DL Sub-carrier spacing of EUTRA cell in SCG (kHz) (Note1) | Maximum receive timing difference (μs) |
|---|---|---|
| 15 | 15 | 33 |
| 30 | 15 | |
| 60 | 15 | |
| 120 | 15 | |

## 7.6.6 Minimum requirements for inter-band NR-DC

The UE shall be capable of handling at least a relative receive timing difference between slot timing of signal from a cell belonging to the MCG in FR1 or FR2-1 and slot timing of signal from a cell belonging to the SCG in FR1 or FR2-1 at the UE receiver as shown in table 7.6.6-1 provided that the UE indicates that it is capable of synchronous NR-DC only [16].

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a cell belonging to the MCG in FR1 and subframe timing of signal from a cell belonging to the SCG in FR2-2 at the UE receiver as shown in table 7.6.6-1 provided that the UE indicates that it is capable of synchronous NR-DC only [16].

**Table 7.6.6-1: Maximum receive timing difference requirement for inter-band synchronous NR-DC**

| Frequency Range | | Maximum receive timing difference (μs) |
|---|---|---|
| Cell in MCG | Cell in SCG | |
| FR1 | FR1 | 33 |
| FR2-1 | FR2-1 | 8 |
| FR1 | FR2-1 | 33 |
| FR1 | FR2-2 | 33 |

The UE shall be capable of handling at least a relative receive timing difference between slot timing of signal from a cell belonging to the MCG in FR1 or FR2-1 and slot timing of signal from a cell belonging to the SCG in FR1 or FR2-1 at the UE receiver as shown in table 7.6.6-2 provided that the UE indicates that it is capable of asynchronous NR-DC [16].

The UE shall be capable of handling at least a relative receive timing difference between subframe timing of signal from a cell belonging to the MCG in FR1 and subframe timing of signal from a cell belonging to the SCG in FR2-2 at the UE receiver as shown in table 7.6.6-2 provided that the UE indicates that it is capable of asynchronous NR-DC [16].

**Table 7.6.6-2 Maximum receive timing difference requirement for inter-band asynchronous NR-DC**

| Max {Sub-carrier spacing in PCell (kHz), Sub-carrier spacing in PSCell (kHz)} | Maximum receive timing difference (μs) |
|---|---|
| 15 | 500 |
| 30 | 250 |
| 60 | 125 |
| 120 | 62.5 |
| 480 | 15.625 |
| 960 | 7.8125 |

## 7.6.7 Minimum requirements for PC6 UE in FR2

In HST FR2 scenario, when *highSpeedMeasFlagFR2-r17* is configured and *highSpeedDeploymentTypeFR2-r17* is configured as bidirectional for a PC6 UE supporting *simultaneousReceptionTwoQCL-r18*, the UE shall be capable of handling a maximum receive timing difference specified as in the below table 7.6.7-1. The specified timing difference

is between the subframe boundaries of the signals on the same CC which UE receives using two different Rx chains simultaneously.

**Table 7.6.7-1: Maximum receive timing difference requirement for PC6 UE supporting *simultaneousReceptionTwoQCL-r18***

| Frequency Range | Subcarrier spacing (kHz) | Maximum receive timing difference (μs) |
|---|---|---|
| FR2-1 | 120 | 8 |

## 7.6.8 Minimum requirements for Multi-TRPs

A UE supporting *multiDCI-IntraCellMultiTRP-TwoTA-r18* or *multiDCI-InterCellMultiTRP-TwoTA-r18* shall be capable of handling at least a relative receive timing difference between slot timing of different TRPs on the same carrier at the UE receiver as shown in table 7.6.8-1 below, if the UE does not indicate support of *rxTimingDiff-r18*.

A UE supporting *multiDCI-IntraCellMultiTRP-TwoTA-r18* or *multiDCI-InterCellMultiTRP-TwoTA-r18* shall be capable of handling at least a relative receive timing difference between slot timing of different TRPs on the same carrier at the UE receiver as shown in table 7.6.8-2 below, provided that the UE indicates that it is capable of *rxTimingDiff-r18*.

A UE supporting 2 TA enhancement with single DCI provided no PL_offset is configured shall be capable of handling at least a relative receive timing difference between slot timing of different TRPs on the same carrier at the UE receiver as shown in table 7.6.8-1 below, if the UE does not indicate support of *rxTimingDiff-r18*, and in Table 7.6.8-2, if the UE indicates that it is capable of *rxTimingDiff-r18*.

**Table 7.6.8-1: Maximum receive timing difference requirement for multi-TRPs with two TAs for UE not capable of *rxTimingDiff-r18***

| Frequency Range | Maximum receive timing difference |
|---|---|
| FR1 | CP length[note 1] |
| FR2-1 | CP length[note 1] |
| NOTE 1: CP length of the maximum SCS on the carrier. | |

**Table 7.6.8-2: Maximum receive timing difference requirement for multi-TRPs with two TAs for UE capable of *rxTimingDiff-r18***

| Frequency Range of the pair of carriers | Maximum receive timing difference (μs) |
|---|---|
| FR1 | 33 |
| FR2-1 | 8 |

A UE supporting *schedulingMeasurementRelaxation-r18 or fastBeamSweepingMultiRx-r18* shall be capable of handling at least a relative receive timing difference between slot timing of different TCI states on the same carrier at the UE receiver as shown in table 7.6.8-3.

**Table 7.6.8-3: Maximum receive timing difference requirement for UE supporting multi-RX**

| Frequency Range | Maximum receive timing difference |
|---|---|
| FR2-1 | CP length |

# 7.6D Maximum Receive Timing Difference for ATG UE

## 7.6D.1 Introduction

An ATG UE shall be capable of handling a relative receive timing difference between the closest slot timing boundaries of different carriers in FR1 to be aggregated in NR carrier aggregation.

## 7.6D.2 Minimum requirements for NR Carrier Aggregation

The ATG UE shall be capable of handling at least a relative receive timing difference between slot timing of all pairs of carriers in FR1 to be aggregated at the ATG UE receiver as shown in table 7.6D.2-1 below.

**Table 7.6D.2-1: Maximum receive timing difference requirement for ATG UE in inter-band NR carrier aggregation**

| Frequency Range of the pair of carriers | Maximum receive timing difference (μs) |
|---|---|
| FR1 | 33 |

# 7.7 *deriveSSB-IndexFromCell* tolerance

## 7.7.1 Minimum requirements

When *deriveSSB-IndexFromCell* is enabled, the UE assumes frame boundary alignment (including half frame, subframe and slot boundary alignment) across cells on the same frequency carrier is within a tolerance not worse than

- min (2 SSB symbols, 1 PDSCH symbol) for sub-carrier spacings of SSB and PDSCH up to 240 kHz,
- min (3 SSB symbols, $N_{PDSCH}$ PDSCH symbols) for sub-carrier spacing of 480 kHz and 960 kHz of either SSB or PDSCH where $N_{PDSCH}$ is defined in table 7.7.1-1

and the SFNs of all cells on the same frequency carrier are the same.

**Table 7.7.1-1 $N_{PDSCH}$ when deriveSSB-IndexFromCell is enabled**

| SSB SCS (kHz) | PDSCH SCS (kHz) | $N_{PDSCH}$ |
|---|---|---|
| 120 | 480 | 3 |
| 120 | 960 | 6 |
| 480 | 120 | 1 |
| 480 | 480 | 3 |
| 480 | 960 | 6 |
| 960 | 120 | 1 |
| 960 | 480 | 2 |
| 960 | 960 | 3 |

When *deriveSSB-IndexFromCell* is not enabled, the UE assumes frame boundary alignment (including half frame, subframe and slot boundary alignment) across cells on the same frequency carrier is within a tolerance not worse than 6 SSB symbols for sub-carrier spacing of 960 kHz and the SFNs of all cells on the same frequency carrier are the same.

# 7.7A deriveSSB-IndexFromCell tolerance for RedCap

## 7.7A.1 Minimum requirements

When *deriveSSB-IndexFromCell* is enabled, the RedCap UE assumes frame boundary alignment (including half frame, subframe and slot boundary alignment) across cells on the same frequency carrier is within a tolerance not worse than min(2 SSB symbols, 1 PDSCH symbol) and the SFNs of all cells on the same frequency carrier are the same.

# 7.7D DeriveSSB-IndexFromCell tolerance for ATG

## 7.7D.1 Minimum requirements

When *deriveSSB-IndexFromCell* is enabled, the ATG UE assumes frame boundary alignment (including half frame, subframe and slot boundary alignment) across cells on the same frequency carrier is within a tolerance not worse than min(2 SSB symbols, 1 PDSCH symbol) and the SFNs of all cells on the same frequency carrier are the same.

UE does not expect the *deriveSSB-IndexFromCell* to be set as true when frame boundary across detectable cells on the same frequency carrier is larger than the minimum tolerance requirement.

# 7.8 Void

# 7.9 *deriveSSB-IndexFromCellInter-r17* tolerance

## 7.9.1 Minimum requirements

When *deriveSSB-IndexFromCellInter-r17* is enabled, the UE assumes frame boundary alignment (including half frame, subframe and slot boundary alignment) across cells on the target carrier and reference cell is within a tolerance not worse than min(2 SSB symbols of target carrier, 1 PDSCH symbol of the reference cell) and the SFNs of all cells on the target carrier and reference cell are the same. The reference cell is the serving cell which is used for SSB indexes derivation as indicated via *deriveSSB-IndexFromCellInter-r17*.

# 7.9D *DeriveSSB-IndexFromCellInter-r17* tolerance for ATG

## 7.9D.1 Minimum requirements

When *deriveSSB-IndexFromCellInter-r17* is enabled, the ATG UE assumes frame boundary alignment (including half frame, subframe and slot boundary alignment) across cells on the target carrier and reference cell is within a tolerance not worse than min (2 SSB symbols of target carrier, 1 PDSCH symbol of the reference cell) and the SFNs of all cells on the target carrier and reference cell are the same. The reference cell is the serving cell which is used for SSB indexes derivation as indicated via *deriveSSB-IndexFromCellInter-r17*.

UE does not expect the *deriveSSB-IndexFromCellInter-r17* to be set as true when frame boundary across detectable cells on the target carrier and reference cell is larger than the minimum tolerance requirement.

# 8 Signalling characteristics

## 8.1 Radio Link Monitoring

### 8.1.1 Introduction

The requirements in clause 8.1 apply for radio link monitoring on:

- PCell in SA NR, NR-DC and NE-DC operation mode,
- PCell operating with less than 5 MHz BW in SA NR (single carrier) operation mode,
- PSCell in NR-DC and EN-DC operation mode,
- Deactivated PSCell in NR-DC and EN-DC operation mode, when configured.

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell, PSCell and deactivated PSCell if configured with *bfd-and-RLM* with value *true* as specified in TS 38.331 [2]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. The configured RLM-RSs can be from the same or different TRPs. UE is not required to perform RLM outside the active DL BWP unless the UE supports *bwpOperationMeasWithoutInterrupt-r18*, provided that the SSB is within the configured UE-specific CBW. For UE supporting *ncd-SSB-BWP-Wor-r18*, the SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not additional specified. If SSB in the active DL BWP of serving cell *i* is NCD-SSB, for serving cell *i* the requirements in clause 8.1 apply provided that serving cell *i* is PCell or activated PSCell.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out}$ and $Q_{in}$ for the purpose of monitoring downlink radio link quality of the cell.

When a CORESET that the UE uses for monitoring PDCCH includes two TCI states and the UE is provided *sfnSchemePdcch* set to 'sfnSchemeA' or 'sfnSchemeB', the UE shall estimate a single downlink radio link quality to derive single SNR and compare it to the single thresholds $Q_{out}$ and $Q_{in}$ for the purpose of monitoring downlink radio link quality of the cell(s). How to compute the single SNR based on two active TCI states is up to UE implementation.

The threshold $Q_{out}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in table 8.1.1-1. For SSB based radio link monitoring, $Q_{out_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.2.1-1. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.3.1-1.

The threshold $Q_{in}$ is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at $Q_{out}$ and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in table 8.1.1-1. For SSB based radio link monitoring, $Q_{in_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.2.1-2. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.3.1-2.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1.1-1 by default. All requirements in clause 8.1 are applicable for BLER Configuration #0 in table 8.1.1-1.

**Table 8.1.1-1: Out-of-sync and in-sync block error rates**

| Configuration | $BLER_{out}$ | $BLER_{in}$ |
|---|---|---|
| 0 | 10 % | 2 % |

UE shall be able to monitor up to $N_{RLM}$ RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number $L_{max}$ of SSBs per half frame according to TS 38.213 [3], where $N_{RLM}$ is specified in table 8.1.1-2 according TS 38.213 [3], and meet the requirements as specified in clause 8.1. UE is not required to meet the requirements in clause 8.1 if RLM-RS is not configured and no TCI state for PDCCH is activated.

**Table 8.1.1-2: Maximum number of RLM-RS resources $N_{RLM}$**

| Carrier frequency range of PCell/PSCell | $L_{max}$ | Maximum number of RLM-RS resources, $N_{RLM}$ |
|---|---|---|
| FR1, ≤ 3 GHz[Note] | 4 | 2 |
| FR1, > 3 GHz[Note] | 8 | 4 |
| FR2 | 64 | 8 |
| NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [3]. | | |

### 8.1.1.1 Introduction of Requirement on Radio Link Monitoring for UE Configured with Relaxed Measurement Criteria

For the UE supports *rlm-Relaxation-r17*and configured with explicit signalling *goodServingCellEvaluationRLM*, which is always configured to the UE when the network enables RLM relaxation for the UE as specified in TS 38.331 [2], the relaxed requirements defined in clause 8.1.2.4 for SSB based radio link monitoring and the relaxed requirements defined in clause 8.1.3.4 for CSI-RS based radio link monitoring are allowed to apply to the relaxed RLM measurements on SpCell after fulfilling the following conditions:

- for the serving cells in intra-band carrier aggregation configured with SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell, when
  - the good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the serving cell based on the measurements that are configured for SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell in the intra-band carrier aggregation if the *lowMobilityEvaluationConnected* is not configured, or
  - the UE is also configured with *lowMobilityEvaluationConnected* and both low mobility criterion defined in clause 5.7.13.1 of TS 38.331 [2] is fulfilled for a period of $T_{SearchDeltaP-Connected}$ and good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the serving cell based on the measurements that are configured for SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell in the intra-band carrier aggregation.
- for other serving cells, when
  - the good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the SpCell if the *lowMobilityEvaluationConnected* is not configured, or
  - the UE is also configured with *lowMobilityEvaluationConnected* and both low mobility criterion defined in clause 5.7.13.1 of TS 38.331 [2] is fulfilled for a period of $T_{SearchDeltaP-Connected}$ and good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the SpCell.

Otherwise, UE shall apply the requirements defined in clause 8.1.2.2 for SSB based radio link monitoring and the requirements defined in clause 8.1.3.2 for CSI-RS based radio link monitoring. Note that when multiple resources are configured on a serving cell for RLM or BFD evaluation, the good serving cell quality critierion is considered as fulfilled for the serving cell when any resource configured for the cell fulfills the good serving defined in clause 5.7.13.2 of TS 38.331 [2].

The UE is no longer allowed to relax RLM measurements and apply the relaxed radio link monitoring provided that at least one of the following conditions is met:

- The UE sends out-of sync indications to the higher layers,
- The timer T310 is running.
- No DRX is configured or configured DRX cycle is longer than 80 ms

NOTE: Applicability of DRX configuration follows TS 38.331 [2] clause 5.7.13.0.

## 8.1.2 Requirements for SSB based radio link monitoring

### 8.1.2.1 Introduction

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell, PSCell or deactivated PSCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1.2.2 unless the UE supports *bwpOperationMeasWithoutInterrupt-r18*, provided that the SSB is within the configured UE-specific CBW.

**Table 8.1.2.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 4 dB |
| Bandwidth (PRBs) | 24 |

| Mapping from REG to CCE | Distributed | Non-Distributed | Distributed |

## 8.1.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB}$ period becomes worse than the threshold $Q_{out_SSB}$ within $T_{Evaluate_out_SSB}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB}$ period becomes better than the threshold $Q_{in_SSB}$ within $T_{Evaluate_in_SSB}$ evaluation period.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-1 for FR1.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-2 for FR2 with scaling factor N, where

- N=2, 4, or 6 for FR2-1 for UE supporting *fastBeamSweepingMultiRx-r18* according to the conditions in clause 3.6.19, and
- N=8 for other cases in FR2-1, and
- N=12 for FR2-2.

for FR2 power classes other than power class 6 or for FR2 power class 6 when *highSpeedMeasFlagFR2-r17* is not configured.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-3 for FR2 power class 6 UE configured with *highSpeedMeasFlagFR2-r17*.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-4 for FR1 (deactivated PSCell).

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1.2.2-5 for FR2 (deactivated PSCell) with scaling factor N=8 for FR2-1 and N=12 for FR2-2.

For a UE supporting *featureSetCombinationLowBandSwitching-r19*, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both *concurrentMeasGap-r17* and *musim-GapPreference-r17*, and when concurrent measurement gaps or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are configured,

- an RLM-RS resource occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clauses 9.1.8 and 9.1.10,

P value for an RLM-RS resource to be measured is defined as

- $N_{total}$ / $N_{outside_MG}$ in FR1
- $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
- $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0

- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or periodic MUSIM gap(s) or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any RLM-RS resource occasion:
  - $N_{total}$ is the total number of RLM-RS resource occasions within the window W, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window W. For UEs supporting *featureSetCombinationLowBandSwitching-r19*, $N_{total}$ also includes RLM-RS occasions that overlap with the SDL ON duration within the window, as defined by the configured switching pattern, and
  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion, and that are overlapped with PCell ON duration corresponding to the LB CA switching pattern within the window W for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, and
  - $N_{available}$ is the number of RLM-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion nor any SMTC occasion within the window W, and
  - an RLM-RS resource occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion, and
  - $T_{L1}$ is periodicity of the target RLM-RS.
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.
  - for UEs that support *featureSetCombinationLowBandSwitching-r19*, switching pattern periodicity is the periodicity of the RRC configured semi-static switching pattern; otherwise, it is not applicable.
  - RLM requirement in this clause is not applied when $N_{outside_MG}$ = 0.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* nor supporting *musim-GapPreference-r17* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s), concurrent measurement gap(s) with NCSG(s), and periodic MUSIM gaps,

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, and these GAPs are overlapping with some but not all occasions of the SSB; and
- P = 1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB.

For FR2

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when RLM-RS resource is not overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- P is $P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with GAP and RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and

- $T_{SMTCperiod} \neq$ xRP or
- $T_{SMTCperiod}$ = xRP and $T_{SSB} < 0.5*T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when the RLM-RS is partially overlapped with GAP and the RLM-RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod}$ = xRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{Min(xRP,T_{SMTCperiod})}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} <$ xRP)

where,

- $P_{sharing\ factor}$ = 1, if the RLM-RS resource outside GAP is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{sharing\ factor}$ = 3, otherwise.
- If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.
- When a GAP is configured only and the GAP is not NCSG,
  - an RLM-RS resource or an SMTC occasion is considered to be overlapped with the GAP if it overlaps a GAP occasion, and
  - xRP = MGRP
- Otherwise, when NCSG is configured,
  - an RLM-RS resource or an SMTC occasion is considered to be overlapped with the GAP if
    - it overlaps the VIL1 or VIL2 of NCSG, or
    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,
  - and
    - xRP = VIRP
- If the UE is configured with Pre-MG only, an RLM-RS resource or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, an RLM-RS resource or an SMTC occasion is not considered as overlapped by a

GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform SSB measurements during the cancelled gap occasions, and no restrictions on the scheduling availability apply during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

When the configured aperiodic MUSIM gap is overlapping with RLM-RS resource occasion, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and if RLM-RS resource occasions are fully overlapped with MUSIM gap(s) or the union of MUSIM gap(s) and GAPs, no requirement applies for SSB based RLM.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

### 8.1.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1, when the SSB OFDM symbols used for RLM fully or partially overlap with CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined

For FR2, when the SSB for RLM measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement on one CC is in the same or adjacent OFDM symbol as SSB from cell with additional PCI for BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure either SSB or CSI-RS but not both. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, there is no measurement restriction allowed when the network configures mixed numerology between SSB for RLM measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, provided that UE is capable of independent beam management on this FR2 band pair.

### 8.1.2.4 Minimum requirement of SSB based radio link monitoring for UE fulfilling relaxed measurement criteria

This clause contains minimum requirements for relaxed radio link monitoring based on SSB.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB_Relax}$ period becomes worse than the threshold $Q_{out_SSB}$ within $T_{Evaluate_out_SSB_Relax}$ evaluation period.

$T_{Evaluate_out_SSB_Relax}$ is defined in table 8.1.2.4-1 for FR1.

$T_{Evaluate_out_SSB_Relax}$ is defined in table 8.1.2.4-2 for FR2 with scaling factor N=8.

The value of P is defined in clause 8.1.2.2.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 8.1.2.4-1: Evaluation period $T_{Evaluate_out_SSB_Relax}$ for FR1**

| Configuration | $T_{Evaluate_out_SSB_Relax}$ (ms) |
|---|---|
| $Max(T_{DRX},T_{SSB}) \leq 80$ ms | $Max(200 \times K3^{NOTE3}, Ceil(15 \times K1^{NOTE2} \times P) \times Max(T_{DRX},T_{SSB}))$ |
| 80 ms < $Max(T_{DRX},T_{SSB}) \leq 160$ ms | $Ceil(15 \times P) \times Max(T_{DRX},T_{SSB})$ |
| NOTE 1: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length and no longer than 80 ms.<br>NOTE 2: K1 = 4 for $Max(T_{DRX},T_{SSB}) \leq 40$ ms and K1 = 2 for 40 ms<$Max(T_{DRX},T_{SSB}) \leq 80$ ms.<br>NOTE 3: K3 = K1, if K1 ≤ 2; otherwise K3 = 1. | |

| 80 ms < $Max(T_{DRX},T_{SSB}) \leq 160$ ms | $Ceil(15 \times P \times N) \times Max(T_{DRX},T_{SSB})$ |
| NOTE 1: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length and no longer than 80 ms.<br>NOTE 2: K2 = 2.<br>NOTE 3: K4 = K2, if K2 ≤ 2; otherwise K4 = 1. | |

## 8.1.3 Requirements for CSI-RS based radio link monitoring

### 8.1.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, PSCell or deactivated PSCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.1.3.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|

| | |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 4 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.1.3.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI payload size | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 4 |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

### 8.1.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI\text{-}RS}$ period becomes worse than the threshold $Q_{out_CSI\text{-}RS}$ within $T_{Evaluate_out_CSI\text{-}RS}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI\text{-}RS}$ ms period becomes better than the threshold $Q_{in_CSI\text{-}RS}$ within $T_{Evaluate_in_CSI\text{-}RS}$ ms evaluation period.

- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1.3.2-1 for FR1.
- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1.3.2-2 for FR2 with scaling factor N=1.
- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1.3.2-3 for FR1 (deactivated PSCell).
- $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ are defined in table 8.1.3.2-4 for FR2 (deactivated PSCell) with scaling factor N=1.

The requirements of $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For the value of $L1_{Out}$ and $L1_{In}$,

1> If the UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network,

2> $L1_{Out}$ is not applicable;

2> $L1_{In}$ is not applicable;

1> Else if the UE supports *sbfd-Aware-r19* and SBFD is configured by the network,

2> If DRX is not configured,

3> $L1_{Out}$ is the number of occasions of the CSI-RS resource for RLM that are overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_Out_CSI-RS}$;

3> $L1_{In}$ is the number of occasions of the CSI-RS resource for RLM that are overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_In_CSI-RS}$, when DRX is not configured

2> If DRX is configured,

3> $L1_{Out}$ is the number of DRX cycles in which at least one occasion of the CSI-RS resource for RLM is overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_Out_CSI-RS}$;

3> $L1_{In}$ is the number of DRX cycles in which at least one occasion of the CSI-RS resource for RLM is overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_In_CSI-RS}$;

If the UE supports *sbfd-Aware-r19* and SBFD is configured by the network, the requirements in this clause apply provided that all the occasions of the CSI-RS resource are in the same type (i.e., SBFD or non-SBFD) of symbols.

For a UE supporting *featureSetCombinationLowBandSwitching-r19*, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both *concurrentMeasGap-r17* and *musim-GapPreference-r17,* and when concurrent measurement gaps or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are are configured,

- an RLM-RS resource occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clauses 9.1.8 and 9.1.10,
- P value for an RLM-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with Navailable > 0
- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or periodic MUSIM gap(s) or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any RLM-RS resource occasion:
  - $N_{total}$ is the total number of RLM-RS resource occasions within the window W, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window W. For UEs supporting *featureSetCombinationLowBandSwitching-r19*, $N_{total}$ also includes RLM-RS occasions that overlap with the SDL ON duration within the window, as defined by the configured switching pattern, and
  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion, and that are overlapped with PCell ON duration corresponding to the LB CA switching pattern within the window W for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, and
  - $N_{available}$ is the number of RLM-RS resource occasions that are not overlapped with any non-dropped GAP occasion, nor non-dropped MUSIM gap occasion, nor any SMTC occasion within the window W, and
  - an RLM-RS resource occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion, and
  - $T_{L1}$ is periodicity of the target RLM-RS.
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.
  - for UEs that support *featureSetCombinationLowBandSwitching-r19*, switching pattern periodicity is the periodicity of the RRC configured semi-static switching pattern; otherwise, it is not applicable.
  - RLM requirement in this clause is not applied when $N_{outside_MG}$ = 0.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* nor supporting *musim-GapPreference-r17* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s), concurrent measurement gap(s) with NCSG(s), and periodic MUSIM gaps,

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, and these GAPs] are overlapping with some but not all occasions of the CSI-RS; and
- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the CSI-RS.

For FR2,

- P=1, when the RLM-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is not overlapped with SMTC occasion ($T_{CSI-RS} < xRP$)
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is not overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with GAP and RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and
  - $T_{SMTCperiod} \neq xRP$ or
  - $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$
- $P = \frac{P_{\text{sharing factor}}}{1-\frac{T_{CSI-RS}}{xRP}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{Min(xRP,T_{SMTCperiod})}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP
- $P = \frac{P_{\text{sharing factor}}}{1-\frac{T_{CSI-RS}}{xRP}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} < xRP$)

where,

- $P_{sharing\ factor} = 1$, if the RLM-RS resource outside GAP is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

- not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.

- If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

- When a GAP is configured only and the GAP is not NCSG,

  - an RLM-RS resource or an SMTC occasion is considered to be overlapped with the GAP if it overlaps a GAP occasion, and

  - xRP = MGRP

- Otherwise, when NCSG is configured,

  - an RLM-RS resource or an SMTC occasion is considered to be overlapped with the GAP if

    - it overlaps the VIL1 or VIL2 of NCSG, or

    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,

  - and

    - xRP = VIRP

If the UE is configured with Pre-MG only, an RLM-RS resource or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.

When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured , an RLM-RS resource or an SMTC occasion is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

NOTE: The overlap between CSI-RS for RLM and SMTC means that CSI-RS based RLM is within the SMTC window duration.

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform CSI-RS measurements during the cancelled gap occasions, and no restrictions on the scheduling availability apply during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

When the configured aperiodic MUSIM gap is overlapping with RLM-RS resource occasion, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and if RLM-RS resource occasions are fully overlapped with MUSIM gap(s) or the union of MUSIM gap(s) and GAPs, no requirement applies for CSI-RS based RLM.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{out}$ and $M_{in}$ used in table 8.1.3.2-1, table 8.1.3.2-2, table 8.1.3.2-3 and table 8.1.3.2-4 are defined as:

- $M_{out}$ = 20 and $M_{in}$ = 10, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

If the UE supports *sbfd-Aware-r19* and SBFD is configured by the network, the requirements in this clause apply provided that the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs in at least one DL subband.

**Table 8.1.3.2-1: Evaluation period $T_{Evaluate_out_CSI\text{-}RS}$ and $T_{Evaluate_in_CSI\text{-}RS}$ for FR1**

| Configuration | $T_{Evaluate_out_CSI\text{-}RS}$ (ms) | $T_{Evaluate_in_CSI\text{-}RS}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(($M_{out}$+ $L1_{Out}$)×P)×max($T_{CSI\text{-}RS}$, $T_{proc}$)) | Max(100, Ceil(($M_{in}$+ $L1_{In}$)×P) × max($T_{CSI\text{-}RS}$, $T_{proc}$)) |
| DRX $\leqslant$ 320 ms | Max(200, Ceil(1.5×($M_{out}$+ $L1_{Out}$)×P)× Max($T_{DRX}$, $T_{CSI\text{-}RS}$, $T_{proc}$)) | Max(100, Ceil(1.5×($M_{in}$+ $L1_{In}$)×P)× Max($T_{DRX}$, $T_{CSI\text{-}RS}$, $T_{proc}$)) |
| DRX > 320 ms | Ceil(($M_{out}$+ $L1_{Out}$)×P) × $T_{DRX}$ | Ceil(($M_{in}$+ $L1_{In}$)×P) × $T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI\text{-}RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length.<br>NOTE 2: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for RLM is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | | |

### 8.1.3.3 Measurement restrictions for CSI-RS based RLM

The SSB mentioned in this clause can be associated with either the serving cell PCI or a PCI different from serving cell PCI or intra-frequency neighbor cell(s) configured with L1-RSRP measurement or inter-frequency neighbor cell(s) configured with L1-RSRP measurement without gap.

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For both FR1 and FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

For FR2, when the CSI-RS for RLM measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For both FR1 and FR2, when the CSI-RS for RLM measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for RLM measurement in the PRBs that overlap with an SSB.

For both FR1 and FR2, when the CSI-RS for RLM measurement fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is not required to receive CSI-RS for RLM measurement in the PRBs that overlap with the CSI-RS from candidate LTM neighbour cell.

For FR1, when the CSI-RS for RLM measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support simultaneousRxDataSSB-DiffNumerology, UE is required to measure one of but not both CSI-RS for RLM measurement and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for RLM measurement and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both CSI-RS for RLM measurement and CSI-RS for candidate LTM neighbour L1-RSRP measurement. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for RLM and the other CSI-RS. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

  - The CSI-RS for RLM or the other CSI-RS in a resource set configured with repetition ON, or

  - The other CSI-RS is configured in q1 and beam failure is detected, or

  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,

- Otherwise, UE shall be able to measure the CSI-RS for RLM without any restriction.

For FR2-1, there is no measurement restriction allowed for UE supporting *schedulingMeasurementRelaxation-r18*, according to the conditions described in clause 3.6.19, and the UE is required to measure both the CSI-RS for RLM and the other CSI-RS for RLM, BFD or L1-RSRP measurement, while meeting requirements in clause 8.1.3.2, provided the following conditions are met:

- Both CSI-RSs are not in any CSI-RS resource set with repetition ON, and
- One CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and
- the other CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and
- Resources of the active TCI states of the two PDSCHs, or QCL sources of the default QCL assumption, or the active TCI state of PDSCH and QCL source of the default QCL assumption have been reported as a resource group in Rel-17 group-based RSRP report.

### 8.1.3.4 Minimum requirement of CSI-RS based radio link monitoring for UE fulfilling relaxed measurement criteria

This clause contains minimum requirements for relaxed radio link monitoring based on CSI-RS.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI-RS_Relax}$ period becomes worse than the threshold $Q_{out_CSI-RS}$ within $T_{Evaluate_out_CSI-RS_Relax}$ evaluation period.

$T_{Evaluate_out_CSI-RS_Relax}$ is defined in table 8.1.3.4-1 for FR1.

$T_{Evaluate_out_CSI-RS_Relax}$ is defined in table 8.1.3.4-2 for FR2 with scaling factor N=1.

The value of P is defined in clause 8.1.3.2.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{out}$ used in table 8.1.3.4-1 and table 8.1.3.4-2 are defined as:

- $M_{out}$ = 20, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geq$ 24 PRBs.

**Table 8.1.3.4-1: Evaluation period $T_{Evaluate_out_CSI-RS_Relax}$ for FR1**

| Configuration | $T_{Evaluate_out_CSI-RS_Relax}$ (ms) |
|---|---|
| $Max(T_{DRX}, T_{CSI-RS}) \leq 80$ ms | $Max(200 \times K3^{NOTE3}, Ceil(1.5 \times M_{out} \times P \times K1^{NOTE2}) \times Max(T_{DRX}, T_{CSI-RS})^{NOTE1})$ |
| NOTE1: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length and no longer than 80 ms. | |

NOTE2: K1 = 2 for 40 ms < MAX($T_{DRX}$, $T_{CSI-RS}$) ≤ 80 ms, K1 = 4 for MAX($T_{DRX}$, $T_{CSI-RS}$) ≤ 40 ms
NOTE3: K3 = K1, if K1 ≤ 2; K3 = 1 otherwise.

**Table 8.1.3.4-2: Evaluation period $T_{Evaluate_out_CSI-RS_Relax}$ for FR2**

| Configuration | $T_{Evaluate_out_CSI-RS_Relax}$ (ms) |
|---|---|
| Max($T_{DRX}$, $T_{CSI-RS}$) ≤ 80 ms | Max(200 × K4 [NOTE3], Ceil(1.5 × $M_{out}$ × P × N × K2 [NOTE2]) × Max($T_{DRX}$, $T_{CSI-RS}$) [NOTE1]) |
| NOTE1: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length and no longer than 80 ms.<br>NOTE2: K2 = 2.<br>NOTE3: K4 = K2, if K2 ≤ 2; K4 = 1 otherwise. | |

## 8.1.4 Minimum requirement at transitions

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each RLM-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each RLM-RS resource. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of RLM resources to a second configuration of RLM resources that is different from the first configuration, for each RLM resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each RLM resource present in the second configuration. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of active TCI state of the CORESET to a second configuration of active TCI state of the CORESET, for each CSI-RS for RLM present in the second configuration, the UE shall use an evaluation period corresponding to the second configuration from the time of transition. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

For UE supporting *ncd-SSB-BWP-Wor-r18*, when the UE transitions between RLM CD-SSB resource and RLM NCD-SSB resource due to BWP switching or due to SCG activation or deactivation during one evaluation period, the UE shall use an evaluation period that is the maximum of the evaluation periods corresponding to the first SSB type and the second SSB type after the BWP switching or the SCG activation or deactivation. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each RLM-RS resource.

## 8.1.5 Minimum requirement for UE turning off the transmitter

The transmitter power of the UE in the monitored cell shall be turned off within 40 ms after expiry of T310 timer as specified in TS 38.331 [2].

## 8.1.6 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than $Q_{out}$, layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval}$.

When DRX is not used $T_{Indication_interval}$ is max(10 ms, $T_{RLM-RS,M}$), where $T_{RLM-RS,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to $T_{SSB}$ specified in clause 8.1.2 if the RLM-RS resource is SSB, or $T_{CSI-RS}$ specified in clause 8.1.3 if the RLM-RS resource is CSI-RS.

In case DRX is used, $T_{Indication_interval}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM-RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

For deactivated PSCell, when DRX is not used $T_{Indication_interval}$ is Max (10ms, *measCyclePSCell*). In case DRX is used, $T_{Indication_interval}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × *measCyclePSCell*)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval}$ is Max (DRX_cycle_length, *measCyclePSCell*) if DRX_cycle_length is greater than 320ms.

## 8.1.7 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM has different subcarrier spacing than PDSCH/PDCCH or is in FR2, there are restrictions on the scheduling availability as described in the following clauses.

### 8.1.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH on FR1.

### 8.1.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

When intra-band carrier aggregation in FR1 is performed, the scheduling restrictions on FR1 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18*, there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band if *nonCollocatedTypeNR-CA-r18* is not provided. Otherwise, the scheduling restrictions on FR1 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

When intra-band non-contiguous carrier aggregation is configured for a UE supporting *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is “type 4”

3> there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band

2> if *nonCollocatedTypeNR-CA-v1900* is “type 1”

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band

2>else

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band FR1-FR1 NR-DC is configured, there are no scheduling restrictions on FR1 serving cell(s) in the bands due to radio link monitoring performed on FR1 serving PCell or PSCell in different bands.

### 8.1.7.3 Scheduling availability of UE performing radio link monitoring on FR2

The following scheduling restriction applies due to radio link monitoring on an FR2 serving PCell and/or PSCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,
  - There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.
- For FR2-1, for UE supporting *schedulingMeasurementRelaxation-r18*,, according to the conditions described in clause 3.6.19, and is configured to receive two PDSCH transmission occasions from two different QCL sources on PCell, there are no scheduling restrictions for the PDSCHs due to radio link monitoring based on the CSI-RS, when following conditions are met:
  - The CSI-RS is not in a CSI-RS resource set with repetition ON,
  - The CSI-RS has same QCL source as the active TCI state of one of the PDSCHs and has different QCL-TypeD from the other PDSCH,
  - The CSI-RS and both of the PDSCHs are on the same OFDM symbol(s),
  - The CSI-RS and both of the PDSCHs are on the same OFDM symbol(s), or the CSI-RS and one of the PDSCHs with different QCL typeD are on the same OFDM symbol(s) when partially overlapping PDSCHs are scheduled,
  - Resources of the active TCI states for the two PDSCHs have been reported as a resource group in Rel-17 group-based RSRP report.
- Otherwise
  - For FR2-1 or the RLM-RS is not using 480 kHz SCS or 960 kHz SCS on FR2-2, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.
  - For FR2-2 and the RLM-RS is using 480 kHz SCS or 960 kHz SCS, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring, and on one data symbol before each RLM-RS symbol to be measured and one data symbol after each RLM-RS symbol to be measured.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions on FR2 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cell(s) in the bands for the following cases, provided that UE is capable of independent beam management on this FR2 band pair:

- when performing radio link monitoring performed on FR2 serving PCell or PSCell in different bands,

- the UE is configured with same or different numerology between SSB on one FR2 band and data on the other FR2 band.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

#### 8.1.7.4 Scheduling availability of UE performing radio link monitoring on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to radio link monitoring performed on FR2 serving PCell and/or PSCell.

There are no scheduling restrictions on FR2 serving cell(s) due to radio link monitoring performed on FR1 serving PCell and/or PSCell.

### 8.1.8 Minimum requirement under IDC Interference

When the UE is provided with IDC solution, the UE shall also perform radio link monitoring and meet the corresponding requirements in clause 8.1.

## 8.1A Radio Link Monitoring with CCA on Target Frequency

### 8.1A.1 Introduction

The requirements in clause 8.1A apply for radio link monitoring on a carrier frequency with CCA for cells:

- PCell in SA NR operation mode,
- PSCell in EN-DC operation mode.
- PSCell in NR-DC operation mode.

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell and PSCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out,CCA}$ and $Q_{in,CCA}$ for the purpose of monitoring downlink radio link quality of the cell.

The threshold $Q_{out,CCA}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out,CCA}$) as defined in table 8.1A.1-1. For SSB based radio link monitoring, $Q_{out_SSB,CCA}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1A.2.1-1.

The threshold $Q_{in,CCA}$ is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at $Q_{out,CCA}$ and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in table 8.1A.1-1. For SSB based radio link monitoring, $Q_{in_SSB,CCA}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1A.2.1-2.

The out-of-sync block error rate ($BLER_{out,CCA}$) and in-sync block error rate ($BLER_{in,CCA}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1A.1-1 as default. All requirements in clause 8.1A are applicable for BLER Configuration #0 in table 8.1A.1-1.

**Table 8.1A.1-1: Out-of-sync and in-sync block error rates**

| Configuration | $BLER_{out,CCA}$ | $BLER_{in,CCA}$ |
|---|---|---|
| 0 | 10 % | 2 % |

UE shall be able to monitor up to $N_{RLM}$ RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number $L_{max}$ of SSBs per half frame according to TS 38.213 [3], where $N_{RLM}$ is specified in table 8.1A.1-2, and meet the requirements as specified in clause 8.1A. UE is not required to meet the requirements in clause 8.1A if RLM-RS is not configured and no TCI state for PDCCH is activated.

**Table 8.1A.1-2: Maximum number of RLM-RS resources $N_{RLM}$**

| Carrier frequency range of PCell/PSCell | $L_{max}$ | Maximum number of RLM-RS resources, $N_{RLM}$ |
|---|---|---|
| FR1 | 8 | 4 |
| FR2-2 | 64 | 8 |

In the requirements of clause 8.1A, the term RLM-RS SSB occasion not available at the UE refers to when the RLM-RS SSB is configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SSB index within the set of configured RLM-RS resources are not available at the UE due to DL CCA failures at gNB during the corresponding evaluation period; otherwise the RLM-RS SSB is considered as available at the UE.

The requirements in clause 8.1A apply for any *channelAccessMode* configuration [2].

## 8.1A.2 Requirements for SSB Based Radio Link Monitoring

### 8.1A.2.1 Introduction

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell or PSCell, provided that the SSB configured for RLM are actually configured to be transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1A.2.2 but occasionally may not be transmitted due to CCA operation.

**Table 8.1A.2.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 4 dB |
| Bandwidth (PRBs) | 24 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.1A.2.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI payload size | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 4 |

| | |
|---|---|
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 24 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

### 8.1A.2.2 Minimum Requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB,CCA}$ period becomes worse than the threshold $Q_{out_SSB,CCA}$ within $T_{Evaluate_out_SSB,CCA}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB,CCA}$ period becomes better than the threshold $Q_{in_SSB,CCA}$ within $T_{Evaluate_in_SSB,CCA}$ evaluation period. During the in-sync evaluation procedure, layer 1 of the UE shall not send any in-sync indication for the cell to the higher layers when $L_{in}$ exceeds $L_{in,max}$, where $L_{in}$ and $L_{in,max}$ are defined in table 8.1A.2.2-1.

$T_{Evaluate_out_SSB,CCA}$ and $T_{Evaluate_in_SSB,CCA}$ are defined in table 8.1A.2.2-1 for FR1.

$T_{Evaluate_out_SSB,CCA}$ and $T_{Evaluate_in_SSB,CCA}$ are defined in table 8.1A.2.2-2 for FR2-2 with scaling factor N = 12.

For a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* and when concurrent gaps are configured,

- P value for an RLM-RS resource to be measured is defined as $N_{total}$ / $N_{outside_MG}$
- For a window W of duration max($T_{L1}$, xRP_max), where xRP_max is the maximum xRP across all configured per-UE measurement gap or NCSGs and per-FR measurement gap or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any RLM-RS resource occasion:
  - $N_{total}$ is the total number of RLM-RS resource occasions within the window W, including those overlapped with GAP occasions within the window W, and
  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any GAP occasion within the window W
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG(s),

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, and these GAPs are overlapping with some but not all occasions of the SSB RLM-RS resources; and
- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB RLM-RS resources.

When a GAP is configured only and the GAP is not NCSG,

- an RLM-RS resource is considered to be overlapped with the GAP f it overlaps a GAP occasion, and
- xRP = MGRP

Otherwise, when NCSG only is configured,

- an RLM-RS resource is considered to be overlapped with the GAP if it overlaps the VIL1 or VIL2 of NCSG, and
- xRP = VIRP

If the UE is configured with Pre-MG only, an RLM-RS resource is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.

When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, an RLM-RS resource is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

For FR2-2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when RLM-RS resource is not overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- P is $P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with GAP and RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and
  - $T_{SMTCperiod} \neq$ MGRP or
  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the RLM-RS is partially overlapped with GAP and the RLM-RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MRGP}}$, when the RLM-RS resource is partially overlapped with GAP and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} <$ MGRP)
- $P_{sharing\ factor} = 1$, if the RLM-RS resource outside GAP is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and K data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and K data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and K is defined in clause 9.2.5.3.3, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and K data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and K data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured, and K is defined in clause 9.2.5.3.3.
- $P_{sharing\ factor} = 3$, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2-2 band, provided the SMTC offset of all CCs in FR2-2 have the same offset.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

**Table 8.1A.2.2-1: Evaluation period $T_{Evaluate_out_SSB,CCA}$ and $T_{Evaluate_in_SSB,CCA}$ for FR1**

| Configuration | $T_{Evaluate_out_SSB,CCA}$ (ms) | | $T_{Evaluate_in_SSB,CCA}$ (ms) |
|---|---|---|---|
| | RLM-RS SSB Es/Iot[Note4] ≥-7 dB | RLM-RS SSB Es/Iot [Note4] <-7 dB | |
| no DRX | Max(200, Ceil(17*P)*$T_{SSB}$) | Max(200, Ceil(24*P)*$T_{SSB}$) | Max(100, Ceil((5+$L_{in}$)*P)*$T_{SSB}$) |
| DRX cycle≤320 | Max(200, Ceil(1.5*15*P)*Max($T_{DRX}$,$T_{SSB}$)) | Max(200, Ceil(1.5*20*P)*Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(1.5*(5+$L_{in}$)*P)*Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle>320 | Ceil(13*P)*$T_{DRX}$ | Ceil(16*P)*$T_{DRX}$ | Ceil((5+$L_{in}$)*P)*$T_{DRX}$ |

NOTE 1: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length.
NOTE 2: When DRX is not configured, $L_{in}$ is the number of RLM-RS SSB occasions which are not available at the UE during $T_{Evaluate_in_SSB,CCA}$, where $L_{in} \le L_{in,max}$. When DRX is configured, $L_{in}$ is the number of DRX cycles in which at least one RLM-RS SSB occasion is not available at the UE during $T_{Evaluate_in_SSB,CCA}$, where $L_{in} \le L_{in,max}$. The UE is not required to determine the availability of SSB occasions more frequent than
Once per Max(10 ms, P * $T_{SSB}$) if no DRX is used,
Once per Max(10 ms, Ceil(1.5 * P) * Max($T_{DRX}$, $T_{SSB}$)) if DRX cycle ≤ 320 ms,
Once per P * $T_{DRX}$ if DRX cycle > 320 ms.
NOTE 3: $L_{in,max}$=7 for Max($T_{DRX}$,$T_{SSB}$) ≤ 40 assuming $T_{DRX}$=0 for non-DRX case,
$L_{in,max}$=5 for 40<Max($T_{DRX}$,$T_{SSB}$)≤320,
$L_{in,max}$=3 for $T_{DRX}$>320.
NOTE 4: RLM-RS SSB Es/Iot is the averaged Es/Iot over the most recent previous out-of-sync evaluation period.

**Table 8.1A.2.2-2: Evaluation period $T_{Evaluate_out_SSB,CCA}$ and $T_{Evaluate_in_SSB,CCA}$ for FR2-2**

| Configuration | $T_{Evaluate_out_SSB,CCA}$ (ms) | $T_{Evaluate_in_SSB,CCA}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(12*P* N)*$T_{SSB}$) | Max(100, Ceil((5 +$L_{in}$)*P* N)*$T_{SSB}$) |
| DRX cycle≤320 | Max(200, Ceil(1.5*10*P* N)*Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(1.5*(5 +$L_{in}$)*P* N)*Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle>320 | Ceil(10*P* N)*$T_{DRX}$ | Ceil((5+$L_{in}$)*P* N)*$T_{DRX}$ |

NOTE 1: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length.
NOTE 2: When DRX is not configured, $L_{in}$ is the number of RLM-RS SSB occasions groups which are not available at the UE during $T_{Evaluate_in_SSB,CCA}$, where $L_{in} \le L_{in,max}$. An RLM-RS SSB occasions group consists of N consecutive RLM-RS SSB occasions, and the RLM-RS SSB occasions group is not available at the UE when at least one RLM-SSB occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{in}$ is the number of DRX cycles groups which are not available at the UE during $T_{Evaluate_in_SSB,CCA}$, where Lin ≤ $L_{in,max}$. A DRX group consists of N DRX cycles, and the DRX group is not available when there is at least one DRX in which at least one RLM-RS SSB occasion is not available. The UE is not required to determine the availability of SSB occasions more frequent than once per DRX cycle length, when configured with DRX.
NOTE 3: $L_{in,max}$=7 for Max($T_{DRX}$,$T_{SSB}$) ≤ 40 assuming $T_{DRX}$=0 for non-DRX case,
$L_{in,max}$=5 for 40<Max($T_{DRX}$,$T_{SSB}$)≤320,
$L_{in,max}$=3 for $T_{DRX}$>320.

## 8.1A.2.3 Measurement Restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;

- If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure SSB for RLM.

For FR2-2, when the SSB for RLM measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

## 8.1A.3 Minimum requirement at transitions

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each RLM-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each RLM-RS resource. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of RLM resources to a second configuration of RLM resources that is different from the first configuration, for each RLM resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each RLM resource present in the second configuration. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

## 8.1A.4 Minimum requirement for UE turning off the transmitter

The transmitter power of the UE in the monitored cell shall be turned off within 40 ms after expiry of T310 timer as specified in TS 38.331 [2]. The UE shall not perform CCA procedure on any of the serving carrier frequencies with CCA after the expiry of T310.

## 8.1A.5 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than $Q_{out,CCA}$, layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in,CCA}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval,CCA}$.

When DRX is not used $T_{Indication_interval,CCA}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to $T_{SSB}$ specified in clause 8.1A.2 if the RLM-RS resource is SSB.

In case DRX is used, $T_{Indication_interval,CCA}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval,CCA}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

## 8.1A.6 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM on a carrier frequency with CCA has different subcarrier spacing than PDSCH/PDCCH, there are restrictions on the scheduling availability as described in the following clauses.

### 8.1A.6.1 Scheduling availability of UE performing radio link monitoring with the same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH on FR1.

### 8.1A.6.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

When intra-band carrier aggregation is performed, the scheduling restrictions on PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols.

### 8.1A.6.3 Scheduling availability of UE performing radio link monitoring on FR2-2

The following scheduling restriction applies due to radio link monitoring on an FR2-2 serving PCell and/or PSCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,
  - There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.
- Otherwise
  - When the RLM-RS is using 120 kHz SCS, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.
  - When the RLM-RS is using 480 kHz SCS or 960 kHz SCS, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS resource symbols to be measured for radio link monitoring, and on one data symbol before each RLM-RS symbol to be measured and one data symbol after each RLM-RS symbol to be measured.

When intra-band carrier aggregation in FR2-2 is performed, the scheduling restrictions on FR2-2 serving PCell or PSCell applies to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

For FR2-2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE’s reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

### 8.1A.6.4 Scheduling availability of UE performing radio link monitoring on FR1 or FR2-2 in case of FR1-FR2-2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to radio link monitoring performed on FR2-2 serving PCell and/or PSCell.

There are no scheduling restrictions on FR2-2 serving cell(s) due to radio link monitoring performed on FR1 serving PCell and/or PSCell.

## 8.1B Radio Link Monitoring for RedCap

### 8.1B.1 Introduction

The requirements in clause 8.1B apply for radio link monitoring on UE with reduced capabilities:

- PCell in SA NR operation mode,

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP. The SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not additional specified.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out,RedCap}$ and $Q_{in,RedCap}$ for the purpose of monitoring downlink radio link quality of the cell.

The threshold $Q_{out,RedCap}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in table 8.1B.1-1. For SSB based radio link monitoring, $Q_{out_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1B.2.1-1. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1B.3.1-1.

The threshold $Q_{in,RedCap}$ is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at $Q_{out,RedCap}$ and shall correspond to the in-sync block error rate ($BLER_{in,RedCap}$) as defined in table 8.1B.1-1. For SSB based radio link monitoring, $Q_{in_SSB,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1B.2.1-2. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS,RedCap}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1B.3.1-2.

The out-of-sync block error rate ($BLER_{out,RedCap}$) and in-sync block error rate ($BLER_{in,RedCap}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1B.1-1 by default. All requirements in clause 8.1B are applicable for BLER Configuration #0 in table 8.1B.1-1.

**Table 8.1B.1-1: Out-of-sync and in-sync block error rates for RedCap UE**

| Configuration | $BLER_{out,RedCap}$ | $BLER_{in,RedCap}$ |
|---|---|---|
| 0 | 10 % | 2 % |

UE shall be able to monitor up to $N_{RLM}$ RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number $L_{max}$ of SSBs per half frame according to TS 38.213 [3], where $N_{RLM}$ is specified in table 8.1B.1-2 according TS 38.213 [3], and meet the requirements as specified in clause 8.1B. UE is not required to meet the requirements in clause 8.1B if RLM-RS is not configured and no TCI state for PDCCH is activated.

**Table 8.1B.1-2: Maximum number of RLM-RS resources $N_{RLM}$ for RedCap UE**

| Carrier frequency range of PCell | $L_{max}$ | Maximum number of RLM-RS resources, $N_{RLM}$ |
|---|---|---|
| FR1, ≤ 3 GHz[Note] | 4 | 2 |
| FR1, > 3 GHz[Note] | 8 | 4 |

| | | |
|---|---|---|
| FR2 | 64 | 8 |
| NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [3]. | | |

## 8.1B.2 Requirements for SSB based radio link monitoring

### 8.1B.2.1 Introduction

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1B.2.2.

**Table 8.1B.2.1-1: PDCCH transmission parameters for out-of-sync evaluation for RedCap UE**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 16; for RedCap UE with 1Rx branch.<br>8; for RedCap UE with 2Rx branches. |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 4 dB |
| Bandwidth (PRBs) | 48; for RedCap UE with 1Rx branch.<br>24; for RedCap UE with 2Rx branches. |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |
| NOTE: SCS = 60kHz is not applicable for FR1. | |

**Table 8.1B.2.1-2: PDCCH transmission parameters for in-sync evaluation for RedCap UE**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI payload size | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8; for RedCap UE with 1Rx branch.<br>4; for RedCap UE with 2Rx branches. |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 48; for RedCap UE with 1Rx branch.<br>24; for RedCap UE with 2Rx branches. |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |
| NOTE: SCS = 60kHz is not applicable for FR1. | |

### 8.1B.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB,RedCap}$ period becomes worse than the threshold $Q_{out_SSB,RedCap}$ within $T_{Evaluate_out_SSB,RedCap}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB,RedCap}$ period becomes better than the threshold $Q_{in_SSB,RedCap}$ within $T_{Evaluate_in_SSB,RedCap}$ evaluation period.

$T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ are defined in table 8.1B.2.2-1 and table 8.1B.2.2-3 for FR1 for UE with 2Rx RedCap and 1Rx RedCap, respectively.

$T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ are defined in table 8.1B.2.2-2 and for FR2 with scaling factor N=8 for 2Rx RedCap.

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, and these measurement gaps are overlapping with some but not all occasions of the SSB; and

- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the RLM-RS is partially overlapped with measurement gap and the RLM-RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MRGP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} <$ MGRP)

- $P_{sharing\ factor}$ = 1, if the RLM-RS resource outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 8.1B.2.2-1: Evaluation period $T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ for FR1 for 2Rx RedCap UE**

| Configuration | $T_{Evaluate_out_SSB,RedCap}$ (ms) | $T_{Evaluate_in_SSB,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(10 × P) × $T_{SSB}$) | Max(100, Ceil(5 × P) × $T_{SSB}$) |
| DRX cycle≤320 ms | Max(200, Ceil(15 × P) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle>320 ms | Ceil(10 × P) × $T_{DRX}$ | Ceil(5 × P) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

**Table 8.1B.2.2-2: Evaluation period $T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ for FR2 for 2Rx RedCap UE**

| Configuration | $T_{Evaluate_out_SSB,RedCap}$ (ms) | $T_{Evaluate_in_SSB,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(10 × P × N) × $T_{SSB}$) | Max(100, Ceil(5 × P × N) × $T_{SSB}$) |
| DRX cycle≤320 ms | Max(200, Ceil(15 × P × N) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P × N) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle>320 ms | Ceil(10 × P × N) × $T_{DRX}$ | Ceil(5 × P × N) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

**Table 8.1B.2.2-3: Evaluation period $T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ for FR1 for 1Rx RedCap UE**

| Configuration | $T_{Evaluate_out_SSB,RedCap}$ (ms) | $T_{Evaluate_in_SSB,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(400, Ceil(20 × P) × $T_{SSB}$) | Max(100, Ceil(5 × P) × $T_{SSB}$) |
| DRX cycle≤320 ms | Max(400, Ceil(30 × P) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle>320 ms | Ceil(20 × P) × $T_{DRX}$ | Ceil(5 × P) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

### 8.1B.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

For FR2, when the SSB for RLM measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

## 8.1B.3 Requirements for CSI-RS based radio link monitoring

### 8.1B.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1B.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.1B.3.1-1: PDCCH transmission parameters for out-of-sync evaluation for RedCap UE**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 16; for RedCap UE with 1Rx branch.<br>8; for RedCap UE with 2Rx branches. |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 4 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |
| NOTE: SCS = 60kHz is not applicable for FR1. | |

**Table 8.1B.3.1-2: PDCCH transmission parameters for in-sync evaluation for RedCap UE**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI payload size | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8; for RedCap UE with 1Rx branch.<br>4; for RedCap UE with 2Rx branches. |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 |

| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |
| NOTE: SCS = 60kHz is not applicable for FR1. | |

### 8.1B.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ period becomes worse than the threshold $Q_{out_CSI\text{-}RS,RedCap}$ within $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI\text{-}RS,RedCap}$ period becomes better than the threshold $Q_{in_CSI\text{-}RS,RedCap}$ within $T_{Evaluate_in_CSI\text{-}RS,RedCap}$ evaluation period.

- $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ and $T_{Evaluate_in_CSI\text{-}RS,RedCap}$ are defined in table 8.1B.3.2-1 and table 8.1B.3.2-3 for FR1 for RedCap 2Rx RedCap and 1Rx RedCap, respectively.

- $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ and $T_{Evaluate_in_CSI\text{-}RS,RedCap}$ are defined in table 8.1B.3.2-2 for FR2 with scaling factor N=1 for 2 Rx RedCap.

The requirements of $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, and these measurement gaps are overlapping with some but not all occasions of the CSI-RS; and
- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- P=1, when the RLM-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is not overlapped with SMTC occasion ($T_{CSI-RS} < MGRP$)
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is not overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when the RLM-RS resource is not overlapped with measurement gap and RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq MGRP$ or
  - $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$
- $P = \frac{P_{\text{sharing factor}}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap
- $P = \frac{P_{\text{sharing factor}}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the RLM-RS resource is partially overlapped with measurement gap and the RLM-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} < MGRP$)
- $P_{sharing\ factor} = 1$, if the RLM-RS resource outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

NOTE: The overlap between CSI-RS for RLM and SMTC means that CSI-RS based RLM is within the SMTC window duration.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{out,RedCap}$ and $M_{in,RedCap}$ used in table 8.1B.3.2-1 and table 8.1B.3.2-2 for UE with 2Rx are defined as:

- $M_{out,RedCap}$ = 20 and $M_{in,RedCap}$ = 10, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $M_{out,RedCap}$ and $M_{in,RedCap}$ used in table 8.1B.3.2-3 for RedCap UE with 1Rx are defined as:

- $M_{out,RedCap}$ = 40 and $M_{in,RedCap}$ = 10, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

**Table 8.1B.3.2-1: Evaluation period $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ and $T_{Evaluate_in_CSI\text{-}RS,RedCap}$ for FR1 for 2Rx RedCap UE**

| Configuration | $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ (ms) | $T_{Evaluate_in_CSI\text{-}RS,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil($M_{out,RedCap}$×P)×$T_{CSI\text{-}RS}$) | Max(100, Ceil($M_{in,RedCap}$×P) × $T_{CSI\text{-}RS}$) |
| DRX ≤ 320 ms | Max(200, Ceil(1.5×$M_{out,RedCap}$ ×P)× Max($T_{DRX}$, $T_{CSI\text{-}RS}$)) | Max(100, Ceil(1.5×$M_{in,RedCap}$×P)× Max($T_{DRX}$, $T_{CSI\text{-}RS}$)) |
| DRX > 320 ms | Ceil($M_{out,RedCap}$ ×P) × $T_{DRX}$ | Ceil($M_{in,RedCap}$ ×P) × $T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI\text{-}RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

**Table 8.1B.3.2-2: Evaluation period $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ and $T_{Evaluate_in_CSI\text{-}RS,RedCap}$ for FR2 for 2Rx RedCap UE**

| Configuration | $T_{Evaluate_out_CSI\text{-}RS,RedCap}$ (ms) | $T_{Evaluate_in_CSI\text{-}RS,RedCap}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil($M_{out,RedCap}$×P×N)×$T_{CSI\text{-}RS}$) | Max(100, Ceil($M_{in,RedCap}$×P×N) × $T_{CSI\text{-}RS}$) |
| DRX ≤ 320 ms | Max(200, Ceil(1.5×$M_{out,RedCap}$×P×N)× Max($T_{DRX}$, $T_{CSI\text{-}RS}$)) | Max(100, Ceil(1.5×$M_{in,RedCap}$×P×N)× Max($T_{DRX}$, $T_{CSI\text{-}RS}$)) |
| DRX > 320 ms | Ceil($M_{out,RedCap}$×P×N) × $T_{DRX}$ | Ceil($M_{in,RedCap}$×P×N) × $T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI\text{-}RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

| DRX > 320 ms | Ceil($M_{out,RedCap}$ ×P) × $T_{DRX}$ | Ceil($M_{in,RedCap}$ ×P) × $T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI\text{-}RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

### 8.1B.3.3 Measurement restrictions for CSI-RS based RLM

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For both FR1 and FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

For FR2, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, or L1-RSRP measurement, or in the same symbol as SSB for CBD when beam failure is detected, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR2, when the CSI-RS for RLM measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- In the following cases, UE is required to measure one of but not both CSI-RS for RLM and the other CSI-RS. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.
  - The CSI-RS for RLM or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in q1 and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS for RLM without any restriction.

## 8.1B.4 Minimum requirement at transitions

When the UE transitions between RLM CD-SSB resource and RLM NCD-SSB resource due to BWP switching during one evaluation period, the UE shall use an evaluation period that is the maximum of the evaluation periods corresponding to the first SSB type and the second SSB type after the BWP switching. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each RLM-RS resource.

The requirements in clause 8.1.4 shall also apply except the scenarios described above.

## 8.1B.5 Minimum requirement for UE turning off the transmitter

The requirements in clause 8.1.5 shall apply.

## 8.1B.6 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than $Q_{out,RedCap}$, layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in,RedCap}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval,RedCap}$.

When DRX is not used for RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM\text{-}RS,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to $T_{SSB}$ specified in clause 8.1B.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in clause 8.1B.3 if the RLM-RS resource is CSI-RS.

In case DRX is used for RedCap UEs, $T_{Indication_interval,RedCap}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval,RedCap}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

When DRX is not used for HD-FDD RedCap UEs, $T_{Indication_interval,RedCap}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM\text{-}RS,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to $T_{SSB}$ specified in clause 8.1B.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in clause 8.1B.3 if the RLM-RS resource is CSI-RS, under the following condition

- For each RLM-RS configuration, at least one RLM-RS sample must fall with DL occasion within an indication period.

In case DRX is used for HD-FDD RedCap UEs, $T_{Indication_interval,RedCap}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval,RedCap}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms, under the following condition

- For each RLM-RS configuration, at least one RLM-RS sample must fall with DL occasion within an indication period.

## 8.1B.7 Scheduling availability of UE during radio link monitoring

The requirements in clause 8.1.7 shall apply.

### 8.1B.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1

The requirements in clause 8.1.7.1 shall apply.

### 8.1B.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

### 8.1B.7.3 Scheduling availability of UE performing radio link monitoring on FR2

The following scheduling restriction applies due to radio link monitoring on an FR2 serving PCell.

- If the RLM-RS is CSI-RS which is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON,
  - There are no scheduling restrictions due to radio link monitoring based on the CSI-RS.
- Otherwise

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on RLM-RS symbols to be measured for radio link monitoring.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for RLM; and

For the SSB for RLM and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for RLM.

# 8.1C Radio Link Monitoring for Satellite Access

## 8.1C.1 Introduction

The requirements in clause 8.1C apply for radio link monitoring on PCell and the UE is configured with only PCell, which is served by satellite access node (SAN). The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out}$ and $Q_{in}$ for the purpose of monitoring downlink radio link quality of the cell.

The threshold $Q_{out}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in table 8.1C.1-1. For SSB based radio link monitoring, $Q_{out_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1C.2.1-1, and table 8.1C.2.1-3 for a UE operating on a cell with less than 5 MHz BW. For CSI-RS based radio link monitoring, $Q_{out_CSI-RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1C.3.1-1.

The threshold $Q_{in}$ is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at $Q_{out}$ and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in table 8.1C.1-1. For SSB based radio link monitoring, $Q_{in_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1C.2.1-2. For CSI-RS based radio link monitoring, $Q_{in_CSI-RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1C.3.1-2.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1C.1-1 by default. All requirements in clause 8.1C are applicable for BLER Configuration #0 in table 8.1C.1-1.

**Table 8.1C.1-1: Out-of-sync and in-sync block error rates**

| Configuration | $BLER_{out}$ | $BLER_{in}$ |
|---|---|---|
| 0 | 10 % | 2 % |

UE shall be able to monitor up to $N_{RLM}$ RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number $L_{max}$ of SSBs per half frame according to TS 38.213 [3], where $N_{RLM}$ is specified in table 8.1C.1-2 according TS 38.213 [3], and meet the requirements as specified in clause 8.1C. UE is not required to meet the requirements in clause 8.1C if RLM-RS is not configured and no TCI state for PDCCH is activated.

**Table 8.1C.1-2: Maximum number of RLM-RS resources $N_{RLM}$**

| Carrier frequency range of PCell | $L_{max}$ | Maximum number of RLM-RS resources, $N_{RLM}$ |
|---|---|---|
| FR1-NTN, ≤ 3 GHz[Note] | 4 | 2 |
| FR1-NTN, > 3 GHz[Note] | 8 | 4 |
| FR2-NTN[Note 2] | 64 | 8 |
| NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [3]. | | |
| NOTE 2: NTN bands within this frequency range are regarded as a FR2-1 band when references from other specifications unless otherwise stated. | | |

## 8.1C.2 Requirements for SSB based radio link monitoring

### 8.1C.2.1 Introduction

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1C.2.2.

**Table 8.1C.2.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 for FR1-NTN<br>16 for FR2-NTN |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 4 dB |
| Bandwidth (PRBs) | 24 for FR1-NTN<br>48 for FR2-NTN |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.1C.2.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI payload size | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 4 for FR1-NTN<br>8 for FR2-NTN |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 24 for FR1-NTN<br>48 for FR2-NTN |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.1C.2.1-3: PDCCH transmission parameters for out-of-sync evaluation for a UE operating on a cell with less than 5MHz BW**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| **Channel BW** | **3MHz** |
| **DL Transmission BW** | **15 PRBs** |

| | |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 3 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 4dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 4dB |
| Bandwidth (PRBs) | 15 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Non-Distributed[Note 1] |
| NOTE 1: For 15 PRB Transmission BW, distributed mapping may lead to unexpected out-of-sync indication. | |

**Table 8.1C.2.1-4: PDCCH transmission parameters for in-sync evaluation for a UE operating on a cell with less than 5MHz BW**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| **Channel BW** | **3MHz** |
| **DL Transmission BW** | **15 PRBs** |
| DCI format | 1-0 |
| Number of control OFDM symbols | 3 |
| Aggregation level (CCE) | 4 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0dB |
| Bandwidth (PRBs) | 15 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Non-Distributed |

## 8.1C.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB}$ period becomes worse than the threshold $Q_{out_SSB}$ within $T_{Evaluate_out_SSB}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB}$ period becomes better than the threshold $Q_{in_SSB}$ within $T_{Evaluate_in_SSB}$ evaluation period.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1C.2.2-1 and table 8.1C.2.2-2 for FR1-NTN and FR2-NTN, respectively.

P value for an RLM-RS resource to be measured is defined as

- $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
- $N_{total} / N_{available}$ with $N_{available} > 0$

For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is
  - for FR1-NTN,
    - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction* and LEO satellites are measured for intra-frequency measurement, and
    - same as $N_{outside_MG}$, otherwise
  - for FR2-NTN, same as $N_{outside_MG}$.
- $T_{L1}$ is periodicity of the target RLM-RS
- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For an FR1-NTN and FR2-NTN serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

**Table 8.1C.2.2-1: Evaluation period $T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ for FR1-NTN**

| Configuration | $T_{Evaluate_out_SSB}$ (ms) | $T_{Evaluate_in_SSB}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(10 × P) × $T_{SSB}$) | Max(100, Ceil(5 × P) × $T_{SSB}$) |
| DRX cycle≤320 ms | Max(200, Ceil(15 × P) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle>320 ms | Ceil(10 × P) × $T_{DRX}$ | Ceil(5 × P) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

**Table 8.1C.2.2-2: Evaluation period $T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ for FR2-NTN**

| Configuration | $T_{Evaluate_out_SSB}$ (ms) | $T_{Evaluate_in_SSB}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil(20 × P) × $T_{SSB}$) | Max(100, Ceil(5 × P) × $T_{SSB}$) |
| DRX cycle≤320 ms | Max(200, Ceil(30 × P) × Max($T_{DRX}$,$T_{SSB}$)) | Max(100, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle>320 ms | Ceil(20 × P) × $T_{DRX}$ | Ceil(5 × P) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

## 8.1C.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1-NTN and FR2-NTN, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,

- If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;

- If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

## 8.1C.3 Requirements for CSI-RS based radio link monitoring

### 8.1C.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1C.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.1C.3.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 for FR1-NTN<br>16 for FR2-NTN |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 4 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.1C.3.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI payload size | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 4 for FR1-NTN<br>8 for FR2-NTN |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

### 8.1C.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI-RS}$ period becomes worse than the threshold $Q_{out_CSI-RS}$ within $T_{Evaluate_out_CSI-RS}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI-RS}$ period becomes better than the threshold $Q_{in_CSI-RS}$ within $T_{Evaluate_in_CSI-RS}$ evaluation period.

- $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ are defined in table 8.1C.3.2-1 for FR1-NTN.

- $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ are defined in table 8.1C.3.2-2 for FR2-NTN.

The requirements of $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

P value for an RLM-RS resource to be measured is defined as

- $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
- $N_{total} / N_{available}$ with $N_{available} > 0$

For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is
  - for FR1-NTN,
    - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction* and LEO satellites are measured for intra-frequency measurement, and
    - same as $N_{outside_MG}$, otherwise
  - for FR2-NTN, same as $N_{outside_MG}$.
- $T_{L1}$ is periodicity of the target RLM-RS
- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For an FR1-NTN and FR2-NTN serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

The values of $M_{out}$ and $M_{in}$ used in table 8.1C.3.2-1 are defined as:

- $M_{out} = 20$ and $M_{in} = 10$, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $M_{out}$ and $M_{in}$ used in table 8.1C.3.2-2 are defined as:

- $M_{out} = 40$ and $M_{in} = 10$, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* TS 38.211 [6], clause 7.4.1, set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

**Table 8.1C.3.2-1: Evaluation period $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ for FR1-NTN**

| Configuration | $T_{Evaluate_out_CSI-RS}$ (ms) | $T_{Evaluate_in_CSI-RS}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil($M_{out}$×P)×$T_{CSI-RS}$) | Max(100, Ceil($M_{in}$×P) × $T_{CSI-RS}$) |
| DRX ≤ 320 ms | Max(200, Ceil(1.5×$M_{out}$×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) | Max(100, Ceil(1.5×$M_{in}$×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) |
| DRX > 320 ms | Ceil($M_{out}$×P) × $T_{DRX}$ | Ceil($M_{in}$×P) × $T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

**Table 8.1C.3.2-2: Evaluation period $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ for FR2-NTN**

| Configuration | $T_{Evaluate_out_CSI-RS}$ (ms) | $T_{Evaluate_in_CSI-RS}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil($M_{out}$×P)×$T_{CSI-RS}$) | Max(100, Ceil($M_{in}$×P) × $T_{CSI-RS}$) |
| DRX ≤ 320 ms | Max(200, Ceil(1.5×$M_{out}$×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) | Max(100, Ceil(1.5×$M_{in}$×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) |
| DRX > 320 ms | Ceil($M_{out}$×P) × $T_{DRX}$ | Ceil($M_{in}$×P) × $T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

### 8.1C.3.3 Measurement restrictions for CSI-RS based RLM

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For FR1-NTN and FR2-NTN, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1-NTN and FR2-NTN, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1-NTN and FR2-NTN, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1-NTN and FR2-NTN, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

## 8.1C.4 Minimum requirement at transitions

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each RLM-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each RLM-RS resource. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of RLM resources to a second configuration of RLM resources that is different from the first configuration, for each RLM resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each RLM resource present in the second configuration. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

When the UE transitions from a first configuration of active TCI state of the CORESET to a second configuration of active TCI state of the CORESET, for each CSI-RS for RLM present in the second configuration, the UE shall use an evaluation period corresponding to the second configuration from the time of transition. This requirement shall be applied to both out-of-sync evaluation and in-sync evaluation of the monitored cell.

## 8.1C.5 Minimum requirement for UE turning off the transmitter

The transmitter power of the UE in the monitored cell shall be turned off within 40 ms after expiry of T310 timer as specified in TS 38.331 [2].

## 8.1C.6 Minimum requirement for L1 indication

When the downlink radio link quality on all the configured RLM-RS resources is worse than $Q_{out}$, layer 1 of the UE shall send an out-of-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the out-of-sync indications as specified in TS 38.331 [2].

When the downlink radio link quality on at least one of the configured RLM-RS resources is better than $Q_{in}$, layer 1 of the UE shall send an in-sync indication for the cell to the higher layers. A layer 3 filter shall be applied to the in-sync indications as specified in TS 38.331 [2].

The out-of-sync and in-sync evaluations for the configured RLM-RS resources shall be performed as specified in clause 5 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval}$.

When DRX is not used $T_{Indication_interval}$ is max(10 ms, $T_{RLM\text{-}RS,M}$), where $T_{RLM\text{-}RS,M}$ is the shortest periodicity of all configured RLM-RS resources for the monitored cell, which corresponds to $T_{SSB}$ specified in clause 8.1C.2 if the RLM-RS resource is SSB, or $T_{CSI\text{-}RS}$ specified in clause 8.1C.3 if the RLM-RS resource is CSI-RS.

In case DRX is used, $T_{Indication_interval}$ is Max(10ms, 1.5 × DRX_cycle_length, 1.5 × $T_{RLM\text{-}RS,M}$)) if DRX_cycle_length is less than or equal to 320ms, and $T_{Indication_interval}$ is DRX_cycle_length if DRX_cycle_length is greater than 320ms. Upon start of T310 timer as specified in TS 38.331 [2], the UE shall monitor the configured RLM-RS resources for recovery using the evaluation period and layer 1 indication interval corresponding to the no DRX mode until the expiry or stop of T310 timer.

## 8.1C.7 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM has different subcarrier spacing than PDSCH/PDCCH , there are restrictions on the scheduling availability as described in the following clauses.

### 8.1C.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1-NTN and FR2-NTN

There are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH on FR1-NTN and FR2-NTN.

### 8.1C.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1-NTN and FR2-NTN

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

# 8.1D Radio Link Monitoring for ATG

## 8.1D.1 Introduction

The requirements in clause 8.1D apply for radio link monitoring on ATG UE.

The UE shall monitor the downlink radio link quality based on the reference signal configured as RLM-RS resource(s) in order to detect the downlink radio link quality of the PCell as specified in TS 38.213 [3]. The configured RLM-RS resources can be all SSBs, or all CSI-RSs, or a mix of SSBs and CSI-RSs. UE is not required to perform RLM outside the active DL BWP.

On each RLM-RS resource, the UE shall estimate the downlink radio link quality and compare it to the thresholds $Q_{out}$ and $Q_{in}$ for the purpose of monitoring downlink radio link quality of the cell.

The threshold $Q_{out}$ is defined as the level at which the downlink radio link cannot be reliably received and shall correspond to the out-of-sync block error rate ($BLER_{out}$) as defined in table 8.1.1-1. For SSB based radio link monitoring, $Q_{out_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.2.1-1. For CSI-RS based radio link monitoring, $Q_{out_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.3.1-1.

The threshold $Q_{in}$ is defined as the level at which the downlink radio link quality can be received with significantly higher reliability than at $Q_{out}$ and shall correspond to the in-sync block error rate ($BLER_{in}$) as defined in table 8.1.1-1. For SSB based radio link monitoring, $Q_{in_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.2.1-2. For CSI-RS based radio link monitoring, $Q_{in_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.1.3.1-2.

The out-of-sync block error rate ($BLER_{out}$) and in-sync block error rate ($BLER_{in}$) are determined from the network configuration via parameter *rlmInSyncOutOfSyncThreshold* signalled by higher layers. When UE is not configured with *rlmInSyncOutOfSyncThreshold* from the network, UE determines out-of-sync and in-sync block error rates from Configuration #0 in table 8.1.1-1 by default. All requirements in clause 8.1D are applicable for BLER Configuration #0 in table 8.1.1-1.

**Table 8.1D.1-1: Void**

UE shall be able to monitor up to $N_{RLM}$ RLM-RS resources of the same or different types in each corresponding carrier frequency range, depending on a maximum number $L_{max}$ of SSBs per half frame according to TS 38.213 [3], where $N_{RLM}$ is specified in table 8.1D.1-2 according TS 38.213 [3], and meet the requirements as specified in clause 8.1D. UE is not required to meet the requirements in clause 8.1D if RLM-RS is not configured and no TCI state for PDCCH is activated.

**Table 8.1D.1-2: Maximum number of RLM-RS resources $N_{RLM}$**

| Carrier frequency range of PCell | $L_{max}$ | Maximum number of RLM-RS resources, $N_{RLM}$ |
|---|---|---|
| FR1, ≤ 3 GHz[Note] | 4 | 2 |
| FR1, > 3 GHz[Note] | 8 | 4 |
| NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [3]. | | |

## 8.1D.2 Requirements for SSB based radio link monitoring

### 8.1D.2.1 Introduction

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1D.2.2.

**Table 8.1D.2.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 4 dB |
| Bandwidth (PRBs) | 24 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.1D.2.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI payload size | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 4 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 24 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

## 8.1D.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_SSB}$ period becomes worse than the threshold $Q_{out_SSB}$ within $T_{Evaluate_out_SSB}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_SSB}$ period becomes better than the threshold $Q_{in_SSB}$ within $T_{Evaluate_in_SSB}$ evaluation period.

$T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ are defined in table 8.1D.2.2-1 for FR1.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency measurements, and these measurement gaps are overlapping with some but not all occasions of the SSB; and
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR1 ATG UE with the antenna array on the measured carrier,

- P value for an RLM-RS resource to be measured is defined as
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
    - For a window W of duration max($T_{L1}$, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:
    - $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    - -- $N_{available}$ is
      - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams
        - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,
      - otherwise,
    - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

- $T_{L1}$ is periodicity of the target RLM-RS
- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 8.1D.2.2-1: Evaluation period $T_{Evaluate_out_SSB}$ and $T_{Evaluate_in_SSB}$ for FR1**

| Configuration | $T_{Evaluate_out_SSB}$ (ms) | $T_{Evaluate_in_SSB}$ (ms) |
|---|---|---|
| no DRX | $Max(200, Ceil(10 \times P) \times T_{SSB})$ | $Max(100, Ceil(5 \times P) \times T_{SSB})$ |
| DRX cycle≤320 ms | $Max(200, Ceil(15 \times P) \times Max(T_{DRX},T_{SSB}))$ | $Max(100, Ceil(7.5 \times P) \times Max(T_{DRX},T_{SSB}))$ |
| DRX cycle>320 ms | $Ceil(10 \times P) \times T_{DRX}$ | $Ceil(5 \times P) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

### 8.1D.2.3 Measurement restrictions for SSB based RLM

The UE is required to be capable of measuring SSB for RLM without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for RLM is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for RLM without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for RLM without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for RLM and CSI-RS. Longer measurement period for SSB based RLM is expected, and no requirements are defined.

## 8.1D.3 Requirements for CSI-RS based radio link monitoring

### 8.1D.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1D.3.2. UE is not expected to perform radio link monitoring measurements on the CSI-RS configured as RLM-RS if the CSI-RS is not in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.1D.3.1-1: Void**

**Table 8.1D.3.1-2: Void**

### 8.1D.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_out_CSI-RS}$ period becomes worse than the threshold $Q_{out_CSI-RS}$ within $T_{Evaluate_out_CSI-RS}$ evaluation period.

UE shall be able to evaluate whether the downlink radio link quality on the configured RLM-RS resource estimated over the last $T_{Evaluate_in_CSI-RS}$ period becomes better than the threshold $Q_{in_CSI-RS}$ within $T_{Evaluate_in_CSI-RS}$ evaluation period.

- $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ are defined in table 8.1D.3.2-1 for FR1.

The requirements of $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ apply provided that the CSI-RS for RLM is not in a resource set configured with repetition ON. The requirements do not apply when the CSI-RS resource in the active TCI state of

CORESET is the same CSI-RS resource for RLM and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency measurements, and these measurement gaps are overlapping with some but not all occasions of the CSI-RS; and

- P = 1, when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR1 ATG UE with the antenna array on the measured carrier,

- P value for an RLM-RS resource to be measured is defined as

  $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$

  $N_{total} / N_{available}$ with $N_{available} > 0$

  - For a window W of duration max($T_{L1}$, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

  - $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and

  - $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W

  - $N_{available}$ is

    - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams

      - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,

    - otherwise,

    - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

  - $T_{L1}$ is periodicity of the target RLM-RS

  - $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of $M_{out}$ and $M_{in}$ used in table 8.1D.3.2-1 are defined as:

- $M_{out} = 20$ and $M_{in} = 10$, if the CSI-RS resource configured for RLM is transmitted with higher layer CSI-RS parameter *density* [6, clause 7.4.1] set to 3 and over the bandwidth $\geqslant$ 24 PRBs.

**Table 8.1D.3.2-1: Evaluation period $T_{Evaluate_out_CSI-RS}$ and $T_{Evaluate_in_CSI-RS}$ for FR1**

| Configuration | $T_{Evaluate_out_CSI-RS}$ (ms) | $T_{Evaluate_in_CSI-RS}$ (ms) |
|---|---|---|
| no DRX | Max(200, Ceil($M_{out}$×P)×$T_{CSI-RS}$) | Max(100, Ceil($M_{in}$×P) × $T_{CSI-RS}$) |
| DRX ≤ 320 ms | Max(200, Ceil(1.5×$M_{out}$×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) | Max(100, Ceil(1.5×$M_{in}$×P)× Max($T_{DRX}$, $T_{CSI-RS}$)) |
| DRX > 320 ms | Ceil($M_{out}$×P) × $T_{DRX}$ | Ceil($M_{in}$×P) × $T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

#### 8.1D.3.3 Measurement restrictions for CSI-RS based RLM

The UE is required to be capable of measuring CSI-RS for RLM without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for RLM in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for RLM, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS for RLM measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for RLM and SSB. Longer measurement period for CSI-RS based RLM is expected, and no requirements are defined.

For FR1, when the CSI-RS for RLM is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for RLM without any restriction.

### 8.1D.4 Minimum requirement at transitions

The requirement in clause 8.1.4 shall apply.

### 8.1D.5 Minimum requirement for UE turning off the transmitter

The requirement in clause 8.1.5 shall apply.

### 8.1D.6 Minimum requirement for L1 indication

The requirements in clause 8.1.6 shall apply only for UE in NR SA operation mode.

### 8.1D.7 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM has different subcarrier spacing than PDSCH/PDCCH, there are restrictions on the scheduling availability as described in the following clauses.

#### 8.1D.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH on FR1.

#### 8.1D.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

When intra-band carrier aggregation in FR1 is performed, the scheduling restrictions on FR1 serving PCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols.

When inter-band carrier aggregation within FR1 is performed, there are no scheduling restrictions on FR1 serving cell(s) in the bands due to radio link monitoring performed on FR1 serving PCell in different bands.

# 8.1E Radio Link Monitoring for RedCap UE with Satellite Access

## 8.1E.1 Introduction

The requirements in clause 8.1C.1 shall apply for RedCap UE except that:

- clause 8.1C is replaced with 8.1E, and
- table 8.1C.1-2 is replaced with 8.1E.1-2, and
- table 8.1C.2.1-1 is replaced with 8.1E.2.1-1, and
- table 8.1C.2.1-2 is replaced with 8.1E.2.1-2, and
- table 8.1C.3.1-1 is replaced with 8.1E.3.1-1, and
- table 8.1C.3.1-2 is replaced with 8.1E.3.1-2, and
- Maximum number of RLM-RS resources $N_{RLM}$ as specified in Table 8.1E.1-2.

**Table 8.1E.1-2: Maximum number of RLM-RS resources $N_{RLM}$**

| Carrier frequency range of PCell | $L_{max}$ | Maximum number of RLM-RS resources, $N_{RLM}$ |
|---|---|---|
| FR1, ≤ 3 GHz[Note] | 4 | 2 |
| FR1, > 3 GHz[Note] | 8 | 4 |
| NOTE: For unpaired spectrum operation with Case C - 30 kHz SCS, 3 GHz is replaced by 1.88 GHz, as specified in clause 4.1 in TS 38.213 [3]. | | |

## 8.1E.2 Requirements for SSB based radio link monitoring

### 8.1E.2.1 Introduction

The requirements in this clause apply for each SSB based RLM-RS resource configured for PCell, provided that the SSB configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1E.2.2.

**Table 8.1E.2.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 16; for RedCap UE with 1Rx branch.<br>8; for RedCap UE with 2Rx branches. |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 4 dB |
| Bandwidth (PRBs) | 48; for RedCap UE with 1Rx branch.<br>24; for RedCap UE with 2Rx branches. |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.1E.2.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI payload size | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8; for RedCap UE with 1Rx branch.<br>4; for RedCap UE with 2Rx branches. |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 48; for RedCap UE with 1Rx branch.<br>24; for RedCap UE with 2Rx branches. |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

## 8.1E.2.2 Minimum requirement

The requirements in clause 8.1C.2.2 shall apply when RedCap UE is capable of 2 Rx. When UE is only required to support 1 Rx antenna, the requirements defined in clause 8.1C.2.2 for FR1 shall apply except that:

- $T_{Evaluate_BFD_SSB_RedCap}$ as defined in table 8.1E.2.2-1 for FR1.

**Table 8.1E.2.2-1: Evaluation period $T_{Evaluate_out_SSB,RedCap}$ and $T_{Evaluate_in_SSB,RedCap}$ 1Rx RedCap UE**

| Configuration | $T_{Evaluate_out_SSB,RedCap}$ (ms) | $T_{Evaluate_in_SSB,RedCap}$ (ms) |
|---|---|---|
| no DRX | $\text{Max}(400, \text{Ceil}(20 \times P) \times T_{SSB})$ | $\text{Max}(100, \text{Ceil}(5 \times P) \times T_{SSB})$ |
| DRX cycle ≤320 ms | $\text{Max}(400, \text{Ceil}(30 \times P) \times \text{Max}(T_{DRX}, T_{SSB}))$ | $\text{Max}(100, \text{Ceil}(7.5 \times P) \times \text{Max}(T_{DRX}, T_{SSB}))$ |
| DRX cycle>320 ms | $\text{Ceil}(20 \times P) \times T_{DRX}$ | $\text{Ceil}(5 \times P) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of the SSB configured for RLM. $T_{DRX}$ is the DRX cycle length. | | |

## 8.1E.2.3 Measurement restrictions for SSB based RLM

The requirements for FR1 in clause 8.1C.2.3 shall apply.

# 8.1E.3 Requirements for CSI-RS based radio link monitoring

## 8.1E.3.1 Introduction

The requirements in this clause apply for each CSI-RS based RLM-RS resource configured for PCell, provided that the CSI-RS configured for RLM is actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.1E.3.2.

**Table 8.1E.3.1-1: PDCCH transmission parameters for out-of-sync evaluation**

| Attribute | Value for BLER Configuration #0 |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 16; for RedCap UE with 1Rx branch.<br>8; for RedCap UE with 2Rx branches. |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 4 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 4 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.1E.3.1-2: PDCCH transmission parameters for in-sync evaluation**

| Attribute | Value for BLER Configuration #0 |

| Mapping from REG to CCE | Distributed |

## 8.1E.3.2 Minimum requirement

The requirements in clause 8.1C.3.2 shall apply when RedCap UE is capable of 2 Rx. When UE is only required to support 1 Rx antenna, the requirements defined in clause 8.1C.3.2 for FR1 shall apply except that:

- $T_{Evaluate_BFD_SSB_RedCap}$ as defined in table 8.1E.3.2-1 for FR1.

**Table 8.1E.3.2-1: Evaluation period $T_{Evaluate_out_CSI-RS,RedCap}$ and $T_{Evaluate_in_CSI-RS,RedCap}$ 1Rx RedCap UE**

| Configuration | $T_{Evaluate_out_CSI-RS,RedCap}$ (ms) | $T_{Evaluate_in_CSI-RS,RedCap}$ (ms) |
|---|---|---|
| no DRX | $\text{Max}(400, \text{Ceil}(M_{out,RedCap} \times P) \times T_{CSI-RS})$ | $\text{Max}(100, \text{Ceil}(M_{in,RedCap} \times P) \times T_{CSI-RS})$ |
| DRX ≤ 320 ms | $\text{Max}(400, \text{Ceil}(1.5 \times M_{out,RedCap} \times P) \times \text{Max}(T_{DRX}, T_{CSI-RS}))$ | $\text{Max}(100, \text{Ceil}(1.5 \times M_{in,RedCap} \times P) \times \text{Max}(T_{DRX}, T_{CSI-RS}))$ |
| DRX > 320 ms | $\text{Ceil}(M_{out,RedCap} \times P) \times T_{DRX}$ | $\text{Ceil}(M_{in,RedCap} \times P) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of the CSI-RS resource configured for RLM. The requirements in this table apply for $T_{CSI-RS}$ equal to 5 ms, 10 ms, 20 ms or 40 ms. $T_{DRX}$ is the DRX cycle length. | | |

For HD-FDD UE indicating *CollisionHandlingOfHDFDDOperation*, the requirements in clause 8.1E.3.2 shall apply, provided that the following conditions are met:

there is no collision between the CSI-RS resources for RLM measurements and UL transmission when network indicates *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision,* or

in case of collision between the CSI-RS resources for RLM measurements and UL transmission except PRACH, and *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* is not indicated by network.

there is no collision between the CSI-RS resources for RLM measurements and PRACH.

## 8.1E.3.3 Measurement restrictions for CSI-RS based RLM

The requirements for FR1 in clause 8.1C.3.3 shall apply.

# 8.1E.4 Minimum requirement at transitions

The requirements in clause 8.1C.4 shall apply.

# 8.1E.5 Minimum requirement for UE turning off the transmitter

The requirements in clause 8.1C.5 shall apply.

## 8.1E.6 Minimum requirement for L1 indication

The requirements in clause 8.1C.6 shall apply.

In addition, for HD-FDD UE, the conditions and requirements for $T_{Indication_interval_BFD_Redcap}$ apply given that for each BFD-RS configuration, at least one BFD-RS sample must fall with DL occasion within an indication period.

## 8.1E.7 Scheduling availability of UE during radio link monitoring

When the reference signal to be measured for RLM has different subcarrier spacing than PDSCH/PDCCH , there are restrictions on the scheduling availability as described in the following clauses.

### 8.1E.7.1 Scheduling availability of UE performing radio link monitoring with a same subcarrier spacing as PDSCH/PDCCH

For FD-FDD and TDD RedCap UEs, there are no scheduling restrictions due to radio link monitoring performed with a same subcarrier spacing as PDSCH/PDCCH.

For HD-FDD UE, scheduling restrictions apply for transmission on PUCCH/PUSCH/SRS during radio link monitoring, except when UE indicates *CollisionHandlingOfHDFDDOperation* and is indicated that UL transmission is prioritized over RLM measurements via *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* in case of collision between CSI-RS resources to be measured and UL transmission.

### 8.1E.7.2 Scheduling availability of UE performing radio link monitoring with a different subcarrier spacing than PDSCH/PDCCH

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to radio link monitoring based on SSB as RLM-RS. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to radio link monitoring based on SSB as RLM-RS.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for radio link monitoring.

# 8.2 Interruption

## 8.2.1 EN-DC Interruption

### 8.2.1.1 Introduction

This clause contains the requirements related to the interruptions on PSCell, and SCell, when

- E-UTRA PCell transitions between active and non-active during DRX, or
- E-UTRA PCell transitions from non-DRX to DRX, or
- E-UTRA SCell in MCG or SCell in SCG is added or released, or
- E-UTRA SCell in MCG or SCell(s) in SCG is activated or deactivated, or
- measurements on SCC with deactivated SCell in either E-UTRA MCG or NR SCG, or
- a supplementary UL carrier or an UL carrier is configured or de-configured, or
- UL/DL active BWP is switched on PSCell or SCell in SCG, or
- E-UTRA SCell in MCG or SCell(s) in SCG is directly activated and hibernated, or
- E-UTRA SCell in MCG is hibernated, or
- Multiple SCells in SCG are activated or deactivated, or

- SCell dormancy switches, or
- CQI/RRM measurement happens during SCell dormancy, or
- UE-specific CBW is changed on PSCell or SCell in SCG, or
- CGI reading of an NR neighbour cell with autonomous gaps, or
- CGI reading of an E-UTRA neighbour cell with autonomous gaps, or
- NR SRS carrier based switching, or
- E-UTRA SRS carrier based switching, or
- NR SRS antenna port switching, or
- UE dynamic Tx switches between two uplink carriers, or
- SCell in SCG is activated based on aperiodic CSI-RS.

The requirements shall apply for E-UTRA-NR-DC with an E-UTRA PCell.

This clause contains interruptions where victim cell is PSCell or SCell belonging to SCG. Requirements for interruptions requirements when the victim cell is E-UTRA PCell or E-UTRA SCell belonging to MCG are specified in TS 36.133 [15].

For a UE which does not support per-FR measurement gaps, interruptions to the PSCell or activated SCG SCells may be caused by EUTRA PCell, EUTRA SCells or SCells on any frequency range. For UE which support per-FR gaps, interruptions to the PSCell or activated SCG SCells may be caused by EUTRA PCell, EUTRA SCells or SCells on the same frequency range as the victim cell.

## 8.2.1.2 Requirements

### 8.2.1.2.1 Interruptions at transitions between active and non-active during DRX

Interruption on PSCell and the activated SCell if configured due to E-UTRA PCell transitions between active and non-active during DRX when PSCell or SCell is in non-DRX are allowed with up to 1% probability of missed ACK/NACK when the configured E-UTRA PCell DRX cycle is less than 640 ms, and 0.625% probability of missed ACK/NACK is allowed when the configured E-UTRA PCell DRX cycle is 640 ms or longer. Each interruption shall not exceed X slots as defined in table 8.2.1.2.1-1.

**Table 8.2.1.2.1-1: Interruption length X at transition between active and non-active during DRX**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) | |
|---|---|---|---|
| | | Sync | Async |
| 0 | 1 | 1 | 2 |
| 1 | 0.5 | 1 | 2 |
| 2 | 0.25 | 3 | |
| 3 | 0.125 | 5 | |

When both E-UTRA PCell and PSCell are in DRX, no interruption is allowed.

### 8.2.1.2.2 Interruptions at transitions from non-DRX to DRX

Interruption on PSCell and the activated SCell if configured due to E-UTRA PCell transitions from non-DRX to DRX when PSCell or SCell is in non-DRX shall not exceed X slots as defined in table 8.2.1.2.1-1.

When PSCell and the activated SCell are in DRX, no interruption due to E-UTRA PCell transitions from non-DRX to DRX is allowed.

### 8.2.1.2.3 Interruptions at SCell addition/release

The requirements in this clause shall apply for the UE configured with PSCell.

When one E-UTRA SCell in MCG is added or released, the UE is allowed an interruption on any active serving cell in SCG:

- of up to X1 slots, if the active serving cell is not in the same band as any of the E-UTRA SCells being added or released, or

- of up to X1 slots, if the active serving cell is in the band overlapping or partially overlapping with the E-UTRA SCell being added or released and UE not supporting *requirementTypeIndication-r18* indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is not provided with *nonCollocatedTypeMRDC-r18*, or

- of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms}, if the active serving cells are in the same band or in the band overlapping or partially overlapping with the E-UTRA SCells being added or released, and UE does not indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE capable of *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and provided with *nonCollocatedTypeMRDC-r18*, provided the cell specific reference signals from the active serving cells and the E-UTRA SCells being added or released are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above active serving cells in SCG;

- if the active serving cell is in the band overlapping or partially overlapping with the E-UTRA SCell being added or released,

  1> when UE is configured with maxMIMO-Layers with value equal to 4 for all corresponding serving cells, in case of TDD-TDD inter-band (NG) EN-DC with overlapping or partially overlapping bands

    2> if UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r19* on this band pair

      3> if *nonCollocatedTypeMRDC-v19xy* is presented with “type 4”

        4> of up to X1 slots

      3>else if *nonCollocatedTypeMRDC-v19xy* is presented with “type 1”

        4> of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms}

      3>else if *nonCollocatedTypeMRDC-v19xy* is not provided

        4> of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms}

    2> else if UE not supporting *requirementTypeIndication-r18* indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r19* on this band pair

      3> of up to X1 slots

  1> when UE is configured with maxMIMO-Layers with value equal to 2 for all corresponding serving cells, in case of TDD-TDD inter-band (NG) EN-DC with overlapping or partially overlapping bands

    2> if *nonCollocatedTypeMRDC-r18* is not provided

      3> of up to X1 slots

    2> else

      3> of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms},

  Where X1 and Y1 are specified in table 8.2.1.2.3-1.

When one SCell in SCG is added or released, the UE is allowed an interruption on any active serving cell in SCG:

- of up to X1 slot, if the active serving cell and the SCell being added or released are in a FR1 band pair or in a FR1+FR2 band pair.

- of up to X1 slots, if the active serving cell and the SCell being added or released are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair

- of up to X1 slots, if the active serving cell is non-contiguous to the SCell being added or released in the same FR1 band and UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided.

or

- of up to Y1 slots + $T_{SMTC_duration}$, if the active serving cells are contiguous to any of the SCells being added or released in the same FR1 band, or if the active serving cells are non-contiguous to any of the SCells being added or released in the same FR1 band and UE is not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, provided the cell specific reference signals from the active serving cells and the SCells being added or released are available in the same slot,

- if the active serving cell is non-contiguous to the SCell being added or released in the same FR1 band, and UE is capable of *intraBandNR-CA-non-collocated-r19*,

  1> when UE is configured with maxMIMO-Layers with value equal to 4 for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

    2> if *nonCollocatedTypeNR-CA-v19xy* is presented with "type 4"

      3> of up to X1 slots

    2> else if *nonCollocatedTypeNR-CA-v19xy* is presented with "type 1"

      3> of up to Y1 slots + $T_{SMTC_duration}$

    2> else if *nonCollocatedTypeNR-CA-v19xy* is not provided

      3> of up to Y1 slots + $T_{SMTC_duration}$

  1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

    2> if *nonCollocatedTypeNR-CA-r18* is not provided

      3> of up to X1 slots

    2> else

      3> of up to Y1 slots + $T_{SMTC_duration}$

where, $T_{SMTC_duration}$ is

  - the longest SMTC duration among all above active serving cells in SCG and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added, $T_{SMTC\ duration}$ for the SCell being added is 0 ms;

  - the longest SMTC duration among all above active serving cells in SCG when one SCell is released.

- of up to Y1 slots + $T_{SMTC_duration}$ if the active serving cells are in the same FR2 band as any of the SCells being added or released, provided the cell specific reference signals from the active serving cells and the SCells being added or released are available in the same slot, where, $T_{SMTC_duration}$ is

  - the longest SMTC duration among all above active serving cells in SCG and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added, $T_{SMTC\ duration}$ for the SCell being added is 0 ms;

  - the longest SMTC duration among all above active serving cells in SCG when one SCell is released.

Where X1 and Y1 are specified in table 8.2.1.2.3-2.

For UE supporting On-demand SSB operation, when one OD-SSB SCell in SCG is added or released, no interruption is allowed on any active serving cell in SCG before OD-SSB is activated on the SCell wherein there is only OD-SSB transmission without the first SSB transmission.

**Table 8.2.1.2.3-1: Interruption length X1 and Y1 at E-UTRA SCell addition/Release**

| $\mu$ | NR Slot length (ms) | Interruption length X1 (slots) | | Interruption length Y1 (slots) | |
|---|---|---|---|---|---|
| | | Sync | Async | Sync | Async |
| 0 | 1 | 1 | 2 | 1 | 2 |
| 1 | 0.5 | 2 | 3 | 2 | 3 |
| 2 | 0.25 | 5 | | 4 | 5 |
| 3 | 0.125 | 9 | | N/A | - N/A |

**Table 8.2.1.2.3-2: Interruption length X1 and Y1 at SCell addition/Release**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | | Interruption length Y1 (slots) |
|---|---|---|---|---|
| 0 | 1 | 1 | | 1 |
| 1 | 0.5 | 2 | | 2 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 4 | 4 |
| | | Either aggressor cell or victim cell is on FR1 | 5 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 8 | 8 |
| | | Aggressor cell is on FR1 | 9 | |

### 8.2.1.2.4 Interruptions at SCell activation/deactivation

The requirements in this clause shall apply for the UE configured with PSCell and one SCell.

When one E-UTRA SCell in MCG is activated from deactivated or dormant state, or deactivated from activated or dormant state, the UE is allowed an interruption on any active serving cell in SCG:

- of up to X2 slots, if the active serving cell is not in the same band as any of the E-UTRA SCells being activated or deactivated, or

- of up to X2 slots, if the active serving cell is in the band overlapping or partially overlapping with the E-UTRA SCell being activated or deactivated and UE not supporting *requirementTypeIndication-r18* indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and not provided with *nonCollocatedTypeMRDC-r18*, or

- of up to max{Y2 slots + $T_{SMTC_duration}$, 5ms}, if the active serving cells are in the same band or in the band overlapping or partially overlapping with the E-UTRA SCells being activated or deactivated, and UE does not indicate it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is provided with *nonCollocatedTypeMRDC-r18*, provided the cell specific reference signals from the active serving cells and the E-UTRA SCells being activated or deactivated are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above active serving cells in SCG.

- if the active serving cell is in the band overlapping or partially overlapping with the E-UTRA SCell being added or released,

  1> when UE is configured with maxMIMO-Layers with value equal to 4 for all corresponding serving cells, in case of TDD-TDD inter-band (NG) EN-DC with overlapping or partially overlapping bands

2> if UE supporting *requirementTypeIndication-r18* is capable of *interBandMRDC-WithOverlapDL-Bands-r19*on this band pair

3> if *nonCollocatedTypeMRDC-v19xy* is presented with “type 4”

4> of up to X2 slots

3> else if *nonCollocatedTypeMRDC-v19xy* is presented with “type 1”

4> of up to max{Y2 slots + $T_{SMTC_duration}$, 5ms}

3> else if *nonCollocatedTypeMRDC-v19xy* is not provided

4> of up to max{Y2 slots + $T_{SMTC_duration}$, 5ms}

2> else if UE not supporting *requirementTypeIndication-r18* indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r19* on this band pair

3> of up to X2 slots

1> when UE is configured with maxMIMO-Layers with value equal to 2 for all corresponding serving cells, in case of TDD-TDD inter-band (NG) EN-DC with overlapping or partially overlapping bands

2> if *nonCollocatedTypeMRDC-r18* is not provided

3> of up to X2 slots

2> else

3> of up to max{Y2 slots + $T_{SMTC_duration}$, 5ms}Where X2 and Y2 are specified in table 8.2.1.2.4-1.

When one SCell in SCG is activated or deactivated, the UE is allowed an interruption on any active serving cell in SCG:

- of up to X2 slots, if the active serving cell and the SCell being activated or deactivated are in a FR1 band pair or in a FR1+FR2 band pair.
- of up to X2 slots, if the active serving cells and the SCells being activated or deactivated are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair.
- of up to X2 slots, if the active serving cell is non-contiguous to the SCell being activated or deactivated in the same FR1 band and UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided.

or

- of up to Y2 slots + $T_{SMTC_duration}$, if the active serving cells are contiguous to any of the SCells being activated or deactivated in the same FR1 band, or if the active serving cells are non-contiguous to any of the SCells being activated or deactivated in the same FR1 band and UE is not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, provided the cell specific reference signals from the active serving cells and the SCells being activated or deactivated are available in the same slot,
- if the active serving cell is non-contiguous to the SCell being activated or deactivated in the same FR1 band, and UE is capable of *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

2> if *nonCollocatedTypeMRDC-v19xy* is presented with “type 4”

3> of up to X1 slots

2> else if *nonCollocatedTypeMRDC-v19xy* is presented with “type 1”

3> of up to Y1 slots + $T_{SMTC_duration}$

2> else if *nonCollocatedTypeMRDC-v19xy* is not provided

3> of up to Y1 slots + $T_{SMTC_duration}$

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> of up to X1 slots

2> else

3> of up to Y1 slots + $T_{SMTC_duration}$

,where, $T_{SMTC_duration}$ is

- the longest SMTC duration among all above active serving cells in SCG and the SCell being activated when one SCell is activated. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated, $T_{SMTC\ duration}$ for the SCell being activated is 0ms;

- the longest SMTC duration among all above active serving cells in SCG when one SCell is deactivated.

- of up to Y2 slots + $T_{SMTC_duration}$ if the active serving cells are in the same FR2 band as any of the SCells being activated or deactivated, provided the cell specific reference signals from the active serving cells and the SCells being activated or deactivated are available in the same slot, where, $T_{SMTC_duration}$ is

- the longest SMTC duration among all above active serving cells in SCG and the SCell being activated when one SCell is activated. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated, $T_{SMTC\ duration}$ for the SCell being activated is 0ms;

  - the longest SMTC duration among all above active serving cells in SCG when one SCell is deactivated.

Where X2 and Y2 are specified in table 8.2.1.2.4-2.

For UE supporting *On-demand SSB operation*, when one OD-SSB SCell in SCG is activated or deactivated, the requirements in this clause shall apply provided OD-SSB is activated on the SCell or OD-SSB activation/deactivation command and SCell activation/deactivation command are received in the same MAC command.

**Table 8.2.1.2.4-1: Interruption length X2 and Y2 at E-UTRA SCell activation/deactivation**

| $\mu$ | NR Slot length (ms) | nterruption length X2 (slots) | | Interruption length Y2 (slots) | |
|---|---|---|---|---|---|
| | | Sync | Async | Sync | Async |
| 0 | 1 | 1 | 2 | 1 | 2 |
| 1 | 0.5 | 1 | 2 | 1 | 2 |
| 2 | 0.25 | 3 | | 2 | 3 |
| 3 | 0.125 | 5 | | N/A | N/A |

**Table 8.2.1.2.4-2: Interruption length X2 and Y2 at SCell activation/deactivation**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X2 (slots) | | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 1 | | 1 |
| 1 | 0.5 | 1 | | 1 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 2 | 2 |

| | | | | |
|---|---|---|---|---|
| | | Either aggressor cell or victim cell is on FR1 | 3 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 4 | 4 |
| | | Aggressor cell is on FR1 | 5 | |

### 8.2.1.2.5 Interruptions during measurements on SCC

#### 8.2.1.2.5.1 Interruptions during measurements on deactivated NR SCC

Interruption on PSCell and other activated NR SCell(s) during measurement on the deactivated NR SCC shall meet requirements in clause 8.2.2.2.3, where the term PCell in clause 8.2.2.2.3 shall be deemed to be replaced with PSCell.

#### 8.2.1.2.5.2 Interruptions during measurements on deactivated E-UTRAN SCC

When one E-UTRA SCell in MCG is deactivated, the UE is allowed due to measurements on the E-UTRA SCC with the deactivated E-UTRA SCell:

- an interruption on PSCell or any activated SCell with up to 0.5 % probability of missed ACK/NACK when any of the configured *measCycleSCell* [15] for the deactivated E-UTRA SCells is 640 ms or longer.

- an interruption on PSCell or any activated SCell with up to 0.5 % probability of missed ACK/NACK regardless of the configured *measCycleSCell* [15] for the deactivated E-UTRA SCells if indicated by the network using IE *allowInterruptions* [15].

Each interruption shall not exceed

- X3 slots, if the PSCell or activated SCell is not in the same band as the E-UTRA deactivated SCC being measured, or

- X3 slots, if the PSCell or activated SCell is in the band overlapping or partially overlapping with the E-UTRA deactivated SCC being measured, and UE not supporting *requirementTypeIndication-r18* indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is not provided with *nonCollocatedTypeMRDC-r18*, or

- Y3 slots + SMTC duration, if the PSCell or activated SCell is in the same band or in the band overlapping or partially overlapping with the E-UTRA deactivated SCC being measured, and UE does not indicate it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is provided with *nonCollocatedTypeMRDC-r18*, provided the cell specific reference signals from the PSCell or activated SCell and the E-UTRA deactivated SCC being measured are available in the same slot.

**Table 8.2.1.2.5.2-1: Interruption length X3 and Y3 at measurements on deactivated E-UTRA SCC**

| $\mu$ | NR Slot length (ms) | Interruption length X3 (slots) | | Interruption length Y3 (slots) | |
|---|---|---|---|---|---|
| | | Sync | Async | Sync | Async |

#### 8.2.1.2.5.3 Interruptions during CQI measurements on dormant E-UTRAN SCell

When one E-UTRA SCell in MCG is dormant, the UE is allowed due to CQI measurements on the dormant E-UTRA SCell:

- an interruption on PSCell or any activated SCell with up to 0.5 % probability of missed ACK/NACK.

Each interruption shall not exceed

- X3 slots, if the PSCell or activated SCell is not in the same band as the E-UTRA dormant SCell being measured, or
- X3 slots, if the PSCell or activated SCell is in the band overlapping or partially overlapping with the E-UTRA dormant SCC being measured, and UE not supporting *requirementTypeIndication-r18* indicates it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is not provided with *nonCollocatedTypeMRDC-r18*, or
- Y3 slots + SMTC duration, if the PSCell or activated SCell is in the same band or in the band overlapping or partially overlapping with the E-UTRA dormant SCell being measured, and UE does not report *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* indicates that it is capable of *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is provided with *nonCollocatedTypeMRDC-r18*, provided the cell specific reference signals from the PSCell or activated SCell and the E-UTRA dormant SCell being measured are available in the same slot.

Where X3 and Y3 are defined in table 8.2.1.2.5.2-1.

#### 8.2.1.2.5.4 Interruptions during RRM measurements on dormant E-UTRAN SCC

When one E-UTRA SCell in MCG is dormant, the UE is allowed due to RRM measurements on the E-UTRA SCC with the dormant E-UTRA SCell:

- an interruption on PSCell or any activated SCell with up to 0.5 % probability of missed ACK/NACK.

Each interruption shall not exceed

- X3 slots, if the PSCell or activated SCell is not in the same band as the E-UTRA dormant SCC being measured, or
- X3 slots, if the PSCell or activated SCell is in the band overlapping or partially overlapping with the E-UTRA dormant SCC being measured, and UE not supporting *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is not provided with *nonCollocatedTypeMRDC-r18*, or
- Y3 slots + SMTC duration, if the PSCell or activated SCell is in the same band or in the band overlapping or partially overlapping with the E-UTRA dormant SCC being measured, and UE does not report *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is provided with *nonCollocatedTypeMRDC-r18*, provided the cell specific reference signals from the PSCell or activated SCell and the E-UTRA dormant SCC being measured are available in the same slot.

Where X3 and Y3 are defined in table 8.2.1.2.5.2-1.

### 8.2.1.2.6 Interruptions at UL carrier RRC reconfiguration

The requirements in this clause shall apply when a supplementary UL carrier or an UL carrier is configured or de-configured in NR non-standalone operation as defined in TS 38.331 [2].

When an UL carrier or supplementary UL carrier is configured or de-configured, an interruption of up to X4 slots, is allowed during the RRC reconfiguration procedure [2] on E-UTRA PCell, all activated E-UTRA SCells, PSCell and all activated SCells within the same FR as the reconfigured uplink carrier. The interruption is for both uplink and downlink of E-UTRA PCell, all activated E-UTRA SCells, PSCell and all activated SCells within the same FR as the configured or de-configured UL.

**Table 8.2.1.2.6-1: Interruption length X4 at UL carrier RRC reconfiguration**

| $\mu$ | NR Slot length (ms) | Interruption length X4 (slots) | |
|---|---|---|---|
| | | Sync | Async |
| 0 | 1 | 1 | 2 |
| 1 | 0.5 | 2 | 3 |
| 2 | 0.25 | 5 | |
| 3 | 0.125 | 9 | |

### 8.2.1.2.7 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based BWP switch, timer-based BWP switch or UL BWP switch triggered by consistent uplink CCA failures and RRC based in this clause apply to the case that the BWP switch is performed on a single CC or multiple CCs.

When either of the DCI-based, timer-based or RRC-based downlink BWP switch and/or uplink BWP switch occur on multiple CCs simultaneously or over partially overlapping period, the interruption requirements described in this clause apply for each BWP switch.

When UE receives a DCI indicating UE to switch its active BWP involving changes in any of the parameters listed in table 8.2.1.2.7-2, the UE is allowed to cause interruption of up to X slots to other active serving cells if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in table 8.2.1.2.7-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slots to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in table 8.2.1.2.7-1. The starting time of interruption is only allowed within the BWP switching delay $T_{BWPswitchDelay}$ as defined in clause 8.6.2 when BWP switch occurs on a single CC. The starting time of interruption caused by each BWP switch is only allowed within the BWP switch delay $T_{MultipleBWPswitchDelay}$ +Y as defined in clause 8.6.2A.1 when BWP switch occurs on multiple CCs. Interruptions are not allowed during BWP switch involving any other parameter change.

When a BWP timer *bwp-InactivityTimer* defined in TS 38.331 [2] expires, UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in table 8.2.1.2.7-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in table 8.2.1.2.7-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slots to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in table 8.2.1.2.7-1. The starting time of interruption is only allowed within the BWP switching delay $T_{BWPswitchDelay}$ as defined in clause 8.6.2 when BWP switch occurs on a single CC. The starting time of interruption caused by each BWP switch is only allowed within the BWP switch delay $T_{MultipleBWPswitchDelay}$ as defined in clause 8.6.2B.1 when BWP switch occurs on multiple CCs simultaneously or $T_{MultipleBWPswitchDelayTotal}$ as defined in clause 8.6.2B.2 when BWP switch occurs on multiple CCs over partially overlapping time period. Interruptions are not allowed during BWP switch involving any other parameter change.

When UE receives an RRC reconfiguration that only requests UE to switch its active BWP on one single CC, the UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in table 8.2.1.2.7-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in table 8.2.1.2.7-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slots to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in table 8.2.1.2.7-1. The interruption is only allowed within the delay $T_{RRCprocessingDelay}$ + $T_{BWPswitchDelayRRC}$ defined in clause 8.6.3 when BWP switch occurs on a single CC. The interruption is only allowed within the delay $T_{RRCprocessingDelay}$ + $T_{BWPswitchDelayRRC}$ + $D_{RRC}$*(N-1) as defined in clause 8.6.3A when BWP switch occurs on multiple CCs.

When UL BWP switch is triggered by consistent uplink CCA failures [7], the UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its active UL BWP involving changes in any of the parameters listed in table 8.2.1.2.7-2 if the UE is not capable of per-FR gap, or if the UL BWP switching involves SCS changing. When the UL BWP switch imposes changes in any of the parameters listed in table 8.2.1.2.7-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slots to other active serving cells in the same frequency range wherein the UE is performing UL BWP switching. X is defined in table 8.2.1.2.7-1. The starting time of interruption is only allowed within the UL BWP switching delay $T_{BWPswitchDelay}$ as defined in clause 8.6.2. Interruptions are not allowed during UL BWP switch involving other parameter change.

**Table 8.2.1.2.7-1: interruption length X**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 1 |
| 2 | 0.25 | 3 |
| 3 | 0.125 | 5 |

### 8.2.1.2.8 Interruptions at direct SCell activation and hibernation

#### 8.2.1.2.8.1 Interruptions during direct SCell activation and hibernation of E-UTRA SCell

When one E-UTRA SCell in MCG is directly activated and hibernated, the UE is allowed an interruption on any active serving cell in SCG:

- of up to X1 slots, if the active serving cell is not in the same band as any of the E-UTRA SCells being directly activated or hibernated, or
- of up to X1 slots, if the active serving cell is in the band overlapping or partially overlapping with any of the E-UTRA SCells being directly activated or hibernated, and UE not supporting *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE capable of *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is not provided with *nonCollocatedTypeMRDC-r18*, or
  - of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms} if the active serving cells are in the same band or in the band overlapping or partially overlapping with any of the E-UTRA SCells being directly activated or hibernated, and UE does not report *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is provided with *nonCollocatedTypeMRDC-r18*, provided the cell specific reference signals from the active serving cells and the E-UTRA SCells being directly activated or hibernated are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above active serving cells in MCG Where X1 and Y1 are specified in table 8.2.1.2.3-1.

#### 8.2.1.2.8.2 Interruptions during direct SCell activation

When one or multiple SCell(s) in SCG are directly activated at SCell addition, the UE is allowed an interruption on any active serving cell in SCG:

- of up to X1 slots, if the active serving cell is not in the same band as the SCell being directly activated, or
- of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms} if the active serving cells are in the same band as the SCell being directly activated, provided the cell specific reference signals from the active serving cells and the SCell being directly activated are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above active serving cells in SCG.

  Where X1 and Y1 are specified in table 8.2.1.2.3-2.

### 8.2.1.2.9 Interruptions at SCell hibernation

When one E-UTRA SCell in MCG is hibernated, the UE is allowed an interruption on any active serving cell in SCG:

- of up to X2 slots, if the active serving cell is not in the same band as any of the E-UTRA SCells being hibernated, or

- of up to X2 slots, if the active serving cell is in the band overlapping or partially overlapping with any of the E-UTRA SCells being hibernated, and UE not supporting *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is not provided with *nonCollocatedTypeMRDC-r18*, or

- of up to max{Y2 slots + $T_{SMTC_duration}$, 5ms}, if the active serving cells are in the same band or in the band overlapping or partially overlapping with any of the E-UTRA SCells being hibernated, and UE does not report *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair or UE supporting *requirementTypeIndication-r18* reports *interBandMRDC-WithOverlapDL-Bands-r16* on this band pair and is provided with *nonCollocatedTypeMRDC-r18*, provided the cell specific reference signals from the active serving cells and the E-UTRA SCells being hibernated are available in the same slot.Where X2 and Y2 are specified in table 8.2.1.2.4-1.

### 8.2.1.2.10 Interruptions at SCell activation/deactivation with multiple downlink SCells

The requirements in this clause shall apply for the UE configured with PSCell and up to 6 downlink SCell(s).

When multiple SCells in SCG are activated or deactivated by one single MAC CE command, the UE is allowed an interruption on any serving cell in SCG as specified in clause 8.2.1.2.4.

### 8.2.1.2.11 Interruptions due to UE-specific CBW change

When UE receives an RRC reconfiguration that changes *offsetToCarrier* or *carrierBandwidth*, the UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its CBW. X is defined in table 8.2.1.2.11-1. The interruption is only allowed within the delay $T_{RRCprocessingDelay}$ + $T_{CBWchangeDelayRRC}$ defined in clause 8.7.

**Table 8.2.1.2.11-1: interruption length X**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 1 |
| 2 | 0.25 | 3 |
| 3 | 0.125 | 5 |

### 8.2.1.2.12 Interruptions at NR SRS carrier based switching

SRS transmission can be configured on a carrier not configured for PUCCH/PUSCH transmission. When a UE needs to transmit periodic, semi-persistent or aperiodic SRS on a carrier of a serving cell not configured for PUCCH/PUSCH transmission, the UE can perform carrier based switching to one or more carriers not configured for PUCCH/PUSCH transmission from a carrier with PUCCH/PUSCH transmission or from a carrier not configured for PUCCH/PUSCH transmission prior to transmitting SRS, provided that:

- switching is from a configured carrier to an active UL BWP of another activated carrier;

- the carrier of SCells not configured for PUCCH/PUSCH transmission to which SRS carrier based switching is performed is indicated by DCI SRS request field for aperiodic SRS transmission, or indicated by MAC-CE for semi-persistent SRS transmission, or configured via RRC for periodic SRS transmission;

- the serving cell, from which SRS carrier based switching is performed and whose UL transmission may therefore be interrupted, is indicated by srs-SwitchFromServCellIndex and srs-SwitchFromCarrier in TS 38.331 [2];

- the SRS switching is not colliding with any other transmission with higher priority defined in TS 38.214 [26];

- the SRS switching is not colliding with any SSB/CSI-RS based L3 measurements and the measurements for RLM/BFD in SCG;

- for UE, which does not support simultaneous reception and transmission for inter-band TDD CA specified in TS 38.331 [2], and is compliant to the requirements for inter-band CA with uplink in one NR band and without simultaneous Rx/Tx specified in TS 38.101-3 [20], the SRS transmission are not simultaneously scheduled with DL SSB/CSI-RS for L3 or L1 measurements transmission on other carriers.

The UE shall not perform SRS carrier based switching if the above conditions cannot be met.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell in SCG if UE is not capable of per-FR gap, or on active serving cell(s) in SCG in FR1 if UE is capable of per-FR gap, during the switching to the carrier of a serving cell in FR1 not configured for PUCCH/PUSCH transmission,

- with up to X1 slots as specified in table 8.2.1.2.12-1.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell in SCG if UE is not capable of per-FR gap, or on active serving cell(s) in SCG in FR2 if UE is capable of per-FR gap, during the switching to the carrier of a serving cell in FR2 not configured for PUCCH/PUSCH transmission,

- with up to X2 slots as specified in table 8.2.1.2.12-2.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell in SCG if UE is not capable of per-FR gap, or on active serving cell(s) in SCG in FR1 if UE is capable of per-FR gap, during the switching from the carrier of a serving cell in FR1 not configured for PUCCH/PUSCH transmission,

- with up to X1 slots as specified in table 8.2.1.2.12-1.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell in SCG if UE is not capable of per-FR gap, or on active serving cell(s) in SCG in FR2 if UE is capable of per-FR gap, during the switching from the carrier of a serving cell in FR2 not configured for PUCCH/PUSCH transmission,

- with up to X2 slots as specified in table 8.2.1.2.12-2.

**Table 8.2.1.2.12-1: Interruption length X1 (slots)**

| $\mu$ | NR Slot length (ms) of victim cell | SRS carrier switching time (us)[Note 1] | Interruption length X1 (slots) | |
|---|---|---|---|---|
| | | | Sub carrier spacing for aggressor cell (kHz) | |
| | | | 15 | 30 |
| 0 | 1 | ≤ 200 | 2 | 2 |
| | | 300, 500 | 2 | 2 |
| | | 900 | 3 | 3 |
| 1 | 0.5 | ≤ 200 | 3 | 2 |
| | | 300, 500 | 3 | 3 |
| | | 900 | 4 | 4 |
| 2 | 0.25 | ≤ 200 | 4 | 3 |
| | | 300, 500 | 5 | 4 |
| | | 900 | 7 | 6 |
| 3 | 0.125 | ≤ 200 | 7 | 5 |
| | | 300, 500 | 9 | 7 |
| | | 900 | 12 | 10 |
| NOTE 1: NR SRS carrier switching time is UE capability indicated by higher layer parameter *SRS-SwitchingTimeNR*. | | | | |

**Table 8.2.1.2.12-2: Interruption length X2 (slots)**

| $\mu$ | NR Slot length (ms) of victim cell | SRS carrier switching time (us) [Note] | Interruption length X2 (slots) | |
|---|---|---|---|---|
| | | | Sub carrier spacing for aggressor cell (kHz) | |
| | | | 60 | 120 |
| 0 | 1 | $\leq$ 200 | 2 | 2 |
| 1 | 0.5 | $\leq$ 200 | 2 | 2 |
| 2 | 0.25 | $\leq$ 200 | 3 | 3 |
| 3 | 0.125 | $\leq$ 200 | 4 | 4 |

NOTE 1: NR SRS carrier switching time is UE capability indicated by higher layer parameter *SRS-SwitchingTimeNR*.

For intra-band SRS carrier switching in FR1 or FR2, interruptions in table 8.2.1.2.12-1 and in table 8.2.1.2.12-2 based on SRS carrier switching time $\leq$ 200μs shall apply. For inter-band SRS carrier switching in FR1, interruptions in table 8.2.1.2.12-1 and in table 8.2.1.2.12-2 shall apply.

### 8.2.1.2.13 Interruptions at E-UTRA SRS carrier based switching

A PUSCH-less carrier of E-UTRA SCell is a TDD carrier without PUCCH/PUSCH configured. When a UE needs to transmit periodic or aperiodic SRS [23] and/or non-contention based PRACH on a PUSCH-less carrier of E-UTRA SCell, the UE can perform carrier based switching to one or more PUSCH-less carrier of E-UTRA SCells from a E-UTRA carrier with PUSCH or from another PUSCH-less E-UTRA carrier of SCell prior to transmitting SRS and/or PRACH, provided that:

- switching is from a configured E-UTRA carrier to another activated TDD E-UTRA carrier;
- the PUSCH-less carrier of E-UTRA SCells to which SRS carrier based switching is performed is indicated by DCI SRS request field for aperiodic SRS transmission or configured via RRC [15] for periodic SRS transmission;
- the E-UTRA serving cell, from which SRS carrier based switching is performed and whose UL transmission may therefore be interrupted, is indicated by srs-SwitchFromServCellIndex [15];

  the SRS switching is not colliding with any other transmission with higher priority defined in TS 36.213 [39];
- the SRS switching is not colliding with PDCCH in subframe 0 and 5 as specified in TS 36.213 [39];
- for UE, which does not support simultaneous reception and transmission for inter-band TDD CA specified in TS 36.331 [16], and is compliant to the requirements for inter-band CA with uplink in one E-UTRA band and without simultaneous Rx/Tx specified in TS 36.101 [25], the SRS or RACH transmission are not simultaneously scheduled with DL subframe #0 or DL subframe #5 on other E-UTRA carriers.

The UE shall not perform SRS carrier based switching if the above conditions cannot be met.

When SRS carrier based switching is performed between E-UTRA carriers, the UE is allowed interruptions on any active serving cell in SCG if UE is not capable of per-FR gap, or on active serving cell(s) in SCG in FR1 if UE is capable of per-FR gap, during the switching to the PUSCH-less carrier of a serving cell,

- with up to X3 slots as specified in table 8.2.1.2.13-1.

When SRS carrier based switching is performed between E-UTRA carriers, the UE is allowed interruptions on any active serving cell in SCG if UE is not capable of per-FR gap, or on active serving cell(s) in SCG in FR1 if UE is capable of per-FR gap, during the switching from the PUSCH-less carrier of a serving cell,

- with up to X3 slots as specified in table 8.2.1.2.13-1

**Table 8.2.1.2.13-1: Interruption length X3 (slots)**

| $\mu$ | NR Slot length (ms) | Interruption length X3 (slots) |
|---|---|---|
| 0 | 1 | 2 |
| 1 | 0.5 | 3 |
| 2 | 0.25 | 5 |
| 3 | 0.125 | 9 |

### 8.2.1.2.14 DL Interruptions at switching between two uplink carriers

The DL interruption requirements at dynamic switching between two uplink carriers specified in this clause are applicable for an uplink band pair of an inter-band EN-DC configuration when the capability *uplinkTxSwitchingPeriod* is present, and is only applicable for uplink switching mechanism specified in clause 6.1.6 of TS 38.214 [26], where E-

UTRA UL carrier is capable of one transmit antenna connector and NR UL carrier is capable of two transmit antenna connectors, and the two uplink carriers are in different bands with different carrier frequencies.

When dynamic switching between two uplink carriers is conducted, UE is allowed to cause DL interruption of X OFDM symbols in NR downlink carrier(s) as indicated by *uplinkTxSwitching-DL-Interruption* [2]. The DL interruption starts from the first OFDM symbol which fully or partially overlaps with the UL switching period located in NR carrier. The DL interruption lengths of X for NR carrier(s) are defined in table 8.2.1.2.14-1.

No DL interruption is allowed in the NR downlink carrier(s) which is not indicated by *uplinkTxSwitching-DL-Interruption*. No DL interruption is allowed for some inter-band EN-DC configurations as specified in clause 5.5B.4 of TS 38.101-3 [20].

**Table 8.2.1.2.14-1: DL interruption length on NR carrier(s) in the unit of OFDM symbols (X) for switching between two uplink carriers**

| $\mu$ | NR Slot length (ms) | Uplink Tx switching period Note1 | |
|---|---|---|---|
| | | 35μs | 140μs |
| 0 | 1 | 2 | 3 |
| 1 | 0.5 | 3 | 6 |
| 2 | 0.25 | 4 | 10 |
| NOTE 1: Uplink Tx switching period depends on UE capability *uplinkTxSwitchingPeriod.* | | | |

## 8.2.1.2.15 Interruptions due to SCell dormancy

### 8.2.1.2.15.1 Interruptions due to SCell dormancy switch

When one SCell in SCG is switched from dormancy to non-dormancy or from non-dormancy to dormancy [7] when UE is in DRX active time,

- the UE is allowed an interruption on active serving cell in SCG as defined in clause 8.2.1.2.7, except that the interruption is allowed regardless of which parameters change between the dormant BWP and the non-dormant BWP

- The starting time of interruption shall be within the dormancy switching delay as defined in clause 8.6.2.

When multiple SCells in SCG are switched from dormancy to non-dormancy or vice versa when the UE is in DRX active time, the interruption requirement described above applies for each BWP switch.

### 8.2.1.2.15.2 Interruptions due to CQI measurements during SCell dormancy

When one or more SCells are in dormancy, the UE is for the purpose of CQI measurements on the dormant SCell(s) allowed to cause interruptions to non-dormant serving cell(s).

The rate of ACK/NACK feedback loss on any non-dormant serving cell resulting from CQI measurements on dormant SCells shall not exceed 0.5 %.

### 8.2.1.2.15.3 Interruptions due to RRM measurements during SCell dormancy

When one or more SCells are in dormancy, the UE is for the purpose of RRM measurements on the dormant SCell(s) allowed to cause interruptions to non-dormant serving cell(s).

The rate of ACK/NACK feedback loss on any non-dormant serving cell resulting from RRM measurements on dormant SCells shall not exceed 1.0 %.

## 8.2.1.2.16 Interruptions when identifying CGI of an NR cell with autonomous gaps

When a UE is identifying CGI of an NR cell with autonomous gaps, the UE is allowed interruptions on PSCell or any activated SCell:

- with up to K1 interruptions with interrupted slots up to interruption length X1 specified in table 8.2.1.2.16-1 for each interruption during MIB decoding time period $T_{MIB}$ (ms) specified in clause 9.11.

- with up to L1 interruptions with interrupted slots up to interruption length Y1 specified in table 8.2.1.2.16-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11 for SSB and CORESET for RMSI scheduling multiplexing patterns 1.

- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in table 8.2.1.2.16-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11 for SSB and CORESET for RMSI scheduling multiplexing patterns 2 and 3.

Where:

- K1 = 6 for the target cell carrier frequency on FR1 and K1 = 25 for the target cell carrier frequency on FR2, and

- L1 = $T_{SIB1}/20$, and

- L2 = $T_{SIB1}/T_{SMTC}$, where $T_{SMTC}$ is the periodicity of the SMTC occasion configured for the target cell carrier.

**Table 8.2.1.2.16-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | Interruption length Y1 (slots) | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 6 | 7 | 6 |
| 1 | 0.5 | 12 | 13 | 10 |
| 2 | 0.25 | 24 | 25 | 19 |
| 3 | 0.125 | 48 | 49 | 37 |

### 8.2.1.2.17 Interruptions when identifying CGI of an E-UTRA cell with autonomous gaps

When a UE is identifying CGI of an E-UTRA FDD cell or E-UTRA TDD cell with autonomous gaps, within time period

- $T_{identify_CGI,\ intra}$ specified in clause 8.1.2.2.3, or clause 8.1.2.2.4 in TS 36.133 [15], or

- $T_{identify_CGI,\ inter}$ specified in clause 8.1.2.3.5, or clause 8.1.2.3.6, or clause 8.1.2.3.7, or clause 8.1.2.3.6 in TS 36.133 [15], or

- $T_{identify_CGI,\ E\text{-}UTRA}$ specified in clause 9.4.7.1

the UE shall be able to transmit at least the number of ACK/NACKs specified in table 8.2.1.2.17-1 on PSCell or any activated SCell in the frequency range where autonomous gaps are used, provided that:

- there is continuous DL data allocation,

- no DRX cycle is used,

- no measurement gaps are configured,

- only one code word is transmitted in each slot,

- 2 slot ACK/NACK feedback is configured,

- 20 ms SMTC period is configured.

**Table 8.2.1.2.17-1: Minimum number of ACK/NACKs transmitted by the UE**

| Minimum number of transmitted ACK/NACKs | Configuration of the serving cell in which the transmitted ACK/NACKs are counted | |
|---|---|---|
| | Duplex mode configuration | SCS |
| 84 | FDD | 15 kHz |
| 193 | FDD | 30 kHz |
| 402 | FDD | 60 kHz |
| 28 | TDD Note 1 | 15 kHz |

| | | |
|---|---|---|
| 81 | TDD Note 1 | 30 kHz |
| 159 | TDD Note 1 | 60 kHz |
| 233 | TDD Note 2 | 60 kHz |
| 491 | TDD Note 2 | 120 kHz |
| NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [18].<br>NOTE 2: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-2 [19]. | | |

### 8.2.1.2.18 Interruptions at NR SRS antenna port switching

The requirements in this clause are applicable to SRS antenna port switching on FR1 and SRS resource(s) is only configured within the last 6 symbols of a slot. For interruption caused by SRS antenna port switching, the victim cell is based on the entry number of the band indicated by *txSwitchImpactToRx* and/or *txSwitchWithAnotherBand* regardless of per-FR MG capability. An UL interruption is allowed on any of the serving cells as indicated in *txSwitchWithAnotherBand*, and a DL interruption is allowed on any of the serving cells as indicated in *txSwitchImpactToRx*.

The UE shall perform SRS antenna port switching only if the below conditions are met.

- the SRS switching is not colliding with any other UL transmission with higher priority defined in TS 38.214 [26] if the serving cell on which the higher priority transmission is performed is a victim cell based on *txSwitchWithAnotherBand* or is the same carrier on which SRS is transmitted.

- the SRS switching is not colliding with any NR measurements (i.e. SSB/CSI-RS based L1/L3 measurements) and the measurements for RLM/BFD/CBD if the serving cell on which the NR measurements and the measurements for RLM/BFD/CBD is performed is a victim cell based on *txSwitchImpactToRx* or is the same carrier on which SRS is transmitted.

No requirements are defined for SRS antenna port switching if aperiodic SRS switching is colliding with aperiodic L1-RSRP/L1-SINR measurements and the serving cell on which the aperiodic L1-RSRP/L1-SINR measurement is configured is indicated in *txSwitchImpactToRx* or is the same carrier on which aperiodic SRS is scheduled/configured.

No requirements apply when SRS antenna port switching is colliding with E-UTRA measurement if the carrier on which the E-UTRA measurement is performed is indicated in *txSwitchImpactToRx* or is the same carrier on which SRS is scheduled/configured.When 1 SRS symbol is configured in a slot for SRS antenna switching and the aggressor and victim cells are synchronized, the interruption requirement in table 8.2.1.2.18-1 applies.

When 1 SRS symbol is configured in a slot for SRS antenna switching and the aggressor and victim cells are asynchronized, the interruption requirement in table 8.2.1.2.18-2 applies. For the rest of SRS configurations, the interruption requirement in table 8.2.1.2.18-3 applies.

**Table 8.2.1.2.18-1: Interruption length in symbols of victim CC when 1 SRS symbol is configured, and aggressor and victim cells are synchronized**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 3 | 2 | 2 |
| 30 | 4 | 3 | 3 |
| 60 | 8 | 6 | 5 |
| 120 | 14 | 10 | 8 |

**Table 8.2.1.2.18-2: Interruption length in slots of victim CC when 1 SRS symbol is configured, and aggressor and victim cells are asynchronized**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 2 | 2 | 2 |
| 30 | 2 | 2 | 2 |
| 60 | 2 | 2 | 2 |
| 120 | 2 | 2 | 2 |

**Table 8.2.1.2.18-3: Interruption length in slots of victim CC for rest of the SRS configurations for synchronized and asynchronized scenarios**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 2 | 2 | 2 |
| 30 | 2 | 2 | 2 |
| 60 | 3 | 2 | 2 |
| 120 | 5 | 3 | 3 |

### 8.2.1.2.19 Interruptions at fast SCell activation

The requirements in this clause shall apply for the UE configured with PSCell and one SCell when aperiodic CSI-RS resources is configured for fast SCell activation.

When one SCell in SCG configured with aperiodic CSI-RS resources is configured for fast SCell activation is activated from deactivated, the UE is allowed an interruption on any serving cell in SCG:

- of up to X2 slots, if the active serving cell and the SCell being activated are in a FR1 band pair or in a FR1+FR2 band pair.
- of up to X2 slots, if the active serving cells and the SCells being activated are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair.

or

- of up to Y2 slots +$T_{ATRS_duration}$ if the active serving cells are in the same band as any of the SCells being activated, when
  - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is larger than 2400ms, or
  - SCell is unknown and belongs to FR1, and SCell is contiguous to an active serving cell in the same band.

or

- of up to Y2 slots if the active serving cells are in the same band as any of the SCells being activated, when
  - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is equal to or smaller than 2400ms, or
  - SCell to be activated belongs to FR2.

Where:

- $T_{ATRS_duration}$ is CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots on the being activated SCell.
- X2 and Y2 are specified in table 8.2.1.2.4-2.

### 8.2.1.2.20 Interruptions due to PUCCH SCell activation/deactivation

When one SCell in SCG configured with PUCCH is activated or deactivated,

- The UE is allowed an interruption on active serving cell in SCG as defined in clause 8.2.1.2.4.
- The starting time of interruption shall be within the delay as defined in clause 8.3.12.
- For inter-band CA, if the UE is not capable of *parallelTxPRACH-SRS-PUCCH-PUSCH*, additional interruption is allowed on SRS/PUCCH/PUSCH of active serving cells when colliding with RACH transmission on PUCCH SCell. Interruption occurs on the symbols containing SRS/PUCCH/PUSCH, which overlap with the duration of the PRACH preamble [3] transmitted on the PUCCH SCell.

#### 8.2.1.2.21 Interruptions at OD-SSB activation/deactivation

The requirements in this clause shall apply for the UE configured with PSCell and at least one deactivated OD-SSB SCell. If more than one deactivated SCells are configured with OD-SSB transmission, the requirements in this clause shall apply provided that OD-SSB is activated or deactivated on only one of the deactivated OD-SSB SCells.

When OD-SSB is activated or deactivated on one deactivated SCell in SCG by a MAC CE, the UE is allowed an interruption on any active serving cell in SCG, provided that the OD-SSB activation/deactivation command and SCell activation/deactivation command are not received at the same time:

- of up to X2 slots, if the active serving cell and the SCell on which the OD-SSB is being activated or deactivated are in a FR1 band pair or in a FR1+FR2 band pair.
- of up to X2 slots, if the active serving cells and the SCells on which the OD-SSB is being activated or deactivated are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair.
- of up to X2 slots, if the active serving cell is non-contiguous to the SCell on which the OD-SSB is being activated or deactivated in the same FR1 band and UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided.

or

- of up to Y2 slots, if the active serving cells are contiguous to the SCell on which the OD-SSB is being activated or deactivated in the same FR1 band, or if the active serving cells are non-contiguous to the SCell on which the OD-SSB is being activated or deactivated in the same FR1 band and UE is not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, provided the cell specific reference signals from the active serving cells and the SCells on which the OD-SSB is being activated or deactivated are available in the same slot.
- of up to Y2 slots if the active serving cells are in the same FR2 band as the SCell on which the OD-SSB is being activated or deactivated, provided the cell specific reference signals from the active serving cells and the SCells on which the OD-SSB is being activated or deactivated are available in the same slot.

Where X2 and Y2 are specified in table 8.2.1.2.21-1.

**Table 8.2.1.2.21-1: Interruption length X2 and Y2 at OD-SSB activation/deactivation**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X2 (slots) | | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 1 | | 1 |
| 1 | 0.5 | 1 | | 1 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 2 | 2 |
| | | Either aggressor cell or victim cell is on FR1 | 3 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 4 | 4 |
| | | Aggressor cell is on FR1 | 5 | |

## 8.2.2 SA: Interruptions with Standalone NR Carrier Aggregation

### 8.2.2.1 Introduction

This clause contains the requirements related to the interruptions on PCell and activated SCell if configured, when

- up to 7 SCells are configured, de-configured, activated or deactivated, or
- a supplementary UL carrier or an UL carrier is configured or de-configured, or
- measurements on SCC with deactivated SCell in NR SCG, or
- UL/DL BWP is switched on PCell or SCell, or
- CGI reading of an NR neighbour cell with autonomous gaps, or

- CGI reading of an E-UTRA neighbour cell with autonomous gaps, or
- UE-specific CBW is changed on PCell or SCell, or
- NR SRS carrier based switching, or
- NR SRS antenna port switching, or
- UE dynamic Tx switches between two uplink carriers, or
- SCell is activated based on aperiodic CSI-RS, or
- PDCCH ordered RACH on target cell in LTM.

NOTE: interruptions at SCell addition/release, activation/deactivation and during measurements on SCC may not be required by all UEs.

The interruptions shall not interrupt RRC signalling or ACK/NACKs related to RRC reconfiguration procedure according to TS 38.331 [2] for SCell addition/release or MAC control signalling according to TS 37.340 [17] for SCell activation/deactivation command.

This clause additionally contains requirements related to interruptions at inter-frequency SFTD between PCell in FR1 and neighbour cell in FR2.

For a UE which does not support per-FR measurement gap, interruptions to the PCell and activated SCell may be caused by SCells on any frequency range. For a UE which supports per-FR gaps, interruptions to PCell and activated SCell may be caused by SCells on the same frequency range as the victim cell.

In addition to standalone NR carrier aggregation when no CCA is configured, the requirements in clause 8.2.2. and all subclauses of 8.2.2 apply when the UE is configured with

- A PCell not using CCA in downlink and one or more SCells using CCA in downlink, or
- A PCell and one or more SCells using CCA in downlink.

### 8.2.2.2 Requirements

#### 8.2.2.2.1 Interruptions at SCell addition/release

When any number of SCells between one and 7 is added or released using the same *RRCConnectionReconfiguration* message as defined in TS 38.331 [2], the UE is allowed an interruption on any active serving cell during the RRC reconfiguration procedure as follows:

- of up to X1 slots, if the active serving cell and the SCell being added or released are in a FR1 band pair or in a FR1+FR2 band pair.
- of up to X1 slots, if the active serving cell and the SCell being added or released are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair.
- of up to X1 slots, if the active serving cell is non-contiguous to the SCell being added or released in the same FR1 band and UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided.

Where X1 is specified in table 8.2.2.2.1-1.

or

- of up to the duration shown in table 8.2.2.2.1-2, if the active serving cells are contiguous to any of the SCells being added or released in the same FR1 band, or if the active serving cells are non-contiguous to any of the SCells being added or released in the same FR1 band and UE is not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, provided the cell specific reference signals from the active serving cells and the SCells being added or released are available in the same slot.

- of up to the duration shown in table 8.2.2.2.1-2, if the active serving cells are in the same FR2 band as any of the SCells being added or released, provided the cell specific reference signals from the active serving cells and the SCells being added or released are available in the same slot.

- if the active serving cell is non-contiguous to the SCell being added or released in the same FR1 band, and UE is capable of *intraBandNR-CA-non-collocated-r19*,

  1> when UE is configured with maxMIMO-Layers with value equal to 4 for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

    2> if *nonCollocatedTypeMRDC-v19xy* is presented with “type 4”

      3> of up to X1 slots

    2>else if *nonCollocatedTypeMRDC-v19xy* is presented with “type 1”

      3> of up to the duration shown in table 8.2.2.2.1-2

    2>else if *nonCollocatedTypeMRDC-v19xy* is not provided

      3> of up to the duration shown in table 8.2.2.2.1-2

  1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

    2> if *nonCollocatedTypeNR-CA-r18* is not provided

      3> of up to X1 slots

    2> else

      3> of up to the duration shown in table 8.2.2.2.1-2

For UE supporting On-demand SSB operation, when one OD-SSB SCell in SCG is added or released, no interruption is allowed on any active serving cell during the RRC reconfiguration procedure before OD-SSB is activated on the SCell wherein there is only OD-SSB transmission without the first SSB transmission.

**Table 8.2.2.2.1-1: Interruption length X1 for SCell addition/release for inter-band CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | |
|---|---|---|---|
| 0 | 1 | 1 | |
| 1 | 0.5 | 2 | |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 4 |
| | | Either aggressor cell or victim cell is on FR1 | 5 |
| 3 | 0.125 | Aggressor cell is on FR2 | 8 |
| | | Aggressor cell is on FR1 | 9 |
| 5 | 0.03125 | Aggressor cell is on FR1 | 33 |
| 6 | 0.015625 | Aggressor cell is on FR1 | 65 |

**Table 8.2.2.2.1-2: Interruption duration for SCell addition/release for intra-band CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 + $T_{SMTC_duration} * N_{slot}^{subframe,\mu}$ |
| 1 | 0.5 | 2 + $T_{SMTC_duration} * N_{slot}^{subframe,\mu}$ |
| 2 | 0.25 | 4 + $T_{SMTC_duration} * N_{slot}^{subframe,\mu}$ |
| 3 | 0.125 | 8 + $T_{SMTC_duration} * N_{slot}^{subframe,\mu}$ |
| 5 | 0.03125 | 32+ $T_{SMTC_duration} * N_{slot}^{subframe,\mu}$ |
| 6 | 0.015625 | 64+ $T_{SMTC_duration} * N_{slot}^{subframe,\mu}$ |
| NOTE 1: When UE is not supporting *On-demand SSB operation* or OD-SSB transmission is not indicated, $T_{SMTC_duration}$ measured in subframes is<br>- the longest SMTC duration among all above active serving cells and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell | | |

being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added, $T_{SMTC\ duration}$ for the SCell being added is 0ms;
- the longest SMTC duration among all active serving cells in the same band when one SCell is released. Otherwise, $T_{SMTC\ duration}$ is the time duration of the transmitted one OD-SSB burst.

NOTE 2: $N_{slot}^{subframe,\mu}$ is as defined in TS 38.211 [6].

#### 8.2.2.2.2 Interruptions at SCell activation/deactivation

When an SCell is activated or deactivated as defined in TS 37.340 [17], the UE is allowed an interruption on any active serving cell:

- of up to X2 slots, if the active serving cell and the SCell being activated or deactivated are in a FR1 band pair or in a FR1+FR2 band pair.
- of up to X2 slots, if the active serving cell and the SCell being activated or deactivated are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair.
- of up to X2 slots, if the active serving cell is non-contiguous to the SCell being activated or deactivated in the same FR1 band and UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided.

Where X2 is specified in table 8.2.2.2.2-1.

or

- of up to the duration shown in table 8.2.2.2.2-2, if the active serving cells are contiguous to any of the SCells being activated or deactivated in the same FR1 band, or if the active serving cells are non-contiguous to any of the SCells being activated or deactivated in the same FR1 band and UE is not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, provided the cell specific reference signals from the active serving cells and the SCells being activated or deactivated are available in the same slot.
- of up to the duration shown in table 8.2.2.2.2-2, if the active serving cells are in the same FR2 band as any of the SCells being activated or deactivated provided the cell specific reference signals from the active serving cells and the SCells being activated or deactivated are available in the same slot.
- if the active serving cell is non-contiguous to the SCell being activated or deactivated in the same FR1 band, and UE is capable of *intraBandNR-CA-non-collocated-r19*,

  1> when UE is configured with maxMIMO-Layers with value equal to 4 for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

    2> if *nonCollocatedTypeMRDC-v19xy* is presented with “type 4”

      3> of up to X2 slots

    2>else if *nonCollocatedTypeMRDC-v19xy* is presented with “type 1”

      3> of up to the duration shown in table 8.2.2.2.2-2

    2>else if *nonCollocatedTypeMRDC-v19xy* is not provided

      3> of up to the duration shown in table 8.2.2.2.2-2

  1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

    2> if *nonCollocatedTypeNR-CA-r18* is not provided

      3> of up to X2 slots

    2> else

      3> of up to the duration shown in table 8.2.2.2.2-2

For UE supporting *On-demand SSB operation*, when one OD-SSB SCell is activated or deactivated, the requirements in this clause shall apply provided OD-SSB is activated on the SCell or OD-SSB activation/deactivation command and SCell activation/deactivation command are received in the same MAC command.

**Table 8.2.2.2.2-1: Interruption length X2 for SCell activation/deactivation for inter-band CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X2 (slots) | |
|---|---|---|---|
| 0 | 1 | | 1 |
| 1 | 0.5 | | 1 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 2 |
| | | Either aggressor cell or victim cell is on FR1 | 3 |
| 3 | 0.125 | Aggressor cell is on FR2 | 4 |
| | | Aggressor cell is on FR1 | 5 |
| 5 | 0.03125 | Aggressor cell is on FR1 | 17 |
| 6 | 0.015625 | Aggressor cell is on FR1 | 33 |

**Table 8.2.2.2.2-2: Interruption duration for SCell activation/deactivation for intra-band CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 1 | 0.5 | 1 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 2 | 0.25 | 2 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 3 | 0.125 | 4 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 5 | 0.03125 | 16+ $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 6 | 0.015625 | 32+ $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |

NOTE 1: When UE is not supporting *On-demand SSB operation* or OD-SSB transmission is not indicated, $T_{SMTC_duration}$ measured in subframes is
- the longest SMTC duration among all above active serving cells and the SCell being activated when one SCell is activated. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If no SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated, $T_{SMTC\ duration}$ for the SCell being activated is 0ms;
- the longest SMTC duration among all active serving cells in the same band when one SCell is deactivated. Otherwise, $T_{SMTC\ duration}$ for the SCell being activated is the time duration of the transmitted one OD-SSB burst.

NOTE 2: $N_{slot}^{subframe,\mu}$ is as defined in TS 38.211 [6].

### 8.2.2.2.3 Interruptions during measurements on deactivated SCC

Interruptions on PCell or activated SCell(s) due to measurements when an SCell is deactivated are allowed with up to 0.5% probability of missed ACK/NACK

when the configured *measCycleSCell* [2] is 640 ms or longer.

- If the PCell or activated SCell(s) is not in the same band as the deactivated SCell, the UE is only allowed to cause interruptions on PCell or activated SCell(s) immediately before and immediately after an SMTC. Each interruption shall not exceed requirement in table 8.2.2.2.2-1.

- If the PCell or activated SCell(s) is non-contiguous to the deactivated SCell in the same FR1 band and UE is capable of *intraBandNR-CA-non-collocated-r18* on this FR1 band and *nonCollocatedTypeNR-CA-r18* is not provided, the UE is only allowed to cause interruptions on PCell or activated SCell(s) immediately before and immediately after an SMTC. Each interruption shall not exceed requirement in table 8.2.2.2.2-1.

- If the PCell or activated SCell(s) is contiguous to the deactivated SCell in the same FR1 band, or if the PCell or activated SCell(s) is non-contiguous to the deactivated SCell in the same FR1 band and UE is not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and

*nonCollocatedTypeNR-CA-r18* is provided, the UE is only allowed to cause an interruption on PCell or activated SCell(s) no earlier than X slots before $T_{SMTC_duration}$ and no later than X slots after $T_{SMTC_duration}$, provided the cell specific reference signals from the active serving cells and the deactivated SCell are available in the same slot, where X and $T_{SMTC_duration}$ are given by table 8.2.2.2.3-1. The interruption shall not exceed requirements in table 8.2.2.2.3-1.

- If the PCell or activated SCell(s) is contiguous to the deactivated SCell in the same FR1 band, or if the PCell or activated SCell(s) is non-contiguous to the deactivated SCell in the same FR1 band and UE is not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, the UE is only allowed to cause an interruption on PCell or activated SCell(s) no earlier than X slots before $T_{SMTC_duration}$ and no later than X slots after $T_{SMTC_duration}$, provided the cell specific reference signals from the active serving cells and the deactivated SCell are available in the same slot, where X and $T_{SMTC_duration}$ are given by table 8.2.2.2.3-1. The interruption shall not exceed requirements in table 8.2.2.2.3-1.

- If the PCell or activated SCell(s) is non-contiguous to the deactivated SCell in the same FR1 band, and UE is capable of *intraBandNR-CA-non-collocated-r19*,

  1> when UE is configured with maxMIMO-Layers with value equal to 4 for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

    2> if *nonCollocatedTypeNR-CA-v1900* is presented with “type 4”

      3> the UE is only allowed to cause interruptions on PCell or activated SCell(s) immediately before and immediately after an SMTC. Each interruption shall not exceed requirement in table 8.2.2.2.2-1.

    2> if *nonCollocatedTypeNR-CA-v1900* is presented with “type 1”

      3> the UE is only allowed to cause an interruption on PCell or activated SCell(s) no earlier than X slots before $T_{SMTC_duration}$ and no later than X slots after $T_{SMTC_duration}$, provided the cell specific reference signals from the active serving cells and the deactivated SCell are available in the same slot, where X and $T_{SMTC_duration}$ are given by table 8.2.2.2.3-1. The interruption shall not exceed requirements in table 8.2.2.2.3-1.

    2>else if *nonCollocatedTypeNR-CA-v1900* is not provided

      3> the UE is only allowed to cause an interruption on PCell or activated SCell(s) no earlier than X slots before $T_{SMTC_duration}$ and no later than X slots after $T_{SMTC_duration}$, provided the cell specific reference signals from the active serving cells and the deactivated SCell are available in the same slot, where X and $T_{SMTC_duration}$ are given by table 8.2.2.2.3-1. The interruption shall not exceed requirements in table 8.2.2.2.3-1.

  1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA for all corresponding serving cells, in case of TDD-TDD intra-band NR-CA

    2> if *nonCollocatedTypeNR-CA-r18* is not provided

      3> the UE is only allowed to cause interruptions on PCell or activated SCell(s) immediately before and immediately after an SMTC. Each interruption shall not exceed requirement in table 8.2.2.2.2-1.

    2> else

      3> the UE is only allowed to cause an interruption on PCell or activated SCell(s) no earlier than X slots before $T_{SMTC_duration}$ and no later than X slots after $T_{SMTC_duration}$, provided the cell specific reference signals from the active serving cells and the deactivated SCell are available in the same slot, where X and $T_{SMTC_duration}$ are given by table 8.2.2.2.3-1. The interruption shall not exceed requirements in table 8.2.2.2.3-1.

The interruption requirements in table 8.2.2.2.3-1 are not applicable when a UE is configured with NCSG in the same frequency range as the deactivated SCell unless the SMTC on the deactivated SCC is fully non-overlapped with NCSG.

For UE supporting *On-demand SSB operation* and *od-ssb-config* being configured in the SCell,

- No interruption is allowed on PCell or activated SCell(s) due to measurements on deactivated SCC before OD-SSB is activated on the deactivated OD-SSB SCell wherein there is only OD-SSB but not the first SSB transmission.

- For the measurements on deactivated SCC during FMW as specified in clause 9.17.5.3, the UE is only allowed to cause interruptions on PCell or activated SCell(s) immediately before the first SSB burst and immediately after the last SSB burst within FMW. No interruption is allowed due to the measurements within the fast measurement window (FMW). Each interruption shall not exceed requirement in table 8.2.2.2.2-1 or table 8.2.2.2.3-1.

- For the measurements outside FMW, the interruption requirement in clause 8.2.2.3 shall apply.

**Table 8.2.2.2.3-1: Interruption duration for measurement on deactivated SCC for intra-band CA**

| $\mu$ | NR Slot length (ms) | X (slots) | Interruption length (slots) |
|---|---|---|---|
| 0 | 1 | 1 | 2 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 1 | 0.5 | 1 | 2 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 2 | 0.25 | 2 | 4 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 3 | 0.125 | 4 | 8 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 5 | 0.03125 | 16 | 32 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 6 | 0.015625 | 32 | 64 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| NOTE 1: $T_{SMTC_duration}$ measured in subframes is the longest SMTC duration among all above active serving cells and the deactivated SCell to be measured i;<br>If UE does not receive SCell activation command before the end of FMW, $T_{SMTC\ duration}$ is x ms where x = the number of consecutive subframes in one OD-SSB burst<br>NOTE 2: $N_{slot}^{subframe,\mu}$ is as defined in TS 38.211 [6]. | | | |

For a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, interruptions on PCell due to the measurement on deactivated SDL SCell are allowed with up to Y % probability of missed ACK/NACK. The value of Y is defined as $\frac{2*\text{Length_int}}{\text{measCycleSCell}}$; where, Length_int is equal to (Tuning time from PCell to SCell + $T_{SMTC_duation}$ + Retuning time from SCell to PCell),

Tuning time from PCell to SCell is equal to the RRC configured switching gap from PCell to SCell, i.e., *gapDurationPCelltoSCell-r19* in slots

Returning time from SCell to PCell is equal to the RRC configured switching gap from SCell to PCell, i.e., *gapDurationSCelltoPCell-r19* in slots

### 8.2.2.2.4 Interruptions at UL carrier RRC reconfiguration

The requirements in this clause shall apply when a supplementary UL carrier or an UL carrier is configured or de-configured in NR standalone carrier aggregation as defined in TS 38.331 [2]. Further, the requirements in this clause are applicable to UE capable of independent beam management in FR2 inter-band CA and UE capable of FR2 intra-band CA and FR1.

When an UL carrier or supplementary UL carrier is configured or de-configured, an interruption of up to the duration shown in table 8.2.2.2.4-1, is allowed during the RRC reconfiguration procedure [2] on PCell and all activated SCells within the same FR as the reconfigured uplink carrier. The interruption is for both uplink and downlink of PCell and all the activated SCells within the same FR as the configured or de-configured UL.

**Table 8.2.2.2.4-1: Interruption duration for UL carrier RRC reconfiguration**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 2 |
| 2 | 0.25 | 4 |
| 3 | 0.125 | 8 |
| 5 | 0.03125 | 32 |
| 6 | 0.015625 | 64 |

#### 8.2.2.2.5 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based BWP switch, timer-based BWP switch or UL BWP switch triggered by consistent uplink CCA failures and RRC based in this clause apply to the case that the BWP switch is performed on a single CC or multiple CCs.

When either of the DCI-based, timer-based or RRC-based downlink BWP switch and/or uplink BWP switch occur on multiple CCs simultaneously or over partially overlapping period, the interruption requirements described in this clause apply for each BWP switch. Further, the requirements in this clause are applicable to UE capable of independent beam management in FR2 inter-band CA and UE capable of FR2 intra-band CA and FR1.

When UE receives a DCI indicating UE to switch its active BWP involving changes in any of the parameters listed in table 8.2.2.2.5-2, the UE is allowed to cause interruption of up to X slots to other active serving cells if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in table 8.2.2.2.5-2 and the UE is capable of per-FR gap the UE is allowed to cause interruption of up to X slots to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in table 8.2.2.2.5-1. The starting time of interruption is only allowed within the BWP switching delay $T_{BWPswitchDelay}$ as defined in clause 8.6.2 when BWP switch occurs on a single CC. The starting time of interruption caused by each BWP switch is only allowed within the BWP switch delay $T_{MultipleBWPswitchDelay}$ +Y as defined in clause 8.6.2A.1 when BWP switch occurs on multiple CCs. Interruptions are not allowed during BWP switch involving any other parameter change.

When a BWP timer *bwp-InactivityTimer* defined in TS 38.331 [2] expires, UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in table 8.2.2.2.5-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in table 8.2.2.2.5-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slots to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in table 8.2.2.2.5-1. The starting time of interruption is only allowed within the BWP switching delay $T_{BWPswitchDelay}$ as defined in clause 8.6.2 when BWP switch occurs on a single CC. The starting time of interruption caused by each BWP switch is only allowed within the BWP switch delay $T_{MultipleBWPswitchDelay}$ as defined in clause 8.6.2B.1 when BWP switch occurs on multiple CCs simultaneously or $T_{MultipleBWPswitchDelayTotal}$ as defined in clause 8.6.2B.2 when BWP switch occurs on multiple CCs over partially overlapping time period. Interruptions are not allowed during BWP switch involving any other parameter change.

When UE receives an RRC reconfiguration that only requests UE to switch its active BWP on one single CC, the UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in table 8.2.2.2.5-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the BWP switch imposes changes in any of the parameters listed in table 8.2.2.2.5-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slots to other active serving cells in the same frequency range wherein the UE is performing BWP switching. X is defined in table 8.2.2.2.5-1. The interruption is only allowed within the delay $T_{RRCprocessingDelay}$ + $T_{BWPswitchDelayRRC}$ defined in clause 8.6.3 when BWP switch occurs on a single CC. The interruption is only allowed within the delay $T_{RRCprocessingDelay}$ + $T_{BWPswitchDelayRRC}$ + $D_{RRC}$*(N-1) as defined in clause 8.6.3A when BWP switch occurs on multiple CCs.

When UL BWP switch is triggered by consistent uplink CCA failures [7], UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its active UL BWP involving changes in any of the parameters listed in table 8.2.2.2.5-2 if the UE is not capable of per-FR gap, or if the BWP switching involves SCS changing. When the UL BWP switch imposes changes in any of the parameters listed in table 8.2.2.2.5-2 and the UE is capable of per-FR gap, the UE is allowed to cause interruption of up to X slots to other active serving cells in the same frequency range wherein the UE is performing UL BWP switching. X is defined in table 8.2.2.2.5-1. The starting time of interruption is only allowed within the UL BWP switching delay $T_{BWPswitchDelay}$ as defined in clause 8.6.2. Interruptions are not allowed during BWP switch involving other parameter change.

### 8.2.2.2.6 Interruptions at inter-frequency SFTD measurement

The requirements in this clause concern interruptions on PCell, as well as on activated SCells in MCG, when the UE is performing SFTD measurements on inter-frequency neighbour cell(s). The following requirements apply when no PSCell is configured.

For a UE supporting per-FR gap capability:

- for neighbour cell in FR1:
  - the percentage of interrupted slots on uplink and downlink on FR1 serving cells during the SFTD measurement period $T_{measure_SFTD1}$ specified in clause 9.3.8 shall not exceed the percentages specified in table 8.2.2.2.6-1. No interruption is allowed on FR2 serving cells.
  - the length of each interruption on FR1 serving cells shall not exceed the number of slots specified in table 8.2.2.2.6-2.
- for neighbour cell in FR2:
  - the percentage of interrupted slots on uplink and downlink on FR2 serving cells during the SFTD measurement period $T_{measure_SFTD1}$ specified in clause 9.3.8 shall not exceed the percentages specified in table 8.2.2.2.6-1. No interruption is allowed on FR1 serving cells.
  - the length of each interruption on FR2 serving cells shall not exceed the number of slots specified in table 8.2.2.2.6-2.

For a UE not supporting per-FR gap capability:

- for neighbour cell in FR1 or FR2:
  - the percentage of interrupted slots on uplink and downlink on FR1 and FR2 serving cells during the SFTD measurement period $T_{measure_SFTD1}$ specified in clause 9.3.8 shall not exceed the percentages specified in table 8.2.2.2.6-1.
  - the length of each interruption on FR1 and FR2 serving cells shall not exceed the number of slots specified in table 8.2.2.2.6-2.

**Table 8.2.2.2.6-1: Requirements on maximum percentage of interrupted slots in serving cell in inter-frequency SFTD**

| SFTD configuration | Serving cell μ | Neighbour cell SMTC periodicity | | | | | |
|---|---|---|---|---|---|---|---|
| | | 5 ms | 10 ms | 20 ms | 40 ms | 80 ms | 160 ms |
| With RSRP report | 0 | 8.4 % | 6.3 % | 8.4 % | 6.3 % | 5.3 % | 4.7 % |
| | 1 | | | | | | |
| | 2 | | | | | | |
| | 3 | | | | | | |
| Without RSRP report | 0 | 11.4 % | 8.6 % | 7.9 % | 6.8 % | 6.3 % | 6.0 % |
| | 1 | | | | | | |
| | 2 | | | | | | |
| | 3 | | | | | | |

**Table 8.2.2.2.6-2: Interruption duration for FR1 serving cell in inter-frequency SFTD with neighbour cell in FR1**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 2 |
| 2 | 0.25 | 4 |
| 3 | 0.125 | 8 |

**Table 8.2.2.2.6-3: Void**

**Table 8.2.2.2.6-4: Void**

### 8.2.2.2.7 Interruptions at SCell activation/deactivation with multiple downlink SCells

The requirements in this clause shall apply for the UE configured with PCell and up to 7 downlink SCell(s).

When multiple SCell is activated or deactivated by one single MAC CE command, the UE is allowed an interruption on any active serving cell as specified in clause 8.2.2.2.2:

### 8.2.2.2.8 Interruptions due to UE-specific CBW change

When UE receives an RRC reconfiguration that changes *offsetToCarrier* or *carrierBandwidth*, the UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its CBW. X is defined in table 8.2.2.2.8-1. The interruption is only allowed within the delay $T_{RRCprocessingDelay} + T_{CBWchangeDelayRRC}$ defined in clause 8.13.

**Table 8.2.2.2.8-1: interruption length X**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 1 |
| 2 | 0.25 | 3 |
| 3 | 0.125 | 5 |
| 5 | 0.03125 | 17 |
| 6 | 0.015625 | 33 |

### 8.2.2.2.9 Interruptions at NR SRS carrier based switching

SRS transmission can be configured on a carrier not configured for PUCCH/PUSCH transmission. When a UE needs to transmit periodic, semi-persistent or aperiodic SRS on a carrier of a serving cell not configured for PUCCH/PUSCH transmission, the UE can perform carrier based switching to one or more carriers not configured for PUCCH/PUSCH transmission from a carrier with PUCCH/PUSCH transmission or from a carrier not configured for PUCCH/PUSCH transmission prior to transmitting SRS, provided that:

- switching is from a configured carrier to another activated carrier;
- the carrier of SCells not configured for PUCCH/PUSCH transmission to which SRS carrier based switching is performed is indicated by DCI SRS request field for aperiodic SRS transmission, or indicated by MAC-CE for semi-persistent SRS transmission, or configured via RRC for periodic SRS transmission;
- the serving cell, from which SRS carrier based switching is performed and whose UL transmission may therefore be interrupted, is indicated by srs-SwitchFromServCellIndex and srs-SwitchFromCarrier in TS 38.331 [2];
- the SRS switching is not colliding with any other transmission with higher priority defined in TS 38.214 [26];
- the SRS switching is not colliding with any SSB/CSI-RS based L3 measurements and the measurements for RLM/BFD;
- for UE, which does not support simultaneous reception and transmission for inter-band TDD CA specified in TS 38.331 [2], and is compliant to the requirements for inter-band CA with uplink in one NR band and without

simultaneous Rx/Tx specified in TS 38.101-1 [18] for FR1 and TS 38.101-2 [19] for FR2, the SRS transmission are not simultaneously scheduled with DL SSB/CSI-RS for L3 or L1 measurements transmission on other carriers.

The UE shall not perform SRS carrier based switching if the above conditions cannot be met.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell if UE is not capable of per-FR gap, or on active serving cell(s) in FR1 if UE is capable of per-FR gap, during the switching to the carrier of a serving cell in FR1 not configured for PUCCH/PUSCH transmission,

- with up to X1 slot as specified in table 8.2.2.2.9-1.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell if UE is not capable of per-FR gap, or on active serving cell(s) in FR2 if UE is capable of per-FR gap, during the switching to the carrier of a serving cell in FR2 not configured for PUCCH/PUSCH transmission,

- with up to X2 slots as specified in table 8.2.2.2.9-2.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell if UE is not capable of per-FR gap, or on active serving cell(s) in FR1 if UE is capable of per-FR gap, during the switching from the carrier of a serving cell in FR1 not configured for PUCCH/PUSCH transmission,

- with up to X1 slots as specified in table 8.2.2.2.9-1.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell if UE is not capable of per-FR gap, or on active serving cell(s) in FR2 if UE is capable of per-FR gap, during the switching from the carrier of a serving cell in FR2 not configured for PUCCH/PUSCH transmission,

- with up to X2 slots as specified in table 8.2.2.2.9-2.

**Table 8.2.2.2.9-1: Interruption length X1 (slots)**

| $\mu$ | NR Slot length (ms) of victim cell | SRS carrier switching time (us)[Note 1] | Interruption length X1 (slots) | |

| | | 300, 500 | 31 | 24 |
| | | 900 | 44 | 37 |
| 6 | 0.015625 | ≤ 200 | 42 | 28 |
| | | 300, 500 | 61 | 47 |
| | | 900 | 87 | 73 |
| NOTE 1: NR SRS carrier switching time is UE capability indicated by higher layer parameter *SRS-SwitchingTimeNR*. | | | | |

**Table 8.2.2.2.9-2: Interruption length X2 (slot)**

| $\mu$ | length (ms) of victim cell | switching time (us) [Note 1] | Sub carrier spacing for aggressor cell (kHz) | | | |
|---|---|---|---|---|---|---|
| | | | 60 | 120 | 480 | 960 |
| 0 | 1 | ≤ 200 | 2 | 2 | 2 | 2 |
| 1 | 0.5 | ≤ 200 | 2 | 2 | 2 | 2 |

| | | | | | | |
|---|---|---|---|---|---|---|
| 2 | 0.25 | ≤ 200 | 3 | 3 | 2 | 2 |
| 3 | 0.125 | ≤ 200 | 4 | 4 | 3 | 3 |
| 5 | 0.03125 | ≤ 200 | 11 | 10 | 8 | 8 |
| 6 | 0.015625 | ≤ 200 | 21 | 18 | 15 | 15 |
| NOTE 1: NR SRS carrier switching time is UE capability indicated by higher layer parameter *SRS-SwitchingTimeNR*. | | | | | | |

For intra-band SRS carrier switching in FR1 or FR2, interruptions in table 8.2.2.2.9-1 and in table 8.2.2.2.9-2 based on SRS carrier switching time ≤ 200μs shall apply. For inter-band SRS carrier switching in FR1, interruptions in table 8.2.2.2.9-1 and in table 8.2.2.2.9-2 shall apply.

### 8.2.2.2.10 DL Interruptions at UE switching between two uplink carriers

The DL interruption requirements at dynamic switching between two uplink carreirs specified in this clause are applicable for an uplink band pair of an inter-band UL CA configuration in FR1 when the capability *uplinkTxSwitchingPeriod* is present, and is only applicable for uplink switching mechanism specified in clause 6.1.6 of TS 38.214 [26], where NR uplink carrier 1 is capable of one transmit antenna connector and NR uplink carrier 2 is capable of two transmit antenna connectors, and the two uplink carriers are in different bands with different carrier frequencies.

When dynamic switching between two uplink carriers is conducted, UE is allowed to cause DL interruption of X OFDM symbols in NR downlink carrier(s) as indicated by *uplinkTxSwitching-DL-Interruption* [2]. The DL interruption starts from the first OFDM symbol which fully or partially overlaps with the UL switching period located in either NR carrier 1 or carrier 2 as indicated in RRC signalling [2]. The DL interruption lengths of X are defined in table 8.2.2.2.10-1.

No DL interruption is allowed in the NR downlink carrier(s) which is not indicated by *uplinkTxSwitching-DL-Interruption*. No DL interruption is allowed for some inter-band UL CA configurations as specified in clause 5.2A.2 of TS 38.101-1 [18].

**Table 8.2.2.2.10-1: DL interruption length on NR carrier(s) in the unit of OFDM symbols (X) for switching between two uplink carriers**

| $\mu$ | NR Slot length (ms) | Uplink Tx switching period Note1 | | |
|---|---|---|---|---|
| | | 35μs | 140μs | 210μs |
| 0 | 1 | 2 | 3 | 4 |
| 1 | 0.5 | 3 | 6 | 7 |
| 2 | 0.25 | 4 | 10 | 14 |
| NOTE 1: Uplink Tx switching period depends on UE capability *uplinkTxSwitchingPeriod* | | | | |

### 8.2.2.2.10A DL Interruptions at UE switching between two uplink carriers with two transmit antenna connectors

The DL interruption requirements at dynamic switching between two uplink carriers specified in this clause are applicable for an uplink band pair of an inter-band UL CA configuration when the capability *[uplinkTxSwitchingPeriod2T2T]* is present, and is only applicable for uplink switching mechanism specified in clause 6.1.6 of TS 38.214 [26], where NR UL carrier 1 is capable of two transmit antenna connectors and NR UL carrier 2 is capable of two transmit antenna connectors, and the two uplink carriers are in different bands with different carrier frequencies.

When dynamic switching between two uplink carriers is conducted, UE is allowed to cause DL interruption of X OFDM symbols in NR downlink carrier(s) as indicated by *uplinkTxSwitching-DL-Interruption* [2]. The DL interruption starts from the first OFDM symbol which fully or partially overlaps with the UL switching period located in either NR carrier 1 or carrier 2 as indicated in RRC signalling [2]. The DL interruption lengths of X are defined in table 8.2.2.2.10A-1.

No DL interruption is allowed in the NR downlink carrier(s) which is not indicated by *uplinkTxSwitching-DL-Interruption*. No DL interruption is allowed for some inter-band UL CA configurations as specified in clause 5.2A.2 of TS 38.101-1 [18].

**Table 8.2.2.2.10A -1: DL interruption length on NR carrier(s) in the unit of OFDM symbols (X) for switching between two uplink carriers**

| $\mu$ | NR Slot length (ms) | Uplink Tx switching period Note1 | | |
|---|---|---|---|---|
| | | 35μs | 140μs | 210μs |
| 0 | 1 | 2 | 3 | 4 |
| 1 | 0.5 | 3 | 6 | 7 |
| 2 | 0.25 | 4 | 10 | 14 |
| NOTE 1: Uplink Tx switching period depends on UE capability [*uplinkTxSwitchingPeriod2T2T]*. | | | | |

### 8.2.2.2.10B DL Interruptions at UE switching between one uplink band with one transmit antenna connector and one uplink band with two transmit antenna connectors

The DL interruption requirements at dynamic switching between two uplink bands specified in this clause are applicable for an uplink band pair of an inter-band UL CA configuration when the capability *[uplinkTxSwitchingPeriod]* is present, and is only applicable for uplink switching mechanism specified in clause 6.1.6 of TS 38.214 [26], where NR UL carrier 1 in band A is capable of one transmit antenna connector, NR UL carrier 2 and carrier 3 in band B are capable of two transmit antenna connectors. NR UL carrier 2 and carrier 3 are two contiguous aggregated carriers, and band A and band B are different bands with different carrier frequencies.

When dynamic switching between two uplink bands is conducted, UE is allowed to cause DL interruption of X OFDM symbols in NR downlink carrier(s) as indicated by *uplinkTxSwitching-DL-Interruption* [2]. The DL interruption starts from the first OFDM symbol which fully or partially overlaps with the UL switching period located in either NR band A or band B as indicated in RRC signalling [2]. The DL interruption lengths of X are defined in table 8.2.2.2.10-1.

No DL interruption is allowed in the NR downlink carrier(s) which is not indicated by *uplinkTxSwitching-DL-Interruption*. No DL interruption is allowed for some inter-band UL CA configurations as specified in clause 5.2A.2 of TS 38.101-1 [18].

### 8.2.2.2.10C DL Interruptions at UE switching between two uplink bands with two transmit antenna connectors

The DL interruption requirements at dynamic switching between two uplink bands specified in this clause are applicable for an uplink band pair of an inter-band UL CA configuration when the capability *[uplinkTxSwitchingPeriod2T2T]* is present, and is only applicable for uplink switching mechanism specified in clause 6.1.6 of TS 38.214 [26], where NR UL carrier 1 in band A is capable of two transmit antenna connectors, NR UL carrier 2 and carrier 3 in band B are capable of two transmit antenna connectors. NR UL carrier 2 and carrier 3 are two contiguous aggregated carriers, and band A and band B are different bands with different carrier frequencies.

When dynamic switching between two uplink bands is conducted, UE is allowed to cause DL interruption of X OFDM symbols in NR downlink carrier(s) as indicated by *uplinkTxSwitching-DL-Interruption* [2]. The DL interruption starts from the first OFDM symbol which fully or partially overlaps with the UL switching period located in either NR band A or band B as indicated in RRC signalling [2]. The DL interruption lengths of X are defined in table 8.2.2.2.10A -1.

No DL interruption is allowed in the NR downlink carrier(s) which is not indicated by *uplinkTxSwitching-DL-Interruption*. No DL interruption is allowed for some inter-band UL CA configurations as specified in clause 5.2A.2 of TS 38.101-1 [18].

### 8.2.2.2.10D DL Interruptions at UE switching across three or four uplink bands

The DL interruption requirements at dynamic switching across three or four uplink bands specified in this clause are applicable for an NR inter-band CA configuration and SUL band configuration with inter-band CA when the capability [*BandCombination-UplinkTxSwitch-v1800*] is present, and are only applicable for uplink switching mechanisms specified in clause [6.1.6] of TS 38.214 [26]. In the NR inter-band CA configuration and SUL band configuration with inter-band CA, the number of NR uplink bands with different carrier frequencies is three or four. NR UL carrier(s) in

each of the three or four uplink bands are capable of one or two transmit antenna connector(s), according to the UE capability.

When dynamic switching across three or four uplink bands is conducted, UE is allowed to cause DL interruption of X OFDM symbols in NR downlink carrier(s) as indicated by *uplinkTxSwitching-DL-Interruption* [2]. The DL interruption starts from the first OFDM symbol which fully or partially overlaps with the UL Tx switching period located in uplink NR band(s) as indicated in RRC signalling [2]. The DL interruption lengths of X for single TAG and for 2-TAG are defined in table 8.2.2.2.10D-1 and table 8.2.2.2.10D-2.

NOTE: If one downlink carrier is indicated to be interrupted by two band pairs for dynamic switching simultaneously, the DL interruption length on the victim carrier is determined by the maximum of uplink switching periods of the two band pairs. If [*UplinkTxSwitchingAdditionalPeriodDualUL-r18*] is reported, DL interruption length is determined by the uplink Tx switching period, which is indicated by [*UplinkTxSwitchingAdditionalPeriodDualUL-r18*]. If [*periodOnULBands-r18*] is reported, DL interruption length is determined by the uplink Tx switching period, which is indicated by [*periodOnULBands-r18*].

No DL interruption is allowed in the NR downlink carrier(s) which is not indicated by *uplinkTxSwitching-DL-Interruption*. No DL interruption is allowed for some inter-band UL CA configurations and SUL band configurations with inter-band CA as specified in TS 38.101-1 [18].

**Table 8.2.2.2.10D -1: DL interruption length on NR carrier(s) in the unit of OFDM symbols (X) for switching across three or four uplink bands for single TAG**

| $\mu$ | NR Slot length (ms) | Uplink Tx switching period Note1 | | |
|---|---|---|---|---|
| | | 35μs | 140μs | 210μs |
| 0 | 1 | 2 | 3 | 4 |
| 1 | 0.5 | 3 | 6 | 7 |
| 2 | 0.25 | 4 | 10 | 14 |
| Note 1: Uplink Tx switching period depends on UE capability.<br>Note 2: RTD=3 μs is assumed to derive the DL interruption length. | | | | |

**Table 8.2.2.2.10D -2: DL interruption length on NR carrier(s) in the unit of OFDM symbols (X) for switching across three or four uplink bands for two TAGs**

| $\mu$ | NR Slot length (ms) | Uplink Tx switching period Note1 | | |
|---|---|---|---|---|
| | | 35μs | 140μs | 210μs |
| 0 | 1 | 2 | 3 | 4 |
| 1 | 0.5 | 3 | 6 | 8 |
| 2 | 0.25 | 4 | 10 | 14 |
| Note 1: Uplink Tx switching period depends on UE capability.<br>Note 2: RTD=9 μs is assumed to derive the DL interruption length. | | | | |

### 8.2.2.2.10E DL Interruptions at UE switching between two uplink bands with three transmit antenna connectors and maximum two transmit antenna connectors for each band

The DL interruption requirements at dynamic switching between two uplink bands specified in this clause are applicable for an uplink band pair of an inter-band UL CA configuration when the capability *Uplink3TxSwitchingPeriodUpTo2TPerBandDualUL* is present, and is only applicable for uplink switching mechanism specified in clause 6.1.6 of TS 38.214 [26], where NR UL carriers in band A and B are capable of a maximum of two transmit antenna connectors, but simultaneously only a maximum of three transmit antenna connector are supported across both bands. Band A and band B are different bands with different carrier frequencies. The UE shall support the switch between the following two transmit configurations 1 and 2:

- *Configuration 1*: Two antenna ports on band A and one antenna port on band B
- *Configuration 2*: One antenna port on band A and two antenna ports on band B

When dynamic switching between configurations 1 and 2 is conducted, UE is allowed to cause DL interruption of X OFDM symbols in NR downlink carrier(s) as indicated by *uplinkTxSwitching-DL-Interruption-DualUL* [2]. The DL

interruption starts from the first OFDM symbol which fully or partially overlaps with the UL switching period located in either NR band A or band B as indicated in RRC signalling [2]. The DL interruption lengths of X for single TAG and for 2-TAG are defined in table 8.2.2.2.10D-1 and table 8.2.2.2.10D-2.

No DL interruption is allowed in the NR downlink carrier(s) which is not indicated by *uplinkTxSwitching-DL-Interruption-DualUL*. No DL interruption is allowed for some inter-band UL CA configurations as specified in clause 5.2A.2 of TS 38.101-1 [18].

#### 8.2.2.2.11 Interruptions at direct SCell activation

When one or multiple SCell(s) are directly activated at SCell addition, the UE is allowed an interruption on any active serving cell:

- of up to the duration shown in table 8.2.2.2.1-1, if the active serving cell is not in the same band as the SCell being directly activated, or
- of up to the duration shown in table 8.2.2.2.1-2, if the active serving cells are in the same band as the SCell being activated provided the cell specific reference signals from the active serving cells and the SCell being activated are available in the same slot.

#### 8.2.2.2.12 Interruptions due to SCell dormancy

##### 8.2.2.2.12.1 Interruptions due to SCell dormancy switch

When one SCell in MCG is switched from dormancy to non-dormancy or from non-dormancy to dormancy [7] when UE is in DRX active time,

- the UE is allowed an interruption on active serving cell in MCG as defined in clause 8.2.2.2.5, except that the interruption is allowed regardless of which parameters change between the dormant BWP and the non-dormant BWP
- The starting time of interruption shall be within the dormancy switching delay as defined in clause 8.6.2.

When multiple SCells in MCG are switched from dormancy to non-dormancy or vice versa when the UE is in DRX active time, the interruption requirement described above applies for each BWP switch.

##### 8.2.2.2.12.2 Interruptions due to CQI measurements during SCell dormancy

When one or more SCells are in dormancy, the UE is for the purpose of CQI measurements on the dormant SCell(s) allowed to cause interruptions to non-dormant serving cell(s).

The rate of ACK/NACK feedback loss on any non-dormant serving cell resulting from CQI measurements on dormant SCells shall not exceed 0.5 %.

##### 8.2.2.2.12.3 Interruptions due to RRM measurements during SCell dormancy

When one or more SCells are in dormancy, the UE is for the purpose of RRM measurements on the dormant SCell(s) allowed to cause interruptions to non-dormant serving cell(s).

The rate of ACK/NACK feedback loss on any non-dormant serving cell resulting from RRM measurements on dormant SCells shall not exceed 1.0 %.

#### 8.2.2.2.13 Interruptions at transitions between active and non-active during DRX

For the UEs that are capable of *secondaryDRX-Group*[14] in FR1+FR2 CA, when two DRX groups are configured each group of serving cells, no interruption is allowed for UEs supporting either per UE or per FR gaps.

#### 8.2.2.2.14 Interruptions when identifying CGI of an NR cell with autonomous gaps

When a UE is identifying CGI of an NR cell with autonomous gaps, the UE is allowed interruptions on PCell or any activated SCell:

- with up to K1 interruptions with interrupted slots up to interruption length X1 specified in table 8.2.2.2.14-1 for each interruption during MIB decoding time period $T_{MIB}$ (ms) specified in clause 9.11.

- with up to L1 interruptions with interrupted slots up to interruption length Y1 specified in table 8.2.2.2.14-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11 for SSB and CORESET for RMSI scheduling multiplexing patterns 1.

- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in table 8.2.2.2.14-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11 for SSB and CORESET for RMSI scheduling multiplexing patterns 2 and 3.

Where:

- K1 = 6 for the target cell carrier frequency on FR1 and K1 = 25 for the target cell carrier frequency on FR2, and

- L1 = $T_{SIB1}$/20and

- L2 = $T_{SIB1}/T_{SMTC}$, where $T_{SMTC}$ is the periodicity of the SMTC occasion configured for the target cell carrier.

**Table 8.2.2.2.14-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | Interruption length Y1 (slots) | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 6 | 7 | 6 |
| 1 | 0.5 | 12 | 13 | 10 |
| 2 | 0.25 | 24 | 25 | 19 |
| 3 | 0.125 | 48 | 49 | 37 |

### 8.2.2.2.15 Interruptions when identifying CGI of an E-UTRA cell with autonomous gaps

When a UE is identifying CGI of an E-UTRA FDD cell or E-UTRA TDD cell with autonomous gaps, within time period $T_{identify_CGI,\ E\text{-}UTRA}$ specified in clause 9.4.7.1, the UE shall be able to transmit at least the number of ACK/NACKs specified in table 8.2.2.2.15-1 on PCell or any activated SCell in the frequency range where autonomous gaps are used, provided that:

- there is continuous DL data allocation,

- no DRX cycle is used,

- no measurement gaps are configured,

- only one code word is transmitted in each slot,

- 2 slot ACK/NACK feedback is configured,

- 20 ms SMTC period is configured.

**Table 8.2.2.2.15-1: Minimum number of ACK/NACKs transmitted by the UE during $T_{identify_CGI,\ E\text{-}UTRA}$**

| Minimum number of transmitted ACK/NACKs | SCS | |
|---|---|---|
| | Duplex mode configuration | SCS |
| | Duplex mode configuration | SCS |
| 84 | FDD | 15 kHz |
| 193 | FDD | 30 kHz |
| 402 | FDD | 60 kHz |
| 28 | TDD Note 1 | 15 kHz |
| 81 | TDD Note 1 | 30 kHz |
| 159 | TDD Note 1 | 60 kHz |
| 233 | TDD Note 2 | 60 kHz |
| 491 | TDD Note 2 | 120 kHz |
| NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [18].<br>NOTE 2: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-2 [19]. | | |

### 8.2.2.2.16 Interruptions at NR SRS antenna port switching

The requirements in this clause are applicable to SRS antenna port switching on FR1 and SRS resource(s) is only configured within the last 6 symbols of a slot. For interruption caused by SRS antenna port switching, the victim cell is based on the entry number of the band indicated by *txSwitchImpactToRx* and/or *txSwitchWithAnotherBand* regardless of per-FR MG capability. An UL interruption is allowed on any of the serving cells as indicated in *txSwitchWithAnotherBand*, and a DL interruption is allowed on any of the serving cells as indicated in *txSwitchImpactToRx*.

The UE shall perform SRS antenna port switching only if the below conditions are met.

- the SRS switching is not colliding with any other UL transmission with higher priority defined in TS 38.214 [26] if the serving cell on which the higher priority transmission is performed is a victim cell based on *txSwitchWithAnotherBand* or is the same carrier on which SRS is transmitted.
- the SRS switching is not colliding with any NR measurements (i.e. SSB/CSI-RS based L1/L3 measurements) and the measurements for RLM/BFD/CBD if the serving cell on which the NR measurements and the measurements for RLM/BFD/CBD is performed is a victim cell based on *txSwitchImpactToRx* or is the same carrier on which SRS is transmitted.

No requirements are defined for SRS antenna port switching if aperiodic SRS switching is colliding with aperiodic L1-RSRP/L1-SINR measurements and the serving cell on which the aperiodic L1-RSRP/L1-SINR measurement is configured is indicated in *txSwitchImpactToRx* or is the same carrier on which aperiodic SRS is scheduled/configured.

When 1 SRS symbol is configured in a slot for SRS antenna switching, the interruption requirement in table 8.2.2.2.16-1 applies. For the rest of SRS configurations, the interruption requirement in table 8.2.2.2.16-3 applies.

**Table 8.2.2.2.16-1: Interruption length in symbols of victim CC when 1 SRS symbol is configured**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 3 | 2 | 2 |
| 30 | 4 | 3 | 3 |
| 60 | 8 | 6 | 5 |
| 120 | 14 | 10 | 8 |

**Table 8.2.2.2.16.2: Void**

**Table 8.2.2.2.16-3: Interruption length in slots of victim CC for rest of the SRS configurations**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 2 | 2 | 2 |
| 30 | 2 | 2 | 2 |
| 60 | 3 | 2 | 2 |
| 120 | 5 | 3 | 3 |

### 8.2.2.2.17 Interruptions at fast SCell activation

The requirements in this clause shall apply for the UE configured with PCell and one SCell when aperiodic CSI-RS resources is configured for fast SCell activation.

When one SCell in MCG configured with aperiodic CSI-RS resources is configured for fast SCell activation is activated from deactivated, the UE is allowed an interruption on any active serving cell:

- of up to X2 slots, if the active serving cell and the SCell being activated are in a FR1 band pair or in a FR1+FR2 band pair.
- of up to X2 slots, if the active serving cell and the SCell being activated are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair.

Where X2 is specified in table 8.2.2.2.2-1.

or

- of up to Y2 slots +$T_{ATRS_duration}$, if the active serving cells are in the same band as any of the SCells being activated, when
  - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is larger than 2400ms, or
  - SCell is unknown and belongs to FR1, and SCell is contiguous to an active serving cell in the same band.

or

  - of up to Y2 slots if the active serving cells are in the same band as any of the SCells being activated, when
    - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms, or
- SCell to be activated belongs to FR2

Where:

  - $T_{ATRS_duration}$ is CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots on the being activated SCell.
  - Y2 are specified in table 8.2.1.2.4-2.

### 8.2.2.2.18 Interruptions due to PUCCH SCell activation/deactivation

When one SCell configured with PUCCH is activated or deactivated,

- The UE is allowed an interruption on active serving cell as defined in clause 8.2.2.2.2.
- The starting time of interruption shall be within the delay as defined in clause 8.3.12.
- For inter-band CA, if the UE is not capable of *parallelTxPRACH-SRS-PUCCH-PUSCH*, additional interruption is allowed on SRS/PUCCH/PUSCH of active serving cells when colliding with RACH transmission on PUCCH SCell. Interruption occurs on the symbols containing SRS/PUCCH/PUSCH, which overlap with the duration of the PRACH preamble [3] transmitted on the PUCCH SCell.

### 8.2.2.2.19 Interruptions due to measurements without gap carried out by UE supporting *NeedForInterruptionInfoNR*

When a UE supports *NeedForInterruptionInfoNR-r18* and indicates *no-gap-with-interruption* on intra-frequency SSB-based or inter-frequency SSB-based measurements, the UE is allowed to cause interruptions while performing measurements on the frequency layers of the bands for which *no-gap-with-interruption* is indicated.

The UE is allowed to cause interruption on each of the active serving cells due to UE measurements without gap on a certain frequency layer *i* which equals to $\frac{2L}{T_{cycle,i}}$, where

- $T_{cycle,i}$ is the interruption cycle on a certain frequency layer i, specified in table 8.2.2.2.19-1, and
- $CSSF_{outside_gap,i}$ is defined in clause 9.1.5.1 for measurement conducted outside measurement gaps.

**Table 8.2.2.2.19-1: $T_{cycle,i}$ length for inter/intra-frequency measurement on frequency layer *i***

| DRX cycle | $T_{Cycle,i}$ |
|---|---|
| No DRX | max (80 ms, SMTC period) x $CSSF_{outside_gap,i}$ |
| DRX cycle ≤ 320 ms | 1.5*max(80 ms, SMTC period, DRX cycle) x $CSSF_{outside_gap,i}$ |
| DRX cycle>320 ms | DRX cycle x $CSSF_{outside_gap,i}$ |

The total allowed maximum interruption ratio (D) on any active serving cell if UE does not support per-FR measurement gaps or in the same FR if UE supports per-FR measurement gaps is specified as

$$D = \sum_{i=1}^{N} \frac{2L}{T_{cycle,i}}$$

Where,

- N is the total number of configured SSB based frequency layers to be measured outside gap including intra-frequency and inter-frequency target carriers in the bands where UE indicates that interruption is needed through *no-gap-with-interruption*, and

- L is the maximum interruption length for each interruption occasion specified in table 8.2.2.2.19-2 and 8.2.2.2.19-3.

When no SMTC occasion of the NR measurement objects occurs within the time period which starts from 2 ms before the starting point of the DRX ON duration to 2 ms after the ending point of the DRX ON duration, UE is not allowed to cause interruption during DRX ON duration except the time duration extended due to *drx-inactivityTimer*.

**Table 8.2.2.2.19-2: Interruption length L in FR1**

| $\mu$ | SCS (kHz) of victim cell | NR Slot length (ms) of victim cell | Number of interrupted slots in the victim cell (slots) | Interruption length L (ms) |
|---|---|---|---|---|
| 0 | 15 | 1 | 1 | 1 |
| 1 | 30 | 0.5 | 2 | 1 |
| 2 | 60 | 0.25 | 4 | 1 |

**Table 8.2.2.2.19-3: Interruption length L in FR2**

| $\mu$ | SCS (kHz) of victim cell | NR Slot length (ms) of victim cell | Number of interrupted slots in the victim cell (slots) | Interruption length L (ms) |
|---|---|---|---|---|
| 2 | 60 | 0.25 | 3 | 0.75 |
| 3 | 120 | 0.125 | 6 | 0.75 |

### 8.2.2.2.20 Interruptions due to PDCCH ordered RACH on target LTM cell

When PRACH transmission is triggered by PDCCH order on target LTM cell,

- During RACH transmission, the UE is allowed an interruption on activated serving cell's DL slot(s) overlapped with RACH occasion depending on UE capability *pdcch-RACH-AffectedBands-TargetBandList-r18*.

  - If UE indicates NoInterruption for an activated serving band in the *pdcch-RACH-AffectedBands-TargetBandList-r18*, the UE shall not cause interruption on DL slot(s) overlapped with RACH occasion for the serving band indicated in the band pair.

  - If UE indicates Interruption for an activated serving band in the *pdcch-RACH-AffectedBands-TargetBandList-r18*, the UE may cause interruption on DL slot(s) overlapped with RACH occasion for the serving band indicated in the band pair.

- Before and after PRACH transmission, UE is allowed an interruption on any activated serving cell as follows:

  - of up to the duration shown in table 8.2.2.2.20-1, if PRACH bandwidth is outside active UL BWP but within one of configured UL BWPs of any active serving cell, or

  - of up to ceil(Y/NR Slot length)+1 slots, where Yms as reported in *pdcch-RACH-Switching-TargetBandTimeList-r18*, if PRACH bandwidth is outside any of the configured UL BWPs of any active serving cell

  - of up to ceil((Y+1)/NR Slot length)+1 slots, where Yms as reported in *pdcch-RACH-Switching-TargetBandTimeList-r18*, if PRACH bandwidth is outside any of the configured UL BWPs of any active serving cell, and if the number of RRC-configured LTM cells whose PRACH resources are not fully

contained in any of UE's configured UL BWP(s) of serving cell(s) is more than 2, and if UE is configured with SRS carrier switching.

**Table 8.2.2.2.20-1: Interruption duration due to PDCCH ordered RACH on target LTM cell when PRACH bandwidth is outside active UL BWP but within one of configured UL BWPs of any active serving cell**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X (slots) |
|---|---|---|
| 0 | 1 | 2 |
| 1 | 0.5 | 2 |
| 2 | 0.25 | 4 |
| 3 | 0.125 | 6 |

### 8.2.2.2.21 Interruptions at NR SRS bandwidth aggregation for positioning

The requirements in this clause are applicable to SRS transmission for positioning with bandwidth aggregation, when SRS resource configured in a CC without PUSCH/PUCCH is linked for aggregation with an SRS resource configured in an UL active BWP of a CC with PUSCH/PUCCH.

SRS resource sets across two or three CCs are aggregated for positioning when UE is configured with linkage information *SRS-PosResourceSetLinkedForAggBW* specified in TS 38.331 [2], provided that:

- the aggregated SRS transmission satisfy all the conditions defined in clause 6.2.1.4.2 in TS 38.214 [26];
- the aggregated SRS transmission and the guard period before and after the SRS transmission are not colliding with any other UL transmission or/and DL reception with higher priority in victim cells defined in TS 38.214 [26];
- the aggregated SRS transmission and the guard period before and after does not collide with any NR L3 or L1 measurements on victim cells.

For interruption caused by SRS transmission for positioning with bandwidth aggregation, the victim cell is identified based on the entry number of the band indicated by UE in *posSRS-BWA-AffectedBandList-r18* regardless of per-FR MG capability.

NOTE 1: UE may indicate no other bands in the band combination are affected by the SRS carrier switching, in which case, only the band with the aggregated SRS transmissions is affected.

NOTE 2: If the capability is not indicated, interruption is allowed on all serving cells.

For each SRS transmission, interruption with up to X OFDM symbols is allowed on any active serving cell on the band as indicated in *posSRS-BWA-AffectedBandList-r18*, during the guard periods before and after aggregated SRS transmission and the aggregated SRS transmission duration, where X equals to (Y+Z+1). Interruption length of one extra OFDM symbol is added to cover the impact of receive timing difference between aggressor and victim cells.

The supported guard period is reported by UE in *guardPeriod* in *PosSRS-BWA-IndependentCA-RRC-Connected-r18* [2] and the total duration Y of guard periods before and after aggregated SRS transmission is converted into number of OFDM symbols in table 8.2.2.2.21-1.

**Table 8.2.2.2.21-1: Total duration Y of guard periods before and after aggregated SRS transmission (OFDM symbols)**

| | Guard period (μs) | | | | |
|---|---|---|---|---|---|
| **SCS of victim cell (kHz)** | **0** | **30** | **100** | **140** | **200** |
| **15** | 0 | 1 | 3 | 4 | 6 |
| **30** | | 2 | 6 | 8 | 12 |
| **60** | | 4 | 12 | 16 | 23 |
| **120** | | 7 | 23 | 32 | 45 |
| **480** | | 27 | 87 | 122 | 174 |
| **960** | | 53 | 174 | 244 | 348 |

The duration of aggregated SRS transmission is given by *nrofSymbols* in corresponding SRS-Resource configurations [2]. This duration in number of *nrofSymbols* OFDM symbols is converted to Z OFDM symbols in victim cells according to the SCS configurations among the aggressor cell and victim cell(s). Z is specified in table 8.2.2.2.21-2, table 8.2.2.2.21-3, table 8.2.2.2.21-4, table 8.2.2.2.21-5 and table 8.2.2.2.21-6 for *nrofSymbols* equal to {1, 2, 4, 8, 12} respectively with different SCS configurations.

**Table 8.2.2.2.21-2: Duration Z of aggregated SRS transmission with *nrofSymbols* = 1 (OFDM symbols)**

| | SCS of aggressor cell (kHz) | | | |
|---|---|---|---|---|
| **SCS of victim cell (kHz)** | **15** | **30** | **60** | **120** |
| **15** | 1 | 1 | 1 | 1 |
| **30** | 2 | 1 | 1 | 1 |
| **60** | 4 | 2 | 1 | 1 |
| **120** | 8 | 4 | 2 | 1 |
| **480** | 32 | 16 | 8 | 4 |
| **960** | 64 | 32 | 16 | 8 |

**Table 8.2.2.2.21-3: Duration Z of aggregated SRS transmission with *nrofSymbols* = 2 (OFDM symbols)**

| | SCS of aggressor cell (kHz) | | | |
|---|---|---|---|---|
| **SCS of victim cell (kHz)** | **15** | **30** | **60** | **120** |
| **15** | 2 | 1 | 1 | 1 |
| **30** | 4 | 2 | 1 | 1 |
| **60** | 8 | 4 | 2 | 1 |
| **120** | 16 | 8 | 4 | 2 |
| **480** | 64 | 32 | 16 | 8 |
| **960** | 128 | 64 | 32 | 16 |

**Table 8.2.2.2.21-4: Duration Z of aggregated SRS transmission with *nrofSymbols* = 4 (OFDM symbols)**

| | SCS of aggressor cell (kHz) | | | |
|---|---|---|---|---|
| **SCS of victim cell (kHz)** | **15** | **30** | **60** | **120** |
| **15** | 4 | 2 | 1 | 1 |
| **30** | 8 | 4 | 2 | 1 |
| **60** | 16 | 8 | 4 | 2 |

### 8.2.2.2.22 Interruptions at OD-SSB activation/deactivation

The requirements in this clause shall apply for the UE configured with at least one deactivated OD-SSB SCell. If more than one deactivated SCells are configured with OD-SSB transmission, the requirements in this clause shall apply provided OD-SSB is activated or deactivated on only one of the deactivated OD-SSB SCells.

When OD-SSB is activated or deactivated on a deactivated SCell, the UE is allowed an interruption on any active serving cell, provided that the OD-SSB activation/deactivation command and SCell activation/deactivation command are not received at the same time:

- of up to X2 slots, if the active serving cell and the SCell on which the OD-SSB is being activated or deactivated are in a FR1 band pair or in a FR1+FR2 band pair.
- of up to X2 slots, if the active serving cell and the SCell on which the OD-SSB is being activated or deactivated are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair.
- of up to X2 slots, if the active serving cell is non-contiguous to the SCell on which the OD-SSB is being activated or deactivated in the same FR1 band and UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided.

Where X2 is specified in table 8.2.2.2.22-1.

or

- of up to the duration shown in table 8.2.2.2.22-2, if the active serving cells are contiguous to the SCell on which the OD-SSB is being activated or deactivated in the same FR1 band, or if the active serving cells are non-contiguous to the SCell on which the OD-SSB is being activated or deactivated in the same FR1 band and UE is not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, provided the cell specific reference signals from the active serving cells and the SCells on which the OD-SSB is being activated or deactivated are available in the same slot.
- of up to the duration shown in table 8.2.2.2.22-2, if the active serving cells are in the same FR2 band as the SCell on which the OD-SSB is being activated or deactivated provided the cell specific reference signals from the active serving cells and the SCells on which the OD-SSB is being activated or deactivated are available in the same slot.

**Table 8.2.2.2.22-1: Interruption length X2 for OD-SSB activation/deactivation for inter-band CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X2 (slots) | |

## 8.2.3 NE-DC Interruptions

### 8.2.3.1 Introduction

This clause contains the requirements related to the interruptions on PCell and SCell, when

- E-UTRA PSCell transitions between active and non-active during DRX, or
- E-UTRA PSCell transitions from non-DRX to DRX, or
- E-UTRA PSCell/SCell in SCG or SCell in MCG is added or released, or
- E-UTRA PSCell/SCell in SCG or SCell(s) in MCG is activated or deactivated, or
- measurements on SCC with deactivated SCell in either E-UTRA SCG or NR MCG or
- PUSCH/PUCCH carrier configuration and deconfiguration in NR MCG, or
- UL/DL BWP is switched on PCell or SCell in MCG, or
- UE-specific CBW is changed on PCell or SCell in MCG, or
- CGI reading of an NR neighbour cell with autonomous gaps, or
- CGI reading of an E-UTRA neighbour cell with autonomous gaps, or
- NR SRS carrier based switching, or
- E-UTRA SRS carrier based switching, or
- NR SRS antenna port switching, or
- SCell in NR MCG is activated based on aperiodic CSI-RS.

The requirements shall apply for NE-DC with an NR PCell.

This clause contains interruptions where victim cell is PCell or SCell belonging to MCG. Requirements for interruptions requirements when the victim cell is E-UTRA PSCell or E-UTRA SCell belonging to SCG are specified in TS 36.133 [15].

For a UE which does not support per-FR measurement gap, interruptions to the PCell, E-UTRA PSCell or activated MCG SCells may be caused by EUTRA PSCell, EUTRA SCells or SCells on any frequency range. For UE which support per-FR gap, interruptions to the PCell, E-UTRA PSCell or activated MCG SCells may be caused by EUTRA PSCell, EUTRA SCells or SCells on the same frequency range as the victim cell.

## 8.2.3.2 Requirements

### 8.2.3.2.1 Interruptions at transitions between active and non-active during DRX

Interruption on PCell and the activated SCell if configured due to E-UTRA PSCell transitions between active and non-active during DRX when PCell or SCell is in non-DRX are allowed with up to 1% probability of missed ACK/NACK when the configured E-UTRA PSCell DRX cycle is less than 640 ms, and 0.625% probability of missed ACK/NACK is allowed when the configured E-UTRA PCell DRX cycle is 640 ms or longer. Each interruption shall not exceed X slots as defined in table 8.2.3.2.1-1.

**Table 8.2.3.2.1-1: Interruption length X at transition between active and non-active during DRX**

| $\mu$ | NR slot length (ms) | Interruption length X (slots) | |
|---|---|---|---|
| | | Sync | Async |
| 0 | 1 | 1 | 2 |
| 1 | 0.5 | 1 | 2 |
| 2 | 0.25 | 3 | |
| 3 | 0.125 | 5 | |

When both PCell and E-UTRA PSCell are in DRX, no interruption is allowed.

### 8.2.3.2.2 Interruptions at transitions from non-DRX to DRX

Interruption on PCell and the activated SCell if configured due to E-UTRA PSCell transitions from non-DRX to DRX when PCell or SCell is in non-DRX shall not exceed X slots as defined in table 8.2.3.2.1-1.

### 8.2.3.2.3 Interruptions at PSCell/SCell addition/release

The requirements in this clause shall apply for the UE configured with E-UTRA PSCell.

When one E-UTRA PSCell/SCell in SCG is added or released, the UE is allowed an interruption on any active serving cell in MCG:

- of up to X1 slots, if the active serving cell is not in the same band as any of the E-UTRA PSCell/SCells being added or released, or
- of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms} if the active serving cells are in the same band as any of the E-UTRA PSCell/SCells being added or released, provided the cell specific reference signals from the active serving cells and the E-UTRA PSCell/SCells being added or released are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above activated serving cells in MCG;

Where X1 and Y1 are specified in table 8.2.3.2.3-1.

When one SCell in MCG is added or released, the UE is allowed an interruption on any activated serving cell in MCG:

- of up to X1 slots, if the active serving cell and the SCell being added or released are in a FR1 band pair or in a FR1+FR2 band pair.
- of up to X1 slots, if the active serving cell and the SCell being added or released are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair.

or

- of up to Y1 slots + $T_{SMTC_duration}$ if the active serving cells are in the same band as any of the SCells being added or released, provided the cell specific reference signals from the active serving cells and the SCells being added or released are available in the same slot, where, $T_{SMTC_duration}$ is
  - the longest SMTC duration among all above active serving cells in MCG and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB

burst transmitted by the SCell being added. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added, $T_{SMTC\ duration}$ for the SCell being added is 0ms;

- the longest SMTC duration among all above active serving cells in MCG when one SCell is released.

Where X1 and Y1 are specified in table 8.2.3.2.3-2.

**Table 8.2.3.2.3-1: Interruption length X1 and Y1 at E-UTRA PSCell/SCell addition/release**

| $\mu$ | NR Slot length (ms) | Interruption length X1 (slots) | | Interruption length Y1 (slots) | |
|---|---|---|---|---|---|
| | | Sync | Async | Sync | Async |
| 0 | 1 | 1 | 2 | 1 | 2 |
| 1 | 0.5 | 2 | 3 | 2 | 3 |
| 2 | 0.25 | 5 | | 4 | 5 |
| 3 | 0.125 | 9 | | N/A | N/A |

**Table 8.2.3.2.3-2: Interruption length X1 and Y1 at SCell addition/Release**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | | Interruption length Y1 (slots) |
|---|---|---|---|---|
| 0 | 1 | 1 | | 1 |
| 1 | 0.5 | 2 | | 2 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 4 | 4 |
| | | Either aggressor cell or victim cell is on FR1 | 5 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 8 | 8 |
| | | Aggressor cell is on FR1 | 9 | |

### 8.2.3.2.4 Interruptions at SCell activation/deactivation

The requirements in this clause shall apply for the UE configured with E-UTRA PSCell and one SCell.

When one E-UTRA SCell in SCG is activated from deactivated or dormant state, or deactivated from activated or dormant state the UE is allowed an interruption on any active serving cell in MCG:

- of up to X2 slots, if the active serving cell is not in the same band as any of the SCells being activated or deactivated, or

- of up to max{Y2 slots + $T_{SMTC_duration}$, 5ms} if the active serving cells are in the same band as any of the E-UTRA SCells being activated or deactivated, provided the cell specific reference signals from the active serving cells and the E-UTRA SCells being activated or deactivated are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above active serving cells in MCG.

Where X2 and Y2 are specified in table 8.2.3.2.4-1.

When one SCell in MCG is activated or deactivated the UE is allowed an interruption on any serving cell in MCG:

- of up to X2 slots, if the active serving cell is not in the same band as any of the SCells being activated or deactivated, or

- of up to Y2 slots + $T_{SMTC_duration}$ if the active serving cells are in the same band as any of the SCells being activated or deactivated, provided the cell specific reference signals from the active serving cells and the SCells being activated or deactivated are available in the same slot, where, $T_{SMTC_duration}$ is

  - the longest SMTC duration among all above active serving cells in MCG and the SCell being activated when one SCell is activated, If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one

SSB burst transmitted by the SCell being activated. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated, $T_{SMTC\ duration}$ for the SCell being activated is 0ms;

- the longest SMTC duration among all above active serving cells in MCG when one SCell is deactivated.

Where X2 and Y2 are specified in table 8.2.3.2.4-2.

**Table 8.2.3.2.4-1: Interruption length X2 and Y2 at E-UTRA SCell activation/deactivation**

| $\mu$ | NR Slot length (ms) | Interruption length X2 (slots) | | Interruption length Y2 (slots) | |
|---|---|---|---|---|---|
| | | Sync | Async | Sync | Async |
| 0 | 1 | 1 | 2 | 1 | 2 |
| 1 | 0.5 | 1 | 2 | 1 | 2 |
| 2 | 0.25 | 3 | | 2 | 3 |
| 3 | 0.125 | 5 | | N/A | N/A |

**Table 8.2.3.2.4-2: Interruption length X2 and Y2 at SCell activation/deactivation**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X2 (slots) | | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 1 | | 1 |
| 1 | 0.5 | 1 | | 1 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 2 | 2 |
| | | Either aggressor cell or victim cell is on FR1 | 3 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 4 | 4 |
| | | Aggressor cell is on FR1 | 5 | |

## 8.2.3.2.5 Interruptions during measurements on SCC

### 8.2.3.2.5.1 Interruptions during measurements on deactivated NR SCC

Interruption on PCell and other activated SCell(s) during measurement on the deactivated NR SCC shall meet requirements in clause 8.2.2.2.3.

### 8.2.3.2.5.2 Interruptions during measurements on deactivated E-UTRAN SCC

When one E-UTRA SCell in SCG is deactivated, the UE is allowed due to measurements on the E-UTRA SCC with the deactivated E-UTRA SCell:

- an interruption on PCell or any activated SCell with up to 0.5 % probability of missed ACK/NACK when any of the configured *measCycleSCell* [15] for the deactivated E-UTRA SCells is 640 ms or longer.

- an interruption on PCell or any activated SCell with up to 0.5 % probability of missed ACK/NACK regardless of the configured *measCycleSCell* [15] for the deactivated E-UTRA SCells if indicated by the network using IE *allowInterruptions* [15].

Each interruption shall not exceed

- X3 slots, if the PCell or activated SCell is not in the same band as the E-UTRA deactivated SCC being measured, or

- Y3 slots + SMTC duration, if the PCell or activated SCell is in the same band as the E-UTRA deactivated SCC being measured, provided the cell specific reference signals from the PCell or activated SCell and the E-UTRA deactivated SCC being measured are available in the same slot.

  Where X3 and Y3 are specified in table 8.2.3.2.5-1

**Table 8.2.3.2.5-1: Interruption length X3 and Y3 at measurements on deactivated E-UTRA SCC**

| $\mu$ | NR Slot length (ms) | Interruption length X3 (slots) | | Interruption length Y3 (slot) | |
|---|---|---|---|---|---|
| | | Sync | Async | Sync | Async |
| 0 | 1 | 1 | 2 | 1 | 2 |
| 1 | 0.5 | 1 | 2 | 1 | 2 |
| 2 | 0.25 | 3 | | 2 | 3 |
| 3 | 0.125 | 5 | | N/A | N/A |

#### 8.2.3.2.5.3 Interruptions during CQI measurements on dormant E-UTRAN SCC

When one E-UTRA SCell in SCG is dormant, the UE is allowed due to CQI measurements on the dormant E-UTRA SCell:

- an interruption on PCell or any activated SCell with up to 0.5 % probability of missed ACK/NACK.

Each interruption shall not exceed

- X3 slots, if the PCell or activated SCell is not in the same band as the E-UTRA dormant SCell being measured, or
- Y3 slots + SMTC duration, if the PCell or activated SCell is in the same band as the E-UTRA dormant SCell being measured, provided the cell specific reference signals from the PSCell or activated SCell and the E-UTRA dormant SCell being measured are available in the same slot.

Where X3 and Y3 are defined in table 8.2.3.2.5.2-1.

#### 8.2.3.2.5.4 Interruptions during RRM measurements on dormant E-UTRAN SCC

When one E-UTRA SCell in SCG is dormant, the UE is allowed due to RRM measurements on the E-UTRA SCC with the dormant E-UTRA SCell:

- an interruption on PCell or any activated SCell with up to 0.5 % probability of missed ACK/NACK.

Each interruption shall not exceed

- X3 slots, if the PCell or activated SCell is not in the same band as the E-UTRA dormant SCC being measured, or
- Y3 slots + SMTC duration, if the PCell or activated SCell is in the same band as the E-UTRA dormant SCC being measured, provided the cell specific reference signals from the PSCell or activated SCell and the E-UTRA dormant SCC being measured are available in the same slot.

Where X3 and Y3 are defined in table 8.2.3.2.5.2-1.

### 8.2.3.2.6 Interruptions at UL carrier RRC reconfiguration

The requirements in this clause shall apply when a supplementary UL carrier or an UL carrier is configured or de-configured in NE-DC.

When an UL carrier or supplementary UL carrier is configured or deconfigured, an interruption of up to X4 slots as specified in table 8.2.3.2.6-1, is allowed during the RRC reconfiguration procedure in TS 38.331 [2] on PCell, all activated SCells within the same FR as the reconfigured uplink carrier. The interruption is for both uplink and downlink of PCell, all activated E-UTRA SCells, E-UTRA PSCell and all activated SCells within the same FR as the configured or de-configured UL.

**Table 8.2.3.2.6-1: Interruption length X4 at UL carrier RRC reconfiguration**

| $\mu$ | NR Slot length (ms) | Interruption length X4 (slots) | |
|---|---|---|---|
| | | Sync | Async |
| 0 | 1 | 1 | 2 |
| 1 | 0.5 | 2 | 3 |

| | | |
|---|---|---|
| 2 | 0.25 | 5 |
| 3 | 0.125 | 9 |

#### 8.2.3.2.7 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based BWP switch , timer-based BWP switch or UL BWP switch triggered by consistent uplink CCA failures and RRC based in this clause apply to the case that the BWP switch is performed on a single CC or multiple CCs.

When either of the DCI-based, timer-based or RRC-based downlink BWP switch and/or uplink BWP switch occur on multiple CCs simultaneously or over partially overlapping period, the interruption requirements described in this clause apply for each BWP switch.

When UE receives a DCI indicating the UE to switch its active BWP, or when a BWP timer *bwp-InactivityTimer* defined in TS 38.331 [2] expires, or when the UE receives an RRC command indicating the UE to switch its active BWP or when UL BWP switch is triggered by consistent uplink CCA failures, the UE is allowed an interruption on PCell and any other activated SCells as defined in clause 8.2.2.2.5.

#### 8.2.3.2.8 Interruptions at direct SCell activation and hibernation

##### 8.2.3.2.8.1 Interruptions during direct SCell activation and hibernation of E-UTRA SCell

When one E-UTRA SCell in SCG is directly activated and hibernated, the UE is allowed an interruption on any active serving cell in MCG:

- of up to X1 slots, if the active serving cell is not in the same band as any of the E-UTRA SCells being directly activated or hibernated, or
- of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms} if the active serving cells are in the same band as any of the E-UTRA SCells being directly activated or hibernated, provided the cell specific reference signals from the active serving cells and the E-UTRA SCells being directly activated or hibernated are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above active serving cells in MCG.

Where X1 and Y1 are specified in table 8.2.3.2.3-1.

##### 8.2.3.2.8.2 Interruptions during direct SCell activation

When one or multiple SCell(s) in MCG are directly activated at SCell addition, the UE is allowed an interruption on any active serving cell in MCG:

- of up to X1 slots, if the active serving cell is not in the same band as the SCell being directly activated, or
- of up to max{Y1 slots + $T_{SMTC_duration}$, 5ms} if the active serving cells are in the same band as the SCell being directly activated, provided the cell specific reference signals from the active serving cells and the SCell being directly activated are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above active serving cells in MCG.

  Where X1 and Y1 are specified in table 8.2.3.2.3-2.

#### 8.2.3.2.9 Interruptions at SCell hibernation

When one E-UTRA SCell in SCG is hibernated, the UE is allowed an interruption on any active serving cell in MCG:

- of up to X2 slots, if the active serving cell is not in the same band as any of the E-UTRA SCells being hibernated, or
- of up to max{Y2 slots + $T_{SMTC_duration}$, 5ms} if the active serving cells are in the same band as any of the E-UTRA SCells being hibernated, provided the cell specific reference signals from the active serving cells and the E-UTRA SCells being hibernated are available in the same slot, where $T_{SMTC_duration}$ is the longest SMTC duration among all above active serving cells in MCG.

  Where X2 and Y2 are specified in table 8.2.3.2.4-1.

### 8.2.3.2.10 Interruptions at SCell activation/deactivation with multiple downlink SCells

The requirements in this clause shall apply for the UE configured with E-UTRA PSCell and up to 6 downlink SCell(s).

When multiple SCells in MCG are activated or deactivated by one single MAC CE command, the UE is allowed an interruption on any serving cell in MCG as specified in clause 8.2.3.2.4.

### 8.2.3.2.11 Interruptions at NR SRS carrier based switching

SRS transmission can be configured on a carrier not configured for PUCCH/PUSCH transmission. When a UE needs to transmit periodic, semi-persistent or aperiodic SRS on a carrier of a serving cell not configured for PUCCH/PUSCH transmission, the UE can perform carrier based switching to one or more carriers not configured for PUCCH/PUSCH transmission from a carrier with PUCCH/PUSCH transmission or from a carrier not configured for PUCCH/PUSCH transmission prior to transmitting SRS, provided that:

- switching is from a configured carrier to another activated carrier;
- the carrier of SCells not configured for PUCCH/PUSCH transmission to which SRS carrier based switching is performed is indicated by DCI SRS request field for aperiodic SRS transmission, or indicated by MAC-CE for semi-persistent SRS transmission, or configured via RRC for periodic SRS transmission;
- the serving cell, from which SRS carrier based switching is performed and whose UL transmission may therefore be interrupted, is indicated by srs-SwitchFromServCellIndex and srs-SwitchFromCarrier in TS 38.331 [2];
- the SRS switching is not colliding with any other transmission with higher priority defined in TS 38.214 [26];
- the SRS switching is not colliding with any SSB/CSI-RS based L3 measurements and the measurements for RLM/BFD in MCG.- for UE, which does not support simultaneous reception and transmission for inter-band TDD CA specified in TS 38.331 [2], and is compliant to the requirements for inter-band CA with uplink in one NR band and without simultaneous Rx/Tx specified in TS 38.101-3 [20], the SRS transmission are not simultaneously scheduled with DL SSB/CSI-RS for L3 or L1 measurements transmission on other carriers.

The UE shall not perform SRS carrier based switching if the above conditions cannot be met.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell in MCG if UE is not capable of per-FR gap, or on active serving cell(s) in MCG in FR1 if UE is capable of per-FR gap, during the switching to the carrier of a serving cell in FR1 not configured for PUCCH/PUSCH transmission,

- with up to X1 slots as specified in table 8.2.3.2.11-1.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell in MCG if UE is not capable of per-FR gap, or on active serving cell(s) in MCG in FR2 if UE is capable of per-FR gap, during the switching to the carrier of a serving cell in FR2 not configured for PUCCH/PUSCH transmission,

- with up to X2 slots as specified in table 8.2.3.2.11-2.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell in MCG if UE is not capable of per-FR gap, or on active serving cell(s) in MCG in FR1 if UE is capable of per-FR gap, during the switching from the carrier of a serving cell in FR1 not configured for PUCCH/PUSCH transmission,

- with up to X1 slots as specified in table 8.2.3.2.11-1.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell in MCG if UE is not capable of per-FR gap, or on active serving cell(s) in MCG in FR2 if UE is capable of per-FR gap, during the switching from the carrier of a serving cell in FR2 not configured for PUCCH/PUSCH transmission,

- with up to X2 slots as specified in table 8.2.3.2.11-2.

**Table 8.2.3.2.11-1: Interruption length X1 (slots)**

| $\mu$ | NR Slot length (ms) of victim cell | SRS carrier switching time (us)[Note 1] | Interruption length X1 (slots) | |

| 3 | 0.125 | ≤ 200 | 7 | 5 |
| | | 300, 500 | 9 | 7 |
| | | 900 | 12 | 10 |
| NOTE 1: NR SRS carrier switching time is UE capability indicated by higher layer parameter *SRS-SwitchingTimeNR*. | | | | |

**Table 8.2.3.2.11-2: Interruption length X2 (slots)**

| $\mu$ | NR Slot length (ms) of victim cell | SRS carrier switching time (us) [Note 1] | Interruption length X2 (slots) | |
|---|---|---|---|---|
| | | | Sub carrier spacing for aggressor cell (kHz) | |
| | | | 60 | 120 |
| 0 | 1 | $\leq$ 200 | 2 | 2 |
| 1 | 0.5 | $\leq$ 200 | 2 | 2 |
| 2 | 0.25 | $\leq$ 200 | 3 | 3 |
| 3 | 0.125 | ≤ 200 | 4 | 4 |
| NOTE 1: NR SRS carrier switching time is UE capability indicated by higher layer parameter *SRS-SwitchingTimeNR*. | | | | |

For intra-band SRS carrier switching in FR1 or FR2, interruptions in table 8.2.3.2.11-1 and in table 8.2.3.2.11-2 based on SRS carrier switching time $\leq$ 200μs shall apply. For inter-band SRS carrier switching in FR1, interruptions in table 8.2.3.2.11-1 and in table 8.2.3.2.11-2 shall apply.

### 8.2.3.2.12 Interruptions at E-UTRA SRS carrier based switching

A PUSCH-less carrier of E-UTRA SCell is a TDD carrier without PUCCH/PUSCH configured. When a UE needs to transmit periodic or aperiodic SRS [23] and/or non-contention based PRACH on a PUSCH-less E-UTRA carrier of SCell, the UE can perform carrier based switching to one or more PUSCH-less carrier of E-UTRA SCells from a E-UTRA carrier with PUSCH or from another PUSCH-less E-UTRA carrier of SCell prior to transmitting SRS and/or PRACH, provided that:

- switching is from a configured E-UTRA carrier to another activated TDD carrier;
- the PUSCH-less carrier of E-UTRA SCells to which SRS carrier based switching is performed is indicated by DCI SRS request field for aperiodic SRS transmission or configured via RRC [15] for periodic SRS transmission;
- the E-UTRA serving cell, from which SRS carrier based switching is performed and whose UL transmission may therefore be interrupted, is indicated by srs-SwitchFromServCellIndex [15];
- the SRS switching is not colliding with any other transmission with higher priority defined in [39];
- the SRS switching is not colliding with PDCCH in subframe 0 and 5 as specified in [39];
- for UE, which does not support simultaneous reception and transmission for inter-band TDD CA specified in TS 36.331 [16], and is compliant to the requirements for inter-band CA with uplink in one E-UTRA band and without simultaneous Rx/Tx specified in TS 36.101 [25], the SRS or RACH transmission are not simultaneously scheduled with DL subframe #0 or DL subframe #5 on other E-UTRA carriers.

The UE shall not perform SRS carrier based switching if the above conditions cannot be met.

When SRS carrier based switching is performed between E-UTRA carriers, the UE is allowed interruptions on any active serving cell in MCG if UE is not capable of per-FR gap, or on active serving cell(s) in MCG in FR1 if UE is capable of per-FR gap, during the switching to the PUSCH-less carrier of a serving cell,

- with up to X2 slot as specified in table 8.2.3.2.12-1.

When SRS carrier based switching is performed between E-UTRA carriers, the UE is allowed interruptions on any active serving cell in MCG if UE is not capable of per-FR gap, or on active serving cell(s) in MCG in FR1 if UE is capable of per-FR gap, during the switching from the PUSCH-less carrier of a serving cell,

- with up to X2 slots as specified in table 8.2.3.2.12-1

**Table 8.2.3.2.12-1: Interruption length X2 (slots)**

| $\mu$ | NR Slot length (ms) | Interruption length X2 (slots) |
|---|---|---|
| 0 | 1 | 2 |
| 1 | 0.5 | 3 |
| 2 | 0.25 | 5 |
| 3 | 0.125 | 9 |

### 8.2.3.2.13 Interruptions due to SCell dormancy

#### 8.2.3.2.13.1 Interruptions due to SCell dormancy switch

When one SCell in MCG is switched from dormancy to non-dormancy or from non-dormancy to dormancy [7] when UE is in DRX active time,

- the UE is allowed an interruption on active serving cell in MCG as defined in clause 8.2.3.2.7, except that the interruption is allowed regardless of which parameters change between the dormant BWP and the non-dormant BWP

- The starting time of interruption shall be within the dormancy switching delay as defined in clause 8.6.2.

When multiple SCells in MCG are switched from dormancy to non-dormancy or vice versa when the UE is in DRX active time, the interruption requirement described above applies for each BWP switch.

#### 8.2.3.2.13.2 Interruptions due to CQI measurements during SCell dormancy

When one or more SCells are in dormancy, the UE is for the purpose of CQI measurements on the dormant SCell(s) allowed to cause interruptions to non-dormant serving cell(s).

The rate of ACK/NACK feedback loss on any non-dormant serving cell resulting from CQI measurements on dormant SCells shall not exceed 0.5 %.

#### 8.2.3.2.13.3 Interruptions due to RRM measurements during SCell dormancy

When one or more SCells are in dormancy, the UE is for the purpose of RRM measurements on the dormant SCell(s) allowed to cause interruptions to non-dormant serving cell(s).

The rate of ACK/NACK feedback loss on any non-dormant serving cell resulting from RRM measurements on dormant SCells shall not exceed 1.0 %.

### 8.2.3.2.14 Interruptions when identifying CGI of an NR cell with autonomous gaps

When a UE is identifying CGI of an NR cell with autonomous gaps, the UE is allowed interruptions on PCell or any activated SCell:

- with up to K1 interruptions with interrupted slots up to interruption length X1 specified in table 8.2.3.2.14-1 for each interruption during MIB decoding time period $T_{MIB}$ (ms) specified in clause 9.11.

- with up to L1 interruptions with interrupted slots up to interruption length Y1 specified in table 8.2.3.2.14-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11 for SSB and CORESET for RMSI scheduling multiplexing patterns 1.

- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in table 8.2.3.2.14-1 for each interruption during SIB1 decoding time period $T_{SIB}$ Where:
- K1 = 6 for the target cell carrier frequency on FR1 and K1 = 25 for the target cell carrier frequency on FR2, and
- L1 = $T_{SIB1}/20$, and
- L2 = $T_{SIB1}/T_{SMTC}$, where $T_{SMTC}$ is the periodicity of the SMTC occasion configured for the target cell carrier.

**Table 8.2.3.2.14-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | Interruption length Y1 (slots) | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 6 | 7 | 6 |
| 1 | 0.5 | 12 | 13 | 10 |
| 2 | 0.25 | 24 | 25 | 19 |
| 3 | 0.125 | 48 | 49 | 37 |

### 8.2.3.2.15 Interruptions when identifying CGI of an E-UTRA cell with autonomous gaps

When a UE is identifying CGI of an E-UTRA FDD cell or E-UTRA TDD cell with autonomous gaps, within time period

- $T_{identify_CGI,\ intra}$ specified in clause 8.1.2.2.3, or clause 8.1.2.2.4 in TS 36.133 [15], or
- $T_{identify_CGI,\ inter}$ specified in clause 8.1.2.3.5, or clause 8.1.2.3.6, or clause 8.1.2.3.7, or clause 8.1.2.3.6 in TS 36.133 [15], or
- $T_{identify_CGI,\ E\text{-}UTRA}$ specified in clause 9.4.7.1

the UE shall be able to transmit at least the number of ACK/NACKs specified in table 8.2.3.2.15-1 on PCell or any activated SCell in the frequency range where autonomous gaps are used, provided that:

- there is continuous DL data allocation,
- no DRX cycle is used,
- no measurement gaps are configured,
- only one code word is transmitted in each slot,
- 2 slot ACK/NACK feedback is configured,
- 20 ms SMTC period is configured.

**Table 8.2.3.2.15-1: Minimum number of ACK/NACKs transmitted by the UE**

| Minimum number of transmitted ACK/NACKs | Configuration of the serving cell in which the transmitted ACK/NACKs are counted | |
|---|---|---|
| | Duplex mode configuration | SCS |
| 84 | FDD | 15 kHz |
| 193 | FDD | 30 kHz |
| 402 | FDD | 60 kHz |
| 28 | TDD Note 1 | 15 kHz |
| 81 | TDD Note 1 | 30 kHz |
| 159 | TDD Note 1 | 60 kHz |
| 233 | TDD Note 2 | 60 kHz |
| 491 | TDD Note 2 | 120 kHz |
| NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [18].<br>NOTE 2: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-2 [19]. | | |

### 8.2.3.2.16 Interruptions at NR SRS antenna port switching

The requirements in this clause are applicable to SRS antenna port switching on FR1 and SRS resource(s) is only configured within the last 6 symbols of a slot. For interruption caused by SRS antenna port switching, the victim cell is based on the entry number of the band indicated by *txSwitchImpactToRx* and/or *txSwitchWithAnotherBand* regardless of per-FR MG capability. An UL interruption is allowed on any of the serving cells as indicated in *txSwitchWithAnotherBand*, and a DL interruption is allowed on any of the serving cells as indicated in *txSwitchImpactToRx*.

The UE shall perform SRS antenna port switching only if the below conditions are met.

- the SRS switching is not colliding with any other UL transmission with higher priority defined in TS 38.214 [26] if the serving cell on which the higher priority transmission is performed is a victim cell based on *txSwitchWithAnotherBand* or is the same carrier on which SRS is transmitted.

- the SRS switching is not colliding with any NR measurements (i.e. SSB/CSI-RS based L1/L3 measurements) and the measurements for RLM/BFD/CBD if the serving cell on which the NR measurements and the measurements for RLM/BFD/CBD is performed is a victim cell based on *txSwitchImpactToRx* or is the same carrier on which SRS is transmitted.

No requirements are defined for SRS antenna port switching if aperiodic SRS switching is colliding with aperiodic L1-RSRP/L1-SINR measurements and the serving cell on which the aperiodic L1-RSRP/L1-SINR measurement is configured is indicated in *txSwitchImpactToRx* or is the same carrier on which aperiodic SRS is scheduled/configured.

No requirements apply when SRS antenna port switching is colliding with E-UTRA measurement if the carrier on which the E-UTRA measurement is performed is indicated in *txSwitchImpactToRx* or is the same carrier on which SRS is scheduled/configured.

When 1 SRS symbol is configured in a slot for SRS antenna switching and the aggressor and victim cells are synchronized, the interruption requirement in table 8.2.3.2.16-1 applies. When 1 SRS symbol is configured in a slot for SRS antenna switching and the aggressor and victim cells are asynchronized, the interruption requirement in table 8.2.3.2.16-2 applies. For the rest of SRS configurations, the interruption requirement in table 8.2.3.2.16-3 applies.

**Table 8.2.3.2.16-1: Interruption length in symbols of victim CC when 1 SRS symbol is configured, and aggressor and victim cells are synchronized**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 3 | 2 | 2 |
| 30 | 4 | 3 | 3 |
| 60 | 8 | 6 | 5 |
| 120 | 14 | 10 | 8 |

**Table 8.2.3.2.16-2: Interruption length in slots of victim CC when 1 SRS symbol is configured, and aggressor and victim cells are asynchronized**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 2 | 2 | 2 |
| 30 | 2 | 2 | 2 |
| 60 | 2 | 2 | 2 |
| 120 | 2 | 2 | 2 |

**Table 8.2.3.2.16-3: Interruption length in slots of victim CC for rest of the SRS configurations for synchronised and asynchronized scenarios**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 2 | 2 | 2 |
| 30 | 2 | 2 | 2 |
| 60 | 3 | 2 | 2 |
| 120 | 5 | 3 | 3 |

#### 8.2.3.2.17 Interruptions at fast SCell activation

The requirements in this clause shall apply for the UE configured with E-UTRA PSCell and one SCell in MCG when aperiodic CSI-RS resources is configured for fast SCell activation.

When one SCell in MCG configured with aperiodic CSI-RS resources is configured for fast SCell activation is activated from deactivated, the UE is allowed an interruption on any serving cell in MCG:

- of up to X2 slots, if the active serving cell is not in the same band as any of the SCells being activated, or
- of up to Y2 slots + $T_{ATRS_duration}$ if the active serving cells are in the same band as any of the SCells being activated, when
  - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is larger than 2400ms, or
  - SCell is unknown and belongs to FR1, and SCell is contiguous to an active serving cell in the same band.
- of up to Y2 slots if the active serving cells are in the same band as any of the SCells being activated, when
  - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is equal to or smaller than 2400ms, or
  - SCell to be activated belongs to FR2.

Where

- $T_{ATRS_duration}$ is CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots on the being activated SCell.
- X2 and Y2 are specified in table 8.2.3.2.4-2.

#### 8.2.3.2.18 Interruptions due to UE-specific CBW change

The requirements in clause 8.2.1.2.11 apply for this clause.

#### 8.2.3.2.19 Interruptions due to PUCCH SCell activation/deactivation

When one SCell in MCG configured with PUCCH is activated or deactivated,

The UE is allowed an interruption on active serving cell in MCG as defined in clause 8.2.3.2.4.

- The starting time of interruption shall be within the delay as defined in clause 8.3.12.
- For inter-band CA, if the UE is not capable of *parallelTxPRACH-SRS-PUCCH-PUSCH*, additional interruption is allowed on SRS/PUCCH/PUSCH of active serving cells when colliding with RACH transmission on PUCCH SCell. Interruption occurs on the symbols containing SRS/PUCCH/PUSCH, which overlap with the duration of the PRACH preamble [3] transmitted on the PUCCH SCell.

#### 8.2.3.2.20 Interruptions at OD-SSB activation/deactivation

The requirements in this clause shall apply for the UE configured with E-UTRA PSCell and one SCell.

When OD-SSB on one deactivated SCell in MCG is activated or deactivated the UE is allowed an interruption on any serving cell in MCG, provided that the OD-SSB activation/deactivation command and SCell activation/deactivation command are not received at the same time:

- of up to X2 slots, if the active serving cell is not in the same band as any of the SCells on which OD-SSB is being activated or deactivated, or
- of up to Y2 slots if the active serving cells are in the same band as any of the SCells on which OD-SSB is being activated or deactivated, provided the cell specific reference signals from the active serving cells and the SCells on which OD-SSB is being activated or deactivated are available in the same slot.

Where X2 and Y2 are specified in table 8.2.3.2.20-1.

**Table 8.2.3.2.20-1: Interruption length X2 and Y2 at OD-SSB activation/deactivation**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X2 (slots) | | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 1 | | 1 |
| 1 | 0.5 | 1 | | 1 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 2 | 2 |
| | | Either aggressor cell or victim cell is on FR1 | 3 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 4 | 4 |
| | | Aggressor cell is on FR1 | 5 | |

## 8.2.4 NR-DC: Interruptions

### 8.2.4.1 Introduction

This clause contains the requirements related to the interruptions on PCell, PSCell and activated SCell if configured, when

- up to 1 SCell in FR1 and up to 7 SCell(s) in FR2 are configured, deconfigured, activated or deactivated when UE is operating in NR-DC (FR1+FR2), or
- up to [4] SCell(s) in FR1 are configured, deconfigured, activated or deactivated when UE is operating in NR-DC (FR1+FR1), or
- a supplementary UL carrier or an UL carrier is configured or de-configured, or
- measurements on SCC with deactivated SCell in NR SCG, or
- measurements on the deactivated PSCell in NR SCG, or
- UL/DL BWP is switched on PCell, PSCell or SCell, or
- UE-specific CBW is changed on PCell, PSCell or SCell, or
- transitions between active and non-active during DRX, or
- transitions from non-DRX to DRX, or
- CGI reading of an NR neighbour cell with autonomous gaps, or
- CGI reading of an E-UTRA neighbour cell with autonomous gaps, or
- NR SRS carrier based switching, or
- NR SRS antenna port switching, or
- RLM/BFD Measurement on deactivatd NR PSCell, or
- NR SCell is activated based on aperiodic CSI-RS, or
- PDCCH ordered RACH on target cell in LTM, or
- PSCell cell switch.

NOTE: interruptions at SCell addition/release, activation/deactivation and during measurements on SCC may not be required by all UEs.

The interruptions shall not interrupt RRC signalling or ACK/NACKs related to RRC reconfiguration procedure [2] for SCell addition/release or MAC control signalling [17] for SCell activation/deactivation command.

The requirements shall apply for NR-DC with an NR PCell, PSCell or SCell.

For a UE which does not support per-FR measurement gap, interruptions to the PCell and activated SCell may be caused by SCells on any frequency range. For a UE which supports per-FR gaps, interruptions to PCell, PSCell and activated SCell may be caused by SCells on the same frequency range as the victim cell.

## 8.2.4.2 Requirements

### 8.2.4.2.1 Interruptions at PSCell/SCell addition/release

When PSCell or one or more SCells is added or released using the same *RRCConnectionReconfiguration* message as defined in TS 38.331 [2], the UE is allowed an interruption on any activated serving cell during the RRC reconfiguration procedure as follows:

- of up to the duration shown in table 8.2.4.2.1-1, if the active serving cell is not in the same band as the PSCell or SCell being added or released, where the requirements for Sync apply for synchronous NR-DC, and for asynchronous NR-DC if the active serving cell is in the same CG as the PSCell or SCell being added or released, and the requirements for Async apply for asynchronous NR-DC if the active serving cell is not in the same CG as the PSCell or SCell being added or released, or

- of up to the duration shown in table 8.2.4.2.1-2, if the active serving cells are in the same band as the SCell being added or released, provided the cell specific reference signals from the active serving cells and the SCell being added or released are available in the same slot.

**Table 8.2.4.2.1-1: Interruption duration for PSCell/SCell addition/release for inter-band DC/CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots) | | |
|---|---|---|---|---|
| | | Sync | | Async |
| 0 | 1 | 1 | | 2 |
| 1 | 0.5 | 2 | | 3 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 4 | 5 |
| | | Either aggressor cell or victim cell is on FR1 | 5 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 8 | 9 |
| | | Aggressor cell is on FR1 | 9 | |
| 5 | 0.03125 | Aggressor cell is on FR1 | 33 | 33 |
| 6 | 0.015625 | Aggressor cell is on FR1 | 65 | 65 |

**Table 8.2.4.2.1-2: Interruption duration for SCell addition/release for intra-band DC/CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 1 | 0.5 | 2 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 2 | 0.25 | 4 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 3 | 0.125 | 8 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 5 | 0.03125 | 32+ $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 6 | 0.015625 | 64+ $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |

NOTE 1: $T_{SMTC_duration}$ measured in subframes is
- the longest SMTC duration among all above active serving cells and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added, $T_{SMTC\ duration}$ for the SCell being added is 0ms;
- the longest SMTC duration among all active serving cells in the same band when one SCell is released.

NOTE 2: $N_{slot}^{subframe,\mu}$ is as defined in TS 38.211 [6].

### 8.2.4.2.2 Interruptions at SCell activation/deactivation

When a SCell is activated or deactivated as defined in TS 37.340 [17], the UE is allowed an interruption on any active serving cell:

- of up to the duration shown in table 8.2.4.2.2-1, if the active serving cell is not in the same band as any of the SCells being activated or deactivated, where the requirements for Sync apply for synchronous NR-DC, and for asynchronous NR-DC if the active serving cell is in the same CG as all the SCells being activated, and the requirements for Async apply for asynchronous NR-DC if the active serving cell is not in the same CG as any of the SCells being activated, or

- of up to the duration shown in table 8.2.4.2.2-2, if the active serving cells are in the same band as any of the SCells being activated or deactivated provided the cell specific reference signals from the active serving cells and the SCells being activated or deactivated are available in the same slot.

**Table 8.2.4.2.2-1: Interruption duration for SCell activation/deactivation for inter-band DC/CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots) | | |
|---|---|---|---|---|
| | | Sync | | Async |
| 0 | 1 | 1 | | 2 |
| 1 | 0.5 | 1 | | 2 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 2 | 3 |
| | | Either aggressor cell or victim cell is on FR1 | 3 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 4 | 5 |
| | | Aggressor cell is on FR1 | 5 | |
| 5 | 0.03125 | Aggressor cell is on FR1 | 17 | 17 |
| 6 | 0.015625 | Aggressor cell is on FR1 | 33 | 33 |

**Table 8.2.4.2.2-2: Interruption duration for SCell activation/deactivation for intra-band DC/CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 1 | 0.5 | 1 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 2 | 0.25 | 2 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 3 | 0.125 | 4 + $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 5 | 0.03125 | 16+ $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |
| 6 | 0.015625 | 32+ $T_{SMTC_duration}$ * $N_{slot}^{subframe,\mu}$ |

NOTE 1: $T_{SMTC_duration}$ measured in subframes is
- the longest SMTC duration among all above active serving cells and the SCell being activated when one SCell is activated. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC\ duration}$ for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated, $T_{SMTC\ duration}$ for the SCell being activated is 0ms;
- the longest SMTC duration among all active serving cells in the same band when one SCell is deactivated.

NOTE 2: $N_{slot}^{subframe,\mu}$ is as defined in TS 38.211 [6].

### 8.2.4.2.3 Interruptions during measurements on SCC

Interruption on PCell, PSCell and other activated SCell(s) during measurement on the deactivated NR SCC shall meet requirements in clause 8.2.2.2.3, where the term PCell in clause 8.2.2.2.3 shall be deemed to be replaced with SpCell.

#### 8.2.4.2.4 Interruptions at UL carrier RRC reconfiguration

The requirements in this clause shall apply when a supplementary UL carrier or an UL carrier is configured or de-configured in NR-DC as defined in TS 38.331 [2].

When an UL carrier or supplementary UL carrier is configured or de-configured, an interruption of up to the duration shown in table 8.2.4.2.4-1, is allowed during the RRC reconfiguration procedure in TS 38.331 [2] on all the other activated serving cells within the same FR as the reconfigured uplink carrier. The interruption is for both uplink and downlink of all the other serving cells within the same FR as the configured or de-configured UL.

**Table 8.2.4.2.4-1: Interruption duration for UL carrier RRC reconfiguration**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 2 |
| 2 | 0.25 | 4 |
| 3 | 0.125 | 8 |
| 5 | 0.03125 | 32 |
| 6 | 0.015625 | 64 |

#### 8.2.4.2.5 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based BWP switch, timer-based BWP switch or UL BWP switch triggered by consistent uplink CCA failures and RRC based in this clause apply to the case that the BWP switch is performed on a single CC or multiple CCs.

When either of the DCI-based, timer-based or RRC-based downlink BWP switch and/or uplink BWP switch occur on multiple CCs simultaneously or over partially overlapping period, the interruption requirements described in this clause apply for each BWP switch.

When UE receives a DCI indicating the UE to switch its active BWP, or when a BWP timer *bwp-InactivityTimer* defined in TS 38.331 [2] expires, or when the UE receives an RRC command indicating the UE to switch its active BWP or when UL BWP switch is triggered by consistent uplink CCA failures,, the UE is allowed to cause an interruption on any other serving cells as defined in clause 8.2.2.2.5. In addition to what is defined in clause 8.2.2.5, when RRC-based BWP switch occurs on multiple CCs over partially overlapping period, the interruption is only allowed within the delay $T_{RRCprocessingDelay} + T_{Waiting} + T_{BWPswitchDelayRRC} + D_{RRC}*(M-1)$ as defined in clause 8.6.3A.3. Besides, in asynchronous scenario the UE is allowed an additional interrupt of 1 slot length.

#### 8.2.4.2.6 Interruptions at transitions between active and non-active during DRX

When PCell is in non-DRX and PSCell is in DRX, interruptions on PCell and the activated SCell in MCG if configured due to transitions from active to non-active and from non-active to active during PSCell DRX are allowed with up to 1 % probability of missed ACK/NACK when the configured PSCell DRX cycle is less than 640 ms, and 0.625 % probability of missed ACK/NACK is allowed when the configured PSCell DRX cycle is 640 ms or longer. Each interruption shall not exceed X slots as defined in table 8.2.4.2.6-1.

When PSCell is in non-DRX and PCell is in DRX, interruptions on PSCell on the activated SCell in SCG if configured due to transitions from active to non-active and from non-active to active during PCell DRX are allowed with up to 1 % probability of missed ACK/NACK when the configured PCell DRX cycle is less than 640 ms, and 0.625 % probability of missed ACK/NACK is allowed when the configured PCell DRX cycle is 640 ms or longer. Each interruption shall not exceed X slots as defined in table 8.2.4.2.6-1.

**Table 8.2.4.2.6-1: Interruption length X at transition between active and non-active during DRX**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) | |
|---|---|---|---|
| | | Sync | Async |
| 0 | 1 | 1 | 2 |
| 1 | 0.5 | 1 | 2 |
| 2 | 0.25 | 3 | |
| 3 | 0.125 | 5 | |
| 5 | 0.03125 | 17 | |

| | | |
|---|---|---|
| 6 | 0.015625 | 33 |

When both PCell and PSCell are in DRX, no interruption is allowed.

#### 8.2.4.2.7 Interruptions at transitions from non-DRX to DRX

Interruption on PCell and the activated SCell in MCG if configured due to PSCell transitions from non-DRX to DRX when PCell is in non-DRX shall not exceed X slots as defined in table 8.2.4.2.6-1.

Interruption on PSCell and the activated SCell in SCG if configured due to PCell transitions from non-DRX to DRX when PSCell is in non-DRX shall not exceed X slots as defined in table 8.2.4.2.6-1.

#### 8.2.4.2.8 Interruptions at SCell activation/deactivation with multiple downlink SCells

The requirements in this clause shall apply for the UE configured with NR-DC and up to 1 downlink SCell in FR1 and up to 7 downlink SCell(s) in FR2.

When multiple SCell are activated or deactivated by one single MAC CE command in MCG or SCG, the UE is allowed an interruption on any serving cell in MCG or SCG as specified in clause 8.2.4.2.2.

When multiple SCell are activated or deactivated in both MCG and SCG by two MAC CE commands respectively, the UE is allowed an interruption:

- on any serving cell in MCG as specified in clause 8.2.4.2.2, and
- on any serving cell in SCG as specified in clause 8.2.4.2.2.

#### 8.2.4.2.9 Interruptions at NR SRS carrier based switching

SRS transmission can be configured on a carrier not configured for PUCCH/PUSCH transmission. When a UE needs to transmit periodic, semi-persistent or aperiodic SRS on a carrier of a serving cell not configured for PUCCH/PUSCH transmission, the UE can perform carrier based switching to one or more carriers not configured for PUCCH/PUSCH transmission from a carrier with PUCCH/PUSCH transmission or from a carrier not configured for PUCCH/PUSCH transmission prior to transmitting SRS, provided that:

- switching is from a configured carrier to another activated carrier;
- the carrier of SCells not configured for PUCCH/PUSCH transmission to which SRS carrier based switching is performed is indicated by DCI SRS request field for aperiodic SRS transmission, or indicated by MAC-CE for semi-persistent SRS transmission, or configured via RRC for periodic SRS transmission;
- the serving cell, from which SRS carrier based switching is performed and whose UL transmission may therefore be interrupted, is indicated by srs-SwitchFromServCellIndex and srs-SwitchFromCarrier in TS 38.331 [2];
- the SRS switching is not colliding with any other transmission with higher priority defined in TS 38.214 [26];
- the SRS switching is not colliding with any SSB/CSI-RS based L3 measurements and the measurements for RLM/BFD in the same CG.- for UE, which does not support simultaneous reception and transmission for inter-band TDD CA specified in TS 38.331 [2], and is compliant to the requirements for inter-band CA with uplink in one NR band and without simultaneous Rx/Tx specified in TS 38.101-3 [20], the SRS transmission are not simultaneously scheduled with DL SSB/CSI-RS for L3 or L1 measurements transmission on other carriers.

The UE shall not perform SRS carrier based switching if the above conditions cannot be met.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell if UE is not capable of per-FR gap, or on active serving cell(s) in FR1 if UE is capable of per-FR gap, during the switching to the carrier of a serving cell in FR1 not configured for PUCCH/PUSCH transmission,

- with up to X1 slots as specified in table 8.2.4.2.9-1.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell if UE is not capable of per-FR gap, or on active serving cell(s) in FR2 if UE is capable of per-FR gap, during the switching to the carrier of a serving cell in FR2 not configured for PUCCH/PUSCH transmission,

- with up to X2 slots as specified in table 8.2.4.2.9-2.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell if UE is not capable of per-FR gap, or on active serving cell(s) in FR1 if UE is capable of per-FR gap, during the switching from the carrier of a serving cell in FR1 not configured for PUCCH/PUSCH transmission,

- with up to X1 slots as specified in table 8.2.4.2.9-1.

When SRS carrier based switching is performed between carriers, the UE is allowed interruptions on any active serving cell if UE is not capable of per-FR gap, or on active serving cell(s) in FR2 if UE is capable of per-FR gap, during the switching from the carrier of a serving cell in FR2 not configured for PUCCH/PUSCH transmission,

- with up to X2 slots as specified in table 8.2.4.2.9-2.

**Table 8.2.4.2.9-1: Interruption length X1 (slots)**

| $\mu$ | NR Slot length (ms) of victim cell | SRS carrier switching time (us)[Note 1] | Interruption length X1 (slots) Sub carrier spacing for aggressor cell (kHz) | |
|---|---|---|---|---|
| | | | 15 | 30 |
| 0 | 1 | ≤ 200 | 2 | 2 |
| | | 300, 500 | 2 | 2 |
| | | 900 | 3 | 3 |
| 1 | 0.5 | ≤ 200 | 3 | 2 |
| | | 300, 500 | 3 | 3 |
| | | 900 | 4 | 4 |
| 2 | 0.25 | ≤ 200 | 4 | 3 |
| | | 300, 500 | 5 | 4 |
| | | 900 | 7 | 6 |
| 3 | 0.125 | ≤ 200 | 7 | 5 |
| | | 300, 500 | 9 | 7 |
| | | 900 | 12 | 10 |
| 5 | 0.03125 | ≤ 200 | 22 | 15 |
| | | 300, 500 | 31 | 24 |
| | | 900 | 44 | 37 |
| 6 | 0.015625 | ≤ 200 | 42 | 28 |
| | | 300, 500 | 61 | 47 |
| | | 900 | 87 | 73 |
| NOTE 1: NR SRS carrier switching time is UE capability indicated by higher layer parameter *SRS-SwitchingTimeNR*. | | | | |

**Table 8.2.4.2.9-2: Interruption length X2 (slots)**

| $\mu$ | NR Slot length (ms) of victim cell | SRS carrie switching time (us) [Note 1] | Interruption length X2 (slots) Sub carrier spacing for aggressor cell (kHz) | | | |
|---|---|---|---|---|---|---|
| | | | 60 | 120 | 480 | 960 |
| 0 | 1 | ≤ 200 | 2 | 2 | 2 | 2 |
| 1 | 0.5 | ≤ 200 | 2 | 2 | 2 | 2 |
| 2 | 0.25 | ≤ 200 | 3 | 3 | 2 | 2 |
| 3 | 0.125 | ≤ 200 | 4 | 4 | 3 | 3 |
| 5 | 0.03125 | ≤ 200 | 11 | 10 | 8 | 8 |
| 6 | 0.015625 | ≤ 200 | 21 | 18 | 15 | 15 |
| NOTE 1: NR SRS carrier switching time is UE capability indicated by higher layer parameter *SRS-SwitchingTimeNR*. | | | | | | |

For intra-band SRS carrier switching in FR1or FR2, interruptions in table 8.2.2.2.9-1 and in table 8.2.2.2.9-2 based on SRS carrier switching time ≤ 200μs shall apply. For inter-band SRS carrier switching in FR1, interruptions in table 8.2.2.2.9-1 and in table 8.2.2.2.9-2 shall apply.

### 8.2.4.2.10 Interruptions at direct SCell activation

When one or multiple SCell(s) are directly activated at SCell addition, the UE is allowed an interruption on any active serving cell:

- of up to the duration shown in table 8.2.4.2.1-1, if the active serving cell is not in the same band as the SCell being directly activated, where the requirements for Sync apply for synchronous NR-DC, and for asynchronous NR-DC if the active serving cell is in the same CG as the SCell being directly activated, and the requirements for Async apply for asynchronous NR-DC if the active serving cell is not in the same CG as the SCell being directly activated, or

- of up to the duration shown in table 8.2.4.2.1-2, if the active serving cells are in the same band as the SCell being directly activated provided the cell specific reference signals from the active serving cells and the SCell being directly activated are available in the same slot.

### 8.2.4.2.11 Interruptions when identifying CGI of an NR cell with autonomous gaps

When a UE is identifying CGI of an NR cell with autonomous gaps, the UE is allowed interruptions on PCell, PSCell or any activated SCell:

- with up to K1 interruptions with interrupted slots up to interruption length X1 specified in table 8.2.4.2.11-1 for each interruption during MIB decoding time period $T_{MIB}$ (ms) specified in clause 9.11.

- with up to L1 interruptions with interrupted slots up to interruption length Y1 specified in table 8.2.4.2.11-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11 for SSB and CORESET for RMSI scheduling multiplexing patterns 1.

- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in table 8.2.4.2.11-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11 for SSB and CORESET for RMSI scheduling multiplexing patterns 2 and 3.

Where:

- K1 = 6 for the target cell carrier frequency on FR1 and K1 = 25 for the target cell carrier frequency on FR2, and

- L1 = $T_{SIB1}/20$, and

- L2 = $T_{SIB1}/T_{SMTC}$, where $T_{SMTC}$ is the periodicity of the SMTC occasion configured for the target cell carrier.

**Table 8.2.4.2.11-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | Interruption length Y1 (slots) | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 6 | 7 | 6 |
| 1 | 0.5 | 12 | 13 | 10 |
| 2 | 0.25 | 24 | 25 | 19 |
| 3 | 0.125 | 48 | 49 | 37 |
| 5 | 0.03125 | 192 | 193 | 145 |
| 6 | 0.015625 | 384 | 385 | 289 |

### 8.2.4.2.12 Interruptions when identifying CGI of an E-UTRA cell with autonomous gaps

When a UE is identifying CGI of an E-UTRA FDD cell or E-UTRA TDD cell with autonomous gaps, within time period $T_{identify_CGI,\ E\text{-}UTRA}$ specified in clause 9.4.7.1, the UE shall be able to transmit at least the number of ACK/NACKs specified in table 8.2.4.2.12-1 on PCell, PSCell or any activated SCell in the frequency range where autonomous gaps are used, provided that:

- there is continuous DL data allocation,

- no DRX cycle is used,

- no measurement gaps are configured,

- only one code word is transmitted in each slot,

- 2 slot ACK/NACK feedback is configured,
- 20 ms SMTC period is configured.

**Table 8.2.4.2.12-1: Minimum number of ACK/NACKs transmitted by the UE during $T_{identify_CGI,\ E\text{-}UTRA}$**

| Minimum number of transmitted ACK/NACKs | Configuration of the serving cell in which the transmitted ACK/NACKs are counted | |
|---|---|---|
| | Duplex mode configuration | SCS |
| 84 | FDD | 15 kHz |
| 193 | FDD | 30 kHz |
| 402 | FDD | 60 kHz |
| 28 | TDD Note 1 | 15 kHz |
| 81 | TDD Note 1 | 30 kHz |
| 159 | TDD Note 1 | 60 kHz |
| 233 | TDD Note 2 | 60 kHz |
| 491 | TDD Note 2 | 120 kHz |
| NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [18].<br>NOTE 2: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-2 [19]. | | |

### 8.2.4.2.13 Interruptions due to SCell dormancy

#### 8.2.4.2.13.1 Interruptions due to SCell dormancy switch

When one SCell in MCG or SCG is switched from dormancy to non-dormancy or from non-dormancy to dormancy [7] when UE is in DRX active time,

- the UE is allowed an interruption on active serving cell in MCG and SCG as defined in clause 8.2.4.2.5, except that the interruption is allowed regardless of which parameters change between the dormant BWP and the non-dormant BWP
- The starting time of interruption shall be within the dormancy switching delay as defined in clause 8.6.2.

When multiple SCells in MCG or SCG are switched from dormancy to non-dormancy or vice versa when the UE is in DRX active time, the interruption requirement described above applies for each BWP switch.

#### 8.2.4.2.13.2 Interruptions due to CQI measurements during SCell dormancy

When one or more SCells are in dormancy, the UE is for the purpose of CQI measurements on the dormant SCell(s) allowed to cause interruptions to non-dormant serving cell(s).

The rate of ACK/NACK feedback loss on any non-dormant serving cell resulting from CQI measurements on dormant SCells shall not exceed 0.5 %.

#### 8.2.4.2.13.3 Interruptions due to RRM measurements during SCell dormancy

When one or more SCells are in dormancy, the UE is for the purpose of RRM measurements on the dormant SCell(s) allowed to cause interruptions to non-dormant serving cell(s).

The rate of ACK/NACK feedback loss on any non-dormant serving cell resulting from RRM measurements on dormant SCells shall not exceed 1.0 %.

### 8.2.4.2.14 Interruptions at NR SRS antenna port switching

The requirements in this clause are applicable to SRS antenna port switching on FR1 and SRS resource(s) is only configured within the last 6 symbols of a slot. For interruption caused by SRS antenna port switching, the victim cell is based on the entry number of the band indicated by *txSwitchImpactToRx* and/or *txSwitchWithAnotherBand* regardless of per-FR MG capability. An UL interruption is allowed on any of the serving cells as indicated in *txSwitchWithAnotherBand*, and a DL interruption is allowed on any of the serving cells as indicated in *txSwitchImpactToRx*..

The UE shall perform SRS antenna port switching only if the below conditions are met.

- the SRS switching is not colliding with any other UL transmission with higher priority defined in TS 38.214 [26] if the serving cell on which the higher priority transmission is performed is a victim cell based on *txSwitchWithAnotherBand* or is the same carrier on which SRS is transmitted.

- the SRS switching is not colliding with any NR measurements (i.e. SSB/CSI-RS based L1/L3 measurements) and the measurements for RLM/BFD/CBD if the serving cell on which the NR measurements and the measurements for RLM/BFD/CBD is performed is a victim cell based on *txSwitchImpactToRx* or is the same carrier on which SRS is transmitted.

No requirements are defined for SRS antenna port switching if aperiodic SRS switching is colliding with aperiodic L1-RSRP/L1-SINR measurements and the serving cell on which the aperiodic L1-RSRP/L1-SINR measurement is configured is indicated in *txSwitchImpactToRx* or is the same carrier on which aperiodic SRS is scheduled/configured.

When 1 SRS symbol is configured in a slot for SRS antenna switching and the aggressor and victim cells are synchronized, the interruption requirement in table 8.2.4.2.14-1 applies. When 1 SRS symbol is configured in a slot for SRS antenna switching and the aggressor and victim cells are asynchronized, the interruption requirement in table 8.2.4.2.14-2 applies. For the rest of SRS configurations, the interruption requirement in table 8.2.4.2.14-3 applies.

**Table 8.2.4.2.14-1: Interruption length in symbols of victim CC when 1 SRS symbol is configured, and aggressor and victim cells are synchronized**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 3 | 2 | 2 |
| 30 | 4 | 3 | 3 |
| 60 | 8 | 6 | 5 |
| 120 | 14 | 10 | 8 |

**Table 8.2.4.2.14-2: Interruption length in slots of victim CC when 1 SRS symbol is configured, and aggressor and victim cells are asynchronized**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 2 | 2 | 2 |
| 30 | 2 | 2 | 2 |
| 60 | 2 | 2 | 2 |
| 120 | 2 | 2 | 2 |

**Table 8.2.4.2.14-3: Interruption length in slots of victim CC for rest of the SRS configurations for synchronised and asynchronized scenarios**

| Victim cell SCS(kHz) | Aggressor cell SCS (kHz) | | |
|---|---|---|---|
| | 15 | 30 | 60 |
| 15 | 2 | 2 | 2 |
| 30 | 2 | 2 | 2 |
| 60 | 3 | 2 | 2 |
| 120 | 5 | 3 | 3 |

### 8.2.4.2.15 Interruptions at fast SCell activation

The requirements in this clause shall apply for the UE configured with one SCell when aperiodic CSI-RS resources is configured for fast SCell activation.

When one SCell in MCG or SCG is activated from deactivated, and aperiodic CSI-RS resources is configured for fast SCell activation, the UE is allowed an interruption on any active serving cell:

- of up to the duration shown in table 8.2.4.2.2-1, if the active serving cell is not in the same band as the SCell being activated, where the requirements for Sync apply for synchronous NR-DC, and for asynchronous NR-DC if the active serving cell is in the same CG as the SCell being activated, and the requirements for Async apply for asynchronous NR-DC if the active serving cell is not in the same CG as the SCell being activated, or

- of up to Y2 slots + $T_{ATRS_duration}$ if the active serving cells are in the same band as the SCell being activated, when
  - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is larger than 2400ms, or
  - SCell is unknown and belongs to FR1, and SCell is contiguous to an active serving cell in the same band.
- of up to Y2 slots if the active serving cells are in the same band as any of the SCells being activated, when
  - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is equal to or smaller than 2400ms, or
  - SCell to be activated belongs to FR2.

Where

- $T_{ATRS_duration}$ is CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots on the being activated SCell.
- Y2 are specified in table 8.2.3.2.4-2.

### 8.2.4.2.16 Interruptions at SCG activation/deactivation

When SCG is activated or deactivated using an *RRCConnectionReconfiguration* message as defined in TS 38.331 [2], the UE is allowed an interruption on any activated serving cell in MCG during the RRC reconfiguration procedure as follows:

- of up to the duration shown in table 8.2.4.2.16-1, if the active serving cell is not in the same band as the PSCell being activated or deactivated, where the requirements for Sync apply for synchronous NR-DC. The requirements for Async apply for asynchronous NR-DC.

**Table 8.2.4.2.16-1: Interruption duration for SCG activation/deactivation for inter-band DC/CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots) | | |
|---|---|---|---|---|
| | | Sync | | Async |
| 0 | 1 | 1 | | 2 |
| 1 | 0.5 | 2 | | 3 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2 | 4 | 5 |
| | | Either aggressor cell or victim cell is on FR1 | 5 | |
| 3 | 0.125 | Aggressor cell is on FR2 | 8 | 9 |
| | | Aggressor cell is on FR1 | 9 | |

### 8.2.4.2.17 Interruptions due to RRM measurements on deactivated SCG

If the UE is not configured with RLM or BFD on the deactivated PSCell, interruptions on PCell or activated SCell(s) due to measurements on the deactivated PSCell are allowed with up to 0.5 % probability of missed ACK/NACK feedback when the configured *measCyclePSCell* is 640 ms or longer. The UE is only allowed to cause interruptions on PCell or activated SCell(s) immediately before and immediately after an SMTC. Each interruption shall not exceed requirement in table 8.2.2.2.2-1.

If the UE is configured with RLM or BFD on the deactivated PSCell, the rate of ACK/NACK feedback loss on any active serving cell resulting from RRM measurements on the deactivated PSCell shall not exceed 1.0 %.

### 8.2.4.2.18 Interruptions during RLM/BFD measurements on deactivated PSCell

When PSCell is configured with *bfd-and-RLM* with value *true*, if NR PSCell is deactivated, the UE is for the purpose of RLM/BFD measurements on the deactivated PSCell allowed to cause interruptions to activated serving cell(s) which can either be PCell or SCell in MCG.

The rate of ACK/NACK feedback loss on any activated serving cell resulting from RLM/BFD measurements on deactivated PSCell shall not exceed 0.5 %.

### 8.2.4.2.19 Interruptions due to UE-specific CBW change

The requirements in clause 8.2.2.2.8 apply for this clause.

### 8.2.4.2.20 Interruptions due to PDCCH ordered RACH on target LTM cell

When PRACH transmission is triggered by PDCCH order on target LTM cell,

- During RACH transmission, the UE is allowed an interruption on activated serving cell's DL slot(s) overlapped with RACH occasion depending on UE capability *pdcch-RACH-AffectedBands-TargetBandList-r18*.
- Before and after PRACH transmission, UE is allowed an interruption on any activated serving cell as follows:
  - of up to the duration shown in table 8.2.4.2.20-1, if PRACH bandwidth is outside active UL BWP but within one of configured UL BWPs of any active serving cell, or
  - of up to ceil(Y/NR Slot length)+1 slots, where Yms as reported in *pdcch-RACH-Switching-TargetBandTimeList-r18*, if PRACH bandwidth is outside any of the configured UL BWPs.
  - of up to ceil((Y+1)/NR Slot length)+1 slots, where Yms as reported in *pdcch-RACH-Switching-TargetBandTimeList-r18*, if PRACH bandwidth is outside any of the configured UL BWPs of any active serving cell, and if the number of RRC-configured LTM cells whose PRACH resources are not fully contained in any of UE's configured UL BWP(s) of serving cell(s) is more than 2, and if UE is configured with SRS carrier switching.

**Table 8.2.4.2.20-1: Interruption duration due to PDCCH ordered RACH on target LTM cell when PRACH bandwidth is outside active UL BWP but within one of configured UL BWPs of any active serving cell**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X (slots) |
|---|---|---|
| 0 | 1 | 2 |
| 1 | 0.5 | 2 |
| 2 | 0.25 | 4 |
| 3 | 0.125 | 6 |

### 8.2.4.2.21 Interruptions at PSCell Cell switch

When PSCell cell switch is triggered using the LTM Cell Switch Command as defined in TS 38.321 [7], the UE is allowed an interruption of up to the duration shown in table 8.2.4.2.21-1 on any activated serving cell in MCG during the cell switch delay.

**Table 8.2.4.2.21-1: Interruption duration for PSCell cell switch for inter-band DC**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots) | | |
|---|---|---|---|---|
| | | Sync | | Async |
| 0 | 1 | 1 | | 2 |
| 1 | 0.5 | 2 | | 3 |
| 2 | 0.25 | Both aggressor cell and victim cell are on FR2-1 | 4 | 5 |
| | | Either aggressor cell or victim cell is on FR1 | 5 | |
| 3 | 0.125 | Aggressor cell is on FR2-1 | 8 | 9 |
| | | Aggressor cell is on FR1 | 9 | |

### 8.2.4.2.22 Interruptions at OD-SSB activation/deactivation

When OD-SSB is activated or deactivated on a deactivated SCell, the UE is allowed an interruption on any active serving cell, provided that the OD-SSB activation/deactivation command and SCell activation/deactivation command are not received at the same time:

- of up to the duration shown in table 8.2.4.2.22-1, if the active serving cell is not in the same band as any of the SCells on which OD-SSB is being activated or deactivated, where the requirements for Sync apply for synchronous NR-DC, and for asynchronous NR-DC if the active serving cell is in the same CG as all the SCells on which OD-SSB is being activated, and the requirements for Async apply for asynchronous NR-DC if the active serving cell is not in the same CG as any of the SCells on which OD-SSB is being activated, or

- of up to the duration shown in table 8.2.4.2.22-2, if the active serving cells are in the same band as any of the SCells on which OD-SSB is being activated or deactivated provided the cell specific reference signals from the active serving cells and the SCells on which OD-SSB is being activated or deactivated are available in the same slot.

**Table 8.2.4.2.22-1: Interruption duration for OD-SSB activation/deactivation for inter-band DC/CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots) | | |
|---|---|---|---|---|
| | | Sync | | Async |
| 0 | 1 | 1 | | 2 |
| 1 | 0.5 | 1 | | 2 |

## 8.2D Interruption for ATG UE

### 8.2D.1 Interruptions with Standalone NR Carrier Aggregation

#### 8.2D.1.1 Introduction

This clause contains the requirements related to the interruptions on PCell and activated SCell if configured to an ATG UE, when

- Single DL SCell is configured, de-configured, activated or deactivated, or

- UL/DL BWP is switched on PCell or DL BWP is switched on SCell, or

- CGI reading of an NR neighbour cell with autonomous gaps, or

- UE-specific CBW is changed on PCell or SCell, or
- NR SRS antenna port switching on PCell, or
- SCell is activated based on aperiodic CSI-RS.

NOTE: interruptions at SCell addition/release, activation/deactivation and during measurements on SCC may not be required by all UEs.

The interruptions shall not interrupt RRC signalling or ACK/NACKs related to RRC reconfiguration procedure according to TS 38.331 [2] for SCell addition/release or MAC control signalling according to TS 37.340 [17] for SCell activation/deactivation command.

## 8.2D.1.2 Requirements

### 8.2D.1.2.1 Interruptions at SCell addition/release

When one DL SCell is added or released using the same *RRCConnectionReconfiguration* message as defined in TS 38.331 [2], the ATG UE is allowed an interruption on any active serving cell during the RRC reconfiguration based SCell addition/release procedures as follows:

- of up to the interruption length specified in table 8.2D.1.2.1-1, if the active serving cells are contiguous to the SCell being added or released in the same FR1 band, provided the cell specific reference signals from the active serving cells and the SCell being added or released are available in the same slot or,
- of up to the interruption length sepcified in table 8.2D.1.2.1-2, if the active serving cell and the SCell being added or released are in a FR1 band pair.

**Table 8.2D.1.2.1-1: Interruption length for SCell addition/release for ATG intra-band contiguous CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 + $T_{SMTC_duration_ATG}$ * $N_{slot}^{subframe,\mu}$ |
| 1 | 0.5 | 2 + $T_{SMTC_duration_ATG}$ * $N_{slot}^{subframe,\mu}$ |
| NOTE 1: $T_{SMTC_duration_ATG}$ measured in subframes is<br>- the longest SMTC duration among all above active serving cells and the SCell being added when one SCell is added. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being added, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC_duration_ATG}$ for the SCell being added is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being added. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being added, $T_{SMTC_duration_ATG}$ for the SCell being added is 0ms;<br>- the longest SMTC duration among all active serving cells in the same band when one SCell is released.<br>NOTE 2: $N_{slot}^{subframe,\mu}$ is as defined in TS 38.211 [6]. | | |

**Table 8.2D.1.2.1-2: Interruption length for SCell addition/release for ATG inter-band CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 2 |

### 8.2D.1.2.2 Interruptions at SCell activation/deactivation

When an SCell is activated or deactivated as defined in TS 37.340 [17], the ATG UE is allowed an interruption on any active serving cell:

- of up to the interruption length specified in table 8.2D.18.2D.1.2.2-2, if the active serving cell and the SCell being activated or deactivated are in a FR1 band pair.

**Table 8.2D.1.2.2-1: Interruption length for SCell activation/deactivation for ATG intra-band contiguous CA**

| $\mu$ | NR Slot length (ms) | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 + $T_{SMTC_duration_ATG}$ * $N_{slot}^{subframe,\mu}$ |
| 1 | 0.5 | 1 + $T_{SMTC_duration_ATG}$ * $N_{slot}^{subframe,\mu}$ |
| NOTE 1: $T_{SMTC_duration_ATG}$ measured in subframes is<br>- the longest SMTC duration among all above active serving cells and the SCell being activated when one SCell is activated. If SSB configuration (*absoluteFrequencySSB*) but no SMTC configuration is provided for the SCell being activated, the SSB transmission periodicity is assumed to be 5ms and $T_{SMTC_duration_ATG}$ for the SCell being activated is x ms, where x = the number of consecutive subframes containing all SSBs in one SSB burst transmitted by the SCell being activated. If neither SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration is provided for the SCell being activated, $T_{SMTC_duration_ATG}$ for the SCell being activated is 0ms;<br>- the longest SMTC duration among all active serving cells in the same band when one SCell is deactivated.<br>NOTE 2: $N_{slot}^{subframe,\mu}$ is as defined in TS 38.211 [6]. | | |

**Table 8.2D.1.2.2-2: Interruption length for SCell activation/deactivation for ATG inter-band CA**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 1 |

### 8.2D.1.2.3 Interruptions during measurements on deactivated SCC

Interruptions on PCell due to measurements when an SCell is deactivated are allowed for an ATG UE with up to 0.5 % probability of missed ACK/NACK when the configured *measCycleSCell* [2] is 640 ms or longer.

- If the PCell is not in the same band as the deactivated SCell, the ATG UE is only allowed to cause interruptions on PCell immediately before and immediately after an SMTC. Each interruption shall not exceed requirement in table 8.2D.1.2.2-1 or,

- If the PCell is contiguous to the deactivated SCell in the same FR1 band, the ATG UE is allowed to cause an interruption on PCell no earlier than X slots before $T_{SMTC_duration_ATG}$ and no later than X slots after $T_{SMTC_duration_ATG}$, provided the cell specific reference signals from the active serving cells and the deactivated SCell are available in the same slot, where X and $T_{SMTC_duration_ATG}$ are given by table 8.2D.1.2.3-1. The interruption shall not exceed requirements in table 8.2D.1.2.3-1.

**Table 8.2D.1.2.3-1: Interruption duration for measurement on deactivated SCell for intra-band CA**

| $\mu$ | NR Slot length (ms) | X (slots) | Interruption length (slots) |
|---|---|---|---|
| 0 | 1 | 1 | 2 + $T_{SMTC_duration_ATG}$ * $N_{slot}^{subframe,\mu}$ |
| 1 | 0.5 | 1 | 2 + $T_{SMTC_duration_ATG}$ * $N_{slot}^{subframe,\mu}$ |
| NOTE 1: $T_{SMTC_duration_ATG}$ measured in subframes is the longest SMTC duration among all above active serving cells and the deactivated SCell to be measured;<br>NOTE 2: $N_{slot}^{subframe,\mu}$ is as defined in TS 38.211 [6]. | | | |

### 8.2D.1.2.4 Interruptions at direct SCell activation

When one SCell is directly activated at SCell addition, the ATG UE is allowed an interruption on any active serving cell:

- of up to the interruption length specified in table 8.2D.1.2.1-1, if the active serving cells are in the same band as the SCell being activated provided the cell specific reference signals from the active serving cells and the SCell being activated are available in the same slot or,

- of up to the interruption length specified in table 8.2D.1.2.1-2, if the active serving cell is not in the same band as the SCell being directly activated.

### 8.2D.1.2.5 Interruptions due to SCell dormancy

#### 8.2D.1.2.5.1 Interruptions due to SCell dormancy switch

When one SCell is switched from dormancy to non-dormancy or from non-dormancy to dormancy [7] when ATG UE is in DRX active time,

- the ATG UE is allowed an interruption on PCell as defined in clause 8.2D.1.2.7, except that the interruption is allowed regardless of which parameters change between the dormant BWP and the non-dormant BWP and,
- The starting time of interruption shall be within the dormancy switching delay as defined in clause 8.6D.2.

#### 8.2D.1.2.5.2 Interruptions due to CQI measurements during SCell dormancy

The requirements specified in clause 8.2.2.2.12.2 apply to ATG UE.

#### 8.2D.1.2.5.3 Interruptions due to RRM measurements during SCell dormancy

The requirements specified in clause 8.2.2.2.12.3 apply to ATG UE.

### 8.2D.1.2.6 Interruptions at fast SCell activation

The requirements in this clause shall apply for the ATG UE configured with PCell and one SCell when aperiodic CSI-RS resources is configured for fast SCell activation.

When one SCell in MCG configured with aperiodic CSI-RS resources is configured for fast SCell activation is activated from deactivated, the ATG UE is allowed an interruption on any active serving cell:

- of up to the interruption length specified in table 8.2D.1.2.2-2, if the active serving cell and the SCell being activated are in a FR1 band pair.

or

- of up to A slots +$T_{ATRS_duration_ATG}$, if the active serving cells are in the same band as any of the SCells being activated, when
  - SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is larger than 2400ms, or
  - SCell is unknown and belongs to FR1, and SCell is contiguous to an active serving cell in the same band.

or

- of up to A slots if the active serving cells are in the same band as any of the SCells being activated, when SCell to be activated is known and belongs to FR1, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.

Where:

- $T_{ATRS_duration_ATG}$ is CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots on the being activated SCell.
- A is specified in table 8.2D.1.2.6-1.

**Table 8.2D.1.2.6-1: Interruption length A at SCell activation/deactivation for ATG UE**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length A (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 1 |

### 8.2D.1.2.7 Interruptions due to Active BWP switching Requirement

The requirements for DCI-based BWP switch, timer-based BWP switch in this clause apply to the case that the BWP switch is performed on a single CC or multiple CCs.

When the DCI-based, timer-based or RRC-based downlink BWP switch occur on multiple CCs simultaneously or over partially overlapping period, the interruption requirements described in this clause apply for each BWP switch.

When ATG UE receives a DCI indicating UE to switch its active BWP involving changes in any of the parameters listed in table 8.2D.1.2.7-2, the ATG UE is allowed to cause interruption of up to X slots to other active serving cells. X is defined in table 8.2D.1.2.7-1. The starting time of interruption is only allowed within the BWP switching delay $T_{BWPswitchDelay}$ as defined in clause 8.6D.2 when BWP switch occurs on a single CC. The starting time of interruption caused by each BWP switch is only allowed within the BWP switch delay $T_{MultipleBWPswitchDelay}$ +Y as defined in clause 8.6D.2A.1 when BWP switch occurs on multiple CCs. Interruptions are not allowed during BWP switch involving any other parameter change.

When a BWP timer *bwp-InactivityTimer* defined in TS 38.331 [2] expires, the ATG UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in table 8.2D.1.2.7-2. X is defined in table 8.2D.1.2.7-1. The starting time of interruption is only allowed within the BWP switching delay $T_{BWPswitchDelay}$ as defined in clause 8.6D.2 when BWP switch occurs on a single CC. The starting time of interruption caused by each BWP switch is only allowed within the BWP switch delay $T_{MultipleBWPswitchDelay}$ as defined in clause 8.6D.2B.1 when BWP switch occurs on multiple CCs simultaneously or $T_{MultipleBWPswitchDelayTotal}$ as defined in clause 8.6D.2B.2 when BWP switch occurs on multiple CCs over partially overlapping time period. Interruptions are not allowed during BWP switch involving any other parameter change.

When ATG UE receives an RRC reconfiguration that only requests UE to switch its active BWP on one single CC, the ATG UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its active BWP involving changes in any of the parameters listed in table 8.2D.1.2.7-2. X is defined in table 8.2D.1.2.7-1. The interruption is only allowed within the delay $T_{RRCprocessingDelay}$ + $T_{BWPswitchDelayRRC}$ defined in clause 8.6D.3 when BWP switch occurs on a single CC. The interruption is only allowed within the delay $T_{RRCprocessingDelay}$ + $T_{BWPswitchDelayRRC}$ + $D_{RRC}$*(N-1) as defined in clause 8.6D.3A when BWP switch occurs on multiple CCs.

**Table 8.2D.1.2.7-1: Interruption length X**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 1 |

**Table 8.2D.1.2.7-2: Parameters which cause interruption other than SCS**

| Parameters | Comment |
|---|---|
| *locationAndBandwidth* | From TS 38.331 [2] |
| *nrofSRS-Ports* | |
| *maxMIMO-Layers-r16* | |

### 8.2D.1.2.8 Interruptions due to UE-specific CBW change

When an ATG UE receives an RRC reconfiguration that changes *offsetToCarrier* or *carrierBandwidth*, the ATG UE is allowed to cause interruption of up to X slots to other active serving cells due to switching its CBW. X is defined in table 8.2D.1.2.8-1. The interruption is only allowed within the delay $T_{RRCprocessingDelay}$ + $T_{CBWchangeDelayRRC}$ defined in clause 8.13D.

**Table 8.2D.1.2.8-1: interruption length X**

| $\mu$ | NR Slot length (ms) | Interruption length X (slots) |
|---|---|---|
| 0 | 1 | 1 |
| 1 | 0.5 | 1 |

### 8.2D.1.2.9 Interruptions when identifying CGI of an NR cell with autonomous gaps

When an ATG UE is identifying CGI of an NR cell with autonomous gaps, the ATG UE is allowed interruptions on PCell or any activated SCell:

- with up to K1 interruptions with interrupted slots up to interruption length X1 specified in table 8.2D.1.2.9-1 for each interruption during MIB decoding time period $T_{MIB}$ (ms) specified in clause 9.11D.
- with up to L1 interruptions with interrupted slots up to interruption length Y1 specified in table 8.2D.1.2.9-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11D for SSB and CORESET for RMSI scheduling multiplexing patterns 1.
- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in table 8.2D.1.2.9-1 for each interruption during SIB1 decoding time period $T_{SIB1}$ (ms) specified in clause 9.11D for SSB and CORESET for RMSI scheduling multiplexing patterns 2 and 3.

Where:

- K1 = 6 for the target cell carrier frequency on FR1, and
- L1 = $T_{SIB1}$/20and
- L2 = $T_{SIB1}/T_{SMTC}$, where $T_{SMTC}$ is the periodicity of the SMTC occasion configured for the target cell carrier.

**Table 8.2D.1.2.9-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | Interruption length Y1 (slots) | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 6 | 7 | 6 |
| 1 | 0.5 | 12 | 13 | 10 |

### 8.2D.1.2.10 Interruptions at NR SRS antenna port switching

The requirements in this clause are applicable to ATG UE SRS antenna port switching on FR1 and SRS resource(s) is only configured within the last 6 symbols of a slot. For interruption caused by SRS antenna port switching, the victim cell is based on the entry number of the band indicated by *txSwitchImpactToRx*. DL interruption is allowed on any of the serving cells as indicated in *txSwitchImpactToRx*.

The ATG UE shall perform SRS antenna port switching only if the below conditions are met.

- the SRS switching is not colliding with any NR measurements (i.e. SSB/CSI-RS based L1/L3 measurements) and the measurements for RLM/BFD/CBD if the serving cell on which the NR measurements and the measurements for RLM/BFD/CBD is performed is a victim cell based on *txSwitchImpactToRx* or is the same carrier on which SRS is transmitted.

No requirements are defined for SRS antenna port switching if aperiodic SRS switching is colliding with aperiodic L1-RSRP/L1-SINR measurements and the serving cell on which the aperiodic L1-RSRP/L1-SINR measurement is configured is indicated in *txSwitchImpactToRx* or is the same carrier on which aperiodic SRS is scheduled/configured.

When 1 SRS symbol is configured in a slot for SRS antenna switching, the interruption requirement in table 8.2D.1.2.10-1 applies. For the rest of SRS configurations, the interruption requirement in table 8.2D.1.2.10-2 applies.

**Table 8.2D.1.2.10-1: Interruption length in symbols of victim CC when 1 SRS symbol is configured**

| 15 | 2 | 2 |
| 30 | 2 | 2 |

# 8.3 SCell Activation and Deactivation Delay

## 8.3.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to activate at least one deactivated SCell and deactivate at least one activated SCell in EN-DC, or in standalone NR carrier aggregation, or in NE-DC, or in NR-DC.

The requirements shall apply for EN-DC, standalone NR carrier aggregation, NE-DC, and NR-DC.

## 8.3.2 SCell Activation Delay Requirement for Deactivated SCell

The requirements in this clause shall apply for the UE configured with at least one downlink SCell in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one SCell is being activated.

When the UE supporting *featureSetCombinationLowBandSwitching-r19* is configured with *LowBandCA-Switching-r19* in FR1, the following requirements apply for activation of SDL SCell, when the SDL SCell reference signals to be measured for SCell activation are fully or partially overlapped with the SDL SCell active periods based on the *switchingPattern-r19*. The requirements do not apply if none of the SDL SCell reference signals to be measured for SDL SCell activation are overlapping with SCell active periods of the *switchingPattern-r19*.

When the UE is configured with *LowBandCA-Switching-r19* and the SCell to be activated is an SDL SCell, upon receiving SCell activation command in slot *n*, the UE shall activate the configured *switchingPattern-r19* at slot $n + \frac{T_{HARQ}+3ms+T_{LBCA}}{NR\ slot\ length}$, where $T_{LBCA}$ = 1 ms is the UE processing delay for activating the *switchingPattern-r19*. If the $n+T_{HARQ}+6$ is the slot of SCell on-duration as per switching pattern, UE shall switch to SDL SCell by the end of slot $n+T_{HARQ}+5$. Otherwise, UE shall switch to the SDL SCell by end of the slot immediately prior to the first slot in the SCell on-duration based on the switching pattern.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot *n*, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot $n + \frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time}$ is the SCell activation delay in milliseconds.

If the SCell is known and belongs to FR1, $T_{activation_time}$ is:

- $T_{FirstSSB}+ T_{\Delta} + 5$ ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.
- $T_{FirstSSB_MAX} + T_{rs}+ T_{\Delta} + 5$ ms, if the measurement period of the SCell being activated is larger than 2400 ms.

If the SCell is unknown and belongs to FR1, and if one of the following conditions is met

- ‘ssb-PositionInBurst’ indicates only one SSB is being actually transmitted, or
- ‘ssb-PositionInBurst’ indicates multiple SSBs and TCI indication is provided in same MAC PDU with SCell activation,

provided that the side condition Ês/Iot ≥ -2 dB is fulfilled, $T_{activation_time}$ is:

- If UE supports *shortMeasInterval-r18*, then
  - $T_{FirstSSB_MAX, enhanced} + T_{SMTC_MAX, enhanced} + T_{rs, enhanced}$ + 5 ms, if the following conditions are met,
    - the SCell is contiguous to an active serving cell in the same band, and
    - its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
    - its SMTC offset is same as the one of contiguous FR1 active serving cell, and
    - its RTD with contiguous FR1 active serving cell is smaller than or equal to 260 ns with respect to the to-be-activated SCell's SSB numerology, and its reception power difference with contiguous FR1 active serving cell is smaller than or equal to 6 dB;
  - $T_{FirstSSB_MAX, enhanced} + T_{SMTC_MAX, enhanced} + 2*T_{rs, enhanced}$ + 5 ms, otherwise.
- Otherwise
  - $T_{FirstSSB_MAX} + T_{SMTC_MAX} + T_{rs}$ + 5 ms, if the following conditions are met,
    - the SCell is contiguous to an active serving cell in the same band, and
    - its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
    - its SMTC offset is same as the one of contiguous FR1 active serving cell, and
    - its RTD with contiguous FR1 active serving cell is smaller than or equal to 260 ns, and its reception power difference with contiguous FR1 active serving cell is smaller than or equal to 6 dB;
  - $T_{FirstSSB_MAX} + T_{SMTC_MAX} + 2*T_{rs} + T_{\Delta}$ + 5 ms, otherwise.

Otherwise, provided that the side condition Ês/Iot ≥ -2 dB is fulfilled, $T_{activation_time}$ is:

- If UE supports *shortMeasInterval-r18*, then
  - 6 ms + $T_{FirstSSB_MAX, enhanced} + T_{SMTC_MAX, enhanced} + T_{rs, enhanced} + T_{L1\text{-}RSRP, enhanced_measure} + T_{L1\text{-}RSRP, report} + T_{HARQ}$ + $\max(T_{uncertainty_MAC} + T_{FineTiming} + 2\text{ ms}, T_{uncertainty_SP})$, if semi-persistent CSI-RS is used for CSI reporting,
  - 3 ms + $T_{FirstSSB_MAX, enhanced} + T_{SMTC_MAX, enhanced} + T_{rs, enhanced} + T_{L1\text{-}RSRP, enhanced_measure} + T_{L1\text{-}RSRP ,report} + \max(T_{HARQ} + T_{uncertainty_MAC} + 5\text{ ms} + T_{FineTiming}, T_{uncertainty_RRC} + T_{RRC_delay})$, if periodic CSI-RS is used for CSI reporting.
- Otherwise
  - 6 ms + $T_{FirstSSB_MAX} + T_{SMTC_MAX} + T_{rs} + T_{\Delta} + T_{L1\text{-}RSRP, measure} + T_{L1\text{-}RSRP,report} + T_{HARQ}$ + $\max(T_{uncertainty_MAC} + T_{FineTiming} + 2\text{ ms}, T_{uncertainty_SP})$, if semi-persistent CSI-RS is used for CSI reporting,
  - 3 ms + $T_{FirstSSB_MAX} + T_{SMTC_MAX} + T_{rs} + T_{\Delta} + T_{L1\text{-}RSRP, measure} + T_{L1\text{-}RSRP,report} + \max(T_{HARQ} + T_{uncertainty_MAC} + 5\text{ ms} + T_{FineTiming}, T_{uncertainty_RRC} + T_{RRC_delay})$, if periodic CSI-RS is used for CSI reporting.
- However, when the following conditions are fulfilled, no activation requirement will be applied for this unknown SCell:
  - the SCell is contiguous to an active serving cell in the same band, and
  - A single SSB is used in the unknown SCell; or multiple SSBs are used in the SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and
  - its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
  - its SMTC offset is same as the one of contiguous FR1 active serving cell

- its RTD with contiguous FR1 active serving cell is larger than 260 ns, or its reception power difference with contiguous FR1 active serving cell is larger than 6 dB;

If the SCell being activated belongs to FR1 and if there is at least one active serving cell contiguous to the SCell on that FR1 band, if the UE is not provided with SSB configuration (*absoluteFrequencySSB*) or SMTC configuration for the target SCell, $T_{activation_time}$ is 3 ms for UE supporting *scellWithoutSSB*, provided

- The RTD between the target SCell and the contiguous active serving cell is within ±260ns, and
- The difference of the reception power with the contiguous active serving cell is <= 6 dB, and
- The RS(s) of SCell being activated is (are) QCL-TypeA with TRS(s) of the SCell being activated, and the TRS(s) of the SCell being activated is (are) further QCL-TypeC with SSB(s) of any active serving cell that is contiguous to the SCell being activated on that FR1 band.

For a UE supporting *scellWithoutSSB-InterBandCA-r18* if the SCell being activated belongs to FR1 and if the UE is not provided with SSB configuration (*absoluteFrequencySSB*) in the target SCell (FrequencyInfoDL) nor SMTC configuration for the target SCell, and if there is one collocated active reference serving cell on different FR1 band, when the following conditions are fulfilled,

- The RTD between the target SCell and the collocated reference serving cell is within CP where CP is corresponding to the SCS of SSB-less SCell, and
- The EPRE difference at the UE is smaller than or equal to 30 dB, where EPRE difference is the power difference between TRS/A-TRS symbol on the SSB-less SCell and SSB symbol on the reference serving cell normalized by SCSs of SSB of reference cell and A-TRS/P-TRS of SSB-less SCell, and
- The RS(s) of the SSB-less SCell being activated is (are) QCL-TypeA with TRS(s) of the SSB-less SCell being activated, and the TRS(s) of the SSB-less SCell being activated is (are) further QCL-TypeC with SSB(s) of an inter-band active serving cell, and the inter-band active serving cell shall be same as the reference serving cell.

where the reference serving cell can be indicated by higherlayer parameter *referenceCell-r18*. If UE is not indicated with *referenceCell-r18*, the reference serving cell is assumed to be the QCL-typeC source cell if there is only one active QCL-typeC source cell configured.

$T_{activation_time}$ is

- $T_{first_TRS} + T_{TRS}$ +5 ms, if aperiodic CSI-RS resources are not configured for SCell activation or UE do not support *aperiodicCSI-RS-FastScellActivation-r17*, when the EPRE difference at UE is smaller than or equal to 12 dB, or
- $T_{first_ATRS} + T_{gap} + T_{ATRS}$ + 5 ms if aperiodic CSI-RS resources are configured for SCell activation for UE supporting *aperiodicCSI-RS-FastScellActivation-r17*, when the EPRE difference at UE is smaller than or equal to 12 dB, or
- $T_{first_TRS} + 2*T_{TRS}$ +5 ms, when the EPRE difference at UE is larger than 12 dB but smaller than or equal to 30 dB.

For a UE supporting *scellWithoutSSB-InterBandCA-r18*, when UE receive SCell activation command for more than one SSB-less SCell, the SCell activation delay for each of the to-be-activated SSB-less SCell in FR1 is the same as the single SSB-less SCell activation delay, when

- SSB-less SCells being activated are on different bands, or
- all SCells being activated are SSB-less SCells, the SCells are contiguous on the same band, and all to-be-activated SCells have the same QCL-typeC QCL source cell.

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, then $T_{activation_time}$ is $T_{FirstSSB}$+ 5ms provided:

- the UE is provided with SMTC for the target SCell, and
- the SSBs in the serving cell(s) and the SSBs in the SCell fulfil the condition defined in clause 3.6.3, and
- the parameter ssb-PositionsInBurst is same for the serving cell(s) and the SCell, and

- SSB is in the same half-frame on the SCell and the contiguous FR2 active serving cell.

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, if the UE supporting *scellWithoutSSB* is not provided with any SMTC for the target SCell, $T_{activation_time}$ is 3 ms, provided

- the RS (s) of SCell being activated is (are) QCL-TypeD with RS (s) of one active serving cell on that FR2 band.

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, if *highSpeedMeasFlagFR2-r17* is configured for the FR2 power class 6 UE supporting *scellWithoutSSB* and *measEnhCAInterFreqFR2-r18*, $T_{activation_time}$ is 3 ms , provided

- the RS (s) of SCell being activated is (are) QCL-TypeD with RS (s) of one active serving cell on that FR2 band.

If the SCell being activated belongs to FR2 and if there is no active serving cell on that FR2 band provided that PCell or PSCell is in FR1 or in FR2:

If the target SCell is known to UE and semi-persistent CSI-RS is used for CSI reporting, then $T_{activation_time}$ is:

- 3 ms + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2 ms, $T_{uncertainty_SP}$), where $T_{uncertainty_MAC}$=0 and $T_{uncertainty_SP}$=0 if UE receives the SCell activation command, semi-persistent CSI-RS activation command and TCI state activation command at the same time.

If the target SCell is known to UE and periodic CSI-RS is used for CSI reporting, then $T_{activation_time}$ is:

- max($T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$, $T_{uncertainty_RRC}$ + $T_{RRC_delay}$-$T_{HARQ}$), where $T_{uncertainty_MAC}$=0 if UE receives the SCell activation command and TCI state activation commands at the same time.

If the PCell/PSCell and the target SCell are configured as FR1-FR2-1 CA or if the PCell/PSCell and the target SCell are in a FR2-1 band pair with independent beam management, and the target SCell is unknown to UE and semi-persistent CSI-RS is used for CSI reporting, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, then $T_{activation_time}$ is:

- 6 ms + $T_{FirstSSB_MAX}$ + 15*$T_{SMTC_MAX}$ + 8*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ + $T_{HARQ}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2 ms, $T_{uncertainty_SP}$), or

- 6 ms + $T_{FirstSSB_MAX,enhanced}$ + 15*$T_{SMTC_MAX,\ enhanced}$ + X1*$T_{rs,\ enhanced}$ + $T_{L1\text{-}RSRP,\ enhanced_measure}$ + $T_{L1\text{-}RSRP,\ report}$ + $T_{HARQ}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2 ms, $T_{uncertainty_SP}$) if UE supports *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* and/or *shortMeasInterval-r18* capabilities, and when SCell activation triggered L3 report is not configured or SCell activation triggered L3 report is configured but not reported.

If the PCell/PSCell and the target SCell are configured as FR1-FR2-2 CA or if the PCell/PSCell and the target SCell are in a FR2-2 band pair with independent beam management, and the target SCell is unknown to UE and semi-persistent CSI-RS is used for CSI reporting, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, then $T_{activation_time}$ is:

- 6 ms + $T_{FirstSSB_MAX}$ + 23*$T_{SMTC_MAX}$ + 12*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ + $T_{HARQ}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2 ms, $T_{uncertainty_SP}$).

If the PCell/PSCell and the target SCell are configured as FR1-FR2-1 CA or if the PCell/PSCell and the target SCell are in a FR2-1 band pair with independent beam management, and the target SCell is unknown to UE and periodic CSI-RS is used for CSI reporting, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, then $T_{activation_time}$ is:

- 3 ms + $T_{FirstSSB_MAX}$ + 15*$T_{SMTC_MAX}$ + 8*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ + max {($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$), ($T_{uncertainty_RRC}$ + $T_{RRC_delay}$)}, or

- 3 ms + $T_{FirstSSB_MAX,\ enhanced}$ + 15*$T_{SMTC_MAX,\ enhanced}$ + X1*$T_{rs,\ enhanced}$ + $T_{L1\text{-}RSRP,\ enhanced_measure}$ + $T_{L1\text{-}RSRP,\ report}$ + max {($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$), ($T_{uncertainty_RRC}$ + $T_{RRC_delay}$)} if UE supports *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* and/or *shortMeasInterval-r18* capabilities, and when SCell activation triggered L3 report is not configured or SCell activation triggered L3 report is configured but not reported.

If the PCell/PSCell and the target SCell are configured as FR1-FR2-2 CA or if the PCell/PSCell and the target SCell are in a FR2-2 band pair with independent beam management, and the target SCell is unknown to UE and periodic CSI-RS is used for CSI reporting, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, then $T_{activation_time}$ is:

- 3 ms + $T_{FirstSSB_MAX}$ + 23*$T_{SMTC_MAX}$ + 12*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ + max {($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$), ($T_{uncertainty_RRC}$ + $T_{RRC_delay}$)}.

where,

$T_{SMTC_MAX}$:

- In FR1, in case of intra-band contiguous SCell activation or in case of intra-band non-contiguous SCell activation for UE not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, $T_{SMTC_MAX}$ is the longer SMTC periodicity between active serving cells and SCell being activated provided the cell specific reference signals from the active serving cells and the SCells being activated or released are available in the same slot; in case of intra-band non-contiguous SCell activation for UE capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided or in case of inter-band SCell activation, $T_{SMTC_MAX}$ is the SMTC periodicity of SCell being activated.

- In FR1, in case of intra-band non-contiguous SCell activation for UE capable of *intraBandNR-CA-non-collocated-r19*,

  1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

    2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

      3> $T_{SMTC_MAX}$ is the SMTC periodicity of SCell being activated

    2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

      3> $T_{SMTC_MAX}$ is the longer SMTC periodicity between active serving cells and SCell being activated provided the cell specific reference signals from the active serving cells and the SCells being activated or released are available in the same slot

    2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

      3> $T_{SMTC_MAX}$ is the longer SMTC periodicity between active serving cells and SCell being activated provided the cell specific reference signals from the active serving cells and the SCells being activated or released are available in the same slot

  1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

    2> if *nonCollocatedTypeNR-CA-r18* is not provided

      3> $T_{SMTC_MAX}$ is the SMTC periodicity of SCell being activated

    2>else

      3> $T_{SMTC_MAX}$ is the longer SMTC periodicity between active serving cells and SCell being activated provided the cell specific reference signals from the active serving cells and the SCells being activated or released are available in the same slot

- In FR2, in case of intra-band SCell activation, $T_{SMTC_MAX}$ is the longer SMTC periodicity between active serving cells and SCell being activated provided that in Rel-15 only support FR2 intra-band CA; in case of FR2 inter-band SCell activation, $T_{SMTC_MAX}$ is the SMTC periodicity of SCell being activated.

- $T_{SMTC_MAX}$ is bounded to a minimum value of 10 ms.

$T_{SMTC_MAX,\ enhanced}$:

- In FR1 or FR2-1, a UE supporting *shortMeasInterval-r18* if the SMTC for SCell being activated is only configured in measObjectNR, $T_{SMTC_MAX,\ enhanced}$ is the SSB periodicity of SCell being activated. Otherwise, $T_{SMTC_MAX,\ enhanced} = T_{SMTC_MAX}$.

$T_{rs}$ is the SMTC periodicity of the SCell being activated if the UE has been provided with an SMTC configuration for the SCell in SCell addition message, otherwise $T_{rs}$ is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the measObjectNRs having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, Trs is the periodicity of one of the SMTC which is up to UE implementation. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement which involves $T_{rs}$ is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There are no requirements if the SSB transmission periodicity is not 5 ms.

$T_{rs,\ enhanced}$ is the SSB periodicity of the SCell being activated for a UE supporting *shortMeasInterval-r18* in FR1 or FR2-1, if the SMTC for SCell being activated is only configured in the *measObjectNR*. Otherwise, $T_{rs,\ enhanced} = T_{rs}$

$T_{\Delta}$ is the additional time for fine time tracking and acquiring full timing information of the SCell. $T_{\Delta} = 2*T_{rs}$ ms for SCell operating with 12 PRB SSB BW. Otherwise, $T_{\Delta} = 0$ ms.

$T_{FirstSSB}$: is the time to the end of the first complete SSB burst indicated by the SMTC, or within 5 ms if SMTC is not configured, after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$.

$T_{FirstSSB_MAX}$: Is the time to the end of the first complete SSB burst indicated by the SMTC, or within 5 ms if SMTC is not configured, after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, further fulfilling:

- In FR1, in case of intra-band contiguous SCell activation or in case of intra-band non-contiguous SCell activation for UE not capable of *intraBandNR-CA-non-collocated-r18* or UE is capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is provided, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of intra-band non-contiguous SCell activation for UE capable of *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided or in case of inter-band SCell activation, the first occasion when the SCell being activated is transmitting SSB burst.

- In FR1, in case of intra-band non-contiguous SCell activation for UE capable of *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3>the first occasion when the SCell being activated is transmitting SSB burst

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> the first occasion when the SCell being activated is transmitting SSB burst

2>else

3> the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot

- In FR2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.

$T_{FirstSSB_MAX,\ enhanced}$: For a UE supporting *shortMeasInterval-r18* in FR1 or FR2-1, if the SMTC for SCell being activated is only configured in the measObjectNR, $T_{FirstSSB_MAX,\ enhanced}$ is the time to the end of the first complete SSB burst indicated by the SSB periodicity of the SCell being activated, after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$. Otherwise, $T_{FirstSSB_MAX,\ enhanced} = T_{FirstSSB_MAX}$

When the UE is configured with *LowBandCA-Switching-r19* in FR1, when the SCell to be activated is an SDL SCell:

- for each applicable SCell activation delay requirement, the definition of $T_{FirstSSB}$, $T_{FirstSSB_MAX}$, $T_{SMTC_MAX}$, and $T_{rs}$ in this section apply with the difference that only the SSBs and SMTCs that overlap with the SCell active periods according to the *switchingPattern* after slot n +$\frac{T_{HARQ}+3\ \text{ms}+T_{LBCA}}{NR\ slot\ length}$ are taken into account.

  $T_{FineTiming}$ is the time period between UE finish processing the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and the timing of first complete available SSB corresponding to the TCI state.

  X1 is equal to the reported value in *reduceForCellDetection* in FR2-1. Otherwise, if *reduceForCellDetection* is absent, X1 is 8.

  $T_{L1\text{-}RSRP,\ measure}$ is L1-RSRP measurement delay $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ or $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ based on applicability as defined in clause 9.5 assuming M=1 and $T_{Report}$=0.

  $T_{L1\text{-}RSRP,\ enhanced_measure}$ is

  - SSB based L1-RSRP measurement delay $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ based on applicability as defined in clause 9.5 assuming M=1 and $T_{Report}$=0; N is equal to the value reported by the UE in *reduceForSSB-L1-RSRP-Meas*. Otherwise, if *reduceForSSB-L1-RSRP-Meas* is absent, N= 8. Or,

  - CSI-RS based L1-RSRP measurement delay $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ based on applicability as defined in clause 9.5 assuming M=1 and $T_{Report}$=0.

  - If UE supports *shortMeasInterval-r18* capability, L1-RSRP measurement for $T_{L1\text{-}RSRP,\ enhanced_measure}$ can be performed based on non-DRX mode even if DRX is configured.

  $T_{L1\text{-}RSRP,\ report}$ is delay of acquiring CSI reporting resources.

  $T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to

  - SCell activation command for known case;

  - First valid L1-RSRP reporting for unknown case.

  $T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

  - SCell activation command for known case;

  - First valid L1-RSRP reporting for unknown case.

  $T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to

  - SCell activation command for known case;

  - First valid L1-RSRP reporting for unknown case.

  $T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

Longer delays for RRM measurement requirements, and in case of FR2 also SSB based RLM/BFD/CBD/L1-RSRP measurement requirements, can be expected during the cell detection time for unknown SCell activation.

When *absoluteFrequencySSB* is not configured in *DownlinkConfigCommon* for target SCell but SMTC for target SCell is configured, no requirement would be applied.

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

$T_{firstTRS}$: is the time to the end of the first complete periodic CSI-RS burst for SCell activation after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$. If multiple TRSs of the SSB-less SCell being activated are QCL-TypeC with SSBs of the reference serving cell, the TRS used for activation is the one QCL-typeC with the SSB associated with the active TCI for PDCCH/PDSCH DMRS in the reference serving cell.

$T_{TRS}$ is the periodicity of periodic CSI-RS burst used for SCell activation.

$T_{firstATRS}$: is the time to the end of the first complete aperiodic CSI-RS burst for SCell activation after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots.

$T_{ATRS}$ is the aperiodic CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots.

$T_{gap}$ is a gap length between two aperiodic CSI-RS bursts,

- at least 2 slots for 15 kHz and 30 kHz
- at least 3 slots for 60 kHz

SCell in FR1 is known if it has been meeting the following conditions:

- During the period equal to max(5*measCycleSCell, 5*DRX cycles) for FR1 before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable according to the cell identification conditions specified in clause 9.2 and 9.3.
- the SSB measured during the period equal to max(5*measCycleSCell, 5*DRX cycles) also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2 and 9.3.

Otherwise SCell in FR1 is unknown.

For the first SCell activation in FR2 bands, the SCell is known if it has been meeting the following conditions:

- During the period equal to 4 s for UE supporting power class 1/5 and 3 s for UE supporting power class 2/3/4 before UE receives the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and semi-persistent CSI-RS for CQI reporting (when applicable):
  - the UE has sent a valid L3-RSRP measurement report with SSB index, and
  - SCell activation command is received after L3-RSRP reporting and no later than the time when UE receives MAC-CE command for TCI activation
- During the period from L3-RSRP reporting to the valid CQI reporting, the reported SSBs with indexes remain detectable according to the cell identification conditions specified in clauses 9.2 and 9.3, and the TCI state is selected based on one of the latest reported SSB indexes.

Otherwise, the first SCell in FR2 band is unknown. The requirement for unknown SCell applies provided that the activation commands for PDCCH TCI, PDSCH TCI (when applicable), semi-persistent CSI-RS for CQI reporting (when applicable), and configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) are based on the latest valid L1-RSRP reporting.

If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the activation command, $T_{SMTC_Scell}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell being activated. $T_{SMTC_MAX}$ follows *smtc1* or *smtc2* according to the physical cell IDs of the target cells being activated and the active serving cells.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot slot n+1+$\frac{T_{HARQ}+3ms+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being activated, and $T_X$ is:

- 0, if $T_{activation_time}$ is 3 ms;
- $T_{FirstSSB}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB}$;
- $T_{FirstSSB_MAX}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB_MAX}$;
- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time}$ includes only $T_{FineTiming}$ and no $T_{FirstSSB_MAX;}$
- $T_{first_TRS}$, for FR1 inter-band SSB-less SCell activation scenario where $T_{activation_time}$ includes $T_{first_TRS}$;
- $T_{first_ATRS}$, for FR1 inter-band SSB-less SCell activation scenario where $T_{activation_time}$ includes $T_{first_ATRS}$.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

Note: The interruption requirements specified in this clause are not applicable to UE configured with *LowBandCA-Switching-r19*.

The requirements in this clause and requirements on interruption due to SCell activation in clause 8.2 apply provided that the SSB of the to-be-activated SCell is within the first active DL BWP of the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

## 8.3.2A SCell Activation Delay Requirement for Deactivated SCell based on measurement in IDLE/INACTIVE mode

The requirements in this clause shall apply for the UE configured with at least one downlink SCell in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one SCell is being activated.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot *n*, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot n + $\frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

$T_{activation_time}$ is the SCell activation delay in millisecond, which is defined as:

Requirements in this clause apply for the UE supporting *fastSCellActivationEarlyMeas-r19* if the SCell is unknown, provided:

- UE supports *measValidationReportEMR* and *measIdleValidityDuration-r18* is configured or,

- UE supports *measValidationReportReselectionMeasurements* and *measReselectionValidityDuration-r18* is configured or,

- UE supports *idleInactiveNR-MeasReport-r16*, and neither *measIdleValidityDuration-r18* nor *measReselectionValidityDuration-r18* is configured and *measIdleDuration-r16* has not expired at the moment of initiation of RRC state transition to CONNECTED mode,

The SCell is unknown if the corresponding known conditions specified in clause 8.3.2 are not met.

If the SCell belongs to FR1, $T_{activation_time}$ is $T_{FirstSSB_MAX} + T_{rs}$ + 5ms provided that the side condition $\hat{E}s/Iot \geq$ -2dB is fulfilled, if the following conditions are met:

- During the period equal to 5s for FR1 before the reception of the SCell activation command:

  - the UE has sent a measurement report with SSB index according to the reporting requirements in 4.7.3 or 5.8.3.

- the SSB measured is detectable from the earliest measurement to the end of the defined SCell activation latency (i.e., a valid CQI reporting)

  - If *measIdleValidityDuration-r18* or *measReselectionValidityDuration-r18* is configured, the earliest measurement refers to the time instance *measIdleValidityDuration-r18* or *measReselectionValidityDuration-r18* before Msg1 transmission.

  - If only *measIdleDuration-r16* is configured, the earliest measurement refers to the time instance when the UE obtained the configuration parameter.

  - the SSB measured remains detectable according to the IDLE/INACTIVE mode measurement conditions specified in 4.2 or the CA/DC measurement conditions specified in 4.4 when UE is in IDLE/INACTIVE state and

  - the SSB measured remains detectable according to the cell identification conditions specified in clause 9.2 and 9.3 when UE is in CONNECTED mode.

If the SCell belongs to FR2, provided that the side condition $\hat{E}s/Iot \geq$ -2dB is fulfilled, and if the following conditions are met:

- During the period equal to 4s for UE supporting power class 1/5 and 3s for UE supporting power class 2/3/4 before UE receives the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and semi-persistent CSI-RS for CQI reporting (when applicable):

  - the UE has sent a measurement report with SSB index according to the reporting requirements in 4.7.3 or 5.8.3.

- the SSB measured is detectable from the earliest measurement to the end of the defined SCell activation latency (i.e. a valid CQI reporting)

  - If *measIdleValidityDuration-r18* or *measReselectionValidityDuration-r18* is configured, the earliest measurement refers to the time instance *measIdleValidityDuration-r18* or *measReselectionValidityDuration-r18* before Msg1 transmission.

  - If only *measIdleDuration-r16* is configured, the earliest measurement refers to the time instance when the UE obtained the configuration parameter.

  - the SSB measured remains detectable according to the IDLE/ INACTIVE mode measurement conditions specified in 4.2 or the CA/DC measurement conditions specified in 4.4 when UE is in IDLE/INACTIVE state and

  - the SSB measured remains detectable according to the cell identification conditions specified in clause 9.2 and 9.3 when UE is in CONNECTED mode.

Then $T_{activation_time}$ is:

If the PCell/PSCell and the target SCell are configured as FR1-FR2-1 CA or if the PCell/PSCell and the target SCell are in a FR2-1 band pair with independent beam management, and the target SCell is

unknown to UE and semi-persistent CSI-RS is used for CSI reporting, provided that the side condition Ês/Iot ≥ -2dB is fulfilled, then $T_{activation_time}$ is:

- 3ms + $T_{FirstSSB_MAX}$ + 15*$T_{SMTC_MAX}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2ms, $T_{uncertainty_SP}$) where $T_{uncertainty_MAC}$=0 and $T_{uncertainty_SP}$=0 if UE receives the SCell activation command, semi-persistent CSI-RS activation command and TCI state activation command at the same time.

If the PCell/PSCell and the target SCell are configured as FR1-FR2-1 CA or if the PCell/PSCell and the target SCell are in a FR2-1 band pair with independent beam management, and the target SCell is unknown to UE and periodic CSI-RS is used for CSI reporting, provided that the side condition Ês/Iot ≥ -2dB is fulfilled, then $T_{activation_time}$ is:

- $T_{FirstSSB_MAX}$ + 15*$T_{SMTC_MAX}$ + max($T_{uncertainty_MAC}$ + 5ms + $T_{FineTiming}$, $T_{uncertainty_RRC}$ + $T_{RRC_delay}$- $T_{HARQ}$) where $T_{uncertainty_MAC}$=0 if UE receives the SCell activation command and TCI state activation commands at the same time.

Where:

$T_{FirstSSB_MAX}$, $T_{rs}$, $T_{SMTC_MAX}$, $T_{FineTiming}$ and $T_{RRC_delay}$ are same as that defined in clause 8.3.2.

$T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to SCell activation command, and the TCI state is selected based on one of the latest reported SSB indexes

$T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to SCell activation command, and the TCI state is selected based on one of the latest reported SSB indexes;

$T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to SCell activation command, the TCI state for semi-persistent CSI-RS is selected based on one of the latest reported SSB indexes.

## 8.3.3 SCell Deactivation Delay Requirement for Activated SCell

The requirements in this clause shall apply for the UE configured with at least one downlink SCell in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one SCell is being deactivated.

Upon receiving SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot $n + \frac{T_{HARQ}+3ms}{NR\ slot\ length}$.

When a UE supporting *featureSetCombinationLowBandSwitching-r19* is configured with *LowBandCA-Switching-r19* and the SCell to be deactivated is an SDL SCell, upon receiving SCell deactivation command in slot *n*, the UE shall deactivate the configured *switchingPattern-r19* at slot $n + \frac{T_{HARQ}+3\text{ms}+T_{LBCA}}{NR\ slot\ length}$, where $T_{LBCA}$ = 1 ms is the UE processing delay for deactivating the *switchingPattern-r19*. If UE is on PCell after completion of SCell deactivation, UE keeps staying on PCell. If UE is on SCell after completion of SCell deactivation, UE switches to PCell immediately by the end of slot n+ (($T_{HARQ}$+3ms+ $T_{LBCA}$)/slot-length).

The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot n+1+$\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being deactivated.

Upon expiry of the *sCellDeactivationTimer* in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot $n + \frac{3ms}{NR\ slot\ length}$. The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1 and not occur after slot n+1+ $\frac{3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being deactivated.

When a UE is configured with *LowBandCA-Switching-r19*, and the SCell to be deactivated is an SDL SCell, upon expiry of the *sCellDeactivationTimer* in slot *n*, the UE shall switch to PCell by the end of slot *n*+3+ceil((*gapDurationSCelltoPCell-r19*+3)/14).

Note: The interruption requirements specified in this clause are not applicable to UE configured with *LowBandCA-Switching-r19*.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

## 8.3.4 Direct SCell Activation at SCell addition

The requirements in this clause apply for UE being configured in the RRC reconfiguration message, TS 38.331 [2], with one SCell for which the parameter *sCellState* is set to *activated*. If the RRC reconfiguration message for direct SCell activation also configures PSCell addition or PSCell change, the direct SCell activation delay may be longer than the requirements defined in this clause.

When the UE supporting *featureSetCombinationLowBandSwitching-r19* and *directSCellActivation-r19* is configured with *LowBandCA-Switching-r19* in FR1, the following requirements apply for activation of SDL SCell, when the SDL SCell reference signals to be measured for SCell activation are fully or partially overlapped with the SDL SCell active periods based on the *switchingPattern-r19*. The requirements do not apply if none of the SDL SCell reference signals to be measured for SDL SCell activation are overlapping with SCell active periods of the *switchingPattern-r19*.

When the UE supports *directSCellActivation-r19* and is configured with *switchingPattern-r19* and the SCell to be activated is an SDL SCell, the UE shall activate the configured *switchingPattern-r19* at slot $n + \frac{T_{RRC_Process}}{NR\ slot\ length}$. If the n+$T_{RRC_Process}$ +2 is the slot of SCell on-duration as per switching pattern, UE shall switch to SDL SCell by the end of slot n+ $T_{RRC_Process}$ +1. Otherwise, UE shall switch to the SDL SCell by end of the slot immediately prior to the first slot in the SCell on-duration based on the switching pattern.

If the RRC reconfiguration message for direct SCell activation also configures TCI state information, the requirements in clause 8.3.2 based on that TCI state activation command is received at the same time as SCell activation command shall apply.

The UE shall configure the SCell in activated state upon successful completion of the RRC reconfiguration procedure within the specified delay. The UE shall be capable to transmit valid CSI report and apply actions for the directly activated SCell no later than in slot n + $\frac{N_{direct}}{NR\ slot\ length}$ ,

where:

- Slot n is the last slot overlapping with the PDSCH containing the RRC reconfiguration message,
- $N_{direct}$ = $T_{RRC_Process}$ + $T_1$ + $T_{activation_time}$ + $T_{CSI_Reporting}$ - 3 ms for the cases specified in clause 8.3.2 that TCI state is not indicated within $T_{activation_time}$; otherwise, $N_{direct}$ = $T_{RRC_Process}$ + $T_1$ + $T_{HARQ}$ + $T_{activation_time}$ + $T_{CSI_Reporting}$
  - $T_{RRC_Process}$: RRC procedure delay as specified in clause 11.2 of TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC procedure delay defined in clause 12 of TS 38.331 [2],
  - $T_1$: Delay from slot $n + \frac{T_{RRC_Process}}{NR\ slot\ length}$ until the transmission of *RRCReconfigurationComplete* message,

NOTE: $T_1$ is UE implementation dependent.

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],

For the UE supporting *fastSCellActivationEarlyMeas-r19*, if target SCell is unknown, $T_{activation_time}$ is specified in 8.3.2A provided the following conditions are met:

- UE supports *measValidationReportEMR* and *measIdleValidityDuration-r18* is configured or,
- UE supports *measValidationReportReselectionMeasurements* and *measReselectionValidityDuration-r18* is configured or,
- UE supports idleInactiveNR-*MeasReport-r16*, and neither *measIdleValidityDuration-r18* nor *measReselectionValidityDuration*-r18 is configured and *measIdleDuration*-r16 has not expired at the moment of initiation of RRC state transition to CONNECTED mode,

Otherwise:

- Otherwise, $T_{activation_time}$ and $T_{CSI_Reporting}$ are specified in clause 8.3.2, where the following definitions of $T_{FirstSSB}$ and $T_{FirstSSB_MAX}$ shall override the existing ones:

  - $T_{FirstSSB}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_Process}+T_1}{NR\ slot\ length}$

  - $T_{FirstSSB_MAX}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_{Process}}+T_1}{NR\ slot\ length}$

    - In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCell being activated is transmitting SSB burst.

    - In FR2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.

  When the UE is configured with *LowBandCA-Switching-r19* in FR1, when the SCell to be activated is an SDL SCell:

- for each applicable SCell activation delay requirement, the definition of $T_{FirstSSB}$, $T_{FirstSSB_MAX}$ in this section and the definition of $T_{SMTC_MAX}$, and $T_{rs}$ in section 8.3.2 apply with the difference that only the SSBs and SMTCs that overlap with the SCell active periods according to the *switchingPattern* after slot n +$\frac{T_{RRC_Process}}{NR\ slot\ length}$ are taken into account.

- If a UE supports, *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* and/or *shortMeasInterval-r18* capabilities, the reduced $T_{activation_time}$ specified in clause 8.3.2 when UE supports these capabilities is applicable for Direct SCell activation at SCell addition also.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.321 [7] for an SCell at the first opportunities for the corresponding actions once the SCell is activated.

The SCell in FR1 is known provided the following conditions are met for the SCell:

- During the last 5 seconds before the reception of the direct SCell configuration command:

  - the UE has sent a valid measurement report for the SCell being directly activated, and

  - the SSB measured remains detectable according to the cell identification conditions specified in clauses 9.2 and 9.3,

- the SSB measured during the period equal to [5] seconds also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2 and 9.3.

Otherwise, the SCell is unknown.

The SCell in FR2 is known provided it meets the corresponding conditions as defined in clause 8.3.2. Otherwise, the SCell is unknown.

The UE may be allowed to cause interruptions to serving cells on other component carriers during an interruption window, as specified in clause 8.2. The starting point of an interruption window on SpCell or any activated SCell shall not occur before slot $n$+1, and shall not occur after slot $n$+1+$\frac{T_{RRC_Process}+T_1+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology of the SCell being activated, and $T_X$ is:

- $T_{FirstSSB}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB}$;

- $T_{FirstSSB_MAX}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB_MAX}$;

- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time}$ includes $T_{FineTiming}$.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

Note: he interruption requirements specified in this clause are not applicable to UE configured with *LowBandCA-Switching-r19*.

Starting from the slot $n + \frac{T_{RRC_Process} + T_1}{NR\ slot\ length}$ until the UE has completed the direct SCell activation, the UE shall report CQI index = 0 (out of range) if the UE has available uplink resources to report CQI for the SCell.

## 8.3.5 Direct SCell Activation at Handover

The requirements in this clause apply for UE being configured in the RRC reconfiguration message, TS 38.331 [2], for handover with one SCell for which the parameter *sCellState* is set to *activated*.

The UE shall configure the SCell in activated state upon successful completion of the RRC reconfiguration procedure within the specified delay. The UE shall be capable to transmit valid CSI report and apply actions for the directly activated SCell no later than in slot n + $\frac{N_{direct}}{NR\ slot\ length}$ ,

Where:

- Slot n is the last slot overlapping with the PDSCH containing RRC reconfiguration message.
- $N_{direct} = T_{RRC_process} + T_{interrupt} + T_2 + T_3 + T_{activation_time} + T_{CSI_Reporting}$ - 3 ms for the cases specified in clause 8.3.2 that TCI state is not indicated within $T_{activation_time}$; otherwise, $N_{direct} = T_{RRC_process} + T_{interrupt} + T_2 + T_3 + T_{HARQ} + T_{activation_time} + T_{CSI_Reporting}$
- $T_{RRC_Process}$: RRC procedure delay as specified in clause 11.2 of TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC procedure delay defined in clause 12 of TS 38.331 [2],
- $T_{interrupt}$: Interruption time during handover as specified in clause 6.1.1,
- $T_2$: Delay from slot $n + \frac{T_{RRC_Process} + T_{interrupt}}{NR\ slot\ length}$ until UE has obtained a valid TA command for the target PCell,
- $T_3$: Delay for applying the received TA for uplink transmission in the target PCell, and greater than or equal to k+1 slot, where k is defined in clause 4.2 in TS 38.213 [3],
- $T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],
- If the SCell is known and belongs to FR1, $T_{CSI_Reporting}$ is specified in clause 8.3.2 and $T_{activation_time}$ is defined as:
  - $T_{FirstSSB}$ + 5 ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.
  - $T_{FirstSSB_MAX} + T_{rs}$ + 5 ms, if measurement period of the SCell being activated is larger than 2400 ms.

    where,

    the measurement period in table 9.2.5.2-1 applies if the target SCell was in an intra-frequency layer corresponding to an activated SCell;

    the measurement period in table 9.2.5.2-3 applies if the target SCell was in an intra-frequency layer corresponding to a deactivated SCell;

    the measurement period in table 9.3.5-1 applies if the target SCell was in an inter-frequency layer.
- Otherwise, $T_{activation_time}$ and $T_{CSI_Reporting}$ are specified in clause 8.3.2, where the following definitions of $T_{FirstSSB}$ and $T_{FirstSSB_MAX}$ shall override the existing ones:
  - $T_{FirstSSB}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_Process} + T_{interrupt} + T_2 + T_3}{NR\ slot\ length}$
  - $T_{FirstSSB_MAX}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_{Process}} + T_{interrupt} + T_2 + T_3}{NR\ slot\ length}$

- In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCell being activated is transmitting SSB burst.
- In FR2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.

- If a UE supports, *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* and/or *shortMeasInterval-r18* capabilities, the reduced $T_{activation_time}$ specified in clause 8.3.2 when UE supports these capabilities is applicable for Direct SCell activation at handover also.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.321 [7] for an SCell at the first opportunities for the corresponding actions once the SCell is activated.

The SCell in FR1 is known provided the following conditions are met for the SCell:

- During the last 5 seconds before the reception of the direct SCell configuration command:
  - the UE has sent a valid measurement report for the SCell being directly activated, and
  - the SSB measured remains detectable according to the cell identification conditions specified in clauses 9.2 and 9.3,
  - the SSB measured during the period equal to [5] seconds also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2 and 9.3.

Otherwise, the SCell is unknown.

The SCell in FR2 is known provided it meets the corresponding conditions as defined in clause 8.3.2. Otherwise, the SCell is unknown.

The UE may be allowed to cause interruptions to PCell during an interruption window, as specified in clause 8.2. The starting point of an interruption window on PCell shall not occur before slot $n$+1+ $\frac{T_{RRC\ Processing}+T_{interrupt}+T_2+T_3}{NR\ slot\ length}$, and not occur after slot $n$+1+$\frac{T_{RRC\ Processing}+T_{interrupt}+T_2+T_3+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology of the SCell being activated, and $T_X$ is:

- $T_{FirstSSB}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB}$;
- $T_{FirstSSB_MAX}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB_MAX}$;
- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time}$ includes $T_{FineTiming}$.

The length of the interruption window depends on the frequency band relation between the aggressor SCell and the victim PCell.

Starting from the slot $n + \frac{T_{RRC_Process} + T_{interrupt}+T_2+ T_3}{NR\ slot\ length}$ and until the UE has completed the direct SCell activation, the UE shall report CQI index = 0 (out of range) if the UE has available uplink resources to report CQI for the SCell.

## 8.3.6 Direct SCell Activation at RRCResume

The requirements in this clause apply for UE being configured in the RRC reconfiguration message in TS 38.331 [2] for RRC Resume with one SCell for which the parameter *sCellState* is set to *activated*.

The requirements in clause 8.3.4 shall apply, except that the definition of $T_1$ shall be deemed to be replaced with

$T_1$: Delay from slot $n + \frac{T_{RRC_Process}}{NR\ slot\ length}$ until the transmission of RRCResumeComplete message,

## 8.3.7 SCell Activation Delay Requirement for Deactivated SCell with Multiple Downlink SCells

The requirements in this clause shall apply for the UE configured with more than one downlink SCells.

In EN-DC, NE-DC, standalone NR carrier aggregation, or in one CG of NR-DC, the requirements in this clause shall apply when the following conditions are met:

- UE only receives one single MAC command for multiple SCell activation within the activation period defined in this clause
- in each single CG, there are no other SCell activation, deactivation, addition or release before activation is completed for all the SCells activated by the single MAC CE in this clause, and
- in EN-DC and NE-DC, there are no E-UTRAN SCell activation, deactivation, addition or release before multiple SCell activation is completed in this clause, and
- any to-be-activated unknown SCell has active serving cell(s) or known to-be-activated SCell(s) on the same band

In two CGs of NR-DC, the requirements in this clause shall apply when the following conditions are met:

- UE receives one MAC command per CG for multiple SCell activation within the activation period defined in this clause, and
- UE supports per-FR measurement gap capability, and
- any to-be-activated unknown SCell has active serving cell(s) or known to-be-activated SCell(s) on the same band

The delay within which the UE shall be able to activate the deactivated SCell with other downlink to-be-activated SCell(s) depends upon the specified conditions.

Upon receiving SCell activation command in slot *n* for more than one SCell, for each of the to-be-activated SCell, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot $n + \frac{T_{HARQ}+T_{activation_time_multiple_scells}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time_multiple_scells}$ is the target SCell activation delay in milliseconds in multiple SCell activation scenario.

If the SCell is known and belongs to FR1 and the measurement period of the SCell being activated is equal to or smaller than 2400ms, $T_{activation_time_multiple_scells}$ is:

- $T_{FirstSSB_MAX_multiple_scells} + T_{rs}$ + 5ms, if on the same band UE also has at least one parallel to-be-activated SCell which is FR1 known SCell with the measurement period larger than 2400ms but does not have any parallel to-be-activated SCell which is FR1 unknown SCell.
- $T_{FirstSSB_MAX_multiple_scells} + T_{SMTC_MAX_multiple_scells} + T_{rs}$ + 5ms, if on the same band UE also has at least one parallel to-be-activated SCell which is FR1 unknown SCell
- otherwise, $T_{FirstSSB_MAX_multiple_scells}$ + 5ms.

If the SCell is known and belongs to FR1 and the measurement period of the SCell being activated is larger than 2400 ms, $T_{activation_time_multiple_scells}$ is:

- $T_{FirstSSB_MAX_multiple_scells} + T_{SMTC_MAX_multiple_scells} + T_{rs}$ + 5ms, if on the same band UE also has at least one parallel to-be-activated SCell which is FR1 unknown SCell
- otherwise, $T_{FirstSSB_MAX_multiple_scells} + T_{rs}$ + 5 ms

If the SCell is unknown and belongs to FR1, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, $T_{activation_time_multiple_scells}$ is:

- $T_{FirstSSB_MAX_multiple_scells} + T_{SMTC_MAX_multiple_scells} + T_{rs}$ +5 ms, if the SCell is not counted in $N_1$
  - The activation delay may be longer if SSB is not in the same half-frame on the SCell and the contiguous FR1 known cell or contiguous FR1 active serving cell

otherwise

- if the following conditions are met

- 'ssb-PositionInBurst' indicates only one SSB is being actually transmitted, or
- 'ssb-PositionInBurst' indicates multiple SSBs and TCI indication is provided in same MAC PDU with SCell activation,

- $T_{activation_time_multiple_scells}$ is:
  - $T_{FirstSSB_MAX_multiple_scells} + T_{SMTC_MAX_multiple_scells} + T_{rs} * N_1 + T_{rs} + 5$ ms,
- Otherwise:

  $T_{activation_time_multiple_scells}$ is:

  - 6 ms + $T_{FirstSSB_MAX_multiple_scells} + T_{SMTC_MAX_multiple_scells} + T_{rs} * N_1 + T_{L1\text{-}RSRP,measure} + T_{L1\text{-}RSRP,report} + T_{HARQ} + \max(T_{uncertainty_MAC_multiple_scells} + T_{FineTiming} + 2$ ms, $T_{uncertainty_SP_multiple_scells})$, if semi-persistent CSI-RS is used for CSI reporting,
  - 3 ms + $T_{FirstSSB_MAX_multiple_scells} + T_{SMTC_MAX_multiple_scells} + T_{rs} * N_1 + T_{L1\text{-}RSRP,measure} + T_{L1\text{-}RSRP,report} + \max(T_{HARQ} + T_{uncertainty_MAC_multiple_scells} + 5$ ms + $T_{FineTiming}, T_{uncertainty_RRC_multiple_scells} + T_{RRC_delay})$, if periodic CSI-RS is used for CSI reporting.

If the SCell being activated belongs to FR1 and if there is at least one active serving cell contiguous to the SCell on that FR1 band, if the UE is not provided with SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration for the target SCell, $T_{activation_time_multiple_scells}$ is same as single SCell activation delay requirement as defined in clause 8.3.2.

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, then $T_{activation_time_multiple_scells}$ is same as single SCell activation delay requirement as defined in clause 8.3.2.

If the SCell being activated belongs to FR2 and if there is no active serving cell on that FR2 band provided that PCell or PSCell is FR1:

If the target SCell is known to UE and semi-persistent CSI-RS is used for CSI reporting, then $T_{activation_time_multiple_scells}$ is same as single SCell activation delay requirement as defined in clause 8.3.2.

If the target SCell is known to UE and periodic CSI-RS is used for CSI reporting, then $T_{activation_time_multiple_scells}$ is same as single SCell activation delay requirement as defined in clause 8.3.2.

If the target SCell is unknown to UE and semi-persistent CSI-RS is used for CSI reporting, provided that the side condition $\hat{E}s/Iot \geq -2$dB is fulfilled, then $T_{activation_time_multiple_scells}$ is:

- 3 ms + $\max(T_{uncertainty_MAC_multiple_scells} + T_{FineTiming} + 2$ms, $T_{uncertainty_SP_multiple_scells})$, if on the same band UE also has at least one parallel to-be-activated SCell which is FR2 known SCell. $T_{uncertainty_MAC_multiple_scells} = 0$ and $T_{uncertainty_SP_multiple_scells} = 0$ if UE receives the SCell activation command, semi-persistent CSI-RS activation command and TCI state activation commands at the same time.

If the target SCell is unknown to UE and periodic CSI-RS is used for CSI reporting, provided that the side condition $\hat{E}s/Iot \geq -2$dB is fulfilled, then $T_{activation_time_multiple_scells}$ is:

- $\max(T_{uncertainty_MAC_multiple_scells} + 5$ms + $T_{FineTiming}, T_{uncertainty_RRC_multiple_scells} + T_{RRC_delay} - T_{HARQ})$, if on the same band UE also has at least one parallel to-be-activated SCell which is FR2 known SCell . $T_{uncertainty_MAC_multiple_scells} = 0$ if UE receives the SCell activation command and TCI state activation commands at the same time.

The requirements for FR2 unknown SCells apply provided that the parameter *ssb-PositionsInBurst* is same for the SCell and the known serving cell on the same FR2 band. The activation delay FR2 unknown SCell may be longer if SSB is not in the same half-frame on the SCell and the FR2 known cell on the same band.

Where,

$N_1$ is the number counting for parallel FR1 unknown to-be-activated SCell(s) only except the ones which fulfilled the following conditions:

- contiguous to an active serving cell in the same band, or to a known SCell in the same band being activated by the same MAC PDU, and

- A single SSB is used in the unknown SCell; or multiple SSBs are used in the unknown SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and
- its *ssb-PositionInBurst* is same as the one of contiguous FR1 known cell or contiguous FR1 active serving cell, and
- its RTD with contiguous FR1 known cell or contiguous FR1 active serving cell is smaller than or equal to 260 ns and its reception power difference with contiguous FR1 known cell or contiguous FR1 active serving cell is smaller than or equal to 6 dB, and
- its SMTC offset is same as the one of contiguous FR1 known cell or contiguous FR1 active serving cell

However, when the following conditions are fulfilled, no activation requirement will be applied for this unknown SCell and other SCells being activated and counted in $N_1$:

- contiguous to an active serving cell in the same band, or to a known SCell in the same band being activated by the same MAC PDU, and
- A single SSB is used in the unknown SCell; or multiple SSBs are used in the unknown SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and
- its *ssb-PositionInBurst* is same as the one of FR1 known cell or FR1 active serving cell, and
- its RTD with contiguous FR1 known cell or contiguous FR1 active serving cell is larger than 260 ns or its reception power difference with contiguous FR1 known cell or contiguous FR1 active serving cell is larger than 6 dB, and
- its SMTC offset is same as the one of FR1 known cell or FR1 active serving cell

$T_{SMTC_MAX_multiple_scells}$:

- In FR1, in case of intra-band SCell activation, $T_{SMTC_MAX_multiple_scells}$ is the longest SMTC periodicity between active serving cells and SCells being activated on the same band provided the cell specific reference signals from the active serving cells and the SCells being activated or released are available in the same slot; in case of inter-band SCell activation, $T_{SMTC_MAX_multiple_scells}$ is the longest SMTC periodicity of SCells being activated on the same band.
- In FR2, $T_{SMTC_MAX_multiple_scells}$ is the longest SMTC periodicity between active serving cells and SCell(s) being activated in FR2 intra-band CA.
- $T_{SMTC_MAX_multiple_scells}$ is bounded to a minimum value of 10 ms.

$T_{FirstSSB_MAX_multiple_scells}$: is the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, further fulfilling:

- In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCells being activated are transmitting SSB burst.
- In FR2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.

$T_{uncertainty_MAC_multiple_scells}$ is the time period between reception of the activation command for PDCCH TCI, PDSCH TCI (when applicable) and SCell activation command of this unknown SCell.

$T_{uncertainty_SP_multiple_scells}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting and SCell activation command of this unknown SCell.

$T_{uncertainty_RRC_multiple_scells}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) and SCell activation command of this unknown SCell.

$T_{rs}$, $T_{FineTiming}$, and $T_{RRC_delay}$ is defined in clause 8.3.2.

Longer delays for RRM measurement requirements, and in case of FR2 also SSB based RLM/BFD/CBD/L1-RSRP measurement requirements, can be expected during the cell detection time for unknown SCell activation.

The condition of known SCell in FR1 or FR2 is defined in clause 8.3.2.

If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the activation command, $T_{SMTC_Scell}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell being activated. $T_{SMTC_MAX_multiple_scell}$ follows *smtc1* or *smtc2* according to the physical cell IDs of the target cells being activated and the active serving cells.

The starting point and the end-point of an interruption window on PCell or any activated SCell in MCG for NR standalone mode, or on PSCell or any activated SCell in SCG for EN-DC mode is same as single SCell activation requirement in clause 8.3.2.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Upon receiving SCell activation command in slot *n*, if the start of the first complete SSB used in the $T_X$ in the different bands which have SCells being activated after $n+\frac{T_{HARQ}+3ms}{NR\ slot\ length}$ are not aligned on time domain among

- SCells in different bands being activated by the same MAC CE if UE does not support per FR gap, or
- SCells in different FR1 bands being activated by the same MAC CE if UE supports per FR gap,

additional interruptions may be expected for the activated serving cells, where

- The number of additional interruptions is no more than the number of FR1 bands which have both SCell being activated for which the activation requirements involve $T_{FirstSSB_MAX\ multiple_scells}$ with $T_{rs}$ and the active serving cell, and
- In each interruption occasion, the interruption length is defined in clause 8.2.2.2.2, and
- Longer activation delay may be expected for multiple SCell activation under one MAC CE with multiple interruptions, and
- $T_X$ is:
  - $T_{FirstSSB}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FirstSSB}$;
  - $T_{FirstSSB_MAX\ multiple_scells}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FirstSSB_MAX\ multiple_scells}$;
  - $T_{uncertainty_MAC}+T_{FineTiming}$ or $T_{uncertainty_MAC\ multiple_scells}+T_{FineTiming}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FineTiming}$.

Otherwise, no additional interruption is expected due to activation of multiple SCells.

Starting from slot $n + T_{HARQ} + 3$ ms where slot *n* is the slot where SCell activation command is received (as specified in clause 4.3 of TS 38.213 [3]) and until the SCell activation completion at UE, after at least one CSI-RS transmission occasion for the channel measurement and reporting (specified in clause 5.2.2.5 of TS 38.214 [26]), the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

## 8.3.8 SCell Deactivation Delay Requirement for Activated SCell with Multiple Downlink SCells

The requirements in this clause shall apply for the UE configured with multiple downlink SCells in EN-DC, or in standalone NR carrier aggregation, or in NE-DC, or in NR-DC, provided that,

- in each single CG, there are no other SCell activation, deactivation, addition or release before deactivation is completed for all the SCells deactivated by the single MAC CE in this clause, and
- in EN-DC and NE-DC, there are no E-UTRAN SCell activation, deactivation, addition or release before multiple SCell deactivation is completed in this clause, and
- in EN-DC, NE-DC, NR-DC and standalone NR, UE only receives one single MAC command for multiple SCell deactivation within the deactivation period defined in this clause, or, in NR-DC, per-FR measurement gap capable UE receives one MAC command per CG for multiple SCell deactivation within the deactivation period defined in this clause

Upon receiving SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated within the same delay as specified in clause 8.3.3.

The starting point and the end-point of an interruption window on PCell or any activated SCell in MCG for NR standalone mode, or on PSCell or any activated SCell in SCG for EN-DC mode is same as single SCell activation requirement in clause 8.3.3.

## 8.3.9 Direct SCell Activation of Multiple Downlink SCells at SCell addition

The requirements in this clause apply for UE being configured in the RRC reconfiguration message, TS 38.331 [2], with 2 SCells for which the parameter *sCellState* is set to *activated*.

In EN-DC, NE-DC, stand-alone NR, or in one CG of NR-DC, the requirements in this clause shall apply when the following conditions are met:

- UE only receives one RRC reconfiguration message for direct activation of SCells within the activation period defined in this clause,
- in each single CG, there are no other SCell activation, deactivation, addition or release before direct activation is completed for all the SCells activated by the single RRC reconfiguration message in this clause, and
- in EN-DC and NE-DC, there are no E-UTRAN SCell activation, deactivation, addition or release before the direct SCell activation of multiple SCells in this clause is completed.

In two CGs of NR-DC, the requirements in this clause shall apply when the following conditions are met:

- UE receives one RRC message per CG for direct activation of SCells within the activation period defined in this clause,
- UE supports per-FR measurement gap capability, and
- any to-be-activated unknown SCell has active serving cell(s) or known to-be-activated SCell(s) on the same band.

The UE shall configure the SCells in activated state upon successful completion of the RRC reconfiguration procedure within the specified delay. The UE shall be capable to transmit valid CSI report and apply actions for the directly activated SCell no later than in slot n + $\frac{N_{direct_multiple_scells}}{NR\ slot\ length}$,

where:

- Slot n is the last slot overlapping with the PDSCH containing the RRC reconfiguration message.
- $N_{direct_multiple_scells} = T_{RRC_Process} + T_1 + T_{activation_time_multiple_scells} + T_{CSI_Reporting}$ - 3 ms for the cases specified in clause 8.3.7 that TCI state is not indicated within $T_{activation_time}$; otherwise, $N_{direct_multiple_scells} = T_{RRC_Process} + T_1 + T_{HARQ} + T_{activation_time_multiple_scells} + T_{CSI_Reporting}$
  - $T_1$ and $T_{RRC_Process}$ are specified in clause 8.3.4,
  - $T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],
  - $T_{activation_time_multiple_scells}$ and $T_{CSI_Reporting}$ are specified in clause 8.3.7, where the following definition of $T_{FirstSSB}$, $T_{FirstSSB_MAX}$, and $T_{FirstSSB_MAX_multiple_scells}$ shall override the existing ones:

- $T_{FirstSSB}$ and $T_{FirstSSB_MAX}$: as specified in clause 8.3.4,
- $T_{FirstSSB_MAX_multiple_scells}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot $n + \frac{T_{RRC_{Process}} + T_1}{NR\ slot\ length}$, further fulfilling:
  - In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCells being activated are transmitting SSB burst.
  - In FR2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.
- If a UE supports, *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* and/or *shortMeasInterval-r18* capabilities, the reduced $T_{activation_time}$ specified in clause 8.3.2 when UE supports these capabilities is applicable for Direct SCell activation at SCell addition also.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.321 [7] for an SCell at the first opportunities for the corresponding actions once the SCell is activated.

The UE may be allowed to cause interruptions to serving cells on other component carriers during an interruption window, as specified in clause 8.2. The starting point of an interruption window on SpCell or any activated SCell shall not occur before slot $n$+1+$\frac{T_{HARQ}}{NR\ slot\ length}$, and shall not occur after slot $n$+1+$\frac{T_{RRC_Process}+T_1+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology of the SCell being activated, and $T_X$ is:

- $T_{FirstSSB}$, for any scenario where $T_{activation_time_multiple_scells}$ includes $T_{FirstSSB}$;
- $T_{FirstSSB_MAX}$, for any scenario where $T_{activation_time_multiple_scells}$ includes $T_{FirstSSB_MAX}$;
- $T_{FirstSSB_MAX_multiple_scell}$, for any scenario where $T_{activation_time_multiple_scells}$ includes $T_{FirstSSB_MAX_multiple_scells}$;
- $T_{uncertainty_MAC} + T_{FineTiming}$, for any scenario where $T_{activation_time_multiple_scells}$ includes $T_{FineTiming}$.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

Starting from the slot $n + \frac{T_{RRC_Process} + T_1}{NR\ slot\ length}$ until the UE has completed the direct SCell activation, the UE shall report CQI index = 0 (out of range) if the UE has available uplink resources to report CQI for the SCells.

## 8.3.10 Direct SCell Activation of Multiple Downlink SCells at Handover

The requirements in this clause apply for UE being configured in the RRC reconfiguration message, TS 38.331 [2], for handover with 2 SCells for which the parameter *sCellState* is set to *activated*.

In MCG of NE-DC, MCG of NR-DC, or in stand-alone NR, the requirements in this clause shall apply when the following conditions are met:

- UE does not receive any RRC reconfiguration message for direct activation of SCells within the activation period defined in this clause,
- there is no other SCell activation, deactivation, addition or release before direct activation is completed for all the SCells activated by the single RRC reconfiguration message in this clause, and
- in NE-DC, there is no E-UTRAN SCell activation, deactivation, addition or release before the direct activation of SCells in this clause is completed.

The UE shall configure the SCells in activated state upon successful completion of the RRC reconfiguration procedure within the specified delay. The UE shall be capable to transmit valid CSI report and apply actions for the directly activated SCells no later than in slot n + $\frac{N_{direct_multiple_scells}}{NR\ slot\ length}$ where:

- Slot n is the last slot overlapping with the PDSCH containing the RRC reconfiguration message,

- $N_{direct_multiple_scells} = T_{RRC_process} + T_{interrupt} + T_2 + T_3 + T_{activation_time_multiple_scells} + T_{CSI_Reporting}$ - 3 ms for the cases specified in clause 8.3.7 that TCI state is not indicated within $T_{activation_time}$; otherwise, $N_{direct_multiple_scells} = T_{RRC_process} + T_{interrupt} + T_2 + T_3 + T_{HARQ} + T_{activation_time_multiple_scells} + T_{CSI_Reporting}$

  - $T_{RRC_Process}$, $T_{interrupt}$,$T_2$, and $T_3$ are specified in clause 8.3.5,

  - $T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],

  - $T_{activation_time_multiple_scells}$ and $T_{CSI_Reporting}$ are specified in clause 8.3.7, where the following definitions of $T_{FirstSSB}$, $T_{FirstSSB_MAX}$, and $T_{FirstSSB_MAX_multiple_scells}$ shall override the existing ones:

    - $T_{FirstSSB}$, $T_{FirstSSB_MAX}$: as specified in clause 8.3.5,

    - $T_{FirstSSB_MAX_multiple_scell}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_Process}+T_{interrupt}+T_2+T_3}{NR\,slot\,length}$, further fulfilling:

      - In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCells being activated are transmitting SSB burst.

      - In FR2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.

  - If a UE supports, *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* and/or *shortMeasInterval-r18* capabilities, the reduced $T_{activation_time}$ specified in clause 8.3.2 when UE supports these capabilities is applicable for Direct SCell activation at handover also.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.321 [7] for an SCell at the first opportunities for the corresponding actions once the SCell is activated.

The UE may be allowed to cause interruptions to PCell during an interruption window, as specified in clause 8.2. The starting point of an interruption window on PCell shall not occur before slot $n$+1+ $\frac{T_{RRC\,Processing}+T_{interrupt}+T_2+T_3}{NR\,slot\,length}$, and not occur after slot $n$+1+$\frac{T_{RRC\,Processing}+T_{interrupt}+T_2+T_3+T_X}{NR\,slot\,length}$, where NR slot length is with respect to the numerology of the SCell being activated, and $T_X$ is:

- $T_{FirstSSB}$, for any scenario where $T_{activation_time_multiple_scells}$ includes $T_{FirstSSB}$;
- $T_{FirstSSB_MAX}$, for any scenario where $T_{activation_time_multiple_scells}$ includes $T_{FirstSSB_MAX}$;
- $T_{FirstSSB_MAX_multiple_scell}$, for any scenario where $T_{activation_time_multiple_scells}$ includes $T_{FirstSSB_MAX_multiple_scells}$;
- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time_multiple_scells}$ includes $T_{FineTiming}$.

The length of the interruption window depends on the frequency band relation between the aggressor SCell and the victim PCell.

Starting from the slot $n + \frac{T_{RRC_Process} + T_{interrupt}+T_2+ T_3}{NR\,slot\,length}$ and until the UE has completed the direct SCell activation, the UE shall report CQI index = 0 (out of range) if the UE has available uplink resources to report CQI for the SCells.

## 8.3.11 Direct SCell Activation of Multiple Downlink SCells at RRC Resume

The requirements in this clause apply for UE being configured in the RRC reconfiguration message in TS 38.331 [2] for RRC Resume with 2 SCells for which the parameter *sCellState* is set to *activated*.

The requirements in clause 8.3.9 shall apply, except that the definition of $T_1$ shall be replaced by the corresponding definition in clause 8.3.6.

## 8.3.12 SCell Activation Delay Requirement for Deactivated PUCCH SCell

The requirements in this clause shall apply for the UE configured with one downlink SCell and when PUCCH is configured for the SCell being activated.

If the UE has a valid TA for transmitting on an SCell then the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated on the PUCCH SCell no later than in slot $n+\frac{T_{HARQ}+T_{activation_time}+\max((T_{First_available_CSI}+T_{CSI_processing}),\ 3*T_{target_PL-RS})+T_{CSI_Reporting_after}}{NR\ slot\ length}$,

Where:

- A TA is considered to be valid provided that the *TimeAlignmentTimer* [2] associated with the TAG containing the PUCCH SCell is running.
- $T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].
- $T_{activation_time}$ is the SCell activation delay in milliseconds.

  If target SCell is unknown, $T_{activation_time}$ is specified in 8.3.2A provided the following conditions are met:

  - UE supports *measValidationReportEMR* and *measIdleValidityDuration-r18* is configured or,
  - UE supports *measValidationReportReselectionMeasurements* and *measReselectionValidityDuration-r18* is configured or,
  - UE supports idleInactiveNR-*MeasReport-r16*, and neither *measIdleValidityDuration-r18* nor *measReselectionValidityDuration*-r18 is configured and *measIdleDuration*-r16 has not expired at the moment of initiation of RRC state transition to CONNECTED mode,

  For the UE capable of *l3-MeasUnknownSCellActivation-r18*, if the UE is provided with *ReportOnScellActivation* and it reports valid L3 measurement results after receiving the SCell activation command for unknown SCell, the $T_{activation_time}$ is the SCell activation delay with L3 reporting in milliseconds as specified in clause 8.3.17 except the definition of $T_{uncertainty_MAC}$ is replaced with:

  - $T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable), UL spatial relation (for FR2) relative to
    - SCell activation command for known case;
    - First valid L3 report for unknown case, if UE reports valid L3-RSRP before receiving TCI activation command;
    - First valid L1-RSRP reporting for unknown case, if UE reports valid L3-RSRP after receiving TCI activation command.

  Otherwise, $T_{activation_time}$ is the SCell activation delay in milliseconds as specified in clause 8.3.2 except the definition of $T_{uncertainty_MAC}$ is replaced with:

  - $T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable), UL spatial relation (for FR2) relative to
    - SCell activation command for known case;
    - First valid L1-RSRP reporting for unknown case.
- $T_{target_PL-RS}$ is the periodicity of the target pathloss reference signal determined during PUCCH SCell activation.
- $T_{First_available_CSI}$ is the delay uncertainty (in ms) in acquiring the first available downlink CSI reference resource.
- $T_{CSI_processing}$ is the UE processing time for CSI reporting.
- $T_{CSI_reporting_after}$ is the delay uncertainty (in ms) in acquiring the first available CSI reporting resources after end of max $((T_{First_available_CSI} + T_{CSI_processing}), 3*T_{target_PL-RS})$

If the UE does not have a valid TA for transmitting on an SCell then the UE shall be capable to perform downlink actions related to the SCell activation command as specified in [7] for the SCell being activated on the PUCCH SCell no later than in slot n+$\frac{T_{HARQ}+T_{activation_time}}{NR\ slot\ length}$, and shall be capable to perform uplink actions related to the SCell activation command as specified in [7] for the SCell being activated on the PUCCH SCell no later than in slot n + $\frac{T_{HARQ}+T_{delay_PUCCH_SCell}}{NR\ slot\ length}$ and shall transmit valid CSI report for the SCell being activated on the PUCCH SCell no later than in slot n + $\frac{T_{HARQ}+T_{delay_PUCCH_SCell}}{NR\ slot\ length}$, where:

$T_{delay_PUCCH_SCell} = T_{activation_time} + \max((T_{First_available_CSI} + T_{CSI_processing}), (T1+T2+T3), 3*T_{target_PL\text{-}RS}) + T_{CSI_reporting_after}$

Where:

- $T_{activation_time}$ is the SCell activation delay in milliseconds.

  If target SCell is unknown, $T_{activation_time}$ is specified in 8.3.2A provided the following conditions are met:

  - UE supports *measValidationReportEMR* and *measIdleValidityDuration-r18* is configured or,
  - UE supports *measValidationReportReselectionMeasurements* and *measReselectionValidityDuration-r18* is configured or,
  - UE supports idleInactiveNR-*MeasReport-r16*, and neither *measIdleValidityDuration-r18* nor *measReselectionValidityDuration*-r18 is configured and *measIdleDuration*-r16 has not expired at the moment of initiation of RRC state transition to CONNECTED mode,

  For the UE capable of *l3-MeasUnknownSCellActivation-r18*, if the UE is provided with *ReportOnScellActivation* and it reports valid L3 measurement results after receiving the SCell activation command for unknown SCell, the $T_{activation_time}$ is the SCell activation delay with L3 reporting in milliseconds as specified in clause 8.3.17 except the definition of $T_{uncertainty_MAC}$ is replaced with:

  - $T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable), UL spatial relation (for FR2) relative to
    - SCell activation command for known case;
    - First valid L3 report for unknown case, if UE reports valid L3-RSRP before receiving TCI activation command;
    - First valid L1-RSRP reporting for unknown case, if UE reports valid L3-RSRP after receiving TCI activation command;

  Otherwise, $T_{activation_time}$ is the SCell activation delay in milliseconds as specified in clause 8.3.2 except the definition of $T_{uncertainty_MAC}$ is replaced with:

  - $T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable), UL spatial relation (when applicable in FR2) relative to
    - SCell activation command for known case;
    - First valid L1-RSRP reporting for unknown case.
- $T_{target_PL\text{-}RS}$ is the periodicity of the target pathloss reference signal determined during PUCCH SCell activation.
- $T_{First_available_CSI}$ is the delay uncertainty (in ms) in acquiring the first available downlink CSI reference resource.
- $T_{CSI_processing}$ is the UE processing time for CSI reporting.
- $T_{CSI_reporting_after}$ is the delay uncertainty (in ms) in acquiring the first available CSI reporting resources after end of max ($(T_{First_available_CSI} + T_{CSI_processing})$, (T1+T2+T3), $3*T_{target_PL\text{-}RS}$)
- T1 is the delay uncertainty in acquiring the first available PDCCH triggered PRACH occasion in the PUCCH SCell after the slot n+$\frac{T_{HARQ}+T_{activation_time}}{NR\ slot\ length}$.

- T1 is up to the summation of a delay uncertainty for reception of PDCCH order, SSB to PRACH occasion association period and 10 ms, where SSB to PRACH occasion association period is defined in table 8.1-1 of TS 38.213 [3]

- T2 is the delay from slot n+$\frac{T_{HARQ}+T_{activation_time}+T_1}{NR\ slot\ length}$until UE has obtained a valid TA command for the target PUCCH Scell being activated. Slot n is the slot where the UE receives PUCCH SCell activation command.

- T3 is the delay for applying the received TA for uplink transmission on target PUCCH SCell being activated, as specified in clause 4.2 in TS 38.213 [3].

The pathloss reference signal is known for known PUCCH SCell during activation if the following conditions are met during the period between the last transmission of the RS resource used for L3 measurement reporting and the completion of PUCCH SCell activation, where the RS resource is the target pathloss reference signal or QCLed (with Type D) to the target pathloss reference signal:

- The PUCCH SCell activation command is received within 1280 ms upon the last transmission of the RS resource used for L3 measurement reporting

- The target pathloss reference signal determination is based on the latest L3 measurement reporting

- The target pathloss reference signal remains detectable during the PUCCH SCell activation period

  - SNR of the target pathloss reference signal ≥-3 dB

- The associated SSBs with the target pathloss reference signal remain detectable during the PUCCH SCell activation period

  - SNR of the associated SSB ≥-3 dB

For the UE supporting *fastSCellActivationEarlyMeas-r19*, if the target SCell is unknown and following conditions are met:

- UE supports *measValidationReportEMR* and *measIdleValidityDuration-r18* is configured or,

- UE supports *measValidationReportReselectionMeasurements* and *measReselectionValidityDuration-r18* is configured or,

- UE supports idleInactiveNR-*MeasReport-r16*, and neither *measIdleValidityDuration-r18* nor *measReselectionValidityDuration*-r18 is configured and *measIdleDuration*-r16 has not expired at the moment of initiation of RRC state transition to CONNECTED mode,

the pathloss reference signal is known for unknown PUCCH SCell during activation if the following conditions are met during the period between the last transmission of the RS resource used for EMR reporting and the completion of PUCCH SCell activation, where the RS resource is the target pathloss reference signal or QCLed (with Type D) to the target pathloss reference signal.

- The target pathloss reference signal determination is based on the EMR reporting in 4.7.3 and 5.8.3.

- The target pathloss reference signal remains detectable during the PUCCH SCell activation period

  - SNR of the target pathloss reference signal≥-3dB

- The associated SSBs reported in EMR report with the target pathloss reference signal remain detectable during the PUCCH SCell activation period

  - SNR of the associated SSB reported in EMR report≥-3dB

For the UE capable of *l3-MeasUnknownSCellActivation-r18*, if the UE is provided with *ReportOnScellActivation* and it reports valid L3 measurement results after receiving the SCell activation command for unknown SCell, the pathloss reference signal is known for unknown PUCCH SCell during activation if the following conditions are met during the period between the last transmission of the RS resource used for L3 reporting after SCell activation command and the completion of PUCCH SCell activation, where the RS resource is the target pathloss reference signal or QCLed (with Type D) to the target pathloss reference signal.

- The PUCCH SCell activation command is received within 1280 ms upon the last transmission of the RS resource used for the L3 reporting after SCell activation command
- The target pathloss reference signal determination is based on either the latest L1-RSRP measurement reporting or the L3 reporting after SCell activation command, if UE reports any of them before receiving TCI activation command
- The target pathloss reference signal remains detectable during the PUCCH SCell activation period
  - SNR of the target pathloss reference signal≥-3 dB
- The associated SSBs with the target pathloss reference signal remain detectable during the PUCCH SCell activation period
  - SNR of the associated SSB ≥-3 dB

Otherwise, the pathloss reference signal is known for unknown PUCCH SCell during activation if the following conditions are met during the period between the last transmission of the RS resource used for L1-RSRP measurement reporting and the completion of PUCCH SCell activation, where the RS resource is the target pathloss reference signal or QCLed (with Type D) to the target pathloss reference signal.

- The PUCCH SCell activation command is received within 1280 ms upon the last transmission of the RS resource used for L1-RSRP measurement reporting
- The target pathloss reference signal determination is based on the latest L1-RSRP measurement reporting
- The target pathloss reference signal remains detectable during the PUCCH SCell activation period
  - SNR of the target pathloss reference signal≥-3 dB
- The associated SSBs with the target pathloss reference signal remain detectable during the PUCCH SCell activation period
  - SNR of the associated SSB ≥-3 dB

Otherwise, the pathloss reference signal is unknown.

The above delay requirement shall apply provided that:

- The target pathloss reference signal determined during PUCCH SCell activation is known otherwise longer activation time is expected if the pathloss reference signal is unknown; and
- The RA on PUCCH SCell is not interrupted by the RA on PCell otherwise additional delay to activate the SCell is expected; and
- No SRS carrier based switching or SRS antenna port switching occurs during the SCell activation procedure otherwise the PUCCH SCell activation delay can be extended.

The starting point and the end-point of an interruption window on PCell or any activated SCell in MCG for NR standalone mode, or on PSCell or any activated SCell in SCG for EN-DC mode is the same as the interruption in single SCell activation requirement in clause 8.3.2.

In addition to the interruption due to RF retuning during PUCCH SCell activation, if the UE is not capable of *parallelTxPRACH-SRS-PUCCH-PUSCH*, and PRACH on PUCCH SCell and PUCCH/PUSCH/SRS on other active serving cell are fully or partially overlapping in time, the UE shall transmit PRACH on PUCCH SCell and is allowed to drop or cause interruption to SRS or PUCCH or PUSCH transmission on the SpCell or on any activated SCell. Otherwise, UE is not allowed to drop or cause any interruption to SRS or PUCCH or PUSCH transmission on SpCell or on any activated SCell.

For unknown PUCCH SCell activation in FR2, the requirement only applies when UE supports *ReportingCrossPUCCH-Grp-r16*, and UE is configured with CSI reporting via SpCell. For unknown PUCCH SCell activation in FR1, the requirement only applies when UE supports *ReportingCrossPUCCH-Grp-r16*, and UE is configured with CSI reporting via SpCell, if ‘ssb-PositionInBurst’ indicates multiple SSBs but TCI state indication is not provided in same MAC PDU with SCell activation.

The requirement for unknown PUCCH SCell applies provided that the PDCCH order (when applicable) and the activation commands for TCI, UL spatial relation and PL-RS (when applicable) are based on the latest valid L1-RSRP reporting or the L3 reporting after SCell activation command via Primary PUCCH group or EMR reporting as defined in 8.3.2A, 4.7.3 and 5.8.3.

## 8.3.13 SCell activation delay Requirement for Deactivated PUCCH SCell with Multiple SCells

The requirements in this clause shall apply for the UE configured with multiple deactivated downlink SCells and PUCCH is configured for a SCell, and when PUCCH SCell with downlink SCell(s) are activated by one MAC command.

For EN-DC, NE-DC, and standalone NR, the requirements in this clause shall apply when the following conditions are met:

- UE only receives a single MAC command for multiple SCell activation within the activation period defined in this clause
- in each single CG, there are no other SCell activation, deactivation, addition or release before activation is completed for all the SCells activated by the single MAC CE in this clause, and
- in EN-DC and NE-DC, there are no E-UTRAN SCell activation, deactivation, addition or release before multiple SCell activation is completed in this clause, and
- any to-be-activated unknown non-PUCCH SCell in a different band from to-be-activated PUCCH SCell has active serving cell(s) or known to-be-activated non-PUCCH SCell(s) on the same band.
- All DL SCells being activated in the secondary PUCCH group are unknown if PUCCH SCell being activated is unknown.
- If the to-be-activated FR2 PUCCH SCell is unknown, and there is no to-be-activated FR1 SCell which is counted in N1 as defined in clause 8.3.7.

Upon receiving SCell activation command in slot *n* for more than one SCell and one among the multiple SCells is PUCCH SCell, the UE shall be able to transmit valid CSI report on PUCCH SCell and apply actions related to the SCell activation command as specified in [7] for the PUCCH SCell being activated no later than in slot *n*+ $T_{activate_total_PUCCH_SCell}$. The UE shall be capable to transmit valid CSI report of other SCell no later than in slot n+ $T_{activate_total_other_SCell}$.

Where:

- $T_{activate_total_PUCCH_SCell}$ is $\frac{T_{HARQ}+T_{delay_multiple_SCells_PUCCH_SCell}}{NR\ slot\ length}$,
- $T_{activate_total_other_SCell}$ is $\frac{T_{HARQ}+T_{delay_multiple_SCells_other_SCell}}{NR\ slot\ length}$

Where:

- $T_{delay_multiple_SCells_other_SCell}$ is the SCell activation delay for other SCell when PUCCH SCell is activated with multiple SCells and is given by $T_{activation_time_multiple_scells} + T_{CSI_Reporting}$.
- $T_{delay_multiple_SCells_PUCCH_SCell}$ is the SCell activation delay for PUCCH SCell when it is activated with multiple SCells and is given as below.

If UE has a Valid TA for transmitting on PUCCH SCell,

- A TA is considered to be valid provided that the *TimeAlignmentTimer* [2] associated with the TAG containing the PUCCH SCell is running.

$T_{delay_multiple_SCells_PUCCH_SCell} = T_{activation_time_multiple_scells} + \max((T_{First_available_CSI} + T_{CSI_processing}), 3*T_{target_PL\text{-}RS}) + T_{CSI_reporting_after}$

If UE does not have valid TA for PUCCH SCell,

$T_{delay_multiple_SCells_PUCCH_SCell} = T_{activation_time_multiple_scells} + \max((T_{First_available_CSI} + T_{CSI_processing}), (T1+T2+T3), 3*T_{target_PL\text{-}RS}) + T_{CSI_reporting_after}$

Where:

- For UE which is capable of *l3-MeasUnknownSCellActivation-r18*, $T_{activation_time_multiple_scells}$ is equal to $T_{activation_time}$ which is the SCell activation delay in milliseconds as specified in clause 8.3.18 except the definition of $T_{uncertainty_MAC}$ and $T_{uncertainty_RRC}$ are replaced with:

  - $T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable), UL spatial relation (for FR2) relative to

  - First valid L3 report of a to-be-activated SCell within the same band for unknown case, if UE reports valid L3 report and L3 report is earlier than TCI command.

  - $T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

  - First valid L3 reporting of a to-be-activated SCell within the same band for unknown case, if UE reports valid L3 and L3 report is earlier than TCI command.

  Otherwise, when the to-be-activated PUCCH SCell is FR2 unknown SCell, $T_{activation_time_multiple_scells}$ is equal to $T_{activation_time}$ as defined in clause 8.3.12; otherwise, $T_{activation_time_multiple_scells}$ is the target SCell activation delay in milliseconds in multiple SCell activation scenario as specified in clause 8.3.7.

- $T_{target_PL\text{-}RS}$ is the periodicity of PL-RS resource when PL-RS of target PUCCH SCell is known

- $T_{first_available_CSI}$: the delay uncertainty in acquiring the first available downlink CSI reference resources for secondary PUCCH group.

- $T_{CSI_processing}$: the UE processing time for CSI reporting of secondary group PUCCH SCells.

- $T_{CSI_reporting_after}$ the delay uncertainty in acquiring the first available CSI reporting resource after end of max $((T_{First_available_CSI} + T_{CSI_processing}), 3*T_{target_PL\text{-}RS})$ if UE has a valid TA for PUCCH SCell or after end of max $((T_{First_available_CSI} + T_{CSI_processing}), (T1+T2+T3), 3*T_{target_PL\text{-}RS})$ if UE does not have a valid TA for PUCCH SCell.

- T1 is the delay uncertainty in acquiring the first available PDCCH triggered PRACH occasion in the PUCCH SCell after $T_{activation_time_multiple_scells}$.

- T1 is up to the summation of a delay uncertainty for reception of PDCCH order, SSB to PRACH occasion association period and 10 ms, where SSB to PRACH occasion association period is defined in the table 8.1-1 of TS 38.213 [3]

- T2 is the delay from slot n + $(T_{HARQ} + T_{activation_time_multiple_scells} + T1)$/NR slot length until UE has obtained a valid TA command for the target PUCCH SCell being activated. Slot n is the slot where the UE receives PUCCH SCell activation command.

- T3 is the delay for applying the received TA for uplink transmission on target PUCCH SCell being activated, and greater than or equal to k+1 slot, where k is defined in clause 4.2 in TS 38.213 [3].

Starting from slot n + $T_{HARQ}$ + 3 ms where n is the slot where SCell activation command is received (as specified in clause 4.3 of TS 38.213 [3]) and until the SCell activation completion at UE, after at least one CSI-RS transmission occasion for the channel measurement and reporting (specified in clause 5.2.2.5 of TS 38.214 [26]), the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

The starting point and the endpoint of an interruption window on PCell or any activated SCell in MCG for NR standalone mode, or on PSCell or any activated SCell in SCG for EN-DC mode is same as single SCell activation requirement in clause 8.3.2.

In addition to the interruption due to RF retuning during multiple SCell activation, if the UE is not capable of *parallelTxPRACH-SRS-PUCCH-PUSCH* for inter-band CA, and PRACH on PUCCH SCell and PUCCH/PUSCH/SRS on other active serving cell are fully or partially overlapping in time, the UE shall transmit PRACH on PUCCH SCell and is allowed to drop or cause interruption to SRS or PUCCH or PUSCH transmission on the SpCell or on any activated SCell. Otherwise, UE is not allowed to drop or cause any interruption of SRS or PUCCH or PUSCH transmission on SpCell or on any activated SCell.

Upon receiving SCell activation command in slot *n*, if the start of the first complete SSB used in the $T_X$ in the different bands which have SCells being activated after $n+\frac{T_{HARQ}+3ms}{NR\ slot\ length}$ are not aligned on time domain among

- SCells in different bands being activated by the same MAC CE if UE does not support per FR gap, or
- SCells in different FR1 bands being activated by the same MAC CE if UE supports per FR gap,

additional interruptions may be expected for the activated serving cells, where

- The number of additional interruptions is no more than the number of FR1 bands which have both SCell being activated for which the activation requirements involve $T_{FirstSSB_MAX\ multiple_scells}$ with $T_{rs}$ and the active serving cell, and
- In each interruption occasion, the interruption length is defined in clause 8.2.2.2.2, and
- Longer activation delay may be expected for multiple SCell activation under one MAC CE with multiple interruptions, and
- $T_X$ is:
  - $T_{FirstSSB}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FirstSSB}$;
  - $T_{FirstSSB_MAX\ multiple_scells}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FirstSSB_MAX\ multiple_scells}$;
  - $T_{uncertainty_MAC}+T_{FineTiming}$ or $T_{uncertainty_MAC\ multiple_scells}+T_{FineTiming}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FineTiming}$.

Otherwise, no additional interruption is expected due to activation of multiple SCells.

The above delay requirement shall apply provided that the target pathloss reference signal determined during PUCCH SCell activation is known otherwise longer activation time is expected if the pathloss reference signal is unknown. The condition whether the pathloss reference signal is known is defined in section 8.3.12.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

## 8.3.14 SCell Deactivation Delay Requirement for Activated PUCCH SCell

The requirements in this clause shall apply for the UE configured with one SCell configured with PUCCH in EN-DC, or in standalone NR carrier aggregation, or in NE-DC.

Upon receiving PUCCH SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the PUCCH SCell being deactivated no later than in slot $n + \frac{T_{HARQ}+3ms}{NR\ slot\ length}$. The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot $n+1+\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot $n+1+\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the PUCCH SCell being deactivated.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

## 8.3.15 SCell Deactivation Delay Requirement for Activated PUCCH SCell with Multiple Downlink SCells

The requirements in this clause shall apply for the UE configured with multiple downlink SCells and one SCell configured with PUCCH in EN-DC, or in standalone NR carrier aggregation, or in NE-DC, provided that,

- in each single CG, there are no other SCell activation, deactivation, addition or release before deactivation is completed for all the SCells deactivated by the single MAC CE in this clause, and

- in EN-DC and NE-DC, there are no E-UTRAN SCell activation, deactivation, addition or release before multiple SCell deactivation is completed in this clause, and
- in EN-DC, NE-DC and standalone NR, UE only receives one single MAC command for multiple SCell deactivation within the deactivation period defined in this clause

Upon receiving SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the SCells (including one SCell configured with PUCCH) being deactivated within the same delay as specified in clause 8.3.14.

The starting point and the end-point of an interruption window on PCell or any activated SCell in MCG for NR standalone mode, or on PSCell or any activated SCell in SCG for EN-DC mode is same as single SCell activation requirement in clause 8.3.14.

## 8.3.16 Fast SCell Activation Delay Requirement for Deactivated SCell

Aperiodic CSI-RS resources can be configured for fast SCell activation. The requirements in this clause shall apply for the UE configured with one downlink SCell in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one SCell is being activated. The requirements in this clause shall apply for the UE provided with aperiodic CSI-RS resources for SCell activation for the target SCell.

NOTE: If UE is allocated A-TRS for fast Scell activation, the UE is not required to use the SSB of the target Scell.

The transmitted SSB defined in clause 8.3.19 is also applied in this clause if UE supports *On-demand SSB operation* and OD-SSB transmission is indicated.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot *n*, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot n + $\frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time}$ is the SCell activation delay in milliseconds.

If the SCell is known and belongs to FR1, $T_{activation_time}$ is:

- $T_{FirstATRS}$+ 5 ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.
- $T_{FirstATRS} + T_{gap} + T_{ATRS}$ + 5 ms, if the measurement period of the SCell being activated is larger than 2400 ms.

NOTE: The RSs on the activated serving cell in the same band are not required to be transmitted in the same slot as the temporary RS.

NOTE: UE may report inaccurate non-zero CQI for any activated Cell and being activated SCell during the fast SCell activation procedure only if the RSs on the activated serving cell in the same band are not transmitted in the same slot as the aperiodic CSI-RS for fast SCell activation.

If the SCell is unknown and belongs to FR1, and SCell is contiguous to an active serving cell in the same band, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, $T_{activation_time}$ is:

- $T_{FirstATRS} + T_{gap} + T_{ATRS}$ + 5 ms, if the following conditions are met,
  - the SCell is contiguous to an active serving cell in the same band, and
  - its *ssb-PositionInBurst* or *od-ssb-PositionsInBurst* if provided for the Scell is same as *ssb-PositionsInBurst* of contiguous FR1 active serving cell, and
  - its SMTC offset is same as the one of contiguous FR1 active serving cell, and
  - its RTD with contiguous FR1 active serving cell is smaller than or equal to 260 ns with respect to the to-be-activated SCell's SSB numerology, and its reception power difference with contiguous FR1 active serving cell is smaller than or equal to 6 dB;

NOTE: The RSs on the activated serving cell in the same band are not required to be transmitted in the same slot as the temporary RS.

NOTE: UE may report inaccurate non-zero CQI for any activated SCell and being activated SCell during the fast SCell activation procedure only if the RSs on the activated serving cell in the same band are not transmitted in the same slot as the aperiodic CSI-RS for fast SCell activation.

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, then $T_{activation_time}$ is $T_{FirstATRS}$+ 5 ms provided:

- The UE is provided with aperiodic CSI-RS resources for SCell activation for the target SCell, and
- The SSBs in the serving cell(s) and the SSBs or OD-SSBs in the SCell being activated fulfil the condition defined in clause 3.6.3, and
- The parameter *ssb-PositionsInBurst* for the serving cell(s) is same as the *ssb-PositionsInBurst* or *od-ssb-PositionsInBurst* if provided for the Scell, and
- SSB or OD-SSB is in the same half-frame on the SCell and the FR2 active serving cell.

If the SCell being activated belongs to FR2 and if there is no active serving cell on that FR2 band provided that PCell or PSCell is in FR1 or in FR2, and assuming PDCCH TCI and PDSCH TCI (when applicable) are associated with the triggered aperiodic CSI-RS resources for fast SCell activation, and when the following conditions are fulfillied:

- One of the candidate TCI states configured in TCI-StatesPDCCH-ToAddList has the same QCL source of the triggered A-TRS,
- The QCL source of CSI-RS for CQI reporting is the same as the triggered A-TRS,
- The TCI state for PDCCH/PDSCH is the same as A-TRS remain unchanged during SCell activation,

- If the target SCell belongs to FR2 is known to UE and semi-persistent CSI-RS is used for CSI reporting, then $T_{activation_time}$ is:
  - 3 ms + max($T_{FirstATRS}$ + 2 ms, $T_{uncertainty_SP}$), where $T_{uncertainty_SP}$=0 if UE receives the SCell activation command and semi-persistent CSI-RS activation command at the same time.
- If the target SCell belongs to FR2 is known to UE and periodic CSI-RS is used for CSI reporting, then $T_{activation_time}$ is:
  - max($T_{FirstATRS}$ + 5 ms, $T_{uncertainty_RRC}$ + $T_{RRC_delay}$-$T_{HARQ}$).

where,

$T_{FirstATRS}$: is the time to the end of the first complete CSI-RS burst for SCell activation after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots.

$T_{ATRS}$ is the CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots.

- $T_{gap}$ is a gap length between two aperiodic CSI-RS bursts,
  - at least 2 slots for 15 kHz and 30 kHz
  - at least 3 slots for 60 kHz

$T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to SCell activation command.

$T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to SCell activation command for known case.

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

SCell in FR1 is known if it has been meeting the following conditions:

- During the period equal to max(5*measCycleSCell, 5*DRX cycles) for FR1 before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable according to the cell identification conditions specified in clauses 9.2 and 9.3.
- the SSB measured during the period equal to max(5*measCycleSCell, 5*DRX cycles) also remains detectable during the SCell activation delay according to the cell identification conditions specified in clauses 9.2 and 9.3.

Otherwise SCell in FR1 is unknown.

For the first SCell activation in FR2 bands, the SCell is known if it has been meeting the following conditions:

- During the period equal to 4 s for UE supporting power class 1/5 and 3 s for UE supporting power class 2/3/4 before UE receives the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and semi-persistent CSI-RS for CQI reporting (when applicable):
  - the UE has sent a valid L3-RSRP measurement report with SSB index
  - SCell activation command is received after L3-RSRP reporting and no later than the time when UE receives MAC-CE command for TCI activation
- During the period from L3-RSRP reporting to the valid CQI reporting, the reported SSBs with indexes remain detectable according to the cell identification conditions specified in clauses 9.2 and 9.3, and the TCI state is selected based on one of the latest reported SSB indexes.

Otherwise, the first SCell in FR2 band is unknown.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot slot n+1+$\frac{T_{HARQ}+3ms+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being activated, and $T_X$ is:

- $T_{FirstATRS}$, for any scenario where $T_{activation_time}$ includes $T_{FirstATRS}$;

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

The requirements in this clause and requriements on interruption due to SCell activation in clause 8.x apply provided that the SSB and/or the OD-SSB and A-TRS of the to-be-activated SCell is within the first active DL BWP of the Scell.

Starting from slot $n$ + $T_{HARQ}$ + 3 ms where slot $n$ is the slot where SCell activation command is received (as specified in clause 4.3 of TS 38.213 [3]) and until the SCell activation completion at UE, after at least one CSI-RS transmission occasion for the channel measurement and reporting (specified in clause 5.2.2.5 of TS 38.214 [26]), the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

## 8.3.17 SCell Activation Delay Requirement for Deactivated SCell with the L3 reporting during activation

The requirements in this clause shall apply for UE supporting *l3-MeasUnknownSCellActivation-r18* and is configured with *ReportOnScellActivation* and reporting valid L3 measurement results after receiving the SCell activation command for unknown SCell. The requirements in this clause shall apply for the UE configured with one downlink SCell in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one SCell is being activated. Clause

8.3.2 is applied for UE who does not report L3 measurement results after receiving SCell activation command for unknown SCell.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot *n*, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot n + $\frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time}$ is the SCell activation delay in milliseconds.

- $T_{activation_time}$ is:
  - 10 ms + $T_{L3,report}$+ $T_{HARQ}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2 ms, $T_{uncertainty_SP}$), if semi-persistent CSI-RS is used for CSI reporting,
  - 7 ms + $T_{L3,report}$+ max($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$, $T_{uncertainty_RRC}$ + $T_{RRC_delay}$), if periodic CSI-RS is used for CSI reporting,

If the following conditions are met:

If the SCell being activated belongs to FR1 and if there is no active serving cell contiguous to the SCell on that FR1 band provided that the side condition Ês/Iot ≥ -2 dB is fulfilled:

If the target SCell belongs to FR1 and none of the following conditions is met

- 'ssb-PositionInBurst' indicates only one SSB is being actually transmitted, or
- 'ssb-PositionInBurst' indicates multiple SSBs and TCI indication is provided in same MAC PDU with SCell activation;

If the SCell being activated belongs to FR2-1 and if there is no active serving cell on that FR2-1 band provided that PCell or PSCell is in FR1 or in FR2-1:

If the PCell/PSCell and the target SCell are configured as FR1-FR2-1 CA or if the PCell/PSCell and the target SCell are in a FR2-1 band pair with independent beam management, and the target SCell is unknown to UE provided that the side condition Ês/Iot ≥ -2 dB is fulfilled.

Otherwise, $T_{activation_time}$ in clause 8.3.2 is applied for unknown SCell activation.

However, when the following conditions are fulfilled, no activation requirement will be applied for this unknown SCell:

- the SCell is contiguous to an active serving cell in the same band, and
- a single SSB is used in the unknown SCell; or multiple SSBs are used in the SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and
- its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
- its SMTC offset is same as the one of contiguous FR1 active serving cell
- its RTD with contiguous FR1 active serving cell is larger than 260 ns with respect to the to-be-activated SCell's SSB numerology, or its reception power difference with contiguous FR1 active serving cell is larger than 6 dB;

where,

$T_{L3,\ report}$ is delay of acquiring the first available UL resource for L3 reporting from 7 ms +$T_{HARQ}$ after receiving SCell activation command.

- The L3 measurement reporting requirement is defined in clause 9.2.4.4

- UE is ready to report the L3 measurement result no later than 7 ms + $T_{HARQ}$ ms from receiving the SCell activation command.

UE is not required to report the L3 results after 3 ms + $T_{HARQ}$+ M ms from receiving the SCell activation command where

- For FR1,
  - M= 2*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *shortMeasInterval-r18* capability,
  - Otherwise, M = $T_{SMTC}$ +$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$
- For FR2-1,
  - M= (X1+X2)*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* and *shortMeasInterval-r18* capability,
  - M = X1*$T_{SMTC}$ +X2*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* without supporting *shortMeasInterval-r18* capability,
  - M = 16*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *shortMeasInterval-r18* without supporting *reduceForCellDetection* and *reduceForSSB-L1-RSRP-Meas* capability,
- Otherwise, M = 8*$T_{SMTC}$ +8*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$

  Where, X1 and X2 are UE capabilities as reported in *reduceForCellDetection* and *reduceForSSB-L1-RSRP-Meas* respectively. $T_{SSB}$ is the same as $T_{rs,\ enhanced}$ as specified in clause 8.3.2. $T_{SMTC}$ is the same as $T_{SMTC_MAX}$ as specified in clause 8.3.2.

$T_{FineTiming}$ is the time period between UE finish processing the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and the timing of first complete available SSB corresponding to the TCI state.

$T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to

- First valid L3-RSRP reporting for unknown case, if UE reports valid L3-RSRP before receiving TCI activation command
- First valid L1-RSRP reporting for unknown case, if UE reports valid L3-RSRP after receiving TCI activation command

$T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

- First valid L3-RSRP reporting for unknown case, if UE reports valid L3-RSRP before receiving TCI activation command
- First valid L1-RSRP reporting for unknown case, if UE reports valid L3-RSRP after receiving TCI activation command

$T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to

- First valid L3-RSRP reporting for unknown case, if UE reports valid L3-RSRP before receiving TCI activation command
- First valid L1-RSRP reporting for unknown case, if UE reports valid L3-RSRP after receiving TCI activation command

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

Longer delays for RRM measurement requirements, and in case of FR2-1 also SSB based RLM/BFD/CBD/L1-RSRP measurement requirements, can be expected during the cell detection time for unknown SCell activation.

When *absoluteFrequencySSB* is not configured in *DownlinkConfigCommon* for target SCell but SMTC for target SCell is configured, no requirement would be applied.

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

SCell in FR1 is known if it has been meeting the following conditions:

- During the period equal to max(5*measCycleSCell, 5*DRX cycles) for FR1 before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable according to the cell identification conditions specified in clause 9.2 and 9.3.
- the SSB measured during the period equal to max(5*measCycleSCell, 5*DRX cycles) also remains detectable during the SCell activation delay according to the cell identification conditions specified in clauses 9.2 and 9.3.

Otherwise SCell in FR1 is unknown.

For the first SCell activation in FR2-1 bands, the SCell is known if it has been meeting the following conditions:

- During the period equal to 4 s for UE supporting power class 1/5 and 3 s for UE supporting power class 2/3/4 before UE receives the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and semi-persistent CSI-RS for CQI reporting (when applicable):
  - the UE has sent a valid L3-RSRP measurement report with SSB index, and
  - SCell activation command is received after L3-RSRP reporting and no later than the time when UE receives MAC-CE command for TCI activation
- During the period from L3-RSRP reporting to the valid CQI reporting, the reported SSBs with indexes remain detectable according to the cell identification conditions specified in clauses 9.2 and 9.3, and the TCI state is selected based on one of the latest reported SSB indexes.

Otherwise, the first SCell in FR2-1 band is unknown.

The requirement for unknown SCell applies provided that the activation commands for PDCCH TCI, PDSCH TCI (when applicable), semi-persistent CSI-RS for CQI reporting (when applicable), and configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) are based on either L1-RSRP or L3-RSRP if any one of them is reported before receiving TCI activation command.

If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the activation command, $T_{SMTC_Scell}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell being activated. $T_{SMTC_MAX}$ follows *smtc1* or *smtc2* according to the physical cell IDs of the target cells being activated and the active serving cells.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot slot n+1+$\frac{T_{HARQ}+3ms+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being activated, and $T_X$ is:

- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time}$ includes only $T_{FineTiming}$ and no $T_{FirstSSB_MAX}$.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

The requirements in this clause and requriements on interruption due to SCell activation in clause 8.2 apply provided that the SSB of the to-be-activated SCell is within the first active DL BWP of the Scell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

## 8.3.18 SCell Activation Delay Requirement for Deactivated SCell with Multiple Downlink SCells with L3 reporting

The requirements in this clause shall apply for the UE configured with more than one SCells and supporting *l3-MeasUnknownSCellActivation-r18* and the UE is configured with *ReportOnScellActivation*.

In EN-DC, NE-DC, standalone NR, or in one CG of NR-DC, the requirements in this clause shall apply when the following conditions are met:

- UE only receives one single MAC command for multiple SCell activation within the activation period defined in this clause, and
- in each single CG, there are no other SCell activation, deactivation, addition or release before activation is completed for all the SCells activated by the single MAC CE in this clause, and
- in EN-DC and NE-DC, there are no E-UTRAN SCell activation, deactivation, addition or release before multiple SCell activation is completed in this clause, and
- all to-be-activated SCells are unknown on the same FR2 band, and there is neither active serving cell(s) nor known SCell(s) on the same band, or,
- all to-be-activated SCells are unknown on the same FR1 band, and there is neither active serving cell contiguous to the SCell nor known SCell(s) contiguous to the to-be-activated SCell on the same band, and
- the UE reports valid L3 measurement results after receiving the SCell activation command for all the to-be-activated unknown SCells in FR1, or at least one unknown SCell in the same FR2 band

In two CGs of NR-DC, the requirements in this clause shall apply when the following conditions are met:

- UE receives one MAC command per CG for multiple SCell activation within the activation period defined in this clause, and
- UE supports per-FR measurement gap capability, and
- all to-be-activated SCells are unknown on the same FR2 band, and there is neither active serving cell(s) nor known SCell(s) on the same band, or,
- all to-be-activated SCells are unknown on the same FR1 band, and there is neither active serving cell contiguous to the SCell nor known SCell(s) contiguous to the to-be-activated SCell on the same band, and
- the UE reports valid L3 measurement results after receiving the SCell activation command for all the to-be-activated unknown SCells in FR1, or at least one unknown SCell in the same FR2 band

Otherwise, clause 8.3.7 is applied.

Upon receiving SCell activation command in slot *n* for more than one SCell, for each of the to-be-activated SCell, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot n + $\frac{T_{HARQ}+T_{activation_time_multiple_scells}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time_multiple_scells}$ is the target SCell activation delay in milliseconds in multiple SCell activation scenario.

$T_{activation_time_multiple_scells}$ is:

- 10ms + $T_{HARQ}$ + $T_{L3,report}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2ms, $T_{uncertainty_SP}$), if the semi-persistent CSI-RS is used for CSI reporting
- 7ms + $T_{L3,report}$ + max ($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5ms + $T_{FineTiming}$, $T_{uncertainty_RRC}$ + $T_{RRC_delay}$), if the periodic CSI-RS is used for CSI reporting

When the following conditions are met:

If the SCell being activated belongs to FR1 provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled:

If the target SCell belongs to FR1 and none of the following conditions is met

- 'ssb-PositionInBurst' indicates only one SSB is being actually transmitted, or
- 'ssb-PositionInBurst' indicates multiple SSBs and TCI indication is provided in same MAC PDU with SCell activation;

If the SCell being activated belongs to FR2 and the PCell or PSCell is in FR1 provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled.

Otherwise, $T_{activation_time_multiple_scells}$ in clause 8.3.7 is applied.

where,

$T_{L3\ report}$ is the delay to acquire the first available UL resource for L3 reporting from 7 ms +$T_{HARQ}$ after receiving the SCell activation command.

- The L3 reporting requirement is defined at clause 9.2.4.4
- UE is ready to report the L3 measurement result no later than 7 ms + $T_{HARQ}$ ms from receiving the SCell activation command,
- UE is not required to report the L3 measurement results after 3 ms + $T_{HARQ}$+ M ms from receiving the SCell activation command where

  For FR1,

  - M= 2*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *shortMeasInterval-r18* capability,
  - Otherwise, M = $T_{SMTC}$+$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$,

  For FR2-1,

  - M = (X1+X2)*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* and *shortMeasInterval-r18* capability,
  - M = X1*$T_{SMTC}$ +X2*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* without supporting *shortMeasInterval-r18* capability,
  - M = 16*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *shortMeasInterval-r18* without supporting *reduceForCellDetection* and *reduceForSSB-L1-RSRP-Meas* capability,
- Otherwise, M = 8*$T_{SMTC}$ +8*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$

Where, X1 and X2 are the values indicated by *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* in UE capability. $T_{SSB}$ is the same as $T_{rs,\ enhanced}$ as specified in clause 8.3.2. $T_{SMTC}$ is the same as $T_{SMTC_MAX_multiple_scells}$ as specified in clause 8.3.7.

$T_{FineTiming}$ is the time period between UE finish processing the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and the timing of first complete available SSB corresponding to the TCI state.

$T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to

- First valid L3 report for unknown case, if UE reports valid L3 report and L3 report is earlier than TCI command
- First valid L1-RSRP reporting for unknown case, if UE reports valid L3 report after TCI command

$T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

- First valid L3 report for unknown case, if UE reports valid L3 report and L3 report is earlier than TCI command

- First valid L1-RSRP reporting for unknown case, if UE reports valid L3 report after TCI command

$T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to

- First valid L3 reporting for unknown case, if UE reports valid L3 report and L3 report is earlier than TCI command

- First valid L1-RSRP reporting for unknown case, if UE reports valid L3 report after TCI command

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

When *absoluteFrequencySSB* is not configured in *DownlinkConfigCommon* for target SCell but SMTC for target SCell is configured, no requirement would be applied.

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

The condition of known SCell in FR1 or FR2 is defined in clause 8.3.2.

If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the activation command, $T_{SMTC}$ follows *smtc1* or *smtc2* according to the physical cell IDs of the target cells being activated and the active serving cells.

The starting point and the end-point of an interruption window on PCell or any activated SCell in MCG for NR standalone mode, or on PSCell or any activated SCell in SCG for EN-DC mode is same as single SCell activation requirement in clause 8.3.2.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Upon receiving SCell activation command in slot *n*, if the start of the first complete SSB used in the $T_X$ in the different bands which have SCells being activated after $n+\frac{T_{HARQ}+3ms}{NR\ slot\ length}$ are not aligned on time domain among

- SCells in different bands being activated by the same MAC CE if UE does not support per FR gap, or

- SCells in different FR1 bands being activated by the same MAC CE if UE supports per FR gap,

additional interruptions may be expected for the activated serving cells, where

- The number of additional interruptions is no more than the number of FR1 bands which have both SCell being activated for which the activation requirements involve $T_{FirstSSB_MAX\ multiple_scells}$ with $T_{rs}$ and the active serving cell, and

- In each interruption occasion, the interruption length is defined in clause 8.2.2.2.2, and

- Longer activation delay may be expected for multiple SCell activation under one MAC CE with multiple interruptions, and

- $T_X$ is:

  - $T_{FirstSSB}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FirstSSB}$;

  - $T_{FirstSSB_MAX\ multiple_scells}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FirstSSB_MAX\ multiple_scells}$;

  - $T_{uncertainty_MAC}+T_{FineTiming}$ or $T_{uncertainty_MAC\ multiple_scells}+T_{FineTiming}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FineTiming}$.

Otherwise, no additional interruption is expected due to activation of multiple SCells.

Starting from slot $n + T_{HARQ} + 3$ ms where slot $n$ is the slot where SCell activation command is received (as specified in clause 4.3 of TS 38.213 [3]) and until the SCell activation completion at UE, after at least one CSI-RS transmission occasion for the channel measurement and reporting (specified in clause 5.2.2.5 of TS 38.214 [26]), the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

## 8.3.19 OD-SSB based SCell Activation Delay Requirement for Deactivated SCell

The requirements in this clause shall apply for the UE supporting On-demand SSB operation and configured with at least one downlink OD-SSB SCell in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one OD-SSB SCell is being activated.

The requirements in the clause 8.3.19 apply, provided the following conditions are met:

- an OD-SSB transmission is activated in a configured DL BWP where a first SSB transmission is not configured, or

- an OD-SSB transmission is activated in a configured DL BWP where a first SSB transmission is configured and the OD-SSB cannot be used to obtain SIB1.

Where the first SSB transmission is specified as in TS 38.213 and have the following relations with the OD-SSB transmission:

- are with the same physical cell identity, and

- are in the same frequency location, and

- are with same sub-carrier spacing, and

- are with the same downlink transmit power, and

- are quasi co-located with respect to Doppler shift, Doppler spread, average gain, average delay, delay spread and, when applicable, spatial RX parameters, when they have a same SSB index.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot $n$, the UE shall perform SCell activation procedure based on the transmitted SSBs, where the transmitted SSBs are

- OD-SSBs being transmitted in the configured DL BWP if no first SSB transmission is configured, or the first SSB transmission is configured and the union of OD-SSBs and first SSBs has a non- periodic time domain pattern, or

- the union of OD-SSBs and first SSBs if first SSBs are transmitted and the time instance when receiving OD-SSB activation indication is no later than the time instance when receiving the SCell activation command and the union of OD-SSBs and first SSBs has a periodic time domain pattern, or

- first SSBs only if first SSBs are transmitted but no OD-SSB transmission during the SCell activation.

Upon receiving SCell activation command in slot $n$, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot $n + \frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time}$ is the SCell activation delay in milliseconds.

If the SCell is known and belongs to FR1, $T_{activation_time}$ is:

- $T_{First, OD-SSB} + T_{\Delta} + 5$ ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.

- $T_{First, OD-SSB} + T_{rs, OD-SSB} + T_{\Delta} + 5$ ms, if the measurement period of the SCell being activated is larger than 2400 ms.

If the SCell is unknown and belongs to FR1, and if one of the following conditions is met

- only one SSB is indicated in '*od-ssb-PositionInBurst*' if provided; otherwise, in *ssb-PositionsInBurst*, or

- multiple SSBs are indicated in '*od-ssb-PositionInBurst*' if provided; otherwise, in *ssb-PositionsInBurst* and TCI indication of SSBs is provided in same MAC PDU with SCell activation,

provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, $T_{activation_time}$ is:

- $T_{First, OD-SSB} + 2* T_{rs,OD-SSB} + 5$ ms, if the following conditions are met,
  - the SCell is contiguous to an active serving cell in the same band, and
  - its *od-ssb-PositionInBurst* if provided; otherwise, *ssb-PositionsInBurst* provided is the same as the one of contiguous FR1 active serving cell, and
  - OD-SSB is in the same half-frame on the SCell and the SSB of the contiguous FR1 active serving cell, and
  - its RTD with contiguous FR1 active serving cell is smaller than or equal to 260 ns with respect to the to-be-activated SCell's SSB numerology, and its reception power difference with contiguous FR1 active serving cell is smaller than or equal to 6 dB;
- $T_{First, OD-SSB} + 3*T_{rs, OD-SSB} + 5$ ms, otherwise.

Otherwise, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, $T_{activation_time}$ is:

- 6 ms + $T_{First, OD-SSB} + 2*T_{rs, OD-SSB} + T_{L1\text{-}RSRP, measure, OD-SSB} + T_{L1\text{-}RSRP, report} + T_{HARQ} + \max(T_{uncertainty_MAC} + T_{FineTiming, OD-SSB} + 2$ ms, $T_{uncertainty_SP})$, if semi-persistent CSI-RS is used for CSI reporting,
- 3 ms + $T_{First, OD-SSB} + 2*T_{rs, OD-SSB} + T_{L1\text{-}RSRP, measure, OD-SSB} + T_{L1\text{-}RSRP ,report} + \max(T_{HARQ} + T_{uncertainty_MAC} + 5$ ms + $T_{FineTiming, OD-SSB}, T_{uncertainty_RRC} + T_{RRC_delay})$, if periodic CSI-RS is used for CSI reporting.

- However, when the following conditions are fulfilled, no activation requirement will be applied for this unknown SCell:
  - the SCell is contiguous to an active serving cell in the same band, and
  - A single SSB is used in the unknown SCell; or multiple SSBs are used in the SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and
  - its *od-ssb-PositionInBurst* if provided; otherwise, *ssb-PositionsInBurst* provided is same as the one of contiguous FR1 active serving cell, and
  - OD-SSB is in the same half-frame on the SCell and the SSB of the contiguous FR1 active serving cell, and
  - its RTD with contiguous FR1 active serving cell is larger than 260 ns, or its reception power difference with contiguous FR1 active serving cell is larger than 6 dB;

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, then $T_{activation_time}$ is $T_{First, OD-SSB}$ + 5ms provided:

- the SSBs in the serving cell(s) and the SSBs in the SCell fulfil the condition defined in clause 3.6.3, and
- the parameter *od-ssb-PositionsInBurst* if provided; otherwise, *ssb-PositionsInBurst* provided if the SCell being activated is same for the serving cell(s), and
- the SSB is in the same half-frame on the SCell and the contiguous FR2 active serving cell.

If the SCell being activated belongs to FR2 and if there is no active serving cell on that FR2 band provided that PCell or PSCell is in FR1 or in FR2:

If the target SCell is known to UE and semi-persistent CSI-RS is used for CSI reporting, then $T_{activation_time}$ is:

- 3 ms + max($T_{uncertainty_MAC}$ + $T_{FineTiming, OD-SSB}$ + 2 ms, $T_{uncertainty_SP}$), where $T_{uncertainty_MAC}$=0 and $T_{uncertainty_SP}$=0, if
  - UE receives the SCell activation command, semi-persistent CSI-RS activation command and TCI state activation command at the same time, or
  - Provided this is the initial activation after SCell addition, and
    - TCI-ActivatedConfig is configured for the SCell, and UE receives the SCell activation command and semi-persistent CSI-RS activation command at the same time.

If the target SCell is known to UE and periodic CSI-RS is used for CSI reporting, then $T_{activation_time}$ is:

- max($T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming, OD-SSB}$, $T_{uncertainty_RRC}$ + $T_{RRC_delay}$-$T_{HARQ}$), where $T_{uncertainty_MAC}$=0, if
  - UE receives the SCell activation command and TCI state activation commands at the same time, or
  - Provided this is the initial activation after SCell addition, and
    - UE receives the SCell activation command and TCI-ActivatedConfig is configured for the SCell.

If the PCell/PSCell and the target SCell are configured as FR1-FR2-1 CA or if the PCell/PSCell and the target SCell are in a FR2-1 band pair with independent beam management, and the target SCell is unknown to UE and semi-persistent CSI-RS is used for CSI reporting, provided that the side condition Ês/Iot ≥ -2 dB is fulfilled, then $T_{activation_time}$ is:

- 6 ms + $T_{First, OD-SSB}$ + 23*$T_{rs, OD-SSB}$ + $T_{L1-RSRP, measure, OD-SSB}$ + $T_{L1-RSRP, report}$ + $T_{HARQ}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming, OD-SSB}$ + 2 ms, $T_{uncertainty_SP}$), or

If the PCell/PSCell and the target SCell are configured as FR1-FR2-1 CA or if the PCell/PSCell and the target SCell are in a FR2-1 band pair with independent beam management, and the target SCell is unknown to UE and periodic CSI-RS is used for CSI reporting, provided that the side condition Ês/Iot ≥ -2 dB is fulfilled, then $T_{activation_time}$ is:

- 3 ms + $T_{First, OD-SSB}$ + 23*$T_{rs, OD-SSB}$ + $T_{L1-RSRP, measure, OD-SSB}$ + $T_{L1-RSRP, report}$ + max {($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming, OD-SSB}$), ($T_{uncertainty_RRC}$ + $T_{RRC_delay}$)}.

where,

$T_{rs, OD-SSB}$ is the periodicity of the transmitted SSB.

$T_{\Delta}$ is the additional time for fine timing tracking and acquiring full timing information of the SCell. $T_{\Delta}$ = 2*$T_{rs, OD-SSB}$ ms for SCell operating with 12 PRB SSB BW. Otherwise, $T_{\Delta}$ = 0 ms.

$T_{First, OD-SSB}$ is the time to the end of the first complete transmitted SSB burst after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where the transmitted SSB is

- OD-SSB in the configured DL BWP if no first SSB transmission is configured, or
- the union of OD-SSB and first SSB if first SSB is transmitted and the time instance when receiving OD-SSB activation indication is no later than the time instance when receiving the SCell activation command, or
- first SSB only if first SSB is transmitted but no OD-SSB transmission during the SCell activation.

$T_{FineTiming, OD-SSB}$ is the time period between UE finish processing the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and the timing of first complete transmited SSB burst corresponding to the TCI state.

$T_{L1-RSRP, measure, OD-SSB}$ is the transmited SSB based L1-RSRP measurement delay $T_{L1-RSRP_Measurement_Period_SSB}$ based on applicability as defined in clause 9.5.4 assuming M=1 and $T_{Report}$=0.

$T_{L1\text{-}RSRP,\ report}$ is delay of acquiring CSI reporting resources.

$T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

Longer delays for RRM measurement requirements, and in case of FR2 also SSB based RLM/BFD/CBD/L1-RSRP measurement requirements, can be expected during the cell detection time for unknown SCell activation.

SCell in FR1 is known if it has been meeting the following conditions:

- During the period equal to max(5*measCycleSCell, 5*DRX cycles) for FR1 before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable according to the cell identification conditions specified in clause 9.2 and 9.3.
- the SSB measured during the period equal to max(5*measCycleSCell, 5*DRX cycles) or the SSB used for SCell activation which has the same SSB index of the SSB measured also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2 and 9.3.

Otherwise SCell in FR1 is unknown.

For the first SCell activation in FR2 bands, the SCell is known if it has been meeting the following conditions:

- During the period equal to 4 s for UE supporting power class 1/5 and 3 s for UE supporting power class 2/3/4 before UE receives the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and semi-persistent CSI-RS for CQI reporting (when applicable):
  - the UE has sent a valid L3-RSRP measurement report with SSB index, and
  - SCell activation command is received after L3-RSRP reporting and no later than the time when UE receives MAC-CE command for TCI activation
- During the period from L3-RSRP reporting to the valid CQI reporting, the reported SSBs with the indexes or the SSBs used for SCell activation with the same indexes remain detectable according to the cell identification conditions specified in clauses 9.2 and 9.3, and the TCI state is selected based on one of the latest reported SSB indexes.

Otherwise, the first SCell in FR2 band is unknown.

The requirement for unknown SCell applies provided that the activation commands for PDCCH TCI, PDSCH TCI (when applicable), semi-persistent CSI-RS for CQI reporting (when applicable), and configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) are based on the latest valid L1-RSRP reporting.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot slot n+1+$\frac{T_{HARQ}+3ms+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being activated, and $T_X$ is:

- 0, if $T_{activation_time}$ is 3 ms;
- $T_{First,\ OD\text{-}SSB}$, for any scenario where $T_{activation_time}$ includes $T_{First,\ OD\text{-}SSB}$;
- $T_{uncertainty_MAC}$ + $T_{FineTiming,\ OD\text{-}SSB}$, for any scenario where $T_{activation_time}$ includes only $T_{FineTiming,\ OD\text{-}SSB}$ and no $T_{First,\ OD\text{-}SSB}$.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

The requirements in this clause and requirements on interruption due to SCell activation in clause 8.2 apply provided that the first SSB and the OD-SSB of the to-be-activated SCell is within the first active DL BWP of the SCell.

No OD-SSB based SCell activation requirement applies if OD-SSB is transmitting upon UE receiving the SCell activation command but NW deactivates the OD-SSB earlier than the slot n + $\frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

## 8.3.20 OD-SSB based SCell Deactivation Delay Requirement for Activated SCell

The requirements in this clause shall apply for the UE supporting *On-demand SSB operation* configured with at least one downlink SCell, where OD-SSB transmission is activated, in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one SCell is being deactivated.

Upon receiving SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot *n* + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$. The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot n+1+$\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being deactivated.

Upon expiry of the *sCellDeactivationTimer* in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot *n* + $\frac{3ms}{NR\ slot\ length}$. The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1 and not occur after slot n+1+ $\frac{3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being deactivated.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

## 8.3.21 OD-SSB based Direct SCell Activation at SCell addition

The requirements in this clause apply for UE supporting On-demand SSB operation being configured in the RRC reconfiguration message, TS 38.331 [2], with one SCell for which the parameter *sCellState* is set to *activated* and OD-SSB configuration is provided. If the RRC reconfiguration message for OD-SSB based direct SCell activation also configures PSCell addition or PSCell change, the direct SCell activation delay may be longer than the requirements defined in this clause.

The applicability of OD-SSB based SCell activation defined in clause 8.3.19 is also applied in this clause.

The transmitted SSB defined in clause 8.3.19 is also applied in this clause for OD-SSB based direct SCell activation at SCell addition.

If the RRC reconfiguration message for direct SCell activation also configures TCI state information, the requirements in clause 8.3.x1 based on that TCI state activation command is received at the same time as SCell activation command shall apply.

The UE shall configure the SCell in activated state upon successful completion of the RRC reconfiguration procedure within the specified delay. The UE shall be capable to transmit valid CSI report and apply actions for the directly activated SCell no later than in slot n + $\frac{N_{direct}}{NR\ slot\ length}$ ,

where:

- Slot n is the last slot overlapping with the PDSCH containing the RRC reconfiguration message,
- $N_{direct} = T_{RRC_Process} + T_1 + T_{activation_time} + T_{CSI_Reporting}$ - 3 ms for the cases specified in clause 8.3.2 that TCI state is not indicated within $T_{activation_time}$; otherwise, $N_{direct} = T_{RRC_Process} + T_1 + T_{HARQ} + T_{activation_time} + T_{CSI_Reporting}$
  - $T_{RRC_Process}$: RRC procedure delay defined in clause 12 of TS 38.331 [2],
  - $T_1$: Delay from slot $n + \frac{T_{RRC_Process}}{NR\ slot\ length}$ until the transmission of *RRCReconfigurationComplete* message,

NOTE: $T_1$ is UE implementation dependent.

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],

If the SCell is known and belongs to FR1, $T_{CSI_Reporting}$ is specified in clause 8.3.x1 and $T_{activation_time}$ is defined as:

- $T_{First,\ OD\text{-}SSB}$+ 5 ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.
- $T_{First,\ OD\text{-}SSB} + T_{rs,\ OD\text{-}SSB}$ + 5 ms, if measurement period of the SCell being activated is larger than 2400 ms.

  where,

  the measurement period in table 9.2.5.2-1 applies if the target SCell was in an intra-frequency layer corresponding to an activated SCell;

  the measurement period in table 9.2.5.2-3 applies if the target SCell was in an intra-frequency layer corresponding to a deactivated SCell;

  the measurement period in table 9.3.5-1 applies if the target SCell was in an inter-frequency layer.

- Otherwise, $T_{activation_time}$ and $T_{CSI_Reporting}$ are specified in clause 8.3.x1, where the following definition of $T_{FirstSSB}$ shall override the existing one:
  - $T_{First,\ OD\text{-}SSB}$ is the time to the end of the first complete transmitted SSB burst after slot n + $\frac{T_{RRC_Process}+T_1}{NR\ slot\ length}$.
- If a UE supports, *reduceForCellDetection* and/or *reduceForSSB-L1-RSRP-Meas* capabilities, the reduced $T_{activation_time}$ specified in clause 8.3.x1 when UE supports these capabilities is applicable for Direct SCell activation at SCell addition also.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.321 [7] for an SCell at the first opportunities for the corresponding actions once the SCell is activated.

The SCell in FR1 is known provided the following conditions are met for the SCell:

- During the last 5 seconds before the reception of the direct SCell configuration command:
  - the UE has sent a valid measurement report for the SCell being directly activated, and
  - the SSB measured remains detectable according to the cell identification conditions specified in clauses 9.2 and 9.3,
- the SSB measured or the SSB used for SCell activation which has the same SSB index of the SSB measured during the period equal to 5 seconds also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2 and 9.3.

Otherwise, the SCell is unknown.

The SCell in FR2 is known provided it meets the corresponding conditions as defined in clause 8.3.x1. Otherwise, the SCell is unknown.

The UE may be allowed to cause interruptions to serving cells on other component carriers during an interruption window, as specified in clause 8.2. The starting point of an interruption window on SpCell or any activated SCell shall not occur before slot $n$+1, and shall not occur after slot $n+1+\frac{T_{RRC_Process}+T_1+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology of the SCell being activated, and $T_X$ is:

- $T_{First,\ OD\text{-}SSB}$, for any scenario where $T_{activation_time}$ includes $T_{First,\ OD\text{-}SSB}$;
- $T_{uncertainty_MAC}$ +$T_{FineTiming,\ OD\text{-}SSB}$, for any scenario where $T_{activation_time}$ includes $T_{FineTiming,\ OD\text{-}SSB}$ and no $T_{First,\ OD\text{-}SSB}$.

The length of the interruption window may be different for different victim cells and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

Starting from the slot $n + \frac{T_{RRC_Process} + T_1}{NR\ slot\ length}$ until the UE has completed the direct SCell activation, the UE shall report CQI index = 0 (out of range) if the UE has available uplink resources to report CQI for the SCell.

## 8.3.22 OD-SSB based SCell Activation Delay Requirement for Deactivated SCell with Multiple Downlink SCells

The requirements in this clause shall apply for the UE configured with more than one downlink OD-SSB based SCells.

In EN-DC, NE-DC, standalone NR carrier aggregation, or in one CG of NR-DC, the requirements in this clause shall apply when the following conditions are met:

- UE only receives one single MAC command for multiple SCell activation within the activation period defined in this clause
- in each single CG, there are no other SCell activation, deactivation, addition or release before activation is completed for all the SCells activated by the single MAC CE in this clause, and
- in EN-DC and NE-DC, there are no E-UTRAN SCell activation, deactivation, addition or release before multiple SCell activation is completed in this clause, and
- any to-be-activated unknown SCell has active serving cell(s) or known to-be-activated SCell(s) on the same band

In two CGs of NR-DC, the requirements in this clause shall apply when the following conditions are met:

- UE receives one MAC command per CG for multiple SCell activation within the activation period defined in this clause, and
- UE supports per-FR measurement gap capability, and
- any to-be-activated unknown SCell has active serving cell(s) or known to-be-activated SCell(s) on the same band

The applicability of OD-SSB based SCell activation defined in clause 8.3.19 is also applied in this clause.

The transmitted SSB defined in clause 8.3.19 is also applied in this clause for OD-SSB based multiple downlink SCells activation.

The delay within which the UE shall be able to activate the deactivated SCell with other downlink to-be-activated SCell(s) depends upon the specified conditions. The deactivated SCell and other downlink to-be-activated SCell(s) are OD-SSB based SCells.

Upon receiving SCell activation command in slot *n* for more than one SCell, for each of the to-be-activated SCell, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot $n + \frac{T_{HARQ}+T_{activation_time_multiple_scells}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time_multiple_scells}$ is the target SCell activation delay in milliseconds in multiple SCell activation scenario.

If the SCell is known and belongs to FR1 and the measurement period of the SCell being activated is equal to or smaller than 2400ms, $T_{activation_time_multiple_scells}$ is:

- $T_{First,\ OD\text{-}SSB_multiple_scells} + T_{rs,\ OD\text{-}SSB}$ + 5ms, if on the same band UE also has at least one parallel to-be-activated SCell which is FR1 known SCell with the measurement period larger than 2400ms but does not have any parallel to-be-activated SCell which is FR1 unknown SCell.

- $T_{First,\ OD\text{-}SSB_multiple_scells} + 2*T_{rs,\ OD\text{-}SSB}$ + 5ms, if on the same band UE also has at least one parallel to-be-activated SCell which is FR1 unknown SCell

- otherwise, $T_{First,\ OD\text{-}SSB_multiple_scells}$ + 5ms.

If the SCell is known and belongs to FR1 and the measurement period of the SCell being activated is larger than 2400 ms, $T_{activation_time_multiple_scells}$ is:

- $T_{First,\ OD\text{-}SSB_multiple_scells} + 2*T_{rs,\ OD\text{-}SSB}$ + 5ms, if on the same band UE also has at least one parallel to-be-activated SCell which is FR1 unknown SCell

- otherwise, $T_{First,\ OD\text{-}SSB_multiple_scells} + T_{rs,\ OD\text{-}SSB}$ + 5 ms

If the SCell is unknown and belongs to FR1, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, $T_{activation_time_multiple_scells}$ is:

- $T_{First,\ OD\text{-}SSB_multiple_scells} + 2*T_{rs,\ OD\text{-}SSB}$ +5 ms, if the SCell is not counted in $N_1$

  - The activation delay may be longer if SSB is not in the same half-frame on the SCell and the contiguous FR1 known cell or contiguous FR1 active serving cell

otherwise

- if the following conditions are met

  - its *od-ssb-PositionInBurst* if provided; otherwise, by *ssb-PositionsInBurst* indicates only one SSB is being actually transmitted, or

  - its *od-ssb-PositionInBurst* if provided; otherwise, by *ssb-PositionsInBurst* indicates multiple SSBs and TCI indication is provided in same MAC PDU with SCell activation,

- $T_{activation_time_multiple_scells}$ is:

  - $T_{First,\ OD\text{-}SSB_multiple_scells} + T_{rs,\ OD\text{-}SSB} + T_{rs,\ OD\text{-}SSB}*N_1 + T_{rs,\ OD\text{-}SSB}$ +5 ms,

- Otherwise:

  $T_{activation_time_multiple_scells}$ is:

  - 6 ms + $T_{First,\ OD\text{-}SSB_multiple_scells} + T_{rs,\ OD\text{-}SSB} + T_{rs,\ OD\text{-}SSB}*N_1 + T_{L1\text{-}RSRP,\ measure,\ OD\text{-}SSB} + T_{L1\text{-}RSRP,report} + T_{HARQ} + \max(T_{uncertainty_MAC_multiple_scells} + T_{FineTiming,\ OD\text{-}SSB} + 2\ ms, T_{uncertainty_SP_multiple_scells})$, if semi-persistent CSI-RS is used for CSI reporting,

- 3 ms + $T_{First, OD-SSB_multiple_scells}$ + $T_{rs, OD-SSB}$ + $T_{rs, OD-SSB}$*$N_1$ + $T_{L1-RSRP, measure, OD-SSB}$ + $T_{L1-RSRP,report}$ + max($T_{HARQ}$ + $T_{uncertainty_MAC_multiple_scells}$ + 5 ms + $T_{FineTiming, OD-SSB}$, $T_{uncertainty_RRC_multiple_scells}$ + $T_{RRC_delay}$), if periodic CSI-RS is used for CSI reporting.

If the SCell being activated belongs to FR1 and if there is at least one active serving cell contiguous to the SCell on that FR1 band, if the UE is not provided with SSB configuration (*absoluteFrequencySSB*) nor SMTC configuration for the target SCell, $T_{activation_time_multiple_scells}$ is same as single SCell activation delay requirement as defined in clause 8.3.x1.

If the SCell being activated belongs to FR2 and if there is at least one active serving cell on that FR2 band, then $T_{activation_time_multiple_scells}$ is same as single SCell activation delay requirement as defined in clause 8.3.x1.

If the SCell being activated belongs to FR2 and if there is no active serving cell on that FR2 band provided that PCell or PSCell is FR1:

If the target SCell is known to UE and semi-persistent CSI-RS is used for CSI reporting, then $T_{activation_time_multiple_scells}$ is same as single SCell activation delay requirement as defined in clause 8.3.x1.

If the target SCell is known to UE and periodic CSI-RS is used for CSI reporting, then $T_{activation_time_multiple_scells}$ is same as single SCell activation delay requirement as defined in clause 8.3.x1.

If the target SCell is unknown to UE and semi-persistent CSI-RS is used for CSI reporting, provided that the side condition $\hat{E}s/Iot \geq -2dB$ is fulfilled, then $T_{activation_time_multiple_scells}$ is:

- 3 ms + max($T_{uncertainty_MAC_multiple_scells}$ +$T_{FineTiming, OD-SSB}$ + 2ms, $T_{uncertainty_SP_multiple_scells}$), if on the same band UE also has at least one parallel to-be-activated SCell which is FR2 known SCell. $T_{uncertainty_MAC_multiple_scells}$ =0 and $T_{uncertainty_SP_multiple_scells}$ =0 if

- UE receives the SCell activation command, semi-persistent CSI-RS activation command and TCI state activation commands at the same time, or

- Provided this is the initial activation after SCell addition, and

  - TCI-ActivatedConfig is configured for the SCell, and UE receives the SCell activation command and semi-persistent CSI-RS activation command at the same time.

If the target SCell is unknown to UE and periodic CSI-RS is used for CSI reporting, provided that the side condition $\hat{E}s/Iot \geq -2dB$ is fulfilled, then $T_{activation_time_multiple_scells}$ is:

- max($T_{uncertainty_MAC_multiple_scells}$ + 5ms + $T_{FineTiming, OD-SSB}$, $T_{uncertainty_RRC_multiple_scells}$ + $T_{RRC_delay}$-$T_{HARQ}$), if on the same band UE also has at least one parallel to-be-activated SCell which is FR2 known SCell. $T_{uncertainty_MAC_multiple_scells}$ =0 if:

- UE receives the SCell activation command and TCI state activation commands at the same time, or

- Provided this is the initial activation after SCell addition, and

  - UE receives the SCell activation command and TCI-ActivatedConfig is configured for the SCell.

The requirements for FR2 unknown SCells apply provided that the parameter *od-ssb-PositionsInBurst* if provided; otherwise, by *ssb-PositionsInBurst* is same for the SCell and the known serving cell on the same FR2 band. The activation delay FR2 unknown SCell may be longer if SSB is not in the same half-frame on the SCell and the FR2 known cell on the same band.

Where,

$N_1$ is the number counting for parallel FR1 unknown to-be-activated SCell(s) only except the ones which fulfilled the following conditions:

- contiguous to an active serving cell in the same band, or to a known SCell in the same band being activated by the same MAC PDU, and

- A single SSB is used in the unknown SCell; or multiple SSBs are used in the unknown SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and

- its *od-ssb-PositionsInBurst* if provided; otherwise, by *ssb-PositionInBurst* is same as the one of contiguous FR1 known cell or contiguous FR1 active serving cell, and

- its RTD with contiguous FR1 known cell or contiguous FR1 active serving cell is smaller than or equal to 260 ns and its reception power difference with contiguous FR1 known cell or contiguous FR1 active serving cell is smaller than or equal to 6 dB, and

- its transmitted SSB offset is same as the one of contiguous FR1 known cell or contiguous FR1 active serving cell

However, when the following conditions are fulfilled, no activation requirement will be applied for this unknown SCell and other SCells being activated and counted in $N_1$:

- contiguous to an active serving cell in the same band, or to a known SCell in the same band being activated by the same MAC PDU, and

- A single SSB is used in the unknown SCell; or multiple SSBs are used in the unknown SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and

- its *od-ssb-PositionsInBurst* if provided; otherwise, by *ssb-PositionInBurst* is same as the one of FR1 known cell or FR1 active serving cell, and

- its RTD with contiguous FR1 known cell or contiguous FR1 active serving cell is larger than 260 ns or its reception power difference with contiguous FR1 known cell or contiguous FR1 active serving cell is larger than 6 dB, and

- its transmitted SSB offset is same as the one of FR1 known cell or FR1 active serving cell

$T_{First,\ OD\text{-}SSB_multiple_scells}$ is the time to the end of the first complete transmitted SSB burst after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, further fulfilling:

- In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCells being activated are transmitting SSB burst.

- In FR2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.

$T_{uncertainty_MAC_multiple_scells}$ is the time period between reception of the activation command for PDCCH TCI, PDSCH TCI (when applicable) and SCell activation command of this unknown SCell.

$T_{uncertainty_SP_multiple_scells}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting and SCell activation command of this unknown SCell.

$T_{uncertainty_RRC_multiple_scells}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) and SCell activation command of this unknown SCell.

$T_{rs,\ OD\text{-}SSB}$, $T_{FineTiming,\ OD\text{-}SSB}$, and $T_{RRC_delay}$ is defined in clause 8.3.x1.

Longer delays for RRM measurement requirements, and in case of FR2 also SSB based RLM/BFD/CBD/L1-RSRP measurement requirements, can be expected during the cell detection time for unknown SCell activation.

The condition of known SCell in FR1 or FR2 is defined in clause 8.3.x1.

The starting point and the end-point of an interruption window on PCell or any activated SCell in MCG for NR standalone mode, or on PSCell or any activated SCell in SCG for EN-DC mode is same as single SCell activation requirement in clause 8.3.2.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Upon receiving SCell activation command in slot *n*, if the start of the first complete transmitted SSB used in the $T_X$ in the different bands which have SCells being activated after $n+\frac{T_{HARQ}+3ms}{NR\ slot\ length}$ are not aligned on time domain among

- SCells in different bands being activated by the same MAC CE if UE does not support per FR gap, or
- SCells in different FR1 bands being activated by the same MAC CE if UE supports per FR gap,

additional interruptions may be expected for the activated serving cells, where

- The number of additional interruptions is no more than the number of FR1 bands which have both SCell being activated for which the activation requirements involve $T_{First, OD-SSB_multiple_scells}$ with $T_{rs, OD-SSB}$ and the active serving cell, and
- In each interruption occasion, the interruption length is defined in clause 8.2.2.2.2, and
- Longer activation delay may be expected for multiple SCell activation under one MAC CE with multiple interruptions, and
- $T_X$ is:
  - $T_{First, OD-SSB}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{First, OD-SSB}$;
  - $T_{First, OD-SSB_multiple_scells}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{First, OD-SSB_multiple_scells}$;
  - $T_{uncertainty_MAC} + T_{FineTiming, OD-SSB}$ or $T_{uncertainty_MAC\ multiple_scells} + T_{FineTiming, OD-SSB}$, for any scenario where $T_{activation_time\ multiple_scells}$ includes $T_{FineTiming, OD-SSB}$.

Otherwise, no additional interruption is expected due to activation of multiple SCells.

Starting from slot $n + T_{HARQ} + 3$ ms where slot $n$ is the slot where SCell activation command is received (as specified in clause 4.3 of TS 38.213 [3]) and until the SCell activation completion at UE, after at least one CSI-RS transmission occasion for the channel measurement and reporting (specified in clause 5.2.2.5 of TS 38.214 [26]), the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

## 8.3.23 OD-SSB based SCell Deactivation Delay Requirement for Activated SCell with Multiple Downlink SCells

The requirements in this clause shall apply for the UE supporting *On-demand SSB operation* configured with multiple downlink SCells, where OD-SSB transmission is activated, in EN-DC, or in standalone NR carrier aggregation, or in NE-DC, or in NR-DC, provided that,

- in each single CG, there are no other SCell activation, deactivation, addition or release before deactivation is completed for all the SCells deactivated by the single MAC CE in this clause, and
- in EN-DC and NE-DC, there are no E-UTRAN SCell activation, deactivation, addition or release before multiple SCell deactivation is completed in this clause, and
- in EN-DC, NE-DC, NR-DC and standalone NR, UE only receives one single MAC command for multiple SCell deactivation within the deactivation period defined in this clause, or, in NR-DC, per-FR measurement gap capable UE receives one MAC command per CG for multiple SCell deactivation within the deactivation period defined in this clause

Upon receiving SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated within the same delay as specified in clause 8.3.20.

The starting point and the end-point of an interruption window on PCell or any activated SCell in MCG for NR standalone mode, or on PSCell or any activated SCell in SCG for EN-DC mode is same as single SCell activation requirement in clause 8.3.20.

## 8.3.24 SCell Activation Delay Requirement for Deactivated PUCCH SCell based on OD-SSB

The requirements in this clause shall apply for the UE configured with one downlink SCell and when PUCCH is configured for the SCell being activated.

For a UE supporting OD-SSB operation and OD-SSB transmission is indicated, if UE receives PUCCH SCell activation command together with on-demand SSB activation command, UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated on the PUCCH SCell as required by clause 8.3.12, expect $T_{activation_time}$. $T_{activation_time}$ is defined in clause 8.3.19.

## 8.3.25 OD-SSB based SCell Deactivation Delay Requirement for Activated PUCCH SCell

The requirements in this clause shall apply for the UE supporting *On-demand SSB operation* configured with one SCell configured with PUCCH, where OD-SSB transmission is activated, in EN-DC, or in standalone NR carrier aggregation, or in NE-DC.

Upon receiving PUCCH SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the PUCCH SCell being deactivated no later than in slot $n + \frac{T_{HARQ}+3ms}{NR\,slot\,length}$. The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot $n+1+\frac{T_{HARQ}}{NR\,slot\,length}$ and not occur after slot $n+1+\frac{T_{HARQ}+3ms}{NR\,slot\,length}$, where NR slot length is with respect to the numerology used in the PUCCH SCell being deactivated.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

## 8.3.26 OD-SSB based SCell Activation Delay Requirement for Deactivated SCell with the L3 reporting during activation

The requirements in this clause shall apply for UE supporting *l3-MeasUnknownSCellActivation-r18* and *On-demand SSB operation* and reporting valid L3 measurement results after receiving the SCell activation command for unknown SCell configured with OD-SSB operation. The requirements in this clause shall apply for the UE configured with one downlink OD-SSB SCell in EN-DC, or in standalone NR carrier aggregation or in NE-DC or in NR-DC and when one SCell is being activated. Clause 8.3.19 is applied for UE who does not report L3 measurement results after receiving SCell activation command for unknown OD-SSB SCell.

The requirements in clause 8.3.17 shall apply, except that the definitions of following parameters are replaced with:

- $T_{FineTiming}$ is the same as $T_{FineTiming,\ OD\text{-}SSB}$ as specified in clause 8.3.19.
- $T_{SSB}$ is the same as $T_{rs,\ OD\text{-}SSB}$ as specified in clause 8.3.19.
- $T_{SMTC}$ is the same as $T_{rs,\ OD\text{-}SSB}$ as specified in clause 8.3.19.
- *ssb-PositionInBurst* is replaced with *od-ssb-PositionsInBurst* if provided.

The OD-SSB SCell in FR1 or FR2 is known if it has been meeting the corresponding known conditions as defined in clause 8.3.19. Otherwise, the OD-SSB SCell is unknown.

# 8.3A SCell Activation and Deactivation Delay in Carriers with CCA

## 8.3A.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to activate a deactivated SCell operating with CCA and deactivate an activated SCell operating with CCA in EN-DC or in standalone NR carrier aggregation.

In the requirements of clause 8.3A, the term SMTC occasion not available at the UE refers to when the SMTC contains SSBs configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SSB index within the discovery burst transmission window are not available at the UE due to DL CCA failures at gNB during the corresponding period; otherwise the SMTC occasion is considered as available at the UE.

In the requirements of clause 8.3A, the term CSI-RS occasion not available at the UE due to DL CCA failures referes to when the CSI-RS is configured by gNB for the UE but not available at the UE due to DL CCA failures at gNB during the corresponding period.

The requirements shall apply for EN-DC and standalone NR carrier aggregation.

## 8.3A.2 SCell Activation Delay Requirement for Deactivated SCell

The requirements in this clause shall apply for the UE configured with at least one downlink SCell operating with CCA in EN-DC or in standalone NR carrier aggregation and when one SCell operating with CCA is being activated but none of the RRC parameters *CO-DurationPerCell-r16*, *SlotFormatIndicator*, and *CSI-RS-ValidationWith-DCI-r16* is configured and all of the CSI reporting resources for being-activated SCell are available.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot *n*, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot n + ($T_{HARQ}$ + $T_{activation_time_withCCA}$ + $T_{CSI_reporting_withCCA}$)/*NR_slot_length*, where:

- $T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]. In the event of UE not being able to transmit the acknowledgment due to UL CCA failures: $T_{HARQ}$ is extended to also include the time to all next HARQ feedback transmission and retransmission opportunities, until the time of its successful transmission, as specified in TS 38.213 [3]; no extension of $T_{HARQ}$ due to UL CCA failures is allowed for Type 2C UL channel access procedure as defined in TS 37.213 [33].

  - $T_{activation_time_withCCA}$ is the SCell activation delay in milliseconds.

    - If the SCell is known and belongs to FR1, $T_{activation_time_withCCA}$ is:

      - $T_{FirstSSB} + L_1 * T_{rs}$ + 5 ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.

      - $T_{FirstSSB_MAX} + L_{2,1} * T_{SMTC_MAX} + (1 + L_{2,2}) * T_{rs}$ + 5 ms, if the measurement period of the SCell being activated is larger than 2400 ms.

    - If the SCell is unknown and belongs to FR1, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled and the SCell can be successfully detected in one attempt, $T_{activation_time_withCCA}$ is:

    - $T_{FirstSSB_MAX} + (1 + L_{3,1}) * T_{SMTC_MAX} + (2 + L_{3,2}) * T_{rs}$ + 5 ms.

    - If the SCell being activated belongs to FR2-2 and if there is at least one active serving cell on that FR2-2 band, if the UE supporting *scellWithoutSSB* is not provided with any SMTC for the target SCell, $T_{activation_time_withCCA}$ is 3 ms, provided

      - the RS (s) of SCell being activated is (are) QCL-TypeD with RS (s) of one active serving cell on that FR2-2 band.

- If the SCell being activated belongs to FR2-2 and if there is no active serving cell on that FR2-2 band provided that PCell or PSCell is in FR1 or in FR2-2:

  - If the target SCell is known to UE and semi-persistent CSI-RS is used for CSI reporting, then $T_{activation_time_withCCA}$ is:

    - 3 ms + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2 ms, $T_{uncertainty_SP}$), where $T_{uncertainty_MAC}$=0 and $T_{uncertainty_SP}$=0 if UE receives the SCell activation command, semi-persistent CSI-RS activation command and TCI state activation command at the same time.

  - If the target SCell is known to UE and periodic CSI-RS is used for CSI reporting, then $T_{activation_time}$ is:

    - max($T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$, $T_{uncertainty_RRC}$ + $T_{RRC_delay}$-$T_{HARQ}$), where $T_{uncertainty_MAC}$=0 if UE receives the SCell activation command and TCI state activation commands at the same time.

  - If the PCell/PSCell and the target SCell are configured as FR1-FR2-2 CA or if the PCell/PSCell and the target SCell are in a FR2-2 band pair with independent beam management, and the target SCell is unknown to UE and semi-persistent CSI-RS is used for CSI reporting, provided that the side condition Ês/Iot ≥ -2 dB is fulfilled, then $T_{activation_time_withCCA}$ is:

    - 6 ms + $T_{FirstSSB_MAX}$ + (23+N*$L_{4,1}$)*$T_{SMTC_MAX}$ + (12+N *$L_{4,2}$)*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ + $T_{HARQ}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2 ms, $T_{uncertainty_SP}$).

  - If the PCell/PSCell and the target SCell are configured as FR1-FR2-2 CA or if the PCell/PSCell and the target SCell are in a FR2-2 band pair with independent beam management, and the target SCell is unknown to UE and periodic CSI-RS is used for CSI reporting, provided that the side condition Ês/Iot ≥ -2 dB is fulfilled, then $T_{activation_time_withCCA}$ is:

    - 3 ms + $T_{FirstSSB_MAX}$ + (23+N*$L_{5,1}$)*$T_{SMTC_MAX}$ + (12+N *$L_{5,2}$)*$T_{rs}$ + $T_{L1\text{-}RSRP,\ measure}$ + $T_{L1\text{-}RSRP,\ report}$ + max {($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$), ($T_{uncertainty_RRC}$ + $T_{RRC_delay}$)}.

  Where,

  $T_{SMTC_MAX}$:

  - In case of intra-band SCell activation, $T_{SMTC_MAX}$ is the longest SMTC periodicity between active serving cells and SCell being activated provided the cell specific reference signals from the active serving cells and the SCells being activated or released are available in the same slot;

  - In case of inter-band SCell activation, $T_{SMTC_MAX}$ is the SMTC periodicity of SCell being activated;

  - $T_{SMTC_MAX}$ is bounded to a minimum value of 10 ms.

  $T_{rs}$ is the SMTC periodicity of the SCell being activated if the UE has been provided with an SMTC configuration for the SCell in SCell addition message, otherwise $T_{rs}$ is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement which involves $T_{rs}$ is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There are no requirements if the SSB transmission periodicity is not 5 ms

  $T_{FirstSSB}$: is the time to the end of the first complete configured SSB burst indicated by the SMTC after slot n + ($T_{HARQ}$+3 ms)/*NR_slot_length*

  $T_{FirstSSB_MAX}$: is the time to the end of first complete configured SSB burst indicated by the SMTC after slot n + ($T_{HARQ}$+3 ms)/*NR_slot_length* when all active serving cells and SCells being activated or released have configured SSB bursts in the same slot for intra-band scenario. In case of inter-band SCell activation, $T_{FirstSSB_MAX}$ is the time to the end of the first complete configured SSB burst of the SCell being activated. In FR2-2, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot.

  $L_1$ ($L_1 \leq L_{1,max}$) is the number of configured SMTC occasions not available at the UE. $L_{1,max}$ = 2 if $T_{rs} \leq$ 40 ms; otherwise $L_{1,max}$ = 1.

  $L_{2,1}$ ($L_{2,1} \leq L_{2,1,max}$) and $L_{3,1}$ ($L_{3,1} \leq L_{3,1,max}$) are the numbers of configured SMTC occasions not available at the UE, for a known and unknown SCell activation respectively,

in the SCell being activated, for inter-band scenario, or

in any of the SCells already activated or being activated provided their cell specific reference signals are configured in the same slot, for intra-band scenario

and $L_{2,1,max} = 2$ if $T_{SMTC_MAX} \leq 40$ ms; otherwise $L_{2,1,max} = 1$. $L_{3,1,max} = 2$ if $T_{SMTC_MAX} \leq 40$ ms; otherwise $L_{3,1,max} = 1$.

$L_{2,2}$ ($L_{2,2} \leq L_{2,2,max}$) and $L_{3,2}$ ($L_{3,2} \leq L_{3,2,max}$) are the number of configured SMTC occasions not available at the UE in the SCell being activated. $L_{2,2,max} = 2$ if $T_{rs} \leq 40$ ms; otherwise $L_{2,2,max} = 1$. $L_{3,2,max} = 2$ if $T_{rs} \leq 40$ ms; otherwise $L_{3,2,max} = 1$.

N = 12 for an FR2-2 unknown SCell activation.

$L_{4,1}$ ($L_{4,1} \leq L_{4,1,max}$) and $L_{5,1}$ ($L_{5,1} \leq L_{5,1,max}$) are the numbers of SMTC occasions groups not available at the UE, for an FR2-2 unknown SCell activation,

in the SCell being activated, for inter-band scenario, or

in any of the SCells already activated or being activated provided their cell specific reference signals are configured in the same slot, for intra-band scenario

and $L_{4,1,max} = 2$ if $T_{SMTC_MAX} \leq 40$ ms; otherwise $L_{4,1,max} = 1$. $L_{5,1,max} = 2$ if $T_{SMTC_MAX} \leq 40$ ms; otherwise $L_{5,1,max} = 1$.

$L_{4,2}$ ($L_{4,2} \leq L_{4,2,max}$) and $L_{5,2}$ ($L_{5,2} \leq L_{5,2,max}$) are the number of SMTC occasions groups not available at the UE in the FR2-2 unknown SCell being activated. $L_{4,2,max} = 2$ if $T_{rs} \leq 40$ ms; otherwise $L_{4,2,max} = 1$. $L_{5,2,max} = 2$ if $T_{rs} \leq 40$ ms; otherwise $L_{5,2,max} = 1$.

$T_{FineTiming}$ is the time period between UE finish processing the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and the timing of first complete available SSB corresponding to the TCI state.

$T_{L1\text{-}RSRP,\ measure}$ is L1-RSRP measurement delay $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$ ms as defined in clause 9.5A.4.1 with the assumption of M=1.

$T_{L1\text{-}RSRP,\ report}$ is delay of acquiring CSI reporting resources.

$T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

Longer delays for RRM measurement requirements, and in case of FR2-2 also SSB based RLM/BFD/CBD/L1-RSRP measurement requirements, can be expected during the cell detection time for unknown SCell activation.

When *absoluteFrequencySSB* is not configured in *DownlinkConfigCommon* for target SCell but SMTC for target SCell is configured, no requirements apply.

$T_{CSI_reporting_withCCA} = T_{CSI_reporting} + T_{CSI_ReportingDelay}$ , where

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

$T_{CSI_ReportingDelay}$ is the additional delay in transmission of CSI reporting due to UL CCA failures at the UE. If there are no uplink resources for reporting the valid CSI, then the UE shall use the next available opportunities for reporting the corresponding valid CSI as specified in TS 38.213 [3].

Upon exceeding any of the maximum numbers $L_{1,max}$, $L_{2,1,max}$, $L_{2,2,max}$, $L_{3,1,max}$, and $L_{3,2,max}$ of SMTC occasions or CSI-RS occasions, respectively, not available at the UE, the UE shall abandon the SCell activation procedure.

SCell operating with CCA in FR1 is known if it has been meeting the following conditions:

- During the period equal to max(5 measCycleSCell, 5 DRX cycles) before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable in the SMTC occasions available at the UE, according to the cell identification conditions specified in clause 9.2A and 9.3A.
- the SSB measured during the period equal to max(5 measCycleSCell, 5 DRX cycles) also remains detectable - the SSB measured during the period equal to max(5 measCycleSCell, 5 DRX cycles) also remains detectable in the SMTC occasions available at the UE during the SCell activation delay according to the cell identification conditions specified in clause 9.2A and 9.3A.

Otherwise SCell operating with CCA in FR1 is unknown.

For the first SCell activation with CCA in FR2-2 bands, the SCell is known if it has been meeting the following conditions:

- During the period equal to 4 s for UE supporting power class 1/5 and 3 s for UE supporting power class 2/3/4 before UE receives the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and semi-persistent CSI-RS for CQI reporting (when applicable):
  - the UE has sent a valid L3-RSRP measurement report with SSB index
  - SCell activation command is received after L3-RSRP reporting and no later than the time when UE receives MAC-CE command for TCI activation
- During the period from L3-RSRP reporting to the valid CQI reporting, the reported SSBs with indexes remain detectable according to the cell identification conditions specified in clauses 9.2 and 9.3, and the TCI state is selected based on one of the latest reported SSB indexes.

Otherwise, the first SCell with CCA in FR2-2 band is unknown. The requirement for unknown SCell applies provided that the activation commands for PDCCH TCI, PDSCH TCI (when applicable), semi-persistent CSI-RS for CQI reporting (when applicable), and configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) are based on the latest valid L1-RSRP reporting.

If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the activation command, $T_{SMTC_Scell}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell being activated. $T_{SMTC_MAX}$ follows *smtc1* or *smtc2* according to the physical cell IDs of the target cells being activated and the active serving cells.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

For intra-band CA, the starting point of an interruption window on SpCell or any activated SCell as specified in clause 8.2, shall not occur before slot $n+1+\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot $n+1+\frac{T_{HARQ}+3+T_X}{NR\ slot\ length}$, where $T_X$ is:

- $T_{FirstSSB}$, for known SCell activation when SCell measurement cycle is equal to or smaller than 160 ms;
- $T_{FirstSSB_MAX} + L_{2,1} * T_{SMTC_MAX}$ for known SCell activation when SCell measurement cycle is greater than 160 ms;

- $T_{FirstSSB_MAX} + L_{3,1} * T_{SMTC_MAX}$ for unknown SCell activation

For inter-band CA, the starting point of an interruption window on SpCell or any activated SCell as specified in clause 8.2, shall not occur before slot n+1+ $\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot n+1+$\frac{T_{HARQ}+3+T_X}{NR\ slot\ length}$, where $T_X$ is:

- $T_{FirstSSB}$, for known SCell activation when SCell measurement cycle is equal to, or smaller than, 160 ms.

For intra-band CA,

- While the SCell being activated is known with measurement cycle equal to or smaller than 160 ms, no more than one interruption is allowed during SCell activation.
- While the SCell being activated is known with measurement cycle greater than 160 ms, up to $1+L_{2,1}$ interruptions are allowed during SCell activation,
- While the SCell being activated is unknown, up to $1+L_{3,1}$ interruptions are allowed during SCell activation. When $L_{3,1}>0$, performance degradation may be expected on any activated intra-band victim cells during the SCell activation
- For a single interruption (L=0), interruption window length at SCell activation does not depend on DL CCA failures.

For inter-band CA,

- For any active cell in the same band with the SCell being activated, the interruption requirements (i.e. number of interruptions and starting point of an interruption) for intra-band CA apply.
- For any active cell outside the band with the SCell being activated, a single interruption applies

The number of interruptions and length of each interruption window may be different for different victim cells and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell. For a single interruption (L=0), the interruption window length at SCell activation does not depend on DL CCA failures.

Starting from slot *n* + $T_{HARQ}$ + 3 ms where slot *n* is the slot where SCell activation command is received (as specified in clause 4.3 of TS 38.213 [3]) and until the SCell activation completion at UE, after at least one CSI-RS transmission occasion for the channel measurement and reporting (specified in clause 5.2.2.5 of TS 38.214 [26]), the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

The requirements in this clause do not apply when *sCellDeactivationTimer* [2] is not configured and when $T_{activation_time_withCCA}$ exceeds 1280 ms.

## 8.3A.3 SCell Deactivation Delay Requirement for Activated SCell

The requirements in this clause shall apply for the UE configured with at least one downlink SCell operating with CCA in EN-DC or in standalone NR carrier aggregation and one SCell is deactivated.

Upon receiving SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot *n*+($T_{HARQ}$ +3 ms)/*NR_slot_length*. The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot n+1+$\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being deactivated.

Upon expiry of the *sCellDeactivationTimer* in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot *n* + $\frac{3ms}{NR\ slot\ length}$. The starting point of an interruption window on SpCell or any activated SCell, as specified in clause 8.2, shall not occur before slot n+1 and not occur after slot n+1+ $\frac{3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being deactivated. The length of the

interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

The requirements in this clause do not apply when *sCellDeactivationTimer* [2] is not configured and when SCell deactivation delay exceeds 1280 ms.

# 8.3D SCell Activation and Deactivation Delay for ATG

## 8.3D.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to activate at least one deactivated SCell and deactivate at least one activated SCell in standalone NR carrier aggregation.

## 8.3D.2 SCell Activation Delay Requirement for Deactivated SCell

The requirements in this clause shall apply for the UE configured with at least one downlink SCell in standalone NR carrier aggregation and when one SCell is being activated.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot *n*, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot n + $\frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time}$ is the SCell activation delay in milliseconds.

If the SCell is known and belongs to FR1, $T_{activation_time}$ is:

- $T_{FirstSSB}$+ 5 ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.
- $T_{FirstSSB_MAX}$ + $T_{rs}$ + 5 ms, if the measurement period of the SCell being activated is larger than 2400 ms.

If the SCell is unknown and belongs to FR1, and if one of the following conditions is met

- ‘ssb-PositionInBurst’ indicates only one SSB is being actually transmitted, or
- ‘ssb-PositionInBurst’ indicates multiple SSBs and TCI indication is provided in same MAC PDU with SCell activation,

provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, $T_{activation_time}$ is:

- If UE supports *shortMeasInterval-r18*, then
  - $T_{FirstSSB_MAX,\ enhanced}$ + $T_{SMTC_MAX,\ enhanced}$ + $T_{rs,\ enhanced}$ + 5 ms, if the following conditions are met,
    - the SCell is contiguous to an active serving cell in the same band, and
    - its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
    - its SMTC offset is same as the one of contiguous FR1 active serving cell, and
    - its RTD with contiguous FR1 active serving cell is smaller than or equal to 260 ns with respect to the to-be-activated SCell’s SSB numerology, and its reception power difference with contiguous FR1 active serving cell is smaller than or equal to 6 dB;
  - $T_{FirstSSB_MAX,\ enhanced}$ + $T_{SMTC_MAX,\ enhanced}$ + 2*$T_{rs,\ enhanced}$ + 5 ms, otherwise.
- Otherwise
  - $T_{FirstSSB_MAX}$ + $T_{SMTC_MAX}$ + $T_{rs}$ + 5 ms, if the following conditions are met,

- the SCell is contiguous to an active serving cell in the same band, and
- its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
- its SMTC offset is same as the one of contiguous FR1 active serving cell, and
- its RTD with contiguous FR1 active serving cell is smaller than or equal to 260 ns, and its reception power difference with contiguous FR1 active serving cell is smaller than or equal to 6 dB;

- $T_{FirstSSB_MAX} + T_{SMTC_MAX} + 2*T_{rs}$ + 5 ms, otherwise.

Otherwise, provided that the side condition $\hat{E}s/Iot \geq$ -2 dB is fulfilled, $T_{activation_time}$ is:

- If UE supports *shortMeasInterval-r18*, then
  - 6 ms + $T_{FirstSSB_MAX, enhanced} + T_{SMTC_MAX, enhanced} + T_{rs, enhanced} + T_{L1\text{-}RSRP, enhanced_measure} + T_{L1\text{-}RSRP, report} + T_{HARQ} + \max(T_{uncertainty_MAC} + T_{FineTiming} + 2 \text{ ms}, T_{uncertainty_SP})$, if semi-persistent CSI-RS is used for CSI reporting,
  - 3 ms + $T_{FirstSSB_MAX, enhanced} + T_{SMTC_MAX, enhanced} + T_{rs, enhanced} + T_{L1\text{-}RSRP, enhanced_measure} + T_{L1\text{-}RSRP ,report} + \max(T_{HARQ} + T_{uncertainty_MAC} + 5 \text{ ms} + T_{FineTiming}, T_{uncertainty_RRC} + T_{RRC_delay})$, if periodic CSI-RS is used for CSI reporting.
- Otherwise
  - 6 ms + $T_{FirstSSB_MAX} + T_{SMTC_MAX} + T_{rs} + T_{L1\text{-}RSRP, measure} + T_{L1\text{-}RSRP,report} + T_{HARQ} + \max(T_{uncertainty_MAC} + T_{FineTiming} + 2 \text{ ms}, T_{uncertainty_SP})$, if semi-persistent CSI-RS is used for CSI reporting,
  - 3 ms + $T_{FirstSSB_MAX} + T_{SMTC_MAX} + T_{rs} + T_{L1\text{-}RSRP, measure} + T_{L1\text{-}RSRP,report} + \max(T_{HARQ} + T_{uncertainty_MAC} + 5 \text{ ms} + T_{FineTiming}, T_{uncertainty_RRC} + T_{RRC_delay})$, if periodic CSI-RS is used for CSI reporting.
- However, when the following conditions are fulfilled, no activation requirement will be applied for this unknown SCell:
  - the SCell is contiguous to an active serving cell in the same band, and
  - A single SSB is used in the unknown SCell; or multiple SSBs are used in the SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and
  - its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
  - its SMTC offset is same as the one of contiguous FR1 active serving cell
  - its RTD with contiguous FR1 active serving cell is larger than 260 ns, or its reception power difference with contiguous FR1 active serving cell is larger than 6 dB;

If the SCell being activated belongs to FR1 and if there is at least one active serving cell contiguous to the SCell on that FR1 band, if the UE is not provided with SSB configuration (*absoluteFrequencySSB*) or SMTC configuration for the target SCell, $T_{activation_time}$ is 3 ms for UE supporting *scellWithoutSSB*, provided

- The RTD between the target SCell and the contiguous active serving cell is within ±260ns, and
- The difference of the reception power with the contiguous active serving cell is <= 6 dB, and
- The RS(s) of SCell being activated is (are) QCL-TypeA with TRS(s) of the SCell being activated, and the TRS(s) of the SCell being activated is (are) further QCL-TypeC with SSB(s) of any active serving cell that is contiguous to the SCell being activated on that FR1 band.

For a UE supporting *scellWithoutSSB-InterBandCA-r18* if the SCell being activated belongs to FR1 and if the UE is not provided with SSB configuration (*absoluteFrequencySSB*) in the target SCell (FrequencyInfoDL) nor SMTC configuration for the target SCell, and if there is one collocated active reference serving cell on different FR1 band, when the following conditions are fulfilled,

- The RTD between the target SCell and the collocated reference serving cell is within CP where CP is corresponding to the SCS of SSB-less SCell, and

- The EPRE difference at the UE is smaller than or equal to 30 dB, where EPRE difference is the power difference between TRS/A-TRS symbol on the SSB-less SCell and SSB symbol on the reference serving cell normalized by SCSs of SSB of reference cell and A-TRS/P-TRS of SSB-less SCell, and

- The RS(s) of the SSB-less SCell being activated is (are) QCL-TypeA with TRS(s) of the SSB-less SCell being activated, and the TRS(s) of the SSB-less SCell being activated is (are) further QCL-TypeC with SSB(s) of an inter-band active serving cell, and the inter-band active serving cell shall be same as the reference serving cell.

where the reference serving cell can be indicated by higher layer parameter *referenceCell-r18*. If UE is not indicated with *referenceCell-r18*, the reference serving cell is assumed to be the QCL-typeC source cell if there is only one active QCL-typeC source cell configured.

$T_{activation_time}$ is

- $T_{first_TRS} + T_{TRS}$ +5 ms, if aperiodic CSI-RS resources are not configured for SCell activation or UE do not support *aperiodicCSI-RS-FastScellActivation-r17*, when the the EPRE difference is smaller than or equal to 12 dB

- $T_{first_ATRS} + T_{gap} + T_{ATRS}$ + 5 ms if aperiodic CSI-RS resources are configured for SCell activation for UE supporting *aperiodicCSI-RS-FastScellActivation-r17*, when the the EPRE difference is smaller than or equal to 12 dB

- $T_{first_TRS} + 2*T_{TRS}$ +5 ms, when the EPRE difference is larger than 12 dB but smaller than or equal to 30 dB

where,

$T_{SMTC_MAX}$:

- In FR1, in case of intra-band contiguous SCell activation, $T_{SMTC_MAX}$ is the longer SMTC periodicity between active serving cells and SCell being activated provided the cell specific reference signals from the active serving cells and the SCells being activated or released are available in the same slot; in case of inter-band SCell activation, $T_{SMTC_MAX}$ is the SMTC periodicity of SCell being activated.

- $T_{SMTC_MAX}$ is bounded to a minimum value of 10 ms.

$T_{SMTC_MAX,\ enhanced}$:

- In FR1, a UE supporting *shortMeasInterval-r18* if the SMTC for SCell being activated is only configured in measObjectNR, $T_{SMTC_MAX,\ enhanced}$ is the SSB periodicity of SCell being activated. Otherwise, $T_{SMTC_MAX,\ enhanced} = T_{SMTC_MAX}$.

$T_{rs}$ is the SMTC periodicity of the SCell being activated if the UE has been provided with an SMTC configuration for the SCell in SCell addition message, otherwise $T_{rs}$ is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement which involves $T_{rs}$ is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There are no requirements if the SSB transmission periodicity is not 5 ms.

$T_{rs,\ enhanced}$ is the SSB periodicity of the SCell being activated for a UE supporting *shortMeasInterval-r18* in FR1, if the SMTC for SCell being activated is only configured in the *measObjectNR*. Otherwise, $T_{rs,\ enhanced} = T_{rs}$

$T_{FirstSSB}$: is the time to the end of the first complete SSB burst indicated by the SMTC, or within 5 ms if SMTC is not configured, after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$.

$T_{FirstSSB_MAX}$: Is the time to the end of the first complete SSB burst indicated by the SMTC, or within 5 ms if SMTC is not configured, after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, further fulfilling:

- In FR1, in case of intra-band contiguous SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCell being activated is transmitting SSB burst.

$T_{FirstSSB_MAX,\ enhanced}$: For a UE supporting *shortMeasInterval-r18* in FR1, if the SMTC for SCell being activated is only configured in the measObjectNR, $T_{FirstSSB_MAX,\ enhanced}$ is the time to the end of the first complete SSB burst indicated by the SSB periodicity of the SCell being activated, after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$. Otherwise, $T_{FirstSSB_MAX,\ enhanced} = T_{FirstSSB_MAX}$

$T_{FineTiming}$ is the time period between UE finish processing the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and the timing of first complete available SSB corresponding to the TCI state.

$T_{L1\text{-}RSRP,\ measure}$ is L1-RSRP measurement delay $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ or $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ based on applicability as defined in clause 9.5D assuming M=1 and $T_{Report}$=0.

$T_{L1\text{-}RSRP,\ enhanced_measure}$ is

- SSB based L1-RSRP measurement delay $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ based on applicability as defined in clause 9.5D assuming M=1 and $T_{Report}$=0; Or,
- CSI-RS based L1-RSRP measurement delay $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ based on applicability as defined in clause 9.5D assuming M=1 and $T_{Report}$=0.
- If UE supports *shortMeasInterval-r18* capability, L1-RSRP measurement for $T_{L1\text{-}RSRP,\ enhanced_measure}$ can be performed based on non-DRX mode even if DRX is configured.

$T_{L1\text{-}RSRP,\ report}$ is delay of acquiring CSI reporting resources.

$T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to

- SCell activation command for known case;
- First valid L1-RSRP reporting for unknown case.

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

Longer delays for RRM measurement requirements can be expected during the cell detection time for unknown SCell activation.

When *absoluteFrequencySSB* is not configured in *DownlinkConfigCommon* for target SCell but SMTC for target SCell is configured, no requirement would be applied.

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

$T_{FirstTRS}$: is the time to the end of the first complete periodic CSI-RS burst for SCell activation after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$.

$T_{TRS}$ is the periodicity of periodic CSI-RS burst for SCell activation.

$T_{FirstATRS}$: is the time to the end of the first complete CSI-RS burst for SCell activation after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots.

$T_{ATRS}$ is the CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots.

$T_{gap}$ is a gap length between two aperiodic CSI-RS bursts,

- at least 2 slots for 15 kHz and 30 kHz
- at least 3 slots for 60 kHz

SCell in FR1 is known if it has been meeting the following conditions:

- During the period equal to max(5*measCycleSCell, 5*DRX cycles) for FR1 before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable according to the cell identification conditions specified in clause 9.2D and 9.3D.
- the SSB measured during the period equal to max(5*measCycleSCell, 5*DRX cycles) also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2D and 9.3D.

Otherwise SCell in FR1 is unknown.

If the UE has been provided with higher layer in TS 38.331 [2] signalling of *smtc2* prior to the activation command, $T_{SMTC_Scell}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell being activated. $T_{SMTC_MAX}$ follows *smtc1* or *smtc2* according to the physical cell IDs of the target cells being activated and the active serving cells.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

The starting point of an interruption window on Pcell or any activated SCell, as specified in clause 8.2D, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot slot n+1+$\frac{T_{HARQ}+3ms+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being activated, and $T_X$ is:

- 0, if $T_{activation_time}$ is 3 ms;
- $T_{FirstSSB}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB}$;
- $T_{FirstSSB_MAX}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB_MAX}$;
- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time}$ includes only $T_{FineTiming}$ and no $T_{FirstSSB_MAX}$;
- $T_{first_TRS}$, for FR1 inter-band SSB-less SCell activation scenario where $T_{activation_time}$ includes $T_{first_TRS}$;
- $T_{first_ATRS}$, for FR1 inter-band SSB-less SCell activation scenario where $T_{activation_time}$ includes $T_{first_ATRS}$.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

The requirements in this clause and requirements on interruption due to SCell activation in clause 8.2D apply provided that the SSB of the to-be-activated SCell is within the first active DL BWP of the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

## 8.3D.3 SCell Deactivation Delay Requirement for Activated SCell

The requirements in this clause shall apply for the UE configured with at least one downlink SCell in standalone NR carrier aggregation and when one SCell is being deactivated.

Upon receiving SCell deactivation command in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot $n + \frac{T_{HARQ}+3ms}{NR\ slot\ length}$. The starting point of an interruption window on PCell or any activated SCell, as specified in clause 8.2D, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot n+1+$\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being deactivated.

Upon expiry of the *sCellDeactivationTimer* in slot *n*, the UE shall accomplish the deactivation actions for the SCell being deactivated no later than in slot $n + \frac{3ms}{NR\ slot\ length}$. The starting point of an interruption window on Pcell or any activated SCell, as specified in clause 8.2D, shall not occur before slot n+1 and not occur after slot n+1+ $\frac{3ms}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being deactivated.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

## 8.3D.4 Direct SCell Activation at SCell addition

The requirements in this clause apply for UE being configured in the RRC reconfiguration message, TS 38.331 [2], with one SCell for which the parameter *sCellState* is set to *activated*.

If the RRC reconfiguration message for direct SCell activation also configures TCI state information, the requirements in clause 8.3D.2 based on that TCI state activation command is received at the same time as SCell activation command shall apply.

The UE shall configure the SCell in activated state upon successful completion of the RRC reconfiguration procedure within the specified delay. The UE shall be capable to transmit valid CSI report and apply actions for the directly activated SCell no later than in slot n + $\frac{N_{direct}}{NR\ slot\ length}$ ,

where:

- Slot n is the last slot overlapping with the PDSCH containing the RRC reconfiguration message,
- $N_{direct} = T_{RRC_Process} + T_1 + T_{activation_time} + T_{CSI_Reporting}$ - 3 ms for the cases specified in clause 8.3D.2 that TCI state is not indicated within $T_{activation_time}$; otherwise, $N_{direct} = T_{RRC_Process} + T_1 + T_{HARQ} + T_{activation_time} + T_{CSI_Reporting}$
  - $T_{RRC_Process}$: RRC procedure delay as specified in clause 12 of TS 38.331 [2],
  - $T_1$: Delay from slot $n + \frac{T_{RRC_Process}}{NR\ slot\ length}$ until the transmission of *RRCReconfigurationComplete* message,

NOTE: $T_1$ is UE implementation dependent.

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],

If the SCell is known and belongs to FR1, $T_{CSI_Reporting}$ is specified in clause 8.3D.2 and $T_{activation_time}$ is defined as:

- $T_{FirstSSB}$+ 5 ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.
- $T_{FirstSSB_MAX} + T_{rs}$ + 5 ms, if measurement period of the SCell being activated is larger than 2400 ms.

  where,

  the measurement period in table 9.2D.5.2-1 applies if the target SCell was in an intra-frequency layer corresponding to an activated SCell;

  the measurement period in table 9.2D.5.2-2 applies if the target SCell was in an intra-frequency layer corresponding to a deactivated SCell;

the measurement period in table 9.3D.5-1 applies if the target SCell was in an inter-frequency layer.

- Otherwise, $T_{activation_time}$ and $T_{CSI_Reporting}$ are specified in clause 8.3D.2, where the following definitions of $T_{FirstSSB}$ and $T_{FirstSSB_MAX}$ shall override the existing ones:
  - $T_{FirstSSB}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_Process}+T_1}{NR\ slot\ length}$
  - $T_{FirstSSB_MAX}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_{Process}}+T_1}{NR\ slot\ length}$
    - In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCell being activated is transmitting SSB burst.
- If a UE supports *shortMeasInterval-r18* capability, the reduced $T_{activation_time}$ specified in clause 8.3D.2 when UE supports the capability is applicable for Direct SCell activation at SCell addition also.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.321 [7] for an SCell at the first opportunities for the corresponding actions once the SCell is activated.

The SCell in FR1 is known provided the following conditions are met for the SCell:

- During the last 5 seconds before the reception of the direct SCell configuration command:
  - the UE has sent a valid measurement report for the SCell being directly activated, and
  - the SSB measured remains detectable according to the cell identification conditions specified in clauses 9.2D and 9.3D,
- the SSB measured during the period equal to [5] seconds also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2D and 9.3D.

Otherwise, the SCell is unknown.

The UE may be allowed to cause interruptions to serving cells on other component carriers during an interruption window, as specified in clause 8.2D. The starting point of an interruption window on Pcell or any activated SCell shall not occur before slot $n$+1, and shall not occur after slot $n$+1+$\frac{T_{RRC_Process}+T_1+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology of the SCell being activated, and $T_X$ is:

- $T_{FirstSSB}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB}$;
- $T_{FirstSSB_MAX}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB_MAX}$;
- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time}$ includes $T_{FineTiming}$.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

Starting from the slot $n + \frac{T_{RRC_Process} + T_1}{NR\ slot\ length}$ until the UE has completed the direct SCell activation, the UE shall report CQI index = 0 (out of range) if the UE has available uplink resources to report CQI for the SCell.

## 8.3D.5 Direct SCell Activation at Handover

The requirements in this clause apply for UE being configured in the RRC reconfiguration message, TS 38.331 [2], for handover with one SCell for which the parameter *sCellState* is set to *activated*.

The UE shall configure the SCell in activated state upon successful completion of the RRC reconfiguration procedure within the specified delay. The UE shall be capable to transmit valid CSI report and apply actions for the directly activated SCell no later than in slot n + $\frac{N_{direct}}{NR\ slot\ length}$ ,

Where:

- Slot n is the last slot overlapping with the PDSCH containing RRC reconfiguration message.
- $N_{direct} = T_{RRC_process} + T_{interrupt} + T_2 + T_3 + T_{activation_time} + T_{CSI_Reporting}$ - 3 ms for the cases specified in clause 8.3D.2 that TCI state is not indicated within $T_{activation_time}$; otherwise, $N_{direct} = T_{RRC_process} + T_{interrupt} + T_2 + T_3 + T_{HARQ} + T_{activation_time} + T_{CSI_Reporting}$
- $T_{RRC_Process}$: RRC procedure delay as specified in clause 12 of TS 38.331 [2],
- $T_{interrupt}$: Interruption time during handover as specified in clause 6.1E.1,
- $T_2$: Delay from slot $n + \frac{T_{RRC_Process}+T_{interrupt}}{NR\ slot\ length}$ until UE has obtained a valid TA command for the target PCell,
- $T_3$: Delay for applying the received TA for uplink transmission in the target PCell, and greater than or equal to k+1 slot, where k is defined in clause 4.2 in TS 38.213 [3],
- $T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],
- If the SCell is known and belongs to FR1, $T_{CSI_Reporting}$ is specified in clause 8.3D.2 and $T_{activation_time}$ is defined as:
  - $T_{FirstSSB}$+ 5 ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.
  - $T_{FirstSSB_MAX} + T_{rs}$ + 5 ms, if measurement period of the SCell being activated is larger than 2400 ms.

    where,

    the measurement period in table 9.2D.5.2-1 applies if the target SCell was in an intra-frequency layer corresponding to an activated SCell;

    the measurement period in table 9.2D.5.2-2 applies if the target SCell was in an intra-frequency layer corresponding to a deactivated SCell;

    the measurement period in table 9.3D.5-1 applies if the target SCell was in an inter-frequency layer.
- Otherwise, $T_{activation_time}$ and $T_{CSI_Reporting}$ are specified in clause 8.3D.2, where the following definitions of $T_{FirstSSB}$ and $T_{FirstSSB_MAX}$ shall override the existing ones:
  - $T_{FirstSSB}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_Process}+T_{interrupt}+T_2+T_3}{NR\ slot\ length}$
  - $T_{FirstSSB_MAX}$: the time to the end of the first complete SSB burst indicated by the SMTC after slot n + $\frac{T_{RRC_{Process}}+T_{interrupt}+T_2+T_3}{NR\ slot\ length}$
    - In FR1, in case of intra-band SCell activation, the occasion when all active serving cells and SCells being activated or released are transmitting SSB bursts in the same slot; in case of inter-band SCell activation, the first occasion when the SCell being activated is transmitting SSB burst.
- If a UE supports *shortMeasInterval-r18* capability, the reduced $T_{activation_time}$ specified in clause 8.3D.2 when UE supports the capability is applicable for Direct SCell activation at handover also.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.321 [7] for an SCell at the first opportunities for the corresponding actions once the SCell is activated.

The SCell in FR1 is known provided the following conditions are met for the SCell:

- During the last 5 seconds before the reception of the direct SCell configuration command:
  - the UE has sent a valid measurement report for the SCell being directly activated, and
  - the SSB measured remains detectable according to the cell identification conditions specified in clauses 9.2D and 9.3D,

- the SSB measured during the period equal to [5] seconds also remains detectable during the SCell activation delay according to the cell identification conditions specified in clause 9.2D and 9.3D.

Otherwise, the SCell is unknown.

The UE may be allowed to cause interruptions to PCell during an interruption window, as specified in clause 8.2D. The starting point of an interruption window on PCell shall not occur before slot $n$+1+ $\frac{T_{RRC\ Processing}+T_{interrupt}+T_2+T_3}{NR\ slot\ length}$, and not occur after slot $n$+1+$\frac{T_{RRC\ Processing}+T_{interrupt}+T_2+T_3+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology of the SCell being activated, and $T_X$ is:

- $T_{FirstSSB}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB}$;
- $T_{FirstSSB_MAX}$, for any scenario where $T_{activation_time}$ includes $T_{FirstSSB_MAX}$;
- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time}$ includes $T_{FineTiming}$.

The length of the interruption window depends on the frequency band relation between the aggressor SCell and the victim PCell.

Starting from the slot $n + \frac{T_{RRC_Process} + T_{interrupt}+T_2+ T_3}{NR\ slot\ length}$ and until the UE has completed the direct SCell activation, the UE shall report CQI index = 0 (out of range) if the UE has available uplink resources to report CQI for the SCell.

## 8.3D.6 Direct SCell Activation at RRC Resume

The requirements in this clause apply for UE being configured in the RRC reconfiguration message in TS 38.331 [2] for RRC Resume with one SCell for which the parameter *sCellState* is set to *activated*.

The requirements in clause 8.3D.4 shall apply, except that the definition of $T_1$ shall be deemed to be replaced with

$T_1$: Delay from slot $n + \frac{T_{RRC_Process}}{NR\ slot\ length}$ until the transmission of RRCResumeComplete message,

## 8.3D.7 Fast SCell Activation Delay Requirement for Deactivated SCell

Aperiodic CSI-RS resources can be configured for fast SCell activation. The requirements in this clause shall apply for the UE configured with one downlink SCell in standalone NR carrier aggregation and when one SCell is being activated. The requirements in this clause shall apply for the UE provided with aperiodic CSI-RS resources for SCell activation for the target SCell.

NOTE: If UE is allocated A-TRS for fast SCell activation, the UE is not required to use the SSB of the target SCell.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot *n*, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot n + $\frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time}$ is the SCell activation delay in milliseconds.

If the SCell is known and belongs to FR1, $T_{activation_time}$ is:

- $T_{FirstATRS}$+ 5 ms, if the measurement period of the SCell being activated is equal to or smaller than 2400 ms.
- $T_{FirstATRS}$ + $T_{gap}$ + $T_{ATRS}$ + 5 ms, if the measurement period of the SCell being activated is larger than 2400 ms.

NOTE: The RSs on the activated serving cell in the same band are not required to be transmitted in the same slot as the temporary RS.

NOTE: UE may report inaccurate non-zero CQI for any activated Cell and being activated SCell during the fast SCell activation procedure only if the RSs on the activated serving cell in the same band are not transmitted in the same slot as the aperiodic CSI-RS for fast SCell activation.

If the SCell is unknown and belongs to FR1, and SCell is contiguous to an active serving cell in the same band, provided that the side condition $\hat{E}s/Iot \geq -2$ dB is fulfilled, $T_{activation_time}$ is:

- $T_{FirstATRS} + T_{gap} + T_{ATRS} + 5$ ms, if the following conditions are met,
  - the SCell is contiguous to an active serving cell in the same band, and
  - its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
  - its SMTC offset is same as the one of contiguous FR1 active serving cell, and
  - its RTD with contiguous FR1 active serving cell is smaller than or equal to 260 ns with respect to the to-be-activated SCell's SSB numerology, and its reception power difference with contiguous FR1 active serving cell is smaller than or equal to 6 dB;

NOTE: The RSs on the activated serving cell in the same band are not required to be transmitted in the same slot as the temporary RS.

NOTE: UE may report inaccurate non-zero CQI for any activated SCell and being activated SCell during the fast SCell activation procedure only if the RSs on the activated serving cell in the same band are not transmitted in the same slot as the aperiodic CSI-RS for fast SCell activation.

where,

$T_{FirstATRS}$: is the time to the end of the first complete CSI-RS burst for SCell activation after slot n + $\frac{T_{HARQ}+3ms}{NR\ slot\ length}$, where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots.

$T_{ATRS}$ is the CSI-RS burst for SCell activation where the CSI-RS burst is defined as four CSI-RS resources in two consecutive slots.

- $T_{gap}$ is a gap length between two aperiodic CSI-RS bursts,
  - at least 2 slots for 15 kHz and 30 kHz
  - at least 3 slots for 60 kHz

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

SCell in FR1 is known if it has been meeting the following conditions:

- During the period equal to max(5*measCycleSCell, 5*DRX cycles) for FR1 before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable according to the cell identification conditions specified in clauses 9.2D and 9.3D.
- the SSB measured during the period equal to max(5*measCycleSCell, 5*DRX cycles) also remains detectable during the SCell activation delay according to the cell identification conditions specified in clauses 9.2D and 9.3D.

Otherwise SCell in FR1 is unknown.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

The starting point of an interruption window on PCell or any activated SCell, as specified in clause 8.2D, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot slot n+1+$\frac{T_{HARQ}+3ms+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being activated, and $T_X$ is:

- $T_{FirstATRS}$, for any scenario where $T_{activation_time}$ includes $T_{FirstATRS}$;

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

The requirements in this clause and requriements on interruption due to SCell activation in clause 8.2D apply provided that the SSB and A-TRS of the to-be-activated SCell is within the first active DL BWP of the Scell.

Starting from slot *n* + $T_{HARQ}$ + 3 ms where slot *n* is the slot where SCell activation command is received (as specified in clause 4.3 of TS 38.213 [3]) and until the SCell activation completion at UE, after at least one CSI-RS transmission occasion for the channel measurement and reporting (specified in clause 5.2.2.5 of TS 38.214 [26]) , the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

## 8.3D.8 SCell Activation Delay Requirement for Deactivated SCell with the L3 reporting during activation

The requirements in this clause shall apply for UE supporting *l3-MeasUnknownSCellActivation-r18* and is configured with *ReportOnScellActivation* and reporting valid L3 measurement results after receiving the SCell activation command for unknown SCell. The requirements in this clause shall apply for the UE configured with one downlink SCell in NR carrier aggregation and when one SCell is being activated. clause 8.3D.2 is applied for UE who does not report L3 measurement results after receiving SCell activation command for unknown SCell.

The delay within which the UE shall be able to activate the deactivated SCell depends upon the specified conditions.

Upon receiving SCell activation command in slot *n*, the UE shall be capable to transmit valid CSI report and apply actions related to the activation command for the SCell being activated no later than in slot n + $\frac{T_{HARQ}+T_{activation_time}+T_{CSI_Reporting}}{NR\ slot\ length}$, where:

$T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]

$T_{activation_time}$ is the SCell activation delay in milliseconds.

- $T_{activation_time}$ is:
  - 10 ms + $T_{L3,report}$+ $T_{HARQ}$ + max($T_{uncertainty_MAC}$ + $T_{FineTiming}$ + 2 ms, $T_{uncertainty_SP}$), if semi-persistent CSI-RS is used for CSI reporting,
  - 7 ms + $T_{L3,report}$+ max($T_{HARQ}$ + $T_{uncertainty_MAC}$ + 5 ms + $T_{FineTiming}$, $T_{uncertainty_RRC}$ + $T_{RRC_delay}$), if periodic CSI-RS is used for CSI reporting,

If the following conditions are met:

If the SCell being activated belongs to FR1 and if there is no active serving cell contiguous to the SCell on that FR1 band provided that the side condition Ês/Iot ≥ -2 dB is fulfilled:

If the target SCell belongs to FR1 and none of the following conditions is met

- 'ssb-PositionInBurst' indicates only one SSB is being actually transmitted, or
- 'ssb-PositionInBurst' indicates multiple SSBs and TCI indication is provided in same MAC PDU with SCell activation;

Otherwise, $T_{activation_time}$ in clause 8.3D.2 is applied for unknown SCell activation.

However, when the following conditions are fulfilled, no activation requirement will be applied for this unknown SCell:

- the SCell is contiguous to an active serving cell in the same band, and

- a single SSB is used in the unknown SCell; or multiple SSBs are used in the SCell and TCI state indication for PDCCH is provided by the same MAC PDU used for SCell activation; and
- its *ssb-PositionInBurst* is same as the one of contiguous FR1 active serving cell, and
- its SMTC offset is same as the one of contiguous FR1 active serving cell
- its RTD with contiguous FR1 active serving cell is larger than 260 ns with respect to the to-be-activated SCell's SSB numerology, or its reception power difference with contiguous FR1 active serving cell is larger than 6 dB;

where,

$T_{L3,\ report}$ is delay of acquiring the first available UL resource for L3 reporting from 7 ms +$T_{HARQ}$ after receiving SCell activation command.

- The L3 measurement reporting requirement is defined in clause 9.2D.4.4
- UE is ready to report the L3 measurement result no later than 7 ms + $T_{HARQ}$ ms from receiving the SCell activation command.

UE is not required to report the L3 results after 3 ms + $T_{HARQ}$+ M ms from receiving the SCell activation command where

- For FR1,
  - M= 2*$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$ for UE supporting *shortMeasInterval-r18* capability,
  - Otherwise, M = $T_{SMTC}$ +$T_{SSB}$ + $T_{L1\text{-}RSRP,report}$

$T_{FineTiming}$ is the time period between UE finish processing the last activation command for PDCCH TCI, PDSCH TCI (when applicable) and the timing of first complete available SSB corresponding to the TCI state.

$T_{uncertainty_MAC}$ is the time period between reception of the last activation command for PDCCH TCI, PDSCH TCI (when applicable) relative to

- First valid L3-RSRP reporting for unknown case, if UE reports valid L3-RSRP before receiving TCI activation command
- First valid L1-RSRP reporting for unknown case, if UE reports valid L3-RSRP after receiving TCI activation command

$T_{uncertainty_RRC}$ is the time period between reception of the RRC configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) relative to

- First valid L3-RSRP reporting for unknown case, if UE reports valid L3-RSRP before receiving TCI activation command
- First valid L1-RSRP reporting for unknown case, if UE reports valid L3-RSRP after receiving TCI activation command

$T_{uncertainty_SP}$ is the time period between reception of the activation command for semi-persistent CSI-RS resource set for CQI reporting relative to

- First valid L3-RSRP reporting for unknown case, if UE reports valid L3-RSRP before receiving TCI activation command
- First valid L1-RSRP reporting for unknown case, if UE reports valid L3-RSRP after receiving TCI activation command

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

Longer delays for RRM measurement requirements, can be expected during the cell detection time for unknown SCell activation.

When *absoluteFrequencySSB* is not configured in *DownlinkConfigCommon* for target SCell but SMTC for target SCell is configured, no requirement would be applied.

$T_{CSI_reporting}$ is the delay (in ms) including uncertainty in acquiring the first available downlink CSI reference resource, UE processing time for CSI reporting and uncertainty in acquiring the first available CSI reporting resources as specified in TS 38.331 [2].

SCell in FR1 is known if it has been meeting the following conditions:

- During the period equal to max(5*measCycleSCell, 5*DRX cycles) for FR1 before the reception of the SCell activation command:
  - the UE has sent a valid measurement report for the SCell being activated and
  - the SSB measured remains detectable according to the cell identification conditions specified in clause 9.2D and 9.3D.
- the SSB measured during the period equal to max(5*measCycleSCell, 5*DRX cycles) also remains detectable during the SCell activation delay according to the cell identification conditions specified in clauses 9.2D and 9.3D.

Otherwise SCell in FR1 is unknown.

The requirement for unknown SCell applies provided that the activation commands for PDCCH TCI, PDSCH TCI (when applicable), semi-persistent CSI-RS for CQI reporting (when applicable), and configuration message for TCI of periodic CSI-RS for CQI reporting (when applicable) are based on either L1-RSRP or L3-RSRP if any one of them is reported before receiving TCI activation command.

If the UE has been provided with higher layer in TS 38.331 [2] signaling of *smtc2* prior to the activation command, $T_{SMTC_Scell}$ follows *smtc1* or *smtc2* according to the physical cell ID of the target cell being activated. $T_{SMTC_MAX}$ follows *smtc1* or *smtc2* according to the physical cell IDs of the target cells being activated and the active serving cells.

In addition to CSI reporting defined above, UE shall also apply other actions related to the activation command specified in TS 38.331 [2] for a SCell at the first opportunities for the corresponding actions once the SCell is activated.

The starting point of an interruption window on PCell or any activated SCell, as specified in clause 8.2D, shall not occur before slot n+1+$\frac{T_{HARQ}}{NR\ slot\ length}$ and not occur after slot slot n+1+$\frac{T_{HARQ}+3ms+T_X}{NR\ slot\ length}$, where NR slot length is with respect to the numerology used in the SCell being activated, and $T_X$ is:

- $T_{uncertainty_MAC}$ +$T_{FineTiming}$, for any scenario where $T_{activation_time}$ includes only $T_{FineTiming}$ and no $T_{FirstSSB_MAX}$.

The length of the interruption window may be different for different victim cells, and depends on the applicable scenario and on the frequency band relation between the aggressor cell and the victim cell.

The requirements in this clause and requirements on interruption due to SCell activation in clause 8.2D apply provided that the SSB of the to-be-activated SCell is within the first active DL BWP of the Scell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed the SCell activation, the UE shall report out of range if the UE has available uplink resources to report CQI for the SCell.

Starting from the slot specified in clause 4.3 of TS 38.213 [3] (timing for secondary Cell activation/deactivation) and until the UE has completed a first L1-RSRP measurement, the UE shall report lowest valid L1 SS-RSRP range if the UE has available uplink resources to report L1-RSRP for the SCell.

# 8.4 UE UL carrier RRC reconfiguration delay

## 8.4.1 Introduction

The requirements in this clause apply for a UE being configured or deconfigured with a supplementary UL carrier or NR UL carrier.

### 8.4.2 UE UL carrier configuration delay requirement

When the UE receives a RRC message implying NR UL or supplementary UL carrier configuration, the UE shall be ready to start transmission on the newly configured carrier within $T_{UL_carrier_config}$ from the end of slot n.

Where

- Slot n is the last slot overlapping with the PDSCH containing the RRC command.
- $T_{UL_carrier_config}$ equals the maximum RRC procedure delay defined in clause 11.2 in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it equals the maximum RRC procedure delay defined in clause 12 in TS 38.331 [2].

### 8.4.3 UE UL carrier deconfiguration delay requirement

When the UE receives a RRC message implying NR UL or supplementary UL carrier deconfiguration RRC signalling, the UE shall stop UL signalling on the deconfigured UL carrier within $T_{UL_carrier_deconfig}$ from the end of slot n.

Where

- Slot n is the last slot overlapping with the PDSCH containing the RRC command.
- $T_{UL_carrier_deconfig}$ equals the maximum RRC procedure delay defined in clause 11.2 in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it equals the maximum RRC procedure delay defined in clause 12 in TS 38.331 [2].

## 8.5 Link Recovery Procedures

### 8.5.1 Introduction

The UE shall assess the downlink radio link quality of a serving cell based on the reference signal in the set $\bar{q}_0$ as specified in TS 38.213 [3] in order to detect beam failure on:

- PCell in SA, NR-DC, or NE-DC operation mode,
- PSCell in NR-DC and EN-DC operation mode,
- SCell in SA, NR-DC, NE-DC or EN-DC operation mode,
- Deactivated PSCell in NR-DC and EN-DC operation mode

The RS resource configurations in the set $\bar{q}_0$ on PCell, PSCell or deactivated PSCell (if configured with *bfd-and-RLM* with value *true*) can be periodic CSI-RS resources and/or SSBs. RS resource configuration in the set $\bar{q}_0$ on SCell shall be periodic CSI-RS. A UE supporting *bwpOperationMeasWithoutInterrupt-r18* is required to perform beam failure detection outside the active DL BWP, provided the SSB is within the configured UE-specific CBW, in addition to performing beam failure detection within the active DL BWP. Otherwise, the UE is not required to perform beam failure detection outside the active DL BWP. UE is not required to meet the requirements in clause 8.5.2 and 8.5.3 if UE does not have set $\bar{q}_0$. UE is not required to perform beam failure detection on a deactivated SCell, and also not required to perform beam failure detection on resources which is implicitly configured for a deactivated SCell. When more than 2 periodic CSI-RS resources on a CC are configured in the set $\bar{q}_0$ for current SCell or implicitly configured in the set $\bar{q}_0$ for other SCell, it is up to UE implementation to select two of CSI-RS resources in active BWP in current CC to perform beam failure detection. UE is not required to perform beam failure detection on a SCell on which $\bar{q}_1$ is not configured.

On each RS resource configuration in the set $\bar{q}_0$, the UE shall estimate the radio link quality and compare it to the threshold $Q_{out_LR}$ for the purpose of accessing downlink radio link quality of the serving cell beams.

When a CORESET that the UE uses for monitoring PDCCH includes two TCI states and the UE is provided *sfnSchemePdcch* set to 'sfnSchemeA' or 'sfnSchemeB', the UE shall estimate a single downlink radio link quality to derive a single SNR and compare it to the single thresholds $Q_{out_LR}$ for the purpose of accessing downlink radio link quality of the serving cell beams. How to compute the single SNR based on two active TCI states is up to UE implementation.

The threshold $Q_{out_LR}$ is defined as the level at which the downlink radio level link of a given resource configuration on set $\bar{q}_0$ cannot be reliably received and shall correspond to the $BLER_{out}$ = 10% block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection, $Q_{out_LR_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5.2.1-1. For CSI-RS based beam failure detection, $Q_{out_LR_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5.3.1-1.

Upon request the UE shall deliver configuration indexes from the set $\bar{q}_1$as specified in TS 38.213 [3] , to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold $Q_{in_LR}$, which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the $Q_{in_LR}$ threshold to the L1-RSRP measurement obtained from an SSB. The UE applies the $Q_{in_LR}$ threshold to the L1-RSRP measurement obtained for a CSI-RS resource after scaling a respective CSI-RS reception power with a value provided by higher layer parameter *powerControlOffsetSS*. The RS resource configurations in the set $\bar{q}_1$ can be periodic CSI-RS resources or SSBs or both SSB and CSI-RS resources. A UE supporting *bwpOperationMeasWithoutInterrupt-r18* is required to perform beam failure detection outside the active DL BWP, provided the SSB is within the configured UE-specific CBW, in addition to performing beam failure detection within the active DL BWP. Otherwise, the UE is not required to perform candidate beam detection outside the active DL BWP. UE is not required to perform candidate beam detection on a SCell on which $\bar{q}_1$ is not configured.

For a deactivated SCG, the UE may be provided via an RRC reconfiguration message with *tci-info* for PDCCH/PDSCH reception at the transition from deactivated SCG to activated SCG while the SCG is deactivated. After the reception of the RRC reconfiguration message the UE shall perform the BFD on the PSCellof the deactivated SCG using the TCI states according to *tci-info* specified in clause 6.3.2 in TS 38.331 [2].

For UE supporting *ncd-SSB-BWP-Wor-r18*, the SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not explicitly specified otherwise. If SSB in the active DL BWP of serving cell *i* is NCD-SSB, for serving cell *i* the requirements in clause 8.5 apply provided that serving cell *i* is PCell or activated PSCell.

### 8.5.1.1 Introduction of Requirement on Link Recovery Procedures for UE configured with relaxed measurement criteria

For the UE supports *bfd-Relaxation-r17* and configured with dedicated signalling *goodServingCellEvaluationBFD*, which is always configured to the UE when the network enables BFD relaxation for the UE as specified in TS 38.331[2], the relaxed requirements defined in clause 8.5.2.4 for SSB based beam failure detection and the relaxed requirements defined in clause 8.5.3.4 for CSI-RS based beam failure detection are allowed to apply to the relaxed BFD measurements on the serving cell after fulfilling the following conditions:

- for the serving cells in intra-band carrier aggregation configured with SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell, when
  - the good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the serving cell based on the measurements that are configured for SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell in the intra-band carrier aggregation if the *lowMobilityEvaluationConnected* is not configured, or
  - the UE is also configured with *lowMobilityEvaluationConnected* and both low mobility criterion defined in clause 5.7.13.1 of TS 38.331 [2] is fulfilled for a period of $T_{SearchDeltaP\text{-}Connected}$ and good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the serving cell based on the measurements that are configured for SSB-based or CSI-RS based RLM on SpCell together with CSI-RS based BFD on SCell in the intra-band carrier aggregation.
- for other serving cells, when
  - the good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the serving cell configured with BFD-RS if the *lowMobilityEvaluationConnected* is not configured, or
  - the UE is also configured with *lowMobilityEvaluationConnected*, and both low mobility criterion defined in clause 5.7.13.1 of TS 38.331 [2] is fulfilled for a period of $T_{SearchDeltaP\text{-}Connected}$ and good serving cell quality criterion defined in clause 5.7.13.2 of TS 38.331 [2] is fulfilled for the serving cell configured with BFD-RS.

Otherwise, UE shall apply the requirements defined in clause 8.5.2.2 for SSB based beam failure detection and the requirements defined in clause 8.5.3.2 for CSI-RS based beam failure detection. Note that when multiple resources are configured on a serving cell for RLM or BFD evaluation, the good serving cell quality critierion is considered as

fulfilled for the serving cell when any resource configured for the cell fulfills the good serving defined in clause 5.7.13.2 of TS 38.331 [2].

The scenario and RS resource configurations in the set $\bar{q}_0$ defined in clause 8.5.1 apply for this clause.

The UE is no longer allowed to relax BFD measurements and apply the relaxed link recovery procedures provided that at least one of the following conditions is met:

- The timer *beamFailureDetectionTimer* is running.
- No DRX is configured or configured DRX cycle is longer than 80 ms

NOTE: Applicability of DRX configuration follows TS 38.331 [2] clause 5.7.13.0.

## 8.5.2 Requirements for SSB based beam failure detection

### 8.5.2.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_0$ configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5.2.2 unless the UE supports *bwpOperationMeasWithoutInterrupt-r18*, provided that the SSB is within the configured UE-specific CBW. The requirements in this clause could not be applicable if UE is required to perform beam failure detection on more than 1 serving cell per band unless otherwise specified. For UE supporting *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided for the configured FR1 intra-band non-contiguous CA, the requirements in this clause apply when UE is required to perform beam failure detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers, and no more than 1 serving cell per band otherwise.

For UE supporting *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v19xy* is *"type 4"*

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers

2> if *nonCollocatedTypeNR-CA-v19xy* is *"type 1"*

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 1 serving cell per band

2> else if *nonCollocatedTypeNR-CA-v19xy* is not provided

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 1 serving cell per band

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers

2>else

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 1 serving cell per band

**Table 8.5.2.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |

| | |
|---|---|
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 24 |
| Sub-carrier spacing (kHz) | Same as the SCS of RMSI CORESET |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.5.2.1-2: PDCCH transmission parameters for beam failure instance for a UE operating on a cell with less than 5 MHz BW**

| **Attribute** | **Value for BLER** | | |
|---|---|---|---|
| **Channel BW** | **3 MHz** | | **5 MHz** |
| **[DL Transmission BW]** | **12 PRBs** | **15 PRBs** | **20 PRBs** |
| DCI format | 1-0 | | |
| Number of control OFDM symbols | 2 | 3 | 3 |
| Aggregation level (CCE) | 4 | 8 Note 1 | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB | | |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB | | |
| Bandwidth (PRBs) | 12 | 15 | 20 |
| Sub-carrier spacing (kHz) | Same as the SCS of RMSI CORESET | | |
| DMRS precoder granularity | REG bundle size | | |

| CP length | Normal | | |
| Mapping from REG to CCE | Distributed | Non-Distributed Note2 | [Distributed] |
| NOTE 1: PDCCH puncturing as defined in TS 38.214 [26] applies.<br>NOTE 2: For 15PRB Transmission BW, distributed mapping may lead to unexpected beam failure detection. | | | |

## 8.5.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in set $\tilde{q}_0$ estimated over the last $T_{Evaluate_BFD_SSB}$ period becomes worse than the threshold $Q_{out_LR_SSB}$ within $T_{Evaluate_BFD_SSB}$ period.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 8.5.2.2-1 or table 8.5.2.2-4 (deactivated PSCell) for FR1.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 8.5.2.2-2 or table 8.5.2.2-5 (deactivated PSCell) for FR2 with scaling factor N, where

- N = 2, 4 or 6 for serving cell in FR2-1 for UE supporting *fastBeamSweepingMultiRx-r18* according to the conditions in clause 3.6.19,
- N=8 for other cases in FR2-1, and
- N=12 for FR2-2,

for FR2 power classes other than power class 6 or for FR2 power class 6 when *highSpeedMeasFlagFR2-r17* is not configured.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 8.5.2.2-5 (deactivated PSCell) for FR2 with scaling factor N=8 for FR2-1 and N=12 for FR2-2, for FR2 power classes other than power class 6 or for FR2 class 6 when *highSpeedMeasFlagFR2-r17* is not configured.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 8.5.2.2-3 for FR2 power class 6 UE configured with *highSpeedMeasFlagFR2-r17*.

For a UE supporting *featureSetCombinationLowBandSwitching-r19*, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or

a UE supporting *concurrentMeasGap-r17* or *[musim-GapPreference-r17]* or both *concurrentMeasGap-r17* and *[musim-GapPreference-r17]*, and when concurrent gaps or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are configured,

- an SSB resource occasion for beam failure detection is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clauses 9.1.8 and 9.1.10,
- P value for a BFD-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$> 0
- For a window W of duration max($T_{L1}$, xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or periodic MUSIM gap(s) or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any BFD-RS resource occasion:
  - $N_{total}$ is the total number of BFD-RS resource occasions within the window W, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window W,

    For UEs supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*:
    - for the BFD monitoring on PCell, $N_{total}$ also includes SSB resource occasions that overlap with the SDL ON duration within the window,
    - for the BFD monitoring on SCell, $N_{total}$ also includes SSB resource occasions that overlap with the PCell ON duration within the window, as defined by the configured switching pattern, and
  - $N_{outside_MG}$ is the number of BFD-RS resource occasions within the window W,
    - that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion, and
    - that are overlapped with PCell ON duration corresponding to the LB CA switching pattern, for the BFD on PCell for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*,
    - that are overlapped with SCell ON duration corresponding to the LB CA switching pattern, for the BFD on SCell for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19,* and
  - $N_{available}$ is the number of BFD-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion nor any SMTC occasion within the window W, and
  - an SSB resource occasion for beam failure detection is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion, and- $T_{L1}$ is periodicity of the target BFD-RS.
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.
  - for UE not supporting *featureSetCombinationLowBandSwitching-r19*, switching pattern periodicity is not applicable.
  - BFD requirement in this clause is not applied when $N_{outside_MG}$ = 0.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* nor supporting *musim-GapPreference-r17* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG(s), and periodic MUSIM gaps,

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB.
- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB.

For FR2

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when BFD-RS resource is not overlapped with GAPs and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when the BFD-RS resource is not overlapped with GAP and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and
  - $T_{SMTCperiod} \neq xRP$ or
  - $T_{SMTCperiod} = xRP$ and $T_{SSB} < 0.5*T_{SMTCperiod}$
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = xRP$ and $T_{SSB} = 0.5*T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{SSB}}{Min(xRP, T_{SMTCperiod})}}$, when the BFD-RS resource is partially overlapped with GAP ($T_{SSB} < xRP$) and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP.
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} < xRP$)

where,

- $P_{sharing\ factor} = 1$, if the BFD-RS resource outside GAP is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{sharing\ factor} = 3$, otherwise.
- If the higher layer in TS 38.331 [2] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, given the SMTC offset of all CCs in FR2 provided the same offset.
- When a GAP is configured only and the GAP is not NCSG,

- a BFD-RS resource or an SMTC occasion is considered to be overlapped with the GAP if it overlaps a GAP occasion, and
- xRP = MGRP

- Otherwise, when NCSG only is configured,
  - a BFD-RS resource or an SMTC occasion is considered to be overlapped with the GAP if
    - it overlaps the VIL1 or VIL2 of NCSG, or

      it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,
  - and
    - xRP = VIRP
- If the UE is configured with Pre-MG only, a BFD-RS resource or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, a BFD-RS resource or an SMTC occasion is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform SSB measurements during the cancelled gap occasions, and no restrictions on the scheduling availability apply during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and GAP configurations does not meet previous conditionsFor either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

When the configured aperiodic MUSIM gap is overlapping with SSB resource occasion for beam failure detection, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and if SSB resource occasions for beam failure detection are fully overlapped with MUSIM gap(s), or the union of MUSIM gap(s) and GAPs, no requirement applies for SSB based beam failure detection.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 8.5.2.2-1: Evaluation period $T_{Evaluate_BFD_SSB}$ for FR1**

### 8.5.2.3 Measurement restriction for SSB based beam failure detection

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1, when the SSB OFDM symbols used for BFD measurement fully or partially overlap with CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

For FR2, when the SSB for BFD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

For FR2, when the SSB for BFD measurement on one CC is in the same or adjacent OFDM symbol as SSB from cell with additional PCI for L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based BFD is expected, and no requirements are defined.

For FR2, when the SSB for BFD measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based BFD is expected, and no requirements are defined.

For FR2, when the SSB for BFD measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both SSB and CSI-RS. Longer measurement period for SSB based BFD is expected, and no requirements are defined.

For FR2, if the network configures same or mixed numerology between SSB for BFD measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, UE shall be able to perform the related SSB based measurements in one band without any measurement restrictions on the other band, provided that UE is capable of independent beam management on this FR2 band pair.

### 8.5.2.4 Minimum requirement of SSB based beam failure detection for UE fulfilling relaxed measurement criteria

This clause contains minimum requirements for SSB based relaxed beam failure detection.

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_SSB_Relax}$ period becomes worse than the threshold $Q_{out_LR_SSB}$ within $T_{Evaluate_BFD_SSB_Relax}$ period.

The value of $T_{Evaluate_BFD_SSB_Relax}$ is defined in table 8.5.2.4-1 for FR1.

The value of $T_{Evaluate_BFD_SSB_Relax}$ is defined in table 8.5.2.4-2 for FR2 with scaling factor N=8.

The value of P is defined in clause 8.5.2.2.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 8.5.2.4-1: Evaluation period $T_{Evaluate_BFD_SSB_Relax}$ for FR1**

| Configuration | $T_{Evaluate_BFD_SSB_Relax}$ (ms) |
|---|---|
| $Max(T_{DRX}, T_{SSB}) \le 80$ ms | $Max(50 \times K3, Ceil(7.5 \times K1 \times P) \times Max(T_{DRX},T_{SSB}))$ |
| 80 ms $< Max(T_{DRX}, T_{SSB}) \le 160$ ms | $Max(50, Ceil(7.5 \times P) \times Max(T_{DRX},T_{SSB}))$ |
| Note 1: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length and no longer than 80ms. | |
| Note 2: K1 is the relaxation factor. K1 = 2 for 40ms $< Max(T_{DRX}, T_{SSB}) \le 80$ ms, K1 = 4 for $Max(T_{DRX}, T_{SSB}) \le 40$ ms | |
| Note 3: K3 is the relaxation factor for the lower bound. K3 = K1, if $1 < K1 \le 2$; K3 = 1 otherwise. | |

**Table 8.5.2.4-2: Evaluation period $T_{Evaluate_BFD_SSB_Relax}$ for FR2**

| Configuration | $T_{Evaluate_BFD_SSB_Relax}$ (ms) |
|---|---|

| | |
|---|---|
| Mas($T_{DRX}$, $T_{SSB}$) ≤ 80 ms | Max(50 × K4, Ceil(7.5 × K2 × P × N) × Max($T_{DRX}$,$T_{SSB}$)) |
| 80 ms < Max($T_{DRX}$, $T_{SSB}$) ≤ 160 ms | Max(50, Ceil(7.5 × P× N) × Max($T_{DRX}$,$T_{SSB}$)) |
| Note 1: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length and no longer than 80ms.<br>Note 2: K2 is the relaxation factor. K2 = 2.<br>Note 3: K4 is the relaxation factor for the lower bound. K4 = K2, if 1 < K2 ≤ 2; K4 = 1 otherwise. | |

## 8.5.3 Requirements for CSI-RS based beam failure detection

### 8.5.3.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\bar{q}_0$ of resource configurations for a serving cell, provided that the CSI-RS resource(s) in set $\bar{q}_0$ for beam failure detection are actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5.3.2. UE is not expected to perform beam failure detection measurements on the CSI-RS configured for BFD if the CSI-RS is not QCL-ed, with QCL-TypeD when applicable, with the RS in the active TCI state of any CORESET configured in the UE active BWP. The requirements in this clause apply when UE is required to perform beam failure detection on no more than 1 serving cell per band unless otherwise specified. For UE supporting *intraBandNR-CA-non-collocated-r18* and *nonCollocatedTypeNR-CA-r18* is not provided for the configured FR1 intra-band non-contiguous CA, the requirements in this clause apply when UE is required to perform beam failure detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers, and no more than 1 serving cell per band otherwise.

For UE supporting *intraBandNR-CA-non-collocated-r19,*

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v19xy* is *"type 4"*

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers

2> if *nonCollocatedTypeNR-CA-v19xy* is *"type 1"*

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 1 serving cell per band

2> else if *nonCollocatedTypeNR-CA-v19xy* is not provided

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 1 serving cell per band

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers

2>else

3> the requirements in this clause apply when UE is required to perform beam failure detection on no more than 1 serving cell per band

**Table 8.5.3.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |

| | |
|---|---|
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

### 8.5.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in set $\tilde{q}_0$ estimated over the last $T_{Evaluate_BFD_CSI\text{-}RS}$ period becomes worse than the threshold $Q_{out_LR_CSI\text{-}RS}$ within $T_{Evaluate_BFD_CSI\text{-}RS}$ period.

The value of $T_{Evaluate_BFD_CSI\text{-}RS}$ is defined in table 8.5.3.2-1 or table 8.5.3.2-3 (deactivated PSCell) for FR1.

The value of $T_{Evaluate_BFD_CSI\text{-}RS}$ is defined in table 8.5.3.2-2 or table 8.5.3.2-4 (deactivated PSCell) for FR2 with N=1. The requirements of $T_{Evaluate_BFD_CSI\text{-}RS}$ apply provided that the CSI-RS for BFD is not in a resource set configured with repetition ON. The requirements shall not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for BFD and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

- For a UE supporting *featureSetCombinationLowBandSwitching-r19*, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both *concurrentMeasGap-r17* and *musim-GapPreference-r17*, and when concurrent gaps or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are configured,

- an CSI-RS resource occasion for beam failure detection is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clause 9.1.8 and 9.1.10,

- P value for a BFD-RS resource to be measured is defined as

  - $N_{total}$ / $N_{outside_MG}$ in FR1

  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0

  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$> 0

- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or MUSIM gap(s) or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any BFD-RS resource occasion:

  - $N_{total}$ is the total number of BFD-RS resource occasions within the window W, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window W,

    For UEs supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*:

    - for the BFD monitoring on PCell, $N_{total}$ also includes BFD-RS resource occasions that overlap with the SDL ON duration within the window,

    - for the BFD monitoring on SCell, $N_{total}$ also includes BFD-RS resource occasions that overlap with the PCell ON duration within the window, as defined by the configured switching pattern, and

  - $N_{outside_MG}$ is the number of BFD-RS resource occasions within the window W, that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion, and

    - that are overlapped with PCell ON duration corresponding to the LB CA switching pattern, for the BFD on PCell for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*,

- that are overlapped with SCell ON duration corresponding to the LB CA switching pattern, for the BFD on SCell for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, and

- $N_{available}$ is the number of BFD-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion nor any SMTC occasion within the window W, and

- an CSI-RS resource occasion for beam failure detection is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion, and

  $T_{L1}$ is periodicity of the target BFD-RS.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

- for UE not supporting *featureSetCombinationLowBandSwitching-r19*, switching pattern periodicity is not applicable.

- BFD requirement in this clause is not applied when $N_{outside_MG} = 0$.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* nor supporting *musim-GapPreference-r17* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG(s), and periodic MUSIM gaps,For FR1,

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS.

- P = 1 when in the monitored cell there are no GAPs overlapping with any occasion of the CSI-RS.

For FR2,

- P = 1, when the BFD-RS resource is not overlapped with GAP and also not overlapped with SMTC occasion.

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is not overlapped with SMTC occasion ($T_{CSI-RS} < xRP$)

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the BFD-RS resource is not overlapped with GAP and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).

- $P = P_{sharing\ factor}$, when the BFD-RS resource is not overlapped with GAP and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and

  - $T_{SMTCperiod} \neq xRP$ or

  - $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{xRP}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{Min(xRP,T_{SMTCperiod})}}$, when the BFD-RS resource is partially overlapped with GAP ($T_{CSI-RS} < xRP$) and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP.

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{xRP}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} < xRP$)

where,

- $P_{sharing\ factor} = 1$, if the BFD-RS resource outside gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{sharing\ factor} = 3$, otherwise.
- If the higher layer in TS 38.331 [2] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.
- When a GAP is configured only and the GAP is not NCSG,
  - a BFD-RS resource or an SMTC occasion is considered to be overlapped with the GAP if it overlaps a GAP occasion, and
  - xRP = MGRP
- Otherwise, when NCSG GAP only is configured,
  - a BFD-RS resource or an SMTC occasion is considered to be overlapped with the GAP if
    - it overlaps the VIL1 or VIL2 of NCSG, or
    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,
  - and
    - xRP = VIRP
    - If the UE is configured with Pre-MG only, a BFD-RS resource or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, a BFD-RS resource or an SMTC occasion is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

NOTE: The overlap between CSI-RS for BFD and SMTC means that CSI-RS for BFD is within the SMTC window duration.

For the value of L1,

1> If the UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network

2> L1 is not applicable;

1> Else if the UE supports *sbfd-Aware-r19* and SBFD is configured by the network

2> If DRX is not configured,

3> L1 is the number of occasions of the configured BFD-RS resource that are overlapping with the dynamic UL transmission on SBFD symbols during $T_{Evaluate_BFD_CSI-RS}$;

2> Else if DRX is configured,

3> L1 is the number of DRX cycles in which at least one occasion of the BFD-RS resource is overlapping with the dynamic UL transmission on SBFD symbols during $T_{Evaluate_BFD_CSI-RS}$.

If the UE supports *sbfd-Aware-r19* and SBFD is configured by the network, the requirements in this clause apply provided that all occasions of the BFD-RS resource are in the same type (i.e., SBFD or non-SBFD) of symbols.

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform CSI-RS measurements during the cancelled gap occasions, and no restrictions on the scheduling availability apply during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of the BFD-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

When the configured aperiodic MUSIM gap is overlapping with CSI-RS resource occasion for beam failure detection, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and if CSI-RS resource occasions for beam failure detection are fully overlapped with MUSIM gap(s), or the union of MUSIM gap(s) and GAPs, no requirement applies for CSI-RS based beam failure detection.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{BFD}$ used in table 8.5.3.2-1 and table 8.5.3.2-2 are defined as

- $M_{BFD}$ = 10, if the CSI-RS resource(s) in set $\bar{q}_0$ used for BFD is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

Note: If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, the requirements in this clause apply provided that CSI-RS resource(s) in set $\bar{q}_0$ used for BFD is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs in at least one DL subband.

The values of $P_{BFD}$ used in table 8.5.3.2-1 and table 8.5.3.2-2 are defined as

For each CSI-RS resource in the set $\bar{q}_0$ configured for PCell or PSCell in EN-DC or NE-DC or SA; or PCell in NR-DC

- $P_{BFD}$ = 1.

For each CSI-RS resource in the set $\bar{q}_0$ configured for PSCell in NR-DC

- $P_{BFD}$ = 2 if UE is configured for beam failure detection on SCell, 1 otherwise.

For each CSI-RS resource in the set $\bar{q}_0$ configured for a SCell

- $P_{BFD}$ = Z in EN-DC or NE-DC or SA.
- $P_{BFD}$ = 2* Z in NR-DC.
  - Where Z is the number of band(s) on which UE is performing beam failure detection only for SCell.

**Table 8.5.3.2-1: Evaluation period $T_{Evaluate_BFD_CSI-RS}$ for FR1**

| Configuration | $T_{Evaluate_BFD_CSI-RS}$ (ms) |
|---|---|
| no DRX | $Max(50, Ceil((M_{BFD}+L1) \times P \times P_{BFD}) \times Max(T_{CSI-RS}, T_{proc}))$ |

| | |
|---|---|
| DRX cycle $\leqslant$ 320 ms | Max(50, Ceil(1.5 × ($M_{BFD}$+L1) × P × $P_{BFD}$) × Max($T_{DRX}$, $T_{CSI-RS}$, $T_{proc}$)) |
| DRX cycle > 320 ms | Ceil(($M_{BFD}$+L1) × P × $P_{BFD}$) × $T_{DRX}$ |
| NOTE 1: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the set $\overline{q}_0$ . $T_{DRX}$ is the DRX cycle length.<br>NOTE 2: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for BFD is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

**Table 8.5.3.2-2: Evaluation period $T_{Evaluate_BFD_CSI-RS}$ for FR2**

| DRX cycle ≤ 320 ms | Ceil(1.5 × $M_{BFD}$ × P × N × $P_{BFD}$) × Max($T_{DRX}$, measCyclePscell) |
| DRX cycle > 320 ms | Ceil($M_{BFD}$ × P × N × $P_{BFD}$) × Max($T_{DRX}$, measCyclePscell) |
| NOTE: DRX cycle is the configured DRX cycle of the PSCell. measCyclePSCell is the measurement cycle length of the deactivated PSCell. | |

### 8.5.3.3 Measurement restrictions for CSI-RS beam failure detection

The SSB mentioned in this clause can be associated with either the serving cell PCI or a PCI different from serving cell PCI or intra-frequency neighbor cell(s) configured with L1-RSRP measurement or inter-frequency neighbor cell(s) configured with L1-RSRP measurement without gap.

The UE is required to be capable of measuring CSI-RS for BFD without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following scenarios.

For both FR1 and FR2, when the CSI-RS for BFD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has same SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has different SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for BFD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

For FR2, when the CSI-RS for BFD measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.For both FR1 and FR2, when the CSI-RS for BFD measurement fully or partially overlaps with the OFDM symbol as SSB or CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB or CSI-RS from candidate LTM neighbour cell.

For FR1, when the CSI-RS for BFD measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support simultaneousRxDataSSB-DiffNumerology, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD is expected, and no requirements are defined.

For FR2, when the CSI-RS for BFD measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD is expected, and no requirements are defined.

For FR2, when the CSI-RS for BFD measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both CSI-RS for BFD measurement and CSI-RS for candidate LTM neighbour cell for intra-frequency L1-RSRP measurement. Longer measurement period for CSI-RS based BFD is expected, and no requirements are defined.

For FR2, when the CSI-RS for BFD measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for BFD measurement and the other CSI-RS. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.
  - The CSI-RS for BFD measurement or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in set $\tilde{q}_1$ and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

For FR2-1, when the first CSI-RS for BFD measurement is in the same OFDM symbol as the second CSI-RS for RLM, BFD or L1-RSRP measurement on the same serving cell according to the conditions in clause 3.6.19, the UE supporting *schedulingMeasurementRelaxation-r18* is required to measure both the first and the second CSI-RSs without measurement restrictions, provided the following conditions are met:

- Both CSI-RSs are not in any CSI-RS resource set with repetition ON, and
- One CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and
- the other CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or

- the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and

- Resources of the active TCI states of the two PDSCHs, or QCL sources of the default QCL assumption, or the active TCI state of PDSCH and QCL source of the default QCL assumption have been reported as a resource group in Rel-17 group-based RSRP report.

### 8.5.3.4 Minimum requirement of CSI-RS based beam failure detection for UE fulfilling relaxed measurement criteria

This clause contains the minimum requirements for CSI-RS based relaxed beam failure detection.

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_CSI\text{-}RS_Relax}$ period becomes worse than the threshold $Q_{out_LR_CSI\text{-}RS}$ within $T_{Evaluate_BFD_CSI\text{-}RS_Relax}$ period.

The value of $T_{Evaluate_BFD_CSI\text{-}RS_Relax}$ is defined in table 8.5.3.4-1 for FR1.

The value of $T_{Evaluate_BFD_CSI\text{-}RS_Relax}$ is defined in table 8.5.3.4-2 for FR2 with N=1.

The values of P, $M_{BFD}$ and $P_{BFD}$ is defined in clause 8.5.3.2.

Longer evaluation period would be expected if the combination of RLM-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 8.5.3.4-1: Evaluation period $T_{Evaluate_BFD_CSI\text{-}RS_Relax}$ for FR1**

| Configuration | $T_{Evaluate_BFD_CSI\text{-}RS\ Relax}$ (ms) |
|---|---|
| $Max(T_{DRX}, T_{CSI\text{-}RS}) \le 80$ ms | $Max(50 \times K3, Ceil(K1 \times 1.5 \times M_{BFD} \times P \times P_{BFD}) \times Max(T_{DRX}, T_{CSI\text{-}RS}))$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length and no longer than 80 ms.<br>NOTE 2: K1 is the relaxation factor. K1 = 2 for 40 ms < $MAX(T_{DRX}, T_{CSI\text{-}RS}) \le 80$ ms, K1 = 4 for $MAX(T_{DRX}, T_{CSI\text{-}RS}) \le 40$ ms<br>NOTE 3: K3 is the relaxation factor for the lower bound. K3 = K1, if 1 < K1 ≤ 2; K3 = 1 otherwise. | |

**Table 8.5.3.4-2: Evaluation period $T_{Evaluate_BFD_CSI\text{-}RS_Relax}$ for FR2**

| Configuration | $T_{Evaluate_BFD_CSI\text{-}RS\ Relax}$ (ms) |
|---|---|
| $Max(T_{DRX}, T_{CSI\text{-}RS}) \le 80$ ms | $Max(50 \times K4, Ceil(K2 \times 1.5 \times M_{BFD} \times P \times N \times P_{BFD}) \times Max(T_{DRX}, T_{CSI\text{-}RS}))$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length and no longer than 80 ms.<br>NOTE 2: K2 is the relaxation factor. K2 = 2<br>NOTE 3: K4 is the relaxation factor for the lower bound. K4 = K2, if 1 < K2 ≤ 2; K4 = 1 otherwise. | |

## 8.5.4 Minimum requirement for L1 indication

When the radio link quality on all the RS resources in set $\bar{q}_0$ is worse than $Q_{out_LR}$, layer 1 of the UE shall send a beam failure instance indication to the higher layers

The beam failure instance evaluation for the RS resources in set $\bar{q}_0$ shall be performed as specified in clause 6 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval_BFD}$.

When DRX is not used, $T_{Indication_interval_BFD}$ is max(2ms, $T_{SSB-RS,M}$) ) or max(2ms, $T_{CSI-RS,M}$), where $T_{SSB-RS,M}$ and $T_{CSI-RS,M}$ is the shortest periodicity of all RS resources in set $\bar{q}_0$ for the accessed cell, corresponding to either the shortest periodicity of the SSB in the set $\bar{q}_0$ or CSI-RS resource in the set $\bar{q}_0$.

When DRX is used, for SSB based link quality measurement,

- $T_{Indication_interval_BFD}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{SSB-RS,M}$), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

When DRX is used, for CSI-RS based link quality measurement,

- $T_{Indication_interval_BFD}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{CSI-RS,M}$), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

For deactivated PSCell,

when DRX is not used, $T_{Indication_interval_BFD}$ is Max (2 ms, *measCyclePSCell*).

when DRX is used, for SSB based link quality measurement,

- $T_{Indication_interval_BFD}$ = Max (1.5 × DRX_cycle_length, 1.5 × *measCyclePSCell*), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD}$ = Max (DRX_cycle_length, *measCyclePSCell*), if DRX_cycle_length > 320 ms.

When DRX is used, for CSI-RS based link quality measurement,

- $T_{Indication_interval_BFD}$ = Max (1.5 × DRX_cycle_length, 1.5 × *measCyclePSCell*), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD}$ = Max (DRX_cycle_length, *measCyclePSCell*), if DRX_cycle_length > 320 ms.

## 8.5.5 Requirements for SSB based candidate beam detection

### 8.5.5.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_1$ configured for a serving cell, provided that the SSBs configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5.5.2 unless the UE supports *bwpOperationMeasWithoutInterrupt-r18*, provided that the SSB is within the configured UE-specific CBW. The requirements in this clause apply when UE is required to perform candidate beam detection on no more than 1 serving cell per band unless otherwise specified. For UE supporting *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided for the configured FR1 intra-band non-contiguous CA, the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers, and no more than 1 serving cell per band otherwise.

For UE supporting *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v19xy* is *"type 4"*

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers

2> if *nonCollocatedTypeNR-CA-v19xy* is *"type 1"*

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 1 serving cell per band

2> else if *nonCollocatedTypeNR-CA-v19xy* is not provided

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 1 serving cell per band

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers

2>else

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 1 serving cell per band

For UE supporting *On-demand SSB operation* and when OD- SSB transmission is indicated, the UE shall be able to perform candidate beam detection of configured SSBs, provided that the SSB is within the configured DL BWP.

### 8.5.5.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured SSB resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_SSB}$ period becomes better than the threshold $Q_{in_LR}$ provided SSB_RP and SSB $\hat{E}s/Iot$ are according to Annex table B.2.4.1 for a corresponding band.The UE shall monitor the configured SSB resources using the evaluation period in table 8.5.5.2-1 and 8.5.5.2-2 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_SSB}$ is defined in table 8.5.5.2-1 for FR1.

The value of $T_{Evaluate_CBD_SSB}$ is defined in table 8.5.5.2-2 for FR2 with scaling factor N, where

- N = 2, 4 or 6 for serving cell in FR2-1 if the UE supports *fastBeamSweepingMultiRx-r18* according to the conditions in clause 3.6.19,
- N=8 for other cases in FR2-1, and
- N=12 for FR2-2.
- For a UE supporting *featureSetCombinationLowBandSwitching-r19*, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both *concurrentMeasGap-r17* and *musim-GapPreference-r17*, and when concurrent gaps or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are configured,
- an SSB resource occasion for candidate beam detection is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clauses 9.1.8 and 9.1.10,
- P value for a CBD-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$> 0
- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or periodic MUSIM gap(s) or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any CBD-RS resource occasion:
  - $N_{total}$ is the total number of CBD-RS resource occasions within the window W, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window W,

    For UEs supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*:

- for the CBD monitoring on PCell, $N_{total}$ also includes SSB resource occasions that overlap with the SDL ON duration within the window,
- for the CBD monitoring on SCell, $N_{total}$ also includes SSB resource occasions that overlap with the PCell ON duration within the window, as defined by the configured switching pattern, and

- $N_{outside_MG}$ is the number of CBD-RS resource occasions within the window W,
  - that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion, and
  - that are overlapped with PCell ON duration corresponding to the LB CA switching pattern, for the CBD on PCell for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*.
  - that are overlapped with SCell ON duration corresponding to the LB CA switching pattern, for the CBD on SCell for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, and
- $N_{available}$ is the number of CBD-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion nor any SMTC occasion within the window W, and

- an SSB resource occasion for candidate beam detection is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion, and
  - $T_{L1}$ is periodicity of the target CBD-RS.
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.
  - for UE not supporting *featureSetCombinationLowBandSwitching-r19*, switching pattern periodicity is not applicable.
  - CBD requirement in this clause is not applied when $N_{outside_MG} = 0$.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* nor supporting *musim-GapPreference-r17* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s), concurrent measurement gap(s) with NCSG(s), and periodic MUSIM gaps,

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB,
- P = 1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is not overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- P is $P_{sharing\ factor}$, when candidate beam detection RS is not overlapped with GAP and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and
  - $T_{SMTCperiod} \neq$ xRP or
  - $T_{SMTCperiod}$ = xRP and $T_{SSB} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = xRP$ and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{Min(xRP,T_{SMTCperiod})}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} < xRP$)

where,

- $P_{sharing\ factor} = 1$, if the CBD-RS resource outside gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor} = 3$, otherwise.

- If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

- When a measurement gap is configured and the measurement gap is not NCSG,

  - a CBD-RS resource or an SMTC occasion is considered to be overlapped with the GAP if it overlaps a measurement gap occasion, and

  - xRP = MGRP

- Otherwise, when NCSG is measurement gap only is configured,

  - a CBD-RS resource or an SMTC occasion is considered to be overlapped with the GAP if

    - it overlaps the VIL1 or VIL2 of NCSG, or

    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,

  - and

    - xRP = VIRP

    - If the UE is configured with Pre-MG only, an CBD-RS resource or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.

- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, a CBD-RS resource or an SMTC occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

When the configured aperiodic MUSIM gap is overlapping with SSB resource occasion for candidate beam detection, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and if SSB resource occasions for candidate beam detection are fully overlapped with MUSIM gap(s), or the union of MUSIM gap(s) and GAPs, no requirement applies for SSB based candidate beam detection.

For either an FR1 or FR2 serving cell, longer CBD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $P_{CBD}$ used in table 8.5.5.2-1 and table 8.5.5.2-2 are defined as

For each SSB resource in the set $\bar{q}_1$ configured for PCell or PSCell in EN-DC or NE-DC or SA; or PCell in NR-DC

- $P_{CBD} = 1$.

For each SSB resource in the set $\bar{q}_1$ configured for PSCell in NR-DC

- $P_{CBD} = 2$ if UE is configured for candidate beam detection on SCell, 1 otherwise.

For each SSB resource in the set $\bar{q}_1$ configured for a SCell

- $P_{CBD} = Z$ in EN-DC or NE-DC or SA.
- $P_{CBD} = 2^* Z$ in NR-DC.
  - Where Z is the number of band(s) on which UE is performing candidate beam detection only for SCell
- $P_{CBD}$ is the number of band(s) on which UE is performing candidate beam detection only for SCell.

**Table 8.5.5.2-1: Evaluation period $T_{Evaluate_CBD_SSB}$ for FR1**

| Configuration | $T_{Evaluate_CBD_SSB}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(3 \times P \times P_{CBD}) \times T_{SSB})$ |
| DRX cycle > 320 ms | $Ceil(3 \times P \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_1$ for UE not supporting *On-demand SSB operation* or when OD-SSB transmission is not indicated, otherwise, $T_{SSB}$ = EMP of SSB in the set $\bar{q}_1$. The EMP is the periodicity of OD-SSBs in the configured DL BWP if no first SSB transmission is configured, or if UE supports *timec1nc2* and OD-SSB transmission is indicated with first SSB transmission and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern, or the periodicity of the union of OD-SSBs and first SSBs if first SSBs are transmitted and the OD-SSB activation is indicated and the union of OD-SSBs and first SSBs has a periodic time domain pattern. $T_{DRX}$ is the DRX cycle length. | |

**Table 8.5.5.2-2: Evaluation period $T_{Evaluate_CBD_SSB}$ for FR2**

| Configuration | $T_{Evaluate_CBD_SSB}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(3 \times P \times N \times P_{CBD}) \times T_{SSB})$ |
| DRX cycle > 320 ms | $Ceil(3 \times P \times N \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_1$ if UE not supporting *On-demand SSB operation* or when OD-SSB transmission is not indicated, otherwise, $T_{SSB}$ = EMP of SSB in the set $\bar{q}_1$. The EMP is the periodicity of OD-SSBs in the configured DL BWP if no first SSB transmission is configured, or if UE supports *timec1nc2* and OD-SSB transmission is indicated with first SSB transmission and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern, or the periodicity of the union of OD-SSBs and first SSBs if first SSBs are transmitted and the OD-SSB activation is indicated and the union of OD-SSBs and first SSBs has a periodic time domain pattern. $T_{DRX}$ is the DRX cycle length. | |

#### 8.5.5.3 Measurement restriction for SSB based candidate beam detection

For FR1, when the SSB OFDM symbols used for CBD measurement fully or partially overlap with CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for CBD measurement without any restrictions;
- If SSB and CSI-RS have different SCS
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for CBD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, when the SSB for CBD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, when the SSB for CBD measurement on one CC is in the same OFDM symbol as SSB from cell with additional PCI for BFD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, when the SSB for CBD measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, when the SSB for CBD measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both SSB and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, if network configures same or mixed numerology between SSB for CBD measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, UE shall be able to perform the related SSB based measurements in one band without any measurement restrictions in the other band, provided that UE is capable of independent beam management on this FR2 band pair.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated without first SSB transmission, the measurement restriction is expected for OD-SSB occasions only.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated with first SSB transmission, no measurement restriction is expected for first SSB occasions if UE supports *Time-C1nC2* and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern. Otherwise, the measurement restriction is expected for both first SSB and OD-SSB occasions.

### 8.5.6 Requirements for CSI-RS based candidate beam detection

#### 8.5.6.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\tilde{q}_1$ configured for a serving cell, provided that the CSI-RS resources configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5.6.2. The requirements in this clause apply when UE is required to perform candidate beam detection on no more than 1 serving cell per band unless otherwise specified. For UE supporting *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided for the configured FR1 intra-band non-contiguous CA, the requirements in this clause apply when UE is required to perform

candidate beam detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers, and no more than 1 serving cell per band otherwise.

For UE supporting *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v19xy* is *"type 4"*

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers

2> if *nonCollocatedTypeNR-CA-v19xy* is *"type 1"*

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 1 serving cell per band

2> else if *nonCollocatedTypeNR-CA-v19xy* is not provided

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 1 serving cell per band

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 2 serving cells per band if these 2 serving cells are in non-contiguous carriers

2>else

3> the requirements in this clause apply when UE is required to perform candidate beam detection on no more than 1 serving cell per band

### 8.5.6.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured CSI-RS resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_CSI\text{-}RS}$ period becomes better than the threshold $Q_{in_LR}$ within $T_{Evaluate_CBD_CSI\text{-}RS}$ period provided CSI-RS Ês/Iot is according to annex B.2.4.2 for a corresponding band.

The UE shall monitor the configured CSI-RS resources using the evaluation period in table 8.5.6.2-1 and 8.5.6.2-2 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_CSI\text{-}RS}$ is defined in table 8.5.6.2-1 for FR1.

The value of $T_{Evaluate_CBD_CSI\text{-}RS}$ is defined in table 8.5.6.2-2 for FR2 with scaling factor N, where

- N = 2, 4 or 6 for serving cell in FR2-1 if the UE supports *fastBeamSweepingMultiRx-r18* according to the conditions in clause 3.6.19
- N=8 for other cases in FR2-1, and
- N=12 for FR2-2.

For the value of L1,

1> If the UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network,

2> L1 is not applicable;

1> Else if the UE supports *sbfd-Aware-r19* and SBFD is configured by the network,

2> If DRX is not configured,

3> L1 is the number of occasions of the CSI-RS resource for candidate beam detection that are overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_CBD_CSI-RS}$;

2> If DRX is configured,

3> L1 is the number of DRX cycles in which at least one occasion of the CSI-RS resource for candidate beam detection is overlapping with dynamic UL transmission on SBFD symbols during $T_{Evaluate_CBD_CSI-RS}$.

If the UE supports *sbfd-Aware-r19* and SBFD is configured by the network, the requirements in this clause apply provided that all the occasions of the CSI-RS resource are in the same type (i.e., SBFD or non-SBFD) of symbols.

For a UE supporting *featureSetCombinationLowBandSwitching-r19*, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both *concurrentMeasGap-r17* and *musim-GapPreference-r17* and when concurrent gaps or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are configured,

- an CSI-RS resource occasion for candidate beam detection is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clause 9.1.8 and 9.1.10,
- P value for a CBD-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$> 0
- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or periodic MUSIM gap(s) or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any CBD-RS resource occasion:
  - $N_{total}$ is the total number of CBD-RS resource occasions within the window W, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window W,

    For UEs supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*:

    - for the CBD monitoring on PCell, $N_{total}$ also includes CBD-RS resource occasions that overlap with the SDL ON duration within the window,
    - for the CBD monitoring on SCell, $N_{total}$ also includes CBD-RS resource occasions that overlap with the PCell ON duration within the window, as defined by the configured switching pattern, and
  - $N_{outside_MG}$ is the number of CBD-RS resource occasions within the window W,
    - that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion, and
    - that are overlapped with PCell ON duration corresponding to the LB CA switching pattern, for the CBD on PCell for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, or
    - that are overlapped with SCell ON duration corresponding to the LB CA switching pattern, for the CBD on SCell for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, and
  - $N_{available}$ is the number of CBD-RS resource occasions that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion nor any SMTC occasion within the window W, and
  - an CSI-RS resource occasion for candidate beam detection is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion, and
  - $T_{L1}$ is periodicity of the target CBD-RS, and

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.
- for UE not supporting *featureSetCombinationLowBandSwitching-r19*, switching pattern periodicity is not applicable.
- CBD requirement in this clause is not applied when $N_{outside_MG} = 0$.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* nor supporting *musim-GapPreference-r17* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s), concurrent measurement gap(s) with NCSG(s), and periodic MUSIM gaps,

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and
- P = 1 when in the monitored cell there are no GAPs overlapping with any occasion of the CSI-RS.

For FR2,

- P = 1, when candidate beam detection RS is not overlapped with GAP and also not overlapped with SMTC occasion.
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$ when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is not overlapped with SMTC occasion ($T_{CSI-RS} < xRP$)
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when candidate beam detection RS is not overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when candidate beam detection RS is not overlapped with GAP and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{xRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$,, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and
  - $T_{SMTCperiod} \neq xRP$ or
  - $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{xRP}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{Min(xRP,T_{SMTCperiod})}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP
- $P = \frac{3}{1-\frac{T_{CSI-RS}}{xRP}}$,, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} < xRP$)

where,

- $P_{sharing\ factor}$ = 1, if the CBD-RS resource outside GAP is

- not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

- not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.

- If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

  - When a GAP is configured only and the GAP is not NCSG,

  - a CBD-RS resource or an SMTC occasion is considered to be overlapped with the GAP if it overlaps the GAP occasion, and

  - xRP = MGRP

- Otherwise, when NCSG GAP only is configured,

  - a CBD-RS resource or an SMTC occasion is considered to be overlapped with the GAP if

    - it overlaps the VIL1 or VIL2 of NCSG, or

    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,

  - and

    - xRP = VIRP

- If the UE is configured with Pre-MG only, an CBD-RS resource or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.

- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, a CBD-RS resource or an SMTC occasion is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

NOTE: The overlap between CSI-RS for CBD and SMTC means that CSI-RS for CBD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and GAP configurations does not meet previous conditions.

Longer evaluation period would be expected if the CSI-RS is on the same OFDM symbols with RLM, BFD, BM-RS, or other CBD-RS, according to the measurement restrictions defined in clause 8.5.6.3.

When the configured aperiodic MUSIM gap is overlapping with CSI-RS resource occasion for candidate beam detection, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and if CSI-RS resource occasions for candidate beam detection are fully overlapped with MUSIM gap(s), or the union of MUSIM gap(s) and GAPs, no requirement applies for CSI-RS based candidate beam detection.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer CBD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{CBD}$ used in table 8.5.6.2-1 and table 8.5.6.2-2 are defined as

- $M_{CBD}$ = 3, if the CSI-RS resource configured in the set $\bar{q}_1$ is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

If the UE supports *sbfd-Aware-r19* and SBFD is configured by the network, the requirements in this clause apply provided that CSI-RS resource configured in the set $\bar{q}_1$ is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs in at least one DL subband.

The values of $P_{CBD}$ used in table 8.5.6.2-1 and table 8.5.6.2-2 are defined as

- For each CSI-RS resource in the set $\bar{q}_1$ configured for PCell or PSCell in EN-DC or NE-DC or SA; or PCell in NR-DC
  - $P_{CBD}$ = 1.
- For each CSI-RS resource in the set $\bar{q}_1$ configured for PSCell in NR-DC
  - $P_{CBD}$ = 2 if UE is configured for candidate beam detection on SCell, 1 otherwise.
- For each CSI-RS resource in the set $\bar{q}_1$ configured for a SCell
  - $P_{CBD}$ = Z in EN-DC or NE-DC or SA.
  - $P_{CBD}$ = 2* Z in NR-DC.
    - Where Z is the number of band(s) on which UE is performing candidate beam detection only for SCell
  - $P_{CBD}$ is the number of band(s) on which UE is performing candidate beam detection only for SCell.

**Table 8.5.6.2-1: Evaluation period $T_{Evaluate_CBD_CSI-RS}$ for FR1**

| Configuration | $T_{EvaluateC_CBD_CSI-RS}$ (ms) |
|---|---|
| non-DRX, DRX cycle $\leqslant$ 320 ms | Max(25, Ceil((M_CBD+L1) × P × P_CBD) × max(T_CSI-RS, T_proc)) |
| DRX cycle > 320 ms | Ceil((M_CBD+L1) × P × P_CBD) × T_DRX |
| NOTE 1: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length.<br>NOTE 2: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for CBD is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

**Table 8.5.6.2-2: Evaluation period $T_{Evaluate_CBD_CSI-RS}$ for FR2**

| Configuration | $T_{Evaluate_CBD_CSI-RS}$ (ms) |
|---|---|
| non-DRX, DRX cycle $\leqslant$ 320 ms | Max(25, Ceil((M_CBD+L1) × P × N × P_CBD) × max(T_CSI-RS, T_proc)) |
| DRX cycle > 320 ms | Ceil((M_CBD+L1) × P × N × P_CBD) × T_DRX |
| NOTE 1: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length.<br>NOTE 2: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for CBD is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

### 8.5.6.3 Measurement restriction for CSI-RS based candidate beam detection

The SSB mentioned in this clause can be associated with either the serving cell PCI or a PCI different from serving cell PCI or intra-frequency neighbor cell(s) configured with L1-RSRP measurement or inter-frequency neighbor cell(s) configured with L1-RSRP measurement without gap.

For both FR1 and FR2, when the CSI-RS for CBD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for CBD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has same SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has different SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS based CBD measurement for without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for CBD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for CBD measurement without any restriction.

For FR2, when the CSI-RS for CBD measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer evaluation period for CSI-RS based CBD measurement is expected, and no requirements are defined.For both FR1 and FR2, when the CSI-RS for CBD measurement fully or partially overlaps with the OFDM symbol as SSB or CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for CBD measurement in the PRBs that overlap with an SSB or CSI-RS from candidate LTM neighbour cell.

For FR1, when the CSI-RS for CBD measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support simultaneousRxDataSSB-DiffNumerology, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD is expected, and no requirements are defined.

For FR2, when the CSI-RS for CBD measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD is expected, and no requirements are defined.

For FR2, when the CSI-RS for CBD measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both CSI-RS for CBD measurement and CSI-RS for intra-frequency L1-RSRP measurement. Longer measurement period for CSI-RS based CBD is expected, and no requirements are defined.

For FR2, when the CSI-RS for CBD measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and the other CSI-RS. Longer evaluation period for CSI-RS based CBD measurement is expected, and no requirements are defined.

## 8.5.7 Scheduling availability of UE during beam failure detection

Scheduling availability restrictions when the UE is performing beam failure detection are described in the following clauses.

### 8.5.7.1 Scheduling availability of UE performing beam failure detection with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to beam failure detection performed on SSB and CSI-RS configured for BFD with the same SCS as PDSCH or PDCCH in FR1.

### 8.5.7.2 Scheduling availability of UE performing beam failure detection with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to beam failure detection when SSB is configured as BFD. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to beam failure detection when SSB is configured as BFD.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for beam failure detection.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

When intra-band non-contiguous carrier aggregation is configured for a UE supporting intraBandNR-CA-non-collocated-r19,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v19xy* is “type 4”

3> there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band

2> if *nonCollocatedTypeNR-CA-v19xy* is “type 1”

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v19xy* is not provided

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band

2>else

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which PCell or PSCell is configured.

When inter-band FR1-FR1 NR-DC is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in the bands due to beam failure detection performed on FR1 serving PCell or PSCell in different bands.

### 8.5.7.3 Scheduling availability of UE performing beam failure detection on FR2

The following scheduling restriction applies due to beam failure detection.

- For the case where no RSs are provided for BFD, or when CSI-RS is configured for BFD is explicitly configured and is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON

  - There are no scheduling restrictions due to beam failure detection performed based on the CSI-RS.

- For the case when UE supporting *schedulingMeasurementRelaxation-r18* in FR2-1 is configured to receive two PDSCH transmission occasions from two different QCL sources on the cell according to the conditions in clause 3.6.19, there are no scheduling restrictions for the PDSCHs due to beam failure detection performed based on the CSI-RS, when following conditions are met:

  - the CSI-RS configured for BFD is not in a CSI-RS resource set with repetition ON, and

  - the CSI-RS configured for BFD has same QCL source as the active TCI state of one of PDSCHs and has different QCL-TypeD from the other PDSCH, and

  - [The two CSI-RS resources and both PDSCHs are overlapped on the same OFDM symbol], and

  - The CSI-RS and both of the PDSCHs are on the same OFDM symbol(s), or the CSI-RS and one of the PDSCHs with different QCL typeD are on the same OFDM symbol(s) when partially overlapping PDSCHs are scheduled, and

  - Resources of the active TCI states for the two PDSCHs have been reported as a resource group in Rel-17 group-based RSRP report

- Otherwise

  - For FR2-1 or the BFD-RS is not using 480 kHz SCS or 960 kHz SCS on FR2-2, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on BFD-RS resource symbols to be measured for beam failure detection.

  - For FR2-2 and the BFD-RS is using 480 kHz SCS or 960 kHz SCS, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on BFD-RS resource symbols to be measured for beam failure detection, and on one data symbol before each BFD-RS symbol to be measured and one data symbol after each BFD-RS symbol to be measured.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions on FR2 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to beam failure detection performed on FR2 serving cell(s) in different band(s), provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for BFD measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for BFD measurement.

### 8.5.7.4 Scheduling availability of UE performing beam failure detection on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to beam failure detection performed on FR2 serving PCell and/or PSCell.

There are no scheduling restrictions on FR2 serving cell(s) due to beam failure detection performed on FR1 serving PCell and/or PSCell.

## 8.5.8 Scheduling availability of UE during candidate beam detection

Scheduling availability restrictions when the UE is performing L1-RSRP measurement for candidate beam detection are described in the following clauses.

### 8.5.8.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as link recovery detection resource with the same SCS as PDSCH or PDCCH in FR1.

### 8.5.8.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as link recovery detection resource. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured as link recovery detection resource.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, TRS, CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for L1-RSRP.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on one serving cell apply to all other serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions on one serving cell apply to all other serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

When intra-band non-contiguous carrier aggregation is configured for a UE supporting intraBandNR-CA-non-collocated-r19,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v19xy* is “type 4”

3> there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band

2> if *nonCollocatedTypeNR-CA-v19xy* is “type 1”

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v19xy* is not provided

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band

2>else

3> the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands.

When inter-band FR1-FR1 NR-DC is configured, there are no scheduling restrictions on FR1 serving cell(s) in one band due to candidate beam detection performed on FR1 serving cell(s) in other bands.

### 8.5.8.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to candidate beam detection

- For FR2-1 or the reference symbols to be measured for candidate beam detection is not using 480 kHz SCS or 960 kHz SCS on FR2-2, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, CSI-RS for tracking or CSI-RS for CQI on reference symbols to be measured for candidate beam detection.

- For FR2-2 and the reference symbols to be measured for candidate beam detection is using 480 kHz SCS or 960 kHz SCS, the UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, CSI-RS for tracking or CSI-RS for CQI on reference symbols to be measured for candidate beam detection, and on one data symbol before each reference symbol to be measured for candidate beam detection and one data symbol after each reference symbol to be measured for candidate beam detection.

When intra-band carrier aggregation in FR2 is configured, the scheduling restrictions on to one serving cell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to candidate beam detection performed on FR2 serving cell(s) in different band(s), provided that the FR2 serving cell(s) and the FR2 serving cell(s) for candidate beam detection are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE’s reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for CBD mesurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for CBD mesurement.

### 8.5.8.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to L1-RSRP measurement performed on FR2 serving cell(s).

There are no scheduling restrictions on FR2 serving cell(s) due to L1-RSRP measurement performed on FR1 serving cell(s).

## 8.5.9 Requirements for Beam Failure Recovery in SCell

### 8.5.9.1 Introduction

For the UE provided with a configuration of PUCCH transmission with a link recovery request (LRR) as described in clause 9.2.4 in TS 38.213 [3], if beam recovery procedure is triggered for any of SCells, the UE shall transmit SR for UL resource followed by MAC CE providing one index for at least one corresponding SCell with radio link quality is worse than $Q_{out,LR}$, and the index $q_{new}$ for a periodic CSI-RS configuration or for a SSB provided by higher layer, as described in clause 5.17 of TS 38.321 [7], if any, for a corresponding SCell.

For the UE not provided with a configuration of PUCCH transmission with a link recovery request (LRR) as described in clause 9.2.4 in TS 38.213 [3], if beam recovery procedure is triggered for any of SCells, the UE shall transmit preamble for UL-SCH resource application, followed by MAC CE providing one index for at least one corresponding SCell with radio link quality is worse than $Q_{out,LR}$, and the index $q_{new}$ for a periodic CSI-RS configuration or for a SSB provided by higher layer, as described in clause 5.17 of TS 38.321 [7], if any, for a corresponding SCell.

### 8.5.9.2 Requirement

Provided that UE is configured by *schedulingRequestIDForBFR* a configuration for LRR in a PUCCH transmission, after BFR is triggered on any of SCells as described in clause 5.17 of TS 38.321 [7], UE shall be capable of transmit PUCCH with an LRR within a period of T, where

- $T = T_1 \times Ceil((T_2+D)/T_1)$ in which $T_1$, $T_2$ and D are defined as
  - $T_1$ is equal to the periodicity of PUCCH configured with *schedulingRequestIDForBFR*.
  - $T_2 = T_{Evaluate_CBD}$ is the evaluation period specified in clause 8.5.5 or 8.5.6 for SSB or CSI-RS based candidate beam detection, that is $T_{Evaluate_CBD_SSB}$ or $T_{Evaluate_CBD_CSI-RS}$, depending on the applicable reference signal configured for candidate beam detection.
  - D = 2 ms is the UE processing time.

## 8.5.10 Minimum requirement at transitions for beam failure detection

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each BFD-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each BFD-RS resource.

When the UE transitions from a first configuration of BFD resources to a second configuration of BFD resources that is different from the first configuration, for each BFD resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each BFD resource present in the second configuration.

When the UE transitions from a first configuration of active TCI state of the CORESET to a second configuration of active TCI state of the CORESET, for each CSI-RS for BFD present in the second configuration, the UE shall use an evaluation period corresponding to the second configuration from the time of transition.

For UE supporting *ncd-SSB-BWP-Wor-r18*, when the UE transitions between BFD CD-SSB resource and BFD NCD-SSB resource due to BWP switching or due to SCG activation or deactivation during one evaluation period, the UE shall use an evaluation period that is the maximum of the evaluation period corresponding to the first SSB type and the second SSB type after the BWP switching or the SCG activation or deactivation. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each BFD-RS resource.

For UE supporting *On-demand SSB operation*, when UE is indicated, by on-demand SSB Activation/Deactivation MAC-CE, adaptation of periodicities for the activated transmission of OD-SSBs when the SCell is activated, the evaluation period requirements for candidate beam detection are based on the adapted OD-SSB burst periodicity which applies from the first OD-SSB burst after an additional processing time as 2ms or 5ms depending on *OD-SSB post processing time*.

### 8.5.11 Minimum requirement under IDC Interference

When the UE is provided with IDC solution, the UE shall also assess the downlink radio link quality and meet the corresponding requirements in clause 8.5.

### 8.5.12 Minimum requirement at transitions for candidate beam detection

For UE supporting *On-demand SSB operation*, when UE is indicated, by a MAC-CE, adaptation of periodicities for the activated transmission of OD-SSBs when the SCell is activated, the candidate beam detection requirements are based on the EMP of adapted OD-SSB burst periodicity which applies from the first OD-SSB burst after the time point as defined in TS 38.213 for adaptation of the second SS/PBCH blocks transmissionplus additional processing time as 2ms or 5ms depending on *OD-SSB post processing time*.

For UE supporting *ssb-BurstPeriodicityAdaptation-r19*, when UE receives DCI format 2_9 that indicates a change in SSB burst periodicity of the SSB transmission during one evaluation period, the evaluation period requirements for candidate beam detection based on the indicated SSB burst periodicity applies from the first SSB burst after the time point as defined in TS 38.213 plus 2 ms and 3 ms for FR1 and FR2 respectively.

## 8.5A Link Recovery Procedures when CCA is used on target frequency

### 8.5A.1 Introduction

The requirements for link recovery procedure in the clause apply when CCA is used on a serving frequency on the downlink.

The UE shall assess the downlink radio link quality of a serving cell based on the reference signal in the set $\bar{q}_0$ as specified in TS 38.213 [3] in order to detect beam failure on:

- PCell in SA operation mode,
- PSCell in EN-DC operation mode.
- PSCell in NR-DC operation mode.

The RS resource configurations in the set $\bar{q}_0$ can be periodic SSBs. UE is not required to perform beam failure detection outside the active DL BWP. UE is not required to meet the requirements in clause 8.5A.2 and 8.5A.3 if UE does not have set $\bar{q}_0$.

On each RS resource configuration in the set $\bar{q}_0$, the UE shall estimate the radio link quality and compare it to the threshold $Q_{out_LR,CCA}$ for the purpose of accessing downlink radio link quality of the serving cell beams.

The threshold $Q_{out_LR,CCA}$ is defined as the level at which the downlink radio level link of a given resource configuration on set $\bar{q}_0$ cannot be reliably received and shall correspond to the $BLER_{out,CCA}$ = 10 % block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection, $Q_{out_LR_SSB,CCA}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5A.2.1-1.

Upon request the UE shall deliver configuration indexes from the set $\bar{q}_1$ as specified in TS 38.213 [3] , to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold $Q_{in_LR,CCA}$, which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the $Q_{in_LR,CCA}$ threshold to the L1-RSRP measurement obtained from an SSB. The RS resource configurations in the set $\bar{q}_1$ can be periodic SSBs. UE is not required to perform candidate beam detection outside the active DL BWP.

In the requirements of clause 8.5A, the term CBD-RS SSB occasions not available at the UE refers to when the CBD-RS SSB is configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SSB index within the set of configured CBD-RS resources are not available at the UE due to DL CCA failures at gNB during the corresponding evaluation period; otherwise the CBD-RS SSB is considered as available at the UE.

The requirements in clause 8.5A apply for any *channelAccessMode* configuration [2].

# 8.5A.2 Requirements for SSB based beam failure detection

## 8.5A.2.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_0$ configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5A.2.2, but occasionally may not be transmitted due to CCA operation.

**Table 8.5A.2.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 24 |
| Sub-carrier spacing (kHz) | Same as the SCS of RMSI CORESET |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

## 8.5A.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured BFD-RS SSB resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_SSB_CCA}$ period becomes worse than the threshold $Q_{out_LR_SSB,CCA}$ within $T_{Evaluate_BFD_SSB_CCA}$ period.

The value of $T_{Evaluate_BFD_SSB_CCA}$ is defined in table 8.5A.2.2-1 for FR1.

The value of $T_{Evaluate_BFD_SSB_CCA}$ is defined in table 8.5A.2.2-2 for FR2-2 with scaling factor N=12.

- For a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* and when concurrent gaps are configured,

- P value for a BFD-RS resource to be measured is defined as $N_{total}$ / $N_{outside_MG}$

- For a window W of duration max($T_{L1}$, xRP_max), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any BFD-RS resource occasion:

  - $N_{total}$ is the total number of BFD-RS resource occasions within the window W, including those overlapped with GAP occasions within the window W, and

  - $N_{outside_MG}$ is the number of BFD-RS resource occasions that are not overlapped with any GAP occasion within the window W

  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

- Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the BFD-RS SSB.

- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the BFD-RS SSB.

- When a GAP is configured only and the GAP is not NCSG,
  - a BFD-RS resource is considered to be overlapped with the GAP if it overlaps a GAP occasion, and
  - xRP = MGRP
  - If the UE is configured with Pre-MG, a BFD-RS resource is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- Otherwise, when NCSG only is configured,
  - a BFD-RS resource is considered to be overlapped with the GAP if it overlaps the VIL1 or VIL2 of NCSG, and
  - xRP = VIRP
- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, a BFD-RS resource is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

For FR2-2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when BFD-RS resource is not overlapped with GAP and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when the BFD-RS resource is not overlapped with GAP and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and
  - $T_{SMTCperiod} \neq MGRP$ or
  - $T_{SMTCperiod} = MGRP$ and $T_{SSB} < 0.5*T_{SMTCperiod}$
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = MGRP$ and $T_{SSB} = 0.5*T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with GAP ($T_{SSB} <$MGRP) and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP.
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the BFD-RS resource is partially overlapped with GAP and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} <$ MGRP)

Where,

- $P_{sharing\ factor} = 1$, if the BFD-RS resource outside GAP is
  - not overlapped with the SSB symbols indicated by SSB-ToMeasure and K data symbol before each consecutive SSB symbols indicated by SSB-ToMeasure and K data symbol after each consecutive SSB symbols indicated by SSB-ToMeasure, given that SSB-ToMeasure is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and K is defined in clause 9.2.5.3.3, and;

- not overlapped with the RSSI symbols indicated by ss-RSSI-Measurement and K data symbol before each RSSI symbol indicated by ss-RSSI-Measurement and K data symbol after each RSSI symbol indicated by ss-RSSI-Measurement, given that ss-RSSI-Measurement is configured, and K is defined in clause 9.2.5.3.3.

- $P_{sharing\ factor} = 3$, otherwise.

If the higher layer in TS 38.331 [2] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2-2 band, given the SMTC offset of all CCs in FR2-2 provided the same offset.

Longer evaluation period would be expected if the combination of BFD-RS SSB resource, SMTC occasion and GAP configurations does not meet previous conditions.

**Table 8.5A.2.2-1: Evaluation period $T_{Evaluate_BFD_SSB_CCA}$ for FR1**

| Configuration | $T_{Evaluate_BFD_SSB_CCA}$ (ms) | |
|---|---|---|
| | BFD-RS SSB Es/Iot Note2 ≥ -7 dB | BFD-RS SSB Es/Iot Note2 < -7 dB |
| no DRX | Max(50, Ceil((10 × P) × $T_{SSB}$)) | Max(50, Ceil((12 × P) × $T_{SSB}$)) |
| DRX cycle ≤ 320 ms | Max(50, Ceil(1.5 × 8 × P) × Max($T_{DRX}$,$T_{SSB}$)) | Max(50, Ceil(1.5 × 10 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | Ceil(7 × P) × $T_{DRX}$ | Ceil(8 × P) × $T_{DRX}$ |
| NOTE 1: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length.<br>NOTE 2: BFD-RS SSB Es/Iot is the averaged BFD-RS SSB Es/Iot over the most recent previous evaluation period. | | |

**Table 8.5A.2.2-2: Evaluation period $T_{Evaluate_BFD_SSB_CCA}$ for FR2-2**

| Configuration | $T_{Evaluate_BFD_SSB_CCA}$ (ms) |
|---|---|
| no DRX | Max(200, Ceil(12*P* N)*$T_{SSB}$) |
| DRX cycle ≤ 320 ms | Max(200, Ceil(1.5*10*P* N)*Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | Ceil(10*P* N)*$T_{DRX}$ |
| NOTE 1: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5A.2.3 Measurement restriction for SSB based beam failure detection

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for BFD measurement is in the same OFDM symbol as CSI-RS for BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;

- If SSB and CSI-RS have different SCS,

  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction;

  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure SSB for BFD measurement.

For FR2-2, when the SSB for BFD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

## 8.5A.3 Void

## 8.5A.4 Minimum requirement for L1 indication

When the radio link quality on all the RS resources in set $\bar{q}_0$ is worse than $Q_{out_LR,CCA}$, layer 1 of the UE shall send a beam failure instance indication to the higher layers.

The beam failure instance evaluation for the RS resources in set $\bar{q}_0$ shall be performed as specified in clause 6 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval_BFD_CCA}$.

When DRX is not used, $T_{Indication_interval_BFD_CCA}$ is max(2 ms, $T_{SSB\text{-}RS,M}$) ), where $T_{SSB\text{-}RS,M}$ is the shortest periodicity of all RS resources in set $\bar{q}_0$ for the accessed cell, corresponding to either the shortest periodicity of the SSB in the set $\bar{q}_0$ .

When DRX is used, for SSB based link quality measurement,

- $T_{Indication_interval_BFD_CCA}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{SSB\text{-}RS,M}$), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD_CCA}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

## 8.5A.5 Requirements for SSB based candidate beam detection

### 8.5A.5.1 Introduction

The requirements in this clause apply for each CBD-RS SSB resource in the set $\bar{q}_1$ configured for a serving cell, provided that the SSBs configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5A.5.2, but occasionally may not be transmitted due to CCA operation.

### 8.5A.5.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured CBD-RS SSB resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_SSB_CCA}$ period becomes better than the threshold $Q_{in_LR,CCA}$ provided SSB_RP and SSB Ês/Iot are according to annex B.2.4.1 for a corresponding band.

The UE shall monitor the configured SSB resources using the evaluation period in table 8.5A.5.2-1 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_SSB_CCA}$ is defined in table 8.5A.5.2-1 for FR1.

The value of $T_{Evaluate_CBD_SSB_CCA}$ is defined in table 8.5A.5.2-2 for FR2-2 with scaling factor N=12.

For FR1,

- For a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* and when concurrent gaps are configured,
  - P value for a CBD-RS resource to be measured is defined as $N_{total}$ / $N_{outside_MG}$
  - For a window W of duration max($T_{L1}$, xRP_max), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any CBD-RS resource occasion:
    - $N_{total}$ is the total number of CBD-RS resource occasions within the window W, including those overlapped with GAP occasions within the window W, and
    - $N_{outside_MG}$ is the number of CBD-RS resource occasions that are not overlapped with any GAP occasion within the window W
    - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

- Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG(s),

  - $P = \frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CBD-RS SSB,

  - P = 1 when in the monitored cell there are no GAPs overlapping with any occasion of the CBD-RS SSB.

For FR2-2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is not overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when candidate beam detection RS is not overlapped with GAP and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when candidate beam detection RS is partially overlapped with GAP and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod}$ < MGRP)

- $P_{sharing\ factor}$ = 1, if the candidate beam detection RS outside GAP is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and K data symbols before consecutive SSB symbols indicated by *SSB-ToMeasure* and K data symbols after consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and where K is defined in clause 9.2.5.3.3, and;

  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and K data symbols before each RSSI symbol indicated by *ss-RSSI-Measurement* and K data symbols after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured, and where K is defined in clause 9.2.5.3.3.

- $P_{sharing\ factor}$ = 3, otherwise.

where,

- If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2-2 band, provided the SMTC offset of all CCs in FR2-2 have the same offset.

- When a GAP is configured only and the GAP is not NCSG,
  - a CBD-RS resource is considered to be overlapped with the GAP if it overlaps a GAP occasion, and
  - xRP = MGRP
  - If the UE is configured with Pre-MG, a CBD-RS resource is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- Otherwise, when NCSG only is configured,
  - a CBD-RS resource is considered to be overlapped with the GAP if it overlaps the VIL1 or VIL2 of NCSG, and
  - xRP = VIRP
- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, a CBD-RS resource is not considered to be overlapped by a GAP occasion if the GAP occasion is dropped according to clause 9.1.8, clause 9.1.12, clause 9.1.13, respectively.

**Table 8.5A.5.2-1: Evaluation period $T_{Evaluate_CBD_SSB_CCA}$ for FR1**

| Configuration | $T_{Evaluate_CBD_SSB_CCA}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil((3 + L_{CBD}) \times P) \times T_{SSB})$ |
| DRX cycle > 320 ms | $Ceil((3 + L_{CBD}) \times P) \times T_{DRX}$ |
| NOTE 1: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length.<br>NOTE 2: When DRX is not configured, $L_{CBD}$ is the number of CBD-RS SSB occasions not available at the UE during $T_{Evaluate_CBD_SSB_CCA}$ where $L_{CBD} \le L_{CBD,max}$. When DRX is configured, $L_{CBD}$ is the number of DRX cycles in which at least one of the CBD-RS SSB occasions not available at the UE during $T_{Evaluate_CBD_SSB_CCA}$ where $L_{CBD} \le L_{CBD,max}$. The UE, which is configured with DRX, is not required to determine the availability of SSB occasions more frequent than<br>Once per Max(25 ms, P * $T_{SSB}$) if DRX cycle ≤ 320 ms,<br>Once per P * $T_{DRX}$ if DRX cycle > 320 ms.<br>NOTE 3: $L_{CBD,max}$=7 for Max($T_{DRX}$, $T_{SSB}$) ≤ 40 assuming $T_{DRX}$=0 for non-DRX,<br>$L_{CBD,max}$=5 for 40 < Max($T_{DRX}$, $T_{SSB}$) ≤ 320,<br>$L_{CBD,max}$=3 for $T_{DRX}$ > 320.<br>NOTE 4 If $L_{CBD}$>$L_{CBD,max}$, the UE shall assume no new candidate beams are found for this evaluation period. | |

**Table 8.5A.5.2-2: Evaluation period $T_{Evaluate_CBD_SSB_CCA}$ for FR2-2**

| Configuration | $T_{Evaluate_CBD_SSB_CCA}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil((3 + L_{CBD}) \times P \times N) \times T_{SSB})$ |
| DRX cycle > 320 ms | $Ceil((3 + L_{CBD}) \times P \times N) \times T_{DRX}$ |
| NOTE 1: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length.<br>NOTE 2: When DRX is not configured, $L_{in}$ is the number of CBD-RS SSB occasions group which are not available at the UE during $T_{Evaluate_CBD_SSB,CCA}$, where $L_{CBD} \le L_{CBD,max}$. A CBD-RS SSB occasions group consists of N consecutive CBD-RS SSB occasions, and the CBD-RS SSB occasions group is not available at the UE when at least one CBD-SSB occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{in}$ is the number of DRX cycles groups which are not available at the UE during $T_{Evaluate_CBD_SSB,CCA}$, where $L_{in} \le L_{CBD,max}$. A DRX group consists of N DRX cycles, and the DRX group is not available when there is at least one DRX in which at least one CBD-RS SSB occasion is not available. The UE is not required to determine the availability of SSB occasions more frequent than once per DRX cycle length, when configured with DRX.<br>NOTE 3: $L_{CBD,max}$=7 for Max($T_{DRX}$, $T_{SSB}$) ≤ 40 assuming $T_{DRX}$=0 for non-DRX,<br>$L_{CBD,max}$=5 for 40 < Max($T_{DRX}$, $T_{SSB}$) ≤ 320,<br>$L_{CBD,max}$=3 for $T_{DRX}$ > 320.<br>NOTE 4: If $L_{CBD}$>$L_{CBD,max}$, the UE shall assume no new candidate beams are found for this evaluation period. | |

### 8.5A.5.3 Measurement restriction for SSB based candidate beam detection

For FR1, when the SSB for CBD measurement is in the same OFDM symbol as CSI-RS for BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for CBD measurement without any restrictions;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for CBD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure SSB for CBD measurement.

For FR2-2, when the SSB for CBD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

## 8.5A.6 Void

## 8.5A.7 Scheduling availability of UE during beam failure detection

Scheduling availability restrictions when the UE is performing beam failure detection are described in the following clauses.

### 8.5A.7.1 Scheduling availability of UE performing beam failure detection with a same subcarrier spacing as PDSCH/PDCCH

In this clause, the same requirements apply as in clause 8.5.7.1.

### 8.5A.7.2 Scheduling availability of UE performing beam failure detection with a different subcarrier spacing than PDSCH/PDCCH

In this clause, the same requirements apply as in clause 8.5.7.2.

### 8.5A.7.3 Scheduling availability of UE performing beam failure detection on FR2-2

In this clause, the same requirements apply as in clause 8.5.7.3.

### 8.5A.7.4 Scheduling availability of UE performing beam failure detection on FR1 or FR2-2 in case of FR1-FR2-2 inter-band CA and NR-DC

In this clause, the same requirements apply as in clause 8.5.7.4.

## 8.5A.8 Scheduling availability of UE during candidate beam detection

Scheduling availability restrictions when the UE is performing L1-RSRP measurement for candidate beam detection are described in the following clauses.

### 8.5A.8.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

In this clause, the same requirements apply as in clause 8.5.8.1.

### 8.5A.8.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

In this clause, the same requirements apply as in clause 8.5.8.2.

### 8.5A.8.3 Scheduling availability of UE performing L1-RSRP measurement on FR2-2

In this clause, the same requirements apply as in clause 8.5.8.3.

### 8.5.8A.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2-2 in case of FR1-FR2-2 inter-band CA and NR-DC

In this clause, the same requirements apply as in clause 8.5.8.4.

## 8.5B Link Recovery Procedures for Redcap

### 8.5B.1 Introduction

The Redcap UE shall assess the downlink radio link quality of a serving cell based on the reference signal in the set $\bar{q}_0$ as specified in TS 38.213 [3] in order to detect beam failure on PCell in SA. The SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not additional specified.

The RS resource configurations in the set $\bar{q}_0$ on PCell can be periodic CSI-RS resources and/or SSBs. UE is not required to perform beam failure detection outside the active DL BWP. UE is not required to meet the requirements in clause 8.5B.2 and 8.5B.3 if UE does not have set $\bar{q}_0$.

On each RS resource configuration in the set $\bar{q}_0$, the UE shall estimate the radio link quality and compare it to the threshold $Q_{out_LR_Redcap}$ for the purpose of accessing downlink radio link quality of the serving cell beams.

The threshold $Q_{out_LR_Redcap}$ is defined as the level at which the downlink radio level link of a given resource configuration on set $\bar{q}_0$ cannot be reliably received and shall correspond to the $BLER_{out}$ = 10% block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection, $Q_{out_LR_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5B.2.1-1. For CSI-RS based beam failure detection, $Q_{out_LR_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5B.3.1-1.

Upon request the UE shall deliver configuration indexes from the set $\bar{q}_1$as specified in TS 38.213 [3] , to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold $Q_{in_LR_RedCap}$ , which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the $Q_{in_LR_RedCap}$ threshold to the L1-RSRP measurement obtained from an SSB. The UE applies the $Q_{in_LR_RedCap}$ threshold to the L1-RSRP measurement obtained for a CSI-RS resource after scaling a respective CSI-RS reception power with a value provided by higher layer parameter *powerControlOffsetSS*. The RS resource configurations in the set $\bar{q}_1$ can be periodic CSI-RS resources or SSBs or both SSB and CSI-RS resources. UE is not required to perform candidate beam detection outside the active DL BWP.

### 8.5B.2 Requirements for SSB based beam failure detection for Redcap

#### 8.5B.2.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_0$ configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5B.2.2.

**Table 8.5B.2.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 16 for 1 Rx UE; 8 for 2 Rx UE |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 for 1 Rx UE; 24 for 2 Rx UE |
| Sub-carrier spacing (kHz) | Same as the SCS of RMSI CORESET |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |

| | |
|---|---|
| Mapping from REG to CCE | Distributed |
| NOTE 1: SCS=60 kHz is not applicable for FR1 | |

## 8.5B.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_SSB_Redcap}$ period becomes worse than the threshold $Q_{out_LR_SSB}$ within $T_{Evaluate_BFD_SSB_Redcap}$ period.

The value of $T_{Evaluate_BFD_SSB_Redcap}$ is defined in table 8.5B.2.2-1 for FR1.

The value of $T_{Evaluate_BFD_SSB_Redcap}$ is defined in table 8.5B.2.2-2 for FR2 with scaling factor N=8.

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB.
- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq$ MGRP or
  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5*T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with measurement gap ($T_{SSB}$ <MGRP) and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} <$ MGRP)
- $P_{sharing\ factor}$ = 1, if the BFD-RS resource outside measurement gap is
  - not overlapped with the SSB symbols indicated by SSB-ToMeasure and 1 data symbol before each consecutive SSB symbols indicated by SSB-ToMeasure and 1 data symbol after each consecutive SSB symbols indicated by SSB-ToMeasure, given that SSB-ToMeasure is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;

- not overlapped with the RSSI symbols indicated by ss-RSSI-Measurement and 1 data symbol before each RSSI symbol indicated by ss-RSSI-Measurement and 1 data symbol after each RSSI symbol indicated by ss-RSSI-Measurement, given that ss-RSSI-Measurement is configured.

- Psharing factor = 3, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 8.5B.2.2-1: Evaluation period $T_{Evaluate_BFD_SSB_Redcap}$ for FR1**

| Configuration | $T_{Evaluate_BFD_SSB_Redcap}$ (ms) for Redcap UE with 2 Rx | $T_{Evaluate_BFD_SSB_Redcap}$ (ms) for 1 Rx Redcap |
|---|---|---|
| no DRX | $Max(50, Ceil(5 \times P) \times T_{SSB})$ | $[ Max(50, Ceil(10 \times P) \times T_{SSB})]$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(7.5 \times P) \times Max(T_{DRX},T_{SSB}))$ | $[ Max(50, Ceil(15 \times P) \times Max(T_{DRX},T_{SSB}))]$ |
| DRX cycle > 320 ms | $Ceil(5 \times P) \times T_{DRX}$ | $[ Ceil(10 \times P) \times T_{DRX}]$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | | |

**Table 8.5B.2.2-2: Evaluation period $T_{Evaluate_BFD_SSB_Redcap}$ for FR2**

| Configuration | $T_{Evaluate_BFD_SSB_Redcap}$ (ms) |
|---|---|
| no DRX | $Max(50, Ceil(5 \times P \times N) \times T_{SSB})$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(7.5 \times P \times N) \times Max(T_{DRX},T_{SSB}))$ |
| DRX cycle > 320 ms | $Ceil(5 \times P \times N) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5B.2.3 Measurement restriction for SSB based beam failure detection

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1, when the SSB for BFD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;

- If SSB and CSI-RS have different SCS,

  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction;

  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

For FR2, when the SSB for BFD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

# 8.5B.3 Requirements for CSI-RS based beam failure detection for Redcap

## 8.5B.3.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\bar{q}_0$ of resource configurations for a serving cell, provided that the CSI-RS resource(s) in set $\bar{q}_0$ for beam failure detection are actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5B.3.2. UE is not expected to perform beam failure detection measurements on the CSI-RS configured for BFD if the CSI-RS is not QCL-ed, with QCL-TypeD when applicable, with the RS in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.5B.3.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 16 for 1 Rx UE; 8 for 2 Rx UE |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 for 1 Rx UE; 24 for 2 Rx UE |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |
| NOTE 1: SCS=60 kHz is not applicable for FR1 | |

## 8.5B.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_CSI\text{-}RS_Redcap}$ period becomes worse than the threshold $Q_{out_LR_CSI\text{-}RS}$ within $T_{Evaluate_BFD_CSI\text{-}RS_Redcap}$ period.

The value of $T_{Evaluate_BFD_CSI\text{-}RS_Redcap}$ is defined in table 8.5B.3.2-1 for FR1.

The value of $T_{Evaluate_BFD_CSI\text{-}RS_Redcap}$ is defined in table 8.5B.3.2-2 for FR2 with N=1. The requirements of $T_{Evaluate_BFD_CSI\text{-}RS_Redcap}$ apply provided that the CSI-RS for BFD is not in a resource set configured with repetition ON. The requirements shall not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for BFD and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS.
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- P = 1, when the BFD-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is not overlapped with SMTC occasion ($T_{CSI\text{-}RS}$ < MGRP)
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI\text{-}RS} < T_{SMTCperiod}$).

- $P = P_{sharing\ factor}$, when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq MGRP$ or

  - $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with measurement gap ($T_{CSI-RS} < MGRP$) and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} < MGRP$)

- $P_{sharing\ factor} = 1$, if the BFD-RS resource outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;

  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,

- $P_{sharing\ factor} = 3$, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

NOTE: The overlap between CSI-RS for BFD and SMTC means that CSI-RS for BFD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{BFD}$ used in table 8.5B.3.2-1 and table 8.5B.3.2-2 are defined as

- $M_{BFD} = 10$, if the CSI-RS resource(s) in set $\bar{q}_0$ used for BFD is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{BFD}$ used in table 8.5B.3.2-1 and table 8.5B.3.2-2 are defined as

For each CSI-RS resource in the set $\bar{q}_0$ configured for PCell

- $P_{BFD} = 1$.

**Table 8.5B.3.2-1: Evaluation period $T_{Evaluate_BFD_CSI-RS_Redcap}$ for FR1**

| Configuration | $T_{Evaluate_BFD_CSI-RS_Redcap}$ (ms) for Redcap UE with 2 Rx | $T_{Evaluate_BFD_CSI-RS_Redcap}$ (ms) for 1 Rx Redcap |
|---|---|---|
| no DRX | $Max(50, Ceil(M_{BFD} \times P \times P_{BFD}) \times T_{CSI-RS})$ | $Max(50, Ceil(2 \times M_{BFD} \times P \times P_{BFD}) \times T_{CSI-RS})$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(1.5 \times M_{BFD} \times P \times P_{BFD}) \times Max(T_{DRX}, T_{CSI-RS}))$ | $Max(50, Ceil(2 \times 1.5 \times M_{BFD} \times P \times P_{BFD}) \times Max(T_{DRX}, T_{CSI-RS}))$ |
| DRX cycle > 320 ms | $Ceil(M_{BFD} \times P \times P_{BFD}) \times T_{DRX}$ | $Ceil(2 \times M_{BFD} \times P \times P_{BFD}) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | | |

**Table 8.5B.3.2-2: Evaluation period $T_{Evaluate_BFD_CSI-RS_Redcap}$ for FR2**

| Configuration | $T_{Evaluate_BFD_CSI-RS_Redcap}$ (ms) |

| DRX cycle > 320 ms | $Ceil(M_{BFD} \times P \times N \times P_{BFD}) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length | |

### 8.5B.3.3 Measurement restrictions for CSI-RS beam failure detection

The UE is required to be capable of measuring CSI-RS for BFD without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following scenarios.

For both FR1 and FR2, when the CSI-RS for BFD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for BFD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

For FR2, when the CSI-RS for BFD measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for BFD measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for BFD measurement and the other CSI-RS. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

  - The CSI-RS for BFD measurement or the other CSI-RS in a resource set configured with repetition ON, or

- The other CSI-RS is configured in set $\bar{q}_1$ and beam failure is detected, or
- The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,

- Otherwise, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

## 8.5B.4 Minimum requirement for L1 indication for Redcap

When the radio link quality on all the RS resources in set $\bar{q}_0$ is worse than $Q_{out_LR_Redcap}$, layer 1 of the UE shall send a beam failure instance indication to the higher layers

The beam failure instance evaluation for the RS resources in set $\bar{q}_0$ shall be performed as specified in clause 6 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval_BFD_Redcap}$.

When DRX is not used, $T_{Indication_interval_BFD_Redcap}$ is max(2ms, $T_{SSB\text{-}RS,M}$) ) or max(2ms, $T_{CSI\text{-}RS,M}$), where $T_{SSB\text{-}RS,M}$ and $T_{CSI\text{-}RS,M}$ is the shortest periodicity of all RS resources in set $\bar{q}_0$ for the accessed cell, corresponding to either the shortest periodicity of the SSB in the set $\bar{q}_0$ or CSI-RS resource in the set $\bar{q}_0$.

When DRX is used, for SSB based link quality measurement,

- $T_{Indication_interval_BFD_Redcap}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{SSB\text{-}RS,M}$), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD_Redcap}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

When DRX is used, for CSI-RS based link quality measurement,

- $T_{Indication_interval_BFD_Redcap}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{CSI\text{-}RS,M}$), if DRX_cycle_length ≤ 320 ms,
- $T_{Indication_interval_BFD_Redcap}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

For HD-FDD UE, the above conditions and requirements $T_{Indication_interval_BFD_Redcap}$ apply given that for each BFD-RS configuration, at least one BFD-RS sample must fall with DL occasion within an indication perio

## 8.5B.5 Requirements for SSB based candidate beam detection for Redcap

### 8.5B.5.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_1$ configured for a serving cell, provided that the SSBs configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5.5.2.

### 8.5B.5.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured SSB resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_SSB}$ period becomes better than the threshold $Q_{in_LR_RedCap}$ provided SSB_RP and SSB Ês/Iot are according to annex B.2.4.1 for a corresponding band.

The UE shall monitor the configured SSB resources using the evaluation period in table 8.5B.5.2-1 and 8.5B.5.2-2 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_SSB_Redcap}$ is defined in table 8.5B.5.2-1 for FR1.

The value of $T_{Evaluate_CBD_SSB_Redcap}$ is defined in table 8.5B.5.2-2 for FR2 with scaling factor N=8.

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB,
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod}$ < MGRP)

- $P_{sharing\ factor}$ = 1, if the candidate beam detection RS outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;

  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured

- $P_{sharing\ factor}$ = 3, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer CBD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $P_{CBD}$ used in table 8.5.5.2-1 and table 8.5.5.2-2 are defined as:

For each SSB resource in the set $\tilde{q}_1$ configured for PCell

- $P_{CBD}$ = 1.

**Table 8.5B.5.2-1: Evaluation period $T_{Evaluate_CBD_SSB_Redcap}$ for FR1**

| Configuration | $T_{Evaluate_CBD_SSB_Redcap}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(3 \times P \times P_{CBD}) \times T_{SSB})$ |
| DRX cycle > 320 ms | $Ceil(3 \times P \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

**Table 8.5B.5.2-2: Evaluation period $T_{Evaluate_CBD_SSB_Redcap}$ for FR2**

| Configuration | $T_{Evaluate_CBD_SSB_Redcap}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(3 \times P \times N \times P_{CBD}) \times T_{SSB})$ |
| DRX cycle > 320 ms | $Ceil(3 \times P \times N \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

### 8.5B.5.3 Measurement restriction for SSB based candidate beam detection

For FR1, when the SSB for CBD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for CBD measurement without any restrictions;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for CBD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, when the SSB for CBD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

## 8.5B.6 Requirements for CSI-RS based candidate beam detection for Redcap

### 8.5B.6.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\bar{q}_1$ configured for a serving cell, provided that the CSI-RS resources configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5B.6.2.

### 8.5B.6.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured CSI-RS resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ period becomes better than the threshold $Q_{in_LR_RedCap}$ within $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ period provided CSI-RS Ês/Iot is according to annex B.2.4.2 for a corresponding band.

The UE shall monitor the configured CSI-RS resources using the evaluation period in table 8.5B.6.2-1 and 8.5B.6.2-2 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ is defined in table 8.5B.6.2-1 for FR1.

The value of $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ is defined in table 8.5B.6.2-2 for FR2 with scaling factor N=8.

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and

- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- P = 1, when candidate beam detection RS is not overlapped with measurement gap and also not overlapped with SMTC occasion.

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$ when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is not overlapped with SMTC occasion ($T_{CSI-RS} < MGRP$)

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).

- $P = P_{sharing\ factor}$, when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$,, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq MGRP$ or

  - $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap

- $P = \frac{3}{1-\frac{T_{CSI-RS}}{MGRP}}$,, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} < MGRP$)

- $P_{sharing\ factor} = 1$, if the candidate beam detection RS outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;

  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor} = 3$, otherwise.

where,

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*.

NOTE: The overlap between CSI-RS for CBD and SMTC means that CSI-RS for CBD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected if the CSI-RS is on the same OFDM symbols with RLM, BFD, BM-RS, or other CBD-RS, according to the measurement restrictions defined in clause 8.5.6.3.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer CBD evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{CBD}$ used in table 8.5B.6.2-1 and table 8.5B.6.2-2 are defined as

- $M_{CBD}$ = 3, if the CSI-RS resource configured in the set $\bar{q}_1$ is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{CBD}$ used in table 8.5B.6.2-1 and table 8.5B.6.2-2 are defined as

For each CSI-RS resource in the set $\bar{q}_1$ configured for PCell

- $P_{CBD}$ = 1.

**Table 8.5B.6.2-1: Evaluation period $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ for FR1**

| Configuration | $T_{EvaluateC_CBD_CSI\text{-}RS_Redcap}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{CSI\text{-}RS})$ |
| DRX cycle > 320 ms | $Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

**Table 8.5B.6.2-2: Evaluation period $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ for FR2**

| Configuration | $T_{Evaluate_CBD_CSI\text{-}RS_Redcap}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(M_{CBD} \times P \times N \times P_{CBD}) \times T_{CSI\text{-}RS})$ |
| DRX cycle > 320 ms | $Ceil(M_{CBD} \times P \times N \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5B.6.3 Measurement restriction for CSI-RS based candidate beam detection

For both FR1 and FR2, when the CSI-RS for CBD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for CBD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS based CBD measurement for without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for CBD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for CBD measurement without any restriction.

For FR2, when the CSI-RS for CBD measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer evaluation period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for CBD measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and the other CSI-RS. Longer evaluation period for CSI-RS based CBD measurement is expected, and no requirements are defined.

## 8.5B.7 Scheduling availability of UE during beam failure detection for Redcap

Scheduling availability restrictions when the UE is performing beam failure detection are described in the following clauses.

### 8.5B.7.1 Scheduling availability of UE performing beam failure detection with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to beam failure detection performed on SSB and CSI-RS configured for BFD with the same SCS as PDSCH or PDCCH in FR1.

### 8.5B.7.2 Scheduling availability of UE performing beam failure detection with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to beam failure detection when SSB is configured as BFD. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to beam failure detection when SSB is configured as BFD.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for beam failure detection.

### 8.5B.7.3 Scheduling availability of UE performing beam failure detection on FR2

The following scheduling restriction applies due to beam failure detection.

- For the case where no RSs are provided for BFD, or when CSI-RS is configured for BFD is explicitly configured and is type-D QCLed with active TCI state for PDCCH or PDSCH, and the CSI-RS is not in a CSI-RS resource set with repetition ON
  - There are no scheduling restrictions due to beam failure detection performed based on the CSI-RS.
- Otherwise
  - The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on BFD-RS resource symbols to be measured for beam failure detection.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE’s reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for BFD mesurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for BFD mesurement.

## 8.5B.8 Scheduling availability of UE during candidate beam detection for Redcap

Scheduling availability restrictions when the UE is performing L1-RSRP measurement for candidate beam detection are described in the following clauses.

### 8.5B.8.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as link recovery detection resource with the same SCS as PDSCH or PDCCH in FR1.

### 8.5B.8.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as link recovery detection resource. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured as link recovery detection resource.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, TRS, CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for L1-RSRP.

### 8.5B.8.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to candidate beam detection

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, CSI-RS for tracking or CSI-RS for CQI on reference symbols to be measured for candidate beam detection.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE’s reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for CBD mesurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for CBD mesurement.

## 8.5B.9 Minimum requirement at transitions for beam failure detection for Redcap

When the UE transitions between BFD CD-SSB resource and BFD NCD-SSB resource due to BWP switching during one evaluation period, the UE shall use an evaluation period that is the maximum of the evaluation period corresponding to the first SSB type and the second SSB type after the BWP switching. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second SSB type for each BFD-RS resource.

The requirements in clause 8.5.10 shall also apply except the scenarios described above.

# 8.5C Link Recovery Procedures for Satellite Access

## 8.5C.1 Introduction

The UE shall assess the downlink radio link quality of a serving cell based on the reference signal in the set $\bar{q}_0$ as specified in TS 38.213 [3] in order to detect beam failure on PCell and the UE is configured with only PCell, which is served by satellite access node (SAN).

The RS resource configurations in the set $\bar{q}_0$ on PCell can be periodic CSI-RS resources and/or SSBs.

On each RS resource configuration in the set $\bar{q}_0$, the UE shall estimate the radio link quality and compare it to the threshold $Q_{out_LR}$ for the purpose of accessing downlink radio link quality of the serving cell beams.

The threshold $Q_{out_LR}$ is defined as the level at which the downlink radio level link of a given resource configuration on set $\bar{q}_0$ cannot be reliably received and shall correspond to the $BLER_{out}$ = 10% block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection, $Q_{out_LR_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5.2.1C-1, and table 8.5.2.1C-2 for a UE operating on a cell with less than 5 MHz BW. For CSI-RS based beam failure detection, $Q_{out_LR_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5C.3.1-1, and table 8.5.2.1C-2 for a UE operating on a cell with less than 5 MHz BW.

Upon request the UE shall deliver configuration indexes from the set $\bar{q}_1$as specified in TS 38.213 [3] , to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold $Q_{in_LR}$, which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the $Q_{in_LR}$ threshold to the L1-RSRP measurement obtained from an SSB. The UE applies the $Q_{in_LR}$ threshold to the L1-RSRP measurement obtained for a CSI-RS resource after scaling a respective CSI-RS reception power with a value provided by higher layer parameter *powerControlOffsetSS*. The RS resource configurations in the set $\bar{q}_1$ can be periodic CSI-RS resources or SSBs or both SSB and CSI-RS resources.

## 8.5C.2 Requirements for SSB based beam failure detection

### 8.5C.2.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_0$ configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5C.2.2.

**Table 8.5.2.1C-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 24 |
| Sub-carrier spacing (kHz) | Same as the SCS of RMSI CORESET |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

**Table 8.5.2.1C-2: PDCCH transmission parameters for beam failure instance for a UE operating on a cell with less than 5 MHz BW**

| Attribute | Value for BLER |
|---|---|
| **Channel BW** | **3 MHz** |
| **[DL Transmission BW]** | **15 PRBs** |
| DCI format | 1-0 |
| Number of control OFDM symbols | 3 |

| | |
|---|---|
| Aggregation level (CCE) | 8 Note 1 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 15 |
| Sub-carrier spacing (kHz) | Same as the SCS of RMSI CORESET |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Non-Distributed Note2 |
| NOTE 1: PDCCH puncturing as defined in TS 38.214 [26] applies.<br>NOTE 2: For 15PRB Transmission BW, distributed mapping may lead to unexpected beam failure detection. | |

## 8.5C.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_SSB}$ period becomes worse than the threshold $Q_{out_LR_SSB}$ within $T_{Evaluate_BFD_SSB}$ period.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 8.5C.2.2-1 for FR1-NTN.

P value for an RLM-RS resource to be measured is defined as

- $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
- $N_{total} / N_{available}$ with $N_{available} > 0$

For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is
  - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction* and LEO satellites are measured for intra-frequency measurement, and
  - same as $N_{outside_MG}$, otherwise
- $T_{L1}$ is periodicity of the target RLM-RS
- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For an FR1-NTN serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

**Table 8.5C.2.2-1: Evaluation period $T_{Evaluate_BFD_SSB}$ for FR1-NTN**

| Configuration | $T_{Evaluate_BFD_SSB}$ (ms) |
|---|---|
| no DRX | $Max(50, Ceil(5 \times P) \times T_{SSB})$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(7.5 \times P) \times Max(T_{DRX}, T_{SSB}))$ |
| DRX cycle > 320 ms | $Ceil(5 \times P) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | |

### 8.5C.2.3 Measurement restriction for SSB based beam failure detection

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1-NTN, when the SSB for BFD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

## 8.5C.3 Requirements for CSI-RS based beam failure detection

### 8.5C.3.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\bar{q}_0$ of resource configurations for a serving cell, provided that the CSI-RS resource(s) in set $\bar{q}_0$ for beam failure detection are actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5C.3.2. UE is not expected to perform beam failure detection measurements on the CSI-RS configured for BFD if the CSI-RS is not QCL-ed, with QCL-TypeD when applicable, with the RS in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.5C.3.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

### 8.5C.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_CSI\text{-}RS}$ period becomes worse than the threshold $Q_{out_LR_CSI\text{-}RS}$ within $T_{Evaluate_BFD_CSI\text{-}RS}$ period.

The value of $T_{Evaluate_BFD_CSI\text{-}RS}$ is defined in table 8.5C.3.2-1 for FR1-NTN.

The requirements of $T_{Evaluate_BFD_CSI\text{-}RS}$ apply provided that the CSI-RS for BFD is not in a resource set configured with repetition ON. The requirements shall not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for BFD and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

P value for an RLM-RS resource to be measured is defined as

- $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
- $N_{total} / N_{available}$ with $N_{available} > 0$

For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is
  - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction* and LEO satellites are measured for intra-frequency measurement, and
  - same as $N_{outside_MG}$, otherwise
- $T_{L1}$ is periodicity of the target RLM-RS
- $P_{sharing\ factor} = 3$.

NOTE: The overlap between CSI-RS for BFD and SMTC means that CSI-RS for BFD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For an FR1-NTN serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

The values of $M_{BFD}$ used in table 8.5C.3.2-1 are defined as

- $M_{BFD} = 10$, if the CSI-RS resource(s) in set $\bar{q}_0$ used for BFD is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{BFD}$ used in table 8.5C.3.2-1 are defined as

For each CSI-RS resource in the set $\bar{q}_0$ configured for PCell SA

- $P_{BFD} = 1$.

**Table 8.5C.3.2-1: Evaluation period $T_{Evaluate_BFD_CSI\text{-}RS}$ for FR1-NTN**

| Configuration | $T_{Evaluate_BFD_CSI\text{-}RS}$ (ms) |
|---|---|
| no DRX | $Max(50, Ceil(M_{BFD} \times P \times P_{BFD}) \times T_{CSI\text{-}RS})$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(1.5 \times M_{BFD} \times P \times P_{BFD}) \times Max(T_{DRX}, T_{CSI\text{-}RS}))$ |
| DRX cycle > 320 ms | $Ceil(M_{BFD} \times P \times P_{BFD}) \times T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5C.3.3 Measurement restrictions for CSI-RS beam failure detection

The UE is required to be capable of measuring CSI-RS for BFD without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following scenarios.

For FR1-NTN, when the CSI-RS for BFD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB.

For FR1-NTN, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1-NTN, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR1-NTN, when the CSI-RS for BFD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

## 8.5C.4 Minimum requirement for L1 indication

When the radio link quality on all the RS resources in set $\bar{q}_0$ is worse than $Q_{out_LR}$, layer 1 of the UE shall send a beam failure instance indication to the higher layers

The beam failure instance evaluation for the RS resources in set $\bar{q}_0$ shall be performed as specified in clause 6 in TS 38.213 [3]. Two successive indications from layer 1 shall be separated by at least $T_{Indication_interval_BFD}$.

When DRX is not used, $T_{Indication_interval_BFD}$ is max(2ms, $T_{SSB\text{-}RS,M}$) ) or max(2ms, $T_{CSI\text{-}RS,M}$), where $T_{SSB\text{-}RS,M}$ and $T_{CSI\text{-}RS,M}$ is the shortest periodicity of all RS resources in set $\bar{q}_0$ for the accessed cell, corresponding to either the shortest periodicity of the SSB in the set $\bar{q}_0$ or CSI-RS resource in the set $\bar{q}_0$.

When DRX is used, for SSB based link quality measurement,

- $T_{Indication_interval_BFD}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{SSB\text{-}RS,M}$), if DRX_cycle_length ≤ 320 ms,

- $T_{Indication_interval_BFD}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

When DRX is used, for CSI-RS based link quality measurement,

- $T_{Indication_interval_BFD}$ = Max(1.5 × DRX_cycle_length, 1.5 × $T_{CSI\text{-}RS,M}$), if DRX_cycle_length ≤ 320 ms,

- $T_{Indication_interval_BFD}$ = DRX_cycle_length, if DRX_cycle_length > 320 ms.

## 8.5C.5 Requirements for SSB based candidate beam detection

### 8.5C.5.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_1$ configured for a serving cell, provided that the SSBs configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5C.5.2.

### 8.5C.5.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured SSB resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_SSB}$ period becomes better than the threshold $Q_{in_LR}$ provided SSB_RP and SSB Ês/Iot are according to annex B.2.19.1 for a corresponding band.

The UE shall monitor the configured SSB resources using the evaluation period in table 8.5C.5.2-1 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_SSB}$ is defined in table 8.5C.5.2-1 for FR1-NTN.

where,

P value for an RLM-RS resource to be measured is defined as

- $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ with $N_{available}$ = 0

- $N_{total}$ / $N_{available}$ with $N_{available}$ > 0

For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is
  - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction* and LEO satellites are measured for intra-frequency measurement, and
  - same as $N_{outside_MG}$, otherwise
- $T_{L1}$ is periodicity of the target RLM-RS
- $P_{sharing\ factor}$ = 3.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For an FR1-NTN serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

The values of $P_{CBD}$ used in table 8.5C.5.2-1 are defined as:

For each SSB resource in the set $\bar{q}_1$ configured for PCell.

- $P_{CBD}$ = 1.

**Table 8.5C.5.2-1: Evaluation period $T_{Evaluate_CBD_SSB}$ for FR1-NTN**

| Configuration | $T_{Evaluate_CBD_SSB}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(3 \times P \times P_{CBD}) \times T_{SSB})$ |
| DRX cycle > 320 ms | $Ceil(3 \times P \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5C.5.3 Measurement restriction for SSB based candidate beam detection

For FR1-NTN, when the SSB for CBD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for CBD measurement without any restrictions;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for CBD measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

# 8.5C.6 Requirements for CSI-RS based candidate beam detection

## 8.5C.6.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\bar{q}_1$ configured for a serving cell, provided that the CSI-RS resources configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5C.6.2.

## 8.5C.6.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured CSI-RS resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_CSI\text{-}RS}$ period becomes better than the threshold $Q_{in_LR}$ within $T_{Evaluate_CBD_CSI\text{-}RS}$ period provided CSI-RS Ês/Iot is according to annex B.2.19.2 for a corresponding band.

The UE shall monitor the configured CSI-RS resources using the evaluation period in tables 8.5C.6.2-1 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320ms.

The value of $T_{Evaluate_CBD_CSI\text{-}RS}$ is defined in table 8.5C.6.2-1 for FR1-NTN.

P value for an RLM-RS resource to be measured is defined as:

- $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
- $N_{total} / N_{available}$ with $N_{available} > 0$

For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:

- $N_{total}$ is the total number of RLM-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
- $N_{outside_MG}$ is the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is
  - the number of RLM-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction* and LEO satellites are measured for intra-frequency measurement, and
  - same as $N_{outside_MG}$, otherwise
- $T_{L1}$ is periodicity of the target RLM-RS
- $P_{sharing\ factor} = 3$.

Note: The overlap between CSI-RS for CBD and SMTC means that CSI-RS for CBD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For an FR1-NTN serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

he values of $M_{CBD}$ used in table 8.5C.6.2-1 are defined as:

- $M_{CBD} = 3$, if the CSI-RS resource configured in the set $\bar{q}_1$ is transmitted with Density = 3 and over the bandwidth ≥ 24 PRBs.

The values of $P_{CBD}$ used in table 8.5C.6.2-1 are defined as:

For each CSI-RS resource in the set $\bar{q}_1$ configured for SA

- $P_{CBD} = 1$.

**Table 8.5C.6.2-1: Evaluation period $T_{Evaluate_CBD_CSI-RS}$ for FR1-NTN**

| Configuration | $T_{EvaluateC_CBD_CSI-RS}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{CSI-RS})$ |
| DRX cycle > 320 ms | $Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

### 8.5C.6.3 Measurement restriction for CSI-RS based candidate beam detection

For FR1-NTN, when the CSI-RS for CBD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for CBD measurement in the PRBs that overlap with an SSB.

For FR1-NTN, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement without restrictions.

For FR1-NTN, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS based CBD measurement for without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR1-NTN, when the CSI-RS for CBD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for CBD measurement without any restriction.

## 8.5C.7 Scheduling availability of UE during beam failure detection

Scheduling availability restrictions when the UE is performing beam failure detection are described in the following clauses.

### 8.5C.7.1 Scheduling availability of UE performing beam failure detection with a same subcarrier spacing as PDSCH/PDCCH on FR1-NTN

There are no scheduling restrictions due to beam failure detection performed on SSB and CSI-RS configured for BFD with the same SCS as PDSCH or PDCCH in FR1-NTN.

### 8.5C.7.2 Scheduling availability of UE performing beam failure detection with a different subcarrier spacing than PDSCH/PDCCH on FR1-NTN

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to beam failure detection when SSB is configured as BFD. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to beam failure detection when SSB is configured as BFD.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for beam failure detection.

## 8.5C.8 Scheduling availability of UE during candidate beam detection

Scheduling availability restrictions when the UE is performing L1-RSRP measurement for candidate beam detection are described in the following clauses.

### 8.5C.8.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1-NTN

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as link recovery detection resource with the same SCS as PDSCH or PDCCH in FR1-NTN.

### 8.5C.8.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1-NTN

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as link recovery detection resource. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured as link recovery detection resource.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, TRS, CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for L1-RSRP.

## 8.5C.9 Minimum requirement at transitions for beam failure detection

When the UE transitions between DRX and no DRX or when DRX cycle periodicity changes, for each BFD-RS resource, for a duration of time equal to the evaluation period corresponding to the second mode after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation period corresponding to the first mode and the second mode. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second mode for each BFD-RS resource.

When the UE transitions from a first configuration of BFD resources to a second configuration of BFD resources that is different from the first configuration, for each BFD resource present in the second configuration, for a duration of time equal to the evaluation period corresponding to the second configuration after the transition occurs, the UE shall use an evaluation period that is no less than the minimum of evaluation periods corresponding to the first configuration and the second configuration. Subsequent to this duration, the UE shall use an evaluation period corresponding to the second configuration for each BFD resource present in the second configuration.

When the UE transitions from a first configuration of active TCI state of the CORESET to a second configuration of active TCI state of the CORESET, for each CSI-RS for BFD present in the second configuration, the UE shall use an evaluation period corresponding to the second configuration from the time of transition.

# 8.5D Link Recovery Procedures for ATG

## 8.5D.1 Introduction

The requirements in clause 8.5D apply for link recovery procedure on ATG UE.

The UE shall assess the downlink radio link quality of a serving cell based on the reference signal in the set $\bar{q}_0$ as specified in TS 38.213 [3] in order to detect beam failure on PCell and SCell.

The RS resource configurations in the set $\bar{q}_0$ can be periodic CSI-RS resources and/or SSBs. RS resource configuration in the set $\bar{q}_0$ on SCell shall be periodic CSI-RS. UE is not required to perform beam failure detection outside the active DL BWP. UE is not required to meet the requirements in clause 8.5D.2 and 8.5D.3 if UE does not have set $\bar{q}_0$. UE is not required to perform beam failure detection on a deactivated SCell, and also not required to perform beam failure detection on resources which is implicitly configured for a deactivated SCell. When more than 2 periodic CSI-RS resources on a CC are configured in the set $\bar{q}_0$ for current SCell or implicitly configured in the set $\bar{q}_0$ for other SCell, it is up to UE implementation to select two of CSI-RS resources in active BWP in current CC to perform beam failure detection. UE is not required to perform beam failure detection on a SCell on which $\bar{q}_1$ is not configured.

On each RS resource configuration in the set $\bar{q}_0$, the UE shall estimate the radio link quality and compare it to the threshold $Q_{out_LR}$ for the purpose of accessing downlink radio link quality of the serving cell beams.

The threshold $Q_{out_LR}$ is defined as the level at which the downlink radio level link of a given resource configuration on set $\bar{q}_0$ cannot be reliably received and shall correspond to the $BLER_{out}$ = 10% block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection, $Q_{out_LR_SSB}$ is derived based on the hypothetical PDCCH

transmission parameters listed in table 8.5.2.1-1. For CSI-RS based beam failure detection, $Q_{out_LR_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5.3.1-1.

Upon request the UE shall deliver configuration indexes from the set $\bar{q}_1$ as specified in TS 38.213 [3] , to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold $Q_{in_LR}$, which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the $Q_{in_LR}$ threshold to the L1-RSRP measurement obtained from an SSB. The UE applies the $Q_{in_LR}$ threshold to the L1-RSRP measurement obtained for a CSI-RS resource after scaling a respective CSI-RS reception power with a value provided by higher layer parameter *powerControlOffsetSS*. The RS resource configurations in the set $\bar{q}_1$ can be periodic CSI-RS resources or SSBs or both SSB and CSI-RS resources. UE is not required to perform candidate beam detection outside the active DL BWP. UE is not required to perform candidate beam detection on a SCell on which $\bar{q}_1$ is not configured.

## 8.5D.2 Requirements for SSB based beam failure detection

### 8.5D.2.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_0$ configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5D.2.2.

**Table 8.5D.2.1-1: Void**

### 8.5D.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_SSB}$ period becomes worse than the threshold $Q_{out_LR_SSB}$ within $T_{Evaluate_BFD_SSB}$ period.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 8.5D.2.2-1 for FR1.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB.
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR1 ATG UE with the antenna array,

- P value for an BFD-RS resource to be measured is defined as:
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
    - For a window W of duration max($T_{L1}$, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps starting at the beginning of any BFD-RS resource occasion:
    - $N_{total}$ is the total number of BFD-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    - $N_{available}$ is
      - If the measured carrier is the SCC with servingcellMO configured, and *neighSCellMeasSkipping* is set to 'enable' by network
        - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams

- the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W

- otherwise,

- the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions of other serving cell within the window W

- otherwise,

- If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams

- the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,

- otherwise,

- the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

- $T_{L1}$ is periodicity of the target BFD-RS

- $P_{\text{sharing factor}} = 3$.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 8.5D.2.2-1: Evaluation period $T_{Evaluate_BFD_SSB}$ for FR1**

| Configuration | $T_{Evaluate_BFD_SSB}$ (ms) |
|---|---|
| no DRX | $\text{Max}(50, \text{Ceil}(5 \times P) \times T_{SSB})$ |
| DRX cycle ≤ 320 ms | $\text{Max}(50, \text{Ceil}(7.5 \times P) \times \text{Max}(T_{DRX}, T_{SSB}))$ |
| DRX cycle > 320 ms | $\text{Ceil}(5 \times P) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5D.2.3 Measurement restriction for SSB based beam failure detection

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

For FR1, when the SSB for BFD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;

- If SSB and CSI-RS have different SCS,

- If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction;

- If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

# 8.5D.3 Requirements for CSI-RS based beam failure detection

## 8.5D.3.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\bar{q}_0$ of resource configurations for a serving cell, provided that the CSI-RS resource(s) in set $\bar{q}_0$ for beam failure detection are actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5D.3.2. UE is not expected to perform beam failure detection measurements on the CSI-RS configured for BFD if the CSI-RS is not QCL-ed, with QCL-TypeD when applicable, with the RS in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.5D.3.1-1: Void**

## 8.5D.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in set $\bar{q}_0$ estimated over the last $T_{Evaluate_BFD_CSI\text{-}RS}$ period becomes worse than the threshold $Q_{out_LR_CSI\text{-}RS}$ within $T_{Evaluate_BFD_CSI\text{-}RS}$ period.

The value of $T_{Evaluate_BFD_CSI\text{-}RS}$ is defined in table 8.5D.3.2-1 for FR1.

The requirements of $T_{Evaluate_BFD_CSI\text{-}RS}$ apply provided that the CSI-RS for BFD is not in a resource set configured with repetition ON. The requirements shall not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for BFD and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS.
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR1 ATG UE with the antenna array,

- P value for an BFD-RS resource to be measured is defined as:
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
    - For a window W of duration max($T_{L1}$, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any RLM-RS resource occasion:
    - $N_{total}$ is the total number of BFD-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    - $N_{available}$ is
      - If the measured carrier is the SCC with *servingcellMO* configured, and *neighSCellMeasSkipping* is set to 'enable' by network
        - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams
          - the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
        - otherwise,

- the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions of other serving cell within the window W

- otherwise,
  - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams
    - the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,
  - otherwise,
    - the number of BFD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

- $T_{L1}$ is periodicity of the target BFD-RS
- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of the BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of $M_{BFD}$ used in table 8.5D.3.2-1 are defined as:

- $M_{BFD} = 10$, if the CSI-RS resource(s) in set $\bar{q}_0$ used for BFD is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{BFD}$ used in table 8.5D.3.2-1 is defined as

For each CSI-RS resource in the set $\bar{q}_0$ configured for a SCell

- $P_{BFD} = Z$
  - Where Z is the number of band(s) on which UE is performing beam failure detection only for SCell

**Table 8.5D.3.2-1: Evaluation period $T_{Evaluate_BFD_CSI\text{-}RS}$ for FR1**

| Configuration | $T_{Evaluate_BFD_CSI\text{-}RS}$ (ms) |
|---|---|
| no DRX | $Max(50, Ceil(M_{BFD} \times P \times P_{BFD}) \times T_{CSI\text{-}RS})$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(1.5 \times M_{BFD} \times P \times P_{BFD}) \times Max(T_{DRX}, T_{CSI\text{-}RS}))$ |
| DRX cycle > 320 ms | $Ceil(M_{BFD} \times P \times P_{BFD}) \times T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5D.3.3 Measurement restrictions for CSI-RS beam failure detection

The UE is required to be capable of measuring CSI-RS for BFD without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following clauses.

For FR1, when the CSI-RS for BFD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for BFD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

## 8.5D.4 Minimum requirement for L1 indication

The requirements in clause 8.5.4 shall apply only for UE in NR SA operation mode.

## 8.5D.5 Requirements for SSB based candidate beam detection

### 8.5D.5.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_1$ configured for a serving cell, provided that the SSBs configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5D.5.2.

### 8.5D.5.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured SSB resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_SSB}$ period becomes better than the threshold $Q_{in_LR}$ provided SSB_RP and SSB Ês/Iot are according to annex B.2.4.1 for a corresponding band.

The UE shall monitor the configured SSB resources using the evaluation period in table 8.5D.5.2-1 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_SSB}$ is defined in table 8.5D.5.2-1 for FR1.

where,

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB,
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR1 ATG UE with the antenna array,

- P value for an CBD-RS resource to be measured is defined as:
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
    - For a window W of duration max($T_{L1}$, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any CBD-RS resource occasion:
    - $N_{total}$ is the total number of CBD-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    - $N_{available}$ is
      - If the measured carrier is the SCC with servingcellMO configured, and *neighSCellMeasSkipping* is set to ‘enable’ by network

- If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams

  - the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W

- otherwise,

  - the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions of other serving cell within the window W

- otherwise,

  - If inter-band carrier aggregation within FR1 is configured, and UE not capable of antennaArrayType-r18 on the other serving carrier, or UE support two simultaneous separate Rx beams

    - the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,

  - otherwise,

    - the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

- $T_{L1}$ is periodicity of the target CBD-RS
- $P_{\text{sharing factor}} = 3$.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

The values of $P_{CBD}$ used in table 8.5D.5.2-1 is defined as

For each SSB resource in the set $\bar{q}_1$ configured for a SCell

- $P_{CBD} = Z$
  - Where Z is the number of band(s) on which UE is performing candidate beam detection only for SCell

**Table 8.5D.5.2-1: Evaluation period $T_{Evaluate_CBD_SSB}$ for FR1**

| Configuration | $T_{Evaluate_CBD_SSB}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $\text{Max}(25, \text{Ceil}(3 \times P \times P_{CBD}) \times T_{SSB})$ |
| DRX cycle > 320 ms | $\text{Ceil}(3 \times P \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5D.5.3 Measurement restriction for SSB based candidate beam detection

For FR1, when the SSB for CBD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for CBD measurement without any restrictions;
- If SSB and CSI-RS have different SCSs,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for CBD measurement without any restriction;

- If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

## 8.5D.6 Requirements for CSI-RS based candidate beam detection

### 8.5D.6.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\bar{q}_1$ configured for a serving cell, provided that the CSI-RS resources configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.5D.6.2.

### 8.5D.6.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured CSI-RS resource in set $\bar{q}_1$ estimated over the last $T_{Evaluate_CBD_CSI\text{-}RS}$ period becomes better than the threshold $Q_{in_LR}$ within $T_{Evaluate_CBD_CSI\text{-}RS}$ period provided CSI-RS Ês/Iot is according to annex B.2.4.2 for a corresponding band.

The UE shall monitor the configured CSI-RS resources using the evaluation period in table 8.5D.6.2-1 corresponding to the non-DRX mode, if the configured DRX cycle ≤ 320 ms.

The value of $T_{Evaluate_CBD_CSI\text{-}RS}$ is defined in table 8.5D.6.2-1 for FR1.

For FR1 ATG UE with one or multiple omni-directional antenna(s),

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR1 ATG UE with the antenna array,

- P value for an CBD-RS resource to be measured is defined as:
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
    - For a window W of duration max($T_{L1}$, $MGRP_{max}$), where $MGRP_{max}$ is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any CBD-RS resource occasion:
    - $N_{total}$ is the total number of CBD-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    - $N_{available}$ is
      - If the measured carrier is the SCC with *servingcellMO* configured, and *neighSCellMeasSkipping* is set to 'enable' by network
        - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams
          - the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
        - otherwise,

- the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions of other serving cell within the window W

- otherwise,
  - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams
    - the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RSs resource occasions for L3 measurements of the same serving cell within the window W,
  - otherwise,
    - the number of CBD-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W

- $T_{L1}$ is periodicity of the target CBD-RS
- $P_{sharing\ factor}$ = 3.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected if the CSI-RS is on the same OFDM symbols with RLM, BFD, BM-RS, or other CBD-RS, according to the measurement restrictions defined in clause 8.5D.6.3.

The values of $M_{CBD}$ used in table 8.5D.6.2-1 are defined as:

- $M_{CBD}$ = 3, if the CSI-RS resource configured in the set $\bar{q}_1$ is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{CBD}$ used in table 8.5D.6.2-1 is defined as

For each CSI-RS resource in the set $\bar{q}_1$ configured for a SCell

- $P_{CBD}$ = Z
  - Where Z is the number of band(s) on which UE is performing candidate beam detection only for SCell

**Table 8.5D.6.2-1: Evaluation period $T_{Evaluate_CBD_CSI\text{-}RS}$ for FR1**

| Configuration | $T_{EvaluateC_CBD_CSI\text{-}RS}$ (ms) |
|---|---|
| non-DRX, DRX cycle ≤ 320 ms | $Max(25, Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{CSI\text{-}RS})$ |
| DRX cycle > 320 ms | $Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_1$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5D.6.3 Measurement restriction for CSI-RS based candidate beam detection

For FR1, when the CSI-RS for CBD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for CBD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS based CBD measurement for without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for CBD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for CBD measurement without any restriction.

## 8.5D.7 Scheduling availability of UE during beam failure detection

Scheduling availability restrictions when the UE is performing beam failure detection are described in the following clauses.

### 8.5D.7.1 Scheduling availability of UE performing beam failure detection with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to beam failure detection performed on SSB and CSI-RS configured for BFD with the same SCS as PDSCH or PDCCH in FR1.

### 8.5D.7.2 Scheduling availability of UE performing beam failure detection with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to beam failure detection when SSB is configured as BFD. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to beam failure detection when SSB is configured as BFD.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for beam failure detection.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on FR1 serving PCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) in the bands due to beam failure detection performed on FR1 serving PCell in different bands.

## 8.5D.8 Scheduling availability of UE during candidate beam detection

Scheduling availability restrictions when the UE is performing L1-RSRP measurement for candidate beam detection are described in the following clauses.

### 8.5D.8.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as link recovery detection resource with the same SCS as PDSCH or PDCCH in FR1.

### 8.5D.8.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as link recovery detection resource. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured as link recovery detection resource.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, TRS, CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for L1-RSRP.

When intra-band carrier aggregation in FR1 is performed, the scheduling restrictions on FR1 serving PCell applies to all serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols.

When inter-band carrier aggregation within FR1 is performed, there are no scheduling restrictions on FR1 serving cell(s) in the bands due to candidate beam detection performed on FR1 serving PCell in different bands.

## 8.5D.9 Minimum requirement at transitions for beam failure detection

The requirement in clause 8.5.10 shall apply.

## 8.5D.10 Requirements for Beam Failure Recovery in SCell

The requirement in clause 8.5.9 shall apply except that:

- $T_2 = T_{Evaluate_CBD}$ is the evaluation period specified in clause 8.5D.5 or 8.5D.6 for SSB or CSI-RS based candidate beam detection, that is $T_{Evaluate_CBD_SSB}$ or $T_{Evaluate_CBD_CSI\text{-}RS}$, depending on the applicable reference signal configured for candidate beam detection.

# 8.5E Link Recovery Procedures for RedCap UE with Satellite Access

## 8.5E.1 Introduction

The RedCap UE shall assess the downlink radio link quality of a serving cell based on the reference signal in the set $\bar{q}_0$ as specified in TS 38.213 [3] in order to detect beam failure on PCell and the UE is configured with only PCell, which is served by satellite access node (SAN).

The RS resource configurations in the set $\bar{q}_0$ on PCell can be periodic CSI-RS resources and/or SSBs. UE is not required to perform beam failure detection outside the active DL BWP. UE is not required to meet the requirements in clause 8.5E.2 and 8.5E.3 if UE does not have set $\bar{q}_0$.

On each RS resource configuration in the set $\bar{q}_0$, the UE shall estimate the radio link quality and compare it to the threshold $Q_{out_LR_RedCap}$ for the purpose of accessing downlink radio link quality of the serving cell beams.

The threshold $Q_{out_LR_RedCap}$ is defined as the level at which the downlink radio level link of a given resource configuration on set $\bar{q}_0$ cannot be reliably received and shall correspond to the $BLER_{out}$ = 10% block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection, $Q_{out_LR_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5E.2.1-1. For CSI-RS based beam failure detection, $Q_{out_LR_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.5E.3.1-1.

Upon request the UE shall deliver configuration indexes from the set $\bar{q}_1$ as specified in TS 38.213 [3], to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold $Q_{in_LR_RedCap}$, which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the $Q_{in_LR_RedCap}$ threshold to the L1-RSRP measurement obtained from an SSB. The UE applies the $Q_{in_LR_RedCap}$ threshold to the L1-RSRP measurement obtained for a CSI-RS resource after scaling a respective CSI-RS reception power with a value provided by higher layer parameter *powerControlOffsetSS*. The RS resource configurations in the set $\bar{q}_1$ can be periodic CSI-RS resources or SSBs or both SSB and CSI-RS resources. UE is not required to perform candidate beam detection outside the active DL BWP.

## 8.5E.2 Requirements for SSB based beam failure detection for RedCap UE with satellite access

### 8.5E.2.1 Introduction

The requirements in this clause apply for each SSB resource in the set $\bar{q}_0$ configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5E.2.2.

**Table 8.5E.2.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 16 for 1 Rx UE; 8 for 2 Rx UE |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 for 1 Rx UE; 24 for 2 Rx UE |
| Sub-carrier spacing (kHz) | Same as the SCS of RMSI CORESET |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |
| NOTE 1: SCS=60 kHz is not applicable for FR1 | |

## 8.5E.2.2 Minimum requirement

The requirements in clause 8.5C.2.2 shall apply when RedCap UE is capable of 2 Rx. When UE is only required to support 1 Rx antenna, the requirements defined in clause 8.5C.2.2 shall apply except that:

- $T_{Evaluate_BFD_SSB_RedCap}$ as defined in table 8.5E.2.2-1 for FR1.

**Table 8.5E.2.2-1: Evaluation period $T_{Evaluate_BFD_SSB_RedCap}$ for 1 Rx RedCap**

| Configuration | $T_{Evaluate_BFD_SSB_RedCap}$ (ms) |
|---|---|
| no DRX | $\text{Max}(50, \text{Ceil}(10 \times P) \times T_{SSB})$ |
| DRX cycle ≤ 320 ms | $\text{Max}(50, \text{Ceil}(15 \times P) \times \text{Max}(T_{DRX}, T_{SSB}))$ |
| DRX cycle > 320 ms | $\text{Ceil}(10 \times P) \times T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | |

## 8.5E.2.3 Measurement restrictions for SSB beam failure detection

The requirements in clause 8.5C.2.3 shall apply.

# 8.5E.3 Requirements for CSI-RS based beam failure detection for RedCap UE with satellite access

## 8.5E.3.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the set $\bar{q}_0$ of resource configurations for a serving cell, provided that the CSI-RS resource(s) in set $\bar{q}_0$ for beam failure detection are actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.5E.3.2.

**Table 8.5E.3.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 16 for 1 Rx UE; 8 for 2 Rx UE |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 for 1 Rx UE; 24 for 2 Rx UE |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

NOTE 1: SCS=60 kHz is not applicable for FR1

### 8.5E.3.2 Minimum requirement

The requirements in clause 8.5C.3.2 shall apply when FD-FDD and TDD RedCap UE is capable of 2 Rx. When FD-FDD and TDD RedCap UE is only required to support 1 Rx antenna, the requirements defined in clause 8.5C.3.2 shall apply except that:

- $T_{Evaluate_BFD_SSB_RedCap}$ as defined in table 8.5E.3.2-1 for FR1.

**Table 8.5E.3.2-1: Evaluation period $T_{Evaluate_BFD_CSI-RS_RedCap}$ for 1 Rx RedCap**

| Configuration | $T_{Evaluate_BFD_CSI-RS_RedCap}$ (ms) |
|---|---|
| no DRX | $Max(50, Ceil(2 \times M_{BFD} \times P \times P_{BFD}) \times T_{CSI-RS})$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(2 \times 1.5 \times M_{BFD} \times P \times P_{BFD}) \times Max(T_{DRX}, T_{CSI-RS}))$ |
| DRX cycle > 320 ms | $Ceil(2 \times M_{BFD} \times P \times P_{BFD}) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the set $\bar{q}_0$. $T_{DRX}$ is the DRX cycle length. | |

For HD-FDD UE indicating *CollisionHandlingOfHDFDDOperation*, the requirements in clause 8.5E.3.2 shall also apply, provided that the following conditions are met:

- there is no collision between the CSI-RS resources for BFD measurements and UL transmission, or
- in case of collision between the CSI-RS resources for BFD measurements and UL transmission except PRACH, and *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* is not indicated by network.

In case of collision between the CSI-RS resources to be measured and PRACH, if UE indicates *CollisionHandlingOfHDFDDOperation*, it is up to HD-FDD UE implementation to either receive the CSI-RS or transmit the PRACH, according to TS 38.213.

### 8.5E.3.3 Measurement restrictions for CSI-RS beam failure detection

The requirements in clause 8.5C.3.3 shall apply.

## 8.5E.4 Minimum requirement for L1 indication for RedCap UE with satellite access

The requirements in clause 8.5C.4 shall apply.

In addition, for HD-FDD UE, the conditions and requirements for $T_{Indication_interval_BFD_Redcap}$ apply given that for each BFD-RS configuration, at least one BFD-RS sample must fall with DL occasion within an indication period.

## 8.5E.5 Requirements for SSB based candidate beam detection for RedCap UE with satellite access

The requirements in clause 8.5C.5 shall apply when RedCap UE is capable of 2 Rx and 1 Rx RedCap UE.

## 8.5E.6 Requirements for CSI-RS based candidate beam detection for RedCap UE with satellite access

The requirements in clause 8.5C.6 shall apply when RedCap UE is capable of 2 Rx and 1 Rx FD-FDD and TDD RedCap UE.

For HD-FDD UE indicating *CollisionHandlingOfHDFDDOperation*, the requirements in clause 8.5C.3.2 shall also apply, provided that the following conditions are met:

- there is no collision between the CSI-RS resources for CBD measurements and UL transmission, or
- in case of collision between the CSI-RS resources for CBD measurements and UL transmission except PRACH, and *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* is not indicated by network.

In case of collision between the CSI-RS resources to be measured and PRACH, if UE indicates *CollisionHandlingOfHDFDDOperation,* it is up to HD-FDD UE implementation to either receive the CSI-RS or transmit the PRACH, according to TS 38.213.

### 8.5E.7 Scheduling availability of UE during beam failure detection for RedCap UE with satellite access

For FD-FDD and TDD RedCap UEs, the requirements in clause 8.5C.7 shall apply.

For HD-FDD UE, scheduling restrictions apply for transmission on PUCCH/PUSCH/SRS during beam failure detection, except when UE indicates *CollisionHandlingOfHDFDDOperation* and is indicated that UL transmission is prioritized over BFD evaluation via *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* in case of collision between CSI-RS resources to be measured and UL transmission.

### 8.5E.8 Scheduling availability of UE during candidate beam detection for RedCap UE with satellite access

For FD-FDD and TDD RedCap UEs, the requirements in clause 8.5C.8 shall apply.

For HD-FDD UE, scheduling restrictions apply for transmission on PUCCH/PUSCH/SRS during candidate beam detection, except when UE indicates *CollisionHandlingOfHDFDDOperation* and is indicated that UL transmission is prioritized over CBD evaluation via *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* in case of collision between CSI-RS resources to be measured and UL transmission.

### 8.5E.9 Minimum requirement at transitions for beam failure detection for RedCap UE with satellite access

The requirements in clause 8.5C.9 shall apply.

## 8.6 Active BWP switch delay

### 8.6.1 Introduction

The requirements in this clause apply for a UE configured PCell or any activated SCell in standalone NR or NE-DC, PCell, PSCell or any activated SCell in MCG or SCG in NR-DC, or PSCell or any activated SCell in SCG in EN-DC. The requirements in this clause also apply for a UE configured with more than one BWP on PCell or any activated SCell with CCA in standalone NR, or PSCell or any activated SCell with CCA in SCG in EN-DC. The requirements in clause 8.6.4 apply for a UE which is capable of *ul-LBT-FailureDetectionRecovery-r16* configured with more than one UL BWP on PCell with CCA in standalone NR or PSCell with CCA in EN-DC.

UE shall complete the switch of active DL and/or UL BWP within the delay defined in this clause.

### 8.6.2 DCI and timer based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with more than one BWP configurations configured.

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ + Y which starts from the beginning of DL slot n. Where,

- Y=0, if the serving cell where UE receives DCI for BWP switch request is same as the serving cell on which BWP switch occurs.

- Y equals to the length of 1 slot, if the serving cell where UE receives DCI for BWP switch is different from the serving cell on which BWP switch occurs for any involved serving cell. In this scenario, $T_{BWPswitchDelay}$ + Y shall follow the smaller SCS of scheduling cell, scheduled cells before and scheduled cells after active BWP change. If both scheduling cell and scheduled cell are in FR2-2, Y shall follow the SCS of 120 kHz.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL subframe (FR1) or DL half-subframe (FR2) immediately after a BWP-inactivity timer *bwp-InactivityTimer* [2] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* [2], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in table 8.6.2-1.

**Table 8.6.2-1: BWP switch delay**

| $\mu$ | NR Slot length (ms) | BWP switch delay $T_{BWPswitchDelay}$ (slots) | |
|---|---|---|---|
| | | Type 1[Note 1] | Type 2[Note 1] |
| 0 | 1 | 1 | 3 |
| 1 | 0.5 | 2 | 5 |
| 2 | 0.25 | 3 | 9 |
| 3 | 0.125 | 6 | 18 |
| 5 | 0.03125 | 20 | 65 |
| 6 | 0.015625 | 39 | 129 |
| NOTE 1: Depends on UE capability.<br>NOTE 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch. | | | |

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10 in the new BWP.

- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10 in the new BWP.

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.

If the BWP switch is triggered within or outside DRX active time, and one of the two BWPs in a BWP switching is a dormant BWP [7], UE shall be able to complete active BWP switching within the time duration of

- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X$, provided that the dormancy indication is received in any of the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is receiveds, or

- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X + Z$, provided that the dormancy indication is received after the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, where

- $T_{BWPswitchDelay}$ is defined in table 8.6.2-1 corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs;

- X equals to the length of 1 slot corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs. If both scheduling cell and scheduled cell are in FR2-2, X shall follow the SCS of 120 kHz.

- Z equals to the length of 1 slot corresponding to the SCS of the serving cell where UE receives dormancy indication.

For DCI-based BWP switch, if the new BWP is a dormant BWP, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive CSI-RS (for DL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL slot occurs right after a time duration of $T_{dormantBWPswitchDelay}$ which starts from the beginning of DL slot n.

## 8.6.2A DCI based BWP switch delay on multiple CCs

The requirements in this clause only apply to the case when the same type of BWP switch (DCI based BWP switch) is performed on multiple CCs simultaneously or over partially overlapping time period.

### 8.6.2A.1 Simultaneous DCI based BWP switch delay on multiple CCs

The delay requirements for simultaneous DCI based BWP switch on multiple CCs in this clause apply only if the timing difference among the first symbol of slot carrying DCI for all CCs is received within the MRTD for inter-band CA as defined in clause 7.6.4.

For DCI-based BWP switch on multiple CCs, after the UE receives BWP switching request, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWPs on the serving cells on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{MultipleBWPswitchDelay}$ which starts from the beginning of DL slot n, where slot n is slot which UE receives the earliest BWP switching request among CCs on which UE is performing simultaneous DCI-based BWP switching.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{MultipleBWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths on any serving cell.

UE shall finish BWP switch within the time duration $T_{MultipleBWPswitchDelay} + Y$, which is defined as:

$$T_{MultipleBWPswitchDelay} = T_{BWPswitchDelay} + D*(N-1) + D1*(N1-1)$$

Where:

- $T_{BWPswitchDelay}$ is the BWP switching delay on single CC defined in table 8.6.2-1 depending on UE capability *bwp-SwitchingDelay* [2]. $T_{BWPswitchDelay}$ shall be based on the smallest SCS among SCS of all involved CCs before and after BWP switch. If the BWP switch on multiple CCs results in the change of the SCS on any CC among involved CCs, $T_{BWPswitchDelay}$ shall be based on the smallest SCS among all SCS values of all involved CCs.

- D is the incremental delay for each additional CC involved in simultaneous BWP switch and depends on UE capability *bwp-SwitchingMultiCCs-r16* [TS 38.306, 14] for switching between non-dormant BWPs.

- D1 is the incremental delay for each additional CC involved in simultaneous BWP switch and depends on UE capability *bwp-SwitchingMultiDormancyCCs-r16* or *bwp-SwitchingMultiDormancyCC-DCI-0-3-And-1-3-r18* for switching between dormant and non-dormant BWPs. Note: D1 shall be equal to or shorter than D.

- N, N1: for UE which is capable of per-FR gap, and no BWP switch involves SCS change, N is the number of CCs in same FR for switching between non-dormant BWPs, and N1 is the number of CCs in same FR for switching between non-dormant and dormant BWPs; For UE which is not capable of per-FR gap, or the BWP switches on any CC involves SCS changing, N is the number of CCs undergoing simultaneous BWP switch

between non-dormant BWPs, and N1 is the number of CCs undergoing simultaneous BWP switch between non-dormant and dormant BWPs.

- Y=0, if the serving cell where UE receives DCI for BWP switch is same as the serving cell on which BWP switch occurs for each involved serving cell.

  Y equals to the length of one slot at smaller SCS of scheduling cell, scheduled cells before and scheduled cells after active BWP change,

- if the serving cell where UE receives DCI for BWP switch is different from the serving cell on which BWP switch occurs for any involved serving cell. If both scheduling cell and scheduled cell are in FR2-2, Y shall follow the SCS of 120 kHz. .

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10 in the new BWP.

- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10 in the new BWP.

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.

If the BWP switch is triggered on multiple CCs simultaneously within or outside DRX active time, and one of the two BWPs on each CC in a BWP switching is a dormant BWP [7], UE shall be able to complete active BWP switching within the time duration of

- $T_{DormantMultipleBWPswitchDelay} = T_{MultipleBWPswitchDelay}+X$, provided that the dormancy indication is received in any of the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, or

- $T_{DormantMultipleBWPswitchDelay} = T_{MultipleBWPswitchDelay} +X+Z$, provided that the dormancy indication is received after the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, where

- $T_{MultipleBWPswitchDelay}$ is defined above corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs;

- X equals to the length of 1 slot corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs. If both scheduling cell and scheduled cell are in FR2-2, X shall follow the SCS of 120 kHz.

- Z equals to the length of 1 slot corresponding to the SCS of the serving cell where DCI for dormancy indication is received.

The number of CCs, N and/or N1, on which the UE can simultaneously switch BWPs while still meeting the requirements, if any, related to allocations on downlink, uplink, or transmission of HARQ-ACK, depends on the UE reported capabilities related to BWP switching, the network configuration and the BWP switch method.

### 8.6.2A.2 Non-simultaneous DCI based BWP switch delay on multiple CCs

In non-simultaneous case, the DCI-based BWP switch on multiple CCs is triggered over partially overlapping time period between CCs or multiple CCs in different Cell groups. The delay requirements for non-simultaneous DCI based BWP switch on multiple CCs in this clause apply only if:

- the timing difference among the first symbol of slot carrying DCI for all CCs involved in non-simultaneous BWP switch is received exceeds the MRTD for inter-band CA as defined in clause 7.6.4, and

- UE is operating in NR-DC (FR1+FR2), and

- UE is capable of per-FR gap, and
- BWP switch does not involve SCS change

For non-simultaneous DCI based BWP switch on multiple CCs, BWP switching delay requirements defined in clause 8.6.2 apply when BWP switching occurs on single CC in the cell group. BWP switching delay requirements defined in clause 8.6.2A.1 apply when simultaneous BWP switching occurs on multiple CCs in the cell group.

## 8.6.2B Timer based BWP switch delay on multiple CCs

The requirements in this clause only apply to the case when the same type of BWP switch (timer based BWP switch) is performed on multiple CCs simultaneously or over partially overlapping time period.

### 8.6.2B.1 Simultaneous timer based BWP switch delay on multiple CCs

The delay requirements for simultaneous timer based BWP switch on multiple CCs in this clause apply only if the timing difference among the beginning of the slot where timer based BWP switching starts for all CCs is within the MRTD for inter-band CA as defined in clause 7.6.4.

For timer-based BWP switch on multiple CCs, UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL subframe (in FR1) or DL half-subframe ((in FR2) immediately after the earliest BWP-inactivity timer *bwp-InactivityTimer* [2] expiration occurs on multiple serving cells, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWPs on the serving cells on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{MultipleBWPswitchDelay}$ which starts from the beginning of DL slot n, where $T_{MultipleBWPswitchDelay}$ is defined in clause 8.6.2A.1.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{MultipleBWPswitchDelay}$ after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10 in the new BWP.
- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10 in the new BWP.

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.

### 8.6.2B.2 Non-simultaneous timer based BWP switch delay on multiple CCs

In non-simultaneous case, the timer-based BWP switch on multiple CCs is triggered over partially overlapping time period.

The delay requirements for non-simultaneous timer based BWP switch on multiple CCs in this clause apply if the timing difference among the beginning of the slot where timer based BWP switching starts for all CCs is exceeds the MRTD for inter-band CA as defined in clause 7.6.4, and the BWP switch does not involve SCS change. The UE performs the non-simultaneous timer-based BWP switch on the CCs sequentially.

For non-simultaneous timer-based BWP switch, the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{MultipleBWPswitchDelayTotal}$ which starts from the beginning of DL slot n, where slot n is the first slot of a DL subframe (in FR1) or DL half-subframe (in FR2) immediately after the earliest BWP-inactivity timer *bwp-InactivityTimer* [2] expires.

$$T_{MultipleBWPswitchDelayTotal} = T_{Delay} + T_{MultipleBWPswitchDelay}$$

Where:

$T_{Delay}$ is the time required to complete the ongoing timer-based BWP switching on other CCs.

$T_{MultipleBWPswitchDelay}$ is the timer-based BWP switch delay on current single CC defined in clause 8.6.2 or simultaneously triggered on multiple CCs defined in clause 8.6.2B.1.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{MultipleBWPswitchDelayTotal}$ after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10 in the new BWP.
- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10 in the new BWP.

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.

## 8.6.3 RRC based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with one or more than one BWP configuration(s) configured, with

- Active BWP switch or parameter change of its active BWPs for SpCell
- Parameter change of its active BWPs except parameter *firstActiveDownlinkBWP-Id* and *firstActiveUplinkBWP-Id* for SCell

For RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessing\,Delay}+T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessing\,Delay}$ is the length of the RRC processing delay in ms as defined in Table 11.2-1 in clause 11.2 in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC processing delay in ms as defined in Table 12.1-1 in clause 12 in TS 38.331 [2], and

$T_{BWPswitchDelayRRC} = 6ms$ is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$ on the cell where RRC-based BWP switch occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

## 8.6.3A RRC based BWP switch delay on multiple CCs

The requirements in this clause only apply to the case when the same type of BWP switch (RRC based BWP switch) is performed on multiple CCs simultaneously or over partially overlapping time period.

The requirements in this clause shall apply:

- Active BWP switching or parameter change of its active BWPs for SpCell
- Parameter change of its active BWPs except parameter *firstActiveDownlinkBWP-Id* and *firstActiveUplinkBWP-Id* for SCells

### 8.6.3A.1 Simultaneous RRC based BWP switch delay on multiple CCs

Requirements in this clause apply only if RRC based BWP switching on multiple CCs for NR-CA is triggered by a single RRC command.

For RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWPs, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWPs on the serving cells on which BWP switch occurs on the first DL or UL slot right after a time duration $\left\lceil \frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}+D_{RRC}*(N-1)}{NR\ slot\ length} \right\rceil$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smallest SCS among all SCS values of each CC before and after BWP switch if the BWP switch involves changing of SCS, and

$T_{RRCprocessingDelay}$ and $T_{BWPswitchDelayRRC}$ are defined in clause 8.6.3, and

$D_{RRC} = 0$ for UE which is capable of type 1 BWP switching delay depending on UE capability *bwp-SwitchingDelay* [2]. $D_{RRC} = D$ for UE which is capable of type 2 BWP switching delay depending on UE capability *bwp-SwitchingDelay* [2], where D is the incremental delay for each additional CC involved in simultaneous BWP switch and depends on UE capability [14].

N is the number of CCs within the NR-CA configured for performing simultaneous BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC} + D_{RRC} * (N-1)$ on the cells where RRC-based BWP switch occurs.

### 8.6.3A.2 Non-simultaneous RRC based BWP switch delay on multiple CCs

In non-simultaneous case, the RRC-based BWP switch on multiple CCs is triggered over partially overlapping time period in different Cell groups. The delay requirements in this clause apply only if:

BWP switching on multiple CCs in different cell groups are triggered by separate RRC commands, and

UE is operating in NR-DC (FR1+FR2), and

UE is capable of per-FR gap, and

BWP switch does not involve SCS change.

For non-simultaneous RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWPs, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWPs on the serving cells on which BWP switch occurs on the first DL or UL slot right after a time duration $\left\lceil \frac{T_{Waiting}+T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}+D_{RRC}*(M-1)}{NR\ slot\ length} \right\rceil$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot containing the RRC command,

$NR\ Slot\ length$ is determined by the SCS value of each CC in the second CG , and

$T_{Waiting}$ is the waiting time for RRC based BWP switch which is upper bounded by the ongoing BWP switch time in the first CG defined in clause 8.6.3A.1,

*M* is the number of CCs within the NR-CA configured for performing simultaneous BWP switch in the second CG; M=1 if the BWP switch is performed on single CC,

$T_{RRCprocessingDelay}$ and $T_{BWPswitchDelayRRC}$ are defined in clause 8.6.3, and

$D_{RRC}$ is defined in clause 8.6.3A.1.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC} + D_{RRC} * (M - 1)$ on the cells in the second CG where RRC-based BWP switch occurs.

## 8.6.4 BWP switch delay on Consistent UL CCA recovery

Upon detection of consistent UL CCA failure is slot#n in SpCell when UE detects *lbt-FailureInstanceMaxCount* number of CCA failure within *lbt-FailureDetectionTimer*, the UE shall switch the active UL BWP to an UL BWP configured with PRACH occasion and for which consistent CCA failure has not been triggered as defined in TS 38.321 [7] clause 5.21 . The UE shall be ready to transmit PRACH on the new UL BWP of the SpCell on the first UL slot occurs right after slot n+$T_{BWPswitchDelay}$ +1, where $T_{BWPswitchDelay}$ is defined in table 8.6.2-1. The UE shall finish the UL BWP switch within the time duration $T_{BWPswitchDelay}$ depending on UE capability *bwp-SwitchingDelay* [2].

NOTE: Additional delay in acquiring the first available RACH occasion will be derived in a way similar to that in handover in clause 6.1B.1.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ on the SpCell in the UL BWP switch. The UE is not required to follow the requirements defined in this clause when performing a UL BWP switch between the UL BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

# 8.6A Active BWP switch delay for RedCap

## 8.6A.1 Introduction

The requirements in this clause apply for RedCap UE. UE shall complete the switch of active DL and/or UL BWP within the delay defined in this clause.

## 8.6A.2 DCI and timer based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with more than one BWP configurations configured.

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ + Y which starts from the beginning of DL slot n. Where,

- Y=0, if the serving cell where UE receives DCI for BWP switch request is same as the serving cell on which BWP switch occurs.
- Y equals to the length of 1 slot, if the serving cell where UE receives DCI for BWP switch is different from the serving cell on which BWP switch occurs for any involved serving cell. In this scenario, $T_{BWPswitchDelay}$ + Y shall follow the smaller SCS of scheduling cell, scheduled cells before and scheduled cells after active BWP change.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL subframe (FR1) or DL half-subframe (FR2) immediately after a BWP-inactivity timer *bwp-InactivityTimer* [2] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* [2], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in table 8.6A.2-1.

**Table 8.6A.2-1: BWP switch delay**

| $\mu$ | NR Slot length (ms) | BWP switch delay $T_{BWPswitchDelay}$ (slots) | |
|---|---|---|---|
| | | Type 1[Note 1] | Type 2[Note 1] |
| 0 | 1 | 1 | 3 |
| 1 | 0.5 | 2 | 5 |
| 2 | 0.25 | 3 | 9 |
| 3 | 0.125 | 6 | 18 |
| NOTE 1: Depends on UE capability.<br>NOTE 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch. | | | |

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10B in the new BWP.
- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10B in the new BWP.

If the BWP switch is triggered within or outside DRX active time, and one of the two BWPs in a BWP switching is a dormant BWP [7], UE shall be able to complete active BWP switching within the time duration of

- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X$, provided that the dormancy indication is received in any of the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is receiveds, or
- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X + Z$, provided that the dormancy indication is received after the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, where
- $T_{BWPswitchDelay}$ is defined in table 8.6.2-1 corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs;
- X equals to the length of 1 slot corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs.
- Z equals to the length of 1 slot corresponding to the SCS of the serving cell where UE receives dormancy indication.

For DCI-based BWP switch, if the new BWP is a dormant BWP, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive CSI-RS (for DL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL slot occurs right after a time duration of $T_{dormantBWPswitchDelay}$ which starts from the beginning of DL slot n.

## 8.6A.3 RRC based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with one or more than one BWP configuration(s) configured, with

Active BWP switch or parameter change of its active BWPs for PCell

For RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessingDelay}$ is the length of the RRC procedure delay in ms as defined in clause 11.2 in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in ms as defined in clause 12 in TS 38.331 [2], and

$T_{BWPswitchDelayRRC} = 6ms$ is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$ on the cell where RRC-based BWP switch occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

# 8.6C Active BWP switch delay for satellite access

## 8.6C.1 Introduction

The requirements in this clause apply for a UE configured with only PCell, which is served by satellite access node (SAN). The requirements in this clause also apply for a UE configured with more than one BWP on PCell.

UE shall complete the switch of active DL and/or UL BWP within the delay defined in this clause.

## 8.6C.2 DCI and timer based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with more than one BWP configurations configured.

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ + Y which starts from the beginning of DL slot n. Where,

- Y=0, if the serving cell where UE receives DCI for BWP switch request is same as the serving cell on which BWP switch occurs.
- Y equals to the length of 1 slot, if the serving cell where UE receives DCI for BWP switch is different from the serving cell on which BWP switch occurs for any involved serving cell. In this scenario, $T_{BWPswitchDelay}$ + Y shall follow the smaller SCS of scheduling cell, scheduled cells before and scheduled cells after active BWP change.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL subframe (FR1-NTN) immediately after a BWP-inactivity timer *bwp-InactivityTimer* [2] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* [2], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in table 8.6C.2-1.

**Table 8.6C.2-1: BWP switch delay**

| $\mu$ | NR Slot length (ms) | BWP switch delay $T_{BWPswitchDelay}$ (slots) | |
|---|---|---|---|
| | | Type 1[Note 1] | Type 2[Note 1] |
| 0 | 1 | 1 | 3 |
| 1 | 0.5 | 2 | 5 |
| 2 | 0.25 | 3 | 9 |
| NOTE 1: Depends on UE capability.<br>NOTE 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch. | | | |

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10C in the new BWP.

- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10C in the new BWP.

If the BWP switch is triggered within or outside DRX active time, and one of the two BWPs in a BWP switching is a dormant BWP [7], UE shall be able to complete active BWP switching within the time duration of

- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X$, provided that the dormancy indication is received in any of the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is receiveds, or

- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X + Z$, provided that the dormancy indication is received after the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, where

- $T_{BWPswitchDelay}$ is defined in table 8.6C.2-1 corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs.

- X equals to the length of 1 slot corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs.

- Z equals to the length of 1 slot corresponding to the SCS of the serving cell where UE receives dormancy indication.

For DCI-based BWP switch, if the new BWP is a dormant BWP, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive CSI-RS (for DL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL slot occurs right after a time duration of $T_{dormantBWPswitchDelay}$ which starts from the beginning of DL slot n.

## 8.6C.3 RRC based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with one or more than one BWP configuration(s) configured, with

- Active BWP switch or parameter change of its active BWPs for PCell

For RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH

(for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot containing the RRC command, and

$NR\ Slot\ length$ is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessingDelay}$ is the length of the RRC procedure delay in ms as defined in clause 12 in TS 38.331 [2], and

$T_{BWPswitchDelayRRC} = 6ms$ is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$ on the cell where RRC-based BWP switch occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

# 8.6D Active BWP switch delay for ATG

## 8.6D.1 Introduction

The requirements in this clause apply for an ATG UE configured PCell or any activated SCell in standalone NR. The requirements in this clause also apply for a UE configured with more than one BWP on PCell.

UE shall complete the switch of active DL and/or UL BWP within the delay defined in this clause.

## 8.6D.2 DCI and timer based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with more than one BWP configurations configured.

For DCI-based BWP switch, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ + Y which starts from the beginning of DL slot n. Where,

- Y=0, if the serving cell where UE receives DCI for BWP switch request is same as the serving cell on which BWP switch occurs.
- Y equals to the length of 1 slot, if the serving cell where UE receives DCI for BWP switch is different from the serving cell on which BWP switch occurs for any involved serving cell. In this scenario, $T_{BWPswitchDelay}$ + Y shall follow the smaller SCS of scheduling cell, scheduled cells before and scheduled cells after active BWP change.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths.

For timer-based BWP switch, the UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL subframe (FR1) immediately after a BWP-inactivity timer *bwp-InactivityTimer* [2] expires on a serving cell, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{BWPswitchDelay}$ which starts from the beginning of DL slot n.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{BWPswitchDelay}$ after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Depending on UE capability *bwp-SwitchingDelay* [2], UE shall finish BWP switch within the time duration $T_{BWPswitchDelay}$ defined in table 8.6D.2-1.

**Table 8.6D.2-1: BWP switch delay**

| $\mu$ | NR Slot length (ms) | BWP switch delay $T_{BWPswitchDelay}$ (slots) | |
|---|---|---|---|
| | | Type 1[Note 1] | Type 2[Note 1] |
| 0 | 1 | 1 | 3 |
| 1 | 0.5 | 2 | 5 |
| 2 | 0.25 | 3 | 9 |
| NOTE 1: Depends on UE capability.<br>NOTE 2: If the BWP switch involves changing of SCS, the BWP switch delay is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch. | | | |

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10D or 8.15D in the new BWP.

- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10D or 8.15D in the new BWP

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.

If the BWP switch is triggered within or outside DRX active time, and one of the two BWPs in a BWP switching is a dormant BWP [7], UE shall be able to complete active BWP switching within the time duration of

- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X$, provided that the dormancy indication is received in any of the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is receiveds, or

- $T_{dormantBWPswitchDelay} = T_{BWPswitchDelay} + X + Z$, provided that the dormancy indication is received after the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, where

- $T_{BWPswitchDelay}$ is defined in table 8.6.2-1 corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs;

- X equals to the length of 1 slot corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs.

- Z equals to the length of 1 slot corresponding to the SCS of the serving cell where UE receives dormancy indication.

For DCI-based BWP switch, if the new BWP is a dormant BWP, after the UE receives BWP switching request at DL slot n on a serving cell, UE shall be able to receive CSI-RS (for DL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL slot occurs right after a time duration of $T_{dormantBWPswitchDelay}$ which starts from the beginning of DL slot n.

## 8.6D.2A DCI based BWP switch delay on multiple CCs

The requirements in this clause only apply to the case when the same type of BWP switch (DCI based BWP switch) is performed on multiple CCs simultaneously.

### 8.6D.2A.1 Simultaneous DCI based BWP switch delay on multiple CCs

The delay requirements for simultaneous DCI based BWP switch on multiple CCs in this clause apply only if the timing difference among the first symbol of slot carrying DCI for all CCs is received within the MRTD for inter-band CA as defined in clause 7.6D.2

For DCI-based BWP switch on multiple CCs, after the UE receives BWP switching request, UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWPs on the serving cells on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{MultipleBWPswitchDelay}$ which starts from the beginning of DL slot n, where slot n is slot which UE receives the earliest BWP switching request among CCs on which UE is performing simultaneous DCI-based BWP switching.

The UE is not required to transmit UL signals or receive DL signals until the first DL or UL slot occurs right after a time duration of $T_{MultipleBWPswitchDelay}$ which starts from the beginning of DL slot n except DCI triggering BWP switch on the cell where DCI-based BWP switch occurs. The UE is not required to follow the requirements defined in this clause when performing a DCI-based BWP switch between the BWPs in disjoint channel bandwidths or in partially overlapping channel bandwidths on any serving cell.

UE shall finish BWP switch within the time duration $T_{MultipleBWPswitchDelay} + Y$, which is defined as:

$$T_{MultipleBWPswitchDelay} = T_{BWPswitchDelay} + D*(N-1)+D1*(N1-1)$$

Where:

- $T_{BWPswitchDelay}$ is the BWP switching delay on single CC defined in table 8.6D.2-1 depending on UE capability *bwp-SwitchingDelay* [2]. $T_{BWPswitchDelay}$ shall be based on the smallest SCS among SCS of all involved CCs before and after BWP switch. If the BWP switch on multiple CCs results in the change of the SCS on any CC among involved CCs, $T_{BWPswitchDelay}$ shall be based on the smallest SCS among all SCS values of all involved CCs.

- D is the incremental delay for each additional CC involved in simultaneous BWP switch and depends on UE capability *bwp-SwitchingMultiCCs-r16* [14] for switching between non-dormant BWPs, and *bwp-SwitchingMultiDormancyCCs-r16* or *bwp-SwitchingMultiDormancyCC-DCI-0-3-And-1-3-r18* for switching between non-dormant and dormant BWPs.

- D1 is the incremental delay for each additional CC involved in simultaneous BWP switch and depends on UE capability *bwp-SwitchingMultiDormancyCCs-r16* or *bwp-SwitchingMultiDormancyCC-DCI-0-3-And-1-3-r18* for switching between dormant and non-dormant BWPs. Note: D1 shall be equal to or shorter than D.

- N, N1: N is the number of CCs undergoing simultaneous BWP switch between non-dormant BWPs, and N1 is the number of CCs undergoing simultaneous BWP switch between non-dormant and dormant BWPs..

  If no BWP switch involves SCS change, N is the number of CCs in same FR; If the BWP switches on any CC involves SCS changing, N is the number of CCs undergoing simultaneous BWP switch.

- Y=0, if the serving cell where UE receives DCI for BWP switch is same as the serving cell on which BWP switch occurs for each involved serving cell.

  Y equals to the length of one slot at smaller SCS of scheduling cell, scheduled cells before and scheduled cells after active BWP change, if the serving cell where UE receives DCI for BWP switch is different from the serving cell on which BWP switch occurs for any involved serving cell.

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10D in the new BWP.

- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10D in the new BWP.

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.

If the BWP switch is triggered on multiple CCs simultaneously within or outside DRX active time, and one of the two BWPs on each CC in a BWP switching is a dormant BWP [7], UE shall be able to complete active BWP switching within the time duration of

- $T_{DormantMultipleBWPswitchDelay} = T_{MultipleBWPswitchDelay}+X$, provided that the dormancy indication is received in any of the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, or

- $T_{DormantMultipleBWPswitchDelay} = T_{MultipleBWPswitchDelay} +X+Z$, provided that the dormancy indication is received after the first 3 OFDM symbols of a slot in the serving cell where DCI for dormancy indication is received, where

- $T_{MultipleBWPswitchDelay}$ is defined above corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs;

- X equals to the length of 1 slot corresponding to the smallest value among the SCS of the serving cell where UE receives dormancy indication and the SCSs of the dormant BWP and the active BWP immediately before or after switching the BWP of the serving cell where BWP switching occurs.

- Z equals to the length of 1 slot corresponding to the SCS of the serving cell where DCI for dormancy indication is received.

The number of CCs, N and/or N1, on which the UE can simultaneously switch BWPs while still meeting the requirements, if any, related to allocations on downlink, uplink, or transmission of HARQ-ACK, depends on the UE reported capabilities related to BWP switching, the network configuration and the BWP switch method.

## 8.6D.2B Timer based BWP switch delay on multiple CCs

The requirements in this clause only apply to the case when the same type of BWP switch (timer based BWP switch) is performed on multiple CCs simultaneously or over partially overlapping time period.

### 8.6D.2B.1 Simultaneous timer based BWP switch delay on multiple CCs

The delay requirements for simultaneous timer based BWP switch on multiple CCs in this clause apply only if the timing difference among the beginning of the slot where timer based BWP switching starts for all CCs is within the MRTD for inter-band CA as defined in clause 7.6D.2.

For timer-based BWP switch on multiple CCs, UE shall start BWP switch at DL slot n, where slot n is the first slot of a DL subframe (in FR1) immediately after the earliest BWP-inactivity timer *bwp-InactivityTimer* [2] expiration occurs on multiple serving cells, and the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWPs on the serving cells on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{MultipleBWPswitchDelay}$ which starts from the beginning of DL slot n, where $T_{MultipleBWPswitchDelay}$ is defined in clause 8.6D.2A.1.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{MultipleBWPswitchDelay}$ after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10 in the new BWP.

- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10 in the new BWP.

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.

### 8.6D.2B.2 Non-simultaneous timer based BWP switch delay on multiple CCs

In non-simultaneous case, the timer-based BWP switch on multiple CCs is triggered over partially overlapping time period.

The delay requirements for non-simultaneous timer based BWP switch on multiple CCs in this clause apply if the timing difference among the beginning of the slot where timer based BWP switching starts for all CCs exceeds the MRTD for inter-band CA as defined in clause 7.6D.2, and the BWP switch does not involve SCS change. The UE performs the non-simultaneous timer-based BWP switch on the CCs sequentially.

For non-simultaneous timer-based BWP switch, the UE shall be able to receive PDSCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch on the first DL or UL slot occurs right after a time duration of $T_{MultipleBWPswitchDelayTotal}$ which starts from the beginning of DL slot n, where slot n is the first slot of a DL subframe (in FR1) immediately after the earliest BWP-inactivity timer *bwp-InactivityTimer* [2] expires.

$$T_{MultipleBWPswitchDelayTotal} = T_{Delay} + T_{MultipleBWPswitchDelay}$$

Where:

$T_{Delay}$ is the time required to complete the ongoing timer-based BWP switching on other CCs.

$T_{MultipleBWPswitchDelay}$ is the timer-based BWP switch delay on current single CC defined in clause 8.6D.2 or simultaneously triggered on multiple CCs defined in clause 8.6D.2B.1.

The UE is not required to transmit UL signals or receive DL signals during time duration $T_{MultipleBWPswitchDelayTotal}$ after *bwp-InactivityTimer* [2] expires on the cell where timer-based BWP switch occurs.

Provided the UE does not have the required TCI-state information to receive PDCCH and PDSCH in the new BWP, the UE shall use old TCI-states before the BWP switch until a new MAC CE updating the required TCI-state information for PDCCH and PDSCH is received after the BWP switch.

If UE has the information on the required TCI-state information to receive PDCCH and PDSCH in the new BWP,

- UE shall be able to receive PDCCH and PDSCH with old TCI-states before the delay as specified in clause 8.10D in the new BWP.
- UE shall be able to receive PDCCH and PDSCH with new TCI-states after the delay as specified in clause 8.10D in the new BWP.

Provided the UE does not have the required activated TCI-state(s) information to receive PDCCH/ PDSCH and to transmit PUSCH/PUCCH/SRS in the new BWP, the UE shall use old TCI-state(s) before the BWP switch until a new MAC CE updating the required activated TCI-state(s) information is received after the BWP switch.

## 8.6D.3 RRC based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the BWP switch is performed on a single CC with one or more than one BWP configuration(s) configured, with

- Active BWP switch or parameter change of its active BWPs for PCell
- Parameter change of its active BWPs except parameter *firstActiveDownlinkBWP-Id* for SCell

For RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWP, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWP on the serving cell on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessing\,Delay}+T_{BWPswitchDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smaller SCS between the SCS before BWP switch and the SCS after BWP switch if the BWP switch involves changing of SCS.

$T_{RRCprocessing\,Delay}$ is the length of the RRC procedure delay in ms as defined in clause 12 in TS 38.331 [2], and

$T_{BWPswitchDelayRRC} = 6ms$ is the time used by the UE to perform BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC}$ on the cell where RRC-based BWP swithing occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

## 8.6D.3A RRC based BWP switch delay on multiple CCs

The requirements in this clause only apply to the case when the same type of BWP switch (RRC based BWP switch) is performed on multiple CCs simultaneously.

The requirements in this clause shall apply:

- Active BWP switching or parameter change of its active BWPs for Pcell
- Parameter change of its active BWPs except parameter *firstActiveDownlinkBWP-Id* for SCells

### 8.6D.3A.1 Simultaneous RRC based BWP switch delay on multiple CCs

Requirements in this clause apply only if RRC based BWP switching on multiple CCs for NR-CA is triggered by a single RRC command.

For RRC-based BWP switch, after the UE receives RRC reconfiguration involving active BWP switching or parameter change of its active BWPs, UE shall be able to receive PDSCH/PDCCH (for DL active BWP switch) or transmit PUSCH (for UL active BWP switch) on the new BWPs on the serving cells on which BWP switch occurs on the first DL or UL slot right after a time duration of $\frac{T_{RRCprocessingDelay}+T_{BWPswitchDelayRRC}+D_{RRC}*(N-1)}{NR\ slot\ length}$ slots which begins from the beginning of DL slot n, where

DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

$NR\ Slot\ length$ is determined by the smallest SCS among all SCS values of each CC before and after BWP switch if the BWP switch involves changing of SCS, and

$T_{RRCprocessingDelay}$ and $T_{BWPswitchDelayRRC}$ are defined in clause 8.6D.3, and

$D_{RRC} = 0$ for UE which is capable of type 1 BWP switching delay depending on UE capability *bwp-SwitchingDelay* [2]. $D_{RRC} = D$ for UE which is capable of type 2 BWP switching delay depending on UE capability *bwp-SwitchingDelay* [2], where D is the incremental delay for each additional CC involved in simultaneous BWP switch and depends on UE capability [14].

N is the number of CCs within the NR-CA configured for performing simultaneous BWP switch.

The UE is not required to transmit UL signals or receive DL signals during the time defined by $T_{RRCprocessingDelay} + T_{BWPswitchDelayRRC} + D_{RRC} * (N-1)$ on the cells where RRC-based BWP switch occurs.

# 8.6E Active BWP switch delay for RedCap UE with satellite access

## 8.6E.1 Introduction

The requirements in this clause apply for a RedCap UE configured with only PCell, which is served by satellite access node (SAN). The requirements in this clause also apply for a UE configured with more than one BWP on PCell.

UE shall complete the switch of active DL and/or UL BWP within the delay defined in this clause.

## 8.6E.2 DCI and timer based BWP switch delay on a single CC

The requirements in clause 8.6C.2 shall apply.

### 8.6E.3 RRC based BWP switch delay on a single CC

The requirements in clause 8.6C.3 shall apply.

## 8.7 Void

## 8.8 NE-DC: E-UTRAN PSCell Addition and Release Delay

### 8.8.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to configure an E-UTRAN PSCell in NR - E-UTRA dual connectivity. The requirements are applicable to an NR - E-UTRA dual connectivity capable UE.

### 8.8.2 E-UTRAN PSCell Addition Delay Requirement

The requirements in this clause shall apply for the UE, which is configured with PCell, and may also be configured with one or more SCells.

Upon receiving E-UTRAN PSCell addition in subframe *n*, the UE shall be capable to transmit PRACH preamble towards E-UTRAN PSCell no later than in subframe $n + T_{config_EUTRAN\text{-}PSCell}$:

Where:

$T_{config_EUTRAN\text{-}PSCell} = T_{RRC_delay} + T_{activation_time} + 50\ ms + T_{E\text{-}UTRAN\text{-}PSCell_DU}$

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

$T_{activation_time}$ is the E-UTRAN PSCell activation delay. If the E-UTRAN PSCell is known, then $T_{activation_time}$ is 20 ms. If the E-UTRAN PSCell is unknown, then $T_{activation_time}$ is 30 ms provided the E-UTRAN PSCell can be successfully detected on the first attempt.

$T_{E\text{-}UTRAN\text{-}PSCell_DU}$ is the delay uncertainty in acquiring the first available PRACH occasion in the E-UTRAN PSCell. $T_{E\text{-}UTRAN\text{-}PSCell_DU}$ is up to 30 ms.

E-UTRAN PSCell is known if it has been meeting the following conditions:

- During the last 5 seconds before the reception of the E-UTRAN PSCell configuration command:
  - the UE has sent a valid measurement report for the E-UTRAN PSCell being configured and
  - the E-UTRAN PSCell being configured remains detectable according to the cell identification conditions specified in clause 8.8 of TS 36.133 [15],
- E-UTRAN PSCell being configured also remains detectable during the E-UTRAN PSCell configuration delay $T_{config_EUTRAN\text{-}PSCell}$ according to the cell identification conditions specified in clause 8.8 of TS 36.133 [15].

Otherwise it is unknown.

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

### 8.8.3 E-UTRAN PSCell Release Delay Requirement

also be configured with one or more SCells and/or E-UTRAN SCells.

Upon receiving E-UTRAN PSCell release in subframe *n*, the UE shall accomplish the release actions specified in TS 38.331 [2] no later than in subframe $n + T_{RRC_delay}$:

Where

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

# 8.9 NR-DC: PSCell Addition and Release Delay

## 8.9.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to configure an PSCell in NR dual connectivity. The requirements are applicable to an NR dual connectivity capable UE.

## 8.9.2 PSCell Addition Delay Requirement

The requirements in this clause shall apply for the UE configured with only PCell in FR1.

Upon receiving PSCell addition in subframe *n*, the UE shall be capable to transmit PRACH preamble towards PSCell in FR1 or FR2 no later than in slot n + $\frac{T_{config_PSCell}}{NR\ slot\ length}$:

where:

$T_{config_PSCell} = T_{RRC_delay} + T_{processing} + T_{search} + T_{\Delta} + T_{PSCell_DU} + 2$ ms

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

$T_{processing}$ is the SW processing time needed by UE, including RF warm up period. $T_{processing}$ = 20 ms when target cell is in FR1 and $T_{processing}$ = 40 ms when target cell is in FR2.

$T_{search}$ is the time for AGC settling and PSS/SSS detection. If the target cell is known, $T_{search}$ = 0 ms. If the target cell is unknown and the target cell $\hat{E}s/Iot \geq$ -2 dB, $T_{search}$ = 3*N* Trs ms. N = 1 when target cell is in FR1, N = 8 when the target cell is in FR2-1, and N = 12 when the target cell is in FR2-2

$T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = 3*T_{rs}$ ms for target PSCell operating with 12 PRB SSB BW. Otherwise, $T_{\Delta} = 1*T_{rs}$ ms.

$T_{PSCell_DU}$ is the delay uncertainty in acquiring the first available PRACH occasion in the PSCell. $T_{PSCell_DU}$ is up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

Trs is the SMTC periodicity of the target cell if the UE has been provided with an SMTC configuration for the target cell in PSCell addition message, otherwise Trs is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with Trs = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

In FR1 and FR2, the PSCell is known if it has been meeting the following conditions:

- During the last 5 seconds before the reception of the PSCell configuration command:
  - the UE has sent a valid measurement report for the PSCell being configured and
  - One of the SSBs measured from the PSCell being configured remains detectable according to the cell identification conditions specified in clause 9.3.
- One of the SSBs measured from PSCell being configured also remains detectable during the PSCell configuration delay $T_{config_PSCell}$ according to the cell identification conditions specified in clause 9.3.

Otherwise it is unknown.

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

## 8.9.3 PSCell Release Delay Requirement

The requirements in this clause shall apply for a UE which is configured with PCell and one PSCell.

Upon receiving PSCell release in subframe *n*, the UE shall accomplish the release actions specified in TS 38.331 [2] no later than in slot n + $\frac{T_{RRC_delay}}{NR\ slot\ length}$:

where

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

# 8.9A Conditional PSCell Addition Delay

## 8.9A.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to perform conditional PSCell addition in EN-DC or NR-DC. The requirements in this clause are applicable to EN-DC and NR-DC.

## 8.9A.2 Conditional PSCell Addition Delay Requirement

The requirements in this clause shall apply for the UE configured with only PCell in FR1.

Upon receiving conditional PSCell addition in subframe *n*, the UE shall be capable to transmit PRACH preamble towards PSCell no later than in subframe *n* + $T_{config_PSCell_Addition_Conditional}$:

Where:

$T_{config_PSCell_Addition_Conditional} = T_{RRC_delay} + T_{Event_DU} + T_{measure} + T_{UE_preparation} + T_{processing} + T_{\Delta} + T_{PSCell_DU} + 2$ ms

$T_{RRC_delay}$ is the RRC processing delay defined in clause 11.2 in TS 36.331 [16] which is the corresponding RRC message embedded in E-UTRA RRC message, otherwise it is the RRC procedure delay defined in clause 12 in TS 38.331 [2] for processing the conditional PSCell addition command.

$T_{Event_DU}$ is the delay uncertainty which is the time from when the UE successfully decodes a conditional PSCell addition command until a condition exists at the measurement reference point which will trigger the conditional PSCell addition.

$T_{measure}$ is the measurements time stated in clause 8.9A.2.1.

$T_{UE_preparation}$ is the UE preparation time for conditional PSCell addition, and starts after UE realizes the condition of PSCell addition is met and identity of the PSCell is determined. $T_{UE_preparation}$ is up to 10 ms.

$T_{processing}$ is the SW processing time needed by UE, including RF warm up period. $T_{processing}$ = 20 ms when PSCell is in FR1, and $T_{processing}$ = 40 ms when PSCell is in FR2.

$T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = 3*T_{rs}$ ms for target PSCell operating with 12 PRB SSB BW. Otherwise, $T_{\Delta} = 1*$Trs ms.

$T_{PSCell_DU}$ is the delay uncertainty in acquiring the first available PRACH occasion in the PSCell. $T_{PSCell_DU}$ is up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

Trs is the SMTC periodicity of the target cell if the UE has been provided with an SMTC configuration for the target cell in PSCell addition message, otherwise Trs is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with Trs = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

The PCell interruption specified in clause 8.2 is allowed only after the UE starts to execute a conditional PSCell addition.

### 8.9A.2.1 Measurement time

The measurement time delay is defined from the end of $T_{Event_DU}$ until UE executes a PSCell addition and interruption time starts.

The measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ defined in clause 9.3.4. When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for PSCell addition. If a cell, which has been detectable at least for the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for PSCell addition, becomes undetectable for a period and then the cell becomes detectable again and triggers a PSCell addition, the measurement time delay shall be less than $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

## 8.9B NR-DC: PSCell Addition and Release Delay in Carriers with CCA

### 8.9B.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to configure an PSCell in FR2-2 with CCA in NR dual connectivity. The requirements are applicable to an NR dual connectivity capable UE.

### 8.9B.2 PSCell Addition Delay Requirement

The requirements in this clause shall apply for the UE configured with only PCell in FR1.

Upon receiving PSCell addition in subframe *n*, the UE shall be capable to transmit PRACH preamble towards PSCell in FR2-2 no later than in slot n + $\frac{T_{config_PSCell_CCA}}{NR\ slot\ length}$:

where:

$T_{config_PSCell_CCA} = T_{RRC_delay} + T_{processing} + T_{search_CCA} + T_{\Delta_CCA} + T_{PSCell_DU} + 2$ ms

$T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

$T_{processing}$ is the SW processing time needed by UE, including RF warm up period. $T_{processing}$ = 40 ms.

$T_{search_CCA}$ is the time for AGC settling and PSS/SSS detection. If the target cell is known, $T_{search}$ = 0 ms. If the target cell is unknown and the target cell Ês/Iot ≥ -2 dB, $T_{search}$ = (3*N+$L_1$*N) * Trs ms, where $L_1$ is the number of SMTC occasions groups with at least one SSB/SMTC occasion in the group is not transmitted by the gNB during the AGC settling and PSS/SSS detection. N is the Rx beam sweeping factor for FR2-2.

$T_{\Delta_CCA}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta}$ = (1+$L_2$) *Trs ms for a known or unknown PSCell, where $L_2$ is the number of SMTC occasions not avaible at the UE during the time tracking period.

$T_{PSCell_DU}$ is the interruption uncertainty due to the random access procedure when sending PRACH to the new cell. $T_{PSCell_DU}$ can be up to: (1+ $L_3$) * $T_{SSB,RO}$ + 10 ms where $T_{SSB,RO}$ is the SSB to PRACH occasion association period as defined in table 8.1-1 of TS 38.213 [3] and $L_3$ is the number of consecutive SSB to PRACH occasion association periods during which no PRACH occasion is available for PRACH transmission due to UL CCA failure. $L_3$ = 0 for Type 3 UL channel access procedure as defined in TS 37.213 [33]. $L_3$ = 0 if *ra-ChannelAccess-r17* is not configured in FR2-2.

$T_{rs}$ is the SMTC periodicity of the target cell if the UE has been provided with an SMTC configuration for the target cell in PSCell addition message, otherwise $T_{rs}$ is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

NOTE 1: The interruption time considering the potential extensions caused by $L_1$, $L_2$, $L_3$ and by the UL CCA failure detection/recovery mechanism is limited by the T304 timer. The UE behaviour at the T304 timer expiry is detailed in TS 38.331 [2].

In FR2-2, the PSCell is known if it has been meeting the following conditions:

- During the last 5 seconds before the reception of the PSCell configuration command:
  - the UE has sent a valid measurement report for the PSCell being configured and
  - One of the SSBs measured from the PSCell being configured remains detectable according to the cell identification conditions specified in clause 9.3A.
- One of the SSBs measured from PSCell being configured also remains detectable during the PSCell configuration delay $T_{config_PSCell_CCA}$ according to the cell identification conditions specified in clause 9.3A.

Otherwise it is unknown.

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

### 8.9B.3 PSCell Release Delay Requirement

The requirements in this clause shall apply for a UE which is configured with PCell in FR1 and one PSCell in FR2-2.

Upon receiving PSCell release in subframe *n*, the UE shall accomplish the release actions specified in TS 38.331 [2] no later than in slot $n + \frac{T_{RRC_delay}}{NR\ slot\ length}$:

where

- $T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

## 8.9C Subsequent Conditional PSCell Addition Delay

### 8.9C.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to perform subsequent conditional PSCell addition in NR-DC. The requirements in this clause are applicable to NR-DC.

### 8.9C.2 Subsequent Conditional PSCell Addition Delay Requirement

The requirements in this clause shall apply for the UE configured with only PCell in FR1.

Upon receiving RRC Command containing MR-DCRelease configuration and sending an *RRCReconfigurationComplete* message confirming the release in subframe *n*, the UE shall be capable to transmit PRACH preamble towards PSCell no later than in subframe $n + T_{config_PSCell_Addition_Conditional}$:

Where:

- $T_{config_PSCell_Addition_Conditional} = T_{Event_DU} + T_{measure} + T_{UE_preparation} + T_{processing} + T_{\Delta} + T_{PSCell_DU} + 2$ ms
  - $T_{Event_DU}$ is the delay uncertainty which is the time from when the UE successfully transmits an *RRCReconfigurationComplete* message confirming the release of SCG configuration until a condition exists at the measurement reference point which will trigger the conditional PSCell addition.
  - $T_{measure}$ is the measurements time stated in clause 8.9C.2.1.
  - $T_{UE_preparation}$ is the UE preparation time for conditional PSCell addition, and starts after UE realizes the condition of PSCell addition is met and identity of the PSCell is determined. $T_{UE_preparation}$ is up to 10 ms.

- $T_{processing}$ is the SW processing time needed by UE, including RF warm up period. $T_{processing}$ = 20 ms when PSCell is in FR1, and $T_{processing}$ = 40 ms when PSCell is in FR2.

- $T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = 3*T_{rs}$ ms for target PSCell operating with 12 PRB SSB BW. Otherwise, $T_{\Delta} = 1*Trs$ ms.

    - Trs is the SMTC periodicity of the target cell if the UE has been provided with an SMTC configuration for the target cell in PSCell addition message, otherwise Trs is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with Trs = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

- $T_{PSCell_DU}$ is the delay uncertainty in acquiring the first available PRACH occasion in the PSCell. $T_{PSCell_DU}$ is up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

The PCell interruption specified in clause 8.2 is allowed only after the UE starts to execute a conditional PSCell addition.

### 8.9C.2.1 Measurement time

The measurement time delay is defined from the end of $T_{Event_DU}$ until UE executes a PSCell addition and interruption time starts.

The measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ defined in clause 9.3.4. When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for PSCell addition. If a cell, which has been detectable at least for the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for PSCell addition, becomes undetectable for a period and then the cell becomes detectable again and triggers a PSCell addition, the measurement time delay shall be less than $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

## 8.10 Active TCI state switching delay

### 8.10.1 Introduction

The requirements in this clause apply for a UE configured with one or more TCI state configurations on serving cell in MR-DC or standalone NR. UE shall complete the switch of active TCI state within the delay defined in this clause.

### 8.10.2 Known conditions for TCI state

The TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target TCI state to the completion of active TCI state switch, where the RS resource for L1-RSRP measurement is the RS in target TCI state or QCLed to the target TCI state

    - TCI state switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement

    - The UE has sent at least 1 L1-RSRP report for the target TCI state before the TCI state switch command

    - The TCI state remains detectable during the TCI state switching period

    - The SSB associated with the TCI state remain detectable during the TCI switching period

        - SNR of the TCI state $\geq$ -3 dB

Otherwise, the TCI state is unknown.

## 8.10.2A Known conditions for TCI state with beam prediction

The TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource in *resourcesForChannelMeasurement* to the completion of active TCI state switch, where the target TCI state is either
  - RS resource in *resourcesForChannelMeasurement-r19* or QCLed to RS resource in *resourcesForChannelMeasurement-19*

  or
  - one of RS resource in *resourcesForChannelPrediction-r19* or QCLed to one of RS resource in *resourcesForChannelPrediction-r19* and UE supports [FG 59-1]
- TCI state switch command is received within 1280 ms upon the last transmission of the RS resource in *resourcesForChannelMeasurement.*
- The UE has sent at least 1 L1-RSRP report for the predicted RS quantities for the target TCI state before the TCI state switch command
- The TCI state remains detectable during the TCI state switching period
- The SSB associated with the TCI state remain detectable during the TCI switching period
  - SNR of the TCI state ≥ -3 dB

Otherwise, the TCI state is unknown.

## 8.10.3 MAC-CE based TCI state switch delay

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ + $TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ .Where $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];

- $T_{first\text{-}SSB}$ is
  - if the UE supports *featureSetCombinationLowBandSwitching-r19*, time to first available SSB reception based on *switchingPattern-r19* after MAC CE command is decoded by the UE
  - otherwise, time to first SSB transmission after MAC CE command is decoded by the UE;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state
- $T_{SSB\text{-}proc}$ = 2 ms;
- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH, 0 otherwise.

If the target TCI state is unknown, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ +$3N_{slot}^{subframe,\mu}$ + $T_{L1\text{-}RSRP}$ +$TO_{uk}$*($T_{first\text{-}SSB}$+ $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ .

Where

- $T_{L1\text{-}RSRP}$ = 0 in FR1 or when the TCI state switching not involving QCL-TypeD in FR2. Otherwise,
- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as

- $T_{L1\text{-}RSPR_Measurement_Period_SSB}$ for SSB as specified in clause 9.5.4.1,
  - with the assumption of M=1
  - with $T_{Report}$ = 0
- $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for CSI-RS as specified in clause 9.5.4.2
  - configured with higher layer parameter *repetition* set to ON
  - with the assumption of M=1 for periodic CSI-RS
  - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
  - with $T_{Report}$ = 0
- $TO_{uk}$ = 1 for CSI-RS based L1-RSRP measurement, and 0 for SSB based L1-RSRP measurement when TCI state switching involves QCL-TypeD
- $TO_{uk}$ = 1 when TCI state switching involves other QCL types only
- $T_{first\text{-}SSB}$ is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{first\text{-}SSB}$ is
  - if the UE supports *featureSetCombinationLowBandSwitching-r19*, time to first available SSB reception based on *switchingPattern-r19* after MAC CE command is decoded by the UE for other QCL types
  - otherwise, time to first SSB transmission after MAC CE command is decoded by the UE for other QCL types;
- The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

## 8.10.3A MAC-CE based TCI state switch delay in HST FR2 scenarios

For FR2 power class 6 UE, if the target TCI state is known, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the symbol m of the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ + $TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$ + $T_{rs}$ + $T_{rs\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ .Where $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];

- $T_{first\text{-}SSB}$ is time to first SSB transmission after MAC CE command is decoded by the UE;
- $T_{SSB\text{-}proc}$ = 2 ms;
- $T_{rs}$ is time to the first TRS or SSB transmission after the SSB transmission in the definition of $T_{first\text{-}SSB}$ is processed by the UE;
- $T_{rs\text{-}proc}$ = 2 ms;
- $TO_k$ = 1, m = 0 if target TCI state is not in the active TCI state list for PDSCH; otherwise $TO_k$ = 0, m = 1.

For FR2 power class 6 UE, if the target TCI state is unknown, the same requirement for unknown target TCI state case specified in clause 8.10.3 applies.

For FR2 power class 6 UE if the UE indicates to support *tci-StateSwitchInd-r18* and *cross-RRH TCI state indicator for UE-specific PDCCH MAC-CE* as specified in Clause 6.1.3.77 of TS 38.321 [7] is indicated as ‘0’ for the TCI state switch, the same requirement specified in clause 8.10.3 applies.

## 8.10.4 DCI based TCI state switch delay

If the target TCI state is known, when a UE is configured with the higher layer parameter *tci-PresentInDCI* which is set as 'enabled' for the CORESET scheduling PDSCH at slot n, UE shall be able to receive PDSCH with target TCI state of

the serving cell on which TCI state switch occurs at the first slot that is after slot n+*timeDurationForQCL*, where, *timeDurationForQCL* is the time required by the UE to perform PDCCH reception and applying spatial QCL information received in DCI for PDSCH processing as described in TS 38.214 [26], the value of *timeDurationForQCL* is defined in TS 38.331 [2].

The known condition for TCI state defined in clause 8.10.2 or clause 8.10.2A is applied.

## 8.10.5 RRC based TCI state switch delay

If the target TCI state is known, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ ($T_{RRC_processing}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$)) / *NR slot length*, The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{RRC_processing}$ is the RRC processing delay defined in clause 11.2 of TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in clause 12 of TS 38.331 [2].
- $T_{first\text{-}SSB}$ is
  - if the UE supports *featureSetCombinationLowBandSwitching-r19*, time to first available SSB reception based on *switchingPattern-r19* after RRC processing by the UE
  - otherwise, time to first SSB transmission after RRC processing by the UE;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state.
- $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10.3.

If the target TCI state is unknown, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ ($T_{RRC_processing}$ +$T_{L1\text{-}RSRP}$ +$TO_{uk}$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$)) / *NR slot length*, The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{RRC_processing}$ is the RRC processing delay defined in clause 11.2 of TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in clause 12 of TS 38.331 [2].
- $T_{first\text{-}SSB}$ is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{first\text{-}SSB}$ is
  - if the UE supports *featureSetCombinationLowBandSwitching-r19*, time to first available SSB reception based on *switchingPattern-r19* after RRC processing time at the UE for other QCL types
  - otherwise, time to first SSB transmission after RRC processing time at the UE for other QCL types;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state
- $T_{L1\text{-}RSRP}$, $TO_{uk}$ and $T_{SSB\text{-}proc}$ are defined in clause 8.10.3.

The requirements for RRC based TCI state switch delay apply when only 1 TCI state is configured in RRC TCI state list. When $T_{HARQ} > T_{RRC_processing}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

### 8.10.6 Active TCI state list update delay

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE for activation/deactivation of UE-specific PDSCH TCI state as defined in clause 6.1.3.14 of TS 38.321 [7] at slot n, UE shall be able to receive PDCCH to schedule PDSCH with the new target TCI state at the first slot that is after n+ $T_{HARQ}$ +3$N_{slot}^{subframe,\mu}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. Where $T_{HARQ}$, $T_{first\text{-}SSB,}$ $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10.3.

## 8.10A Active TCI state switching delay with CCA

### 8.10A.1 Introduction

The requirements in this clause apply for a UE configured with one or more TCI state configurations on serving cell in EN-DC with PSCell on a carrier frequency with CCA or SA NR with PCell on a carrier frequency with CCA. UE shall complete the switch of active TCI state within the delay defined in this clause.

In the requirements of clause 8.10A, the term SSB occasion not available at the UE refers to when the SSB is configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SSB index within the discovery burst transmission window are not available at the UE due to DL CCA failures at gNB during the corresponding period; otherwise the SSB occasion is considered as available at the UE.

### 8.10A.2 Known conditions for TCI state

The TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target TCI state to the completion of active TCI state switch, where the RS resource for L1-RSRP measurement is the RS in target TCI state or QCLed to the target TCI state
  - TCI state switch command is received within 1280 ms of the last transmission of the RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target TCI state before the TCI state switch command
  - The TCI state remain detectable during the TCI state switching period in the SSB occasions available at the UE
  - The SSB associated with the TCI state remain detectable during the TCI switching period in the SSB occasions available at the UE
    - SNR of the TCI state is ≥ -3 dB

Otherwise, the TCI state is unknown.

### 8.10A.3 MAC-CE based TCI state switch delay

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] at slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ 3$N_{slot}^{subframe,\mu}$ +($T_{HARQ}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$+$T_{SSB}$*$L_{MAC,known}$)) */NR slot length*. The UE shall be able to receive on the old TCI state until slot n + 3$N_{slot}^{subframe,\mu}$ + ($T_{HARQ}$ +$TO_k$*($T_{first\text{-}SSB}$+ $T_{SSB}$*$L_{MAC,known}$)) / *NR slot length*, where

- $T_{HARQ}$ (in ms) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3]. In the event of UE not being able to transmit the acknowledgment due to UL CCA failures: $T_{HARQ}$ is extended to also include the time to all next HARQ feedback transmissions and retransmission opportunities, until the time of its successful transmission, as specified in TS 38.213 [3]; no extension of $T_{HARQ}$ due to UL CCA failures is allowed for Type 2C UL channel access in TS 37.213 [33];
- $T_{first\text{-}SSB}$ is time to first SSB transmission occasion after MAC CE command is decoded by the UE, during which some SSB occasions may not be available at the UE due to DL CCA failures;

- The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state;
- $T_{SSB-proc}$ = 2 ms;
- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH, 0 otherwise;
- $T_{SSB}$ = ssb-periodicityServingCell;
- $L_{MAC,known} \leq L_{MAC,known,max}$ is the corresponding number of SSB occasions not available at the UE;
- $L_{MAC,known,max}$ =2 for $T_{SSB} \leq 40$ ms, $L_{MAC,known,max}$ =1 for $T_{SSB}$>40 ms.

If the target TCI state is unknown, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] at slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot $n+ 3N_{slot}^{subframe,\mu} + (T_{HARQ}+ T_{L1-RSRP} +TO_{uk}*(T_{first-SSB}+ T_{SSB-proc}+T_{SSB}*L_{MAC,unknown}))$ / *NR slot length* . The UE shall be able to receive on the old TCI state until slot $n+ 3N_{slot}^{subframe,\mu} + (T_{HARQ}+TO_{uk}*(T_{first-SSB}+ T_{SSB}*L_{MAC,unknown}))$ / *NR slot length*,

Where:

- $L_{MAC,unknown} \leq L_{MAC,unknown,max}$ is the corresponding number of SSB occasions groups not available at the UE;
- $L_{MAC,unknown,max}$ = 2 for $T_{SSB} \leq 40$ ms, $L_{MAC,unknown,max}$ = 1 for $T_{SSB}$>40 ms;
- $TO_{uk}$ = 1.
- $T_{L1-RSRP}$ = 0 in FR1 or when the TCI state switching not involving QCL-TypeD in FR2-2. Otherwise,
- $T_{L1-RSRP}$ is the time for Rx beam refinement in FR2-2, defined as
- $T_{L1-RSPR_Measurement_Period_SSB_CCA}$ for SSB as specified in clause 9.5A.4.1,
  - with the assumption of M=1
  - with $T_{Report}$ = 0
- $TO_{uk}$ = 0 for SSB based L1-RSRP measurement when TCI state switching involves QCL-TypeD
- $TO_{uk}$ = 1 when TCI state switching involves other QCL types only
- $T_{first-SSB}$ is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{first-SSB}$ is time to first SSB transmission after MAC CE command is decoded by the UE for other QCL types;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

## 8.10A.4 DCI based TCI state switch delay

If the target TCI state is known, when a UE is configured with the higher layer parameter *tci-PresentInDCI* which is set as 'enabled' for the CORESET scheduling the PDSCH at slot n, UE shall be able to receive PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+*timeDurationForQCL*, where, *timeDurationForQCL* is the time required by the UE to perform PDCCH reception and applying spatial QCL information received in DCI for PDSCH processing as described in TS 38.214 [26], the value of *timeDurationForQCL* is defined in TS 38.306 [14].

The known condition for TCI state defined in clause 8.10A.2 is applied.

## 8.10A.5 RRC based TCI state switch delay

If the target TCI state is known, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot $n+ (T_{RRC_processing} +TO_k*(T_{first-SSB} + T_{SSB-proc}+ T_{SSB}*L_{RRC,known}))$ / *NR slot length*. The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot n is last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{RRC_processing}$ is the RRC processing delay defined in Clause 11.2 of TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in Clause 12 of TS 38.331 [2]
- $T_{first\text{-}SSB}$ is time to first SSB transmission occasion after RRC processing by the UE, during which some of the SSB occasions may not be availabledue to DL CCA failures;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state;
- $L_{RRC,known} \leq L_{RRC,known,max}$ is the corresponding number of SSB occasions not available at the UE;
  - $L_{RRC,known,max}$ =2 for $T_{SSB} \leq$ 40 ms, $L_{RRC,known,max}$ =1 for $T_{SSB}$>40 ms.
- $T_{SSB\text{-}proc}$, $TO_k$, and $T_{SSB}$ are as defined in clause 8.10A.3.

If the target TCI state is unknown, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ ($T_{RRC_processing}$ +$T_{L1\text{-}RSRP}$ + $TO_{uk}$*($T_{first\text{-}SSB}$+ $T_{SSB\text{-}proc}$+$T_{SSB}$*$L_{RRC,unknown}$) ) / *NR slot length*. The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where,

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{RRC_processing}$ is the RRC processing delay defined in Clause 11.2 of TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in Clause 12 of TS 38.331 [2].
- $T_{first\text{-}SSB}$ is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{first\text{-}SSB}$ is time to first SSB transmission occasion after RRC processing time at the UE for other QCL types, during which some SSB occasions may not be available at the UE due to DL CCA failures;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state;
- $L_{RRC,unknown} \leq L_{RRC,unknown,max}$ is the corresponding number of SSB occasions not available at the UE;
  - $L_{RRC,unknown,max}$ = 2 for $T_{SSB} \leq$40 ms, $L_{RRC,unknown,max}$ = 1 for $T_{SSB}$>40 ms.
- $T_{L1\text{-}RSRP}$, $TO_{uk}$, $T_{SSB\text{-}proc}$, and $T_{SSB}$ are as defined in clause 8.10A.3

The requirements for RRC based TCI state switch delay apply when only 1 TCI state is configured in RRC TCI state list. When $T_{HARQ} > T_{RRC_processing}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

## 8.10A.6 Active TCI state list update delay

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE for activation/deactivation of UE-specific PDSCH TCI state as defined in clause 6.1.3.14 of TS 38.321 [7] at slot n, UE shall be able to receive PDCCH to schedule PDSCH with the new target TCI state at the first slot that is after n + $3N_{slot}^{subframe,\mu}$ + ($T_{HARQ}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$+$T_{SSB}$*$L_{MAC,known}$)) / *NR slot length*. Where $T_{HARQ}$, $T_{first\text{-}SSB}$, $T_{SSB\text{-}proc}$ , $T_{SSB}$, $L_{MAC,known}$ and $TO_k$ are as defined in clause 8.10A.3.

# 8.10B Active TCI state switching delay for RedCap

## 8.10B.1 Introduction

The requirements in this clause apply for a RedCap UE configured with one or more TCI state configurations on serving cell in standalone NR. UE shall complete the switch of active TCI state within the delay defined in this clause.

## 8.10B.2 Known conditions for TCI state

The TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target TCI state to the completion of active TCI state switch, where the RS resource for L1-RSRP measurement is the RS in target TCI state or QCLed to the target TCI state
  - TCI state switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target TCI state before the TCI state switch command
  - The TCI state remains detectable during the TCI state switching period
  - The SSB associated with the TCI state remain detectable during the TCI switching period
  - SNR of the TCI state $\geq$ -3 dB

Otherwise, the TCI state is unknown.

## 8.10B.3 MAC-CE based TCI state switch delay

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ + $TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ .

Where

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];
- $T_{first\text{-}SSB}$ is time to first SSB transmission after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state;
- $T_{SSB\text{-}proc}$ = 2 ms;
- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH, 0 otherwise.

If the target TCI state is unknown, upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ +$3N_{slot}^{subframe,\mu}$ + $T_{L1\text{-}RSRP}$ +$TO_{uk}$*($T_{first\text{-}SSB}$+ $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ .

Where

- $T_{L1\text{-}RSRP}$ = 0 in FR1 or when the TCI state switching not involving QCL-TypeD in FR2. Otherwise,
- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as
- $T_{L1\text{-}RSPR_Measurement_Period_SSB_RedCap}$ for SSB as specified in clause 9.5B.4.1,
  - with the assumption of M=1

  - with $T_{Report}$ = 0

- $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ for CSI-RS as specified in clause 9.5B.4.2
  - configured with higher layer parameter *repetition* set to ON
  - with the assumption of M=1 for periodic CSI-RS
  - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
  - with $T_{Report}$ = 0
  - $TO_{uk}$ = 1 for CSI-RS based L1-RSRP measurement, and 0 for SSB based L1-RSRP measurement when TCI state switching involves QCL-TypeD
  - $TO_{uk}$ = 1 when TCI state switching involves other QCL types only
  - $T_{first\text{-}SSB}$ is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
  - $T_{first\text{-}SSB}$ is time to first SSB transmission after MAC CE command is decoded by the UE for other QCL types;
- The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

## 8.10B.4 DCI based TCI state switch delay

If the target TCI state is known, when a UE is configured with the higher layer parameter *tci-PresentInDCI* which is set as 'enabled' for the CORESET scheduling PDSCH at slot n, UE shall be able to receive PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+*timeDurationForQCL*, where, *timeDurationForQCL* is the time required by the UE to perform PDCCH reception and applying spatial QCL information received in DCI for PDSCH processing as described in TS 38.214 [26], the value of *timeDurationForQCL* is defined in TS 38.331 [2].

The known condition for TCI state defined in clause 8.10.2 is applied.

## 8.10B.5 RRC based TCI state switch delay

If the target TCI state is known, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $(T_{RRC_processing} + TO_k * (T_{first\text{-}SSB} + T_{SSB\text{-}proc}))$ / *NR slot length*, The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{RRC_processing}$ is the RRC processing delay defined in clause 11.2 of TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in clause 12 of TS 38.331 [2].
- $T_{first\text{-}SSB}$ is time to first SSB transmission after RRC processing by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state.
- $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10B.3.

If the target TCI state is unknown, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $(T_{RRC_processing} + T_{L1\text{-}RSRP} + TO_{uk} * (T_{first\text{-}SSB} + T_{SSB\text{-}proc}))$ / *NR slot length*, The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command.

- $T_{RRC_processing}$ is the RRC processing delay defined in clause 11.2 of TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in clause 12 of TS 38.331 [2].

- $T_{first\text{-}SSB}$ is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;

- $T_{first\text{-}SSB}$ is time to first SSB transmission after RRC processing time at the UE for other QCL types;

  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

  - $T_{L1\text{-}RSRP}$, $TO_{uk}$ and $T_{SSB\text{-}proc}$ are defined in clause 8.10B.3.

The requirements for RRC based TCI state switch delay apply when only 1 TCI state is configured in RRC TCI state list. When $T_{HARQ} > T_{RRC_processing}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

## 8.10B.6 Active TCI state list update delay

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE for activation/deactivation of UE-specific PDSCH TCI state as defined in clause 6.1.3.14 of TS 38.321 [7] at slot n, UE shall be able to receive PDCCH to schedule PDSCH with the new target TCI state at the first slot that is after n+ $T_{HARQ}$ +3$N_{slot}^{subframe,\mu}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. Where $T_{HARQ}$, $T_{first\text{-}SSB,}$ $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10B.3.

# 8.10C Active TCI state switching delay for satellite access

## 8.10C.1 Introduction

The requirements in this clause apply for a UE configured with one or more TCI state configurations on PCell in satellite access. UE shall complete the switch of active TCI state within the delay defined in this clause.

## 8.10C.2 MAC-CE based TCI state switch delay

Upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ + 3$N_{slot}^{subframe,\mu}$+ $TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI state until slot n+ $T_{HARQ}$ + 3$N_{slot}^{subframe,\mu}$ .

Where

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];

- $T_{first\text{-}SSB}$ is time to first SSB transmission after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

- $T_{SSB\text{-}proc}$ = 2 ms;

- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH, 0 otherwise.

## 8.10C.4 DCI based TCI state switch delay

When a UE is configured with the higher layer parameter *tci-PresentInDCI* which is set as 'enabled' for the CORESET scheduling PDSCH at slot n, UE shall be able to receive PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+*timeDurationForQCL*, where, *timeDurationForQCL* is the time required by the UE to perform PDCCH reception and applying spatial QCL information received in DCI for PDSCH processing as described in TS 38.214 [26], the value of *timeDurationForQCL* is defined in TS 38.331 [2].

## 8.10C.5 RRC based TCI state switch delay

UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ ($T_{RRC_processing}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$)) / *NR slot length*, The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{RRC_processing}$ is the RRC processing delay defined in clause 12 of TS 38.331 [2].
- $T_{first\text{-}SSB}$ is time to first SSB transmission after RRC processing by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state.
- $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10C.2.

The requirements for RRC based TCI state switch delay apply when only 1 TCI state is configured in RRC TCI state list. When $T_{HARQ} > T_{RRC_processing}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

## 8.10C.6 Active TCI state list update delay

Upon receiving PDSCH carrying MAC-CE for activation/deactivation of UE-specific PDSCH TCI state as defined in clause 6.1.3.14 of TS 38.321 [7] at slot n, UE shall be able to receive PDCCH to schedule PDSCH with the new target TCI state at the first slot that is after n+ $T_{HARQ}$ +3$N_{slot}^{subframe,\mu}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. Where $T_{HARQ}$, $T_{first\text{-}SSB}$, $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10C.2.

# 8.10D Active TCI state switching delay for ATG

## 8.10D.1 Introduction

The requirements in this clause apply for an ATG UE configured with one or more TCI state configurations on PCell. The UE shall complete the switch of active TCI state within the delay defined in this clause.

## 8.10D.2 Void

## 8.10D.3 MAC-CE based TCI state switch delay

Upon receiving PDSCH carrying MAC-CE for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] in slot n, UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ + 3$N_{slot}^{subframe,\mu}$+ $TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI state until slot n+ $T_{HARQ}$ +3$N_{slot}^{subframe,\mu}$ .

Where

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];
- $T_{first\text{-}SSB}$ is time to first SSB transmission after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state;
- $T_{SSB\text{-}proc}$ = 2 ms;
- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH, 0 otherwise.

## 8.10D.4 DCI based TCI state switch delay

When a UE is configured with the higher layer parameter *tci-PresentInDCI* which is set as 'enabled' for the CORESET scheduling PDSCH at slot n, UE shall be able to receive PDSCH with target TCI state of the serving cell on which TCI

state switch occurs at the first slot that is after slot n+*timeDurationForQCL*, where, *timeDurationForQCL* is the time required by the UE to perform PDCCH reception and applying spatial QCL information received in DCI for PDSCH processing as described in TS 38.214 [26], the value of *timeDurationForQCL* is defined in TS 38.331 [2].

## 8.10D.5 RRC based TCI state switch delay

UE shall be able to receive PDCCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ ($T_{RRC_processing}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$)) / *NR slot length*, The UE is not required to receive PDCCH/PDSCH/CSI-RS or transmit PUCCH/PUSCH until the end of switching period.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command.
- $T_{RRC_processing}$ is the RRC processing delay defined in clause 12 of TS 38.331 [2].
- $T_{first\text{-}SSB}$ is time to first SSB transmission after RRC processing by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state.
- $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10D.3.

The requirements for RRC based TCI state switch delay apply when only 1 TCI state is configured in RRC TCI state list. When $T_{HARQ} > T_{RRC_processing}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

## 8.10D.6 Active TCI state list update delay

Upon receiving PDSCH carrying MAC-CE for activation/deactivation of UE-specific PDSCH TCI state as defined in clause 6.1.3.14 of TS 38.321 [7] at slot n, UE shall be able to receive PDCCH to schedule PDSCH with the new target TCI state at the first slot that is after n+ $T_{HARQ}$ +3$N_{slot}^{subframe,\mu}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. Where $T_{HARQ}$, $T_{first\text{-}SSB,}$ $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10D.3.

# 8.10E Active TCI state switching delay for UE operating in FR2-1 and configured with groupBasedBeamReporting-r17

## 8.10E.1 Introduction

The requirements in this clause apply for a UE configured with groupBasedBeamReporting-r17 and dual TCI state configurations on PCell, PSCell or SCell in standalone NR, when the UE is configured with a single serving cell (PCell, PSCell, or SCell) in FR2-1. The requirements apply when the dual target TCI states are known and the UE can receive the dual target TCI states simultaneously, where the known conditions are defined in clause 8.10E.2. UE shall complete the switch of active TCI states within the delay defined in this clause.

## 8.10E.2 Known conditions for TCI state

Dual TCI states will be indicated in one or two TCI state switch commands. The dual target TCI states are known if the following conditions are met:

- Dual target TCI states are QCL-ed with typeD to reference signals in a resource group in the latest Rel-17 group based beam report
- The dual target TCI states and all the RSs in the two QCL chains remain detectable during the TCI state switching period
  - SNR of the TCI state ≥ -3 dB
- RS resource group configured for dual target TCI states is reported in the last [1280] ms

Editor's note: FFS whether additional conditions are needed for tests.

# 8.10E.3 MAC-CE based dual DL TCI state switch delay

## 8.10E.3.1 MAC-CE based dual DL TCI state switching delay for sDCI

The requirement in this clause applies when UE is provided with *twoQCLTypeDforPDCCHRepetition*.

When a MAC CE command for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] indicating TCI state switch with CORESET index p are received in slot n, and if the TCI state is known, UE shall be able to receive PDCCH with the target TCI state at the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ $TO_k$*( $T_{first\text{-}SSBp,}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI states until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ ,

Where:

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].
- $T_{first\text{-}SSBp}$ is time to first SSB transmission (associated with TCI state of CORESET p) after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state.
- $T_{SSB\text{-}proc}$ = 2 ms.
- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH, 0 otherwise.

When UE receive TCI state switch command for CORESET index p while UE is performing TCI state switch of CORESET index q, UE shall be ready to receive PDCCH with the target TCI states of CORESET index p and q after completing both the TCI state switch of CORESET p and q.

## 8.10E.3.2 MAC-CE based dual DL TCI state switching delay for mDCI

The requirement in this clause applies when UE is capable of *multiDCI-MultiTRP-r16* and configured with two *CORESETPoolIndex*es.

When a MAC CE command for indication of UE-specific PDCCH TCI state as defined in clause 6.1.3.15 of TS 38.321 [7] indicating a TCI state switch for *CORESETPoolIndex p* is received at slot n, and if the TCI state is known, UE shall be able to receive PDCCH with the target TCI state at the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ $TO_k$*( $T_{first\text{-}SSBp,}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive PDCCH with the old TCI states until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$.

Where:

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].
- $T_{first\text{-}SSBp}$ is time to first SSB transmission (i.e., SSB associated to *CORESETPoolIndex p*) after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state.
- $T_{SSB\text{-}proc}$ = 2 ms.
- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH, 0 otherwise.

When UE receives TCI state switch command for *CORESETPoolIndex p* while UE is performing TCI state switch of *CORESETPoolIndex* q, UE shall be ready to receive PDCCH with the target TCI states of *CORESETPoolIndex* p and q after completing both the TCI state switch of *CORESETPoolIndex* p and q.

# 8.10E.4 DCI based dual DL TCI state switch delay for sDCI and mDCI

## 8.10E.4.1 DCI based dual DL TCI state switching delay for sDCI

For sDCI, if the dual target TCI states are known, when a UE is configured with the higher layer parameter *tci-PresentInDCI* from one TRP which is set as 'enabled' for the CORESET scheduling two PDSCHs at slot n, UE shall be able to receive PDSCHs with target TCI states of the serving cell on which TCI state switch occurs at the first slot that is after slot n+*timeDurationForQCL*, where, *timeDurationForQCL* is the time required by the UE to perform PDCCH

reception and apply spatial QCL information received in DCI for PDSCHs processing as described in TS 38.214 [26], the value of *timeDurationForQCL* is defined in TS 38.331 [2].

The known condition for dual target TCI states defined in clause 8.10E.2 is applied.

### 8.10E.4.2 DCI based dual DL TCI state switching delay for mDCI

For mDCI, if the dual target TCI states are known, when a UE is configured with the higher layer parameter *tci-PresentInDCI* from two TRPs which is set as 'enabled' for the DCIs scheduling two PDSCHs at slot n1 and n2 respectively, UE shall be able to receive PDSCHs with target TCI states of the serving cell on which TCI state switch occurs at the first slot that is after slot n1 + *timeDurationForQCL* and slot n2 + *timeDurationForQCL* respectively, where, *timeDurationForQCL* is the time required by the UE to perform PDCCH reception and apply spatial QCL information received in DCI for PDSCHs processing as described in TS 38.214 [26], the value of *timeDurationForQCL* is defined in TS 38.331 [2]. UE shall be able to simultaneously receive PDSCHs with target TCI states after slot max(n1, n2) + *timeDurationForQCL*.

For mDCI, if the dual target TCI states are known, when a UE is configured with the higher layer parameter *tci-PresentInDCI* from one TRP which is set as 'enabled' for the DCI scheduling PDSCHs at slot n1, while the indicated TCI for the other TRP remains unchanged, UE shall be able to simultaneously receive PDSCHs with target dual TCI states of the serving cell on which TCI state switch occurs at the first slot that is after slot n1 + *timeDurationForQCL*.

The known condition for dual target TCI states defined in clause 8.10E.2 is applied.

## 8.10E.5 RRC based dual DL TCI state switch delay

For mDCI, when there is single TCI configured by RRC for a CORESET other than a CORESET with index 0 in field *tci-StatesPDCCH-ToAddList*, and each CORESET is associated with a different value of *coresetPoolIndex*, for each known TCI state switch associated with different *coresetPoolIndex*, requirements in clause 8.10.5 apply.

## 8.10E.6 Active DL TCI state list update delay

### 8.10E.6.1 Active DL TCI state list update delay for sDCI

For sDCI, if the dual target TCI states are known, upon receiving PDSCH carrying MAC-CE for activation/deactivation of UE-specific PDSCH TCI state as defined in clause 6.1.3.14 of TS 38.321 [7] from a TRP at slot n, UE shall be ready to receive PDCCH to schedule PDSCHs from both TRPs with the new target TCI states at the first slot that is after n+ $T_{HARQ}$ +3$N_{slot}^{subframe,\mu}$ +$TO_k$*(max ($T_{first\text{-}SSB1}$, $T_{first\text{-}SSB2}$)+ $T_{SSB\text{-}proc}$) / *NR slot length*. Where $T_{HARQ}$, $T_{first\text{-}SSB1}$, $T_{first\text{-}SSB2}$, $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10E.3.

### 8.10E.6.2 Active DL TCI state list update delay for mDCI

For mDCI case, if the target TCI state is known, upon receiving PDSCH carrying MAC-CE for activation/deactivation of UE-specific PDSCH TCI state as defined in clause 6.1.3.14 of TS 38.321 [7]from a TRP at slot n, UE shall be ready to receive PDCCH to schedule PDSCH from the TRP with the new target TCI state at the first slot that is after n+ $T_{HARQ}$ +3$N_{slot}^{subframe,\mu}$ +$TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. Where $T_{HARQ}$, $T_{first\text{-}SSB,}$ $T_{SSB\text{-}proc}$ and $TO_k$ are defined in clause 8.10.3. Dual target TCI states can be used in the same slot for PDSCH only after both TCI states on TCI state list(s) are activated.

# 8.10F Active TCI state switching delay for RedCap UE with satellite access

## 8.10F.1 Introduction

The requirements in this clause apply for a RedCap UE configured with one or more TCI state configurations on PCell in satellite access. UE shall complete the switch of active TCI state within the delay defined in this clause.

## 8.10F.2 MAC-CE based TCI state switch delay

The requirements in clause 8.10C.2 shall apply.

## 8.10F.4 DCI based TCI state switch delay

The requirements in clause 8.10C.4 shall apply.

## 8.10F.5 RRC based TCI state switch delay

The requirements in clause 8.10C.5 shall apply.

## 8.10F.6 Active TCI state list update delay

The requirements in clause 8.10C.6 shall apply.

# 8.11 PSCell Change

This clause defines requirements for the delay within which the UE shall be able to change PSCell to other cell in EN-DC or NR-DC. The requirements in this clause are applicable to EN-DC and NR-DC.

The UE shall be capable of transmitting PRACH preamble towards the target PSCell no later than specified in clause 8.9.2 for the case of NR-DC and in TS 36.133 [15] clause 7.31.2 for the case of EN-DC,, where the following values for slot n, $T_{processing}$ and $T_{RRC_delay}$ shall override the existing ones:

- Slot n is the last slot overlapping with the PDSCH containing PSCell change,
- $T_{processing}$ = 20 ms when source and target cells are in the same FR,
- $T_{processing}$ = 40 ms when source and target cells are in different FRs.
- $T_{RRC_delay}$ is the RRC procedure delay as specified in TS 36.331 [16] if the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC procedure delay as specified in TS 38.331 [2].

If the SMTC periodicity of the target cell is not provided within the PSCell change message, and measObjectNRs having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, $T_{rs}$ is the periodicity of one of the SMTC which is up to UE implementation.

In the case of NR-DC PSCell change in FR1, when the UE indicating *support3MHz-ChannelBW-Symmetric-r18* is configured with a target PSCell that is with 12PRB SSB bandwidth, the UE shall transmit PRACH preamble towards the target PSCell no later than the delay requirements specified in clause 8.9.2.

The target PSCell is known if it has been meeting the conditions in clause 8.9.2 for the case of NR-DC and in TS 36.133 [15] clause 7.31.2 for the case of EN-DC.

The interruption on PCell and other serving cells specified in TS 36.133 clause 7.32.2.1 for EN-DC and in TS 38.133 [2] clause 8.2.4.2.1 for NR-DC is allowed only during the RRC reconfiguration procedure [2].

# 8.11A PSCell Change in Carriers with CCA

This clause defines requirements for the delay within which the UE shall be able to change PSCell in FR2-2 with CCA to other cell in NR-DC. The requirements in this clause are applicable to NR-DC.

The UE shall be capable of transmitting PRACH preamble towards the target PSCell no later than specified in clause 8.9A.2 for the case of NR-DC, where the following values for slot n, $T_{processing}$ and $T_{RRC_delay}$ shall override the existing ones:

- Slot n is the last slot overlapping with the PDSCH containing PSCell change,
- $T_{processing}$ = 20 ms when source and target cells are in the same FR,
- $T_{processing}$ = 40 ms when source and target cells are in different FRs.

- $T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

If the SMTC periodicity of the target cell is not provided within the PSCell change message, and measObjectNRs having the same SSB frequency and subcarrier spacing configured by MN and SN have different SMTC, $T_{rs}$ is the periodicity of one of the SMTC which is up to UE implementation.

The target PSCell is known if it has been meeting the conditions in clause 8.9A.2 for the case of NR-DC.

The interruption on PCell and other serving cells specified in TS 38.133 [2] clause 8.2.4.2.1 for NR-DC is allowed only during the RRC reconfiguration procedure [2].

# 8.11B Conditional PSCell Change

## 8.11B.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to perform conditional PSCell change in EN-DC or NR-DC. The requirements in this clause are applicable to EN-DC and NR-DC.

## 8.11B.2 Conditional PSCell Change delay

The requirements in this clause shall apply for the UE configured with only PCell in FR1.

The UE shall be capable to transmit PRACH preamble towards the new target PSCell no later than in slot $n$ + $T_{config_PSCell_Conditional}$:

Where:

- Slot n is the last slot overlapping with the PDSCH containing conditional PSCell change.
- $T_{config_PSCell_Conditional} = T_{RRC_delay} + T_{Event_DU} + T_{measure} + T_{UE_preparation} + T_{processing} + T_{\Delta} + T_{PSCell_DU} + 2$ ms
  - $T_{RRC_delay}$ is the RRC processing delay defined in clause 11.2 in TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC procedure delay defined in clause 12 in TS 38.331 [2] for processing the conditional PSCell change command.
  - $T_{Event_DU}$ is the delay uncertainty which is the time from when the UE successfully decodes a conditional PSCell change command until a condition exists at the measurement reference point which will trigger the conditional PSCell change.
  - $T_{measure}$ is the measurements time stated in clause 8.11B.2.1.
  - $T_{UE_preparation}$ is the UE preparation time for conditional PSCell change, and starts after UE realizes the condition of PSCell change is met and identity of new PSCell is determined. $T_{UE_preparation}$ is up to 10 ms.
  - $T_{processing}$ is the SW processing time needed by UE, including RF warm up period. $T_{processing}$ = 20 ms when source and target cells are in the same FR, and $T_{processing}$ = 40 ms when source and target cells are in different FRs.
  - $T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = 3*T_{rs}$ ms for target PSCell operating with 12 PRB SSB BW. Otherwise, $T_{\Delta} = 1*T_{rs}$ ms.
    - $T_{rs}$ is the SMTC periodicity of the target cell if the UE has been provided with an SMTC configuration for the target cell in PSCell addition message, otherwise $T_{rs}$ is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.
  - $T_{PSCell_DU}$ is the delay uncertainty in acquiring the first available PRACH occasion in the PSCell. $T_{PSCell_DU}$ is up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

The PCell interruption specified in clause 8.2 is allowed only after the UE starts to execute a conditional PSCell change.

### 8.11B.2.1 Measurement time

The measurement time delay is defined from the end of $T_{Event_DU}$ until UE executes a PSCell change to a target cell and interruption time starts.

For intra-frequency PSCell change, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify\ intra\ with\ index}$ or $T_{identify_intra_without_index}$ defined in clause 9.2.5.1 or clause 9.2.6.2.

For inter-frequency PSCell change, the measurement time delay measured without TTT and L3 filtering shall be less than $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ defined in clause 9.3.4. When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency PSCell change or the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency PSCell change. If a cell, which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency PSCell change or the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency PSCell change, becomes undetectable for a period and then the cell becomes detectable again and triggers a PSCell change, the measurement time delay shall be less than $T_{SSB_measurement_period_intra}$ or $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

# 8.11D Conditional PSCell Change in Carriers with CCA

## 8.11D.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to perform conditional PSCell in FR2-2 with CCA change in NR-DC. The requirements in this clause are applicable to NR-DC.

## 8.11D.2 Conditional PSCell Change delay

The requirements in this clause shall apply for the UE configured with only PCell in FR1.

The UE shall be capable to transmit PRACH preamble towards the new target PSCell no later than in slot $n + \frac{T_{config_PSCell_Conditional}}{NR\ slot\ length}$:

Where:

- Slot n is the last slot overlapping with the PDSCH containing conditional PSCell change.
- $T_{config_PSCell_Conditional} = T_{RRC_delay} + T_{Event_DU} + T_{measure_CCA} + T_{UE_preparation} + T_{processing} + T_{\Delta_CCA} + T_{PSCell_DU} + 2$ ms
  - $T_{RRC_delay}$ is the RRC procedure delay defined in clause 12 in TS 38.331 [2] for processing the conditional PSCell change command.
  - $T_{Event_DU}$ is the delay uncertainty which is the time from when the UE successfully decodes a conditional PSCell change command until a condition exists at the measurement reference point which will trigger the conditional PSCell change.
  - $T_{measure_CCA}$ is the measurements time stated in clause 8.11D.2.1.
  - $T_{UE_preparation}$ is the UE preparation time for conditional PSCell change, and starts after UE realizes the condition of PSCell change is met and identity of new PSCell is determined. $T_{UE_preparation}$ is up to 10 ms.
  - $T_{processing}$ is the SW processing time needed by UE, including RF warm up period. $T_{processing}$ = 20 ms when source and target cells are in the same FR, and $T_{processing}$ = 40 ms when source and target cells are in different FRs.
  - $T_{\Delta_CCA}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = (1+L_2) * T_{rs}$ ms, where $L_2$ is the number of SMTC occasions not avaible at the UE during the time tracking period.

- $T_{rs}$ is the SMTC periodicity of the target cell if the UE has been provided with an SMTC configuration for the target cell in PSCell addition message, otherwise $T_{rs}$ is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

- $T_{PSCell_DU}$ is the interruption uncertainty due to the random access procedure when sending PRACH to the new cell. $T_{PSCell_DU}$ can be up to: $(1+ L_3) * T_{SSB,RO} + 10$ ms where $T_{SSB,RO}$ is the SSB to PRACH occasion association period as defined in table 8.1-1 of TS 38.213 [3] and $L_3$ is the number of consecutive SSB to PRACH occasion association periods during which no PRACH occasion is available for PRACH transmission due to UL CCA failure. $L_3 = 0$ for Type 3 UL channel access procedure as defined in TS 37.213 [33].

NOTE 1: The interruption time considering the potential extensions caused by $L_2$, $L_3$ and by the UL CCA failure detection/recovery mechanism is limited by the T304 timer. The UE behaviour at the T304 timer expiry is detailed in TS 38.331 [2].

The PCell interruption specified in clause 8.2 is allowed only after the UE starts to execute a conditional PSCell change.

### 8.11D.2.1 Measurement time

The measurement time delay is defined from the end of $T_{Event_DU}$ until UE executes a PSCell change to a target cell and interruption time starts.

For intra-frequency PSCell change, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify\ intra_cca\ with\ index}$ or $T_{identify_intra_cca_without_index}$ defined in clause 9.2A.5.1 or clause 9.2A.6.2.

For inter-frequency PSCell change, the measurement time delay measured without TTT and L3 filtering shall be less than $T_{identify_inter_cca_without_index}$ or $T_{identify_inter_cca_with_index}$ defined in clause 9.3A.4. When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_cca_without_index}$ or $T_{identify_intra_cca_with_index}$ for intra-frequency PSCell change or the time period $T_{identify_inter_cca_without_index}$ or $T_{identify_inter_cca_with_index}$ for inter-frequency PSCell change. If a cell, which has been detectable at least for the time period $T_{identify_intra_cca_without_index}$ or $T_{identify_intra_cca_with_index}$ for intra-frequency PSCell change or the time period $T_{identify_inter_cca_without_index}$ or $T_{identify_inter_cca_with_index}$ for inter-frequency PSCell change, becomes undetectable for a period and then the cell becomes detectable again and triggers a PSCell change, the measurement time delay shall be less than $T_{SSB_measurement_period_intra_cca}$ or $T_{SSB_measurement_period_inter_cca}$ provided the timing to that cell has not changed more than ± 3200 Tc while the measurement gap has not been available and the L3 filter has not been used. When L3 filtering is used, an additional delay can be expected.

## 8.11E Subsequent Conditional PSCell Change

### 8.11E.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to perform subsequent conditional PSCell change in NR-DC. The requirements in this clause are applicable to NR-DC.

### 8.11E.2 Subsequent Conditional PSCell Change delay

The requirements in this clause shall apply for the UE configured with only PCell in FR1.

The UE shall be capable to transmit PRACH preamble towards the new target PSCell no later than in slot $n$ + $T_{config_PSCell_Subsequent_Change_Conditional}$:

Where:

- Slot n is the time when UE transmits SN *RRCReconfigurationcomplete* message for the previous PSCell addition or change.

- $T_{config_PSCell_Subsequent_Change_Conditional} = T_{Event_DU} + T_{measure} + T_{UE_preparation} + T_{processing} + T_{\Delta} + T_{PSCell_DU} + 2$ ms

  - $T_{Event_DU}$ is the delay uncertainty which is the time from when UE transmits SN *RRCReconfigurationcomplete* message for the previous PSCell addition or change until a condition exists at the measurement reference point which will trigger the subsequent conditional PSCell change.

  - $T_{measure}$ is the measurements time stated in clause 8.11E.2.1.

  - $T_{UE_preparation}$ is the UE preparation time for subsequent conditional PSCell change, and starts after UE realizes the condition of PSCell change is met and identity of new PSCell is determined. $T_{UE_preparation}$ is up to 10 ms.

  - $T_{processing}$ is the SW processing time needed by UE, including RF warm up period. $T_{processing}$ = 20 ms when source and target cells are in the same FR, and $T_{processing}$ = 40 ms when source and target cells are in different FRs.

  - $T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target cell. $T_{\Delta} = 3*T_{rs}$ ms for PSCell operating with 12 PRB SSB BW. Otherwise, $T_{\Delta} = 1*T_{rs}$.

    - $T_{rs}$ is the SMTC periodicity of the target cell if the UE has been provided with an SMTC configuration for the target cell in PSCell addition message, otherwise $T_{rs}$ is the SMTC configured in the *measObjectNR* having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with $T_{rs}$ = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5 ms.

  - $T_{PSCell_DU}$ is the delay uncertainty in acquiring the first available PRACH occasion in the PSCell. $T_{PSCell_DU}$ is up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

The PCell interruption specified in clause 8.2 is allowed only after the UE starts to execute a subsequent conditional PSCell change.

### 8.11E.2.1 Measurement time

The measurement time delay is defined from the end of $T_{Event_DU}$ until UE executes a PSCell change to a target cell and interruption time starts.

For intra-frequency PSCell change, the measurement time delay measured without Time To Trigger (TTT) and L3 filtering shall be less than $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ defined in clause 9.2.5.1 or clause 9.2.6.2.

For inter-frequency PSCell change, the measurement time delay measured without TTT and L3 filtering shall be less than $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ defined in clause 9.3.4. When TTT or L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency PSCell change or the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency PSCell change. If a cell, which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ for intra-frequency PSCell change or the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ for inter-frequency PSCell change, becomes undetectable for a period and then the cell becomes detectable again and triggers a PSCell change, the measurement time delay shall be less than $T_{SSB_measurement_period_intra}$ or $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

## 8.12 Uplink spatial relation switch delay

### 8.12.1 Introduction

The requirements in this clause apply for a UE configured with one or more spatial relation configurations on serving cell in MR-DC or standalone NR. There is no requirement when the UE is requested to switch to a spatial relation with the higher layer parameter *spatialRelationInfo* associated to SRS. UE shall complete the switch of active spatial relation

within the delay defined in this clause when the UE is requested to switch to a spatial relation with the higher layer parameter *spatialRelationInfo* associated to a DL RS.

## 8.12.2 Known conditions for spatial relation when associated with DL-RS

The spatial relation associated to DL RS is known if the following conditions are met:

- During the period from the last transmission of the DL RS resource used for the L1-RSRP measurement reporting for the target spatial relation to the completion of active spatial relation switch, where the DL RS resource for L1-RSRP measurement is the DL RS in target spatial relation or QCLed to the target spatial relation with QCL type-D.
  - Spatial relation switch command is received within 1280 ms upon the last transmission of the DL RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target spatial relation before the spatial relation switch command
  - The DL RS configured in spatial relation remains detectable during the spatial relation switching period
    - SNR of the DL RS configured in spatial relation ≥ -3 dB
  - The SSB associated with the spatial relation remain detectable during the spatial relation switching period
    - SNR of the SSB associated with the spatial relation ≥ -3 dB

Otherwise, the spatial relation is unknown.

## 8.12.3 MAC-CE based spatial relation switch delay

If the target spatial relation associated to DL RS is known, upon receiving PDSCH carrying MAC-CE activation command in slot n, for UL spatial relation switch for PUCCH or semi-persistent SRS transmission of serving cell with a target UL spatial relation, the UE shall be able to transmit PUCCH or semi-persistent SRS with the target UL spatial relation in the slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ 1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1 where $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].

If the target spatial relation associated to DL RS is unknown, upon receiving PDSCH carrying MAC-CE activation command in slot n, for UL spatial relation switch for PUCCH or semi-persistent SRS transmission of serving cell with a target UL spatial relation, the UE shall be able to transmit PUCCH or semi-persistent SRS with the target UL spatial relation in the slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ $T_{L1\text{-}RSRP}$+1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],
- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as
  - $T_{L1\text{-}RSPR_Measurement_Period_SSB}$ for SSB as specified in clause 9.5.4.1,
    - with the assumption of M=1
    - with $T_{Report}$ = 0
  - $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for CSI-RS as specified in clause 9.5.4.2
    - configured with higher layer parameter *repetition* set to ON
    - with the assumption of M=1 for periodic CSI-RS
    - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
    - with $_{T}$Report = 0

The UE shall be able to transmit with the old UL spatial relation until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$.

When the UL spatial relation info switch for PUCCH changes both the associated DL RS and *pucch-PathlossReferenceRS* with the same MAC-CE activation, and if both the DL RS and *pucch-PathlossReferenceRS* are known as specified in clause 8.12.2 and 8.14.2 respectively, the UE shall be able to transmit PUCCH with the target UL spatial relation after the delay specified in clause 8.14.3. If either the associated DL RS or *pucch-PathlossReferenceRS* are unknown, a longer switching delay is allowed. The UE is not required to transmit PUCCH with the target UL spatial relation until the DL RS and pathloss reference RS switch are completed.

### 8.12.4 DCI based spatial relation switch delay

If the target spatial relation associated to DL RS is known, when a UE receives the DCI triggering aperiodic SRS at slot n with the higher layer parameter *spatialRelationInfo*, UE shall be able to transmit aperiodic SRS with target spatial relation of the serving cell on which spatial relation switch occurs in the slot $\left\lfloor n \cdot \frac{2^{\mu_{SRS}}}{2^{\mu_{PDCCH}}} \right\rfloor + k + 1$, where, *k* is configured via higher layer parameter *slotOffset*[2] for each triggered SRS resources set and is based on the subcarrier spacing of the triggered SRS transmission, $\mu_{SRS}$ and $\mu_{PDCCH}$ are the subcarrier spacing configurations for triggered SRS and PDCCH carrying the triggering command respectively in TS 38.214 [26].

The known condition for spatial relation associated to DL RS defined in clause 8.12.2 is applied.

### 8.12.5 RRC based spatial relation switch delay

If the target spatial relation associated to DL RS is known, UE shall be able to transmit target periodic SRS with spatial relation of the serving cell on which periodic SRS with spatial relation reconfigured in the slot n+ $T_{RRC_processing}$ */NR slot length* +1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command,
- $T_{RRC_processing}$ is the RRC processing delay defined in TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in TS 38.331 [2].

If the target spatial relation associated to DL RS is unknown, UE shall be able to transmit target periodic SRS with spatial relation of the serving cell on which periodic SRS with spatial relation reconfigured in the slot n+ $T_{RRC_processing}$ */NR slot length* + $T_{L1\text{-}RSRP}$ +1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command,
- $T_{RRC_processing}$ is the RRC processing delay defined in TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in TS 38.331 [2].
- $T_{L1\text{-}RSRP}$ is defined in clause 8.12.3

## 8.12A Uplink spatial relation switch delay for RedCap

### 8.12A.1 Introduction

The requirements in this clause apply for a RedCap UE configured with one or more spatial relation configurations on serving cell in standalone NR. There is no requirement when the UE is requested to switch to a spatial relation with the higher layer parameter *spatialRelationInfo* associated to SRS. UE shall complete the switch of active spatial relation within the delay defined in this clause when the UE is requested to switch to a spatial relation with the higher layer parameter *spatialRelationInfo* associated to a DL RS.

## 8.12A.2 Known conditions for spatial relation when associated with DL-RS

The spatial relation associated to DL RS is known if the following conditions are met:

- During the period from the last transmission of the DL RS resource used for the L1-RSRP measurement reporting for the target spatial relation to the completion of active spatial relation, where the DL RS resource for L1-RSRP measurement is the DL RS in target spatial relation or QCLed to the target spatial relation with QCL type-D.
  - Spatial relation switch command is received within 1280 ms upon the last transmission of the DL RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target spatial relation before the spatial relation switch command
  - The DL RS configured in spatial relation remains detectable during the spatial relation switching period
    - SNR of the DL RS configured in spatial relation ≥ -3 dB
  - The SSB associated with the spatial relation remain detectable during the spatial relation switching period
    - SNR of the SSB associated with the spatial relation ≥ -3 dB

Otherwise, the spatial relation is unknown.

## 8.12A.3 MAC-CE based spatial relation switch delay

If the target spatial relation associated to DL RS is known and UE is configured with uplink resources for transmission on target spatial relation, upon receiving PDSCH carrying MAC-CE activation command in slot n, for UL spatial relation switch for PUCCH or semi-persistent SRS transmission of serving cell with a target UL spatial relation, the UE shall be able to transmit PUCCH or semi-persistent SRS with the target UL spatial relation no later than slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ 1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1 where $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].

If the target spatial relation associated to DL RS is unknown and UE is configured with uplink resources for transmission on target spatial relation, upon receiving PDSCH carrying MAC-CE activation command in slot n, for UL spatial relation switch for PUCCH or semi-persistent SRS transmission of serving cell with a target UL spatial relation, the UE shall be able to transmit PUCCH or semi-persistent SRS with the target UL spatial relation no later than slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ $T_{L1\text{-}RSRP}$+1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3],
- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as
  - $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$ for SSB as specified in clause 9.5B,
    - with the assumption of M=1
    - with $T_{Report}$ = 0
  - $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ for CSI-RS as specified in clause 9.5.4.2
    - configured with higher layer parameter *repetition* set to ON
    - with the assumption of M=1 for periodic CSI-RS
    - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
    - with $_{T}$Report = 0

The UE shall be able to transmit with the old UL spatial relation until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$.

For RedCap UE in HD-FDD mode, if a downlink reception overlaps with PUCCH or semi-persistent SRS transmission of the serving cell with the target UL spatial relation then the UE is allowed to postpone the uplink transmission.

When the UL spatial relation info switch for PUCCH changes both the associated DL RS and *pucch-PathlossReferenceRS* with the same MAC-CE activation, and if both the DL RS and *pucch-PathlossReferenceRS* are known as specified in clause 8.12A.2 and 8.14.2 respectively, the UE shall be able to transmit PUCCH with the target UL spatial relation after the delay specified in clause 8.14.3. If either the associated DL RS or *pucch-PathlossReferenceRS* are unknown, a longer switching delay is allowed. The UE is not required to transmit PUCCH with the target UL spatial relation until the DL RS and pathloss reference RS switch are completed.

## 8.12A.4 DCI based spatial relation switch delay

If the target spatial relation associated to DL RS is known and UE is configured with uplink resources for transmission on target spatial relation, when a UE receives the DCI triggering aperiodic SRS at slot n with the higher layer parameter *spatialRelationInfo*, UE shall be able to transmit aperiodic SRS with target spatial relation of the serving cell on which spatial relation switch occurs no later than slot $\left\lfloor n \cdot \frac{2^{\mu_{SRS}}}{2^{\mu_{PDCCH}}} \right\rfloor + k + 1$, where, $k$ is configured via higher layer parameter *slotOffset*[2] for each triggered SRS resources set and is based on the subcarrier spacing of the triggered SRS transmission, $\mu_{SRS}$ and $\mu_{PDCCH}$ are the subcarrier spacing configurations for triggered SRS and PDCCH carrying the triggering command respectively in TS 38.214 [26].

For RedCap UE in HD-FDD mode, if a downlink reception overlaps with aperiodic SRS with target spatial relation of the serving cell then the UE is allowed to postpone the uplink transmission.

The known condition for spatial relation associated to DL RS defined in clause 8.12A.2 is applied.

## 8.12A.5 RRC based spatial relation switch delay

If the target spatial relation associated to DL RS is known and UE is configured with uplink resources for transmission on target spatial relation, UE shall be able to transmit target periodic SRS with spatial relation of the serving cell on which periodic SRS with spatial relation reconfigured no later than slot n+ $T_{RRC_processing}$ /*NR slot length* +1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command,
- $T_{RRC_processing}$ is the RRC processing delay defined in TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in TS 38.331 [2].

If the target spatial relation associated to DL RS is unknown and UE is configured with uplink resources for transmission on target spatial relation, UE shall be able to transmit target periodic SRS with spatial relation of the serving cell on which periodic SRS with spatial relation reconfigured no later than slot n+ $T_{RRC_processing}$ /*NR slot length* + $T_{L1\text{-}RSRP}$ +1 when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1.

Where

- Slot n is the last slot overlapping with the PDSCH carrying RRC activation command,
- $T_{RRC_processing}$ is the RRC processing delay defined in TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the RRC processing delay defined in TS 38.331 [2].
- $T_{L1\text{-}RSRP}$ is defined in clause 8.12A.3

For RedCap UE in HD-FDD mode, if a downlink reception overlaps with target periodic SRS with spatial relation of the serving cell with periodic SRS with spatial relation reconfigured then the UE is allowed to postpone the uplink transmission.

# 8.12C Uplink spatial relation switch delay for satellite access

UL Spatial relation switch delay requirements do not apply for satellite access in FR1-NTN.

### 8.12C.1 Void

### 8.12C.2 Void

### 8.12C.3 Void

### 8.12C.4 Void

### 8.12C.5 Void

## 8.13 UE-specific CBW change

### 8.13.1 Introduction

The requirements in this clause apply for a UE receiving reconfiguration of *offsetToCarrier* or *carrierBandwidth* to change channel bandwidth.

### 8.13.2 UE-specific CBW change delay

After the UE receives RRC reconfiguration involving *offsetToCarrier* or *carrierBandwidth* change on the old CBW, UE shall be able to receive PDSCH/PDCCH on the DL BWP with BWP ID firstActiveDownlinkBWP-Id or transmit PUSCH on the UL BWP with BWP ID firstActiveUplinkBWP-Id of the new CBW right after a time duration of $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

- DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and
- $T_{RRCprocessingDelay}$ is the length of the RRC procedure delay in milliseconds as defined in clause 11.2 in TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in milliseconds as defined in clause 12 in TS 38.331 [2], and
- $T_{CBWchangeDelayRRC} = 6ms$ is the time used by the UE to perform CBW change.

The UE is not required to transmit UL signals or receive DL signals during the above defined time duration $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ on the cell where UE-specific CBW change occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

## 8.13A UE-specific CBW change for RedCap

### 8.13A.1 Introduction

The requirements in this clause apply for a RedCap UE receiving reconfiguration of *offsetToCarrier* or *carrierBandwidth* to change channel bandwidth.

### 8.13A.2 UE-specific CBW change delay

After the UE receives RRC reconfiguration involving *offsetToCarrier* or *carrierBandwidth* change on the old CBW, UE shall be able to receive PDSCH/PDCCH on an active DL BWP or transmit PUSCH on an active UL BWP of the new CBW right after a time duration of $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

- DL slot n is the last slot overlapping with the PDSCH containing the RRC command, and

- $T_{RRCprocessingDelay}$ is the length of the RRC procedure delay in milliseconds as defined in clause 11.2 in TS 36.331 [16] is the corresponding RRC message is embedded in E-UTRA RRC message, otherwise it is the length of the RRC procedure delay in milliseconds as defined in clause 12 in TS 38.331 [2], and

- $T_{CBWchangeDelayRRC} = 6ms$ is the time used by the UE to perform CBW change.

The UE is not required to transmit UL signals or receive DL signals during the above defined time duration $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ on the cell where UE-specific CBW change occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

# 8.13C UE-specific CBW change for satellite access

## 8.13C.1 Introduction

The requirements in this clause apply for a UE receiving reconfiguration of *offsetToCarrier* or *carrierBandwidth* to change channel bandwidth.

## 8.13C.2 UE-specific CBW change delay

After the UE receives RRC reconfiguration involving *offsetToCarrier* or *carrierBandwidth* change on the old CBW, UE shall be able to receive PDSCH/PDCCH on an active DL BWP or transmit PUSCH on an active UL BWP of the new CBW right after a time duration of $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ slots which begins from the beginning of DL slot n, where

- DL slot n is the last slot containing the RRC command, and

- $T_{RRCprocessingDelay}$ is the length of the RRC procedure delay in milliseconds as defined in clause 12 in TS 38.331 [2], and

- $T_{CBWchangeDelayRRC} = 6ms$ is the time used by the UE to perform CBW change.

The UE is not required to transmit UL signals or receive DL signals during the above defined time duration $\frac{T_{RRCprocessingDelay}+T_{CBWchangeDelayRRC}}{NR\ Slot\ length}$ on the cell where UE-specific CBW change occurs. When $T_{HARQ} > T_{RRCprocessingDelay}$ a longer switching delay is allowed. Where $T_{HARQ}$ is the time between DL data transmission and acknowledgement as specified in TS 38.213 [3].

# 8.13D UE-specific CBW change for ATG

## 8.13D.1 Introduction

The requirements in this clause apply for an ATG UE receiving reconfiguration of *offsetToCarrier* or *carrierBandwidth* to change channel bandwidth.

## 8.13D.2 UE-specific CBW change delay

The requirements in clause 8.13.2 shall apply only for FR1 UE in NR SA operation mode.

# 8.13E UE-specific CBW change for RedCap UE with satellite access

## 8.13E.1 Introduction

The requirements in this clause apply for a RedCap UE with NTN receiving reconfiguration of *offsetToCarrier* or *carrierBandwidth* to change channel bandwidth.

## 8.13E.2 UE-specific CBW change delay

The requirements in clause 8.13C.2 shall apply.

# 8.14 Pathloss reference signal switching delay

## 8.14.1 Introduction

The requirements in this clause apply for pathloss reference signal activated or updated on serving cell in MR-DC or standalone NR in clause 7.1.1 in TS 38.213 [3].

UE shall complete the switch of pathloss reference signal within the delay defined in this clause.

## 8.14.2 Known conditions for pathloss reference signal

In FR2, the pathloss reference signal is known if the following conditions are met during the period between the last transmission of the RS resource used for L1-RSRP measurement reporting and the completion of pathloss reference signal switch, where the RS resource is the target pathloss reference signal or QCLed (with Type D) to the target pathloss reference signal.

- Pathloss reference signal switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
- The UE has sent at least 1 L1-RSRP report for the target pathloss reference signal before the pathloss reference signal switch command
- The target pathloss reference signal remains detectable during the pathloss reference signal switching period
  - SNR of the target pathloss reference signal≥-3 dB
- The associated SSBs with the target pathloss reference signal remain detectable during the pathloss reference signal switching period
  - SNR of the associated SSB ≥-3 dB

In FR1, the pathloss reference signal is known if the following conditions are met

- The target pathloss reference signal remains detectable during the pathloss reference signal switching period
  - SNR of the target pathloss reference signal≥-3 dB

Otherwise, the pathloss reference signal is unknown.

## 8.14.3 MAC-CE based pathloss reference signal switch delay

The requirements in this clause apply for a UE to update a pathloss reference signal by MAC-CE for PUCCH, PUSCH, semi-persistent SRS and aperiodic SRS.

If the target pathloss reference signal is known, upon receiving PDSCH carrying MAC-CE activation in slot n, UE shall be able to apply the target pathloss reference signal of the serving cell on which pathloss reference signal switch occurs no later than the slot $n + T_{HARQ} + 3\mathrm{N}_{\mathrm{slot}}^{\mathrm{subframe},\mu} + \mathrm{NM} * \left\lceil \frac{5 * T_{target_PL-RS} + 2\ \mathrm{ms}}{NR\ slot\ length} \right\rceil$. For a UE is configured with

*LowBandCA-Switching-r19* and the pathloss reference signal of PCell is to be updated, UE shall be able to apply the target pathloss reference signal of the PCell on which pathloss reference signal switch occurs no later than the slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM * \left\lceil \frac{5*Kp*T_{target_PL-RS} + 2\ ms}{NR\ slot\ length} \right\rceil$. The UE shall be able to apply old pathloss reference signals until the slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu}$. Where

- $T_{HARQ}$ is the timing between pathloss reference MAC-CE activation command and acknowledgement as specified in TS 38.321 [7].
- NM = 1, if the target PL-RS is not maintained by the UE, 0 otherwise.

In FR2, if the target pathloss reference signal is SSB, the requirements in this clause shall apply when the target pathloss reference signal is maintained by the UE.

- $T_{target_PL-RS}$ is the periodicity of the target pathloss reference signal which would be SSB or NZP CSI-RS.
- PL-RS is maintained provided:
  - There are no more than 4 different RS activated as PL-RS per serving cell among all active spatial relations for PUSCH/PUCCH/SRS transmissions.
  - The target pathloss reference signal remains detectable during TCI state switching period
    - SNR of the target pathloss reference signal≥-3 dB
  - The associated SSBs with the target pathloss reference signal remain detectable during the TCI state switching period.
  - SNR of the associated SSB ≥-3 dB
- $K_p$ is the scaling factor for the pathloss reference signal of PCell to be measured for UE is configured with *LowBandCA-Switching-r19*. $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

  For a window W of duration max($T_{target_PL-RS}$, $P_{switch\text{-}pattern}$), where $P_{switch\text{-}pattern}$ is the periodicity of the switching pattern for LB CA via switching configured by RRC signaling, and starting from the beginning of any PL-RS occasion:

  - $N_{total}$ is the total number of target PL-RS occasions within the window W, including those overlapped and non-overlapped with the duration of PCell to be measured based on the switching pattern ,and
  - $N_{available}$ is the number of target PL-RS occasions that are overlapped with the duration of PCell to be measured based on the switching pattern within the window W.

  No requirements apply when $N_{available} = 0$ due to fully non-overlapping between PL-RS occasions and the duration of PCell to be measured based on the switching pattern within the window W.

NOTE: longer application time is expected if measurement sample is not available due to measurement gap, DRX or other UE activities.

NOTE: longer application time is expected if the pathloss reference signal is unknown.

# 8.14C Pathloss reference signal switching delay for satellite access

## 8.14C.1 Introduction

The requirements in this clause apply for pathloss reference signal activated or updated on PCell in clause 7.1.1 in TS 38.213 [3] and the UE is configured with only PCell, which is served by satellite access node (SAN).

UE shall complete the switch of pathloss reference signal within the delay defined in this clause.

## 8.14C.2 Known conditions for pathloss reference signal

The pathloss reference signal is known if the following conditions are met during the period between the last transmission of the RS resource used for L1-RSRP measurement reporting and the completion of pathloss reference signal switch, where the RS resource is the target pathloss reference signal or QCLed (with Type D) to the target pathloss reference signal.

- Pathloss reference signal switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
- The UE has sent at least 1 L1-RSRP report for the target pathloss reference signal before the pathloss reference signal switch command
- The target pathloss reference signal remains detectable during the pathloss reference signal switching period
  - SNR of the target pathloss reference signal≥-3 dB
- The associated SSBs with the target pathloss reference signal remain detectable during the pathloss reference signal switching period
  - SNR of the associated SSB ≥-3 dB

Otherwise, the pathloss reference signal is unknown.

## 8.14C.3 MAC-CE based pathloss reference signal switch delay

The requirements in this clause apply for a UE to update a pathloss reference signal by MAC-CE for PUCCH, PUSCH, semi-persistent SRS and aperiodic SRS.

If the target pathloss reference signal is known, upon receiving PDSCH carrying MAC-CE activation in slot n, UE shall be able to apply the target pathloss reference signal of the serving cell on which pathloss reference signal switch occurs no later than the slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM * \left\lceil \frac{5 * T_{target_PL-RS} + 2\ ms}{NR\ slot\ length} \right\rceil$. The UE shall be able to apply old pathloss reference signals until the slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu}$. Where

- $T_{HARQ}$ is the timing between pathloss reference MAC-CE activation command and acknowledgement as specified in TS 38.321 [7].
- NM = 1, if the target PL-RS is not maintained by the UE, 0 otherwise.
- $T_{target_PL-RS}$ is the periodicity of the target pathloss reference signal which would be SSB or NZP CSI-RS.

NOTE: longer application time is expected if measurement sample is not available due to measurement gap, DRX or other UE activities.

NOTE: longer application time is expected if the pathloss reference signal is unknown.

# 8.14D Pathloss reference signal switching delay for ATG

## 8.14D.1 Introduction

The requirements in this clause apply for pathloss reference signal activated or updated on serving cell in clause 7.1.1 in TS 38.213 [3].

ATG UE shall complete the switch of pathloss reference signal within the delay defined in this clause.

## 8.14D.2 Known conditions for pathloss reference signal

In FR1, the pathloss reference signal is known if the following conditions is met

- The target pathloss reference signal remains detectable during the pathloss reference signal switching period

- SNR of the target pathloss reference signal≥-3 dB

Otherwise, the pathloss reference signal is unknown.

### 8.14D.3 MAC-CE based pathloss reference signal switch delay

The requirements in clause 8.14.3 shall apply only for FR1.

## 8.14E Pathloss reference signal switching delay for RedCap UE with satellite access

### 8.14E.1 Introduction

The requirements in this clause apply for pathloss reference signal activated or updated on PCell in clause 7.1.1 in TS 38.213 [3] and the RedCap UE is configured with only PCell, which is served by satellite access node (SAN).

UE shall complete the switch of pathloss reference signal within the delay defined in this clause.

### 8.14E.2 Known conditions for pathloss reference signal

The requirements in clause 8.14C.2 shall apply.

### 8.14E.3 MAC-CE based pathloss reference signal switch delay

The requirements in clause 8.14C.3 shall apply.

## 8.15 Active downlink TCI state switching delay for unified TCI

### 8.15.1 Introduction

The requirements in this clause apply for a UE configured with *dl-OrJointTCI-StateList* configurations for DL channels on a serving cell. Further the requirements also apply for all the list of serving cells in *simultaneousU-TCI-UpdateList1, simultaneousU-TCI-UpdateList2, simultaneousU-TCI-UpdateList3, simultaneousU-TCI-UpdateList4* in MR-DC or standalone NR provided all serving cells in the list are configured with the same serving cell and BWP in *unifiedTCI-StateRef-r17*. UE shall complete the switch of active downlink TCI state within the delay defined in this clause.

When the target DL TCI state refers to an additional PCI different from the serving cell PCI in which this DL TCI-State is configured, the requirements in this clause are applicable provided that following conditions are met:

- Active BWP of the serving cell and a cell with the additional PCI are the same
- Center frequency, SCS and SFN offset of a cell with the additional PCI are as the same as serving cell - The cell with the additional PCI is known to the UE.

A cell with the additional PCI is known if the following conditions are met:

- During the last 5 s before L1-RSRP measurement is configured, the UE has sent a valid L3 measurement report for the cell with the additional PCI
- Timing offset between serving cell and the cell with the additional PCI is within CP of the corresponding SCS

Otherwise, the cell with the additional PCI is unknown.

### 8.15.2 Known conditions for downlink TCI state

The downlink TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target downlink TCI state to the completion of active downlink TCI state switch, where the RS resource for L1-RSRP measurement is the RS in target downlink TCI state or QCLed to the target downlink TCI state
  - Downlink TCI state switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target downlink TCI state before the downlink TCI state switch command
  - The target downlink TCI state remains detectable during the downlink TCI state switching period
  - The SSB associated with the downlink TCI state remain detectable during the downlink TCI switching period
    - SNR of the downlink TCI state $\geq$ -3 dB
    - The SSB can be associated with either the serving cell PCI or a PCI different from serving cell PCI.

Otherwise, the downlink TCI state is unknown.

## 8.15.3 MAC-CE based downlink TCI state switch delay

The requirements in this clause shall apply for DL TCI state switch using separate DL TCI state or joint TCI state of unified TCI state switch framework.

In case that source RS in DL TCI state or joint TCI state is associated with a PCI different from that of the serving cell, the requirements in this clause shall apply if the cell with different PCI satisfies the known cell condition defined in clause 8.15.1. If the known cell condition is not met, longer delay may be expected.

In case of joint TCI state switch, if the target PL-RS is not maintained, UE is not expected to receive on DL based on the target TCI state before UE completes the DL and UL TCI state switch.

If the target TCI state is known, upon receiving PDSCH carrying MAC-CE activation command in slot n, UE shall be able to receive UE-dedicated PDCCH/PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ $TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive UE-dedicated PDCCH/PDSCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ where $T_{HARQ}$ (in slot) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];

- $T_{first\text{-}SSB}$ is
  - if the UE supports *featureSetCombinationLowBandSwitching-r19*, time to first available SSB reception based on *switchingPattern-r19* after MAC CE command is decoded by the UE
  - otherwise, time to first SSB transmission after MAC CE command is decoded by the UE;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state
- $T_{SSB\text{-}proc}$ = 2 ms;
- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH/PDCCH, 0 otherwise.

If the target TCI state is unknown, upon receiving PDSCH carrying MAC-CE activation command in slot n, UE shall be able to receive UE-dedicated PDCCH/PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ +$3N_{slot}^{subframe,\mu}$ + ($T_{L1\text{-}RSRP}$ +$TO_{uk}$*($T_{first\text{-}SSB}$+ $T_{SSB\text{-}proc}$)) / *NR slot length*. The UE shall be able to receive UE-dedicated PDCCH/PDSCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$.

Where

- $T_{L1\text{-}RSRP}$ = 0 in FR1 or when the TCI state switching not involving QCL-TypeD in FR2. Otherwise,
- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as
- $T_{L1\text{-}RSPR_Measurement_Period_SSB}$ for SSB as specified in clause 9.5.4.1,

  - with the assumption of M=1
  - with $T_{Report}$ = 0
- $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for CSI-RS as specified in clause 9.5.4.2
  - CSI-RS based L1-RSRP measurement only apply for TCI state switch when source RS is associated with serving cell
  - configured with higher layer parameter *repetition* set to ON
  - with the assumption of M=1 for periodic CSI-RS
  - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
  - with $T_{Report}$ = 0
- $TO_{uk}$ = 1 for CSI-RS based L1-RSRP measurement, and 0 for SSB based L1-RSRP measurement when TCI state switching involves QCL-TypeD
- $TO_{uk}$ = 1 when TCI state switching involves other QCL types only
- $T_{first\text{-}SSB}$ is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{first\text{-}SSB}$ is
  - if the UE supports *featureSetCombinationLowBandSwitching-r19*, time to first available SSB reception based on *switchingPattern-r19* after MAC CE command is decoded by the UE for other QCL types
  - otherwise, time to first SSB transmission after MAC CE command is decoded by the UE for other QCL types;
- The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

## 8.15.4 DCI based downlink TCI state switch delay

When a UE is configured with the higher layer parameter with *dl-OrJointTCI-StateList* or *TCI-UL-State*, activated with TCI states for downlink transmission by MAC CE indication of more than one codepoints, and receives DCI format 1_1/1_2 with or without DL assignment providing indicated TCI-State or TCI state pair in the active TCI list for a CC, the UE transmits a PUCCH with HARQ-ACK information corresponding to the DCI carrying the TCI-State indication.

If the target TCI state is known, the downlink TCI switching to the indicated DL TCI state or joint TCI state in the DCI format shall be completed starting from the first slot that is at least *beamAppTime-r17* symbols after the last symbol of the PUCCH carrying HARQ-ACK in response to the DCI triggering TCI state activation. The first slot and the *beamAppTime-r17* symbols are both determined on the carrier with the smallest SCS among the carrier(s) applying the beam indication. The value of *beamAppTime-r17* is defined in TS 38.331 [2]. The known condition for TCI state defined in clause 8.15.2 is applied.

## 8.15.5 Active Downlink TCI state list update delay

The requirements specified in this clause are applicable if

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', and a MAC CE activates more than one target separate TCIs, and at least one DL TCI is included, or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', and a MAC CE activates more than one target joint TCI.

If all the target TCI states in the active TCI state list are known, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + TO_k*(T_{first\text{-}SSB_List} + T_{SSB\text{-}proc}) / \textit{NR slot length}.$$

If a subset of the target TCI states in the active TCI state list are unknown, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + (T_{L1\text{-}RSRP_list} + TO_{uk} * (T_{first\text{-}SSB_List} + T_{SSB\text{-}proc})) / \textit{NR slot length}.$$

If all target TCI states in the active TCI state list are unknown, the requirements specified in this clause are not applicable.

Where

- $T_{L1\text{-}RSRP_List}$ is the longest L1 measurement time ($T_{L1\text{-}RSRP}$) of the source RS among the unknown target TCI states, where $T_{L1\text{-}RSRP}$ is specified in clause 8.15.3
- If the number of cells associated with the target TCI states in the active TCI list is 2, and time to first SSBs associated to the TCIs are overlapped in FR2,
- $T_{first\text{-}SSB_List} = T_{first\text{-}SSB_SC} + \min(T_{SSB_SC}, T_{SSB_CDP})$.
- If the number of cells associated with the target TCI states in the active TCI list is 2, and time to first SSBs associated to the TCIs are not overlapped in FR1 or FR2,
- $T_{first\text{-}SSB_List} = \max(T_{first\text{-}SSB_SC}, T_{first\text{-}SSB_CDP})$
- Otherwise,
- $T_{first\text{-}SSB_List} = T_{first\text{-}SSB_SC}$.
- $T_{SSB_SC}$ is the SSB periodicity of serving cell.
- $T_{SSB_CDP}$ is the SSB periodicity of cell with different PCI from serving cell.
- $T_{first\text{-}SSB_SC}$ is the $T_{first\text{-}SSB}$ from serving cell
- $T_{first\text{-}SSB_CDP}$ is the $T_{first\text{-}SSB}$ from cell with different PCI from serving cell.
- $T_{HARQ}$, $T_{first\text{-}SSB}$, $T_{SSB\text{-}proc}$ , $TO_k$, $TO_{uk}$ are defined in clause 8.15.3. $T_{SSB}$ is the SSB periodicity.

When UE receives PDSCH carrying MAC-CE for active TCI state list update, and

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', while the target TCI list comprises at least one DL TCIs and at least one UL TCIs,

UE is not expected to receive on DL based on the target TCI state before UE completes the DL and UL TCI state list update.

# 8.15D Active downlink TCI state switching delay for unified TCI for ATG

## 8.15D.1 Introduction

The requirements in this clause apply for an ATG UE configured with *dl-OrJointTCI-StateList* configurations for DL channels on PCell. UE shall complete the switch of active downlink TCI state within the delay defined in this clause.

## 8.15D.2 Void

## 8.15D.3 MAC-CE based downlink TCI state switch delay

The requirements in this clause shall apply for DL TCI state switch using separate DL TCI state or joint TCI state of unified TCI state switch framework.

In case of joint TCI state switch, if the target PL-RS is not maintained, UE is not expected to receive on DL based on the target TCI state before UE completes the DL and UL TCI state switch.

Upon receiving PDSCH carrying MAC-CE activation command in slot n, UE shall be able to receive UE-dedicated PDCCH/PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ $TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$) / *NR slot length*. The UE shall be able to receive UE-dedicated PDCCH/PDSCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ where $T_{HARQ}$ (in slot) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];

- $T_{first\text{-}SSB}$ is time to first SSB transmission after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state
- $T_{SSB\text{-}proc}$ = 2 ms;
- $TO_k$ = 1 if target TCI state is not in the active TCI state list for PDSCH/PDCCH, 0 otherwise.

## 8.15D.4 DCI based downlink TCI state switch delay

When a UE is configured with the higher layer parameter with *dl-OrJointTCI-StateList* or *TCI-UL-State*, activated with TCI states for downlink transmission by MAC CE indication of more than one codepoints, and receives DCI format 1_1/1_2 with or without DL assignment providing indicated TCI-State or TCI state pair in the active TCI list for a CC, the UE transmits a PUCCH with HARQ-ACK information corresponding to the DCI carrying the TCI-State indication.

The downlink TCI switching to the indicated DL TCI state or joint TCI state in the DCI format shall be completed starting from the first slot that is at least *beamAppTime-r17* symbols after the last symbol of the PUCCH carrying HARQ-ACK in response to the DCI triggering TCI state activation. The first slot and the *beamAppTime-r17* symbols are both determined on PCell. The value of *beamAppTime-r17* is defined in TS 38.331 [2]. The known condition for TCI state defined in clause 8.15D.3 is applied.

## 8.15D.5 Active Downlink TCI state list update delay

The requirements specified in this clause are applicable if

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', and a MAC CE activates more than one target separate TCIs, and at least one DL TCI is included, or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', and a MAC CE activates more than one target joint TCI.

Upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + TO_k*(T_{first\text{-}SSB} + T_{SSB\text{-}proc}) / \textit{NR slot length}.$$

Where $T_{HARQ}$, $T_{first\text{-}SSB}$, $T_{SSB\text{-}proc}$ , $TO_k$ are defined in clause 8.15D.3.

UE is not expected to receive on DL based on the target TCI state before UE completes the DL and UL TCI state list update.

# 8.16 Active uplink TCI state switching delay for unified TCI

## 8.16.1 Introduction

The requirements in this clause apply for a UE configured with *dl-OrJointTCI-StateList* (if unifiedTCI-StateType is indicated as *Joint*) or *TCI-UL-State* configurations for UL channels/signals on a serving cell. Further the requirements also apply for all the list of serving cells in *simultaneousU-TCI-UpdateList1*, *simultaneousU-TCI-UpdateList2*, *simultaneousU-TCI-UpdateList3*, *simultaneousU-TCI-UpdateList4* in MR-DC or standalone NR provided all serving cells in the list are configured with the same serving cell and BWP in *unifiedTCI-StateRef-r17*. There is no requirement when the UE is requested to switch to a TCI state with the higher layer parameter *TCI-UL-State* associated to SRS. UE

shall complete the switch of active uplink TCI state within the delay defined in this clause when the UE is requested to switch to a TCI state with the higher layer parameter *dl-OrJointTCI-StateList* or *TCI-UL-State* associated to a DL RS.

PL-RS may be associated with or included in UL TCI state or joint TCI state. The requirements in this clause shall apply if either of the following conditions are met:

- PL-RS is identical to source RS in UL TCI state or joint TCI state
- PL-RS and source RS in UL TCI state or joint TCI state are QCL-Type D

When the target UL TCI state refers to an additional PCI different from serving cell PCI in which this UL TCI state is configured, the requirements in this clause are applicable provided that the following conditions are met:

- Active BWP of the serving cell and a cell with the additional PCI are the same
- Center frequency, SCS and SFN offset of a cell with the additional PCI are as the same as serving cell
- The cell with the additional PCI is known to the UE.

A cell with the additional PCI is known if the following conditions are met:

- During the last 5 s before L1-RSRP measurement is configured, the UE has sent a valid L3 measurement report for the cell with the additional PCI
- Timing offset between serving cell and the cell with the additional PCI is within CP of the corresponding SCS
- The SSB from the cell with the additional PCI remains detectable according to the cell identification requirements specified in clause 9.2

Otherwise, the cell with the additional PCI is unknown.

## 8.16.2 Known conditions for uplink TCI state

The uplink TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target uplink TCI state to the completion of active uplink TCI state switch, where the RS resource for L1-RSRP measurement is the RS in target uplink TCI state or QCLed to the target uplink TCI state
  - Uplink TCI state switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target uplink TCI state before the uplink TCI state switch command
  - The RS configured in target uplink TCI state remains detectable during the uplink TCI state switching period
    - SNR of the RS configured in target uplink TCI state $\geq$ -3 dB
  - The target uplink TCI state remains detectable during the uplink TCI state switching period
  - The SSB associated with the uplink TCI state remain detectable during the uplink TCI switching period
    - SNR of the uplink TCI state $\geq$ -3 dB
    - The SSB can be associated with either the serving cell PCI or a PCI different from serving cell PCI.

Otherwise, the uplink TCI state is unknown.

## 8.16.3 MAC-CE based uplink TCI state switch delay

The requirements in this clause shall apply for UL TCI state switch using separate UL TCI state or joint TCI state of unified TCI state switch framework.

In case that source RS in UL TCI state or joint TCI state is associated with a PCI different from that of the serving cell, the requirements in this clause shall apply if the cell with different PCI satisfies the known cell condition defined in clause 8.16.1. If the known cell condition is not met, longer delay may be expected.

In case of joint TCI state switch, UE is not expected to transmit on UL based on the target TCI state before UE completes the DL and UL TCI state switch.

For separate UL TCI state switch or joint TCI state switch for PUCCH or PUSCH, or semi-persistent/aperiodic/periodic SRS, when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1, upon receiving PDSCH carrying MAC-CE activation command in slot n on serving cell,

- If target TCI state is known,
- The UE shall be able to transmit uplink signal with the target TCI state in the slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM* (T_{first_target\text{-}PL\text{-}RS} + K_p*4*T_{target_PL\text{-}RS} + 2$ ms) / *NR slot length*.
- If target TCI state is unknown,
  - The UE shall be able to transmit uplink signal with the target TCI state in the slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + (T_{L1\text{-}RSRP} + T_{first_target\text{-}PL\text{-}RS} + 4*T_{target_PL\text{-}RS} + 2$ ms) / *NR slot length*.
  - The UE shall be able to transmit with the old UL TCI state until slot $n+ T_{HARQ} + 3N_{slot}^{subframe,\mu}$.

Where,

- $T_{HARQ}$ (in slot) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].
- NM = 1, if the target PL-RS is not maintained by the UE, 0 otherwise.

In FR2, in case that the target PL-RS associated with or included in the target UL or joint TCI state is SSB, the requirements in this clause shall apply when this target PL-RS is maintained by the UE.

- PL-RS is maintained provided:
  - the target PL-RS is associated with or included in the UL or joint TCI states in the active TCI list for PUSCH/PUCCH/SRS transmissions
  - There are no more than 4 different RS activated as PL-RS per serving cell among all active UL TCI states (UL or joint TCI state) for PUSCH/PUCCH/SRS transmissions
  - The target pathloss reference signal remains detectable during TCI state switching period
  - SNR of the target pathloss reference signal≥-3 dB
  - The associated SSBs with the target pathloss reference signal remain detectable during the TCI state switching period.
    - SNR of the associated SSB ≥-3 dB
- $T_{first_target\text{-}PL\text{-}RS}$:
  - When the target TCI state is unknown:
    - When the UE is configured with *LowBandCA-Switching-r19*, $T_{first_target\text{-}PL\text{-}RS}$ is time to first pathloss RS transmission overlapping with PCell active period according to *switchingPattern-r19* after L1-RSRP measurement.
    - Otherwise, $T_{first_target\text{-}PL\text{-}RS}$ is time to first pathloss RS transmission after L1-RSRP measurement.
  - When the target TCI state is known:
    - When the UE is configured with *LowBandCA-Switching-r19*, $T_{first_target\text{-}PL\text{-}RS}$ is time to first pathloss RS transmission overlapping with PCell active period according to *switchingPattern-r19* after MAC CE command is decoded by the UE.

- Otherwise, $T_{first_target\text{-}PL\text{-}RS}$ is time to first pathloss RS transmission after MAC CE command is decoded by the UE.

- $T_{target_PL\text{-}RS}$ is the periodicity of the target pathloss reference signal which would be SSB or NZP CSI-RS when PL-RS is associated with serving cell

- $T_{target_PL\text{-}RS}$ is the periodicity of the target pathloss reference signal which would be SSB when PL-RS is associated with PCI different from serving cell

- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as

  - $T_{L1\text{-}RSPR_Measurement_Period_SSB}$ for SSB as specified in clause 9.5.4.1 or 9.13.4.1,

    - with the assumption of M=1

    - with $T_{Report} = 0$

  - $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for CSI-RS as specified in clause 9.5.4.2

    - CSI-RS based L1-RSRP measurement only apply for TCI state switch when source RS is associated with serving cell

    - configured with higher layer parameter *repetition* set to ON

    - with the assumption of M=1 for periodic CSI-RS

    - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*

    - with $T_{Report} = 0$

- $K_p$:

  - When the UE is configured with *LowBandCA-Switching-r19*, $K_p$ is the scaling factor for the pathloss reference signal of PCell. $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

    - For a window W of duration max($T_{target_PL-RS}$, $P_{switch\text{-}pattern}$), where $P_{switch\text{-}pattern}$ is the periodicity of the *switchingPattern-r19* configured by RRC signaling, and starting from the beginning of any PL-RS occasion:

      - $N_{total}$ is the total number of target PL-RS occasions within the window W, including those overlapped and non-overlapped with the duration of PCell to be measured based on *switchingPattern-r19*, and

      - $N_{available}$ is the number of target PL-RS occasions that are overlapped with the duration of PCell to be measured based on the *switchingPattern-r19* within the window W.

    - No requirements apply when $N_{available} = 0$ due to fully non-overlapping between PL-RS occasions and the duration of PCell to be measured based on *switchingPattern-r19* within the window W.

  - Otherwise, $K_p = 1$.

The requirements specified in this clause are applicable if no more than 4 different RSs are activated as PL-RS per serving cell among all active UL (or joint) TCI states.

## 8.16.4 DCI based uplink TCI state switch delay

When a UE is configured with the higher layer parameter with *dl-OrJointTCI-StateList* or *TCI-UL-State*, activated with TCI states for uplink transmission by MAC CE indication of more than one codepoints, and receives DCI format 1_1/1_2 with or without DL assignment providing indicated TCI-State or TCI state pair in the active TCI list for a CC, the UE transmits a PUCCH with HARQ-ACK information corresponding to the DCI carrying the TCI-State indication.

The requirements in this clause are applicable only if the DCI format indicating UL TCI state or joint TCI state switch is received by UE when

- target TCI state is known, and

- target TCI state is in active TCI state list, and

- target PL-RS is maintained as defined in clause 8.16.3

If the target TCI state is known, the uplink TCI switching to the indicated UL TCI state or joint TCI state in the DCI format shall be completed starting from the first slot that is at least *beamAppTime-r17* symbols after the last symbol of the PUCCH carrying HARQ-ACK in response to the DCI triggering TCI state activation. The first slot and the *beamAppTime-r17* symbols are both determined on the carrier with the smallest SCS among the carrier(s) applying the beam indication. The value of *beamAppTime-r17* is defined in TS 38.331 [2]. The known condition for TCI state defined in clause 8.16.2 is applied.

If a PL-RS is associated with or included in UL TCI state or joint TCI state, the UL TCI switching and PL-RS switching shall be completed at the same time.

## 8.16.5 Active Uplink TCI state list update delay

The requirements specified in this clause are applicable if

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', and a MAC CE activates more than one target separate TCIs, and at least one UL TCI is included, or

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', and a MAC CE activates more than one target joint TCI.

If all the target TCI states in the active TCI state list are known, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM * (T_{first_target\text{-}PL\text{-}RS_List} + 4 * T_{target_PL\text{-}RS_List} + 2ms)$ / *NR slot length*.

If a subset of target TCI states in the active TCI state list are unknown, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + (T_{L1\text{-}RSRP_List} + T_{first_target\text{-}PL\text{-}RS_List} + 4*T_{target_PL\text{-}RS_List} + 2ms)$ / *NR slot length.*

If all target TCI states in the active TCI state list are unknown, the requirements specified in this clause are not applicable.

Where

- If all TCIs are known,

- if the target PL-RS associated with or included in any UL TCI is not maintained, NM = 1; Where maintained PL-RS is defined in clause 8.16.3

- if a subset of target TCI states in the active TCI state list are unknown,

- $T_{L1\text{-}RSRP_List}$ = is the longest L1 measurement time ($T_{L1\text{-}RSRP}$) of the source RS among the unknown target TCI states , where $T_{L1\text{-}RSRP}$ is specified in clause 8.16.3

- if the number of cells associated with the target TCI states in the active TCI list is 2, and time to first PL-RS associated to the TCIs are overlapped in FR2,

- $T_{first_target\text{-}PL\text{-}RS_List} = T_{first_target\text{-}PL\text{-}RS_SC} + \min(T_{target\text{-}PL\text{-}RS_SC}, T_{target\text{-}PL\text{-}RS_CDP})$ ;

- $T_{target\text{-}PL\text{-}RS_List} = 2 * T_{target\text{-}PL\text{-}RS_SC}$, if $T_{target\text{-}PL\text{-}RS_SC} = T_{target\text{-}PL\text{-}RS_CDP}$

- $T_{target\text{-}PL\text{-}RS_List} = \max(T_{target\text{-}PL\text{-}RS_SC}, T_{target\text{-}PL\text{-}RS_CDP})$, if $T_{target\text{-}PL\text{-}RS_SC} \neq T_{target\text{-}PL\text{-}RS_CDP}$

- if the number of cells associated with the target TCI states in the active TCI list is 2, and time to first PL-RS associated to the TCIs are not overlapped in FR2,

  - $T_{first_target\text{-}PL\text{-}RS_List} = \max(T_{first_target\text{-}PL\text{-}RS_SC}, T_{first_target\text{-}PL\text{-}RS_SC})$;

  - $T_{target\text{-}PL\text{-}RS_List} = \max(T_{target\text{-}PL\text{-}RS_SC}, T_{target\text{-}PL\text{-}RS_CDP})$

- Otherwise,

  - $T_{first_target\text{-}PL\text{-}RS_List} = T_{first_target\text{-}PL\text{-}RS_SC}$

- $T_{target\text{-}PL\text{-}RS_List} = T_{target\text{-}PL\text{-}RS_SC}$.
- $T_{first_target\text{-}PL\text{-}RS_SC}$ is $T_{first_target\text{-}PL\text{-}RS}$ for serving cell
- $T_{first_target\text{-}PL\text{-}RS_CDP}$ is $T_{first_target\text{-}PL\text{-}RS}$ for cell with different PCI from serving cell
- $T_{target\text{-}PL\text{-}RS_SC}$ is $T_{target\text{-}PL\text{-}RS}$ for serving cell

- $T_{target\text{-}PL\text{-}RS_CDP}$ is $T_{target\text{-}PL\text{-}RS}$ for cell with different PCI from serving cell- $T_{HARQ}$, $T_{first_target\text{-}PL\text{-}RS}$, $T_{target\text{-}PL\text{-}RS}$ are defined in clause 8.16.3.

The requirements specified in this clause do not apply if more than 4 different RSs are activated as PL-RS per serving cell among all active UL (or joint) TCI states.

When UE receives PDSCH carrying MAC-CE for active TCI state list update, and

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', while the target TCI list comprises at least one DL TCIs and at least one UL TCIs,

UE is not expected to transmit on UL based on the target TCI before UE completes the DL and UL TCI list update.

The requirements in this clause are applicable when the source RS of the active UL TCI state is a DL-RS and this DL-RS is included as one of the source RSs in the DL active TCI list.

# 8.16D Active uplink TCI state switching delay for unified TCI for ATG

## 8.16D.1 Introduction

The requirements in this clause apply for an ATG UE configured with *dl-OrJointTCI-StateList* (if unifiedTCI-StateType is indicated as *Joint*) or *TCI-UL-State* configurations for UL channels/signals on PCell. There is no requirement when the UE is requested to switch to a TCI state with the higher layer parameter *TCI-UL-State* associated to SRS. The UE shall complete the switch of active uplink TCI state within the delay defined in this clause when the UE is requested to switch to a TCI state with the higher layer parameter *dl-OrJointTCI-StateList* or *TCI-UL-State* associated to a DL RS.

PL-RS may be associated with or included in UL TCI state or joint TCI state. The requirements in this clause shall apply if either of the following conditions are met:

- PL-RS is identical to source RS in UL TCI state or joint TCI state
- PL-RS and source RS in UL TCI state or joint TCI state are QCL-Type D

## 8.16D.2 Void

## 8.16D.3 MAC-CE based uplink TCI state switch delay

The requirements in this clause shall apply for UL TCI state switch using separate UL TCI state or joint TCI state of unified TCI state switch framework.

In case of joint TCI state switch, UE is not expected to transmit on UL based on the target TCI state before UE completes the DL and UL TCI state switch.

For separate UL TCI state switch or joint TCI state switch for PUCCH or PUSCH, or semi-persistent/aperiodic/periodic SRS, when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1, upon receiving PDSCH carrying MAC-CE activation command in slot n on serving cell,

- The UE shall be able to transmit uplink signal with the target TCI state in the slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM^* (T_{first_target\text{-}PL\text{-}RS} + 4^*T_{target_PL\text{-}RS} + 2$ ms) / *NR slot length*.

Where,

- $T_{HARQ}$ (in slot) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].
- NM = 1, if the target PL-RS is not maintained by the UE, 0 otherwise.
- PL-RS is maintained provided:
  - the target PL-RS is associated with or included in the UL or joint TCI states in the active TCI list for PUSCH/PUCCH/SRS transmissions
  - There are no more than 4 different RS activated as PL-RS per serving cell among all active UL TCI states (UL or joint TCI state) for PUSCH/PUCCH/SRS transmissions
  - The target pathloss reference signal remains detectable during TCI state switching period
  - SNR of the target pathloss reference signal≥-3 dB
  - The associated SSBs with the target pathloss reference signal remain detectable during the TCI state switching period.
    - SNR of the associated SSB ≥-3 dB
- $T_{first_target\text{-}PL\text{-}RS}$ is time to first pathloss RS transmission after MAC CE command is decoded by the UE for known TCI State.
- $T_{target_PL\text{-}RS}$ is the periodicity of the target pathloss reference signal which would be SSB or NZP CSI-RS

The requirements specified in this clause are applicable if no more than 4 different RSs are activated as PL-RS per serving cell among all active UL (or joint) TCI states.

## 8.16D.4 DCI based uplink TCI state switch delay

When a UE is configured with the higher layer parameter with *dl-OrJointTCI-StateLis*tor *TCI-UL-State*, activated with TCI states for uplink transmission by MAC CE indication of more than one codepoints, and receives DCI format 1_1/1_2 with or without DL assignment providing indicated TCI-State or TCI state pair in the active TCI list for PCell, the UE transmits a PUCCH with HARQ-ACK information corresponding to the DCI carrying the TCI-State indication.

The requirements in this clause are applicable only if the DCI format indicating UL TCI state or joint TCI state switch is received by UE when

- target TCI state is in active TCI state list, and
- target PL-RS is maintained as defined in clause 8.16D.3

The uplink TCI switching to the indicated UL TCI state or joint TCI state in the DCI format shall be completed starting from the first slot that is at least *beamAppTime-r17* symbols after the last symbol of the PUCCH carrying HARQ-ACK in response to the DCI triggering TCI state activation. The value of *beamAppTime-r17*is defined in TS 38.331 [2].

If a PL-RS is associated with or included in UL TCI state or joint TCI state, the UL TCI switching and PL-RS switching shall be completed at the same time.

## 8.16D.5 Active Uplink TCI state list update delay

The requirements specified in this clause are applicable if

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', and a MAC CE activates more than one target separate TCIs, and at least one UL TCI is included, or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', and a MAC CE activates more than one target joint TCI.

Upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

slot n + $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ + NM * ($T_{first_target\text{-}PL\text{-}RS}$ + 4 * $T_{target_PL\text{-}RS}$ + 2 ms) / *NR slot length*,

Where $T_{HARQ}$, $T_{first_target\text{-}PL\text{-}RS}$, $T_{target\text{-}PL\text{-}RS}$ are defined in clause 8.16D.3.

The requirements specified in this clause do not apply if more than 4 different RSs are activated as PL-RS per serving cell among all active UL (or joint) TCI states.

When UE receives PDSCH carrying MAC-CE for active TCI state list update, and

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', while the target TCI list comprises at least one DL TCIs and at least one UL TCIs,

UE is not expected to transmit on UL based on the target TCI before UE completes the DL and UL TCI list update.

The requirements in this clause are applicable when the source RS of the active UL TCI state is a DL-RS and this DL-RS is included as one of the source RSs in the DL active TCI list.

# 8.17 SCG Activation and Deactivation Delay

## 8.17.1 Introduction

This clause defines requirements for the delay within which the UE shall be able to activate one SCG and deactivate on SCG.

The requirements shall apply for NR-DC with an NR PCell, PSCell or SCell.

## 8.17.2 SCG Activation Delay Requirement

The requirements in this clause shall apply for the UE configured with one deactivated SCG in NR-DC and when PSCell in one SCG is being activated.

The delay within which the UE shall be able to activate the deactivated SCG depends upon the specified conditions.

Upon receiving SCG activation command in slot *n*, the UE shall be capable to transmit PRACH preamble or PUCCH or PUSCH towards PSCell no later than in slot n + $\frac{T_{activation_time}}{NR\ slot\ length}$,

where:

- $T_{activation_time}$ = $T_{RRC_delay}$ + $T_{processing}$ + $T_{search}$ + $T_{\Delta}$ + $T_{IU}$ + 2 ms
- $T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].
- $T_{processing}$ is the SW processing time needed by UE, including RF warm up period. When PSCell is activated from deactivated state, if any PSCell parameter is modified, $T_{processing}$ = 20ms. Otherwise, $T_{processing}$ = 5 ms.
- $T_{search}$ is the time for AGC settling and PSS/SSS detection.
- For RACH based PSCell activation, if the FR1 or FR2 PSCell is known, $T_{search}$ = 0 ms. If the FR2 PSCell is unknown and Es/Iot ≥ -2 dB, then $T_{search}$ = 24* $T_{rs}$ ms. If the target cell is an unknown FR1 PSCell and Es/Iot ≥ -2 dB, then $T_{search}$ =3* $T_{rs}$ ms.
- For RACH-less based PSCell activation, if *bfd-and-RLM* is configured and TCI state is known, $T_{search}$ = 0 ms. There are no requirements if TCI state is unknown.
- $T_{\Delta}$ is time for fine time tracking and acquiring full timing information of the target PSCell. $T_{\Delta}$ = 3*Trs ms for PSCell operating with 12 PRB SSB BW. Otherwise, $T_{\Delta}$ = 1*Trs ms.
- $T_{IU}$: When RACH based PSCell activation is configured, it is the delay uncertainty in acquiring the first available PRACH occasion in the PSCell. $T_{IU}$ is up to the summation of SSB to PRACH occasion association period and 10 ms. SSB to PRACH occasion associated period is defined in table 8.1-1 of TS 38.213 [3].

- When RACH-less based PSCell activation is configured, it is the uncertainty in acquiring the first PUSCH transmission occasion [or SR on PUCCH].

- Trs is the SMTC periodicity of the PSCell if the UE has been provided with an SMTC configuration for the target cell in SCG activation command, otherwise Trs is the SMTC configured in the measObjectNR having the same SSB frequency and subcarrier spacing. If the UE is not provided SMTC configuration or measurement object on this frequency, the requirement in this clause is applied with Trs = 5 ms assuming the SSB transmission periodicity is 5 ms. There is no requirement if the SSB transmission periodicity is not 5.

In FR1 and FR2, the PSCell is known if it has been meeting the following conditions:

- During the last 5 seconds before the reception of the SCG activation command:

  - the UE has sent a valid measurement report for the PSCell being activated and

  - One of the SSBs measured from the PSCell being activated remains detectable according to the cell identification conditions specified in clause 9.2.

- One of the SSBs measured from PSCell being activated also remains detectable during the PSCell activation delay $T_{activation_time}$ according to the cell identification conditions specified in clause 9.2.

Otherwise it is unknown.

If the UE is configured to perform *bfd-and-RLM* while the SCG is deactivated:

- The TCI state is known if all the following conditions are met:

  - During the period from receiving the tci-ActivatedConfig in the SCG configuration to the first transmission towards PSCell on PUCCH or PUSCH, or

  - During the perioc from reception of the RRC-based SCG deactivation command deactivating the PSCell to the first transmission towards PSCell on PUCCH or PUSCH:

    - UE has not detected beam failure

    - The side condition Ês/Iot ≥ -3 dB is fulfilled for the RSs configured for *bfd-and-RLM* for the PSCell being activated

    - The SSB associated with the TCI state remains detectable according to the cell identification conditions specified in clause 9.2.

- Otherwise, the TCI state is unknown.

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

### 8.17.3 SCG Deactivation Delay Requirement

The requirements in this clause shall apply for a UE which is configured with at least PCell and PSCell.

Upon receiving RRC-based SCG deactivation command in subframe *n*, the UE shall accomplish the deactivation actions specified in TS 38.331 [2] no later than in slot $n + \frac{T_{RRC_delay}}{NR\ slot\ length}$, where:

- $T_{RRC_delay}$ is the RRC procedure delay as specified in TS 38.331 [2].

The PCell interruption specified in clause 8.2 is allowed only during the RRC reconfiguration procedure [2].

## 8.18 TRP specific Link Recovery Procedures

### 8.18.1 Introduction

The UE shall assess the downlink radio link quality of a serving cell based on the reference signal provided in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ as specified in TS 38.213 [3] in order to detect beam failure on:

- PCell in SA, NR-DC, or NE-DC operation mode,
- PSCell in NR-DC and EN-DC operation mode,
- SCell in SA, NR-DC, NE-DC or EN-DC operation mode.

The RS resource configurations in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ on PCell or PSCell can be periodic CSI-RS resources and/or SSBs. RS resource configuration in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ on SCell shall be periodic CSI-RS. UE is not required to perform beam failure detection outside the active DL BWP. UE is not required to meet the requirements in clause 8.18.2 and 8.18.3 if UE does not have configured sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$. UE is not required to perform beam failure detection on a deactivated SCell, and also not required to perform beam failure detection on resources which is implicitly configured for a deactivated SCell. UE is not required to perform beam failure detection on a SCell on which $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ is not configured.

If *additionalPCIList* is configured for the serving cell, the SSBs in sets $\bar{q}_{0,1}$ and $\bar{q}_{1,1}$ can be associated to the same additional PCI other than serving cell PCI.

On each RS resource configuration in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$, the UE shall estimate the radio link quality and compare it to the threshold $Q_{out_LR}$ for the purpose of accessing downlink radio link quality of the serving cell.

The threshold $Q_{out_LR}$ is defined as the level at which the downlink radio level link of a given resource configuration on two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ cannot be reliably received and shall correspond to the $BLER_{out}$ = 10 % block error rate of a hypothetical PDCCH transmission. For SSB based beam failure detection, $Q_{out_LR_SSB}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.518.2.1-1. For CSI-RS based beam failure detection, $Q_{out_LR_CSI\text{-}RS}$ is derived based on the hypothetical PDCCH transmission parameters listed in table 8.181.3.1-1.

Upon request the UE shall deliver configuration indexes from the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$as specified in TS 38.213 [3] , to higher layers, and the corresponding L1-RSRP measurement provided that the measured L1-RSRP is equal to or better than the threshold $Q_{in_LR}$, which is indicated by higher layer parameter *rsrp-ThresholdSSB*. The UE applies the $Q_{in_LR}$ threshold to the L1-RSRP measurement obtained from an SSB. The UE applies the $Q_{in_LR}$ threshold to the L1-RSRP measurement obtained for a CSI-RS resource after scaling a respective CSI-RS reception power with a value provided by higher layer parameter *powerControlOffsetSS*. The RS resource configurations in the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ can be periodic CSI-RS resources or SSBs or both SSB and CSI-RS resources. UE is not required to perform candidate beam detection outside the active DL BWP. UE is not required to perform candidate beam detection on a SCell on which $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ is not configured.

## 8.18.2 Requirements for TRP specific SSB based beam failure detection

### 8.18.2.1 Introduction

The requirements in this clause apply for each SSB resource in the set two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ configured for a serving cell, provided that the SSB configured for beam failure detection is actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.18.2.2. The SSB(s) in set $\bar{q}_{0,1}$ can be associated with an additionalPCI other than serving cell PCI.

**Table 8.18.2.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average SSS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average SSS RE energy | 0 dB |
| Bandwidth (PRBs) | 24 |
| Sub-carrier spacing (kHz) | Same as the SCS of RMSI CORESET |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

### 8.18.2.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the configured SSB resource in two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ estimated over the last $T_{Evaluate_BFD_SSB}$ period becomes worse than the threshold $Q_{out_LR_SSB}$ within $T_{Evaluate_BFD_SSB}$ period.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 8.18.2.2-1 for FR1.

The value of $T_{Evaluate_BFD_SSB}$ is defined in table 8.18.2.2-2 for FR2 with scaling factor N, where

- N = 2, 4, or 6 in FR2-1 for UE supporting *fastBeamSweepingMultiRx-r1*8, according to the conditions described in clause 3.6.19, and
- N=8 for other cases in FR2.

For UE supporting *musim-GapPreference-r17* and is configured with one or more per-UE periodic MUSIM gaps,

- P value for an BFD SSB resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0
- For a window W of duration max($T_{SSB,}$ SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE periodic MUSIM gaps, per-UE measurement gaps and per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any configured BFD SSB resource occasion:
  - $N_{total}$ is the total number of configured BFD SSB resource occasions within the window, including those overlapped with MUSIM gap occasions or SMTC occasions within the window
  - $N_{outside_MG}$ is the number of configured BFD SSB resource occasions that are not overlapped with any MUSIM gap occasions within the window W,
  - $N_{available}$ is the number of configured BFD SSB resource occasions that are not overlapped with any non-dropped MUSIM gap occasions nor any SMTC occasion within the window W, and
  - $T_{SSB}$ is periodicity of the target SSB resource for BFD.

    When the configured aperiodic MUSIM gap is overlapping with configured BFD SSB resource occasions, longer evaluation period would be expected.

    Requirements in this clause do not apply when $N_{outside\ MG}$ = 0 due to fully overlapping between target SSB resources for BFD and MUSIM gap occasions within the window W.

Otherwise, when UE is not configured with periodic MUSIM gap(s) or not supporting MUSIM gap capability,

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB.
- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq MGRP$ or
  - $T_{SMTCperiod} = MGRP$ and $T_{SSB} < 0.5*T_{SMTCperiod}$
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod} = MGRP$ and $T_{SSB} = 0.5*T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with measurement gap ($T_{SSB}$ <MGRP) and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} < MGRP$)

where,

- $P_{sharing\ factor} = 1$, if the BFD-RS resource outside measurement gap is
  - not overlapped with the SSB symbols indicated by SSB-ToMeasure and 1 data symbol before each consecutive SSB symbols indicated by SSB-ToMeasure and 1 data symbol after each consecutive SSB symbols indicated by SSB-ToMeasure, given that SSB-ToMeasure is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;
  - not overlapped with the RSSI symbols indicated by ss-RSSI-Measurement and 1 data symbol before each RSSI symbol indicated by ss-RSSI-Measurement and 1 data symbol after each RSSI symbol indicated by ss-RSSI-Measurement, given that ss-RSSI-Measurement is configured.
  - $P_{sharing\ factor} = 3$, otherwise.
  - If the higher layer in TS 38.331 [2] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, given the SMTC offset of all CCs in FR2 provided the same offset.

Longer evaluation period would be expected if the combination of BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The value of $P_{TRP}$ used in table 8.18.2.2-2 is defined as 2, if SSB/CSI-RS resource in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ are overlapped, else it is 1.

**Table 8.18.2.2-1: Evaluation period $T_{Evaluate_BFD_SSB}$ for FR1**

| Configuration | $T_{Evaluate_BFD_SSB}$ (ms) |
|---|---|
| no DRX | Max(50, Ceil(5 × P) × $T_{SSB}$) |
| DRX cycle ≤ 320 ms | Max(50, Ceil(7.5 × P) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | Ceil(5 × P) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$. $T_{DRX}$ is the DRX cycle length. | |

**Table 8.18.2.2-2: Evaluation period $T_{Evaluate_BFD_SSB}$ for FR2**

| Configuration | $T_{Evaluate_BFD_SSB}$ (ms) |
|---|---|
| no DRX | Max(50, Ceil(5 × P × N*$P_{TRP}$) × $T_{SSB}$) |
| DRX cycle ≤ 320 ms | Max(50, Ceil(7.5 × P × N*$P_{TRP}$) × Max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | Ceil(5 × P × N*$P_{TRP}$) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$. $T_{DRX}$ is the DRX cycle length. | |

### 8.18.2.3 Measurement restriction for SSB based beam failure detection

The UE is required to be capable of measuring SSB for BFD without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following scenarios.

For FR1, when the SSB for BFD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for BFD measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for BFD measurement without any restriction.
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined.

For FR2, when the SSB for BFD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for BFD measurement and CSI-RS. Longer measurement period for SSB based BFD measurement is expected, and no requirements are defined. When the SSB and CSI-RS for BFD measurements are from different sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$, UE shall be able to perform measure both SSB and CSI-RS for BFD measurements.

For FR2, when the SSB for BFD measurement on one CC is in the same or adjacent OFDM symbol as SSB with a different PCI for RLM, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs with the two different PCIs. Longer measurement period for SSB based BFD is expected, and no requirements are defined.

For FR2, if the network configures same or mixed numerology between SSB for BFD measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, UE shall be able to perform the related SSB based measurements in one band without any measurement restrictions on the other band, provided that UE is capable of independent beam management on this FR2 band pair.

For FR2, when the SSB for BFD measurement in sets $\bar{q}_{0,1}$ or $\bar{q}_{1,1}$ fully or partially overlaps with the OFDM symbol as SSB for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap on candidate LTM neighbour cell in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based BFD is expected, and no requirements are defined.

## 8.18.3 Requirements for CSI-RS based beam failure detection

### 8.18.3.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$of resource configurations for a serving cell, provided that the CSI-RS resource(s) in two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$for beam failure detection are actually transmitted within the UE active DL BWP during the entire evaluation period specified in clause 8.18.3.2. UE is not expected to perform beam failure detection measurements on the CSI-RS configured for BFD if the CSI-RS is not QCL-ed, with QCL-TypeD when applicable, with the RS in the active TCI state of any CORESET configured in the UE active BWP.

**Table 8.18.3.1-1: PDCCH transmission parameters for beam failure instance**

| Attribute | Value for BLER |
|---|---|
| DCI format | 1-0 |
| Number of control OFDM symbols | 2 |
| Aggregation level (CCE) | 8 |
| Ratio of hypothetical PDCCH RE energy to average CSI-RS RE energy | 0 dB |
| Ratio of hypothetical PDCCH DMRS energy to average CSI-RS RE energy | 0 dB |
| Bandwidth (PRBs) | 48 |
| Sub-carrier spacing (kHz) | SCS of the active DL BWP |
| DMRS precoder granularity | REG bundle size |
| REG bundle size | 6 |
| CP length | Normal |
| Mapping from REG to CCE | Distributed |

## 8.18.3.2 Minimum requirement

UE shall be able to evaluate whether the downlink radio link quality on the CSI-RS resource in two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ estimated over the last $T_{Evaluate_BFD_CSI-RS}$ period becomes worse than the threshold $Q_{out_LR_CSI-RS}$ within $T_{Evaluate_BFD_CSI-RS}$ period.

The value of $T_{Evaluate_BFD_CSI-RS}$ is defined in table 8.18.3.2-1 for FR1.

The value of $T_{Evaluate_BFD_CSI-RS}$ is defined in table 8.18.3.2-2 for FR2 with N=1. The requirements of $T_{Evaluate_BFD_CSI-RS}$ apply provided that the CSI-RS for BFD is not in a resource set configured with repetition ON. The requirements shall not apply when the CSI-RS resource in the active TCI state of CORESET is the same CSI-RS resource for BFD and the TCI state information of the CSI-RS resource is not given, wherein the TCI state information means QCL Type-D to SSB for L1-RSRP or CSI-RS with repetition ON.

For UE supporting *musim-GapPreference-r17* and is configured with one or more per-UE periodic MUSIM gaps,

- P value for an BFD CSI-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0
- For a window W of duration max($T_{CSI-RS,}$ SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE periodic MUSIM gaps, per-UE measurement gaps and per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any configured BFD CSI-RS resource occasion:
  - $N_{total}$ is the total number of configured BFD CSI-RS resource occasions within the window, including those overlapped with MUSIM gap occasions or SMTC occasions within the window,
  - $N_{outside_MG}$ is the number of configured BFD CSI-RS resource occasions that are not overlapped with any MUSIM gap occasions within the window W,
  - $N_{available}$ is the number of configured BFD CSI-RS resource occasions that are not overlapped with any non-dropped MUSIM gap occasions nor any SMTC occasion within the window W, and
  - $T_{CSI-RS}$ is periodicity of the target CSI-RS resource for BFD.

    When the configured aperiodic MUSIM gap is overlapping with configured BFD CSI-RS resource occasions, longer evaluation period would be expected.

    Requirements in this clause do not apply when $N_{outside\ MG}$ = 0 due to fully overlapping between target CSI-RS resource for BFD and MUSIM gap occasions within the window W.

Otherwise, when UE is not configured with periodic MUSIM gap(s) or not supporting MUSIM gap capability,

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS.
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- P = 1, when the BFD-RS resource is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is not overlapped with SMTC occasion ($T_{CSI-RS} < MGRP$)
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).
- $P = P_{sharing\ factor}$, when the BFD-RS resource is not overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq MGRP$ or
  - $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$
- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when the BFD-RS resource is partially overlapped with measurement gap ($T_{CSI-RS} < MGRP$) and the BFD-RS resource is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.
- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when the BFD-RS resource is partially overlapped with measurement gap and the BFD-RS resource is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} < MGRP$)

where,

- $P_{sharing\ factor} = 1$, if the BFD-RS resource outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;
  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,
- $P_{sharing\ factor} = 3$, otherwise.

If the higher layer in TS 38.331 [2] signalling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

NOTE: The overlap between CSI-RS for BFD and SMTC means that CSI-RS for BFD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the BFD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer BFD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{BFD}$ used in table 8.18.3.2-1 and table 8.18.3.2-2 are defined as

- $M_{BFD}$ = 10, if the CSI-RS resource(s) in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ used for BFD is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{BFD}$ used in table 8.18.3.2-1 and table 8.18.3.2-2 are defined as

For each CSI-RS resource in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ configured for PCell or PSCell in EN-DC or NE-DC or SA; or PCell in NR-DC

- $P_{BFD}$ = 1.

For each CSI-RS resource in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ configured for PSCell in NR-DC

$P_{BFD}$ = 2 if UE is configured for beam failure detection on SCell, 1 otherwise.

For each CSI-RS resource in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ configured for a SCell

- $P_{BFD}$ = Z in EN-DC or NE-DC or SA.
- $P_{BFD}$ = 2* Z in NR-DC.

Where Z is the number of band(s) on which UE is performing beam failure detection only for SCell.

For UE not supporting *schedulingMeasurementRelaxation-r18* , the values of $P_{TRP}$ in table 8.18.3.2-2 is defined as 2, if SSB/CSI-RS resources in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ are overlapped, else it is 1.

For FR2-1, for UE supporting *schedulingMeasurementRelaxation-r18* according to the conditions described in clause 3.6.19,, the value of $P_{TRP}$ in table 8.18.3.2-2 is defined as 1, when:

- CSI-RS resources in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ are not overlapped, or
- CSI-RS resources in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$ are overlapped and the following conditions are met:
  - Both CSI-RSs are not in any CSI-RS resource set with repetition ON
  - The CSI-RS in set $\bar{q}_{0,0}$ has same QCL source as either
    - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
    - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and
  - the CSI-RS in set $\bar{q}_{0,1}$ has same QCL source as either
    - the active TCI state of a PDSCH scheduled in the same OFDM symbol or

- the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and

- Resources of the active TCI states of the two PDSCHs, or QCL sources of the default QCL assumption, or the active TCI state of PDSCH and QCL source of the default QCL assumption have been reported as a resource group in Rel-17 group-based RSRP report.

- else, the value of $P_{TRP}$ is 2.

**Table 8.18.2-1: Evaluation period $T_{Evaluate_BFD_CSI-RS}$ for FR1**

| Configuration | $T_{Evaluate_BFD_CSI-RS}$ (ms) |
|---|---|
| no DRX | $Max(50, Ceil(M_{BFD} \times P \times P_{BFD}) \times T_{CSI-RS})$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(1.5 \times M_{BFD} \times P \times P_{BFD}) \times Max(T_{DRX}, T_{CSI-RS}))$ |
| DRX cycle > 320 ms | $Ceil(M_{BFD} \times P \times P_{BFD}) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$. $T_{DRX}$ is the DRX cycle length. | |

**Table 8.18.3.2-2: Evaluation period $T_{Evaluate_BFD_CSI-RS}$ for FR2**

| Configuration | $T_{Evaluate_BFD_CSI-RS}$ (ms) |
|---|---|
| no DRX | $Max(50, Ceil(M_{BFD} \times P \times N \times P_{BFD}*P_{TRP}) \times T_{CSI-RS})$ |
| DRX cycle ≤ 320 ms | $Max(50, Ceil(1.5 \times M_{BFD} \times P \times N \times P_{BFD}*P_{TRP}) \times Max(T_{DRX}, T_{CSI-RS}))$ |
| DRX cycle > 320 ms | $Ceil(M_{BFD} \times P \times N \times P_{BFD}*P_{TRP}) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the two sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$. $T_{DRX}$ is the DRX cycle length. | |

### 8.18.3.3 Measurement restrictions for CSI-RS beam failure detection

The SSB mentioned in this clause can be associated with either the serving cell PCI or a PCI different from serving cell PCI or intra-frequency neighbor cell(s) configured with L1-RSRP measurement or inter-frequency neighbor cell(s) configured with L1-RSRP measurement without gap.

The UE is required to be capable of measuring CSI-RS for BFD without measurement gaps. The UE is required to perform the CSI-RS measurements with measurement restrictions as described in the following scenarios.

For both FR1 and FR2, when the CSI-RS for BFD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for BFD measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for BFD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

For FR2, when the CSI-RS for BFD measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.

For both FR1 and FR2, when the CSI-RS for BFD measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for BFD measurement in the PRBs that overlap with an SSB.

For FR1, when the CSI-RS for BFD measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support simultaneousRxDataSSB-DiffNumerology, UE is required to measure one of but not both CSI-RS for BFD measurement and SSB. Longer measurement period for CSI-RS based BFD is expected, and no requirements are defined.

For FR2, when the CSI-RS for BFD measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based BFD is expected, and no requirements are defined.

For FR2, when the CSI-RS for BFD measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for BFD measurement and the other CSI-RS. Longer measurement period for CSI-RS based BFD measurement is expected, and no requirements are defined.
  - The CSI-RS for BFD measurement or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS for BFD measurement without any restriction.

For FR2-1, there is no measurement restriction allowed for UE supporting *schedulingMeasurementRelaxation-r18* according to the conditions described in clause 3.6.19, and the UE is required to measure both the CSI-RS for BFD and the other CSI-RS for RLM, BFD or L1-RSRP measurement, provided the following conditions are met:

- Both CSI-RSs are not in any CSI-RS resource set with repetition ON, and
- One CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and
- the other CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 [26] clause 5.1.5, and
- Resources of the active TCI states of the two PDSCHs, or QCL sources of the default QCL assumption, or the active TCI state of PDSCH and QCL source of the default QCL assumption have been reported as a resource group in Rel-17 group-based RSRP report.

When two CSI-RSs for BFD measurements are from different sets $\bar{q}_{0,0}$ and $\bar{q}_{0,1}$, UE shall be able to perform measure both CSI-RSs for BFD measurements.

## 8.18.4 Minimum requirement for L1 indication

When more than one TRP is configured with different resource set for each TRP, requirements specified in clause 8.5.4 shall apply for each TRP.

## 8.18.5 Requirements for SSB based candidate beam detection

### 8.18.5.1 Introduction

The requirements in this clause apply for each SSB resource in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$configured for a serving cell, provided that the SSBs configured for candidate beam detection (CBD) are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.18.5.2. The SSB(s) in set $\bar{q}_{1,1}$ can be associated with an additional PCI other than serving PCI.

### 8.18.5.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured SSB resource in the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$,estimated over the last $T_{Evaluate_CBD_SSB}$ period becomes better than the threshold $Q_{in_LR}$ provided SSB_RP and SSB Ês/Iot are according to Annex table B.2.4.1 for a corresponding band.

The UE shall monitor the configured SSB resources using the evaluation period in table 8.18.5.2-1 and 8.18.5.2-2 corresponding to the non-DRX mode, if the configured DRX cycle $\leqslant$ 320 ms.

The value of $T_{Evaluate_CBD_SSB}$ is defined in table 8.18.5.2-1 for FR1.

The value of $T_{Evaluate_CBD_SSB}$ is defined in table 8.18.5.2-2 for FR2 with scaling factor N=8.

For UE supporting *musim-GapPreference-r17* and is configured with one or more per-UE periodic MUSIM gaps,

- P value for an CBD SSB resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0
- For a window W of duration max($T_{SSB,}$ SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE periodic MUSIM gaps, per-UE measurement gaps and per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any configured CBD SSB resource occasion:
  - $N_{total}$ is the total number of configured CBD SSB resource occasions within the window, including those overlapped with MUSIM gap occasions or SMTC occasions within the window,
  - $N_{outside_MG}$ is the number of configured CBD SSB resource occasions that are not overlapped with any MUSIM gap occasions within the window W,
  - $N_{available}$ is the number of configured CBD SSB resource occasions that are not overlapped with any non-dropped MUSIM gap occasions nor any SMTC occasion within the window W, and
  - $T_{SSB}$ is periodicity of the target SSB resource for CBD.

    When the configured aperiodic MUSIM gap is overlapping with configured CBD SSB resource occasions, longer evaluation period would be expected.

    Requirements in this clause do not apply when $N_{outside\ MG}$ = 0 due to fully overlapping between target SSB resource for CBD and MUSIM gap occasions within the window W.

Otherwise, when UE is not configured with periodic MUSIM gap(s) or not supporting MUSIM gap capability,

For FR1,

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB,
- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P = \frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{SSB}}{Min(MGRP,T_{SMTCperiod})}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} <$ MGRP)

where,

- $P_{sharing\ factor}$ = 1, if the candidate beam detection RS outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;

  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured

- $P_{sharing\ factor}$ = 3, otherwise.

  If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer CBD evaluation period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $P_{CBD}$ used in table 8.18.5.2-1 and table 8.18.5.2-2 are defined as

For each SSB resource in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ configured for PCell or PSCell in EN-DC or NE-DC or SA; or PCell in NR-DC

- $P_{CBD}$ = 1.

For each SSB resource in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ configured for PSCell in NR-DC

- $P_{CBD}$ = 2 if UE is configured for candidate beam detection on SCell, 1 otherwise.

For each SSB resource in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ configured for a SCell

- $P_{CBD}$ = Z in EN-DC or NE-DC or SA.
- $P_{CBD}$ = 2* Z in NR-DC.

  Where Z is the number of band(s) on which UE is performing candidate beam detection only for SCell

- $P_{CBD}$ is the number of band(s) on which UE is performing candidate beam detection only for SCell.

The value of $P_{TRP}$ used in table 8.18.5.2-2 is defined as 2, if SSB/CSI-RS resource in the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ are overlapped, else it is 1.

**Table 8.18.5.2-1: Evaluation period $T_{Evaluate_CBD_SSB}$ for FR1**

| Configuration | $T_{Evaluate_CBD_SSB}$ (ms) |
|---|---|
| non-DRX, DRX cycle ⩽ 320 ms | Max(25, Ceil($3 \times P \times P_{CBD}$) × $T_{SSB}$) |
| DRX cycle > 320 ms | Ceil($3 \times P \times P_{CBD}$) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$. $T_{DRX}$ is the DRX cycle length. | |

**Table 8.18.5.2-2: Evaluation period $T_{Evaluate_CBD_SSB}$ for FR2**

| Configuration | $T_{Evaluate_CBD_SSB}$ (ms) |
|---|---|
| non-DRX, DRX cycle ⩽ 320 ms | Max(25, Ceil($3 \times P \times N \times P_{CBD} \times P_{TRP}$) × $T_{SSB}$) |
| DRX cycle > 320 ms | Ceil($3 \times P \times N \times P_{CBD} \times P_{TRP}$) × $T_{DRX}$ |
| NOTE: $T_{SSB}$ is the periodicity of SSB in the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$. $T_{DRX}$ is the DRX cycle length. | |

### 8.18.5.3 Measurement restriction for SSB based candidate beam detection

For FR1, when the SSB for CBD measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for CBD measurement without any restrictions.
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for CBD measurement without any restriction.
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, when the SSB for CBD measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for CBD measurement and CSI-RS. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined. When the SSB and CSI-RS for CBD measurements are from different sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$, UE shall be able to measure both SSB and CSI-RS for CBD measurements.

For FR2, when the SSB for CBD measurement on one CC is in the same OFDM symbol as SSB with a different PCI for RLM, BFD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs with the two different PCIs. Longer measurement period for SSB based CBD measurement is expected, and no requirements are defined.

For FR2, if network configures same or mixed numerology between SSB for CBD measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, UE shall be able to perform the related SSB based measurements in one band without any measurement restrictions in the other band, provided that UE is capable of independent beam management on this FR2 band pair.

For FR2, when the SSB for CBD measurement in sets $\bar{q}_{0,1}$ or $\bar{q}_{1,1}$ fully or partially overlaps with the OFDM symbol as SSB for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap on candidate LTM neighbour cell on the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based CBD is expected, and no requirements are defined.

## 8.18.6 Requirements for CSI-RS based candidate beam detection

### 8.18.6.1 Introduction

The requirements in this clause apply for each CSI-RS resource in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ configured for a serving cell, provided that the CSI-RS resources configured for candidate beam detection are actually transmitted within UE active DL BWP during the entire evaluation period specified in clause 8.18.6.2.

### 8.18.6.2 Minimum requirement

Upon request the UE shall be able to evaluate whether the L1-RSRP measured on the configured CSI-RS resource in sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ estimated over the last $T_{Evaluate_CBD_CSI\text{-}RS}$ period becomes better than the threshold $Q_{in_LR}$ within $T_{Evaluate_CBD_CSI\text{-}RS}$ period provided CSI-RS Ês/Iot is according to Annex table B.2.4.2 for a corresponding band.

The UE shall monitor the configured CSI-RS resources using the evaluation period in tables 8.18.6.2-1 and 8.18.6.2-2 corresponding to the non-DRX mode, if the configured DRX cycle $\leqslant$ 320 ms.

The value of $T_{Evaluate_CBD_CSI\text{-}RS}$ is defined in table 8.18.6.2-1 for FR1.

The value of $T_{Evaluate_CBD_CSI\text{-}RS}$ is defined in table 8.18.6.2-2 for FR2 with scaling factor N=8.

For UE supporting *musim-GapPreference-r17* and is configured with one or more per-UE periodic MUSIM gaps,

- P value for an CBD CSI-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0
- For a window W of duration max($T_{CSI\text{-}RS,}$ SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE periodic MUSIM gaps, per-UE measurement gaps and per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any configured CBD CSI-RS resource occasion:
  - $N_{total}$ is the total number of configured CBD CSI-RS resource occasions within the window, including those overlapped with MUSIM gap occasions or SMTC occasions within the window,
  - $N_{outside_MG}$ is the number of configured CBD CSI-RS resource occasions that are not overlapped with any MUSIM gap occasions within the window W,
  - $N_{available}$ is the number of configured CBD CSI-RS resource occasions that are not overlapped with any non-dropped MUSIM gap occasions nor any SMTC occasion within the window W, and
  - $T_{CSI\text{-}RS}$ is periodicity of the target CSI-RS resource for CBD.

    When the configured aperiodic MUSIM gap is overlapping with configured CBD CSI-RS resource occasions, longer evaluation period would be expected.

    Requirements in this clause do not apply when $N_{outside\ MG}$ = 0 due to fully overlapping between target CSI-RS resource for CBD and MUSIM gap occasions within the window W.

Otherwise, when UE is not configured with periodic MUSIM gap(s) or not supporting MUSIM gap capability,

For FR1,

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and

- P = 1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- P = 1, when candidate beam detection RS is not overlapped with measurement gap and also not overlapped with SMTC occasion.

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$ when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is not overlapped with SMTC occasion ($T_{CSI-RS} < MGRP$)

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).

- $P = P_{sharing\ factor}$, when candidate beam detection RS is not overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$,, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq MGRP$ or

  - $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} < 0.5 \times T_{SMTCperiod}$

- $P = \frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} = 0.5 \times T_{SMTCperiod}$

- $P = \frac{1}{1-\frac{T_{CSI-RS}}{Min(MGRP,T_{SMTCperiod})}}$, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap

- $P = \frac{3}{1-\frac{T_{CSI-RS}}{MGRP}}$,, when candidate beam detection RS is partially overlapped with measurement gap and candidate beam detection RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} < MGRP$)

where,

- $P_{sharing\ factor} = 1$, if the candidate beam detection RS outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and;

  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor} = 3$, otherwise.

If the higher layer in TS 38.331 [2] signalling of *smtc2* is present, $T_{SMTCperiod}$ follows *smtc2*; Otherwise $T_{SMTCperiod}$ follows *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

NOTE: The overlap between CSI-RS for CBD and SMTC means that CSI-RS for CBD is within the SMTC window duration.

Longer evaluation period would be expected if the combination of the CBD-RS resource, SMTC occasion and measurement gap configurations does not meet previous conditions.

Longer evaluation period would be expected if the CSI-RS is on the same OFDM symbols with RLM, BFD, BM-RS, or other CBD-RS, according to the measurement restrictions defined in clause 8.18.6.3.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer CBD evaluation period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

The values of $M_{CBD}$ used in table 8.18.6.2-1 and table 8.18.6.2-2 are defined as

- $M_{CBD}$ = 3, if the CSI-RS resource configured in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ is transmitted with Density = 3 and over the bandwidth $\geqslant$ 24 PRBs.

The values of $P_{CBD}$ used in table 8.18.6.2-1 and table 8.18.6.2-2 are defined as

For each CSI-RS resource in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ configured for PCell or PSCell in EN-DC or NE-DC or SA; or PCell in NR-DC

- $P_{CBD}$ = 1.

For each CSI-RS resource in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ configured for PSCell in NR-DC

- $P_{CBD}$ = 2 if UE is configured for candidate beam detection on SCell, 1 otherwise.

For each CSI-RS resource in the sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ configured for a SCell

- $P_{CBD}$ = Z in EN-DC or NE-DC or SA.
- $P_{CBD}$ = 2* Z in NR-DC.

  Where Z is the number of band(s) on which UE is performing candidate beam detection only for SCell
- $P_{CBD}$ is the number of band(s) on which UE is performing candidate beam detection only for SCell.

The value of $P_{TRP}$ used in table 8.18.6.2-2 is defined as 2, if SSB/CSI-RS resource in the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$ are overlapped, else it is 1.

**Table 8.18.6.2-1: Evaluation period $T_{Evaluate_CBD_CSI-RS}$ for FR1**

| Configuration | $T_{EvaluateC_CBD_CSI-RS}$ (ms) |
|---|---|
| non-DRX, DRX cycle $\leqslant$ 320 ms | $Max(25, Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{CSI-RS})$ |
| DRX cycle > 320 ms | $Ceil(M_{CBD} \times P \times P_{CBD}) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$. $T_{DRX}$ is the DRX cycle length. | |

**Table 8.18.6.2-2: Evaluation period $T_{Evaluate_CBD_CSI-RS}$ for FR2**

| Configuration | $T_{Evaluate_CBD_CSI-RS}$ (ms) |
|---|---|
| non-DRX, DRX cycle $\leqslant$ 320 ms | $Max(25, Ceil(M_{CBD} \times P \times N \times P_{CBD} \times P_{TRP}) \times T_{CSI-RS})$ |
| DRX cycle > 320 ms | $Ceil(M_{CBD} \times P \times N \times P_{CBD} \times P_{TRP}) \times T_{DRX}$ |
| NOTE: $T_{CSI-RS}$ is the periodicity of CSI-RS resource in the two sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$. $T_{DRX}$ is the DRX cycle length. | |

### 8.18.6.3 Measurement restriction for CSI-RS based candidate beam detection

The SSB mentioned in this clause can be associated with either the serving cell PCI or a PCI different from serving cell PCI or intra-frequency neighbor cell(s) configured with L1-RSRP measurement or inter-frequency neighbor cell(s) configured with L1-RSRP measurement without gap.

For both FR1 and FR2, when the CSI-RS for CBD measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for CBD measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for CBD measurement, the UE shall be able to perform CSI-RS based CBD measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS based CBD measurement for without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for CBD measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for CBD measurement without any restriction.

For FR2, when the CSI-RS for CBD measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer evaluation period for CSI-RS based CBD measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for CBD measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and the other CSI-RS. Longer evaluation period for CSI-RS based CBD measurement is expected, and no requirements are defined. When two CSI-RSs for CBD measurements are from different sets $\bar{q}_{1,0}$ and $\bar{q}_{1,1}$, UE shall be able to measure both CSI-RSs for CBD measurements.

For both FR1 and FR2, when the CSI-RS for CBD measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for CBD measurement in the PRBs that overlap with an SSB.

For FR1, when the CSI-RS for CBD measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support simultaneousRxDataSSB-DiffNumerology, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD is expected, and no requirements are defined.

For FR2, when the CSI-RS for CBD measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for CBD measurement and SSB. Longer measurement period for CSI-RS based CBD is expected, and no requirements are defined.

## 8.18.7 Requirements for TRP specific Beam Failure Recovery

### 8.18.7.1 Introduction

For the UE provided with a configuration of PUCCH transmission with a link recovery request (LRR) as described in clause 9.2.4 in TS 38.213 [3], if beam recovery procedure is triggered for any of the TRPs, the UE shall transmit SR for

UL resource followed by MAC CE providing beam index for the corresponding TRP whose radio link quality is worse than $Q_{out,LR}$. The index, $q_{new}$, provided in the TRP specific BFR MAC CE is provided by higher layer for a periodic CSI-RS configuration or for a SSB, as described in clause 5.17 of TS 38.321 [7].

For the UE not provided with a configuration of PUCCH transmission with a link recovery request (LRR) as described in clause 9.2.4 in TS 38.213 [3], if beam recovery procedure is triggered for any of TRPs, the UE shall transmit preamble for UL-SCH resource application, followed by MAC CE providing one index for the corresponding TRP whose radio link quality is worse than $Q_{out,LR}$, and the index $q_{new}$ for a periodic CSI-RS configuration or for a SSB provided by higher layer, as described in clause 5.17 of TS 38.321 [7], if any, for a corresponding TRP.

### 8.18.7.2 Requirement

Provided that UE is configured by *schedulingRequestID-BFR-r17* and/or *schedulingRequestID-BFR2-r17*for BFR set 1 (i.e., TRP1) and BFR set 2 (i.e., TRP2) respectively, a configuration for LRR in a PUCCH transmission, after BFR is triggered on any of the TRPs as described in clause 5.17 of TS 38.321 [7], UE shall be capable of transmit PUCCH with a LRR within a period of T on any of the TRPs where BFR running.Where:

- $T = T_1 \times Ceil((T_2+D)/T_1)$ in which $T_1$, $T_2$ and D are defined as
  - $T_1$ is equal to the periodicity of PUCCH configured with *schedulingRequestID-BFR-r17 for* BFR set 1 schedulingRequestID-BFR2-r17 for BFR set 2..
  - $T_2 = T_{Evaluate_CBD}$ is the evaluation period specified in clause 8.18.5 or 8.18.6 for SSB or CSI-RS based candidate beam detection, that is $T_{Evaluate_CBD_SSB}$ or $T_{Evaluate_CBD_CSI-RS}$, depending on the applicable reference signal configured for candidate beam detection.
  - D = [2 ms] is the UE Processing time.

## 8.18.8 Scheduling availability of UE during TRP specific beam failure detection

Scheduling availability restrictions when the UE is performing TRP specific beam failure detection are described in the following clauses.

### 8.18.8.1 Scheduling availability of UE performing TRP specific beam failure detection with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to TRP specific beam failure detection performed on SSB and CSI-RS configured for BFD with the same SCS as PDSCH or PDCCH in FR1.

### 8.18.8.2 Scheduling availability of UE performing TRP specific beam failure detection with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to TRP specific beam failure detection when SSB is configured as BFD. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to TRP specific beam failure detection when SSB is configured as BFD.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for TRP specific beam failure detection.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on FR1 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols. When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which PCell or PSCell is configured.

### 8.18.8.3 Scheduling availability of UE performing TRP specific beam failure detection on FR2

The following scheduling restriction applies due to TRP specific beam failure detection.

- For FR2-1, for UE supporting *schedulingMeasurementRelaxation-r18* according to the conditions described in clause 3.6.19, there are no scheduling restrictions due to TRP specific beam failure detection performed based on the CSI-RS if the following conditions are met:
  - The CSI-RS is not in a CSI-RS resource set with repetition ON.
  - The CSI-RS has same QCL source as the active TCI state of one of the PDSCHs and has different QCL-TypeD from the other PDSCH.
  - The CSI-RS and both of the PDSCHs are on the same OFDM symbol(s), or the CSI-RS and one of the PDSCHs with different QCL typeD are on the same OFDM symbol(s) when partially overlapping PDSCHs are scheduled, and
  - Resources of the active TCI states for the two PDSCHs have been reported as a resource group in Rel-17 group-based RSRP report.
  - Otherwise
  - The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH or CSI-RS for tracking or CSI-RS for CQI on BFD-RS resource symbols to be measured for TRP specific beam failure detection.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions on FR2 serving PCell or PSCell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to beam failure detection performed on FR2 serving cell(s) in different band(s), provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for BFD measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for BFD measurement.

#### 8.18.8.4 Scheduling availability of UE performing TRP specific beam failure detection on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to TRP specific beam failure detection performed on FR2 serving PCell and/or PSCell.

There are no scheduling restrictions on FR2 serving cell(s) due to TRP specific beam failure detection performed on FR1 serving PCell and/or PSCell.

### 8.18.9 Scheduling availability of UE during TRP specific candidate beam detection

Scheduling availability restrictions when the UE is performing L1-RSRP measurement for TRP specific candidate beam detection are described in the following clauses.

### 8.18.9.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as TRP specific link recovery detection resource with the same SCS as PDSCH or PDCCH in FR1.

### 8.18.9.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as TRP specific link recovery detection resource. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured as TRP specific link recovery detection resource.

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, TRS, CSI-RS for tracking or CSI-RS for CQI on SSB symbols to be measured for L1-RSRP.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on one serving cell apply to all other serving cells in the same band on the symbols that fully or partially overlap with the restricted symbols. When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands.

### 8.18.9.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to TRP specific candidate beam detection

- The UE is not expected to transmit PUCCH, PUSCH or SRS or receive PDCCH, PDSCH, CSI-RS for tracking or CSI-RS for CQI on reference symbols to be measured for TRP specific candidate beam detection.

When intra-band carrier aggregation in FR2 is configured, the scheduling restrictions on to one serving cell apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to candidate beam detection performed on FR2 serving cell(s) in different band(s), provided that the FR2 serving cell(s) and the FR2 serving cell(s) for candidate beam detection are in a FR2 band pair and UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

For FR2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE’s reception of PDCCH that UE monitors in the Type2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for CBD mesurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for CBD mesurement.

### 8.18.9.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA and NR-DC

There are no scheduling restrictions on FR1 serving cell(s) due to L1-RSRP measurement performed on FR2 serving cell(s).

There are no scheduling restrictions on FR2 serving cell(s) due to L1-RSRP measurement performed on FR1 serving cell(s).

# 8.19 Pre-configured measurement gap activation/deactivation delay

## 8.19.1 Introduction

The requirements in this clause apply for a UE configured with PCell or any activated SCell in standalone NR.

UE shall complete the activation/deactivation of pre-configured measurement gap within the delay defined in this clause.

## 8.19.2 Pre-configured measurement gap activation/deactivation upon DCI/timer-based BWP switch

### 8.19.2.1 Activation/deactivation upon DCI/timer-based BWP switch delay on a single CC

The requirements in this clause only apply to the case that the DCI/timer-based BWP switch is performed on a single CC with more than one BWP configurations configured on the CC.

When BWP switch occurs, which results in status change of pre-configured measurement gap according to clause 9.1.7, UE shall be able to finish pre-configured measurement gap activation or deactivation within 5 ms after the completion of the active BWP switch. The active BWP switch delay for single CC is defined in clause 8.6.2. Activation/deactivation of Pre-MG takes effect from the first complete MG occasion after the activation and deactivation delay. If the end of activation/deactivation of Pre-MG is within a Pre-MG gap occasion, the Pre-MG status shall not be changed immediately. Instead, the Pre-MG status shall be changed prior to the next Pre-MG gap occasion.

## 8.19.3 Pre-configured measurement gap activation/deactivation upon SCell activation/deactivation

The requirements in this clause apply when one SCell or multiple SCells are activated/deactivated.

When one SCell or multiple SCells are activated/deactivated, which results in status change of pre-configured measurement gap according to clause 9.1.7, UE shall be able to finish pre-configured measurement gap activation or deactivation within 5 ms after the completion of SCell(s) activation/deactivation. The SCell(s) activation/deactivation delay for is defined in clause 8.3. Activation/deactivation of Pre-MG takes effect from the first complete MG occasion after the SCell(s) activation/deactivation delay. If the end of activation/deactivation of Pre-MG is within a Pre-MG gap occasion, the Pre-MG status shall not be changed immediately. Instead, the Pre-MG status shall be changed prior to the next Pre-MG gap occasion.

## 8.19.4 Pre-configured measurement gap activation/deactivation upon RRC reconfiguration

The requirements in this clause apply when UE is triggered by the RRC based events defined in clause 9.1.7.3.1 if UE supports autonomous activation/deactivation mechanism and/or in clause 9.1.7.3.2 if UE supports network-controlled activation/deactivation mechanism.

If the aforementioned RRC reconfiguration results in status change of pre-configured measurement gap according to clause 9.1.7, UE shall be able to finish pre-configured measurement gap activation or deactivation within 5 ms after RRC processing delay specified in [2]. If the end of activation/deactivation of Pre-MG is within a Pre-MG gap occasion, the Pre-MG status shall not be changed immediately. Instead, the Pre-MG status shall be changed prior to the next Pre-MG gap occasion.

## 8.19.5 Activation/deactivation delay requirements for concurrent measurement gaps with Pre-MG

The requirements in this clause apply to a UE supporting *concurrentMeasGapsPreMG-r18* and configured with concurrent measurement gaps with Pre-MG.

#### 8.19.5.1 Activation/deactivation delay requirements for non-overlapped activation/deactivation of concurrent measurement gaps with Pre- MG

The requirements in this clause only apply when the activation/deactivation procedures of the individual pre-configured measurement gaps do not overlap in time.

When concurrent measurement gaps with Pre-MG activation/deactivation procedure are non-overlapped upon DCI/timer-based BWP switch, upon SCell activation/deactivation or upon RRC reconfiguration, for each individual pre-configured measurement gap, the requirements defined in clauses 8.19.2, 8.19.3 and 8.19.4 apply.

#### 8.19.5.2 Activation/deactivation delay requirements for fully overlapped activation/deactivation of concurrent measurement gaps with Pre- MG

The requirements in this clause only apply when the activation/deactivation procedures of the individual pre-configured measurement gaps fully overlap in time.

Fully overlapped activation/deactivation of pre-configured measurement gaps can occur in the following cases:

- Both pre-configured measurement gaps are triggered by the same event.
- Two pre-configured measurement gaps are triggered by two events of the same type at the same time.

When concurrent measurement gaps with Pre-MG are activated/deactivated simultaneously, the activation/deactivation delay equals the delay requirements defined in clauses 8.19.2, 8.19.3, and 8.19.4 for DCI/timer-based BWP switch, SCell activation/deactivation or RRC reconfiguration triggered activation/deactivation, respectively, plus an additional 2 ms post-processing time.

#### 8.19.5.3 Pre-MG activation/deactivation delay when colliding with a concurrent measurement gap

When the activation/deactivation procedure of a pre-configured measurement gap collides with a concurrent measurement gap occasion, the requirements defined in clause 9.1.12.4 apply.

The endpoint of Pre-MG activation/deactivation is equal to the finalization of the pre-configured measurement gap activation/deactivation as defined in clauses 8.19.2, 8.19.3 and 8.19.4 for DCI/timer-based BWP switch, SCell activation/deactivation or RRC reconfiguration triggered activation/deactivation, respectively, without overlap of the Pre-MG activation/deactivation procedure with a Pre-MG occasion.

## 8.19D Pre-configured measurement gap activation/deactivation delay for ATG

### 8.19D.1 Introduction

The requirements in this clause apply for an ATG UE configured with PCell or any activated SCell in standalone NR.

UE shall complete the activation/deactivation of pre-configured measurement gap within the delay defined in this clause.

### 8.19D.2 Pre-configured measurement gap activation/deactivation upon DCI/timer-based BWP switch

#### 8.19D.2.1 Activation/deactivation upon DCI/timer-based BWP switch delay on a single CC

The requirements in this clause shall apply only for FR1 and NR SA operation mode without considering DC and inter RAT measurement.

The requirements in this clause only apply to the case that the DCI/timer-based BWP switch is performed on a single CC with more than one BWP configurations configured on the CC.

When BWP switch occurs, which results in status change of pre-configured measurement gap according to clause 9.1D.7, UE shall be able to finish pre-configured activation or deactivation within 5 ms after the completion of the active BWP switch. The active BWP switch delay for single CC is defined in clause 8.6D.2. Activation/deactivation of Pre-MG takes effect from the first complete MG occasion after the activation and deactivation delay. If the end of activation/deactivation of Pre-MG is within a gap occasion, the Pre-MG status shall not be changed immediately. Instead, the Pre-MG status shall be changed prior to the next gap occasion.

### 8.19D.3 Pre-configured measurement gap activation/deactivation upon RRC reconfiguration

The requirements in this clause shall apply only for FR1 and NR SA operation mode without considering DC and inter RAT measurement.

The requirements in this clause apply when UE capable of autonomous activation/deactivation mechanism or network-controlled activation/deactivation mechanism receives RRC reconfiguration to:

- Add/remove of any measurement object(s), or
- Switch active BWP or update parameters of its active BWP.

If the aforementioned RRC reconfiguration results in status change of pre-configured measurement gap according to clause 9.1D.7, UE shall be able to finish pre-configured activation or deactivation within 5 ms after RRC processing delay specified in [2]. If the end of activation/deactivation of Pre-MG is within a gap occasion, the Pre-MG status shall not be changed immediately. Instead, the Pre-MG status shall be changed prior to the next gap occasion.

### 8.19D.4 Pre-configured measurement gap activation/deactivation upon SCell activation/deactivation

The requirements in this clause apply when one SCell is activated/deactivated.

When one SCell is activated/deactivated, which results in status change of pre-configured measurement gap according to clause 9.1D.7, UE shall be able to finish pre-configured measurement gap activation or deactivation within 5 ms after the completion of SCell(s) activation/deactivation. The SCell(s) activation/deactivation delay is defined in clause 8.3D. Activation/deactivation of Pre-MG takes effect from the first complete MG occasion after the SCell(s) activation/deactivation delay. If the end of activation/deactivation of Pre-MG is within a Pre-MG gap occasion, the Pre-MG status shall not be changed immediately. Instead, the Pre-MG status shall be changed prior to the next Pre-MG gap occasion.

## 8.20 LTM PSCell Cell Switch

### 8.20.1 Introduction

The purpose of LTM cell switch is to switch the PCell or PSCell to another cell. The requirements in this clause are applicable to LTM PSCell switch.

The requirements in this clause are applicable to both intra-frequency and inter-frequency LTM cell switch.

The requirements for inter-frequency cell switch in this clause are only applicable, when

- network has configured UE to perform SSB based L3 measurement with beam measurement reporting or L1 measurement for the target cell before cell switch command, or
- the SFN of the serving cell from which cell switch command is received and the SFN of the target cell are the same.

The requirements in this clause are applicable to NR-DC for the following scenarios:

PSCell switch to a neighbouring LTM candidate cell

- FR1 cell to FR1 cell
- FR1 cell to FR2 cell
- FR2 cell to FR2 cell
- FR2 cell to FR1 cell

PSCell switch to an LTM candidate cell that is a serving SCell in SCG

- FR1 cell to FR1 cell
- FR2 cell to FR2 cell

The requirements in this section apply when

- the target cell is known, and
  - the target joint UL/DL TCI state or separate UL and DL TCI states in the MAC-CE LTM cell switch command are known, or
  - the target cell is an FR1 cell, and the UE has reported L3-RSRP measurement result with SSB index associated to the target TCI state within 5 seconds before receiving the LTM TCI state activation command, and SNR of the SSB associated to the target TCI state ≥ -3dB, or
  - the target cell is an FR1 cell, and the UE is configured with event-triggered L1 measurement reporting and report on leave, and the UE has sent an event-triggered L1 measurement report with RS associated to the target TCI state and has not sent report on leave for the same RS before receiving the cell switch command.
- PL-RS is QCLed with RS of the TCI state indicated by LTM cell switch command, and
- For CFRA cell switch, RS of the TCI state indicated by LTM cell switch command is QCLed with the SSB indicated for CFRA.

The definition of known LTM target cell and the definition of known target joint DL/UL TCI state or separate DL and UL TCI states are as stated in clause 6.3.1.2.

### 8.20.2 LTM Cell Switch delay

LTM cell switch delay $D_{LTM}$ is the delay from the end of the last TTI containing the MAC-CE command for cell switch until the time the UE transmits the first UL message on the target cell.

LTM cell switch delay is defined as:

$$D_{LTM} = T_{cmd} + T_{LTM\text{-}RRC\text{-}processing} + T_{LTM\text{-}processing} + T_{first\text{-}RS} + T_{RS\text{-}proc} + T_{LTM\text{-}IU} \text{ ms}$$

Where:

$T_{cmd}$, $T_{LTM\text{-}RRC\text{-}processing}$, $T_{LTM\text{-}processing}$, $T_{first\text{-}RS}$, $T_{RS\text{-}proc}$ and $T_{LTM\text{-}IU}$ are as stated in clause 6.3.1.2.

### 8.20.3 Void

## 8.21 Active downlink TCI state switching delay for unified TCI for single-DCI mTRP

### 8.21.1 Introduction

The requirements in this clause apply for a UE configured with *dl-OrJointTCI-StateList* configurations for DL channels on a serving cell and UE reports its capability of S-DCI based MTRP. Further the requirements also apply for all the list of serving cells in *simultaneousU-TCI-UpdateList1, simultaneousU-TCI-UpdateList2, simultaneousU-TCI-UpdateList3,*

*simultaneousU-TCI-UpdateList4* in MR-DC or standalone NR provided all serving cells in the list are configured with the same serving cell and BWP in *unifiedTCI-StateRef-r17*. UE shall complete the switch of active downlink TCI state within the delay defined in this clause.

## 8.21.2 Known conditions for downlink TCI state

The downlink TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target downlink TCI state to the completion of active downlink TCI state switch, where the RS resource for L1-RSRP measurement is the RS in target downlink TCI state or QCLed to the target downlink TCI state
  - Downlink TCI state switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target downlink TCI state before the downlink TCI state switch command
  - The target downlink TCI state remains detectable during the downlink TCI state switching period
  - The SSB associated with the downlink TCI state remain detectable during the downlink TCI switching period
    - SNR of the downlink TCI state ≥ -3 dB
    - The SSB can be associated with the serving cell PCI.

Otherwise, the downlink TCI state is unknown.

## 8.21.3 MAC-CE based downlink TCI state switch delay

The requirements in this clause shall apply for DL TCI state switch using separate DL TCI state or joint TCI state of unified TCI state switch framework and having two indicated TCI states.

In case of joint TCI state based dual TCI state switch, if the target PL-RS is not maintained, UE is not expected to receive on DL based on the target TCI state before UE completes the DL and UL TCI state switch of both TRPs. In case of single TCI state switch requirements specified in clause 8.15.3 apply.

If both the target TCI states are known, upon receiving PDSCH carrying MAC-CE activation command in slot n, UE shall be able to receive UE-dedicated PDCCH/PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ max{$TO_{k1}$*($T_{first\text{-}SSB1}$ + $AD_1$*$T_{SSB1}$ + $T_{SSB\text{-}proc}$), $TO_{k2}$*($T_{first\text{-}SSB2}$ + $AD_2$*$T_{SSB2}$ + $T_{SSB\text{-}proc}$)} / NR slot length.

Among the dual target TCI states indicated for switch, if the one of the target TCI state is unknown, upon receiving PDSCH carrying MAC-CE activation command in slot n, UE shall be able to receive UE-dedicated PDCCH/PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ + $T_{L1\text{-}RSRP1}$ + max {$TO_{uk1}$*($T_{first\text{-}SSB1}$+ $AD_1$*$T_{SSB1}$ + $T_{SSB\text{-}proc}$), $TO_{k2}$*($T_{first\text{-}SSB2}$ + $T_{SSB\text{-}proc}$)} / *NR slot length*.

If the both of the dual target TCI state are unknown, upon receiving PDSCH carrying MAC-CE activation command in slot n, UE shall be able to receive UE-dedicated PDCCH/PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ +$3N_{slot}^{subframe,\mu}$ + max{$T_{L1\text{-}RSRP1}$ +$TO_{uk1}$*($T_{first\text{-}SSB1}$+ $T_{SSB\text{-}proc}$), $T_{L1\text{-}RSRP2}$ +$TO_{uk2}$*($T_{first\text{-}SSB2}$+ $T_{SSB\text{-}proc}$)} / *NR slot length*. The UE shall be able to receive UE-dedicated PDCCH/PDSCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$ .

Where

- $T_{HARQ}$ (in slot) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];
- $T_{first\text{-}SSB1}$ is time to first SSB transmission of first TCI states of the pair of TCI states after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state; $T_{first\text{-}SSB2}$ is time to first SSB transmission of second TCI states of the pair of TCI states after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state
- $T_{SSB\text{-}proc}$ = 2 ms;

- $TO_{k1}$ = 1 if first target TCI state is not in the active TCI state list for PDSCH/PDCCH, 0 otherwise.
- $TO_{k2}$ = 1 if second target TCI state is not in the active TCI state list for PDSCH/PDCCH, 0 otherwise.
- $AD_1$ = 1 if SSBs are adjacent in FR2 and $T_{SSB1} = T_{SSB2}$ ; 0 otherwise
- $AD_2$ = 1 if SSBs are adjacent in FR2 and $T_{SSB2} = T_{SSB1}$ ; 0 otherwise
- $T_{L1\text{-}RSRP1}$ = 0 for the first TCI state and $T_{L1\text{-}RSRP2}$ = 0 for the second TCI state in FR1 or when the TCI state switching not involving QCL-TypeD in FR2. Otherwise,
- $T_{L1\text{-}RSRP1}$ for the first TCI state and $T_{L1\text{-}RSRP2}$ for the second TCI state are the time for Rx beam refinement in FR2, defined as
- $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ for SSB as specified in clause 9.5.4.1,
  - with the assumption of M=1
  - with $T_{Report}$ = 0
- $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for CSI-RS as specified in clause 9.5.4.2
  - CSI-RS based L1-RSRP measurement only apply for TCI state switch when source RS is associated with serving cell
  - configured with higher layer parameter *repetition* set to ON
  - with the assumption of M=1 for periodic CSI-RS
  - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
  - with $T_{Report}$ = 0
- $TO_{uk1}$ is for the first TCI state and $TO_{uk2}$ is for the second TCI state. $TO_{uk1}$ and $TO_{uk2}$ = 1 for CSI-RS based L1-RSRP measurement, and are 0 for SSB based L1-RSRP measurement when TCI state switching involves QCL-TypeD
- $TO_{uk1}$ = 1 and $TO_{uk2}$ = 1when TCI state switching involves QCL types other than QCL-TypeD
- $T_{first\text{-}SSB1}$ is time to first SSB transmission of first TCI states of the pair of TCI states after L1-RSRP measurement when TCI state switching involves QCL-TypeD; $T_{first\text{-}SSB2}$ is time to second SSB transmission of first TCI states of the pair of TCI states after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{first\text{-}SSB1}$ is time to first SSB transmission of first TCI states of the pair of TCI states after MAC CE command is decoded by the UE for QCL types other than QCL-TypeD; $T_{first\text{-}SSB2}$ is time to second SSB transmission of first TCI states of the pair of TCI states after MAC CE command is decoded by the UE for QCL types other than QCL-TypeD;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

In FR2 if both of the target TCI states are unknown and the SSBs are adjacent, longer delay is expected.

## 8.21.4 DCI based downlink TCI state switch delay

When a UE is configured with the higher layer parameter with *dl-OrJointTCI-StateList* or *TCI-UL-State*, activated with TCI states for downlink transmission by MAC CE indication of more than one codepoints, and receives DCI format 1_1/1_2 with or without DL assignment providing indicated two TCI-States or TCI state pair in the active TCI list for a CC, the UE transmits a PUCCH with HARQ-ACK information corresponding to the DCI carrying the TCI-State indication. Requirements in clause 8.15.4 apply.

## 8.21.5 Active Downlink TCI state list update delay

The requirements specified in this clause are applicable if

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', and a MAC CE activates more than one target separate TCIs, and at least one DL TCI is included, or

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', and a MAC CE activates more than one target joint TCI.

If all the target TCI states in the active TCI state list are known, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + TO_k*(T_{first\text{-}SSB_List} + T_{SSB\text{-}proc}) / \textit{NR slot length}.$$

If a subset of the target TCI states in the active TCI state list are unknown, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + (T_{L1\text{-}RSRP_list} + TO_{uk}*(T_{first\text{-}SSB_List} + T_{SSB\text{-}proc})) / \textit{NR slot length}.$$

If all target TCI states in the active TCI state list are unknown, the requirements specified in this clause are not applicable.

Where

- $T_{L1\text{-}RSRP_List}$ is the longest L1 measurement time ($T_{L1\text{-}RSRP}$) of the source RS among the unknown target TCI states, where $T_{L1\text{-}RSRP}$ is specified in clause 8.21.3

- $T_{first\text{-}SSB_List}$ is the $T_{first\text{-}SSB}$ from serving cell

- $T_{HARQ}$, $T_{first\text{-}SSB}$, $T_{SSB\text{-}proc}$ , $TO_k$, $TO_{uk}$ are defined in clause 8.21.3. $T_{SSB}$ is the SSB periodicity.

When UE receives PDSCH carrying MAC-CE for active TCI state list update, and

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', or

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', while the target TCI list comprises at least one DL TCIs and at least one UL TCIs,

UE is not expected to receive on DL based on the target TCI state before UE completes the DL and UL TCI state list update.

# 8.22 Active downlink TCI state switching delay for unified TCI for multi-DCI mTRP

## 8.22.1 Introduction

The requirements in this clause apply for a UE configured with two different values of *CORESETPoolIndex* in ControlResourceSet with *dl-OrJointTCI-StateList* configurations for DL channels on a serving cell. Further, the requirements apply for a UE not configured with 2 TAs or for a UE configured with 2 TAs in FR1 or for a UE configured with 2 TAs in FR2 if RTD<CP. Further the requirements also apply for all the list of serving cells in *simultaneousU-TCI-UpdateList1, simultaneousU-TCI-UpdateList2, simultaneousU-TCI-UpdateList3, simultaneousU-TCI-UpdateList4* in MR-DC or standalone NR provided all serving cells in the list are configured with the same serving cell and BWP in *unifiedTCI-StateRef-r17*. UE shall complete the switch of active downlink TCI state within the delay defined in this clause. The requirements apply when UE is not expected to receive simultaneously from two different QCL-D sources in FR2. The requirements are applicable to each TRP independently.

When the target DL TCI state refers to an additional PCI different from the serving cell PCI in which this DL TCI-State is configured, the requirements in this clause are applicable provided that following conditions are met:

- Active BWP of the serving cell and a cell with the additional PCI are the same

- Center frequency, SCS and SFN offset of a cell with the additional PCI are as the same as serving cell - The cell with the additional PCI is known to the UE.

A cell with the additional PCI is known if the following conditions are met:

- During the last 5 s before L1-RSRP measurement is configured, the UE has sent a valid L3 measurement report for the cell with the additional PCIY
- Timing offset between serving cell and the cell with the additional PCI is within CP of the corresponding SCS, except when UE supports RTD>CP with 2 TAs

Otherwise, the cell with the additional PCI is unknown.

## 8.22.2 Known conditions for downlink TCI state

The downlink TCI state is known if the conditions in clause 8.15.2 are met.

## 8.22.3 MAC-CE based downlink TCI state switch delay

If the MAC-CE from two TRPs indicating TCI state switch are not overlapped, requirements specified in clause 8.15.3 are applicable for each target TCI state switch.

The requirements in this clause shall apply for DL TCI state switch using separate DL TCI state or joint TCI state of unified TCI state switch framework.

In case that source RS in DL TCI state or joint TCI state is associated with a PCI different from that of the serving cell, the requirements in this clause shall apply if the cell with different PCI satisfies the known cell condition defined in clause 8.15.1. If the known cell condition is not met, longer delay may be expected.

In case of joint TCI state switch, if the target PL-RS is not maintained, UE is not expected to receive on DL based on the target TCI state before UE completes the DL and UL TCI state switch.

Upon receiving PDSCH carrying MAC-CE activation command in slot n, if the target TCI state is known, the UE shall be able to receive UE-dedicated PDCCH/PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$+ $TO_k$*($T_{first\text{-}SSB}$ + $T_{SSB\text{-}proc}$+ OL*$T_{SSB}$) / *NR slot length*.

Upon receiving PDSCH carrying MAC-CE activation command in slot n, if the target TCI state is unknown, the UE shall be able to receive UE-dedicated PDCCH/PDSCH with target TCI state of the serving cell on which TCI state switch occurs at the first slot that is after slot n+ $T_{HARQ}$ +$3N_{slot}^{subframe,\mu}$ + ($T_{L1\text{-}RSRP}$ +$TO_{uk}$*($T_{first\text{-}SSB}$+ $T_{SSB\text{-}proc}$+ OL*$T_{SSB}$)) / *NR slot length*.

The UE shall be able to receive UE-dedicated PDCCH/PDSCH with the old TCI state until slot n+ $T_{HARQ}$ + $3N_{slot}^{subframe,\mu}$.

Where

- $T_{HARQ}$ (in slot) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3];
- $T_{first\text{-}SSB}$ is the time to the first SSB transmission after MAC CE command is decoded by the UE; The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state
- $T_{SSB\text{-}proc}$ = 2 ms;
- $TO_k$ = 0 if the target TCI state have QCL relationship with a RS of a TCI state in the active list of TCI states or if the target TCI state is in the active list of TCI states, otherwise $TO_k$ = 1;
- -- OL = 1 if the first SSB overlaps or is adjacent to the first SSB from the other TRP in FR2 and
  - the SSB periodicity is less than the SSB periodicity of the other TRP, or
  - the SSB periodicity is the same than the SSB periodicity of the other TRP, and the SSB is associated to the TRP with the lowest coresetPoolIndex,

  0, otherwise.
- $T_{L1\text{-}RSRP}$ = 0 in FR1 or when the TCI state switching not involving QCL-TypeD in FR2. Otherwise,
- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as
- $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ for SSB as specified in clause 9.5.4.1, when receive timing difference is within CP,

- with the assumption of M=1
- with $T_{Report}$ = 0

- $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for CSI-RS as specified in clause 9.5.4.2, when receive timing difference is within CP
  - CSI-RS based L1-RSRP measurement only apply for TCI state switch when source RS is associated with serving cell
  - configured with higher layer parameter *repetition* set to ON
  - with the assumption of M=1 for periodic CSI-RS
  - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*
  - with $T_{Report}$ = 0
- $TO_{uk}$ = 1 for CSI-RS based L1-RSRP measurement, and 0 for SSB based L1-RSRP measurement when TCI state switching involves QCL-TypeD
- $TO_{uk}$ = 1 when TCI state switching involves QCL types other than QCL-TypeD
- $T_{first\text{-}SSB}$ is time to first SSB transmission after L1-RSRP measurement when TCI state switching involves QCL-TypeD;
- $T_{first\text{-}SSB}$ is time to first SSB transmission after MAC CE command is decoded by the UE for QCL types other than QCL-TypeD;
  - The SSB shall be the QCL-TypeA or QCL-TypeC to target TCI state

## 8.22.4 DCI based downlink TCI state switch delay

For DCI based downlink TCI state switch delay in m-DCI mode of operation, the requirements in clause 8.15.4 apply to TCI state associated with each *CORESETpoolIndex*.

## 8.22.5 Active Downlink TCI state list update delay

The requirements specified in this clause are applicable if

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', and a MAC CE activates more than one target separate TCIs, and at least one DL TCI is included, or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', and a MAC CE activates more than one target joint TCI.

If all the target TCI states in the active TCI state list are known, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + TO_k*(T_{first\text{-}SSB_List} + T_{SSB\text{-}proc}) / \textit{NR slot length}.$$

If a subset of the target TCI states in the active TCI state list are unknown, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + (T_{L1\text{-}RSRP_list} + TO_{uk}*(T_{first\text{-}SSB} + T_{SSB\text{-}proc})) / \textit{NR slot length}.$$

If all target TCI states in the active TCI state list are unknown, the requirements specified in this clause are not applicable.

Editor's note: FFS how to take into account overlapping MAC-CE based switches from two TRPs where the SSB associated to each TCI state is overlapping or adjacent to each other.

Where

- $T_{L1\text{-}RSRP_List}$ is the longest L1 measurement time ($T_{L1\text{-}RSRP}$) of the source RS among the unknown target TCI states, where $T_{L1\text{-}RSRP}$ is specified in clause 8.22.3

  *Editor's note: FFS the L1-RSRP measurement requirement when RTD>CP.*

- $T_{HARQ}$, $T_{first\text{-}SSB}$, $T_{SSB\text{-}proc}$, $TO_k$, $TO_{uk}$ are defined in clause 8.22.3. $T_{SSB}$ is the SSB periodicity.

When UE receives PDSCH carrying MAC-CE for active TCI state list update, and

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', while the target TCI list comprises at least one DL TCIs and at least one UL TCIs,

UE is not expected to receive on DL based on the target TCI state before UE completes the DL and UL TCI state list update.

# 8.23 Active uplink TCI state switching delay for unified TCI for single-DCI mTRP

## 8.23.1 Introduction

The requirements in this clause apply for a UE configured with *dl-OrJointTCI-StateList* (if unifiedTCI-StateType is indicated as *Joint*) or *TCI-UL-State* configurations for UL channels/signals on a serving cell. Further the requirements also apply for all the list of serving cells in *simultaneousU-TCI-UpdateList1, simultaneousU-TCI-UpdateList2, simultaneousU-TCI-UpdateList3, simultaneousU-TCI-UpdateList4* in MR-DC or standalone NR. There is no requirement when the UE is requested to switch to a TCI state with the higher layer parameter *TCI-UL-State* associated to SRS. UE shall complete the switch of active uplink TCI state within the delay defined in this clause when the UE is requested to switch to a TCI state with the higher layer parameter *dl-OrJointTCI-StateList* or *TCI-UL-State* associated to a DL RS.

PL-RS may be associated with or included in UL TCI state or joint TCI state. The requirements in this clause shall apply if the following conditions are met:

- PL-RS is identical to source RS in UL TCI state or joint TCI state
- PL-RS and source RS in UL TCI state or joint TCI state are QCL-Type D

## 8.23.2 Known conditions for uplink TCI state

The uplink TCI state is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target uplink TCI state to the completion of active uplink TCI state switch, where the RS resource for L1-RSRP measurement is the RS in target uplink TCI state or QCLed to the target uplink TCI state
  - Uplink TCI state switch command is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
  - The UE has sent at least 1 L1-RSRP report for the target uplink TCI state before the uplink TCI state switch command
  - The RS configured in target uplink TCI state remains detectable during the uplink TCI state switching period
    - SNR of the RS configured in target uplink TCI state $\geq$ -3 dB
  - The target uplink TCI state remains detectable during the uplink TCI state switching period
  - The SSB associated with the uplink TCI state remain detectable during the uplink TCI switching period
    - SNR of the uplink TCI state $\geq$ -3 dB

Otherwise, the uplink TCI state is unknown.

## 8.23.3 MAC-CE based uplink TCI state switch delay

The requirements in this clause shall apply for UL TCI state switch using separate UL TCI state or joint TCI state of unified TCI state switch framework and having two indicated TCI-States.

In case of joint TCI state based dual TCI state switch, UE is not expected to transmit on UL before UE completes the DL and UL TCI state switch of both TRPs.

For separate UL TCI state switch or joint TCI state switch for PUCCH or PUSCH, or semi-persistent/aperiodic/periodic SRS, when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1, upon receiving PDSCH carrying MAC-CE activation command in slot n on serving cell,

If both target TCI states are known,

- The UE shall be able to transmit uplink signal with the target TCI state(s) in the slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + \max\{NM1^* (T_{first_target\text{-}PL\text{-}RS1} + 4^*T_{target_PL\text{-}RS1} + 2\text{ ms}), NM2^* (T_{first_target\text{-}PL\text{-}RS2} + 4^*T_{target_PL\text{-}RS\,2} + 2\text{ ms})\}$/ *NR slot length*.

If both target TCI states are unknown,

- The UE shall be able to transmit uplink signal with the target TCI state(s) in the slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + \max\{T_{L1\text{-}RSRP1} + T_{first_target\text{-}PL\text{-}RS1} + 4^*T_{target_PL\text{-}RS1} + 2\text{ ms}, T_{L1\text{-}RSRP2} + T_{first_target\text{-}PL\text{-}RS2} + 4^*T_{target_PL\text{-}RS\,2} + 2\text{ ms}\}$/ *NR slot length*.

If one of the target TCI states is unknown and the other TCI state is known,

- The UE shall be able to transmit uplink signal with the target TCI state(s) in the slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + \max\{T_{L1\text{-}RSRP1} + T_{first_target\text{-}PL\text{-}RS1} + 4^*T_{target_PL\text{-}RS1} + 2\text{ ms}, NM2^* (T_{first_target\text{-}PL\text{-}RS2} + 4^*T_{target_PL\text{-}RS\,2} + 2\text{ ms})\}$/ *NR slot length*.

Where,

- $T_{HARQ}$ (in slot) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].
- NM1 = 1, if the target PL-RS of the first TCI state is not maintained by the UE, 0 otherwise.
- NM2 = 1, if the target PL-RS of the second first TCI is not maintained by the UE, 0 otherwise.

  In FR2, in case that the target PL-RS associated with or included in the target UL or joint TCI state is SSB, the requirements in this clause shall apply when this target PL-RS is maintained by the UE.

- PL-RS is maintained provided:
  - the target PL-RS is associated with or included in the UL or joint TCI states in the active TCI list for PUSCH/PUCCH/SRS transmissions
  - There are no more than 4 different RS activated as PL-RS per serving cell among all active UL TCI states (UL or joint TCI state) for PUSCH/PUCCH/SRS transmissions
  - The target pathloss reference signal remains detectable during TCI state switching period
    - SNR of the target pathloss reference signal≥-3 dB
  - The associated SSBs with the target pathloss reference signal remain detectable during the TCI state switching period.
    - SNR of the associated SSB ≥-3 dB
- $T_{first_target\text{-}PL\text{-}RS1}$ is time to first pathloss RS transmission of the first TCI state after L1-RSRP measurement when first target TCI state is unknown.
- $T_{first_target\text{-}PL\text{-}RS2}$ is time to first pathloss RS transmission of the second TCI state after L1-RSRP measurement when second target TCI state is unknown.
- $T_{first_target\text{-}PL\text{-}RS1}$ is time to first pathloss RS transmission of the first TCI state after MAC CE command is decoded by the UE when the first target TCI state is known.

- $T_{first_target\text{-}PL\text{-}RS2}$ is time to first pathloss RS transmission of the second TCI state after MAC CE command is decoded by the UE when the first seond TCI state is known.

- $T_{target_PL\text{-}RS1}$ is the periodicity of the target pathloss reference signal of the first TCI state which would SSB or NZP CSI-RS when PL-RS is associated with serving cell.

- $T_{target_PL\text{-}RS2}$ is the periodicity of the target pathloss reference signal of the second TCI state which would SSB or NZP CSI-RS when PL-RS is associated with serving cell.

- $T_{L1\text{-}RSRP1}$ and $T_{L1\text{-}RSRP2}$ are the time for Rx beam refinement in FR2 for the first and second TCI state, defined as

  - $T_{L1\text{-}RSPR_Measurement_Period_SSB}$ for SSB as specified in clause 9.5.4.1,

    - with the assumption of M=1

    - with $T_{Report} = 0$

  - $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for CSI-RS as specified in clause 9.5.4.2

    - CSI-RS based L1-RSRP measurement only apply for TCI state switch when source RS is associated with serving cell

    - configured with higher layer parameter *repetition* set to ON

    - with the assumption of M=1 for periodic CSI-RS

    - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*

    - with $T_{Report} = 0$

The requirements specified in this clause are applicable if no more than 4 different RSs are activated as PL-RS per serving cell among all active UL (or joint) TCI states.

NOTE: In FR2, the requirements when the target PL-RS is not maintained in this clause apply only when PL-RS are not overlapped or adjacent to the PL-RS of the other TRP.

## 8.23.4 DCI based uplink TCI state switch delay

When a UE is configured with the higher layer parameter with *dl-OrJointTCI-StateList* or *TCI-UL-State*, activated with TCI states for uplink transmission by MAC CE indication of more than one codepoints, and receives DCI format 1_1/1_2 with or without DL assignment providing indicated two TCI-States in the active TCI list for a CC, the UE transmits a PUCCH with HARQ-ACK information corresponding to the DCI carrying the TCI-State indication. Requirements in clause 8.16.4 apply.

## 8.23.5 Active uplink TCI state list update delay

The requirements specified in this clause are applicable if

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', and a MAC CE activates more than one target separate TCIs, and at least one DL TCI is included, or

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', and a MAC CE activates more than one target joint TCI.

If all the target TCI states in the active TCI state list are known, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM * (T_{first_target\text{-}PL\text{-}RS} + 4 * T_{target_PL\text{-}RS} + 2\text{ms}) / \textit{NR slot length}.$$

If a subset of the target TCI states in the active TCI state list are unknown, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + (T_{L1\text{-}RSRP_List} + T_{first_target\text{-}PL\text{-}RS} + 4*T_{target_PL\text{-}RS} + 2\text{ms}) / \textit{NR slot length}.$$

If all target TCI states in the active TCI state list are unknown, the requirements specified in this clause are not applicable.

Where

- $T_{L1\text{-}RSRP_List}$ is the longest L1 measurement time ($T_{L1\text{-}RSRP}$) of the source RS among the unknown target TCI states, where $T_{L1\text{-}RSRP}$ is specified in clause 8.23.2
- $T_{HARQ}$, $T_{first_target\text{-}PL\text{-}RS}$, $T_{target\text{-}PL\text{-}RS}$ are defined in clause 8.23.3.

When UE receives PDSCH carrying MAC-CE for active TCI state list update, and

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', while the target TCI list comprises at least one DL TCIs and at least one UL TCIs,

UE is not expected to transmit on UL based on the target TCI before UE completes the DL and UL TCI list update.

The requirements in this clause are applicable when the source RS of the active UL TCI state is a DL-RS and this DL-RS is included as one of the source RSs in the DL active TCI list.

# 8.24 Active uplink TCI state switching delay for unified TCI for multi-DCI mTRP

## 8.24.1 Introduction

The requirements in this clause apply for a UE configured with *dl-OrJointTCI-StateList* (if unifiedTCI-StateType is indicated as *Joint*) or *TCI-UL-State* configurations for UL channels/signals on a serving cell and when UE is configured two different values of *CORESETPoolIndex* in ControlResourceSet. Further, the requirements apply for a UE not configured with 2 TAs or for a UE configured with 2 TAs in FR1 or for a UE configured with 2 TAs in FR2 if RTD<CP. Further the requirements also apply for all the list of serving cells in *simultaneousU-TCI-UpdateList1, simultaneousU-TCI-UpdateList2, simultaneousU-TCI-UpdateList3, simultaneousU-TCI-UpdateList4* in MR-DC or standalone NR provided all serving cells in the list are configured with the same serving cell and BWP in *unifiedTCI-StateRef-r17*. There is no requirement when the UE is requested to switch to a TCI state with the higher layer parameter *TCI-UL-State* associated to SRS. UE shall complete the switch of active uplink TCI state within the delay defined in this clause when the UE is requested to switch to a TCI state with the higher layer parameter *dl-OrJointTCI-StateList* or *TCI-UL-State* associated to a DL RS. The requirements apply when UE is not expected to receive simultaneously with multi-RX in FR2. The requirements are applicable to each TRP independently.

PL-RS may be associated with or included in UL TCI state or joint TCI state. The requirements in this clause shall apply if either of the following conditions are met:

- PL-RS is identical to source RS in UL TCI state or joint TCI state
- PL-RS and source RS in UL TCI state or joint TCI state are QCL-Type D

When the target UL TCI state refers to an additional PCI different from serving cell PCI in which this UL TCI state is configured, the requirements in this clause are applicable provided that the following conditions are met:

- Active BWP of the serving cell and a cell with the additional PCI are the same
- Center frequency, SCS and SFN offset of a cell with the additional PCI are as the same as serving cell
- The cell with the additional PCI is known to the UE.

A cell with the additional PCI is known if the following conditions are met:

- During the last 5 s before L1-RSRP measurement is configured, the UE has sent a valid L3 measurement report for the cell with the additional PCI
- Timing offset between serving cell and the cell with the additional PCI is within CP of the corresponding SCS, except when UE supports RTD>CP with 2 TAs

- The SSB from the cell with the additional PCI remains detectable according to the cell identification requirements specified in clause 9.2

Otherwise, the cell with the additional PCI is unknown.

## 8.24.2 Known conditions for uplink TCI state

The uplink TCI state is known if the conditions in clause 8.16.2 are met.

## 8.24.3 MAC-CE based uplink TCI state switch delay

The requirements in this clause shall apply for UL TCI state switch using separate UL TCI state or joint TCI state of unified TCI state switch framework.

In case that source RS in UL TCI state or joint TCI state is associated with a PCI different from that of the serving cell, the requirements in this clause shall apply if the cell with different PCI satisfies the known cell condition defined in clause 8.24.1. If the known cell condition is not met, longer delay may be expected.

In case of joint TCI state switch, UE is not expected to transmit on UL based on the target TCI state before UE completes the DL and UL TCI state switch.

For separate UL TCI state switch or joint TCI state switch for PUCCH or PUSCH, or semi-persistent/aperiodic/periodic SRS, when *beamCorrespondenceWithoutUL-BeamSweeping* is set to 1, upon receiving PDSCH carrying MAC-CE activation command in slot n on serving cell,

- If target TCI state is known, the UE shall be able to transmit uplink signal with the target TCI state in the slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM* (T_{first_target\text{-}PL\text{-}RS} + 4*T_{target_PL\text{-}RS} + 2\ ms) / \textit{NR slot length}$.

- If target TCI state is unknown, the UE shall be able to transmit uplink signal with the target TCI state in the slot $n+T_{HARQ} + 3N_{slot}^{subframe,\mu} + (T_{L1\text{-}RSRP} + T_{first_target\text{-}PL\text{-}RS} + 4*T_{target_PL\text{-}RS} + 2\ ms) / \textit{NR slot length}$.

The UE shall be able to transmit with the old UL TCI state until slot $n+ T_{HARQ} + 3N_{slot}^{subframe,\mu}$.

Where,

- $T_{HARQ}$ (in slot) is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].

- NM = 1, if the target PL-RS is not maintained by the UE, 0 otherwise.

In FR2, in case that the target PL-RS associated with or included in the target UL or joint TCI state is SSB, the requirements in this clause shall apply when this target PL-RS is maintained by the UE.

- PL-RS is maintained provided:

  - the target PL-RS is associated with or included in the UL or joint TCI states in the active TCI list for PUSCH/PUCCH/SRS transmissions

  - There are no more than 4 different RS activated as PL-RS per serving cell among all active UL TCI states (UL or joint TCI state) for PUSCH/PUCCH/SRS transmissions

  - The target pathloss reference signal remains detectable during TCI state switching period

  - SNR of the target pathloss reference signal≥-3 dB

  - The associated SSBs with the target pathloss reference signal remain detectable during the TCI state switching period.

    - SNR of the associated SSB ≥-3 dB

- $T_{first_target\text{-}PL\text{-}RS}$ is time to first pathloss RS transmission after L1-RSRP measurement when target TCI state is unknown.

- $T_{first_target\text{-}PL\text{-}RS}$ is time to first pathloss RS transmission after MAC CE command is decoded by the UE for known TCI State.

- $T_{target_PL\text{-}RS}$ is the periodicity of the target pathloss reference signal which would be SSB or NZP CSI-RS when PL-RS is associated with serving cell

- $T_{target_PL\text{-}RS}$ is the periodicity of the target pathloss reference signal which would be SSB when PL-RS is associated with PCI different from serving cell

- $T_{L1\text{-}RSRP}$ is the time for Rx beam refinement in FR2, defined as

  - $T_{L1\text{-}RSPR_Measurement_Period_SSB}$ for SSB as specified in clause 9.5.4.1 or 9.13.4.1, when receive timing difference of the two TRPs is within CP,

    - with the assumption of M=1

    - with $T_{Report} = 0$

  - $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for CSI-RS as specified in clause 9.5.4.2, when receive timing difference of the two TRPs is within CP,

    - CSI-RS based L1-RSRP measurement only apply for TCI state switch when source RS is associated with serving cell

    - configured with higher layer parameter *repetition* set to ON

    - with the assumption of M=1 for periodic CSI-RS

    - for aperiodic CSI-RS if number of resources in resource set at least equal to *MaxNumberRxBeam*

    - with $T_{Report} = 0$

The requirements specified in this clause are applicable if no more than 4 different RSs are activated as PL-RS per serving cell among all active UL (or joint) TCI states. For separate UL TCI state switch the requirements in the clause are not applicable if there is no active DL TCI state with the same coresetPoolIndex as the target UL TCI state.

NOTE: In FR2, the requirements when the target PL-RS is not maintained in this clause apply only when PL-RS are not overlapped or adjacent to the PL-RS of the other TRP.

## 8.24.4 DCI based uplink TCI state switch delay

For DCI based UL TCI state switch in multi-DCI transmission mode the requirements in clause 8.16.6 apply to TCI state associated with each coresetPoolIndex.

## 8.24.5 Active Uplink TCI state list update delay

The requirements specified in this clause are applicable if

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', and a MAC CE activates more than one target separate TCIs, and at least one UL TCI is included, or

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', and a MAC CE activates more than one target joint TCI.

If all the target TCI states in the active TCI state list are known, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + NM * (T_{first_target\text{-}PL\text{-}RS_List} + 4 * T_{target_PL\text{-}RS_List} + 2\text{ms}) / \textit{NR slot length}.$$

FFS on additional time tracking of DL Ref RS for 2TA

If a subset of target TCI states in the active TCI state list are unknown, upon receiving PDSCH carrying MAC-CE active TCI state list update at slot n, UE shall have completed the TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + (T_{L1\text{-}RSRP_List} + T_{first_target\text{-}PL\text{-}RS_List} + 4*T_{target_PL\text{-}RS_List} + 2\text{ms}) / \textit{NR slot length}.$$

FFS on additional time tracking of DL Ref RS for 2TA

If all target TCI states in the active TCI state list are unknown, the requirements specified in this clause are not applicable.

Where

- If all TCIs are known,
- if the target PL-RS associated with or included in any UL TCI is not maintained, NM = 1; Where maintained PL-RS is defined in clause 8.16.3
- if a subset of target TCI states in the active TCI state list are unknown,
- $T_{L1\text{-}RSRP_List}$ = is the longest L1 measurement time ($T_{L1\text{-}RSRP}$) of the source RS among the unknown target TCI states , where $T_{L1\text{-}RSRP}$ is specified in clause 8.16.3
- Otherwise,
  - $T_{first_target\text{-}PL\text{-}RS_List} = T_{first_target\text{-}PL\text{-}RS_SC}$
  - $T_{target\text{-}PL\text{-}RS_List} = T_{target\text{-}PL\text{-}RS_SC}$.
  - $T_{first_target\text{-}PL\text{-}RS_SC}$ is $T_{first_target\text{-}PL\text{-}RS}$ for serving cell
  - $T_{first_target\text{-}PL\text{-}RS_CDP}$ is $T_{first_target\text{-}PL\text{-}RS}$ for cell with different PCI from serving cell
  - $T_{target\text{-}PL\text{-}RS_SC}$ is $T_{target\text{-}PL\text{-}RS}$ for serving cell
- $T_{HARQ}$, $T_{first_target\text{-}PL\text{-}RS}$, $T_{target\text{-}PL\text{-}RS}$ are defined in clause 8.16.3.

The requirements specified in this clause do not apply if more than 4 different RSs are activated as PL-RS per serving cell among all active UL (or joint) TCI states.

When UE receives PDSCH carrying MAC-CE for active TCI state list update, and

- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*joint*', or
- higher layer configuration '*unifiedTCI-StateType-r17*' is set to '*separate*', while the target TCI list comprises at least one DL TCIs and at least one UL TCIs,

UE is not expected to transmit on UL based on the target TCI before UE completes the DL and UL TCI list update.

The requirements in this clause are applicable when the source RS of the active UL TCI state is a DL-RS and this DL-RS is included as one of the source RSs in the DL active TCI list.

# 8.25 TCI state activation for LTM candidate cell

## 8.25.1 Introduction

The requirements in this clause apply for a UE configured with one or more joint or separate uplink/downlink TCI state configurations on LTM candidate cell. UE shall complete the activation of the target joint or separate uplink/downlink TCI states within the delay defined in this clause after receiving a MAC CE indicating LTM candidate cell TCI state activation before cell switch command as specified in clause 6.1.3.75 of TS 38.321 [7].

The requirements in this clause apply for

- Known downlink TCI state in FR1 and FR2 specified in clause 8.25.2, and
- Unknown downlink TCI state in FR1 specified in clause 8.25.2, provided the following conditions are met:
  - the UE is configured with event-triggered L1 measurement reporting and report on leave, and the UE has sent an event-triggered L1 measurement report with RS associated to the target TCI state and has not sent report on leave for the same RS before receiving the TCI state activation command, or
  - UE has reported L3 measurement result with the associated SSB index of the downlink TCI state within 5 seconds before the LTM TCI state activation command, and

- SNR of the associated SSB is above -3 dB.

## 8.25.2 Known TCI state conditions

The candidate downlink TCI state in the TCI state activation command is known if the following conditions are met:

- During the period from the last transmission of the RS resource used for the L1-RSRP measurement reporting for the target downlink TCI state to the completion of TCI state activation, where the RS resource for L1-RSRP measurement is the RS in target downlink TCI state or QCLed to the target downlink TCI state
  - The MAC CE command indicating the activation of the TCI state is received within 1280 ms upon the last transmission of the RS resource for beam reporting or measurement
  - The UE has sent at least 1 valid L1-RSRP report for the target downlink TCI state before the MAC CE command is received.
  - The target downlink TCI state remains detectable during the downlink TCI state activation period
  - The SSB associated with the downlink TCI state remain detectable during the downlink TCI activation period
    - SNR of the downlink TCI state $\geq$ -3 dB

Otherwise, the candidate downlink TCI state is unknown.

## 8.25.3 SSB based TCI state activation delay

In FR1, when the UE receives LTM candidate cell TCI state activation command at slot n, the UE shall have completed the LTM TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + TO_k*( T_{first\text{-}SSB} + T_{SSB\text{-}proc}) / \textit{NR slot length}.$$

In FR2, when all the target downlink TCI states in the active TCI state list are known, when the UE receives TCI state activation command at slot n, UE shall have completed the LTM TCI state list update in

$$\text{slot } n + T_{HARQ} + 3N_{slot}^{subframe,\mu} + TO_k*( T_{first\text{-}SSB} + T_{SSB\text{-}proc}) / \textit{NR slot length}.$$

Where:

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement as specified in TS 38.213 [3].
- $TO_k$ = 1 if the target TCI state is not in the serving cell active TCI state list or LTM candidate cell active TCI state list, 0 otherwise.
- $T_{first\text{-}SSB}$ is the time to first SSB occasion after slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu}$ when the target SSB is to be measured outside MG, upon receiving PDSCH carrying MAC-CE activation command in slot n;
- $T_{first\text{-}SSB}$ is the time to first SSB occasion overlapping with MGL after slot $n + T_{HARQ} + 3N_{slot}^{subframe,\mu}$ + 2 ms if the SSB is to be measured within MG, upon receiving PDSCH carrying MAC-CE activation command in slot n;
- $T_{SSB\text{-}proc}$ = 2 ms.

# 9 Measurement Procedure

## 9.1 General measurement requirement

### 9.1.1 Introduction

This clause contains general requirements on the UE regarding measurement reporting in RRC_CONNECTED state. The requirements are split in intra-frequency, inter-frequency, inter-RAT E-UTRAN FDD, inter-RAT E-UTRAN TDD, and L1-RSRP measurements requirements. These measurements may be used by the NG-RAN. The measurement quantities are defined in TS 38.215 [4], the measurement model is defined in TS 38.300 [10], TS 37.340 [17] and measurement accuracies are specified in clause 10. Control of measurement reporting is specified in TS 38.331 [2].

Unless explicitly stated otherwise, the UE shall perform RRM measurements and meet the corresponding requirements in clause 9 when the UE is provided with IDC solution.

In the requirements of clause 9, the exceptions for side conditions apply as follows:

- for the UE capable of CA but not configured with any SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.1 for UE supporting CA in FR1, and clause B.3.2.3 for UE supporting CA in FR2, respectively;
- for the UE capable of CA and configured with at least one SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.2 for UE configured with CA in FR1, and clause B.3.2.4 for UE supporting CA in FR2, respectively;
- for the UE capable of SUL but not configured with SUL, the applicable exceptions for side conditions are specified in Annex B, clause B.3.4.1 for UE supporting SUL in FR1;
- for the UE capable of SUL and configured with at least one SUL, the applicable exceptions for side conditions are specified in Annex B, clause B.3.4.2 for UE configured with SUL in FR1.

The SSB and SMTC in this clause apply for both CD-SSB and NCD-SSB if the UE supports *ncd-SSB-BWP-Wor-r18*.

### 9.1.2 Measurement gap

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE does not support independent measurement gap patterns for different frequency ranges as specified in table 5.1-1 in [18, 19, 20], in order for the requirements in the following clauses to apply the network must provide a single per-UE measurement gap pattern for concurrent monitoring of all frequency layers.

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE supports independent measurement gap patterns for different frequency ranges as specified in table 5.1-1 in [18, 19, 20], in order for the requirements in the following clauses to apply the network must provide either per-FR measurement gap patterns for frequency range where UE requires per-FR measurement gap for concurrent monitoring of all frequency layers of each frequency range independently, or a single per-UE measurement gap pattern for concurrent monitoring of all frequency layers of all frequency ranges.

If the UE is configured via LPP [34] to measure PRS for any RSTD, PRS-RSRP, UE Rx-Tx time difference measurement, PRS-RSRPP measurement, RSCP and RSCPD measurement defined in TS 38.215 [4], in order for the requirements in clauses 9.9.2, 9.9.3, 9.9.4, 9.9.6, 9.9.7 and 9.9.8 to apply, the network must provide

- a single per-UE measurement gap pattern for concurrent monitoring of all positioning frequency layers and intra-frequency, inter-frequency and/or inter-RAT frequency layers of all frequency ranges, or
- if UE supports independent measurement gap patterns for different frequency ranges for PRS measurement, i.e. supporting *independentGapConfigPRS-r17*, per-FR measurement gap pattern for the frequency range for concurrent monitoring of all positioning frequency layers and intra-frequency, inter-frequency cells and/or inter-RAT frequency layers in the corresponding frequency range.

During the per-UE measurement gaps the UE:

- is not required to conduct reception/transmission from/to the corresponding E-UTRAN PCell, E-UTRAN SCell(s) and NR serving cells for E-UTRA-NR dual connectivity except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS 38.321 [7].

- is not required to conduct reception/transmission from/to the corresponding NR serving cells for SA (with single carrier or CA configured) except the reception of signals used for RRM measurement(s), PRS measurement(s) and the signals used for random access procedure according to [7].

- is not required to conduct reception/transmission from/to the corresponding PCell, SCell(s) and E-UTRAN serving cells for NR-E-UTRA dual connectivity except the reception of signals used for RRM measurement(s), PRS measurement(s) and the signals used for random access procedure according to [7].

- is not required to conduct reception/transmission from/to the corresponding NR serving cells for NR-DC except the reception of signals used for RRM measurement(s), PRS measurement(s) and the signals used for random access procedure according to [7].

During the per-FR measurement gaps the UE:

- is not required to conduct reception/transmission from/to the corresponding E-UTRAN PCell, E-UTRAN SCell(s) and NR serving cells in the corresponding frequency range for E-UTRA-NR dual connectivity except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to TS 38.321 [7].

- is not required to conduct reception/transmission from/to the corresponding NR serving cells in the corresponding frequency range for SA (with single carrier or CA configured) except the reception of signals used for RRM measurement(s), PRS measurement(s) and the signals used for random access procedure according to TS 38.321 [7].

- is not required to conduct reception/transmission from/to the corresponding PCell, SCell(s) and E-UTRAN serving cells in the corresponding frequency range for NR-E-UTRA dual connectivity except the reception of signals used for RRM measurement(s), PRS measurement(s) and the signals used for random access procedure according to TS 38.321 [7].

- is not required to conduct reception/transmission from/to the corresponding NR serving cells in the corresponding frequency range for NR-DC except the reception of signals used for RRM measurement(s), PRS measurement(s) and the signals used for random access procedure according to TS 38.321 [7].

UEs shall support the measurement gap patterns listed in table 9.1.2-1 based on the applicability specified in tables 9.1.2-2 and 9.1.2-3. UE determines measurement gap timing based on gap offset configuration and measurement gap timing advance configuration provided by higher layer signalling as specified in TS 38.331 [2] and TS 36.331 [16].

**Table 9.1.2-1: Gap Pattern Configurations**

| Gap Pattern Id | Measurement Gap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) |
|---|---|---|
| 0 | 6 | 40 |
| 1 | 6 | 80 |
| 2 | 3 | 40 |
| 3 | 3 | 80 |
| 4 | 6 | 20 |
| 5 | 6 | 160 |
| 6 | 4 | 20 |
| 7 | 4 | 40 |
| 8 | 4 | 80 |
| 9 | 4 | 160 |
| 10 | 3 | 20 |
| 11 | 3 | 160 |
| 12 | 5.5 | 20 |
| 13 | 5.5 | 40 |
| 14 | 5.5 | 80 |
| 15 | 5.5 | 160 |
| 16 | 3.5 | 20 |
| 17 | 3.5 | 40 |

| | | |
|---|---|---|
| 18 | 3.5 | 80 |
| 19 | 3.5 | 160 |
| 20 | 1.5 | 20 |
| 21 | 1.5 | 40 |
| 22 | 1.5 | 80 |
| 23 | 1.5 | 160 |
| 24 | 10 | 80 |
| 25 | 20 | 160 |

**Table 9.1.2-2: Applicability for Gap Pattern Configurations supported by the E-UTRA-NR dual connectivity UE or NR-E-UTRA dual connectivity UE**

| Measurement gap pattern configuration | Serving cell | Measurement Purpose[Note 5] | Applicable Gap Pattern Id |
|---|---|---|---|
| Per-UE Measurement gap | E-UTRA + FR1, or E-UTRA + FR2, or E-UTRA + FR1 + FR2 | non-NR RAT [Note1,2] | 0,1,2,3 |
| | | FR1 and/or FR2 [Note 6,7] | 0-11, 24, 25 |
| | | non-NR RAT[Note1,2] and FR1 and/or FR2 [Note 6,7] | 0, 1, 2, 3, 4, 6, 7, 8,10, 24 |
| Per-FR measurement gap | E-UTRA and, FR1 if configured | non-NR RAT [Note1,2] | 0,1,2,3 |
| | FR2 if configured | | No gap |
| | E-UTRA and, FR1 if configured | FR1 only [Note 6,7] | 0-11,24,25 |
| | FR2 if configured | | No gap |
| | E-UTRA and, FR1 if configured | FR2 only [Note 6,7] | No gap |
| | FR2 if configured | | 12-25 |
| | E-UTRA and, FR1 if configured | non-NR RAT [Note1,2] and FR1 [Note 6,7] | 0, 1, 2, 3, 4, 6, 7, 8,10,24 |
| | FR2 if configured | | No gap |
| | E-UTRA and, FR1 if configured | FR1 and FR2 [Note 6,7] | 0-11,24,25 |
| | FR2 if configured | | 12-25 |
| | E-UTRA and, FR1 if configured | non-NR RAT [Note1,2] and FR2 [Note 6,7] | 0, 1, 2, 3, 4, 6, 7, 8,10,24 |
| | FR2 if configured | | 12-25 |
| | E-UTRA and, FR1 if configured | Non-NR RAT [Note1,2] and FR1 and FR2 [Note 6,7] | 0, 1, 2, 3, 4, 6, 7, 8,10,24 |
| | FR2 if configured | | 12-25 |

NOTE: In E-UTRA-NR dual connectivity mode, if GSM or UTRA TDD or UTRA FDD inter-RAT frequency layer is configured to be monitored, only measurement gap pattern #0 and #1 can be used for per-FR gap in E-UTRA and FR1 if configured, or for per-UE gap. In NR-E-UTRA dual connectivity mode, if UTRA FDD inter-RAT frequency layer is configured to be monitored for SRVCC, only measurement gap pattern #0 and #1 can be used for per-FR gap in E-UTRA and FR1 if configured, or for per-UE gap.

NOTE 1: In E-UTRA-NR dual connectivity mode, non-NR RAT includes E-UTRA, UTRA and/or GSM. In NR-E-UTRA dual connectivity mode, non-NR RAT means E-UTRA, and UTRA for SRVCC.

NOTE 2: Void

NOTE 3: When E-UTRA inter-frequency RSTD measurements are configured and the UE requires measurement gaps for performing such measurements, only Gap Pattern #0 can be used.

NOTE 4: For UE supporting *supportedGapPattern-NRonly-NEDC* or *measGapPatterns-NRonly-ENDC-r16* but not supporting *supportedGapPattern* for the corresponding gap patterns among GP2-11, the corresponding gap patterns are not applicable to measurement of non-NR RATs as defined in NOTE 1.

NOTE 5: Inclusion of positioning measurements: Measurement purpose which includes E-UTRA measurements includes also E-UTRA RSRP and E-UTRA RSRQ measurements for E-CID.

NOTE 6: Measurement gap patterns #24 and #25 can be requested [2] only when the UE is configured at least with any of RSTD, UE Rx-Tx, PRS-RSRP, PRS-RSRPP, RSCP or RSCPD measurements requiring such gaps and can only be used during the corresponding positioning measurement period

NOTE 7: Inclusion of positioning measurements for measurement gaps: Measurement purpose which includes any of FR1 and FR2 measurements includes also RSTD, UE Rx-Tx, PRS-RSRP, PRS-RSRPP, RSCP and RSCPD measurements.

In E-UTRA-NR dual connectivity mode,

- if per-UE measurement gap is configured with MG timing advance of $T_{MG}$ ms, the measurement gap starts at time $T_{MG}$ ms advanced to the end of the latest E-UTRA subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.

- if per-FR measurement gap for FR1 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR1 starts at time $T_{MG}$ ms advanced to the end of the latest E-UTRA subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.

- if per-FR measurement gap for FR2 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR2 starts at time $T_{MG}$ ms advanced to the end of the latest NR subframe occurring immediately before the configured measurement gap among SCG serving cells subframes in FR2.

In NR-E-UTRA dual connectivity mode,

- if per-UE measurement gap is configured with MG timing advance of $T_{MG}$ ms, the measurement gap starts at time $T_{MG}$ ms advanced to the end of the latest NR subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.

- if per-FR measurement gap for FR1 is configured with MG timing advance of $T_{MG}$ ms and UE has NR serving cell in FR1, the measurement gap for FR1 starts at time $T_{MG}$ ms advanced to the end of the latest NR subframe occurring immediately before the configured measurement gap among MCG serving cells subframes in FR1.

- if per-FR measurement gap for FR1 is configured with MG timing advance of $T_{MG}$ ms and UE does not have NR serving cell in FR1, the measurement gap for FR1 starts at time $T_{MG}$ ms advanced to the end of the latest E-UTRA subframe occurring immediately before the configured measurement gap among SCG serving cells subframes.

- if per-FR measurement gap for FR2 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR2 starts at time $T_{MG}$ ms advanced to the end of the latest NR subframe occurring immediately before the configured measurement gap among MCG serving cells subframes in FR2.

In NR-NR dual connectivity mode,

- If per-UE measurement gap is configured with MG timing advance of $T_{MG}$ ms, the measurement gap starts at time $T_{MG}$ ms advanced to the end of the latest MCG subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.

- If per-FR measurement gap for FR1 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR1 starts at time $T_{MG}$ ms advanced to the end of the latest MCG subframe occurring immediately before the configured measurement gap among MCG serving cells subframes.

- If per-FR measurement gap for FR2 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR2 starts at time $T_{MG}$ ms advanced to the end of the latest SCG subframe occurring immediately before the configured measurement gap among SCG serving cells subframes in FR2.

$T_{MG}$ is the MG timing advance value provided in *mgta* according to TS 38.331 [2].

In determining the measurement gap starting point, UE shall use the DL timing of the latest E-UTRA or NR subframe occurring immediately before the configured measurement gap among E-UTRA or NR serving cells.

For per-FR measurement gap capable UE configured with E-UTRA-NR dual connectivity or NR-E-UTRA dual connectivity, when serving cells are in E-UTRA and FR1, measurement objects are in both E-UTRA/FR1 and FR2,

- If MN indicates UE that the measurement gap from MN applies to E-UTRA/FR1/FR2 serving cells, UE fulfils the per-UE measurement requirements for both E-UTRA/FR1 and FR2 measurement objects based on the measurement gap pattern configured by MN;

- If MN indicates UE that the measurement gap from MN applies to only LTE/FR1 serving cell(s),

  - UE fulfils the measurement requirements for FR1/LTE measurement objects based on the configured measurement gap pattern;

  - UE fulfils the requirements for FR2 measurement objects based on effective MGRP=20 ms;

For per-FR measurement gap capable UE configured with E-UTRA-NR dual connectivity, NR-E-UTRA dual connectivity or NR-NR dual connectivity, when serving cells are in E-UTRA, FR1 and FR2, or in E-UTRA and FR2, or in FR1 and FR2, measurement objects are in both E-UTRA /FR1 and FR2,

- If MN indicates UE that the measurement gap from MN applies to E-UTRA/FR1/FR2 serving cells, UE fulfils the per-UE measurement requirements for both E-UTRA/FR1 and FR2 measurement objects based on the measurement gap pattern configured by MN.

**Table 9.1.2-3: Applicability for Gap Pattern Configurations supported by the UE with NR standalone operation (with single carrier, NR CA and NR-DC configuration)**

| Measurement gap pattern configuration | Serving cell | Measurement Purpose NOTE 2 | Applicable Gap Pattern Id |
|---|---|---|---|
| Per-UE measurement gap | FR1 NOTE5, or FR1 + FR2 | non-NR RAT NOTE3,6 | 0,1,2,3 |
| | | FR1 and/or FR2 NOTE 8,9 | 0-11, 24, 25 |
| | | non-NR RAT and FR1 and/or FR2 NOTE3,6,8,9 | 0, 1, 2, 3, 4, 6, 7, 8,10, 24 |
| | FR2 NOTE5 | non-NR RAT only NOTE3,6 | 0,1,2,3 |
| | | FR1 only NOTE 8.9 | 0-11, 24, 25 |
| | | FR1 and FR2 NOTE 8,9 | 0-11, 24, 25 |
| | | non-NR RAT and FR1 and/or FR2 NOTE3,6,8,9 | 0, 1, 2, 3, 4, 6, 7, 8,10, 24 |
| | | FR2 only NOTE 8,9 | 12-25 |
| Per-FR measurement gap | FR1 if configured | non-NR RAT only NOTE3,6 | 0,1,2,3 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR1 only NOTE 8.9 | 0-11,24,25 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR2 only NOTE 8.9 | No gap |
| | FR2 if configured | | 12-25 |
| | FR1 if configured | non-NR RAT and FR1 NOTE3,6,8,9 | 0, 1, 2, 3, 4, 6, 7, 8,10,24 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR1 and FR2 NOTE 8.9 | 0-11, 24,25 |
| | FR2 if configured | | 12-25 |
| | FR1 if configured | non-NR RAT and FR2 NOTE3,6,8,9 | 0, 1, 2, 3, 4, 6, 7, 8,10,24 |
| | FR2 if configured | | 12-25 |
| | FR1 if configured | non-NR RAT and FR1 and FR2 NOTE3,6,8,9 | 0, 1, 2, 3, 4, 6, 7, 8,10,24 |
| | FR2 if configured | | 12-25 |

| Measurement gap pattern configuration | Serving cell | Measurement Purpose NOTE 2 | Applicable Gap Pattern Id |
|---|---|---|---|
| NOTE 1: When E-UTRA inter-RAT RSTD measurements are configured and the UE requires measurement gaps for performing such measurements, only Gap Pattern #0 can be used.<br>NOTE 2: Measurement purpose which includes E-UTRA measurements includes also inter-RAT E-UTRA RSRP and RSRQ measurements for E-CID; measurement purpose which includes E-UTRA measurements includes also E-UTRA RSRP and E-UTRA RSRQ measurements for E-CID.<br>NOTE 3: Void<br>NOTE4: If per-UE measurement gap is configured with MG timing advance of $T_{MG}$ ms, the measurement gap starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among all serving cells subframes.<br>If per-FR measurement gap for FR1 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR1 starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among serving cells subframes in FR1.<br>If per-FR measurement gap for FR2 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR2 starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among serving cells subframes in FR2.<br>$T_{MG}$ is the MG timing advance value provided in *mgta* according to [2].<br>In determining the measurement gap starting point, UE shall use the DL timing of the latest subframe occurring immediately before the configured measurement gap among serving cells.<br>NOTE 5: NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG in FR1 and all serving cells in SCG in FR2.<br>NOTE 6: In NR single carrier, NR CA, and NR-DC mode, non-NR RAT means E-UTRA, and UTRA for SRVCC. In NR single carrier, NR CA, and NR-DC mode, if UTRA FDD inter-RAT frequency layer is configured to be monitored for SRVCC, only measurement gap pattern #0 and #1 can be used for per-FR gap in E-UTRA and FR1 if configured, or for per-UE gap.<br>NOTE 7: For UE only supporting *supportedGapPattern-NRonly* for any gap patterns among GP2-11, the corresponding gap patterns are not applicable to measurement of non-NR RATs as defined in NOTE 6.<br>NOTE 8: Measurement gap patterns #24 and #25 can be requested [2] only when the UE is configured with any of RSTD, UE Rx-Tx time difference, PRS-RSRP, PRS-RSRPP, RSCP or RSCPD measurements requiring such gaps and can only be used during the corresponding positioning measurement period.<br>NOTE 9: Inclusion of positioning measurements for measurement gaps: Measurement purpose which includes any of FR1 and FR2 measurements includes also RSTD, UE Rx-Tx time difference, PRS-RSRP, PRS-RSRPP , RSCP and RSCPD measurements. | | | |

For per-FR measurement gap capable UE in NR standalone operation (with single carrier, NR CA and NR-DC configuration), for per-FR gap based measurement, when there is no serving cell in a particular FR, where measurement objects are configured, regardless if explicit per-FR measurement gap is configured in this FR, the effective MGRP in this FR is used to determine requirements;

- 20 ms for FR2 NR measurements
- 40 ms for FR1 NR measurements
- 40 ms for LTE measurements
- 40 ms for FR1+LTE measurements

For per-FR measurement gap capable UE in NR standalone operation (with single carrier, NR CA and NR-DC configuration), when serving cells are in FR1 or FR2, measurement objects are in both E-UTRA /FR1 and FR2,

- If MN indicates UE that the measurement gap from MN applies to E-UTRA/FR1/FR2 serving cells, UE fulfils the per-UE measurement requirements for both E-UTRA/FR1 and FR2 measurement objects based on the measurement gap pattern configured by MN;

If measurement gap is configured in one FR but measurement object is not configured in the FR, the scheduling opportunity in the FR depends on the configured measurement gap pattern.

For single carrier or CA with aligned frame boundaries,

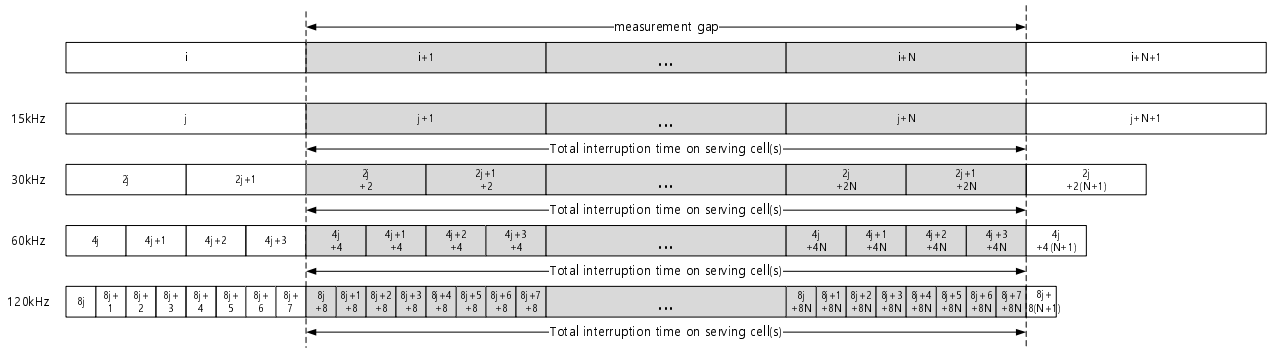
> For E-UTRA-NR dual connectivity (with NR single carrier, NR CA configuration), if UE is not capable of per-FR-gap, total interruption time on SCG during MGL is defined only when MGL(N) = 20 ms, 10 ms, 6 ms, 4 ms and 3 ms. And if UE is capable of per-FR-gap, total interruption time on FR1 serving cells in SCG during MGL is defined only when MGL(N) = 20 ms, 10 ms, 6 ms, 4 ms and 3 ms, and total interruption time on FR2 serving cells in SCG during MGL is defined only when MGL(N) = 20 ms, 10 ms, 5.5 ms, 3.5 ms and 1.5 ms.

For NR standalone operation (with single carrier, NR CA and NR-DC configuration), if UE is not capable of per-FR-gap, total interruption time on a serving cell during MGL is defined when MGL(N) = 20 ms, 10 ms, 6 ms, 5.5 ms, 4 ms, 3.5 ms, 3 ms, and 1.5 ms. And if UE is capable of per-FR-gap, total interruption time on FR1 serving cells during MGL is defined only when MGL(N) = 20 ms, 10 ms, 6 ms, 4 ms, and 3 ms, and total interruption time on FR2 serving cells during MGL is defined only when MGL(N) = 20 ms, 10 ms, 5.5 ms, 3.5 ms, and 1.5 ms.

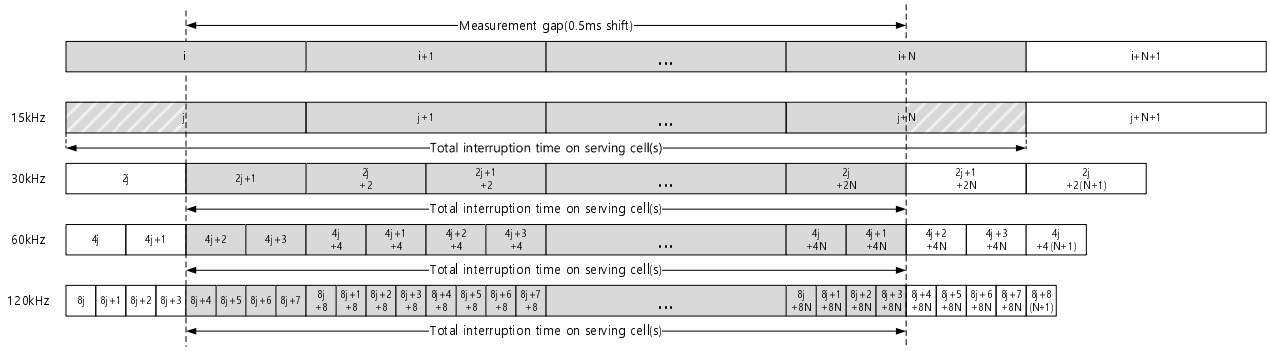
For NR-E-UTRA dual connectivity (with NR single carrier, NR CA configuration), if UE is not capable of per-FR-gap, total interruption time on MCG during MGL is defined only when MGL(N) = 20 ms, 10 ms, 6 ms, 4 ms, and 3 ms. And if UE is capable of per-FR-gap, total interruption time on FR1 serving cells in MCG during MGL is defined only when MGL(N) = 20 ms, 10 ms, 6 ms, 4 ms, and 3 ms, and total interruption time on FR2 serving cells in MCG during MGL is defined only when MGL(N) = 20 ms, 10 ms, 5.5 ms, 3.5 ms, and 1.5 ms.

For CA with non-aligned frame boundaries,

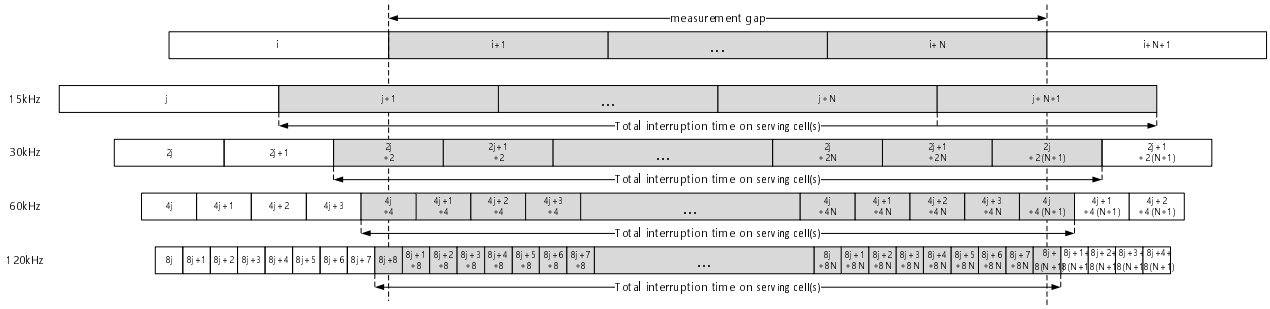
- The total interruption time on an SCC is the same as the case CA with aligned frame boundaries, if no SCC slots are partially overlapped with the measurement gap.
- The total interruption time on an SCC will be additionally extended by one SCC slot, if there exist SCC slots partially overlapped with the measurement gap.



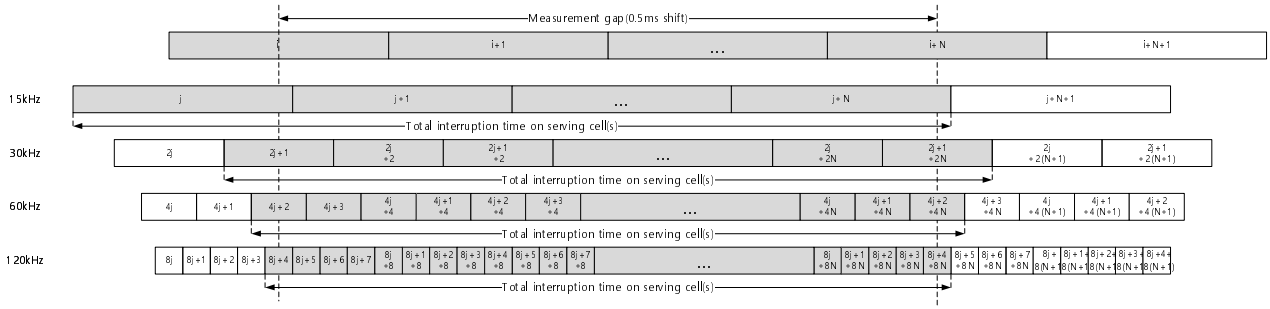
**(a) Measurement gap with MGL = N(ms) with MG timing advance of 0 ms for all serving cells in synchronous EN-DC, NR standalone operation (with single carrier, NR CA and synchronous NR-DC configuration) and synchronous NE-DC, and for serving cells in MCG in NR standalone operation (with asynchronous NR-DC configuration)**



**(b) Measurement gap with MGL = N(ms) with MG timing advance of 0.5 ms for all serving cells in synchronous EN-DC, NR standalone operation (with single carrier, NR CA and synchronous NR-DC configuration) and synchronous NE-DC, and for serving cells in MCG in NR standalone operation (with asynchronous NR-DC configuration)**



**(c) Measurement gap with MGL = N(ms) with MG timing advance of 0 ms for all serving cells in asynchronous EN-DC and asynchronous NE-DC, and for serving cells in SCG in NR standalone operation (with asynchronous NR-DC configuration)**



**(d) Measurement gap with MGL = N(ms) with MG timing advance of 0.5 ms for all serving cells in asynchronous EN-DC and asynchronous NE-DC, and for serving cells in SCG in NR standalone operation (with asynchronous NR-DC configuration)**

**Figure 9.1.2-1: Measurement GAP and total interruption time on serving cells for EN-DC, NR standalone operation (with single carrier, NR CA and NR-DC configuration) and NE-DC**

The corresponding total number of interrupted slots on serving cells is listed in table 9.1.2-4 for all serving cells in synchronous EN-DC, NR standalone (with single carrier, NR CA and synchronous NR-DC configuration) and NE-DC, and for serving cells in MCG in NR standalone operation (with asynchronous NR-DC configuration). The corresponding total number of interrupted slots on serving cells is listed in table 9.1.2-4a for asynchronous EN-DC, and for serving cells in SCG in NR standalone operation (with asynchronous NR-DC configuration).

**Table 9.1.2-4: Total number of interrupted slots on all serving cells during MGL for Synchronous EN-DC, NR standalone operation (with single carrier, NR CA and synchronous NR-DC configuration) and NE-DC, and on all serving cells in MCG for NR standalone operation (with asynchronous NR-DC configuration) with per-UE measurement gap or per-FR measurement gap for FR1**

| NR SCS (kHz) | Total number of interrupted slots on serving cells | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | When MG timing advance of 0 ms is applied | | | | | When MG timing advance of 0.5 ms is applied | | | | |
| | MGL=20 ms | MGL=10 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms | MGL=20 ms | MGL=10 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms |
| 15 | 20 | 10 | 6 | 4 | 3 | 21 Note3 | 11 Note3 | 7 Note3 | 5 Note3 | 4 Note3 |
| 30 | 40 | 20 | 12 | 8 | 6 | 40 | 20 | 12 | 8 | 6 |
| 60 | 80 | 40 | 24 | 16 | 12 | 80 | 40 | 24 | 16 | 12 |

| 960 Note4 | 1280 | 640 | 384 | 256 | 192 | 1280 | 640 | 384 | 256 | 192 |
| 960 Note5 | 1281 | 641 | 385 | 257 | 193 | 1281 | 641 | 385 | 257 | 193 |
| NOTE 1: Void<br>NOTE 2: NR SCSs of 120 kHz, 480 kHz and 960 kHz are only applicable to the case with per-UE measurement gap. | | | | | | | | | | |

NOTE 3: Non-overlapped half-slots occur before and after the measurement gap. Whether a Rel-15 UE can receive and/or transmit in those half-slots is up to UE implementation.
NOTE 4: For NR SCSs of 480 kHz and 960 kHz, total number of interrupted slots on all serving cells during MGL for single carrier, intra-band NR CA with per-UE measurement gap.
NOTE 5: For NR SCSs of 480 kHz and 960 kHz, total number of interrupted slots on all serving cells in SCG for inter-band NR-CA and synchronous NR-DC with per-UE measurement gap.

**Table 9.1.2-4a: Total number of interrupted slots on serving cells during MGL for Asynchronous EN-DC, and on all serving cells in SCG for NR standalone operation (with asynchronous NR-DC configuration) with per-UE measurement gap or per-FR measurement gap for FR1**

| NR SCS (kHz) | Total number of interrupted slots on serving cells | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | When MG timing advance of 0 ms is applied | | | | | When MG timing advance of 0.5 ms is applied | | | | |
| | MGL=20 ms | MGL=10 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms | MGL=20 ms | MGL=10 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms |
| 15 | 21 | 11 | 7 | 5 | 4 | 21 | 11 | 7 | 5 | 4 |
| 30 | 41 | 21 | 13 | 9 | 7 | 41 | 21 | 13 | 9 | 7 |
| 60 | 81 | 41 | 25 | 17 | 13 | 81 | 41 | 25 | 17 | 13 |
| 120 | 161 | 81 | 49 | 33 | 25 | 161 | 81 | 49 | 33 | 25 |
| 480 Note3 | 641 | 321 | 193 | 129 | 97 | 641 | 321 | 193 | 129 | 97 |
| 960 Note3 | 1281 | 641 | 385 | 257 | 193 | 1281 | 641 | 385 | 257 | 193 |

NOTE 1: Void
NOTE 2: NR SCSs of 120 kHz, 480 kHz and 960 kHz are only applicable to the case with per-UE measurement gap.
NOTE 3: For NR SCSs of 480 kHz and 960 kHz, total number of interrupted slots on all serving cells in SCG for asynchronous NR-DC with per-UE measurement gap.

In case that UE capable of per-FR measurement gap is configured with per-FR measurement gap for FR2 serving cells, total number of interrupted slots on FR2 serving cells during MGL is listed in table 9.1.2-4b.

**Table 9.1.2-4b: Total number of interrupted slots on FR2 serving cells during MGL for EN-DC, NR standalone operation (with single carrier, NR CA and NR-DC configuration) and NE-DC with per-UE measurement gap or per-FR measurement gap for FR2**

| NR SCS (kHz) | Total number of interrupted slots on FR2 serving cells | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | When MG timing advance of 0 ms is applied | | | | | When MG timing advance of 0.25 ms is applied | | | | |
| | MGL= 20 ms | MGL= 10 ms | MGL= 5.5 ms | MGL= 3.5 ms | MGL= 1.5 ms | MGL= 20 ms | MGL= 10 ms | MGL= 5.5 ms | MGL= 3.5 ms | MGL= 1.5 ms |
| 60 | 80 | 40 | 22 | 14 | 6 | 80 | 40 | 22 | 14 | 6 |
| 120 | 160 | 80 | 44 | 28 | 12 | 160 | 80 | 44 | 28 | 12 |
| 480 Note3 | 640 | 320 | 176 | 112 | 48 | 640 | 320 | 176 | 112 | 48 |
| 960 Note3 | 1280 | 640 | 352 | 224 | 96 | 1280 | 640 | 352 | 224 | 96 |

NOTE 1: The total number of interrupted slots is based on that SFN and subframe reference for per-FR gap in FR2 indicated by high layer parameter *refServCellIndicator* is an FR2 serving cell.
NOTE 2: Slot occurs before or after the measurement gap may be interrupted additionally if SFN and subframe reference for per-FR gap in FR2 indicated by high layer parameter refServCellIndicator is an FR1 serving cell.
NOTE 3: For NR SCSs of 480 kHz and 960 kHz, total number of interrupted slots on FR2-2 serving cells during MGL for NR standalone operation (single carrier, NR CA and NR-DC) with per-UE measurement gap or per-FR measurement gap for FR2-2.
NOTE 4: If UE is configured with per-UE measurement gap, the MG timing advance of 0.25 is applicable only for FR2 NR SA (with both single carrier and NR CA configuration).

It is up to UE implementation whether or not the UE is able to conduct transmission in the following slot(s),

- when MGTA is not applied, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after measurement gap

- when MGTA is applied and the SCS of the UL carrier is other than 15 kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after measurement gap
- when MGTA is applied and the SCS of the UL carrier is 15 kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after the slot partially overlapped with measurement gap

where UL slot denotes that all the symbols in the slot are uplink symbols, and L=1 if $(N_{TA} + N_{TA\ offset}) \times T_c$ for the UL transmission is less than the length of one slot; L=2 otherwise.

Note: Network is supposed to take into account the possible difference between the estimated TA at network and actual TA at UE when scheduling UE in the above slot(s).

**Table 9.1.2-5: (Void)**

If a positioning measurement gap is configured via *PosGapConfig* and activated by MAC CE, the measurement requirements do not apply for RRM measurement that requires measurement gaps.

### 9.1.2.1 EN-DC: Measurement Gap Sharing

For E-UTRA-NR dual connectivity UE configured with per-UE measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on intra-frequency carriers for both SSB and CSI-RS based L3 measurement or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE requires measurement gaps to identify and measure cells on inter-frequency carriers or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-UE measurement gaps, E-UTRA gap-needed inter-frequency carriers and inter-RAT UTRAN carriers and/or inter-RAT GSM carriers.

For E-UTRA-NR dual connectivity UE configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR1 inter-frequency carriers for both SSB and CSI-RS based L3 measurement or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR1 measurement gaps, E-UTRA gap-needed inter-frequency carriers, inter-RAT UTRAN carriers and/or inter-RAT GSM carriers.

For E-UTRA-NR dual connectivity UE configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR2 inter-frequency carriers for both SSB and CSI-RS based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR2 measurement gaps.

When network signals “01”, “10” or “11” with RRC parameter *MeasGapSharingScheme* [2][16]and the value of X is defined as in table 9.1.2.1-1, and

- $K_{intra} = 1 / X * 100$,
- $K_{inter} = 1 / (100 – X) * 100$,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1.5.2.1.

**Table 9.1.2.1-1: Value of parameter X for EN-DC measurement gap sharing**

| ***measGapSharingScheme*** | **Value of X (%)** |
|---|---|
| ‘00’ | Equal splitting |
| ‘01’ | 25 |
| ‘10’ | 50 |
| ‘11’ | 75 |

NOTE: It is left to UE implementation to determine which measurement gap sharing scheme in the table to be applied, when *MeasGapSharingScheme* is absent and there is no stored value in the field.

### 9.1.2.1a SA: Measurement Gap Sharing

For NR standalone UE without NR-DC operation and configured with per-UE measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on intra-frequency carriers or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE requires measurement gaps to identify and measure cells on inter-frequency carriers for both SSB and CSI-RS based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-UE measurement gaps, and/or inter-RAT E-UTRAN carriers, and/or inter-RAT UTRAN carriers for SRVCC, and when UE is configured to measure positioning frequency layers.

For NR standalone UE without NR-DC operation and configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR1 inter-frequency carriers for both SSB and CSI-RS based L3 measurement and/or inter-RAT E-UTRAN carriers, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR1 measurement gaps, and/or inter-RAT UTRAN carriers for SRVCC, and when UE is configured to measure positioning frequency layers in FR1.

For NR standalone UE without NR-DC operation and configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR2 inter-frequency carriers for both SSB and CSI-RS based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR2 measurement gaps, and when UE is configured to measure positioning frequency layers in FR2.

When network signals “01”, “10” or “11” with RRC parameter *MeasGapSharingScheme* [2] and the value of X is defined as in table 9.1.2.1a-1, and

- $K_{intra} = 1 / X * 100$,
- $K_{inter} = 1 / (100 – X) * 100$,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1.5.2.2.

**Table 9.1.2.1a-1: Value of parameter X for NR standalone measurement gap sharing**

| ***measGapSharingScheme*** | **Value of X (%)** |
|---|---|
| ‘00’ | Equal splitting |
| ‘01’ | 25 |
| ‘10’ | 50 |
| ‘11’ | 75 |
| NOTE: It is left to UE implementation to determine which measurement gap sharing scheme in the table to be applied, when *MeasGapSharingScheme* is absent and there is no stored value in the field. | |

### 9.1.2.1b NE-DC: Measurement Gap Sharing

For NR-E-UTRA dual connectivity UE configured with per-UE measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on intra-frequency carriers or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE requires measurement gaps to identify and measure cells on inter-frequency carriers, E-UTRA gap-needed inter-frequency carriers for both SSB and CSI-RS based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-UE measurement gaps,

and/or inter-RAT E-UTRA carriers, and/or inter-RAT UTRAN carriers for SRVCC, and when UE is configured to measure positioning frequency layers.

For NR-E-UTRA dual connectivity UE configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE requires measurement gaps to identify and measure cells on inter-frequency carriers for both SSB and CSI-RS based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR1 measurement gaps, E-UTRA gap-needed inter-frequency carriers, and/or inter-RAT E-UTRA carriers, and/or inter-RAT UTRAN carriers for SRVCC, and when UE is configured to measure positioning frequency layers in FR1.

For NR-E-UTRA dual connectivity UE configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR2 inter-frequency carriers for both SSB and CSI-RS based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR2 measurement gaps, and when UE is configured to measure positioning frequency layers in FR2.

When network signals “01”, “10” or “11” with RRC parameter *measGapSharingConfig* [2][16] and the value of X is defined as in table 9.1.2.1b-1, and

- $K_{intra} = 1 / X * 100$,
- $K_{inter} = 1 / (100 – X) * 100$,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1.5.2.3.

**Table 9.1.2.1b-1: Value of parameter X for NE-DC measurement gap sharing**

| ***measGapSharingScheme*** | **Value of X (%)** |
|---|---|
| ‘00’ | Equal splitting |
| ‘01’ | 25 |
| ‘10’ | 50 |
| ‘11’ | 75 |
| NOTE: It is left to UE implementation to determine which measurement gap sharing scheme in the table to be applied, when *MeasGapSharingScheme* is absent and there is no stored value in the field. | |

## 9.1.2.1c NR-DC: Measurement Gap Sharing

For UE with NR-DC operation and configured with per-UE measurement gap, measurement gap sharing shall be applies when UE required measurement gaps to identify and measure cells on intra-frequency carriers or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE requires measurement gaps to identify and measure cells on inter-frequency carriers for both SSB and CSI-RS based L3 measurement, and/or inter-RAT E-UTRAN carriers, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-UE measurement gaps, and/or inter-RAT UTRAN carriers for SRVCC, and when UE is configured to measure positioning frequency layers.

For UE with NR-DC operation and configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR1 inter-frequency carriers for both SSB and CSI-RS based L3 measurement and/or inter-RAT E-UTRAN carriers, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR1 measurement gaps, and/or inter-RAT UTRAN carriers for SRVCC, and when UE is configured to measure positioning frequency layers in FR1.

For UE with NR-DC operation and configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR2 inter-frequency carriers for both SSB and CSI-RS based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR2 measurement gaps, and when UE is configured to measure positioning frequency layers in FR2.

When network signals “01”, “10” or “11” with RRC parameter *measGapSharingConfig* [2] and the value of X is defined as in table 9.1.2.1c-1, and

- $K_{intra} = 1 / X * 100$,
- $K_{inter} = 1 / (100 – X) * 100$,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1.5.2.4.

**Table 9.1.2.1c-1: Value of parameter X for NR-DC measurement gap sharing**

| ***measGapSharingConfig*** | **Value of X (%)** |
|---|---|
| ‘00’ | Equal splitting |
| ‘01’ | 25 |
| ‘10’ | 50 |
| ‘11’ | 75 |
| NOTE: It is left to UE implementation to determine which measurement gap sharing scheme in the table to be applied, when *MeasGapSharingScheme* is absent and there is no stored value in the field. | |

## 9.1.3 UE Measurement capability

### 9.1.3.1 EN-DC: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE capable of and configured with the EN-DC operation mode.

When monitoring of multiple inter-frequency E-UTRAN, inter-RAT NR, GSM, UTRA FDD and UTRA TDD carriers as configured by E-UTRA PCell, and inter-frequency NR carriers (with or without CCA) as configured by PSCell using gaps (or without using gaps provided the UE supports such capability or the effective MGRP is applied for per-FR measurement gap capable UE) is configured, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, CSI-SINR, SFTD, E-UTRAN RSRP, E-UTRAN RSRQ, E-UTRAN RS-SINR measurements, UTRAN TDD P-CCPCH RSCP, UTRAN FDD CPICH measurements, GSM carrier RSSI, etc.) of detected cells on all the layers.

For UE configured with the EN-DC operation, the effective total number of frequencies excluding the frequencies of the PSCell, SCells, E-UTRA PCell, and E-UTRA SCells being monitored is $N_{freq, EN-DC}$, which is defined as:

$$N_{freq, EN-DC} = N_{freq, EN-DC, NR} + N_{freq, EN-DC, E-UTRA} + N_{freq, EN-DC, UTRA} + M_{EN-DC, GSM},$$

where

$N_{freq, EN-DC, E-UTRA}$ is the number of E-UTRA inter-frequency carriers being monitored (FDD and TDD) as configured by E-UTRA PCell or via LPP [22],

$N_{freq, EN-DC, NR} \leq N_{freq, EN-DC, NR, inter-RAT} + N_{freq, EN-DC, NR, inter-freq}$

where

$N_{freq, EN-DC, NR, inter-RAT}$ is the number of NR inter-RAT carriers excluding NR serving carrier(s) being monitored as configured by E-UTRA PCell [15],

$N_{freq, EN-DC, NR, inter-freq}$ is the number of NR inter-frequency carriers being monitored as configured by PSCell,

$N_{freq, EN-DC, UTRA}$ is the number of UTRA inter-RAT carriers being monitored as configured by E-UTRA PCell (FDD and TDD).

$M_{EN-DC, GSM}$ is an integer which is a function of the number of GSM inter-RAT carriers as configured by E-UTRA PCell on which measurements are being performed. $M_{EN-DC, GSM}$ is equal to 0 if no GSM carrier is being monitored. For a MGRP of 40 ms, $M_{EN-DC, GSM}$ is equal to 1 if cells on up to 32 GSM carriers are being measured. For a MGRP of 80 ms, $M_{EN-DC, GSM}$ is equal to ceil($N_{carriers,GSM}$ /20) where $N_{carriers,GSM}$ is the number of GSM carriers on which cells are being measured.

### 9.1.3.1a SA: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE configured with SA NR operation mode.

When monitoring of multiple inter-RAT E-UTRAN carriers, inter-frequency NR carriers (with or without CCA) and inter-RAT UTRA FDD carriers using gaps (or without using gaps provided the UE supports such capability or the effective MGRP is applied for per-FR measurement gap capable UE) is configured by PCell, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, CSI-SINR, E-UTRAN RSRP, E-UTRAN RSRQ, E-UTRAN RS-SINR measurements, UTRAN FDD CPICH measurement, etc.) of detected cells on all the layers.

For UE configured with the NR SA operation, the effective total number of frequencies, excluding the frequencies of the PCell, PSCell and SCells being monitored, is $N_{freq, SA}$, which is defined as:

$$N_{freq, SA} = N_{freq, SA, NR} + N_{freq, SA, E-UTRA} + N_{freq, SA, UTRA},$$

where

- $N_{freq, SA, E-UTRA}$ is the number of E-UTRA inter-RAT carriers being monitored (FDD and TDD) as configured by PCell or via LPP [22],
- $N_{freq, SA, UTRA}$ is the number of UTRA FDD inter-RAT carriers being monitored as configured by PCell,
- $N_{freq, SA, NR}$ is the number of NR inter-frequency carriers being monitored as configured by PCell.

### 9.1.3.1b NE-DC: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE capable of and configured with the NE-DC operation mode.

When monitoring of multiple inter-frequency E-UTRAN carriers as configured by E-UTRA PSCell, inter-RAT E-UTRAN carriers as configured by PCell, inter-RAT UTRA FDD carriers as configured by PCell, and inter-frequency NR carriers as configured by PCell using gaps (or without using gaps provided the UE supports such capability or the effective MGRP is applied for per-FR measurement gap capable UE) is configured, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, CSI-SINR, SFTD, E-UTRAN RSRP, E-UTRAN RSRQ, and E-UTRAN RS-SINR measurements, UTRAN FDD CPICH measurements, etc.) of detected cells on all the layers.

For UE configured with the NE-DC operation, the effective total number of frequencies excluding the frequencies of the PCell, SCells, E-UTRA PSCell, and E-UTRA SCells being monitored is $N_{freq, NE-DC}$, which is defined as:

$$N_{freq, NE-DC} = N_{freq, NE-DC, NR} + N_{freq, NE-DC, E-UTRA} + N_{freq, NE-DC, UTRA},$$

where

$N_{freq, NE-DC, NR}$ is the number of NR inter-frequency carriers being monitored as configured by PCell,

$N_{freq, NE-DC, UTRA}$ is the number of UTRA FDD inter-RAT carriers being monitored as configured by PCell,

$N_{freq, NE-DC, E-UTRA} \leq N_{freq, NE-DC, E-UTRA, inter-RAT} + N_{freq, NE-DC, E-UTRA, inter-freq}$

where

$N_{freq, NE-DC, E-UTRA, inter-RAT}$ is the number of E-UTRA inter-RAT carriers (FDD and TDD) excluding E-UTRA serving carrier(s) being monitored as configured by PCell or via LPP [22],

$N_{freq, NE-DC, E-UTRA, inter-freq}$ is the number of E-UTRA inter-frequency carriers (FDD and TDD) being monitored as configured by E-UTRA PSCell [15] or via LPP [22].

### 9.1.3.1c NR-DC: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE configured with NR-DC operation mode.

When monitoring of multiple inter-RAT E-UTRAN carriers and inter-frequency NR carriers using gaps (or without using gaps provided the UE supports such capability or the effective MGRP is applied for per-FR measurement gap capable UE) as configured by PCell, inter-RAT UTRA FDD carriers as configured by PCell, and inter-frequency NR carriers as configured by PSCell is configured, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, CSI-SINR, E-UTRAN RSRP, E-UTRAN RSRQ, E-UTRAN RS-SINR measurements, UTRAN FDD CPICH measurements, etc.) of detected cells on all the layers.

For UE configured with the NR-DC operation, the effective total number of frequencies, excluding the frequencies of the PCell, PSCell and SCells being monitored, is $N_{freq, NR-DC}$, which is defined as:

$$N_{freq, NR-DC} = N_{freq, NR-DC, NR} + N_{freq, NR-DC, E-UTRA} + N_{freq, NR-DC, UTRA},$$

where

- $N_{freq, NR-DC, E-UTRA}$ is the number of E-UTRA inter-RAT carriers being monitored (FDD and TDD) as configured by PCell or via LPP [22].
- $N_{freq, NE-DC, UTRA}$ is the number of UTRA FDD inter-RAT carriers being monitored as configured by PCell,
- $N_{freq, NR-DC, NR}$ is the number of NR inter-frequency carriers being monitored as configured by PCell and PSCell.

### 9.1.3.2 EN-DC: Maximum allowed layers for multiple monitoring

If a UE is configured with EN-DC operation, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR SSB inter-frequency carriers configured by PSCell, and
- Depending on UE capability, 8 NR inter-frequency carriers including SSB and CSI-RS in total configured by PSCell, and
- Depending on UE capability, 7 NR SSB inter-RAT carriers excluding NR serving carrier(s) configured by E-UTRA PCell [15], and
- Depending on UE capability, 6 E-UTRA TDD inter-frequency carriers configured by E-UTRA PCell [15], and
- Depending on UE capability, 6 E-UTRA FDD inter-frequency carriers configured by E-UTRA PCell [15], and
- Depending on UE capability, 3 FDD UTRA carriers, and
- Depending on UE capability, 3 TDD UTRA carriers, and
- Depending on UE capability, 32 GSM carriers (one GSM layer corresponds to 32 carriers), and
- Depending on UE capability, 1 E-UTRA FDD inter-frequency carrier for RSTD measurements configured via LPP [22], and
- Depending on UE capability, 1 E-UTRA TDD inter-frequency carrier for RSTD measurements configured via LPP [22].

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 13 effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD, E-UTRA TDD, UTRA FDD, UTRA TDD and GSM (one GSM layer corresponds to 32 carriers) layers. The UE shall be capable of monitoring a total of at least $7 + N_{CSI}$ effective NR carrier frequency layers excluding NR serving carrier(s), comprising of any above defined combination of NR inter-RAT carriers excluding NR serving carrier(s) configured by E-UTRA PCell and NR inter-frequency carriers configured by PSCell, $N_{CSI}$ equals 1 if UE supports CSI-RS based L3 measurement, and $N_{CSI}$ =0 otherwise.

The number of SSB frequency layers configured by PSCell equals to the total number of MOs with

- *ssb-ConfigMobility* configured, or
- *ssb-ConfigMobility* not configured but *csi-rs-ResourceConfigMobility* configured with *associatedSSB.*

If *ssbfrequency, smtc1, smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

The number of CSI-RS frequency layers equals to the number of MOs with *csi-rs-ResourceConfigMobility* configured assuming single MO is configured per frequency layer.

When the E-UTRA PCell and PSCell configures the same NR carrier frequency layer to be monitored by the UE in synchronous intra-band EN-DC, this layer shall be counted only once to the total number of effective carrier frequency layers provided that the SFN-s and slot boundaries are aligned, unless the configured NR carrier frequency layers to be monitored have

- different RSSI measurement resources or
- different *deriveSSB-IndexFromCell* indications or
- different SMTC configurations or
- different *ssb-PositionQCL-Common-r16* indications or cell list of *ssb-PositionQCL* on NR carrier frequency layer with CCA or
- different *rmtc-Config-r16* indication on NR carrier frequency layer with CCA.

NOTE 1: The E-UTRA-NR dual connectivity capable UE configured with PSCell shall fulfil the requirements defined in only one of clause 9.1.3.2 and clause 8.1.2.1.1b.1 of TS 36.133 [15].

### 9.1.3.2a SA: Maximum allowed layers for multiple monitoring

If a UE is configured with SA NR operation mode, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR SSB inter-frequency carriers configured by PCell, and
- Depending on UE capability, 8 NR inter-frequency carriers including SSB and CSI-RS in total configured by PCell, and
- Depending on UE capability, 7 E-UTRA TDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 7 E-UTRA FDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 3 UTRA FDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 1 E-UTRA FDD inter-RAT carrier for RSTD measurements configured via LPP [22], and
- Depending on UE capability, 1 E-UTRA TDD inter-RAT carrier for RSTD measurements configured via LPP [22].

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least [13] effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD, E-UTRA TDD and UTRA FDD layers.

The number of SSB frequency layers equals to the total number of MOs with

- *ssb-ConfigMobility* configured, or
- *ssb-ConfigMobility* not configured but *csi-rs-ResourceConfigMobility* configured with *associatedSSB.*

If *ssbfrequency, smtc1, smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

The number of CSI-RS frequency layers equals to the number of MOs with *csi-rs-ResourceConfigMobility* configured assuming single MO is configured per frequency layer.

### 9.1.3.2b NE-DC: Maximum allowed layers for multiple monitoring

If a UE is configured with NE-DC operation mode, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR SSB inter-frequency carriers configured by PCell, and
- Depending on UE capability, 8 NR inter-frequency carriers including SSB and CSI-RS in total configured by PCell, and
- Depending on UE capability, 6 E-UTRA TDD inter-RAT carriers excluding E-UTRA serving carriers configured by PCell, and
- Depending on UE capability, 6 E-UTRA FDD inter-RAT carriers excluding E-UTRA serving carriers configured by PCell, and
- Depending on UE capability, 6 E-UTRA TDD inter-frequency carriers configured by E-UTRA PSCell [15], and
- Depending on UE capability, 6 E-UTRA FDD inter-frequency carriers configured by E-UTRA PSCell [15], and
- Depending on UE capability, 3 UTRA FDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 1 E-UTRA FDD inter-frequency carrier for RSTD measurements configured via LPP [22], and
- Depending on UE capability, 1 E-UTRA TDD inter-frequency carrier for RSTD measurements configured via LPP [22].

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 13 effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD, E-UTRA TDD and UTRA FDD layers. The UE shall be capable of monitoring a total of at least 6 effective E-UTRA carrier frequency layers, excluding E-UTRA serving carrier(s), comprising of any above defined combination of E-UTRA inter-RAT carriers excluding E-UTRA serving carrier(s) configured by PCell and E-UTRA inter-frequency carriers configured by E-UTRA PSCell.

The number of SSB frequency layers configured by PCell equals to the total number of MOs with

- *ssb-ConfigMobility* configured, or
- *ssb-ConfigMobility* not configured but *csi-rs-ResourceConfigMobility* configured with *associatedSSB.*

If *ssbfrequency, smtc1, smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

The number of CSI-RS frequency layers equals to the number of MOs with *csi-rs-ResourceConfigMobility* configured assuming single MO is configured per frequency layer.

### 9.1.3.2c NR-DC: Maximum allowed layers for multiple monitoring

If a UE is configured with NR-DC operation, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR SSB inter-frequency carriers configured by PCell, and
- Depending on UE capability, 8 NR inter-frequency carriers including SSB and CSI-RS in total configured by PCell, and
- Depending on UE capability, 7 NR SSB inter-frequency carriers configured by PSCell, and
- Depending on UE capability, 8 NR inter-frequency carriers including SSB and CSI-RS in total configured by PSCell, and
- Depending on UE capability, 7 E-UTRA TDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 7 E-UTRA FDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 3 UTRA FDD inter-RAT carriers configured by PCell, and

- Depending on UE capability, 1 E-UTRA FDD inter-RAT carrier for RSTD measurements configured via LPP [22], and

- Depending on UE capability, 1 E-UTRA TDD inter-RAT carrier for RSTD measurements configured via LPP [22].

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 13 effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD, E-UTRA TDD and UTRA FDD layers. The UE shall be capable of monitoring a total of at least 7 + $N_{CSI}$ effective NR carrier frequency layers excluding NR serving carrier(s), which are configured by PCell and PSCell, $N_{CSI}$ equals 1 if UE supports CSI-RS based L3 measurement, and $N_{CSI}$ =0 otherwise.

The number of SSB frequency layers equals to the total number of MOs with

- *ssb-ConfigMobility* configured, or

- *ssb-ConfigMobility* not configured but *csi-rs-ResourceConfigMobility* configured with *associatedSSB.*

If *ssbfrequency*, *smtc1*, *smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

The number of CSI-RS frequency layers equals to the number of MOs with *csi-rs-ResourceConfigMobility* configured assuming single MO is configured per frequency layer.

When PCell and PSCell configures the same NR carrier frequency layer to be monitored by the UE in NR-DC, this layer shall be counted only once to the total number of effective carrier frequency layers provided that the SFN-s and slot boundaries are aligned, unless the configured NR carrier frequency layers to be monitored have

- different RSSI measurement resources or

- different *deriveSSB-IndexFromCell* indications or

- different SMTC configurations or

- different *ssb-PositionQCL-Common-r16* indications or cell list of *ssb-PositionQCL* on NR carrier frequency layer with CCA or

- different *rmtc-Config-r16* indication on NR carrier frequency layer with CCA.

#### 9.1A.3.2 Void

## 9.1.3A UE Measurement capability under operation mode with CCA

### 9.1.3A.1 EN-DC: Monitoring of multiple layers using gaps under CCA

The requirements in clause 9.1.3.1 are also applicable for the UE capable of and configured with the EN-DC operation mode with CCA on PSCC.

### 9.1.3A.1a SA: Monitoring of multiple layers using gaps under CCA

The requirements in clause 9.1.3.1a are also applicable for UE configured with SA NR operation mode with CCA on PCC.

### 9.1.3A.2 EN-DC: Maximum allowed layers for multiple monitoring under CCA

If a UE is configured with EN-DC operation when CCA is used on PSCell, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR inter-frequency carriers configured by PSCell, and

- Depending on UE capability, 7 NR inter-RAT carriers excluding NR serving carrier(s) configured by E-UTRA PCell [15], and

- Depending on UE capability, 6 E-UTRA TDD inter-frequency carriers configured by E-UTRA PCell [15], and
- Depending on UE capability, 6 E-UTRA FDD inter-frequency carriers configured by E-UTRA PCell [15], and
- Depending on UE capability, 3 FDD UTRA carriers, and
- Depending on UE capability, 3 TDD UTRA carriers, and
- Depending on UE capability, 32 GSM carriers (one GSM layer corresponds to 32 carriers), and

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least 13 effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD, E-UTRA TDD, UTRA FDD, UTRA TDD and GSM (one GSM layer corresponds to 32 carriers) layers. The UE shall be capable of monitoring a total of at least 7 effective NR carrier frequency layers excluding NR serving carrier(s), comprising of any above defined combination of NR inter-RAT carriers excluding NR serving carrier(s) configured by E-UTRA PCell and NR inter-frequency carriers configured by PSCell.

When the E-UTRA PCell and PSCell configures the same NR carrier frequency layer to be monitored by the UE in synchronous intra-band EN-DC, this layer shall be counted only once to the total number of effective carrier frequency layers provided that the SFN-s and slot boundaries are aligned, unless the configured NR carrier frequency layers to be monitored have

- different RSSI measurement resources or
- different *deriveSSB-IndexFromCell* indications or
- different SMTC configurations or
- different *ssb-PositionQCL-Common-r16* indications or cell list of *ssb-PositionQCL* on NR carrier frequency layer with CCA or
- different *rmtc-Config-r16* indication on NR carrier frequency layer with CCA.

### 9.1.3A.2a SA: Maximum allowed layers for multiple monitoring under CCA

If a UE is configured with SA NR operation mode when CCA is used on PCell or SCell only, the UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR inter-frequency carriers configured by PCell, and
- Depending on UE capability, 7 E-UTRA TDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 7 E-UTRA FDD inter-RAT carriers configured by PCell, and

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least [13] effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD and E-UTRA TDD layers.

## 9.1.3C UE Measurement capability under operation mode with satellite access

### 9.1.3C.1a SA: Monitoring of multiple layers using gaps under satellite access

The requirements in this clause are applicable for UE configured with only PCell, which is served by SAN.

When monitoring of multiple SAN carriers and TN carriers using gaps (or without using gaps provided the UE supports such capability) is configured by PCell, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, CSI-SINR) of detected cells on all the layers.

NOTE: For a cell served by SAN, the UE could only be configured to measure SS-RSRP, SS-RSRQ, SS-SINR.

For the UE configured with NR SA operation mode with only PCell served by SAN, the effective total number of frequencies, excluding the frequencies of the serving cell being monitored, is $N_{freq, SA}$, which is defined as:

$$N_{freq,\ SA} = N_{freq,\ SA,\ SAN} + N_{freq,\ SA,\ TN},$$

where

- $N_{freq,\ SA,\ SAN}$ is the number of SAN carriers being monitored as configured by the serving cell served by SAN,

  $N_{freq,\ SA,\ TN}$ is the number of TN carriers being monitored as configured by the serving cell served by SAN.

### 9.1.3C.2a SA: Maximum allowed layers for multiple monitoring for SAN

If a UE is configured with NR SA operation mode with SAN serving cell, the UE shall be capable of monitoring at least:

- Depending on UE capability, 3 NR SAN carriers including serving carrier, and
- Depending on UE capability, 7 NR SAN and TN carriers including serving carrier,
  - The total number of NR SAN and TN carriers does not apply to VSAT UE.

FFS: the number of effective frequency layers UE shall be capable to monitor.

## 9.1.4 Capabilities for Support of Event Triggering and Reporting Criteria

### 9.1.4.1 Introduction

This clause contains requirements on UE capabilities for support of event triggering and reporting criteria. As long as the measurement configuration does not exceed the requirements stated in clause 9.1.4.2, the UE shall meet all other performance requirements defined in clause 9 and clause 10. The requirements in this clause also apply for a UE in EN-DC with PSCell on a carrier frequency with CCA or SA NR with PCell on a carrier frequency with CCA.

The UE can be requested to make measurements under different measurement identities defined in TS 38.331 [2]. Each measurement identity corresponds to either event-based reporting, periodic reporting, or no reporting. In case of event-based reporting, each measurement identity is associated with an event triggering criterion. In case of periodic reporting, a measurement identity is associated with one periodic reporting criterion. In case of no reporting, a measurement identity is associated with one no reporting criterion.

The purpose of this clause is to set some limits on the number of different event triggering, periodic, and no reporting criteria the UE may be requested to track in parallel.

### 9.1.4.2 Requirements

In this clause a reporting criterion corresponds to either one event (in the case of event-based reporting), or one periodic reporting criterion (in case of periodic reporting), or one no reporting criterion (in case of no reporting). For event-based reporting, each instance of event, with the same or different event identities, is counted as separate reporting criterion in table 9.1.4.2-1.

The UE shall be able to support in parallel per category up to $E_{cat}$ reporting criteria according to table 9.1.4.2-1. For the measurement categories belonging to intra-frequency, inter-frequency, and inter-RAT measurements (i.e. without counting other categories that the UE shall always support in parallel), the UE need not support more than the total number of reporting criteria as follows:

- For UE configured with EN-DC: $E_{cat,EN-DC,NR} + E_{cat,EN-DC,E-UTRA}$, where

  $E_{cat,EN-DC,NR} = 10 + 9 \times n$ is the total number of NR reporting criteria configured by PSCell (NR intra- and inter-frequency reporting criteria) and by E-UTRA PCell on NR serving frequencies (NR intra-frequency reporting criteria) applicable for UE configured with EN-DC according to table 9.1.4.2-1, and n is the number of configured NR serving frequencies, including PSCell and SCells carrier frequencies,

  $E_{cat,EN-DC,E-UTRA}$ is the total number of reporting criteria configured by E-UTRA PCell except PSCell and SCells carrier frequencies, as specified in TS 36.133 [15] for UE configured with EN-DC.

- For UE configured with NE-DC: $E_{cat,NE-DC,NR} + E_{cat,NE-DC,E-UTRA}$, where

$E_{cat,NE-DC,NR} = 10 + 9 \times n$ is the total number of NR reporting criteria according to table 9.1.4.2-1, and n is the number of configured NR serving frequencies, including PCell and SCells carrier frequencies,

$E_{cat,NE-DC,E-UTRA} = E_{cat,NE-DC,E-UTRA,inter-RAT} + E_{cat,NE-DC,E-UTRA,intra-RAT}$, where

$E_{cat,NE-DC,E-UTRA,inter-RAT}$ is the total number of inter-RAT E-UTRA reporting criteria configured by PCell except E-UTRA PSCell and E-UTRA SCells carrier frequencies, according to table 9.1.4.2-1,

$E_{cat,NE-DC,E-UTRA,intra-RAT}$ is the total number of E-UTRA reporting criteria including E-UTRA PSCell and E-UTRA SCells carrier frequencies as specified in TS 36.133 [15] for UE configured with NE-DC.

- For UE configured with SA operation mode: $E_{cat,SA,NR} + E_{cat,SA,E-UTRA}$, where

  $E_{cat,SA,NR} = 10 + 9 \times n$ is the total number of NR reporting criteria according to table 9.1.4.2-1, and n is the number of configured NR serving frequencies, including PCell, and SCells carrier frequencies,

  $E_{cat,SA,E-UTRA}$ is the total number of inter-RAT E-UTRA reporting criteria according to table 9.1.4.2-1.

- For UE configured with NR-DC: $E_{cat,NR-DC,NR} + E_{cat,NR-DC,E-UTRA}$, where

  $E_{cat,NR-DC,NR} = 10 + 9 \times n$ is the total number of NR reporting criteria according to table 9.1.4.2-1, and n is the number of configured NR serving frequencies, including PCell, PSCell and SCells carrier frequencies,

  $E_{cat,NR-DC,E-UTRA}$ is the total number of inter-RAT E-UTRA reporting criteria according to table 9.1.4.2-1.

**Table 9.1.4.2-1: Requirements for reporting criteria per measurement category**

| Measurement category | $E_{cat}$ | Note |
|---|---|---|
| Intra-frequency Note 1,2,3,4,5 | 9 | Events for any one or a combination of intra-frequency SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, and CSI-SINR for NG-RAN intra-frequency cells |
| Inter-frequency Note 2,3,4,5 | 10 | Events for any one or a combination of inter-frequency SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, and CSI-SINR for NG-RAN inter-frequency cells |
| Inter-RAT (E-UTRA FDD, E-UTRA TDD) Note 2,4,5 | 10 | Only applicable for UE with this (inter-RAT) capability. These reporting criteria apply for any E-UTRA carrier frequencies other than the carrier frequency of the E-UTRA PSCell or E-UTRA SCell. |
| Inter-RAT (E-UTRA FDD, E-UTRA TDD) RSTD Note 2,4,5 | 1 | Inter-RAT RSTD measurement reporting for UE supporting OTDOA; 1 report capable of minimum 16 inter-RAT cell measurements.<br>Only applicable for UE with this (inter-RAT RSTD via LPP [22]) capability. These reporting criteria apply for any E-UTRA carrier frequencies other than the carrier frequency of the E-UTRA PSCell or E-UTRA SCell. |
| Inter-RAT (E-UTRA FDD, E-UTRA TDD) RSRP and RSRQ measurements for E-CID Note 2,4,5 | 1 | Inter-RAT RSRP and RSRQ measurements for E-CID reported to E-SMLC via LPP [22]. One report capable of at least in total 10 inter-RAT RSRP and RSRQ measurements. Applicable to UE capable of reporting inter-RAT RSRP and RSRQ to E-SMLC via LPP. These reporting criteria apply for any E-UTRA carrier frequencies other than the carrier frequency of the E-UTRA PSCell or E-UTRA SCell. |
| Intra-frequency RSSI and channel occupancy measurements with CCA Note 1,2,3 | 1 | One report capable of one RSSI and one channel occupancy measurements over a channel [TS 37.213] with CCA. Applicable for UE capable of performing and reporting RSSI and channel occupancy on carrier frequencies under CCA. |

| Measurement category | $E_{cat}$ | Note |
|---|---|---|
| Inter-frequency RSSI and channel occupancy measurements with CCA Note 2,3 | 1 | One report capable of one RSSI and one channel occupancy measurements over a channel [TS 37.213] with CCA. Applicable for UE capable of performing and reporting RSSI and channel occupancy on carrier frequencies under CCA. |
| Intra-frequency SSB-based measurements for NR E-CID Note 1,2,3,4,5 | 1 | Intra-frequency SS-RSRP and SS-RSRQ measurements for NR E-CID reported to LMF via LPP [34]. One report capable of at least in total 9 intra-frequency SS-RSRP and SS-RSRQ measurements. Applicable to UE capable of reporting at least one of SS-RSRP and SS-RSRQ to LMF via LPP. |
| Intra-frequency CSI-RS based measurements for NR E-CID Note 1,2,3,4,5 | 1 | Intra-frequency CSI-RSRP and CSI-RSRQ measurements for NR E-CID reported to LMF via LPP [22]. One report capable of at least in total 9 intra-frequency CSI-RSRP and/or CSI-RSRQ measurements. Applicable to UE capable of reporting any of CSI-RSRP and CSI-RSRQ to LMF via LPP, as indicated in *nr-ECID-MeasSupported-r16*. |
| Inter-frequency SSB-based measurements for NR E-CID Note 2,3,4,5 | 1 | Inter-frequency SS-RSRP and SS-RSRQ measurements for NR E-CID reported to LMF via LPP [34]. One report capable of at least in total 10 inter-frequency SS-RSRP and SS-RSRQ measurements. Applicable to UE capable of reporting at least one of SS-RSRP and SS-RSRQ to LMF via LPP. |
| Inter-frequency CSI-RS based measurements for NR E-CID Note 2,3,4,5 | 1 | Inter-frequency CSI-RSRP and CSI-RSRQ measurements for NR E-CID reported to LMF via LPP [22]. One report capable of at least in total 10 inter-frequency CSI-RSRP and CSI-RSRQ measurements. Applicable to UE capable of reporting any of CSI-RSRP and CSI-RSRQ to LMF via LPP, as indicated in *nr-ECID-MeasSupported-r16*. |
| DL RSTD Note 2,4,5 | 1 | DL RSTD measurement reporting; 1 report capable of multiple (within the UE PRS measurement capability, *nr-DL-TDOA-MeasCapability*, indicated via LPP [34]) DL RSTD measurements and if supported also multiple corresponding DL PRS-RSRP measurements configured for DL-TDOA. Only applicable for UE capable of reporting measurements for DL-TDOA to LMF via LPP [34]. |
| UE Rx-Tx time difference Note 2,4,5 | 1 | UE Rx-Tx time difference measurement reporting; 1 report capable of multiple (within the UE PRS measurement capability, *nr-DL-PRS-MeasCapability*, indicated via LPP [34] for multi-RTT) UE Rx-Tx time difference measurements and if supported also multiple corresponding DL PRS-RSRP measurements configured for multi-RTT. Only applicable for UE capable of reporting measurements for multi-RTT to LMF via LPP [34]. |
| DL PRS-RSRP Note 2,4,5 | 1 | DL PRS-RSRP measurement reporting; 1 report capable of multiple (within the UE PRS measurement capability, *nr-DL-PRS-MeasCapability*, indicated via LPP [34] for AoD) DL PRS-RSRP measurements configured for DL-AoD. Only applicable for UE capable of reporting measurements for DL-AoD to LMF via LPP [34]. |

| Measurement category | $E_{cat}$ | Note |
|---|---|---|
| DL PRS-RSRPP Note 2,4,5 | 1 | DL PRS-RSRPP measurement reporting; 1 report capable of multiple (within the UE PRS measurement capability, *nr-DL-PRS-MeasCapability*, indicated via LPP [34] for AoD) DL PRS-RSRPP measurements configured for DL-AoD. Only applicable for UE capable of reporting measurements for DL-AoD to LMF via LPP [34]. |
| SRS-RSRP Note 2,3,4,5 | 1 | SRS-RSRP measurement reporting for CLI; 1 report capable of up to 32 SRS resources measurements. Only applicable for UE supporting *cli-SRS-RSRP-Meas-r16*. |
| CLI-RSSI Note 2,3,4,5 | 1 | CLI-RSSI measurement reporting for CLI; 1 report capable of up to 64 CLi-RSSI resources measurements. Only applicable for UE supporting *cli-RSSI-Meas-r16*. |
| NOTE 1: When the UE is configured with PSCell and SCell carrier frequencies, $E_{cat}$ for Intra-frequency is applied per corresponding NR serving frequency.<br>NOTE 2: Applicable for UE configured with SA NR operation mode.<br>NOTE 3: Applicable for UE configured with EN-DC operation mode.<br>NOTE 4: Applicable for UE configured with NE-DC operation mode.<br>NOTE 5: Applicable for UE configured with NR-DC operation mode. | | |

## 9.1.5 Carrier-specific scaling factor

This clause specifies the derivation of carrier-specific scaling factor (CSSF) values, which scales the measurement delay requirements given in clauses 9.2, 9.2A, 9.3, 9.3A, 9.4, and NR PRS-based positioning measurements in clause 9.9 and CSI-RS based L3 measurement in clause 9.10 when UE is configured to monitor multiple measurement objects. The CSSF values are categorized into $CSSF_{outside_gap,i}$ and $CSSF_{within_gap,i}$, for the measurements conducted outside measurement gaps and within measurement gaps, respectively.

If concurrent measurement gaps are configured by the network, subject to UE capability, the term of the union of concurrent measurement gaps in the following clauses refer to non-dropped measurement gap occasions after accounting for measurement gap collisions as specified in clause 9.1.8.3 from all the configured measurement gap patterns. The term of the associated measurement gap in concurrent measurement gaps in the following clauses refer to non-dropped measurement gap occasions associated by measurement object *i* after accounting for measurement gap collisions as specified in clause 9.1.8.3.

### 9.1.5.1 Monitoring of multiple layers outside gaps

For a UE supporting concurrent gaps or *concurrentMeasGapsPreMG-r18* or *concurrentMeasGapsNCSG-r18*, and when concurrent gaps are configured the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for measurement object *i* derived in this chapter is applied to following measurement types :

- SSB-based intra-frequency measurement without measurement gap as defined in clauses 9.2.1 and 9.2A.1, when none of the SMTC occasions of this intra-frequency measurement object are overlapped by the union of concurrent GAPs.

- SSB-based intra-frequency measurement with out measurement gap as defined in clauses 9.2.1 and 9.2A.1, when part of the SMTC occasions of this intra-frequency measurement object are overlapped by the union of concurrent GAPs.

- CSI-RS based intra-frequency measurement in clause 9.10.2, when none of CSI-RS resources for L3 measurement of this intra-frequency measurement object are overlapped by the union of concurrent GAPs.

- CSI-RS based intra-frequency measurement in clause 9.10.2, when all CSI-RS resources for L3 measurement of this intra-frequency measurement object are partially overlapped by the union of concurrent GAPs.

- SSB-based inter-frequency measurement without measurement gap as defined in clause 9.3.1, when none of the SMTC occasions of this inter-frequency measurement object are overlapped by the union of concurrent GAPs, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

- SSB-based inter-frequency measurement without measurement gap as defined in clause 9.3.1, when part of the SMTC occasions of this inter-frequency measurement object are overlapped by the union of concurrent GAPs, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

For a UE supporting MUSIM gaps or both concurrent measurement gaps and MUSIM gaps, and when periodic MUSIM gaps or both concurrent and periodic MUSIM gaps are configured the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for measurement object *i* derived in this chapter is applied to following measurement types :

- SSB-based intra-frequency measurement without measurement gap as defined in clauses 9.2.1 and 9.2A.1, when none of the SMTC occasions of this intra-frequency measurement object are overlapped by MUSIM gaps or the union of concurrent measurement gaps and MUSIM gaps.

- SSB-based intra-frequency measurement without measurement gap as defined in clauses 9.2.1 and 9.2A.1, when part of the SMTC occasions of this intra-frequency measurement object are overlapped by MUSIM gaps or the union of concurrent measurement gaps and MUSIM gaps.

- CSI-RS based intra-frequency measurement in clause 9.10.2, when none of CSI-RS resources for L3 measurement of this intra-frequency measurement object are overlapped by MUSIM gaps or the union of concurrent measurement gaps and MUSIM gaps.

- CSI-RS based intra-frequency measurement in clause 9.10.2, when all CSI-RS resources for L3 measurement of this intra-frequency measurement object are partially overlapped by MUSIM gaps or the union of concurrent measurement gaps and MUSIM gaps.

- SSB-based inter-frequency measurement without measurement gap as defined in clause 9.3.1, when none of the SMTC occasions of this inter-frequency measurement object are overlapped by MUSIM gaps or the union of concurrent measurement gaps and MUSIM gaps, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

- SSB-based inter-frequency measurement without measurement gap as defined in clause 9.3.1, when part of the SMTC occasions of this inter-frequency measurement object are overlapped by MUSIM gaps or the union of concurrent measurement gaps and MUSIM gaps, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

Otherwise, the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for measurement object *i* derived in this chapter is applied to following measurement types:

- SSB-based intra-frequency measurement without measurement gap as defined in clauses 9.2.1 and 9.2A.1, when none of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.

- SSB-based intra-frequency measurement without measurement gap as defined in clauses 9.2.1 and 9.2A.1, when part of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.

- CSI-RS based intra-frequency measurement in clause 9.10.2, when none of CSI-RS resources for L3 measurement of this intra-frequency measurement object are overlapped by the measurement gap.

- CSI-RS based intra-frequency measurement in clause 9.10.2, when all CSI-RS resources for L3 measurement of this intra-frequency measurement object are partially overlapped by the measurement gap.

- SSB-based inter-frequency measurement without measurement gap as defined in clause 9.3.1, when none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap.

- SSB-based inter-frequency measurement without measurement gap as defined in clause 9.3.1, when part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap.

- SSB-based intra-frequency measurement in clause 9.2.5 for UE supporting *nr-NeedForInterruptionReport-r18* and reporting *no-gap-with-interruption* for this intra-frequency layer via *NeedForInterruptionNR-r18,* when

  - no measuremeng gap is configured by NW, or

  - measurement gap is configured by the NW and none of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap

- SSB-based intra-frequency measurement in clause 9.2.5 for UE supporting *nr-NeedForInterruptionReport-r18* and reporting *no-gap-with-interruption* for this intra-frequency layer via *NeedForInterruptionNR-r18*, when
  - no measuremeng gap is configured by NW, or
  - none of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap, or
  - part of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap
- SSB-based inter-frequency measurement in clause 9.3.9 for UE supporting *nr-NeedForInterruptionReport-r18* and within the band reporting *no-gap-with-interruption* via *NeedForInterruptionNR-r18*, when
  - no GAP is configured by NW, or
  - measurement gap is configured by the NW and none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap
- SSB-based inter-frequency measurement in clause 9.3.9 for UE supporting *nr-NeedForInterruptionReport-r18* reporting *no-gap-with-interruption* for this inter-frequency layer via *NeedForInterruptionNR-r18*, when
  - no measuremeng gap is configured by NW, or
  - none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap
- For a UE in E-UTRA-NR dual connectivity operation, NR SSB-based inter-RAT measurement object configured by the E-UTRAN PCell on an NR serving carrier
  - the SSB is completely contained in the active BWP of the UE, and
  - none or part of the SMTC occasions of this inter-RAT measurement object are overlapped by the measurement gap;
- Intra-frequency RSSI and channel occupancy measurement with no measurement gap on a carrier subject to CCA when SMTC and RMTC are overlapping and RMTCs are not fully overlapped with measurement gap(s).
- E-UTRA inter-RAT measurement object without measurement gap as defined in clause 9.4.8, when
  - no measuremeng gap is configured by NW, or
  - none of the EMW occasions of this inter-RAT measurement object are overlapped by the measurement gap, or
  - part of the EMW occasions of this inter-RAT measurement object are overlapped by the measurement gap

The UE is expected to conduct the measurement of this measurement object *i* only outside the measurement gaps.

For a UE in E-UTRA-NR dual connectivity operation, if a measurement object configured by PSCell and an NR inter-RAT measurement object configured by E-UTRAN PCell are on the same serving carrier, they shall be counted as one intra-frequency measurement object, provided that they meet the measurement object merging conditions in clause 9.1.3.2.

The number of frequency layers for SSB measurements shall include the total number of MOs with

- *ssb-ConfigMobility* configured, or
- *ssb-ConfigMobility* not configured but *csi-rs-ResourceConfigMobility* configured with *associatedSSB.*

If *ssbfrequency*, *smtc1*, *smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, $CSSF_{outside_gap,i}$ and requirements derived from $CSSF_{outside_gap,i}$ are not specified.

The UE cell identification and measurement periods derived based on $CSSF_{outside_gap,i}$ in clauses 9.2.5.1, 9.2.5.2 and 9.10.2 may be extended for measurement objects of which the cell identification and measurement periods are overlapped with $T_{measure_SFTD1}$ specified in clause 9.3.8 when no measurement gaps are provided.

For UE supports OD-SSB operation capability and when OD- SSB transmission is indicated,

- the SMTC for OD-SSB based intra-frequencymeasurementfor serving cell is OD-SMTC when the OD-SSB activation is indicated,
- the SMTC for OD-SSB based intra-frequency measurement for neighbor cell is the first SMTC regardless of status of OD-SSB.

The requirements in this clause apply provided that

- The SMTC on all CCs and inter-frequency layers without measurement gap in FR2 have the same offset, and one of following conditions is met
  - If *smtc2* is configured on any FR2 CC,
    - All CCs have the same configuration for *smtc1*, and
    - All CCs configured with *smtc2* have the same configuration for *smtc2*
  - If *smtc2* is not configured on any FR2 CC,
    - The total number of different SMTC periodicities on all serving CCs and inter-frequency layers without measurement gap does not exceed 4
- The starting point of the first 5 ms window for CSI-RS measurement as defined in clause 9.10.1 on all CCs in FR2 is same and one of following conditions is met
  - If any CSI-RS resource is configured in the second 5 ms window for CSI-RS measurement as defined in clause 9.10.1 on any FR2 CC,
    - All CCs with CSI-RS resources only in the first 5 ms window have the same CSI-RS resource periodcity, and
    - All CCs with CSI-RS resources both in the first and the second 5 ms window have the same CSI-RS resource periodcity
  - If no CSI-RS resource is configured in the second 5 ms window for CSI-RS measurement as defined in clause 9.10.1 on any FR2 CC,
    - The total number of different CSI-RS resources periodicities on all serving CCs does not exceed 3.

    Note: Longer delays for cell identification and measurement periods derived based on $CSSF_{outside_gap,i}$ in clauses 9.2.5.1, 9.2.5.2, can be expected, if the UE is configured with more than 4 different SMTC periodicities on FR2 serving carriers. The longer delay applies for the FR2 intra-frequency measurement objects with the longest SMTC periodicity/periodicities.

#### 9.1.5.1.1 EN-DC mode: carrier-specific scaling factor for SSB-based, CSI-RS based L3 measurements and RSSI and channel occupancy measurements performed outside gaps

For UE configured with the E-UTRA-NR dual connectivity operation, the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for intra-frequency SSB-based measurements, inter-frequency SSB-based measurements performed outside measurements gaps, intra-frequency CSI-RS L3 measurement and RSSI/channel occupancy measurement with no measurement gap on a carrier subject to CCA when SMTC and RMTC are overlapping will be as specified in table 9.1.5.1.1-1.

For UE supporting *threeCarrierMeasWithoutGap-r19* configured with the E-UTRA-NR dual connectivity operation and none of SMTC occasions of outside gap measurement objects in one FR are overlapped with per-FR measurement GAP (if configured) in another FR, the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for intra-frequency SSB-based measurements, inter-frequency SSB-based measurements performed outside measurements gaps, intra-frequency CSI-RS L3 measurement and RSSI/channel occupancy measurement with no measurement gap on a carrier subject to CCA when SMTC and RMTC are overlapping will be as specified in table 9.1.5.1.1-2.

**Table 9.1.5.1.1-1: $CSSF_{outside_gap,i}$ scaling factor for EN-DC mode**

| Scenario | $CSSF_{outside_gap,i}$ for FR1 PSCC | $CSSF_{outside_gap,i}$ for FR1 SCC | $CSSF_{outside_gap,i}$ for FR2 PSCC | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is required Note 2 | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is not required | $CSSF_{outside_gap,i}$ for inter-frequency MO with no measurement gp |
|---|---|---|---|---|---|---|
| **EN-DC with FR1 only CA** | $1+N_{PSCC_CSIRS}+N_{PSCC_CCA_RSSI/CO}$ | $N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}+N_{SCC_CCA_RSSI/CO}-N_{SCC_OD-SSB}$ | N/A | N/A | N/A | $N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}+N_{SCC_CCA_RSSI/CO}$ |
| **EN-DC with FR2 only intra band CA** | N/A | N/A | $1+N_{PSCC_CSIRS}$ | N/A | $N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-N_{SCC_OD-SSB}$ | $N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}$ |
| **EN-DC with FR2 only inter band CA** | N/A | N/A | $1+N_{PSCC_CSIRS}$ | $2x(1+N_{SCC_CSIRS_FR2_NCM})$ Note 3,5 | $2\times(N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})-N_{SCC_OD-SSB}$ | $2\times(N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})$ |
| **EN-DC with FR1 +FR2 CA (FR1 PSCell)** Note 1 | $1+N_{PSCC_CSIRS}$ | $2\times(N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})-N_{SCC_OD-SSB}$ | N/A | $2x(1+N_{SCC_CSIRS_FR2_NCM})$ Note 3 | $2\times(N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})-N_{SCC_OD-SSB}$ | $2\times(N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})$ |
| **EN-DC with FR1 +FR2 CA (FR2 PSCell)** Note 1 | N/A | $N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-N_{SCC_OD-SSB}$ | $1+N_{PSCC_CSIRS}$ | N/A | $N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-N_{SCC_OD-SSB}$ | $N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}$ |

NOTE 1: Only one NR FR1 operating band and one NR FR2 operating band are included for FR1+FR2 inter-band EN-DC.
NOTE 2: Selection of FR2 SCC where neighbour cell measurement is required follows clause 9.2.3.2.
NOTE 3: $CSSF_{outside_gap,i}$ =1 if only one SCell is configured and no inter-frequency MO without gap and only SSB based L3 measurement is configured on SCC; $CSSF_{outside_gap,i}$ =2 if only one SCell is configured and no inter-frequency MO without gap and either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement is configured on SCC.
NOTE 4: Y is the number of configured inter-frequency MOs without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 5: Only two NR FR2 operating band are included for EN-DC with FR2 only inter-band CA
NOTE 6: $N_{PSCC_CSIRS}$=1 if PSCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PSCC_CSIRS}$ =0.
NOTE 7: $N_{SCC_CSIRS}$=Number of configured SCell(s) with either both SSB and CSI-RS based L3 measurement configured or only CSI-RS based L3 measurement configured
NOTE 8: $N_{SCC_CSIRS_FR2_NCM}$=1 if FR2 SCC, where neighbour cell measurement is required, is with either both SSB and CSI-RS configured or only CSI-RS measurement configured; otherwise, $N_{SCC_CSIRS_FR2_NCM}$=0.
NOTE 9: $N_{SCC_SSB}$=Number of configured SCell(s) with only SSB based L3 measurement configured, which is measured without MG. For UE supporting *multiCarrierSingleReportWithoutGap-r19* for intra-frequency measurements without MG, $N_{SCC_SSB}$ is the number of SCCs to be measured following the principles specified in clause 9.2.3.1 and 9.2.3.2.
NOTE 10: $N_{PSCC_CCA_RSSI/CO}$= 1 if PSCC is configured with RSSI/CO measurements without MG when RMTC and SMTC are overlapping; $N_{SCC_CCA_RSSI/CO}$ = Number of MOs for SCell(s) configured with RSSI/CO measurements without MG when RMTC and SMTC are overlapping.
NOTE 11 If a measurement object configured by PSCell and an NR inter-RAT measurement object configured by E-UTRAN PCell are on the same serving carrier, they shall be counted as one intra-frequency measurement object, provided that they meet the measurement object merging conditions [in clause 9.1.3.2], otherwise they are counted separately as two measurement objects.
NOTE 12: $N_{SCC_OD-SSB}$=Number of configured OD-SSB SCell(s) when only OD-SSB is configured in the SCell and without activated OD-SSB transmission.

**Table 9.1.5.1.1-2: Enhanced $CSSF_{outside_gap,i}$ scaling factor for EN-DC mode**

| Scenario | $CSSF_{outside_gap,i}$ for FR1 PSCC | $CSSF_{outside_gap,i}$ for FR1 SCC | $CSSF_{outside_gap,i}$ for FR2 PSCC | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is required Note 2 | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is not required | $CSSF_{outside_gap,i}$ for inter-frequency MO with no measurement gap |
|---|---|---|---|---|---|---|
| **EN-DC with FR1 only CA** | $1+N_{PSCC_CSIRS}+N_{PSCC_CCA_RSSI/CO}$ | $Ceil(0.5\times(N_{SCC_SSB}+2x\ N_{SCC_CSIRS}+N_{SCC_CCA_RSSI/CO}))+Y$ | N/A | N/A | N/A | $Ceil(0.5\times(N_{SCC_SSB}+2x\ N_{SCC_CSIRS}+N_{SCC_CCA_RSSI/CO}))+Y$ |
| **EN-DC with FR2 only intra band CA** | N/A | N/A | $1+N_{PSCC_CSIRS}$ | N/A | $N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}$ | $N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}$ |
| **EN-DC with FR2 only inter band CA** | N/A | N/A | $1+N_{PSCC_CSIRS}$ | $2x(1+N_{SCC_CSIRS_FR2_NCM})$ Note 3,5 | $2\times(N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})$ | $2\times(N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})$ |
| **EN-DC with FR1 +FR2 CA (FR1 PSCell)** Note 1 | $1+N_{PSCC_CSIRS}$ | $2\times(N_{SCC_SSB}+Y+2xN_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})$ | N/A | $2x(1+N_{SCC_CSIRS_FR2_NCM})$ Note 3 | $2\times(N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})$ | $2\times(N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}-1-N_{SCC_CSIRS_FR2_NCM})$ |
| **EN-DC with FR1 +FR2 CA (FR2 PSCell)** Note 1 | N/A | $N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}$ | $1+N_{PSCC_CSIRS}$ | N/A | $N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}$ | $N_{SCC_SSB}+Y+2x\ N_{SCC_CSIRS}$ |

NOTE 1: Only one NR FR1 operating band and one NR FR2 operating band are included for FR1+FR2 inter-band EN-DC.
NOTE 2: Selection of FR2 SCC where neighbour cell measurement is required follows clause 9.2.3.2.
NOTE 3: $CSSF_{outside_gap,i}=1$ if only one SCell is configured and no inter-frequency MO without gap and only SSB based L3 measurement is configured on SCC; $CSSF_{outside_gap,i}=2$ if only one SCell is configured and no inter-frequency MO without gap and either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement is configured on SCC.
NOTE 4: Y is the number of configured inter-frequency MOs without MG that are being measured outside of MG; otherwise, it is 0.

NOTE 5: Only two NR FR2 operating band are included for EN-DC with FR2 only inter-band CA
NOTE 6: $N_{PSCC_CSIRS}$=1 if PSCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PSCC_CSIRS}$ =0.
NOTE 7: $N_{SCC_CSIRS}$=Number of configured SCell(s) with either both SSB and CSI-RS based L3 measurement configured or only CSI-RS based L3 measurement configured
NOTE 8: $N_{SCC_CSIRS_FR2_NCM}$=1 if FR2 SCC, where neighbour cell measurement is required, is with either both SSB and CSI-RS configured or only CSI-RS measurement configured; otherwise, $N_{SCC_CSIRS_FR2_NCM}$=0.
NOTE 9: $N_{SCC_SSB}$=Number of configured SCell(s) with only SSB based L3 measurement configured, which is measured without MG.
NOTE 10: $N_{PSCC_CCA_RSSI/CO}$= 1 if PSCC is configured with RSSI/CO measurements without MG when RMTC and SMTC are overlapping; $N_{SCC_CCA_RSSI/CO}$ = Number of MOs for SCell(s) configured with RSSI/CO measurements without MG when RMTC and SMTC are overlapping.
NOTE 11: If a measurement object configured by PSCell and an NR inter-RAT measurement object configured by E-UTRAN PCell are on the same serving carrier, they shall be counted as one intra-frequency measurement object, provided that they meet the measurement object merging conditions in clause 9.1.3.2, otherwise they are counted separately as two measurement objects.

#### 9.1.5.1.2 SA mode: carrier-specific scaling factor for SSB-based, CSI-RS based L3 measurements and RSSI and channel occupancy measurements performed outside gaps

For UE in SA operation mode, the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for intra-frequency SSB-based measurements, inter-frequency SSB-based measurements performed outside measurements gaps, E-UTRA inter-RAT measurement object without measurement gap, intra-frequency CSI-RS L3 measurement and RSSI/channel occupancy measurement with no measurement gap on a carrier subject to CCA when SMTC and RMTC are overlapping will be as specified in table 9.1.5.1.2-1.

For UE supporting *fr1-CA-NR-DC-r19* or *fr1-FR2-CA-r19* indicated via *threeCarrierMeasWithoutGap-r19* in SA operation mode and none of SMTC occasions of outside gap measurement objects in one FR are overlapped with per-FR measurement GAP (if configured) in another FR, the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for intra-frequency SSB-based measurements, inter-frequency SSB-based measurements performed outside measurements gaps, E-UTRA inter-RAT measurement object without measurement gap, intra-frequency CSI-RS L3 measurement and RSSI/channel occupancy measurement with no measurement gap on a carrier subject to CCA when SMTC and RMTC are overlapping will be as specified in table 9.1.5.1.2-2.

**Table 9.1.5.1.2-1: $CSSF_{outside_gap,i}$ scaling factor for SA mode**

| Scenario | $CSSF_{outside_gap,i}$ for FR1 PCC | $CSSF_{outside_gap,i}$ for FR1 SCC | $CSSF_{outside_gap,i}$ for FR2 PCC | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is required | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is not required | $CSSF_{outside_gap,i}$ for inter-frequency MO with no measurement gap | $CSSF_{outside_gap,i}$ for E-UTRA inter-RAT MO with no measurement gap |
|---|---|---|---|---|---|---|---|
| **FR1 only CA** | $1+N_{PCC_CSIRS}+N_{PCC_CCA_RSSI/CO}$ | $N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}+N_{SCC_CCA_RSSI/CO}-N_{SCC_OD-SSB}$ | N/A | N/A | N/A | $N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}+N_{SCC_CCA_RSSI/CO}-N_{SCC_OD-SSB}$ | $N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}-N_{SCC_OD-SSB}$ |
| **FR2 only intra band CA** | N/A | N/A | $1+N_{PCC_CSIRS}$ | N/A | $N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}-N_{SCC_OD-SSB}$ | $N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}-N_{SCC_OD-SSB}$ | $N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}-N_{SCC_OD-SSB}$ |
| **FR2 only inter band CA** | N/A | N/A | $1+N_{PCC_CSIRS}$ | $2*(1+N_{SCC_CSIRS_FR2_NCM})$ Note 3,5 | $2\times(N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}-$ | $2\times(N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}-1-N_{SCC_CSIRS_}$ | $2\times(N_{SCC_SSB}+Y+Z+2x N_{SCC_CSIRS}-1-N_{SCC_CSIRS_}$ |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| | | | | | 1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ | $_{FR2_NCM}$) - $N_{SCC_OD-SSB}$ | $_{FR2_NCM}$) - $N_{SCC_OD-SSB}$ |
| **FR1 +FR2 CA (FR1 PCell)** Note 1 | 1+$N_{PCC_CSIRS}$ | 2×( $N_{SCC_SSB}$ +Y+Z+2* $N_{SCC_CSIRS}$ -1- $N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ | N/A | 2x(1+ $N_{SCC_CSIRS_FR2_NCM}$) Note 3,5 | 2×( $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ - 1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ | 2×( $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ | 2×( $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ |
| **FR1 +FR2 CA (FR2 PCell)** Note 1 | N/A | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$- $N_{SCC_OD-SSB}$ | 1+$N_{PCC_CSIRS}$ | N/A | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$- $N_{SCC_OD-SSB}$ | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$- $N_{SCC_OD-SSB}$ | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$- $N_{SCC_OD-SSB}$ |

NOTE 1: Only one FR1 operating band and one FR2 operating band are included for FR1+FR2 inter-band CA.
NOTE 2: Selection of FR2 SCC where neighbour cell measurement is required follows clause 9.2.3.2.
NOTE 3: $CSSF_{outside_gap,i}$ =1 if only one SCell is configured and no inter-frequency MO without gap and only SSB based L3 measurement is configured on SCC; $CSSF_{outside_gap,i}$ =2 if only one SCell is configured and no inter-frequency MO without gap and either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement is configured on SCC.
NOTE 4: Y is the number of configured inter-frequency MOs without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 5: Only two NR FR2 operating bands are included for FR2 inter-band CA.
NOTE 6: $N_{PCC_CSIRS}$=1 if PCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PCC_CSIRS}$ =0.
NOTE 7: $N_{SCC_CSIRS}$=Number of configured SCell(s) with either both SSB and CSI-RS based L3 measurement configured or only CSI-RS based L3 measurement configured
NOTE 8: $N_{SCC_CSIRS_FR2_NCM}$=1 if FR2 SCC, where neighbour cell measurement is required, is with either both SSB and CSI-RS configured or only CSI-RS measurement configured; otherwise, $N_{SCC_CSIRS_FR2_NCM}$=0.
NOTE 9: $N_{SCC_SSB}$=Number of configured SCell(s) with only SSB based L3 measurement configured, which is measured without MG. For UE supporting *multiCarrierSingleReportWithoutGap-r19* for intra-frequency measurements without MG, NSCC_SSB is the number of SCCs to be measured following the principles specified in clause 9.2.3.1 and 9.2.3.2.
NOTE 10: $N_{PCC_CCA_RSSI/CO}$= 1 if PCC is configured with RSSI/CO measurements without MG when RMTC and SMTC are overlapping; $N_{SCC_CCA_RSSI/CO}$ = Number of MOs for SCell(s) configured with RSSI/CO measurements without MG when RMTC and SMTC are overlapping.
NOTE 11: Z is the number of configured E-UTRA inter-RAT MOs without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 12: $N_{SCC_OD-SSB}$=Number of configured OD-SSB SCell(s) when only OD-SSB is configured in the SCell and without activated OD-SSB transmission.

**Table 9.1.5.1.2-2: Enhanced $CSSF_{outside_gap,i}$ scaling factor for SA mode**

| Scenario | $CSSF_{outside_gap,i}$ for FR1 PCC | $CSSF_{outside_gap,i}$ for FR1 SCC | $CSSF_{outside_gap,i}$ for FR2 PCC | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is required | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is not required | $CSSF_{outside_gap,i}$ for inter-frequency MO with no measurement gap | $CSSF_{outside_gap,i}$ for E-UTRA inter-RAT MO with no measurement gap |
|---|---|---|---|---|---|---|---|
| **FR1 only CA** Note12 | 1+$N_{PCC_CSIRS}$ + $N_{PCC_CCA_RSSI/CO}$ | Ceil(0.5×($N_{SCC_SSB}$ +2x $N_{SCC_CSIRS}$+ $N_{SCC_CCA_RSSI/CO}$)) +Y+Z | N/A | N/A | N/A | Ceil(0.5×($N_{SCC_SSB}$ +2x $N_{SCC_CSIRS}$+ $N_{SCC_CCA_RSSI/CO}$)) +Y+Z | ($N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| **FR2 only intra band CA** | N/A | N/A | $1+N_{PCC_CSIRS}$ | N/A | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ |
| **FR2 only inter band CA** | N/A | N/A | $1+N_{PCC_CSIRS}$ | 2*(1+ $N_{SCC_CSIRS_FR2_NCM}$) Note 3,5 | 2×( $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) | 2×( $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) | 2×( $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ -1- $N_{SCC_CSIRS_FR2_NCM}$) |
| **FR1 +FR2 CA (FR1 PCell)** **Note 1, Note 12** | $1+N_{PCC_CSIRS}$ | $N_{SCC_SSB}$+Y+Z +2* $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$ | N/A | 1+ $N_{SCC_CSIRS_FR2_NCM}$ Note 3,5 | $N_{SCC_SSB}$+Y+Z +2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$ | $N_{SCC_SSB}$+2*(Y+Z)+2x $N_{SCC_CSIRS}$ -1- $N_{SCC_CSIRS_FR2_NCM}$ | 2 x ( $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ -1- $N_{SCC_CSIRS_FR2_NCM}$) |
| **FR1 +FR2 CA (FR2 PCell)** **Note 1** | N/A | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ | $1+N_{PCC_CSIRS}$ | N/A | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ | $N_{SCC_SSB}$ +Y+Z+2x $N_{SCC_CSIRS}$ |

NOTE 1: Only one FR1 operating band and one FR2 operating band are included for FR1+FR2 inter-band CA.
NOTE 2: Selection of FR2 SCC where neighbour cell measurement is required follows clause 9.2.3.2.
NOTE 3: $CSSF_{outside_gap,i}$ =1 if only one SCell is configured and no inter-frequency MO without gap and only SSB based L3 measurement is configured on SCC; $CSSF_{outside_gap,i}$ =2 if only one SCell is configured and no inter-frequency MO without gap and either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement is configured on SCC.
NOTE 4: Y is the number of configured inter-frequency MOs without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 5: Only two NR FR2 operating bands are included for FR2 inter-band CA.
NOTE 6: $N_{PCC_CSIRS}$=1 if PCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PCC_CSIRS}$ =0.
NOTE 7: $N_{SCC_CSIRS}$=Number of configured SCell(s) with either both SSB and CSI-RS based L3 measurement configured or only CSI-RS based L3 measurement configured
NOTE 8: $N_{SCC_CSIRS_FR2_NCM}$=1 if FR2 SCC, where neighbour cell measurement is required, is with either both SSB and CSI-RS configured or only CSI-RS measurement configured; otherwise, $N_{SCC_CSIRS_FR2_NCM}$=0.
NOTE 9: $N_{SCC_SSB}$=Number of configured SCell(s) with only SSB based L3 measurement configured, which is measured without MG.
NOTE 10: $N_{PCC_CCA_RSSI/CO}$= 1 if PSCC is configured with RSSI/CO measurements without MG when RMTC and SMTC are overlapping; $N_{SCC_CCA_RSSI/CO}$ = Number of MOs for SCell(s) configured with RSSI/CO measurements without MG when RMTC and SMTC are overlapping.
NOTE 11: Z is the number of configured E-UTRA inter-RAT MOs without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 12: For UE supporting *fr1-CA-NR-DC-r19* or *fr1-FR2-CA-r19* indicated via *threeCarrierMeasWithoutGap-r19* in SA operation mode, the Enhanced $CSSF_{outside_gap,i}$ scaling factor does not apply for the E-UTRA inter-RAT MOs without MG that are being measured outside of MG.

#### 9.1.5.1.3 NR-DC mode: carrier-specific scaling factor for SSB-based and CSI-RS based L3 measurements performed outside gaps

For UE configured with NR-DC operation, the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for intra-frequency SSB-based measurement, inter-frequency SSB-based measurements performed outside measurements gaps and intra-frequency CSI-RS based L3 measurement will be as specified in table 9.1.5.1.3-1.

For UE supporting *fr1-CA-NR-DC-r19* or *fr1-FR2-NR-DC-r19* indicated via *threeCarrierMeasWithoutGap-r19* configured with NR-DC operation and none of SMTC occasions of outside gap measurement objects in one FR are overlapped with per-FR measurement GAP (if configured) in another FR, the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for intra-frequency SSB-based measurement, inter-frequency SSB-based measurements performed outside measurements gaps and intra-frequency CSI-RS based L3 measurement will be as specified in table 9.1.5.1.3-2.

**Table 9.1.5.1.3-1: $CSSF_{outside_gap,i}$ scaling factor for NR-DC mode**

| Scenario | $CSSF_{outside_gap,i}$ for FR1 PCC | $CSSF_{outside_gap,i}$ for FR1 SCC | $CSSF_{outside_gap,i}$ for FR1 PSCC | $CSSF_{outside_gap,i}$ for FR2 PSCC | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is not required | $CSSF_{outside_gap,i}$ for inter-frequency MO with no measurement gap |
|---|---|---|---|---|---|---|
| **FR1 + FR2 NR-DC (FR1 PCell and FR2 PSCell)** Note 1 | $1+N_{PCC_CSIRS}$ | $2\times( N_{SCC_SSB} +Y+2xN_{SCC_CSIRS}) - N_{SCC_OD-SSB}$ | N/A | $2x(1+ N_{PSCC_CSIRS})$ Note 2 | $2x(N_{SCC_SSB} +Y+2x N_{SCC_CSIRS} ) - N_{SCC_OD-SSB}$ | $2x(N_{SCC_SSB} +Y+2x N_{SCC_CSIRS} )$ |
| **FR1 + FR1 NR-DC (FR1 PCell and FR1 PSCell)** | $1+N_{PCC_CSIRS}$ | $2\times( N_{SCC_SSB} +Y+2xN_{SCC_CSIRS}) - N_{SCC_OD-SSB}$ | $2x(1+ N_{PSCC_CSIRS})$ Note 2 | N/A | N/A | $2x(N_{SCC_SSB} +Y+2x N_{SCC_CSIRS} )$ |

NOTE 1: NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG in FR1 and all serving cells in SCG in FR2.
NOTE 2: $CSSF_{outside_gap,i}$ =1 if no SCell is configured and no inter-frequency MO without gap and only SSB based L3 measurement is configured on PSCC; $CSSF_{outside_gap,i}$ =2 if no SCell is configured and no inter-frequency MO without gap and either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement is configured on PSCC.
NOTE 3: Y is the number of configured inter-frequency SSB based frequency layers without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 4: $N_{PCC_CSIRS}$=1 if PCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PCC_CSIRS}$ =0.
NOTE 5: $N_{PSCC_CSIRS}$=1 if PSCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PSCC_CSIRS}$ =0.
NOTE 6: $N_{SCC_CSIRS}$=Number of configured SCell(s) with either both SSB and CSI-RS based L3 measurement configured or only CSI-RS based L3 measurement configured
NOTE 8: $N_{SCC_SSB}$=Number of configured SCell(s) with only SSB based L3 measurement configured, which is measured without MG. For UE supporting *multiCarrierSingleReportWithoutGap-r19* for intra-frequency measurements without MG, $N_{SCC_SSB}$ is the number of SCCs to be measured following the principles specified in clause 9.2.3.1 and 9.2.3.2.
NOTE 9: $N_{SCC_OD-SSB}$=Number of configured OD-SSB SCell(s) when only OD-SSB is configured in the SCell and without activated OD-SSB transmission.

**Table 9.1.5.1.3-2: Enhanced $CSSF_{outside_gap,i}$ scaling factor for NR-DC mode**

| Scenario | $CSSF_{outside_gap,i}$ for FR1 PCC | $CSSF_{outside_gap,i}$ for FR1 SCC | $CSSF_{outside_gap,i}$ for FR1 PSCC | $CSSF_{outside_gap,i}$ for FR2 PSCC | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is not required | $CSSF_{outside_gap,i}$ for inter-frequency MO with no measurement gap |
|---|---|---|---|---|---|---|
| **FR1 + FR2 NR-DC (FR1 PCell and FR2 PSCell)** Note 1 | $1+N_{PCC_CSIRS}$ | $( N_{SCC_SSB} +Y+2xN_{SCC_CSIRS})$ | N/A | $(1+ N_{PSCC_CSIRS})$ Note 2 | $(N_{SCC_SSB} +Y+2x N_{SCC_CSIRS} )$ | $(N_{SCC_SSB} +Y+2x N_{SCC_CSIRS} )$ |
| **FR1 + FR1 NR-DC (FR1 PCell and FR1 PSCell)** | $1+N_{PCC_CSIRS}$ | $( N_{SCC_SSB} +Y+2xN_{SCC_CSIRS})$ | $(1+ N_{PSCC_CSIRS})$ Note 2 | N/A | N/A | $(N_{SCC_SSB} +Y+2x N_{SCC_CSIRS} )$ |

NOTE 1: NR-DC in Rel-15 only includes the scenarios where all serving cells in MCG in FR1 and all serving cells in SCG in FR2.

NOTE 2: $CSSF_{outside_gap,i}$ =1 if no SCell is configured and no inter-frequency MO without gap and only SSB based L3 measurement is configured on PSCC; $CSSF_{outside_gap,i}$ =2 if no SCell is configured and no inter-frequency MO without gap and either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement is configured on PSCC.
NOTE 3: Y is the number of configured inter-frequency SSB based frequency layers without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 4: $N_{PCC_CSIRS}$=1 if PCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PCC_CSIRS}$ =0.
NOTE 5: $N_{PSCC_CSIRS}$=1 if PSCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PSCC_CSIRS}$ =0.
NOTE 6: $N_{SCC_CSIRS}$=Number of configured SCell(s) with either both SSB and CSI-RS based L3 measurement configured or only CSI-RS based L3 measurement configured
NOTE 8: $N_{SCC_SSB}$=Number of configured SCell(s) with only SSB based L3 measurement configured, which is measured without MG.

#### 9.1.5.1.4 NE-DC mode: carrier-specific scaling factor for SSB-based and CSI-RS based measurements performed outside gaps

For UE configured with NE-DC operation, the carrier-specific scaling factor $CSSF_{outside_gap,i}$ for intra-frequency SSB-based measurement and inter-frequency SSB-based measurements performed outside measurements gaps and intra-frequency CSI-RS based L3 measurement will be as specified in table 9.1.5.1.4-1.

**Table 9.1.5.1.4-1: $CSSF_{outside_gap,i}$ scaling factor for NE-DC mode**

| Scenario | $CSSF_{outside_gap,i}$ for FR1 PCC | $CSSF_{outside_gap,i}$ for FR1 SCC | $CSSF_{outside_gap,i}$ for FR2 PCC | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is required | $CSSF_{outside_gap,i}$ for FR2 SCC where neighbour cell measurement is not required | $CSSF_{outside_gap,i}$ for inter-frequency MO with no measurement gap |
|---|---|---|---|---|---|---|
| **NE-DC with FR1 only CA** | $1+N_{PCC_CSIRS}$ | $N_{SCC_SSB}$ +Y+2x $N_{SCC_CSIRS}$- $N_{SCC_OD-SSB}$ | N/A | N/A | N/A | $N_{SCC_SSB}$ +Y+2x $N_{SCC_CSIRS}$- $N_{SCC_OD-SSB}$ |
| **NE-DC with FR2 only intra band CA** | N/A | N/A | $1+N_{PCC_CSIRS}$ | N/A | $N_{SCC_SSB}$ +Y+2x $N_{SCC_CSIRS}$ | $N_{SCC_SSB}$ +Y+2x $N_{SCC_CSIRS}$- $N_{SCC_OD-SSB}$ |
| **NE-DC with FR2 only inter band CA** | N/A | N/A | $1+N_{PCC_CSIRS}$ | $2*(1+ N_{SCC_CSIRS_FR2_NCM})$ Note 3,5 | $2\times( N_{SCC_SSB}$ +Y+2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ | $2\times( N_{SCC_SSB}$ +Y+2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ |
| **NE-DC with FR1 +FR2 CA (FR1 PCell)** **Note 1** | $1+N_{PCC_CSIRS}$ | $2\times( N_{SCC_SSB}$ +Y+2* $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ | N/A | $2x(1+ N_{SCC_CSIRS_FR2_NCM})$ Note 3,5 | $2\times( N_{SCC_SSB}$ +Y+2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ | $2\times( N_{SCC_SSB}$ +Y+2x $N_{SCC_CSIRS}$ -1-$N_{SCC_CSIRS_FR2_NCM}$) - $N_{SCC_OD-SSB}$ |

NOTE 1: Only one FR1 operating band and one FR2 operating band are included for FR1+FR2 inter-band CA.
NOTE 2: Selection of FR2 SCC where neighbour cell measurement is required follows clause 9.2.3.2.
NOTE 3: $CSSF_{outside_gap,i}$ =1 if only one SCell is configured and no inter-frequency MO without gap and only SSB based L3 measurement is configured on SCC; $CSSF_{outside_gap,i}$ =2 if only one SCell is configured and no inter-frequency MO without gap and either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement is configured on SCC.
NOTE 4: Y is the number of configured inter-frequency MOs without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 5: Only two NR FR2 operating band are included for NE-DC with FR2 only inter-band CA.
NOTE 6: $N_{PCC_CSIRS}$=1 if PCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PCC_CSIRS}$ =0.
NOTE 7: $N_{SCC_CSIRS}$=Number of configured SCell(s) with either both SSB and CSI-RS based L3 measurement configured or only CSI-RS based L3 measurement configured

NOTE 8: $N_{SCC_CSIRS_FR2_NCM}$=1 if FR2 SCC, where neighbour cell measurement is required, is with either both SSB and CSI-RS configured or only CSI-RS measurement configured; otherwise, $N_{SCC_CSIRS_FR2_NCM}$=0.
NOTE 9: $N_{SCC_SSB}$=Number of configured SCell(s) with only SSB based L3 measurement configured, which is measured without MG. For UE supporting *multiCarrierSingleReportWithoutGap-r19* for intra-frequency measurements without MG, $N_{SCC_SSB}$ is the number of SCCs to be measured following the principles specified in clause 9.2.3.1 and 9.2.3.2.
NOTE 10: $N_{SCC_OD\text{-}SSB}$=Number of configured OD-SSB SCell(s) when only OD-SSB is configured in the SCell and without activated OD-SSB transmission.

### 9.1.5.2 Monitoring of multiple layers within gaps

For a UE supporting concurrent gaps or *concurrentMeasGapsPreMG-r18* or *concurrentMeasGapsNCSG-r18*, and when concurrent gaps are configured, the carrier-specific scaling factor $CSSF_{within_gap,i}$ for a measurement object *i* derived in this chapter is applied to following measurement types for the associated measurement gap:

- SSB-based intra-frequency measurement object without measurement gap as defined in clauses 9.2.1 and 9.2A.1, when
  - all of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated measurement gap in concurrent GAPs, or
  - part of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated measurement gap and all the SMTC occasions of this intra-frequency measurement object are overlapped with the union of concurrent GAPs.
  - part of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated measurement gap and all the SMTC occasions of this intra-frequency measurement object are overlapped with the union of concurrent GAPs or with the union of concurrent concurrent GAPs and MUSIM gaps if MUSIM gaps are configured.
- SSB-based intra-frequency measurement object without measurement gap as defined in clauses 9.2.1 and 9.2A.1.
- CSI-RS based inter-frequency measurement in clause 9.10.3, when CSI-RS resources for L3 measurement of this inter-frequency measurement object are overlapped by the measurement gap or the associated measurement gap in concurrent GAPs.
- CSI-RS based inter-frequency measurement in clause 9.10.3, when CSI-RS resources for L3 measurement of this inter-frequency measurement object are partially overlapped by the measurement gap or the associated measurement gap in concurrent GAPs.
- CSI-RS based intra-frequency measurement in clause 9.10.2, when all CSI-RS resources for L3 measurement of this intra-frequency measurement object are partially overlapped with the associated measurement gap and all CSI-RS resources for L3 measurement of this intra-frequency measurement object are overlapped with the union of the configured concurrent GAPs.
- SSB-based inter-frequency measurement object with measurement gap as defined in clause 9.3.1.
- SSB-based inter-frequency measurement object without measurement gap for UE capable of *interFrequencyMeas-NoGap* as defined in clause 9.3.1, when
  - all of the SMTC occasions of this inter-frequency measurement object are overlapped with the measurement gap or associated measurement gap in concurrent GAPs, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped with the associated measurement gap and all the SMTC occasions of this inter-frequency measurement object are overlapped with the union of concurrent GAPs, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped with the measurement gap or associated measurement gap in concurrent GAPs and the flag *interFrequencyConfig-NoGap-r16* is not configured by the Network.
- NR PRS-based measurements for positioning in clause 9.9.
- E-UTRA Inter-RAT measurement object in clauses 9.4.2 and 9.4.3.

Otherwise, the carrier-specific scaling factor $CSSF_{within_gap,i}$ for a measurement object *i* derived in this chapter is applied to following measurement types:

- SSB-based intra-frequency measurement object without measurement gap as defined in clauses 9.2.1 and 9.2A.1, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.

- SSB-based intra-frequency measurement object without measurement gap as defined in clauses 9.2.1 and 9.2A.1, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap or the union of measurement gaps and MUSIM gaps.

- SSB-based intra-frequency measurement object without measurement gap as defined in clauses 9.2.1 and 9.2A.1.

- SSB-based intra-frequency measurement as defined in clause 9.2.1 for UE supporting *nr-NeedForInterruptionReport-r18*, and reporting *no-gap-with-interruption* for this intra-frequency layer via *NeedForInterruptionNR-r18*, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.

- SSB-based intra-frequency measurement as defined in clause 9.2.1 for UE supporting *nr-NeedForInterruptionReport-r18* and reporting *no-gap-with-interruption* for this intra-frequency layer via *NeedForInterruptionNR-r18*, when

  - all of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap, or

  - part of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.

- CSI-RS based inter-frequency measurement in clause 9.10.3, when CSI-RS resources for L3 measurement of this inter-frequency measurement object are overlapped by the measurement gap.

- CSI-RS based inter-frequency measurement in clause 9.10.3, when CSI-RS resources for L3 measurement of this inter-frequency measurement object are partially overlapped by the measurement gap.

- SSB-based inter-frequency measurement object with measurement gap as defined in clause 9.3.1.

- SSB-based inter-frequency measurement object without measurement gap for UE capable of *interFrequencyMeas-NoGap* as defined in clause 9.3.1, when

  - all of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, or

  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, but the flag *interFrequencyConfig-NoGap-r16* is not configured by the Network.

- SSB-based inter-frequency measurement as defined in clause 9.3.1 for UE supporting *nr-NeedForInterruptionReport-r18* and reporting *no-gap-with-interruption* for this inter-frequency layer via *NeedForInterruptionNR-r18*, when all of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap.

- SSB-based inter-frequency measurement as defined in clause 9.3.1 for UE supporting *nr-NeedForInterruptionReport-r18* and reporting *no-gap-with-interruption* for this inter-frequency layer via *NeedForInterruptionNR-r18*, when

  - all of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, or

  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap.

- Intra-frequency RSSI/CO measurement with measurement gap in clause 9.2A.7.

- Intra-frequency RSSI/CO measurement without measurement gap in clause 9.2A.7 when all of the RMTC occasions of this intra-frequency RSSI/CO measurement are overlapped by the measurement gap(s).

- Inter-frequency RSSI/CO measurement in clauses 9.3A.8 and 9.3A.9.

- E-UTRA inter-RAT measurement object causing scheduling restriction in clauses 9.4.8, when

  - EMW is configured and fully overlapped with measurement gap, and the periodicity of measurement gap and EMW is the same, or

  - EMW is not configured.

- E-UTRA Inter-RAT measurement object in clauses 9.4.2 and 9.4.3.
- NR PRS-based measurements for positioning in clause 9.9.
- E-UTRA Inter-RAT RSTD and E-CID measurements in clauses 9.4.4 and 9.4.5.
- For a UE in E-UTRA-NR dual connectivity operation, NR SSB-based Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.4) on an NR serving carrier
  - the SSB is not completely contained in the active BWP of the UE, or
  - all of the SMTC occasions of this inter-RAT measurement object are overlapped by the measurement gap;
- NR SSB-based Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.4) on an NR non-serving carrier.
- E-UTRAN Inter-frequency measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.3) and by the E-UTRAN PSCell (TS 36.133 [15] clause 8.19.3).
- E-UTRAN Inter-frequency RSTD measurement configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.15).
- UTRA Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clauses 8.17.5 to 8.17.12).
- GSM Inter-RAT measurements configured by the E-UTRAN PCell (TS 36.133 [15] clauses 8.17.13 and 8.17.14).
- Note: The derivation of $CSSF_{within_gap,i}$ additionally considers the impact of SSB-based inter-frequency L1-RSRP measurement with measurement gap in clause 9.15.5.

The UE is expected to conduct the measurement of this measurement object *i* only within the measurement gap or the associated measurement gap if concurrent measurement gaps are configured. If UE is configured with concurrent measurement gaps and an association between measurement object *i* and certain measurement gap is provided, the requirements are defined assuming the UE shall conduct the measurement of this measurement object *i* within the associated measurement gap.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, $CSSF_{within_gap,i}$ and requirements derived from $CSSF_{outside_gap,i}$ are not specified.

Number of SSB layers shall include SSB for mobility and associated SSB for CSI-RS mobility. The ssbfrequency is counted only once if the ssbfrequency for mobility and associated SSB are the same, or ssbfrequency and smtc in multiple MOs are the same.

SSB-based measurement and CSI-RS based measurement for mobility configured in the same measurement object are considered as different layers.

#### 9.1.5.2.1 EN-DC mode: carrier-specific scaling factor for SSB, CSI-RS-based L3 measurements and RSSI and channel occupancy measurements performed within gaps

The scaling value $CSSF_{within_gap,i}$ below has been derived without considering GSM inter-RAT carriers.

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in this clause.

For UE supporting per-FR gap, for each measurement object *i* that are measured based on effective MGRP as defined in clause 9.1.2, $CSSF_{within_gap,i}$ used for deriving the measurement requirements is defined as $2*N_{with_CSI\text{-}RS} + N_{SSB_only}$, where

- $N_{with_CSI\text{-}RS}$ is the number of measurement objects with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured in the same FR as measurement object *i*, and

- $N_{SSB_only}$ is the number of measurement objects with only SSB based L3 measurement configured in the same FR as measurement object *i*.

For a UE in E-UTRA-NR dual connectivity operation, if a SSB-based measurement object configured by PSCell and an NR SSB-based inter-RAT measurement object configured by E-UTRAN PCell are on the same carrier, they shall be counted as one measurement object in $M_{tot,i,j}$, provided that they meet the measurement object merging conditions in clause 9.1.3.2.

If measurement object *i* refers to an RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured, $CSSF_{within_gap,i}$=1. Otherwise, the $CSSF_{within_gap,i}$ for other measurement objects (including RSTD measurement with periodicity Tprs=160 ms) participate in the gap competition are derived as below.

For each measurement gap *j* not used for an RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured within an arbitrary 160 ms period, count the total number of intra-frequency measurement objects and inter-frequency/inter-RAT measurement objects which are candidates to be measured within the gap *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR carriers, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An NR measurement object with CSI-RS measurement configured is a candidate to be measured in a gap if the window confining all CSI-RS resources are fully covered by the MGL excluding RF switching time.

- An NR measurement object with RSSI and channel occupancy measurement is a candidate to be measured in a gap if the RMTC duration is fully covered by MGL excluding RF switching time

- An inter-RAT UTRA measurement object configured by E-UTRA PCell [15] is a candidate to be measured in all measurement gaps.

- An inter-frequency E-UTRA measurement object configured by E-UTRA PCell [15] is a candidate to be measured in all measurement gaps.

- For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis.

- $M_{intra,i,j}$: Number of intra-frequency measurement objects, including both SSB, CSI-RS based and RSSI/CO measurement, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{intra,i,j}$ equals 0.

- $M_{inter,i,j}$ : Number of NR inter-frequency layers including both SSB and CSI-RS based NR inter-RAT frequency layer and RSSI/CO measurement, configured by E-UTRA PCell, EUTRA inter-frequency measurement objects configured by E-UTRA PCell, or UTRA inter-RAT measurement objects configured by E-UTRA PCell which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{inter,i,j}$ equals 0.

- A measurement object *i* in $M_{intra,i,j}$ and in $M_{inter,i,j}$ is counted twice if the measurement object is configured with both RMTC and SMTC which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate

- $M_{tot,i,j} = M_{intra,i,j} + M_{inter,i,j}$ : Total number of intra-frequency, inter-frequency and inter-RAT frequency layers which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{tot,i,j}$ equals 0.

For each measurement gap *j* used for an RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured within an arbitrary 160 ms period, $M_{intra,i,j} = M_{inter,i,j} = M_{tot,i,j} = 0$.

The carrier specific scaling factor $CSSF_{within_gap,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_gap,i} = \max(\text{ceil}(R_i \times M_{tot,i,j}))$, where $j = 0 \ldots (160/MGRP)-1$

If *measGapSharingScheme* is not equal sharing and

- measurement object *i* is an intra-frequency measurement object, $CSSF_{within_gap,i}$ is the maximum among

- ceil($R_i \times K_{intra} \times M_{intra,i,j}$) in gaps where $M_{inter,i,j} \neq 0$, where $j$=0…(160/MGRP)-1
- ceil($R_i \times M_{intra,i,j}$) in gaps where $M_{inter,i,j}=0$, where $j$=0…(160/MGRP)-1

- measurement object *i* is an inter-frequency or inter-RAT measurement object, $CSSF_{within_gap,i}$ is the maximum among
  - ceil($R_i \times K_{inter} \times M_{inter,i,j}$) in gaps where $M_{intra,i,j} \neq 0$, where $j$=0…(160/MGRP)-1
  - ceil($R_i \times M_{inter,i,j}$) in gaps where $M_{intra,i,j}=0$, where $j$=0…(160/MGRP)-1

  Where $R_i$ is the maximal ratio of the number of measurement gap where measurement object *i* is a candidate to be measured over the number of measurement gap where measurement object *i* is a candidate and not used for RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured within an arbitrary 1280 ms period.

#### 9.1.5.2.2 SA mode: carrier-specific scaling factor for SSB, CSI-RS-based L3 measurements and RSSI and channel occupancy measurements performed within gaps

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in this clause.

For UE supporting per-FR gap, for each measurement object *i* that are measured based on effective MGRP as defined in clause 9.1.2, $CSSF_{within_gap,i}$ used for deriving the measurement requirements is defined as $2*N_{with_CSI\text{-}RS} + N_{SSB_only} + N_{L1_SSB}$, where

- $N_{with_CSI\text{-}RS}$ is the number of measurement objects with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured in the same FR as measurement object *i*, and
- $N_{SSB_only}$ is the number of measurement objects with only SSB based L3 measurement configured in the same FR as measurement object *i*, and
- $N_{L1_SSB}$ is the number of FR2 SSB based inter-frequency L1-RSRP measurements configured in the same FR as FR2 measurement object *i.*

If a UE capable of concurrent gaps is configured with concurrent gaps, the carrier specific scaling factor is calculated separately for each gap pattern, provided that the association between measurement objects and gap pattern is configured by network. Only the measurement objects associated to the same measurement gap pattern are counted when deriving $CSSF_{within_gap,i}$ for a target measurement object with index *i*.. In case of collision between concurrent measurement gaps, some measurement gap occasions may be dropped according to clause 9.1.8.3. The dropped gap occasions will not be used in deriving $CSSF_{within_gap,i.}$

If measurement object *i* refers to a long-periodicity measurement which is any of:

- an E-UTRA RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured, or
- an NR measurement for positioning frequency layer *i* with $T_{available_PRS,i}$ >160ms, where $T_{available_PRS,i}$ is defined in clauses 9.9.2.5, 9.9.3.5, 9.9.4.5 and 9.9.6.5 for RSTD, PRS-RSRP ,UE Rx-Tx time difference and PRS-RSRPP measurements, respectively.

then $CSSF_{within_gap,i}$=1. Otherwise, the $CSSF_{within_gap,i}$ for other measurement objects (including E-UTRA RSTD measurement with periodicity Tprs=160 ms) participate in the gap competition and the $CSSF_{within_gap,i}$ are derived as below.

**Table 9.1.5.2.2-1: void**

When multiple positioning frequency layers are configured,

- for each positioning frequency layer i, $CSSF_{within_gap,i}$ is derived with the following steps assuming no other positioning frequency layer is configured.
- for each RRM frequency layer *i*, $CSSF_{within_gap,i}$ is derived as follows:

- an intermediate $CSSF_{within_gap,i,k}$ is derived with the following steps assuming only positioning frequency layer *k* is configured, and

- $CSSF_{within_gap,i}$= max($CSSF_{within_gap,i,k}$), where *k*=0…K-1, and K is the number of configured positioning frequency layers. For each measurement gap *j* not used for a long-periodicity measurement defined above, count the total number of intra-frequency measurement objects and inter-frequency/inter-RAT measurement objects and inter-frequency L1-RSRP measurement layers and NR PRS measurements on all positioning frequency layers which are candidates to be measured within the gap *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An NR measurement object with CSI-RS measurement configured is a candidate to be measured in a gap if the window confining all CSI-RS resources are fully covered by the MGL excluding RF switching time.

- An NR measurement object with RSSI and channel occupancy measurement is a candidate to be measurement in a gap if the RMTC duration is fully covered by MGL excluding RF switching time.

- An inter-frequency SFTD measurement object, if to be measured with measurement gaps, is a candidate to be measured in all measurement gaps.

- A positioning frequency layer is counted as candidate for a MG occasion if at least one PRS resource on that positioning frequency layer is fully covered by the MGL excluding RF switching time.

- An inter-frequency L1-RSRP measurement layer is a candidate to be measured in a gap if all configured SSB resources on that frequency layer to be measured are fully covered by the MGL excluding RF switching time.

- For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis. For UEs which support and are configured with per FR gaps, the CSSF requirements do not apply when NR PRS measurement in one FR gap collides with SSB/CSI-RS/PRS measurements in the other FR gap in time domain.

- $M_{intra,i,j}$: Number of intra-frequency measurement objects, including both SSB, CSI-RS based and RSSI/CO measurements, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{intra,i,j}$ equals 0.

  $M_{inter,i,j}$ : Number of NR inter-frequency layers including both SSB and CSI-RS based, E-UTRA inter-RAT and UTRA inter-RAT frequency layers, up to one positioning frequency layer, RSSI/CO measurements, inter-frequency L1-RSRP measurement layers, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{inter,i,j}$ equals 0.

  - In FR1, an inter-frequency L1-RSRP measurement layer is not counted in $M_{inter,i,j}$ if the SSB resource instance configured for L1-RSRP measurement of an inter-frequency layer is overlapped with the measurement object of this inter-frequency layer which is candidate to be measured in gap *j*.

  - In FR2, an inter-frequency L1-RSRP measurement layer in $M_{inter,i,j}$ contributes the number equal to the cell number for L1-RSRP measurement in this inter-frequency layer, which is candidate to be measured in gap *j*.

  Note: The current $M_{inter,i,j}$ assumes all cells in the same frequency layer have the same SSB periodicity.- A measurement object *i* in $M_{intra,i,j}$ and in $M_{inter,i,j}$ is counted twice if the measurement object is configured with both RMTC and SMTC which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate

- $M_{tot,i,j} = M_{intra,i,j} + M_{inter,i,j}$ : Total number of intra-frequency, inter-frequency and inter-RAT frequency layers and up to one NR PRS measurement on any one positioning frequency layer, inter-frequency L1-RSRP measurement layers, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{tot,i,j}$ equals 0.

For each measurement gap *j* used for a long-periodicity measurement defined above, $M_{intra,i,j} = M_{inter,i,j} = M_{tot,i,j} = 0$. The carrier specific scaling factor $CSSF_{within_gap,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_gap,i}$= max(ceil($R_i \times M_{tot,i,j}$)), where *j*=0…(160/MGRP)-1

If *measGapSharingScheme* is not equal sharing and

- measurement object *i* is an intra-frequency measurement object, $CSSF_{within_gap,i}$ is the maximum among
  - $ceil(R_i \times K_{intra} \times M_{intra,i,j})$ in gaps where $M_{inter,i,j} \neq 0$, where $j$=0…(160/MGRP)-1
  - $ceil(R_i \times M_{intra,i,j})$ in gaps where $M_{inter,i,j}=0$, where $j$=0…(160/MGRP)-1
- measurement object *i* is an inter-frequency or inter-RAT measurement object or NR PRS measurement on any one positioning frequency layer, $CSSF_{within_gap,i}$ is the maximum among
  - $ceil(R_i \times K_{inter} \times M_{inter,i,j})$ in gaps where $M_{intra,i,j} \neq 0$, where $j$=0…(160/MGRP)-1
  - $ceil(R_i \times M_{inter,i,j})$ in gaps where $M_{intra,i,j}=0$, where $j$=0…(160/MGRP)-1

Where $R_i$ is the maximal ratio of the number of measurement gap where measurement object *i* is a candidate to be measured over the number of measurement gap where measurement object *i* is a candidate and not used for a long-periodicity measurement defined above.

$CSSF_{within_gap,k}$=1 during $T_{Detect,\ E\text{-}UTRAN\ FDD}$ specified in clause 9.4.4.1.2.2 and $T_{Detect,\ E\text{-}UTRAN\ TDD}$ specified in clause 9.4.4.2.2.2, where k is the carrier frequency where the UE is performing cell detection of the inter-RAT E-UTRA OTDOA assistance data reference cell when acquiring the subframe and slot timing of the cell according to clause 9.4.4. In this case, the UE cell identification and measurement periods derived based on $CSSF_{within_gap,i}$ in clauses 9.2.5.1, 9.2.5.2, 9.2.6.2, 9.2.6.3, 9.3.4, 9.3.5, 9.4.2.2, 9.4.2.3 and 9.10.2 may be extended for measurement objects of which the cell identification and measurement periods are overlapped with $T_{Detect,\ E\text{-}UTRAN\ FDD}$ and $T_{Detect,\ E\text{-}UTRAN\ TDD}$.

#### 9.1.5.2.3 NE-DC: carrier-specific scaling factor for SSB-based and CSI-RS based L3 measurements performed within gaps

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in this clause.

For UE supporting per-FR gap, for each measurement object *i* that are measured based on effective MGRP as defined in clause 9.1.2, $CSSF_{within_gap,i}$ used for deriving the measurement requirements is defined as $2*N_{with_CSI\text{-}RS} + N_{SSB_only}$, where

- $N_{with_CSI\text{-}RS}$ is the number of measurement objects with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured in the same FR as measurement object *i*, and
- $N_{SSB_only}$ is the number of measurement objects with only SSB based L3 measurement configured in the same FR as measurement object *i*.

If measurement object *i* refers to a long-periodicty measurement which is any of:

- an E-UTRA RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured, or
- an NR measurement for positioning frequency layer *i* with $T_{available_PRS,i}$ >160 ms, where $T_{available_PRS,i}$ is defined in clauses 9.9.2.5, 9.9.3.5 ,9.9.4.5 and 9.9.6.5 for RSTD, PRS-RSRP ,UE Rx-Tx time difference and PRS-RSRPP measurements, respectively.

then $CSSF_{within_gap,i}$=1. Otherwise, the $CSSF_{within_gap,i}$ for other measurement objects (including E-UTRA RSTD measurement with periodicity Tprs=160 ms) participate in the gap competition are derived as below.

When multiple positioning frequency layers are configured,

- for each positioning frequency layer *i*, $CSSF_{within_gap,i}$ is derived with the following steps assuming no other positioning frequency layer is configured.
- for each RRM frequency layer *i*, $CSSF_{within_gap,i}$ is derived as follows:
  - an intermediate $CSSF_{within_gap,i,k}$ is derived with the following steps assuming only positioning frequency layer *k* is configured, and
  - $CSSF_{within_gap,i}$= max($CSSF_{within_gap,i,k}$), where $k$=0…K-1, and K is the number of configured positioning frequency layers.

For each measurement gap *j* not used for a long-periodicity measurement defined above, count the total number of intra-frequency measurement objects and inter-frequency/inter-RAT measurement objects and NR PRS measurements on all positioning frequency layers which are candidates to be measured within the gap *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An NR measurement object with CSI-RS measurement configured is a candidate to be measured in a gap if the window confining all CSI-RS resources are fully covered by the MGL excluding RF switching time.

- An inter-RAT measurement object is a candidate to be measured in all measurement gaps.

- An inter-frequency E-UTRA measurement object is a candidate to be measured in all measurement gaps.

- A positioning frequency layer is counted as candidate for a MG occasion if at least one PRS resource on that positioning frequency layer is fully covered by the MGL excluding RF switching time.

  For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis. For UEs which support and are configured with per FR gaps, the CSSF requirements do not apply when NR PRS measurement in one FR gap collides with SSB/CSI-RS/PRS measurements in the other FR gap in time domain.

  If the number of configured inter-frequency and interRAT measuerement objects and NR PRS measurements on all positioning frequency layers is non-zero and the UE is configured with per UE gaps, or if the UE is configured with per FR gaps:

  FR1 and FR2 intra-frequency measurement objects belong to group A

  Inter-frequency and inter-RAT measurement objects belong to group B

  $M_{groupA,i,j}$: Sum of the number of FR1 intra-frequency measurement objects $M_{intra\text{-}FR1,i,j}$ and the number of FR2 intra-frequency measurement objects $M_{intra\text{-}FR2,i,j}$ , including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupA,i,j}$ equals 0.

  $M_{groupBi,j}$: Number of NR inter-frequency layers including both SSB and CSI-RS based, E-UTRA inter-RAT and UTRA inter-RAT measurement objects, up to one positioning frequency layer, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupB,i,j}$ equals 0.

  If the number of configured inter-frequency and inter-RAT measuerement objects and NR PRS measurements on all positioning frequency layers is zero and the UE is configured with per UE gaps:

  FR1 intra-frequency measurement objects belong to group A

  FR2 intra-frequency measurement objects belong to group B

  $M_{groupA,i,j}$: The number of FR1 intra-frequency measurement objects $M_{intra\text{-}FR1,i,j}$ , including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupA,i,j}$ equals 0.

  $M_{groupBi,j}$ : The number of FR2 intra-frequency measurement objects $M_{intra\text{-}FR2,i,j}$ , including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupB,i,j}$ equals 0.

  $M_{tot,i,j} = M_{groupA,i,j} + M_{groupB,i,j}$ : Total number of group A and group B measurement objects which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{tot,i,j}$ equals 0.

For each measurement gap *j* used for a long-periodicity measurement defined above, $M_{intra,i,j} = M_{inter,i,j} = M_{tot,i,j} = 0$. The carrier specific scaling factor $CSSF_{within_gap,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_gap,i} = \max(\text{ceil}(R_i \times M_{tot,i,j}))$, where $j = 0 \ldots (160/MGRP)-1$

If *measGapSharingScheme* is not equal sharing and

- measurement object *i* is a group A measurement object, $CSSF_{within_gap,i}$ is the maximum among
  - $ceil(R_i \times K_{intra} \times M_{groupA,i,j})$ in gaps where $M_{groupB,i,j} \neq 0$, where $j$=0…(160/MGRP)-1
  - $ceil(R_i \times M_{groupA,i,j})$ in gaps where $M_{groupB,i,j}=0$, where $j$=0…(160/MGRP)-1
- measurement object *i* is an group B measurement object, $CSSF_{within_gap,i}$ is the maximum among
  - $ceil(R_i \times K_{inter} \times M_{groupBi,j})$ in gaps where $M_{groupA,i,j} \neq 0$, where $j$=0…(160/MGRP)-1
  - $ceil(R_i \times M_{groupB,i,j})$ in gaps where $M_{groupA,i,j}=0$, where $j$=0…(160/MGRP)-1

Where $R_i$ is the maximal ratio of the number of measurement gap where measurement object *i* is a candidate to be measured over the number of measurement gap where measurement object *i* is a candidate and not used for a long-periodicity measurement defined above.

#### 9.1.5.2.4 NR-DC: carrier-specific scaling factor for SSB-based and CSI-RS-based L3 measurements performed within gaps

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in this clause.

For UE supporting per-FR gap, for each measurement object *i* that are measured based on effective MGRP as defined in clause 9.1.2, $CSSF_{within_gap,i}$ used for deriving the measurement requirements is defined as $2*N_{with_CSI\text{-}RS} + N_{SSB_only} + N_{L1_SSB}$, where

- $N_{with_CSI\text{-}RS}$ is the number of measurement objects with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured in the same FR as measurement object *i*, and
- $N_{SSB_only}$ is the number of measurement objects with only SSB based L3 measurement configured in the same FR as measurement object *i*.
- $N_{L1_SSB}$ is the number of FR2 SSB based inter-frequency L1-RSRP measurements configured in the same FR as FR2 measurement object *i.*

If measurement object *i* refers to a long-periodicity measurement which is any of:

- an E-UTRA RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured, or
- an NR measurement for positioning frequency layer *i* with $T_{available_PRS,i}$ >160 ms, where $T_{available_PRS,i}$ is defined in clauses 9.9.2.5, 9.9.3.5 ,9.9.4.5 and 9.9.6.5 for RSTD, PRS-RSRP , UE Rx-Tx time difference and PRS-RSRPP measurements, respectively.

then $CSSF_{within_gap,i}$=1. Otherwise, the $CSSF_{within_gap,i}$ for other measurement objects (including E-UTRA RSTD measurement with periodicity Tprs=160 ms) participate in the gap competition and the $CSSF_{within_gap,i}$ are derived as below.

When multiple positioning frequency layers are configured,

- for each positioning frequency layer *i*, $CSSF_{within_gap,i}$ is derived with the following steps assuming no other positioning frequency layer is configured.
- for each RRM frequency layer *i*, $CSSF_{within_gap,i}$ is derived as follows:
  - an intermediate $CSSF_{within_gap,i,k}$ is derived with the following steps assuming only positioning frequency layer *k* is configured, and
  - $CSSF_{within_gap,i}$= max($CSSF_{within_gap,i,k}$), where $k$=0…K-1, and K is the number of configured positioning frequency layers.

For each measurement gap *j* not used for an RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured within an arbitrary 160 ms period, count the total number of intra-frequency measurement objects and inter-frequency/inter-RAT measurement objects and NR PRS measurements on all

positioning frequency layers and inter-frequency L1-RSRP measurement layers which are candidates to be measured within the gap *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An NR measurement object with CSI-RS measurement configured is a candidate to be measured in a gap if the window confining all CSI-RS resources are fully covered by the MGL excluding RF switching time.

- A positioning frequency layer is counted as candidate for a MG occasion if at least one PRS resource on that positioning frequency layer is fully covered by the MGL excluding RF switching time.

- An inter-frequency L1-RSRP measurement layer is a candidate to be measured in a gap if the window confining SSB resource is fully covered by the MGL excluding RF switching time.

  For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis. For UEs which support and are configured with per FR gaps, the CSSF requirements do not apply when NR PRS measurement in one FR gap collides with SSB/CSI-RS/PRS measurements in the other FR gap in time domain.

  If the number of configured inter-frequency and interRAT measuerement objects and NR PRS measurements on all positioning frequency layers is non-zero and the UE is configured with per UE gaps, or if the UE is configured with per FR gaps:

    FR1 and FR2 intra-frequency measurement objects belong to group A

    Inter-frequency and inter-RAT measurement objects and up to one NR PRS measurement on any one positioning frequency layer belong to group B

    $M_{groupA,i,j}$: Sum of the number of FR1 intra-frequency measurement objects $M_{intra\text{-}FR1,i,j}$ and the number of FR2 intra-frequency measurement objects $M_{intra\text{-}FR2,i,j}$ , including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupA,i,j}$ equals 0.

    $M_{groupBi,j}$ : Number of NR inter-frequency layers including both SSB and CSI-RS based, E-UTRA inter-RAT and UTRA inter-RAT measurement objects and up to one positioning frequency layer, inter-frequency L1-RSRP measurement layers, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupB,i,j}$ equals 0.

    - In FR1, an inter-frequency L1-RSRP measurement layer is not counted in $M_{inter,i,j}$ if the SSB resource instance configured for L1-RSRP measurement of an inter-frequency layer is overlapped with the measurement object of this inter-frequency layer which are candidates to be measured in gap *j*.

    - In FR2, an inter-frequency L1-RSRP measurement layer in $M_{inter,i,j}$ contributes the number equal to the cell number for L1-RSRP measurement in this inter-frequency layer, which is candidate to be measured in gap *j*.

  Note: The current $M_{inter,i,j}$ assumes all cells in the same frequency layer have the same SSB periodicity.If the number of configured inter-frequency and interRAT measuerement objects and NR PRS measurements on all positioning frequency layers is zero and the UE is configured with per UE gaps:

    FR1 intra-frequency measurement objects of MCG belong to group A

    FR1 intra-frequency measurement objects of SCG belong to group B for FR1+FR1 NR-DC, or FR2 intra-frequency measurement objects of SCG belong to group B for FR1+FR2 NR-DC.

    $M_{groupA,i,j}$: The number of FR1 intra-frequency measurement objects $M_{intra\text{-}FR1,i,j}$ , including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupA,i,j}$ equals 0.

$M_{groupBi,j}$ : The number of FR2 intra-frequency measurement objects $M_{intra\text{-}FR2,i,j}$, including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupB,i,j}$ equals 0.

$M_{tot,i,j} = M_{groupA,i,j} + M_{groupB,i,j}$: Total number of group A and group B measurement objects and inter-frequency L1-RSRP measurement layers which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{tot,i,j}$ equals 0.For each measurement gap *j* used for a long-periodicity measurement defined above, $M_{intra,i,j} = M_{inter,i,j} = M_{tot,i,j} = 0$. The carrier specific scaling factor $CSSF_{within_gap,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_gap,i} = \max(\text{ceil}(R_i \times M_{tot,i,j}))$, where $j=0\ldots(160/MGRP)-1$

If *measGapSharingScheme* is not equal sharing and

- measurement object *i* is a group A measurement object, $CSSF_{within_gap,i}$ is the maximum among
  - $\text{ceil}(R_i \times K_{intra} \times M_{groupA,i,j})$ in gaps where $M_{groupB,i,j} \neq 0$, where $j=0\ldots(160/MGRP)-1$
  - $\text{ceil}(R_i \times M_{groupA,i,j})$ in gaps where $M_{groupB,i,j}=0$, where $j=0\ldots(160/MGRP)-1$
- measurement object *i* is an group B measurement object, $CSSF_{within_gap,i}$ is the maximum among
  - $\text{ceil}(R_i \times K_{inter} \times M_{groupBi,j})$ in gaps where $M_{groupA,i,j} \neq 0$, where $j=0\ldots(160/MGRP)-1$
  - $\text{ceil}(R_i \times M_{groupB,i,j})$ in gaps where $M_{groupA,i,j}=0$, where $j=0\ldots(160/MGRP)-1$

$R_i$ is the maximal ratio of the number of measurement gap where measurement object *i* is a candidate to be measured over the number of measurement gap where measurement object *i* is a candidate and not used for a long-periodicity measurement defined above.

#### 9.1.5.2.5 SA mode: carrier-specific scaling factor for PRS-based measurements performed within gaps

The requirements in this clause apply for NR PRS-based measurements for positioning in clause 9.9.

When NR PRS-based measurements for positioning are configured on one or more positioning frequency layers within measurement gaps, the carrier specific scaling factor for a target PRS-based positioning measurement on a positioning frequency layer with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in clause 9.1.5.2.2.

NR Positioning measurement requirements for long periodicity measurements apply in case all PRS resources in the PFL are configured with periodicity > 160 ms.

#### 9.1.5.2.6 NE-DC: carrier-specific scaling factor for PRS-based measurements performed within gaps

The requirements in this clause apply for NR PRS-based measurements for positioning in clause 9.9.

When NR PRS-based measurements for positioning are configured on one or more positioning frequency layers within measurement gaps, the carrier specific scaling factor for a target measurement on a positioning frequency layer with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in clause 9.1.5.2.3.

NR Positioning measurement requirements for long periodicity measurements apply in case all PRS resources in the PFL are configured with periodicity larger than 160 ms.

#### 9.1.5.2.7 NR-DC: carrier-specific scaling factor for PRS-based measurements performed within gaps

The requirements in this clause apply for NR PRS-based measurements for positioning in clause 9.9.

When NR PRS-based measurements for positioning are configured on one or more positioning frequency layers within measurement gaps, the carrier specific scaling factor for a target measurement on a positioning frequency layer with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in clause 9.1.5.2.4.

NR Positioning measurement requirements for long periodicity measurements apply in case all PRS resources in the PFL are configured with periodicity larger than 160 ms.

### 9.1.5.3 Monitoring of multiple layers within NCSG

The measurement requirements derived from $CSSF_{within_ncsg,i}$ defined in this clause are applicable provided that network provides NCSG pattern for measurement.

For a UE supporting *concurrentMeasGapsNCSG-r18* and when a gap combination including one or more NCSGs is configured, the carrier-specific scaling factor $CSSF_{within_ncsg,i}$ derived in this chapter for a measurement object *i* associated with an NCSG is applied to following measurement types:

- SSB-based intra-frequency measurement object without measurement gap as defined in clause 9.2.1 corresponding to an activated serving cell, when
  - all of the SMTC occasions of this intra-frequency measurement object are overlapped with associated NCSG in [concurrent gaps], or
  - part of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated NCSG and all the SMTC occasions of this intra-frequency measurement object are overlapped with the union of all the GAPs.
- SSB-based intra-frequency measurement object with NCSG as defined in clause 9.2.1 corresponding to an activated serving cell (in non-dormancy);
- SSB-based intra-frequency measurement object corresponding to a deactivated Serving cell or to an activated Serving cell in dormancy, when all or part of the SMTC occasions of this intra-frequency measurement object are overlapped by the NCSG regardless of the UE capability reporting of *intraFreq-needForNCSG* and regardless of the the gap association.
- SSB-based inter-frequency measurement object without measurement gap as defined in clause 9.3.1, when
  - all of the SMTC occasions of this inter-frequency measurement object are overlapped with associated NCSG in [concurrent gaps], or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped with the associated NCSG and all the SMTC occasions of this inter-frequency measurement object are overlapped with the union of all the GAPs, or
- SSB-based inter-frequency measurement object with NCSG as defined in clause 9.3.1;
- E-UTRA inter-RAT measurement object with NCSG as defined in clause 9.4.1;

Otherwise, the carrier-specific scaling factor $CSSF_{within_ncsg,i}$ for a measurement object *i* derived in this clause is applied to following measurement types:

- SSB-based intra-frequency measurement object without measurement gap as defined in clause 9.2.1 corresponding to an activated serving cell, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the NCSG;
-- SSB-based intra-frequency measurement object with NCSG as defined in clause 9.2.1 corresponding to an activated serving cell, when all or part of the SMTC occasions of this intra-frequency measurement object are overlapped by the NCSG;
- SSB-based intra-frequency measurement object corresponding to a deactivated serving cell, or to an activated serving cell in dormancy with SSB within the dormant BWP, when all or part of the SMTC occasions of this intra-frequency measurement object are overlapped by the NCSG;
- SSB-based inter-frequency measurement object without measurement gap as defined in clause 9.3.1, when all of the SMTC occasions of this inter-frequency measurement object are overlapped by the NCSG;
- SSB-based inter-frequency measurement object with NCSG as defined in clause 9.3.1;
- E-UTRA inter-RAT measurement object with NCSG as defined in clause 9.4.1;

UE is expected to conduct the measurement of this measurement object *i* only within the NCSG.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present for an intra-frequency measurement object, and *smtc1* is fully overlapping with NCSG and *smtc2* is partially overlapping with NCSG, requirements derived from $CSSF_{within_ncsg,i}$ and $CSSF_{outside_gap,i}$ are not applicable.

#### 9.1.5.3.1 SA mode: carrier-specific scaling factor for measurements performed within NCSG

When one or more measurement objects are monitored within NCSG, the carrier specific scaling factor for a target measurement object with index *i* is designated as $CSSF_{within_ncsg,i}$ and is derived as described in this clause.

If a UE capable of *concurrentMeasGapsNCSG-r18* is configured with a gap combination including one or more NCSGs, the carrier specific scaling factor is calculated separately for each gap pattern, provided that the association between measurement objects and gap pattern is configured by network. Only the measurement objects associated to the same NCSG pattern are counted when deriving $CSSF_{within_ncsg,i}$ for a target measurement object with index *i*. In case of collision between concurrent GAPs, some GAP occasions may be dropped according to clause 9.1.13.3. The dropped NCSG occasions will not be used in deriving $CSSF_{within_ncsg,i}$.

For each NCSG occasion *j*, count the total number of intra-frequency measurement objects and inter-frequency/inter-RAT measurement objects which are candidates to be measured within the occaison *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in an NCSG occasion if its SMTC duration is fully covered by the ML. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An inter-RAT E-UTRA measurement object configured is a candidate to be measured in all NCSG occasions.

- $M_{intra,i,j}$: Number of intra-frequency measurement objects which are candidates to be measured in NCSG occasion *j* where the measurement object *i* is also a candidate. Otherwise $M_{intra,i,j}$ equals 0.

- $M_{inter,i,j}$: Number of NR inter-frequency measurement objects and E-UTRA inter-RAT measurement objects which are candidates to be measured in NCSG occasion *j* where the measurement object *i* is also a candidate. Otherwise $M_{inter,i,j}$ equals 0.

- $M_{tot,i,j} = M_{intra,i,j} + M_{inter,i,j}$: Total number of intra-frequency, inter-frequency and inter-RAT measurement objects which are candidates to be measured in NCSG occasion *j* where the measurement object *i* is also a candidate. Otherwise $M_{tot,i,j}$ equals 0.

For UEs which support and are configured with per FR NCSG, the above counting is done on a per FR basis, and for UEs which are configured with per UE NCSG the counting is done on a per UE basis.

The carrier specific scaling factor $CSSF_{within_ncsg,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_ncsg,i} = \max(M_{tot,i,j})$, where $j=0\ldots(160/VIRP)-1$

If *measGapSharingScheme* is not equal sharing and

- measurement object *i* is an intra-frequency measurement object, $CSSF_{within_ncsg,i}$ is the maximum among
  - $ceil(K_{intra} \times M_{intra,i,j})$ in NCSG occasions where $M_{inter,i,j} \neq 0$, where $j=0\ldots(160/VIRP)-1$
  - $M_{intra,i,j}$ in NCSG occasions where $M_{inter,i,j}=0$, where $j=0\ldots(160/VIRP)-1$
- measurement object *i* is an inter-frequency or inter-RAT measurement object, $CSSF_{within_ncsg,i}$ is the maximum among
  - $ceil(K_{inter} \times M_{inter,i,j})$ in NCSG occasions where $M_{intra,i,j} \neq 0$, where $j=0\ldots(160/VIRP)-1$
  - $M_{inter,i,j}$ in NCSG occasions where $M_{intra,i,j}=0$, where $j=0\ldots(160/VIRP)-1$
- $K_{intra}$ and $K_{inter}$ are defined in clause 9.1.2.1a.

### 9.1.5.4 L1-RSRP measurements within measurement gap

The requirements in this clause apply for SSB-based L1-RSRP measurements within measurement gap for LTM in clause 9.15.5.

When SSB-based L1-RSRP measurements are configured on one or more frequecny layers within measurement gap, the carrier sepcific scaling factor for a target L1-RSRP measurement on a inter-frequency layer with index *i* is designated as $CSSF_{within_gap,i}$ and is derived in this chapter, with the consideration of the impact from the following measurement types:

- SSB-based intra-frequency measurement object with no measurement gap in clauses 9.2.5 and 9.2A.5, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- SSB-based intra-frequency measurement object with measurement gap in clauses 9.2.6 and 9.2A.6.
- CSI-RS based inter-frequency measurement in clause 9.10.3, when CSI-RS resources for L3 measurement of this inter-frequency measurement object are overlapped by the measurement gap.
- CSI-RS based inter-frequency measurement in clause 9.10.3, when CSI-RS resources for L3 measurement of this inter-frequency measurement object are partially overlapped by the measurement gap.
- SSB-based inter-frequency measurement object with measurement gap in clause 9.3.4.
- SSB-based inter-frequency measurement object without measurement gap for UE capable of *interFrequencyMeas-NoGap* in clause 9.3.9, when
  - all of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, but the flag *interFrequencyConfig-NoGap-r16* is not configured by the Network.
- Intra-frequency RSSI/CO measurement with measurement gap in clause 9.2A.7.
- Intra-frequency RSSI/CO measurement with no measurement gap in clause 9.2A.7 when all of the RMTC occasions of this intra-frequency RSSI/CO measurement are overlapped by the measurement gap(s).
- Inter-frequency RSSI/CO measurement in clauses 9.3A.8 and 9.3A.9.
- E-UTRA Inter-RAT measurement object in clauses 9.4.2 and 9.4.3.
- NR PRS-based measurements for positioning in clause 9.9.
- E-UTRA Inter-RAT RSTD and E-CID measurements in clauses 9.4.4 and 9.4.5.
- For a UE in E-UTRA-NR dual connectivity operation, NR SSB-based Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.4) on an NR serving carrier
  - the SSB is not completely contained in the active BWP of the UE, or
  - all of the SMTC occasions of this inter-RAT measurement object are overlapped by the measurement gap;
- NR SSB-based Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.4) on an NR non-serving carrier.
- E-UTRAN Inter-frequency measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.3) and by the E-UTRAN PSCell (TS 36.133 [15] clause 8.19.3).
- E-UTRAN Inter-frequency RSTD measurement configured by the E-UTRAN PCell (TS 36.133 [15] clause 8.17.15).
- UTRA Inter-RAT measurement object configured by the E-UTRAN PCell (TS 36.133 [15] clauses 8.17.5 to 8.17.12).
- GSM Inter-RAT measurements configured by the E-UTRAN PCell (TS 36.133 [15] clauses 8.17.13 and 8.17.14).

- SSB-based inter-frequency L1-RSRP measurement with measurement gap in clause 9.15.5

The UE is expected to conduct the measurement of this inter-frequency L1-RSRP measurement layer *i* only within the measurement gap.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, $CSSF_{within_gap,i}$ and requirements derived from $CSSF_{outside_gap,i}$ are not specified.

In derivation of $CSSF_{within_gap,i}$ , number of SSB layers shall include SSB for mobility and that as associated SSB for CSI-RS mobility. The *ssbfrequency* is counted only once if the ssbfrequency for mobility and associated SSB are the same, or *ssbfrequency* and *smtc* in multiple MOs are the same.

#### 9.1.5.4.1 SA mode: carrier-specific scaling factor for L1-RSRP measurements performed within measurement gap

When one or more inter-frequency L1-RSRP measurement layers are monitored within measurement gaps, the carrier specific scaling factor for a target inter-frequency L1-RSRP measurement layer with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in this clause.

For UE supporting per-FR gap, for each inter-frequency L1-RSRP measurement layer *i* that are measured based on effective MGRP as defined in clause 9.1.2, $CSSF_{within_gap,i}$ used for deriving the measurement requirements is defined as $2*N_{with_CSI\text{-}RS} + N_{SSB_only} + N_{L1_SSB}$, where

- $N_{with_CSI\text{-}RS}$ is the number of measurement objects with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured in the same FR as, and

- $N_{SSB_only}$ is the number of measurement objects with only SSB based L3 measurement, and

- $N_{L1_SSB}$ is the number of SSB based inter-frequency L1-RSRP measurements configured in the same FR as measurement object *i.*

When multiple positioning frequency layers are configured,

- for each SSB based inter-frequency L1-RSRP measurement i, $CSSF_{within_gap,i}$ is derived as follows:

  - an intermediate $CSSF_{within_gap,i,k}$ is derived with the following steps assuming only positioning frequency layer *k* is configured, and

  - $CSSF_{within_gap,i} = \max(CSSF_{within_gap,i,k})$, where $k=0\ldots K-1$, and K is the number of configured positioning frequency layers.

For each measurement gap *j* not used for a long-periodicity measurement defined above, count the total number of intra-frequency measurement objects and inter-frequency/inter-RAT measurement objects and NR PRS measurements on all positioning frequency layers and inter-frequency L1-RSRP measurement layers which are candidates to be measured within the gap *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An NR measurement object with CSI-RS measurement configured is a candidate to be measured in a gap if the window confining all CSI-RS resources are fully covered by the MGL excluding RF switching time.

- An NR measurement object with RSSI and channel occupancy measurement is a candidate to be measurement in a gap if the RMTC duration is fully covered by MGL excluding RF switching time

- An inter-frequency SFTD measurement object, if to be measured with measurement gaps, is a candidate to be measured in all measurement gaps.

- A positioning frequency layer is counted as candidate for a MG occasion if at least one PRS resource on that positioning frequency layer is fully covered by the MGL excluding RF switching time.

- An inter-frequency L1-RSRP measurement layer is a candidate to be measured in a gap if all configured SSB resources on that frequency layer to be measured are fully covered by the MGL excluding RF switching time.

- For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis.

- $M_{intra,i,j}$: Number of intra-frequency measurement objects, including both SSB, CSI-RS based and RSSI/CO measurements, which are candidates to be measured in gap *j* where inter-frequency L1-RSRP measurement layer *i* is also a candidate. Otherwise $M_{intra,i,j}$ equals 0.

- $M_{inter,i,j}$ : Number of NR inter-frequency layers including both SSB and CSI-RS based, EUTRA inter-RAT and UTRA inter-RAT frequency layers, up to one positioning frequency layer, RSSI/CO measurements, inter-frequency L1-RSRP measurement layers, which are candidates to be measured in gap *j* where the inter-frequency L1-RSRP measurement layer *i* is also a candidate. Otherwise $M_{inter,i,j}$ equals 0.

  - In FR1, an inter-frequency L1-RSRP measurement layer is not counted in $M_{inter,i,j}$ if the SSB resource instance configured for L1-RSRP measurement of an inter-frequency layer is overlapped with the measurement object of this inter-frequency layer which are candidates to be measured in gap *j*.

  - In FR2, an inter-frequency L1-RSRP measurement layer in $M_{inter,i,j}$ contributes the number equal to the cell number for L1-RSRP measurement in this inter-frequency layer, which is candidate to be measured in gap *j*.

Editor Note: The current $M_{inter,i,j}$ assumes all cells in the same frequency layer have the same SSB periodicity. FFS whether and how to address the case of different periodicities.

- A measurement object *i* in $M_{intra,i,j}$ and in $M_{inter,i,j}$ is counted twice if the measurement object is configured with both RMTC and SMTC which are candidates to be measured in gap *j* where the inter-frequency L1-RSRP measurement layer *i* is also a candidate

- $M_{tot,i,j} = M_{intra,i,j} + M_{inter,i,j}$ : Total number of intra-frequency, inter-frequency and inter-RAT frequency layers and up to one NR PRS measurement on any one positioning frequency layer, inter-frequency L1-RSRP measurement layers, which are candidates to be measured in gap *j* where the inter-frequency L1-RSRP measurement layer *i* is also a candidate. Otherwise $M_{tot,i,j}$ equals 0.

For each measurement gap *j* used for a long-periodicity measurement defined above, $M_{intra,i,j} = M_{inter,i,j} = M_{tot,i,j} = 0$. The carrier specific scaling factor $CSSF_{within_gap,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_gap,i} = \max(\text{ceil}(R_i \times M_{tot,i,j}))$, where $j=0\ldots(160/MGRP)-1$

[If *measGapSharingScheme* is not equal sharing and

- L1-RSRP measurement layer *i* is an SSB based inter-frequency L1-RSRP measurement layer, $CSSF_{within_gap,i}$ is the maximum among

  - $\text{ceil}(R_i \times K_{inter} \times M_{inter,i,j})$ in gaps where $M_{intra,i,j} \neq 0$, where $j=0\ldots(160/MGRP)-1$

  - $\text{ceil}(R_i \times M_{inter,i,j})$ in gaps where $M_{intra,i,j}=0$, where $j=0\ldots(160/MGRP)-1$ ]

Where $R_i$ is the maximal ratio of the number of measurement gap where inter-frequency L1-RSRP measurement layer *i* is a candidate to be measured over the number of measurement gap where inter-frequency L1-RSRP measurement layer *i* is a candidate and not used for a long-periodicity measurement defined above.

#### 9.1.5.4.2 NR-DC: carrier-specific scaling factor for L1-RSRP measurements performed within measurement gap

When one or more inter-frequency L1-RSRP measurement layers are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object or a target inter-frequency L1-RSRP measurement layer with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in this clause.

For UE supporting per-FR gap, for each inter-frequency L1-RSRP measurement layer *i* that are measured based on effective MGRP as defined in clause 9.1.2, $CSSF_{within_gap,i}$ used for derving the measurement requirements is defined as $2*N_{with_CSI\text{-}RS} + N_{SSB_only} + N_{L1_SSB}$, where

- $N_{with_CSI\text{-}RS}$ is the number of measurement objects with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured in the same FR as, and

- $N_{SSB_only}$ is the number of measurement objects with only SSB based L3 measurement, and
- $N_{L1_SSB}$ is the number of SSB based inter-frequency L1-RSRP measurements configured in the same FR as measurement object *i*.

When multiple positioning frequency layers are configured,

- for each SSB based inter-frequency L1-RSRP measurement layer *i*, $CSSF_{within_gap,i}$ is derived as follows:
  - an intermediate $CSSF_{within_gap,i,k}$ is derived with the following steps assuming only positioning frequency layer *k* is configured, and
  - $CSSF_{within_gap,i}$= max($CSSF_{within_gap,i,k}$), where *k*=0…K-1, and K is the number of configured positioning frequency layers.

For each measurement gap *j* not used for an RSTD measurement with periodicity Tprs>160 ms or with periodicity Tprs=160 ms but *prs-MutingInfo-r9* is configured within an arbitrary 160 ms period, count the total number of intra-frequency measurement objects and inter-frequency/inter-RAT measurement objects and NR PRS measurements on all positioning frequency layers and inter-frequency L1-RSRP measurement layers which are candidates to be measured within the gap *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.
- An NR measurement object with CSI-RS measurement configured is a candidate to be measured in a gap if the window confining all CSI-RS resources are fully covered by the MGL excluding RF switching time.
- A positioning frequency layer is counted as candidate for a MG occasion if at least one PRS resource on that positioning frequency layer is fully covered by the MGL excluding RF switching time.
- An inter-frequency L1-RSRP measurement layer is a candidate to be measured in a gap if all configured SSB resources on that frequency layer to be measured are fully covered by the MGL excluding RF switching time.

  For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis.

  If the number of configured inter-frequency and interRAT measuerement objects and NR PRS measurements on all positioning frequency layers is non-zero and the UE is configured with per UE gaps, or if the UE is configured with per FR gaps:

  FR1 and FR2 intra-frequency measurement objects belong to group A

  Inter-frequency and inter-RAT measurement objects and up to one NR PRS measurement on any one positioning frequency layer and [inter-frequency L1-RSRP measurement layers] belong to group B

  $M_{groupA,i,j}$: Sum of the number of FR1 intra-frequency measurement objects $M_{intra\text{-}FR1,i,j}$ and the number of FR2 intra-frequency measurement objects $M_{intra\text{-}FR2,i,j}$ , including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{groupA,i,j}$ equals 0.

  $M_{groupBi,j}$ : Number of NR inter-frequency layers including both SSB and CSI-RS based, E-UTRA inter-RAT and UTRA inter-RAT measurement objects and up to one positioning frequency layer, inter-frequency L1-RSRP measurement layers, which are candidates to be measured in gap *j* where the inter-frequency L1-RSRP measurement layer *i* is also a candidate. Otherwise $M_{groupB,i,j}$ equals 0.

  - In FR1, an inter-frequency L1-RSRP measurement layer is not counted in $M_{inter,i,j}$ if the SSB resource instance configured for L1-RSRP measurement of an inter-frequency layer is overlapped with the measurement object of this inter-frequency layer which are candidates to be measured in gap *j*.
  - In FR2, an inter-frequency L1-RSRP measurement layer in $M_{inter,i,j}$ contributes the number equal to the cell number for L1-RSRP measurement in this inter-frequency layer, which is candidate to be measured in gap *j*.

Editor Note: The current $M_{inter,i,j}$ assumes all cells in the same frequency layer have the same SSB periodicity. FFS whether and how to address the case of different periodicities.

$M_{tot,i,j} = M_{groupA,i,j} + M_{groupB,i,j}$ : Total number of group A and group B measurement objects and inter-frequency L1-RSRP measurement layers which are candidates to be measured in gap *j* where the inter-frequency L1-RSRP measurement layer *i* is also a candidate. Otherwise $M_{tot,i,j}$ equals 0.

For each measurement gap *j* used for a long-periodicity measurement defined above, $M_{intra,i,j} = M_{inter,i,j} = M_{tot,i,j} = 0$. The carrier specific scaling factor $CSSF_{within_gap,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_gap,i} = \max(\text{ceil}(R_i \times M_{tot,i,j}))$, where *j*=0…(160/MGRP)-1

[If *measGapSharingScheme* is not equal sharing and

- inter-frequency L1-RSRP measurement layer *i*, is an group B L1-RSRP measurement layer, $CSSF_{within_gap,i}$ is the maximum among
  - $\text{ceil}(R_i \times K_{inter} \times M_{groupBi,j})$ in gaps where $M_{groupA,i,j} \neq 0$, where *j*=0…(160/MGRP)-1
  - $\text{ceil}(R_i \times M_{groupB,i,j})$ in gaps where $M_{groupA,i,j}=0$, where *j*=0…(160/MGRP)-1]

$R_i$ is the maximal ratio of the number of measurement gap where inter-frequency L1-RSRP measurement layer *i*, is a candidate to be measured over the number of measurement gap where inter-frequency L1-RSRP measurement layer *i*, is a candidate and not used for a long-periodicity measurement defined above.

## 9.1.6 Minimum requirement at transitions

When the measurement on one intra-frequency measurement object transitions from measurements performed outside gaps to measurements performed within gaps or vice versa during one measurement period, the cell identification and measurement period requirements with the longer delay apply.

When the measurement on one intra-frequency measurement object transitions from measurements performed outside gaps to measurements performed within NCSG or vice versa during one measurement period, the cell identification and measurement period requirements with the longer delay apply.

The carrier-specific scaling factor specified in clause 9.1.5 that applies to the other impacted measurement objects will also apply based on the longer measurement or cell identification delay before or after the transition.

When the UE transitions between DRX and non-DRX or when DRX cycle periodicity changes, the cell identification and measurement period requirements apply based on the longer delay before or after the transition.

Subsequent to this measurement period, the cell identification and measurement period requirements on each measurement object are corresponding to the second mode after transition.

For UE supporting *ncd-SSB-BWP-Wor-r18*, when the intra-frequency measurement transitions from measurements performed on CD-SSB to measurements performed on NCD-SSB or vice versa due to BWP switching or SCG activation/deactivation during one cell identification period or measurement period, the UE shall use a cell identification period that is the maximum of the cell identification periods or measurement periods corresponding to the first SSB type and the second SSB type after the BWP switching or SCG activation/deactivation.

Subsequent to the above-mentioned measurement periods and/or cell identification periods, the cell identification and measurement period requirements on each measurement object are based on the SSB type after the BWP switch or SCG activation/deactivation.

For UE supporting *ssb-BurstPeriodicityAdaptation-r19*, when SSB periodicity changes due to SSB adaptation, the cell identification and measurement period requirements apply based on the longer period before or after the transition.

## 9.1.7 Pre-configured measurement gap

### 9.1.7.1 Introduction

A UE capable of Pre-configured measurement gap (Pre-MG) pattern can be configured with a Pre-MG pattern via RRC signalling [2].

The gap interruption requirements in clause 9.1.2 apply to Pre-MG when Pre-MG is activated, and no gap interruption is expected when Pre-MG is deactivated.

- The requirements apply for NR standalone operation with single carrier and NR CA.

### 9.1.7.2 Requirements applicability

The requirements related to pre-configured measurement gap apply provided:

- UE indicates support of *preconfiguredUE-AutonomousMeasGap* [2] and/or *preconfiguredNW-ControlledMeasGap* [2], and
- either a single per-UE measurement gap is pre-configured by the network, or one or two per-FR measurement gaps are pre-configured by the network, and
- one of measurement gap patterns among measurement gap patterns #0 ~ #25 is configured for pre-configured measurement gap, and
- UE is in NR SA with single carrier or with NR CA.

A measurement gap is configured as pre-configured measurement gap if *preConfigInd* is indicated by network in the configuration message of the measurement gap.

If UE indicates support of only *preconfiguredNW-ControlledMeasGap* [2], UE can expect the network to configure *preConfGapStatus*.

If a measurement gap is configured as pre-configured measurement gap, the applicability of measurement gap patterns is defined in table 9.1.2-3.

When a pre-configured measurement gap is used to perform PRS measurements, the UE will inform the network that it is going to start/stop PRS measurements with the configured pre-configured measurement gap by initiating the existing *LocationMeasurementIndication* procedure.

If the Pre-MG status changes during a measurement period of a measurement that can be performed without and within measurement gaps, the UE is allowed to restart the measurement.

If the Pre-MG status changes from activated to deactivated during a measurement period of a measurement that can only be performed within measurement gaps, the measurement requirements do not apply.

### 9.1.7.3 Requirements

Any of the measurement Gap pattern #0 to #25 defined in table 9.1.2-1 can be configured as Pre-MG pattern.

The UE can determine the Pre-MG status based on autonomous activation/deactivation mechanism or based on network-controlled activation/deactivation mechanism.

A UE capable of both autonomous and network-controlled mechanisms for activation/deactivation of Pre-MG pattern will not use autonomous rules to determine the activation/deactivation status of the pre-configured MG if the network provides the activation/deactivation status via RRC indication *preConfGapStatus* for all the DL BWPs of all the activated CCs, and for all the deactivated SCCs.

#### 9.1.7.3.1 Requirements for autonomous activation/deactivation mechanism

Requirements in this clause apply when autonomous mechanism [2] is used for activation/deactivation of Pre-MG pattern.

The UE can autonomously change the Pre-MG status from activation to deactivation or vice versa based on any of the following triggering conditions listed below. The UE shall also autonomously determine the Pre-MG status based on all the concurrent triggering conditions occurring jointly:

- DCI, timer or RRC based active BWP switching,
- Activation/deactivation of SCell(s),
- Addition/removal of any measurement object(s)

- Addition/release/change of a SCell in carrier aggregation,

The UE shall autonomously determine the status of the per-UE Pre-MG pattern as deactivated immediately after the configuration of the per-UE Pre-MG pattern or when any of the triggering conditions above is satisfied provided that all the configured measurements can be performed without measurement gaps. The UE shall autonomously determine the status of the per-FR Pre-MG pattern as deactivated immediately after the configuration of the per-FR Pre-MG pattern or when any of the triggering conditions above is satisfied provided that all the configured measurements in the same FR can be performed without measurement gaps.

A measurement can be performed by the UE without measurement gaps if any of the following conditions is met:

- The UE is configured with SSB based intra-frequency measurements, and the conditions defined for SSB based intra-frequency measurement without gaps in clause 9.2.1 are met, or

- The UE is configured with SSB based inter-frequency measurements, and the conditions defined for SSB based inter-frequency measurement without gaps in clause 9.3.1 are met, or

- The UE is configured with CSI-RS based intra-frequency measurements.

The UE shall autonomously determine the status of the per-UE Pre-MG pattern as activated immediately after the configuration of the per-UE Pre-MG pattern or when any of the triggering conditions above is satisfied provided that at least one of the configured measurements cannot be performed without measurement gaps. The UE shall autonomously determine the status of the per-FR Pre-MG pattern as activated immediately after the configuration of the per-FR Pre-MG pattern or when any of the triggering conditions above is satisfied provided that at least one of the configured measurements in the same FR cannot be performed without measurement gaps.

A measurement cannot be performed by the UE without measurement gaps if any of the following conditions is met:

- The UE is configured with SSB based intra-frequency measurements, and the conditions defined for SSB based intra-frequency measurement without gaps in clause 9.2.1 are not met, or

- The UE is configured with SSB based inter-frequency measurements, and the conditions defined for SSB based inter-frequency measurement without gaps in clause 9.3.1 are not met, or

- The UE is configured with any of the following measurements:

  - CSI-RS based inter-frequency measurements, or

  - E-UTRA Inter-RAT measurements, or

  - UTRA Inter-RAT measurements.

#### 9.1.7.3.2 Requirements for network-controlled activation/deactivation mechanism

The requirements in this clause apply when network-controlled mechanism [2] is used for activation/deactivation of Pre-MG pattern.

For per-UE Pre-configured MG,

- the UE determines that the Pre-configured MG is activated if *preConfGapStatus* is set to ‘1’ for the corresponding gap ID for the active DL BWP of any of the activated CCs, or if *preConfGapStatus* is set to ‘1’ for the corresponding gap ID for any of the deactivated SCCs,

- otherwise, the UE determines that the Pre-configured MG is deactivated

For per-FR Pre-configured MG,

- the UE determines that the Pre-configured MG is activated if *preConfGapStatus* is set to ‘1’ for the corresponding gap ID for the active DL BWP of any of the activated CCs in the corresponding FR, or if *preConfGapStatus* is set to ‘1’ for the corresponding gap ID for any of the deactivated SCCs in the corresponding FR,

- otherwise, the UE determines that the Pre-configured MG is deactivated

#### 9.1.7.3.3 Requirements for reception/transmission during activation/deactivation

The requirements in this clause apply when autonomous mechanism or network-controlled mechanism is used for activation/deactivation [2] of Pre-MG pattern.

If per-UE Pre-MG pattern is activated then the UE is not required to conduct reception/transmission from/to the corresponding serving cells during the gap occasion according to the same principles as described for per-UE measurement gaps in clause 9.1.2. Otherwise, the UE can be scheduled for reception/transmission of signals in all the serving cells during the gap occasion.

If per-FR Pre-MG pattern is activated then the UE is not required to conduct reception/transmission from/to the corresponding serving cells during the gap occasion on the same FR according to the same principles as described for per-FR measurement gaps in clause 9.1.2. Otherwise, the UE can be scheduled for reception/transmission of signals in all the serving cells during the gap occasion in the same FR.

## 9.1.8 Concurrent measurement gaps

### 9.1.8.1 Introduction

When UE supports concurrent measurement gap pattern capability, network can provide multiple measurement gaps configured by RRC message(s) as specified in TS 38.331 [2]. Requirements in this clause apply when the UE is in SA operation mode.

### 9.1.8.2 Requirements

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE supports *concurrentPerUE-OnlyMeasGap-r17* as specified in [14], in order for the requirements in the following clauses to apply, the network can provide at most two per-UE measurement gap patterns for monitoring of all frequency layers.

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE supports *concurrentPerUE-PerFRCombMeasGap-r17* as specified in [14], in order for the requirements defined for concurrent measurement gaps to apply, the network can provide the measurement gap pattern combinations specified in table 9.1.8-1 for monitoring of all frequency layers.

**Table 9.1.8-1: The number of Gap Combination Configurations by UE supporting both concurrent measurement gap patterns and independent measurement gap patterns**

| Gap Combination Configuration Id | The number of simultaneous configured measurement gap patterns | | |
|---|---|---|---|
| | Per-FR1 measurement gap | Per-FR2 measurement gap | Per-UE measurement gap |
| 0 | 2 | 1 | 0 |
| 1 | 1 | 2 | 0 |
| 2 | 0 | 0 | 2 |
| 3 Note 1 | 1 | 0 | 1 |
| 4 Note 1 | 0 | 1 | 1 |
| 5 Note 1 | 1 | 1 | 1 |
| 6 | 2 | 0 | 0 |
| 7 | 0 | 2 | 0 |

NOTE 1: Gap Combination Configuration Id #3, #4, #5 will be only applied when the per-UE measurement gap is associated to measure PRS for any RSTD, PRS-RSRP, UE Rx-Tx time difference, PRS-RSRPP, RSCP and RSCPD measurement defined in TS 38.215 [4].

NOTE 2: In Gap Combination Configuration Id #0, #1, #6, #7, one per-FR measurement gap in an FR can be associated to measure PRS for any RSTD, PRS-RSRP, UE Rx-Tx time difference, PRS-RSRPP, RSCP and RSCPD measurement defined in TS 38.215 [4] provided that UE supports *independentGapConfigPRS-r17*.

For UE configured in the SA operation mode, when monitoring of multiple inter-RAT E-UTRAN carrier frequency layers, intra-frequency NR carrier frequency layers and/or inter-frequency NR carrier frequency layers as configured by PCell using gaps, each monitored carrier frequency layer, including following measurement types:

- a measurement object with SSB based measurement,

- a measurement object with CSI-RS based measurement,
- E-UTRA inter-RAT measurement object,
- E-UTRAN inter-RAT RSTD measurement,
- NR PRS-based positioning measurements,

can be only associated to one measurement gap pattern. Requirements for concurrent measurement gaps apply provided that each frequency layer is only associated with one concurrent measurement gap. There can be one or more frequency layers associated with each concurrent measurement gap. Furthermore, if the UE is not capable of concurrentMeasGapEUTRA-r17 [2], all E-UTRAN measurement objects shall be associated with a single concurrent gap pattern for the requirement to apply.

When UE supports concurrent measurement gap patterns, each measurement gap pattern supported by the UE is listed in table 9.1.2-1 based on the applicability specified in table 9.1.2-3.

The requirements in clause 9.1.2 are also applicable for the UE capable of and configured with multiple concurrent measurement gap patterns within each measurement gap pattern.

When UE supports concurrent measurement gap patterns and configured with more than 1 measurement gap pattern per FR or per-UE according to table 9.1.8-1, requirements does not apply if the UE is configured with more than one measurement gap pattern (MGP) with measurement gap repetition period (MGRP) of 20 ms in an FR.

### 9.1.8.3 Collision between concurrent measurement gaps

Collisions between occasions of two concurrent measurement gaps may occur as specified in this clause if the two measurement gaps are

- two per-UE measurement gaps, or
- two per-FR measurement gaps in the same FR, or
- one per-UE measurement gap and one per-FR measurement gap.

When UE is configured with concurrent measurement gaps, two measurement gap occasions are considered colliding if at least one of the following conditions is met:

- the two occasions are fully or partially overlapping in time domain, or
- the distance between the two occasions is equal to or smaller than 4 ms.

The distance between two measurement gap occasions is defined as the time difference between the ending point of the first occasion and the starting point of the second occasion, where the first measurement gap occasion occurs earlier in time than the second measurement gap occasion.

In case of collision between two measurement gap occasions, the UE shall perform measurements in the occasion of the measurement gap with higher priority, and the occasion of the measurement gap with lower priority shall be dropped. The UE shall be able to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI in the corresponding NR serving cells in the slots that are not interrupted according to requirements in clause 9.1.8.4.

The requirements of concurrent measurement gaps in clause 9 shall not apply when a gap without assigned priority is configured simultaneously with any other gap(s) that affect serving carriers in the same FR and the measurement gaps are colliding with each other.

The priority for a measurement gap is configured by networks via *gapPriority* in *GapConfig*. The requirements with concurrent measurement gaps apply provided that two measurement gaps colliding with each other are configured with different priorities.

### 9.1.8.4 Measurement gap related requirements of concurrent measurement gaps

A slot is considered as interrupted if it is interrupted by an occasion of any of the configured concurrent measurement gaps following the measurement gap interruption requirements in clause 9.1.2, except for a dropped measurement gap occasion.

## 9.1.9 Network controlled small gap

### 9.1.9.1 Introduction

The UE capable of network controlled small gap (NCSG) pattern can be configured with a NCSG pattern via RRC signalling [2].

This clause contains the general requirements on the UE regarding to Network Controlled Small Gap (NCSG).

The requirements in this clause are applicable for UE configured with SA NR (with single carrier or NR CA) operation mode.

It is up to UE implementation whether or not the UE is able to conduct transmission in the following slot(s),

- when *mgta* is not applied, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after the last each of the interrupted slots after VIL1 and VIL2.
- when *mgta* is applied and the SCS of the UL carrier is other than 15 kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after the last each of the interrupted slots after VIL1 and VIL2.
- when *mgta* is applied and the SCS of the UL carrier is 15 kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after the slot partially overlapped with each of the interrupted slots after VIL1 and VIL2.

where UL slot denotes that all the symbols in the slot are uplink symbols, and L=1 if $(N_{\mathrm{TA}} + N_{\mathrm{TA\ offset}}) \times T_{\mathrm{c}}$ for the UL transmission is less than the length of one slot; L=2 otherwise.

NOTE: Network is supposed to take into account the possible difference between the estimated TA at network and actual TA at UE when scheduling UE in the above slot(s).

The interruptions of NCSG in number of slots are listed in table 9.1.9-1 on all serving cells when per-UE NCSG is configured with pattern #0-11 or on FR1 serving cells when per-FR FR1 NCSG is configured to *ncsg-MeasGapPerFR-r17* capable UE. The interruptions of NCSG in number of slots are listed in table 9.1.9-2 on all serving cells when per-UE NCSG is configured with pattern #12-23 or on FR2 serving cells when per-FR FR2 NCSG is configured to *ncsg-MeasGapPerFR-r17* capable UE. There are two interruptions in each NCSG occasion, VIL1 before ML and VIL2 after ML, in NR standalone (with single carrier or NR CA). Each of them has number of interrupted slots captured in table 9.1.9-1 and table 9.1.9-2.

**Table 9.1.9-1: Number of interrupted slots on all serving cells for per-UE NCSG pattern #0-11 or FR1 serving cells for per-FR FR1 NCSG during each VIL in NR standalone operation (with single carrier, NR CA)**

| NR SCS (kHz) | Number of interrupted slots on serving cells<br>When MG timing advance of 0 ms is applied<br>VIL=1 ms |
|---|---|
| 15 | 1 |
| 30 | 2 |
| 60 | 4 |
| 120 | 8 |
| NOTE 1: NR SCS of 120 kHz is only applicable to the case with per-UE NCSG.<br>NOTE 2: Void. | |

**Table 9.1.9-2: Number of interrupted slots on all serving cells for per-UE NCSG pattern #12-23 or FR2 serving cells for per-FR FR2 NCSG during each VIL in NR standalone operation (with single carrier, NR CA)**

| NR SCS (kHz) | Number of interrupted slots on serving cells | |
|---|---|---|
| | When MG timing advance of 0 ms is applied | When MG timing advance of 0.75 ms is applied |
| | VIL=0.75 ms | VIL=0.75 ms |

| | | |
|---|---|---|
| 60 | 3 | 3 |
| 120 | 6 | 6 |
| NOTE 1: Void | | |

### 9.1.9.2 Requirements applicability

Requirements in clause 9.1.9 apply for UE capable of NCSG in standalone NR in both FR1 and FR2 (including FR1+FR2 CA), provided UE is configured with only NCSG and no other measurement gap is configured, and UE is configured with

SSB based intra-frequency measurement (including measurement on de-activated SCC and measurement on dormant SCell), and/or

SSB based inter-frequency measurement, and/or

Inter-RAT E-UTRAN measurement.

Requirements for the following measurements do not apply if UE is configured with NCSG.

CSI-RS based intra-frequency measurement when overlapped with NCSG, or

CSI-RS based inter-frequency measurement, or

Inter-RAT GSM measurement, or

Inter-RAT UTRAN measurement, or

PRS measurement.

### 9.1.9.3 Requirements

The UE shall support NCSG patterns defined in table 9.1.9.3-1 that are relevant to the UE's measurement capabilities. ML is the measurement length. During the VIL1 and VIL2, the UE is not expected to transmit and receive any data. Where, VIL1 is the visible interruption length before the ML and VIL2 is the visible interruption length after the ML. During ML, whether the UE shall transmit and receive data on the corresponding serving carrier(s) depends on the scheduling restriction requirements specified in clauses 9.2.7.3, 9.3.10.3, 9.4.2.5 and 9.4.3.5. The NCSG parameters VIL1, ML, VIL2 and VIRP are illustrated in figure 9.1.9.3-1. The applicability of the NCSG patterns in table 9.1.9.3-1 is specified in table 9.1.9.3-2.

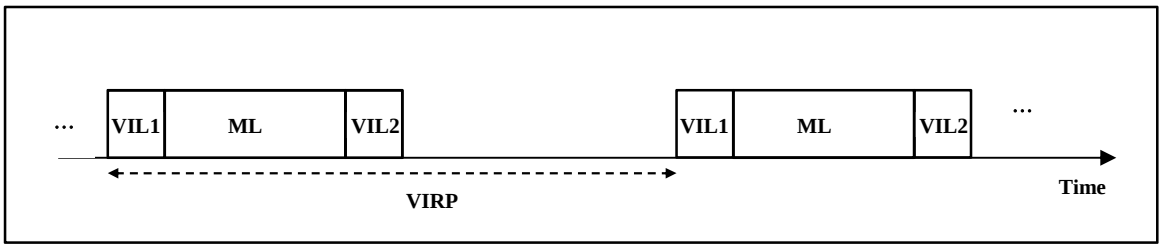

**Figure 9.1.9.3-1: Illustration of NCSG parameters: VIL1, ML, VIL2 and VIRP**

**Table 9.1.9.3-1: NCSG Configurations supported by the UE**

| NCSG Pattern Id | Measurement Length during which there is no gap (ML, ms) | Visible interruption Repetition Period (VIRP, ms) |
|---|---|---|
| 0 | 5 | 40 |
| 1 | 5 | 80 |
| 2 | 2 | 40 |
| 3 | 2 | 80 |
| 4 | 5 | 20 |
| 5 | 5 | 160 |
| 6 | 3 | 20 |
| 7 | 3 | 40 |

| NCSG Pattern Id | Measurement Length during which there is no gap (ML, ms) | Visible interruption Repetition Period (VIRP, ms) |
|---|---|---|
| 8 | 3 | 80 |
| 9 | 3 | 160 |
| 10 | 2 | 20 |
| 11 | 2 | 160 |
| 12 | 5 | 20 |
| 13 | 5 | 40 |
| 14 | 5 | 80 |
| 15 | 5 | 160 |
| 16 | 3 | 20 |
| 17 | 3 | 40 |
| 18 | 3 | 80 |
| 19 | 3 | 160 |
| 20 | 1 | 20 |
| 21 | 1 | 40 |
| 22 | 1 | 80 |
| 23 | 1 | 160 |

**Table 9.1.9.3-2: Applicability for NCSG pattern configurations supported by the UE for NR standalone operation with single carrier or NR CA configuration**

| NCSG pattern configuration | Serving cell | Measurement Purpose NOTE 2 | Applicable NCSG Pattern Id |
|---|---|---|---|
| Per-UE NCSG | FR1, or FR1 + FR2 | E-UTRA | 0,1,2,3 |
| | | FR1 and/or FR2 | 0-11 |
| | | E-UTRA and FR1 and/or FR2 | 0, 1, 2, 3, 4, 6, 7, 8,10 |
| | FR2 | E-UTRA only | 0,1,2,3 |
| | | FR1 only | 0-11 |
| | | FR1 and FR2 | 0-11 |
| | | E-UTRA and FR1 and/or FR2 | 0, 1, 2, 3, 4, 6, 7, 8,10 |
| | | FR2 only | 12-23 |
| Per-FR NCSG | FR1 if configured | E-UTRA only | 0,1,2,3 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR1 only | 0-11 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR2 only | No gap |
| | FR2 if configured | | 12-23 |
| | FR1 if configured | E-UTRA and FR1 | 0, 1, 2, 3, 4, 6, 7, 8,10 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR1 and FR2 | 0-11 |
| | FR2 if configured | | 12-23 |
| | FR1 if configured | E-UTRA and FR2 | 0, 1, 2, 3, 4, 6, 7, 8,10 |
| | FR2 if configured | | 12-23 |
| | FR1 if configured | E-UTRA and FR1 and FR2 | 0, 1, 2, 3, 4, 6, 7, 8,10 |
| | FR2 if configured | | 12-23 |

| NCSG pattern configuration | Serving cell | Measurement Purpose NOTE 2 | Applicable NCSG Pattern Id |
|---|---|---|---|

NOTE 1: When E-UTRA inter-RAT RSTD measurements are configured and the UE requires NCSG for performing such measurements, only NCSG Pattern #0 can be used.

NOTE 2: Measurement purpose which includes E-UTRA measurements includes also inter-RAT E-UTRA RSRP and RSRQ measurements for E-CID.

NOTE 3: If per-UE NCSG is configured with MG timing advance of $T_{MG}$ ms, the NCSG starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured NCSG among all serving cells subframes.
If per-FR NCSG for FR1 is configured with MG timing advance of $T_{MG}$ ms, the NCSG for FR1 starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured NCSG among serving cells subframes in FR1.
If per-FR NCSG for FR2 is configured with MG timing advance of $T_{MG}$ ms, the NCSG for FR2 starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured NCSG among serving cells subframes in FR2.
$T_{MG}$ is the MG timing advance value provided in *mgta* according to [2].
In determining the NCSG starting point, UE shall use the DL timing of the latest subframe occurring immediately before the configured NCSG among serving cells.

NOTE 4: For UE only supporting *ncsg-MeasGapNR-Patterns-r17* for any NCSG patterns among NCSG pattern # 2-11, the corresponding NCSG patterns are not applicable to measurement of E-UTRA.

## 9.1.10 MUSIM gaps

If the UE requires gap patterns for MUSIM purpose, such as cell identification and measurement, paging monitoring, SIB acquisition, and/or on-demand SI request of the target cell in the target network, then the network may provide one or more per-UE MUSIM gap pattern(s) for concurrent monitoring of all frequency layers for MUSIM via *MUSIM-GapConfig* [2]. The UE can be configured with no more than three periodic MUSIM gap patterns and/or one aperiodic MUSIM gap pattern for MUSIM via *MUSIM-GapConfig* [2]. The MUSIM gap patterns specified in table 9.1.10-1 are applicable only for MUSIM operation. The MUSIM requirements apply for the configured MUSIM gap pattern(s) requested by UE, provided UE is allocated one or more of the requested MUSIM gaps.

The UE is not required to perform cell identification and measurement, paging monitoring, SIB acquisition, and/or on-demand SI request of the target cell in the target network that is outside the MUSIM gaps.

The UE is not required to conduct reception or transmission from or to the network during MUSIM gaps that are not dropped due to collisions, as defined in clauses 9.1.10.4 and 9.1.10.5.

The UE supporting MUSIM capability may request MUSIM gap with one or more of the MUSIM gap patterns listed in table 9.1.10-1 via *MUSIM-GapPreferenceList-r17* [2], and the applicability of MUSIM gap patterns is specified in table 9.1.10-2.

The UE determines MUSIM gap timing based on MUSIM gap offset configuration from serving cell provided by higher layer signalling as specified in TS 38.331 [2].

**Table 9.1.10-1: MUSIM Gap Pattern Configurations**

| MUSIM Gap Pattern Id | MUSIM Gap Length (MGL, ms) | MUSIM Gap Repetition Period (MGRP, ms) |
|---|---|---|
| 0 | 6 | 40 |
| 1 | 6 | 80 |
| 2 | 3 | 40 |
| 3 | 3 | 80 |
| 4 | 6 | 20 |
| 5 | 6 | 160 |
| 6 | 4 | 20 |
| 7 | 4 | 40 |
| 8 | 4 | 80 |
| 9 | 4 | 160 |
| 10 | 3 | 20 |
| 11 | 3 | 160 |
| 12 | 10 | 80 |
| 13 | 20 | 160 |
| 14 | 6 | 320 |
| 15 | 6 | 640 |

| MUSIM Gap Pattern Id | MUSIM Gap Length (MGL, ms) | MUSIM Gap Repetition Period (MGRP, ms) |
|---|---|---|
| 16 | 6 | 1280 |
| 17 | 6 | 2560 |
| 18 | 10 | 320 |
| 19 | 10 | 640 |
| 20 | 10 | 1280 |
| 21 | 10 | 2560 |
| 22 | 20 | 320 |
| 23 | 20 | 640 |
| 24 | 20 | 1280 |
| 25 | 20 | 2560 |
| 26 | 20 | 5120 |
| 27 | 10 | NA |
| 28 | 20 | NA |
| NOTE 1: Measurement gap pattern #27, #28 are the aperiodic gap pattern without MGRP. | | |

**Table 9.1.10-2: Applicability for MUSIM Gap Pattern Configurations supported by the UE with NR standalone operation (with single carrier, NR CA configuration)**

| MUSIM gap pattern configuration | Serving cell | Gap Purpose | Applicable MUSIM Gap Pattern Id |
|---|---|---|---|
| Per-UE MUSIM gap | FR1, FR2, or FR1 + FR2 | MUSIM Note1 | 0-13, 14-26, 27, 28 |
| NOTE 1: Inclusion of MUSIM procedures for per-UE MUSIM gaps only in NR single carrier, NR CA mode: MUSIM purpose which includes cell identification and measurement, paging monitoring, SIB acquisition, and/or on-demand SI request of the target cell in the target network. | | | |

## 9.1.10.1 Introduction

This clause contains the requirements on the UE supporting MUSIM capability, requirements in this clause are applicable for UE in NR SA (including CA) operation mode.

## 9.1.10.2 Priorities for MUSIM gaps

Priorities are applied for each periodic MUSIM gap. A UE shall request priorities for all requested periodic MUSIM gaps via *musim-GapPriorityPreferenceList-r18* when the UE requests MUSIM gaps [2]. The UE shall request different priorities for each periodic MUSIM gap. Priorities of the configured MUSIM gaps may be configured via *musim-GapToAddModListExt-v1820*. The configured priorities may differ from the priorities requested by the UE. The MUSIM requirements apply if the configured MUSIM gap priorities retain the same relative priorities among MUSIM gaps as requested by the UE.

The requirements in clause 9.1.10 apply provided different priorities are allocated to each periodic MUSIM gap and each measurement gap which is configured via *GapConfig-r17* without *preConfigInd-r17* or *ncsgInd-r17*.

An aperiodic MUSIM gap, when configured, is unconditionally kept in case of collisions with any other gap occasions, including MUSIM gaps and measurement gaps.

## 9.1.10.3 Keep solution for MUSIM gaps

The UE can request to keep all collided gaps for requested MUSIM gap(s) via *musim-GapKeepPreference-r18* [2]. If the UE's request is granted via *musim-GapKeep-r18*, the UE shall keep all collided periodic and aperiodic MUSIM gaps irrespectively of the configured priorities of the periodic MUSIM gaps.

## 9.1.10.4 Collisions between different MUSIM gaps

MUSIM gap occasions are considered colliding if at least one of the following conditions is met:

- the MUSIM gap occasions are fully overlapping in time domain, or

- the MUSIM gap occasions are partially overlapping in time domain, or
- the distance between the two MUSIM gap occasions is equal to or smaller than 4 ms.

The distance between two MUSIM gap occasions is defined as the time difference between the ending point of the first MUSIM gap occasion and the starting point of the second MUSIM gap occasion, where the first MUSIM gap occasion occurs earlier in time than the second MUSIM gap occasion.

When “keep solution” in clause 9.1.10.3 is not configured:

- the periodic MUSIM gap occasion colliding with an aperiodic MUSIM gap are dropped, and
- collisions between periodic MUSIM gap occasions are resolved based on the assigned MUSIM gap priorities. Collisions are resolved sequentially in order of decreasing priority, starting with the gap that has the highest priority. For each collision, the occasion of the MUSIM gap with higher priority shall be kept and the occasion of the MUSIM gap with lower priority shall be dropped.

### 9.1.10.5 Collisions between MUSIM gaps and measurement gaps

MUSIM gap and measurement gap occasions are considered colliding if at least one of the following conditions is met:

- the MUSIM gap and measurement gap occasions are fully overlapping in time domain, or
- the MUSIM gap and measurement gap occasions are partially overlapping in time domain, or
- the distance between any of the MUSM gap and the measurement gap occasion is equal to or smaller than 4 ms.

The distance between two gap occasions is defined as the time difference between the ending point of the first occasion and the starting point of the second occasion, where the first gap occasion occurs earlier in time than the second gap occasion. The gap occasion can be either a MUSIM gap occasion or a measurement gap occasion.

The measurement gap occasion colliding with an aperiodic MUSIM gap shall be dropped.

Collisions between MUSIM gaps with assigned priority and measurement gaps configured via *GapConfig-r17* with assigned priority but without *preConfigInd-r17* or *ncsgInd-r17* are resolved based on their assigned priorities:

- If ‘keep solution’ in clause 9.1.10.3 is not configured, collisions are resolved sequentially in order of decreasing priority, starting with the gap that has the highest priority. For each collision, the occasion of the MUSIM gap or measurement gap with higher priority shall be kept and the occasion of the MUSIM gap or measurement gap with lower priority shall be dropped. Any collisions between MUSIM gaps shall be addressed as specified in clauses 9.1.10.3 and 9.1.10.4.
- Otherwise if ‘keep solution’ in clause 9.1.10.3 is configured, keep solution is used for the remaining collided and non-dropped MUSIM gaps, after resolving the collisions between measurement gaps and MUSIM gaps based on their priorities.

Collisions between MUSIM gaps with assigned priority and measurement gaps configured via *GapConfig* or configured via *GapConfig-r17* without assigned priority are handled based on MGRP of the colliding gaps:

- If ‘keep solution’ in clause 9.1.10.3 is not configured, collisions are resolved sequentially in order of decreasing MGRP, starting with the gap that has the longest MGRP. For each collision, the occasion of the MUSIM gap or measurement gap with longer MGRP shall be kept and the occasion of the MUSIM gap or measurement gap with shorter MGRP shall be dropped. If the colliding MUSIM gap and measurement gap have the same MGRP, the requirements in clause 9 shall not apply to these gaps. Any collisions between MUSIM gaps shall be addressed as specified in clauses 9.1.10.3 and 9.1.10.4.
- Otherwise if ‘keep solution’ in clause 9.1.10.3 is configured, keep solution is used for the remaining collided and non-dropped MUSIM gaps, after resolving the collisions between measurement gaps and MUSIM gaps based on their MGRP following the above mentioned collision rule.

### 9.1.10.6 MUSIM gap related requirements

A slot is interrupted by a MUSIM gap if it overlaps with any occasion of the configured MUSIM gap, except for a dropped MUSIM gap occasion.

## 9.1.11 UL gap for Tx power management

The UL gap patterns for TX power management are listed in table 9.1.11-1 if UE supports the UL gap for Tx power management, and the UE shall support at least one of UL MGP#1 and UL MGP#3. All other UL MGPs are optional.

**Table 9.1.11-1: UL Gap Pattern Configurations**

| | UL Gap Length (UGL) [ms] | UL gap repetition periodicity (UGRP) [ms] |
|---|---|---|
| UL MGP #0 | 1.0 | 20 |
| UL MGP #1 | 1.0 | 40 |
| UL MGP #2 | 0.5 | 160 |
| UL MGP #3 | 0.125 when SCS of active UL BWP =120 kHz<br>0.25 when SCS of active UL BWP =60 kHz | 5 |

An uplink gap consists of consecutive static UL slot(s) in one or more *TDD-UL-DL-Pattern* duration, starting from the first static UL slot of an UL gap repetition period. UGL is the aggregated length of consecutive UL slots used as the UL gap within an UL gap repetition period. That means, there can be a DL slot and/or special slot but no static UL slot between the two consecutive static UL slots within the UL gap length.

When an UL gap overlaps with an uplink transmission in NR serving cells in FR2 single CC or FR2 intra-band CA or FR2 inter-band CA where UE does not support tx-Support-UL-GapFR2-r17, then the UE is not required to conduct any transmission during the UL gap on the NR serving cells other than those listed in clause 5.30 in TS 38.321 [7].

## 9.1.12 Concurrent measurement gaps with Pre-MG

### 9.1.12.1 Introduction

When the UE supports *concurrentMeasGapsPreMG-r18* capability, network can provide multiple measurement gap patterns with at least one of the measurement gaps is pre-configured measurement gap (Pre-MG) pattern configured by RRC message(s) as specified in TS 38.331 [2]. Requirements in this clause apply when the UE is in SA operation mode.

### 9.1.12.2 Requirements

If the UE requires measurement gaps and/or Pre-MGs to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE supports *concurrentMeasGapsPreMG-r18* but does not support independent measurement gap patterns for different frequency ranges as specified in table 5.1-1 in [18, 19, 20], in order for the requirements in the following clauses to apply, the network can provide the UE with no more than two per-UE measurement gap patterns for monitoring all the frequency layers.

If the UE supports both *concurrentMeasGapsPreMG-r18* and independent measurement gap patterns for different frequency ranges as specified in table 5.1-1 in [18, 19, 20], in order for the requirements defined for concurrent measurement gaps with Pre-MG to apply, the network can provide the measurement gap pattern combinations specified in table 9.1.12.1 for monitoring of all frequency layers.

**Table 9.1.12-1: The number of Gap Combination Configurations by UE supporting both *concurrentMeasGapsPreMG-r18* and independent measurement gap patterns**

| Gap Combination Configuration Id | The number of simultaneous configured measurement gap patterns | | |
|---|---|---|---|
| | Per-FR1 measurement gap | Per-FR2 measurement gap | Per-UE measurement gap |
| 0 | 2 | 1 | 0 |
| 1 | 1 | 2 | 0 |
| 2 | 0 | 0 | 2 |
| 3[Note 1] | 1 | 0 | 1 |
| 4[Note 1] | 0 | 1 | 1 |
| 5[Note 1] | 1 | 1 | 1 |
| 6 | 2 | 0 | 0 |
| 7 | 0 | 2 | 0 |

NOTE 1: Gap Combination Configuration Id #3, #4, #5 are only applicable when the per-UE measurement gap is associated to measure PRS for any RSTD, PRS-RSRP, RSCP, RSCPD, UE Rx-Tx time difference measurement and PRS-RSRPP measurement defined in TS 38.215 [4].
NOTE 2: For UE capable of *concurrentMeasGapsPreMG-r18*, up to 2 measurement gap patterns can be configured as Pre-MG in one FR, regardless of whether they are per-UE or per-FR configuration. Otherwise, the gaps can only be configured as Gap(s) configured via *GapConfig* without suffix or Gap(s) configured via *GapConfig-r17* without *preConfigInd-r17*.
NOTE 3: In Gap Combination Configuration Id #0, #1, #6, #7, one per-FR measurement gap in an FR can be associated to measure PRS for any RSTD, PRS-RSRP, PRS-RSRPP, RSCP, RSCPD and UE Rx-Tx time difference measurement defined in TS 38.215 [4] provided that UE supports *independentGapConfigPRS-r17*.

When the UE supports *concurrentMeasGapsPreMG-r18*, the gap association for a frequency layer is configured by the network via *associatedMeasGapSSB-r17* or *associatedMeasGapCSIRS-r17* in the corresponding MO(s) or via *gapAssociationPRS-r17* in *GapConfig-r17*. In this case the gap association rules in clause 9.1.8.2 shall also apply to either measurement gap or Pre-MG.

When autonomous mechanism [2] is used for activation/deactivation of Pre-MG pattern, the UE shall autonomously determine the Pre-MG status only based on the measurement objects associated with the concerned Pre-MG. The related Pre-MG autonomous activation/deactivation mechanism is specified in clause 9.1.7.3.1.

When network-controlled mechanism [2] is used for activation/deactivation, the requirements specified in clause 9.1.7.3.2 apply.

When UE supports *concurrentMeasGapsPreMG-r18*, where at least one of the concurrent gaps is Pre-MG, applicable measurement gap patterns are listed in table 9.1.2-1, and their applicability based on measurement and serving cell configurations is specified in table 9.1.2-3.

The requirements in clause 9.1.2 are applicable for the UE, capable of *concurrentMeasGapsPreMG-r18* and configured with multiple concurrent measurement gap patterns, within each activated Pre-MG occasion.

### 9.1.12.3 Collisions involving Pre-MG(s)

A collision between occasions of two measurement gaps where the higher priority gap is a Pre-MG and the lower priority gap may or may not be a Pre-MG is called as dynamic collision.

For a UE that supports *dynamicCollision-r18*:

- Collisions between a Pre-MG and a measurement gap may occur only when the Pre-MG is activated.
- Collisions between two Pre-MGs may occur only when both Pre-MGs are activated.

When the collision between a Pre-MG and a measurement gap or two Pre-MGs satisfy the collision rule defined in clause 9.1.8.3, the UE shall perform measurements in the occasion of the non-dropped gap except the scenario specified in clause 9.1.12.5.

For a UE that does not support *dynamicCollision-r18*:

- Collisions between a Pre-MG and a measurement gap or two Pre-MGs may occur when the collision rule defined in clause 9.1.8.3 is satisfied, regardless of the Pre-MG activation status. .

When the collision between a Pre-MG and a measurement gap or two Pre-MGs satisfy the collision rule defined in clause 9.1.8.3, the UE shall perform measurements in the occasion of the non-dropped gap regardless of whether it collides with the Pre-MG activation or deactivation procedure.

The requirements for the UE capable of *concurrentMeasGapsPreMG-r18* apply provided that the two measurement gaps colliding with each other are configured with different priorities.

No collisions can occur between a per-FR Pre-MG and a per-FR measurement gap when they are configured in different FRs.

No collisions can occur between per-FR Pre-MGs when they are configured in different FRs.

### 9.1.12.4 Collision between Pre-MG activation/deactivation and measurement gap

The requirements in this clause apply for UE that supports *dynamicCollision-r18*.

A measurement gap occasion and a Pre-MG activation/deactivation procedure collide when the ending point of the Pre-MG activation/deactivation procedure occurs anywhere within a time period starting 4 ms before the starting point of the gap occasion and ending 4 ms after the ending point of the gap occasion. The ending point of the Pre-MG activation/deactivation procedure in this collision case is defined in clause 8.19.2, 8.19.3 and 8.19.4.

- When a collision occurs between a measurement gap occasion and a Pre-MG activation procedure, and the Pre-MG is configured with higher priority, the UE shall perform measurements during the measurement gap occasion and the activation of the Pre-MG is delayed until 5 ms after the ending point of the measurement gap occasion.
- When a collision occurs between a measurement gap occasion and a Pre-MG deactivation procedure, and the Pre-MG is configured with higher priority, the measurement gap occasion shall be dropped.

### 9.1.12.5 Pre-MG related requirements

A slot is interrupted by a Pre-MG if it overlaps with any occasion of the configured Pre-MG, if the Pre-MG is activated and the Pre-MG occasion is not dropped.

## 9.1.13 Concurrent measurement gaps with NCSG

### 9.1.13.1 Introduction

When UE supports *concurrentMeasGapsNCSG-r18* capability, network can provide multiple measurement gaps with at least one of the measurement gaps is NCSG configured by RRC message(s) as specified in TS 38.331 [2].

Requirements in this clause apply when the UE is in SA operation mode.

### 9.1.13.2 Requirements

If the UE requires concurrent measurement gaps and/or NCSG to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE supports *concurrentMeasGapsNCSG-r18* but does not support *independentGapConfig* or *ncsg-MeasGapPerFR-r17* as specified in [14], in order for the requirements in the following clauses to apply, the network can provide one per-UE concurrent measurement gap and one per-UE NCSG or at most two per-UE NCSGs for monitoring of all frequency layers.

If the UE requires concurrent measurement gaps and/or NCSG to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE supports *concurrentMeasGapsNCSG-r18*, *independentGapConfig* and *ncsg-MeasGapPerFR-r17* as specified in [14], in order for the requirements defined for concurrent measurement gaps with NCSG to apply, the network can provide the concurrent measurement gap with NCSG combinations configurations specified in table 9.1.13-1 for monitoring of all frequency layers.

**Table 9.1.13-1: The number of Gap Combination Configurations by UE supporting concurrent measurement gap with NCSG patterns, per-FR NCSG patterns and independent measurement gap patterns**

| Gap Combination Configuration Id | The number of simultaneous configured measurement gap patterns | | |
|---|---|---|---|
| | Per-FR1 measurement gap/NCSG | Per-FR2 measurement gap/NCSG | Per-UE measurement gap/NCSG |
| 0 | 2 | 1 | 0 |
| 1 | 1 | 2 | 0 |
| 2 | 0 | 0 | 2 |
| 3 Note 1 | 1 | 0 | 1 |
| 4 Note 1 | 0 | 1 | 1 |
| 5 Note 1 | 1 | 1 | 1 |
| 6 | 2 | 0 | 0 |
| 7 | 0 | 2 | 0 |

Note 1: Gap Combination Configuration Id #3, #4, #5 will be only applied when the per-UE measurement gap (and cannot be NCSG) is associated to measure PRS for any RSTD, PRS-RSRP, RSCP, RSCPD, UE Rx-Tx time

| | |
|---|---|
| | difference and PRS-RSRPP measurement defined in TS 38.215 [4], and when the per-FR measurement gap in an FR is NCSG. |
| Note 2: | In Gap Combination Configuration Id #0, #1, #6, #7, one per-FR measurement gap in an FR (and cannot be NCSG) can be associated to measure PRS for any RSTD, PRS-RSRP, RSCP, RSCPD, UE Rx-Tx time difference and PRS-RSRPP measurement defined in TS 38.215 [4] provided that UE supports *independentGapConfigPRS-r17*. |
| Note 3: | In Gap Combination Configuration Id #0, #1, #2, #6, #7, one FR can be configured with up to 2 NCSGs, regardless they are per-UE or per-FR configured. Otherwise, the gaps can only be configured as Gap(s) configured via *GapConfig* without suffix or Gap(s) configured via *GapConfig-r17* without *ncsgInd-r17*. |

For UE configured in the SA operation mode, when monitoring of multiple inter-RAT E-UTRAN carrier frequency layers, intra-frequency NR carrier frequency layers and/or inter-frequency NR carrier frequency layers as configured by PCell using gaps, each monitored carrier frequency layer, including following measurement types:

- a measurement object with SSB based measurement,
- E-UTRA inter-RAT measurement object,

can be associated to either one concurrent measurement gap pattern or one NCSG pattern, while the following measurement types:

- a measurement object with CSI-RS based measurement,
- E-UTRAN inter-RAT RSTD measurement,
- NR PRS-based positioning measurement,

can be only associated to one measurement gap pattern. Requirements for UE capable of *concurrentMeasGapsNCSG-r18* apply provided that each frequency layer is only associated with one concurrent measurement gap or one NCSG, and at least one of the gaps is NCSG. There can be one or more frequency layers associated with each concurrent measurement gap or each NCSG. Furthermore, if the UE is not capable of *concurrentMeasGapEUTRA-r17*[2], all E-UTRAN measurement objects shall be associated with a single concurrent measurement gap or NCSG for the requirement to apply.

When UE supports *concurrentMeasGapsNCSG-r18*, where at least one of the concurrent gaps is NCSG, supported concurrent measurement gap patterns are listed in table 9.1.2-1 based on the applicability specified in table 9.1.2-3, while supported NCSG patterns are listed in table 9.1.9.3-1 based on the applicability specified in table 9.1.9.3-2.

The requirements in clause 9.1.2 are also applicable for the UE capable of *concurrentMeasGapsNCSG-r18* and configured with multiple measurement gap or NCSG patterns within each concurrent measurement gap pattern. The requirements in clause 9.1.9 are also applicable for the UE capable of *concurrentMeasGapsNCSG-r18* and configured with multiple measurement gap or NCSG patterns within each NCSG pattern.

When the measurement of the measurement object is related to a deactivated SCell, and

- when NW configures the concurrent measurement gap and NCSG, UE shall perform the measurement of this measurement object within the NCSG if the SMTC of the measurement object is partially or fully overlapped with the NCSG regardless of the gap assoicaition.
- when NW configures two NCSGs, UE shall perform the measurement of this measurement object based on the configured gap association if the SMTC of the measurement object is partially or fully overlapped with the NCSG. If the association is not provided, UE is not expected to cause interruption outside the VIL due to measurement on any of the deactivated SCells, and the existing measurement delay requirement does not apply to this case if the SMTC of the measurement object is partially or fully overlapped with any of the NCSGs.

### 9.1.13.3 Collision involving NCSGs

Collisions between occasions of concurrent measurement gap and NCSG or of two NCSGs may occur as specified in this clause if the two occasions are

- two per-UE NCSGs, or
- two per-FR NCSGs in the same FR, or
- one per-UE NCSG and one per-UE measurement gap, or

- one per-FR NCSG and one per-UE measurement gap, or
- one per-UE NCSG and one per-FR measurement gap, or
- one per-FR NCSG and one per-FR measurement gap in the same FR.

and if the gap collision condition specified in clause 9.1.8.3 is met then the gap collision rule applies.

When the first occasion is NCSG, the ending point of the first occasion is the end of VIL2 and/or when the second occasion is NCSG, the starting point of the second occasion is the start of VIL1.The requirements with *concurrentMeasGapsNCSG-r18* apply provided that two gaps (at least one of the gaps is NCSG) colliding with each other are configured with different priorities.

## 9.1.14 Measurement gap occasion cancellation

### 9.1.14.1 Introduction

This clause specifies the general requirements and applicability for UE supporting cancellation of measurement gap occasions as specified in TS 38.213 [3] and indicating its capability via *enableTx-RxDuringMeasGap-r19* according to TS 38.331 [2].

### 9.1.14.2 Applicable measurement gap configurations

Measurement gaps configured by one of the below configurations are applicable for measurement gap occasion cancellation:

- *GapConfig* without suffix;
- *GapConfig-r17* with *gapPriority-r17* and without any of: *ncsgInd-r17* or *preConfigInd-r17* or *gapAssociationPRS;*

### 9.1.14.3 Applicability

The measurement gap cancellation requirements apply under the following conditions.

1> if an explicit indication is received via DCI according to TS 38.213 [3] to cancel a measurement gap occasion; and

1> if the UE is configured with NR SA (with or without CA) in FR1 or FR2-1; and

1> if the UE is not power class 6 UE in FR2-1; and

1> if the UE is not configured to do measurements for SRVCC according to clause 9.4.6; and

1> if the UE is not configured with any MUSIM measurement gap pattern via *MUSIM-GapConfig* [2]; and

1> if the UE is not configured with positioning measurements requiring measurement gaps; and

1> if the UE is configured with one of the measurement gap configurations listed in clause 9.1.14.2:

2> if the UE is configured with per-UE measurement gap pattern(s), the measurement gap occasion cancellation applies to both FR1 and FR2-1, and the requirements with measurement gap occasion cancellation in clause 9.1.14.4 apply;

2> Otherwise, if the UE is configured with per-FR measurement gap pattern(s), the measurement gap occasion cancellation only applies to the per-FR measurement gap on the same frequency range as the one or more scheduled cells associated with the DCI format and has no impacts on UE measurement behaviour in the other FR, and the requirements with measurement gap occasion cancellation in clause 9.1.14.4 apply;

### 9.1.14.4 Requirements for cancelling measurement gap occasions

For the measurement gap patterns configured via *gapPriority-r17* and without any of *ncsgInd-r17* or *preConfigInd-r17* or *gapAssociationPRS*, the measurement gap cancellation applies to measurement gap occasions after applying collision rules as defined in clause 9.1.8.3.

UE behaviour during cancelled measurement gap occasions is specified in TS 38.213 [3].

The UE shall cancel the gap provided that the time offset between the DCI indication of cancellation of measurement gap and the start of the measurement gap occasion including MGTA is not smaller than the UE capability indicated by *minimumTimeOffset-r19* [2].

**Table 9.1.14.4-1: Void**

# 9.1A General measurement requirement for RedCap

## 9.1A.1 Introduction

This clause contains general requirements on the RedCap UE regarding measurement reporting in RRC_CONNECTED state. The requirements are split in intra-frequency, inter-frequency, inter-RAT E-UTRAN FDD, inter-RAT E-UTRAN TDD, and L1-RSRP measurements requirements. These measurements may be used by the NG-RAN. The measurement quantities are defined in TS 38.215 [4], the measurement model is defined in TS 38.300 [10], TS 37.340 [17] and measurement accuracies are specified in clause 10. Control of measurement reporting is specified in TS 38.331 [2].

The SSB and SMTC in this clause apply for both CD-SSB and NCD-SSB if it is not additional specified.

## 9.1A.2 Measurement gap

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE does not support independent measurement gap patterns for different frequency ranges as specified in table 5.1-1 in [18, 19, 20], in order for the requirements in the following clauses to apply the network must provide a single per-UE measurement gap pattern for concurrent monitoring of all frequency layers.

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells and/or inter-RAT E-UTRAN cells, and the UE supports independent measurement gap patterns for different frequency ranges as specified in table 5.1-1 in [18, 19, 20], in order for the requirements in the following clauses to apply the network must provide either per-FR measurement gap patterns for frequency range where UE requires per-FR measurement gap for concurrent monitoring of all frequency layers of each frequency range independently, or a single per-UE measurement gap pattern for concurrent monitoring of all frequency layers of all frequency ranges.

If the UE is configured via LPP [34] to measure PRS for any RSTD, PRS-RSRP, UE Rx-Tx time difference measurement and PRS-RSRPP measurement with or without FH defined in TS 38.215 [4], in order for the requirements in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5 to apply, the network must provide:

- a single per-UE measurement gap pattern for concurrent monitoring of all positioning frequency layers and intra-frequency, inter-frequency and/or inter-RAT frequency layers of all frequency ranges, or
- if UE supports independent measurement gap patterns for different frequency ranges for PRS measurement, i.e. supporting *independentGapConfigPRS-r17*, per-FR measurement gap pattern for the frequency range for concurrent monitoring of all positioning frequency layers and intra-frequency, inter-frequency cells and/or inter-RAT frequency layers in the corresponding frequency range.

During the per-UE or per-FR measurement gaps the UE:

- is not required to conduct reception/transmission from/to the corresponding NR serving cell for SA (with single carrier) except the reception of signals used for RRM measurement(s), and the signals used for random access procedure according to [7].

UEs shall support the measurement gap patterns listed in table 9.1A.2-1 based on the applicability specified in table 9.1A.2-2. UE determines measurement gap timing based on gap offset configuration and measurement gap timing advance configuration provided by higher layer signalling as specified in TS 38.331 [2] and TS 36.331 [16].

**Table 9.1A.2-1: Gap Pattern Configurations**

| Gap Pattern Id | Measurement Gap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) |
|---|---|---|
| 0 | 6 | 40 |
| 1 | 6 | 80 |
| 2 | 3 | 40 |
| 3 | 3 | 80 |
| 4 | 6 | 20 |
| 5 | 6 | 160 |
| 6 | 4 | 20 |
| 7 | 4 | 40 |
| 8 | 4 | 80 |
| 9 | 4 | 160 |
| 10 | 3 | 20 |
| 11 | 3 | 160 |
| 12 | 5.5 | 20 |
| 13 | 5.5 | 40 |
| 14 | 5.5 | 80 |
| 15 | 5.5 | 160 |
| 16 | 3.5 | 20 |
| 17 | 3.5 | 40 |
| 18 | 3.5 | 80 |
| 19 | 3.5 | 160 |
| 20 | 1.5 | 20 |
| 21 | 1.5 | 40 |
| 22 | 1.5 | 80 |
| 23 | 1.5 | 160 |
| 24 | 10 | 80 |
| 25 | 20 | 160 |

**Table 9.1A.2-2: Applicability for Gap Pattern Configurations supported by the RedCap UE with NR standalone operation (with single carrier)**

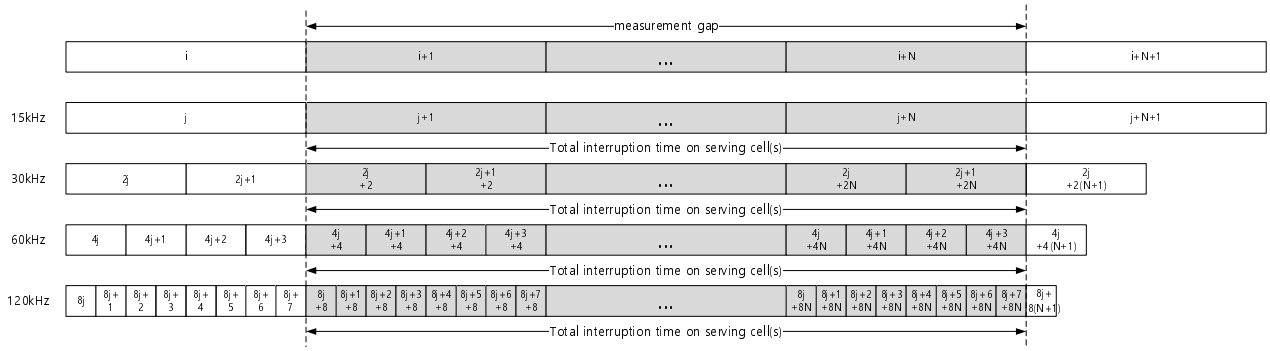
| Measurement gap pattern configuration | Serving cell | Measurement Purpose | Applicable Gap Pattern Id |
|---|---|---|---|
| Per-UE measurement gap | FR1 | non-NR RAT NOTE2 | 0,1,2,3 |
| | | FR1 and/or FR2 | 0-11, 24, 25 |
| | | non-NR RAT and FR1 and/or FR2 NOTE2 | 0, 1, 2, 3, 4, 6, 7, 8,10, 24 |
| | FR2 | non-NR RAT only NOTE2 | 0,1,2,3 |
| | | FR1 only | 0-11, 24, 25 |
| | | FR1 and FR2 | 0-11, 24, 25 |
| | | non-NR RAT and FR1 and/or FR2 NOTE2 | 0, 1, 2, 3, 4, 6, 7, 8, 10, 24 |
| | | FR2 only | 12-25 |
| Per-FR measurement gap | FR1 if configured | non-NR RAT only NOTE2 | 0,1,2,3 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR1 only | 0-11, 24, 25 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR2 only | No gap |
| | FR2 if configured | | 12-25 |
| | FR1 if configured | non-NR RAT and FR1 NOTE2 | 0, 1, 2, 3, 4, 6, 7, 8, 10, 24 |
| | FR2 if configured | | No gap |
| | FR1 if configured | FR1 and FR2 | 0-11, 24, 25 |
| | FR2 if configured | | 12-25 |
| | FR1 if configured | non-NR RAT and FR2 NOTE2 | 0, 1, 2, 3, 4, 6, 7, 8, 10, 24 |
| | FR2 if configured | | 12-25 |

| Measurement gap pattern configuration | Serving cell | Measurement Purpose | Applicable Gap Pattern Id |
|---|---|---|---|
| | FR1 if configured | non-NR RAT and FR1 and FR2 NOTE2 | 0, 1, 2, 3, 4, 6, 7, 8, 10, 24 |
| | FR2 if configured | | 12-25 |

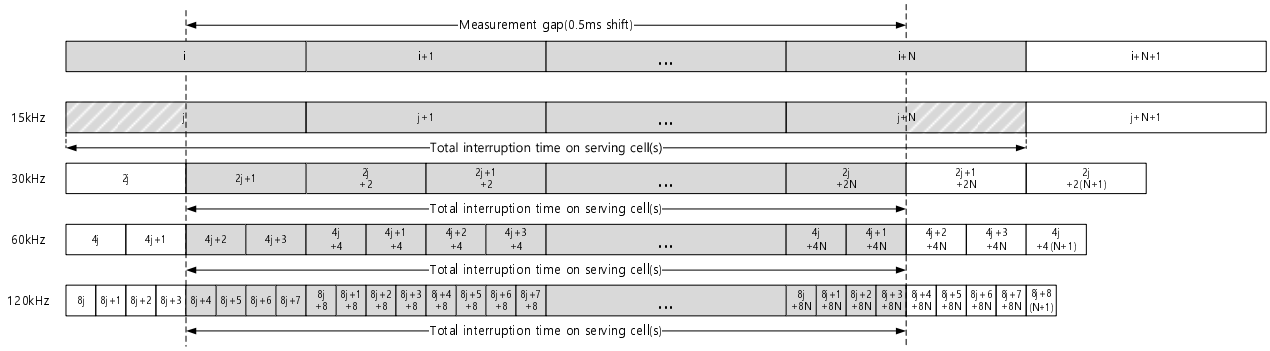
NOTE1: If per-UE measurement gap is configured with MG timing advance of $T_{MG}$ ms, the measurement gap starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among all serving cells subframes.
If per-FR measurement gap for FR1 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR1 starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among serving cells subframes in FR1.
If per-FR measurement gap for FR2 is configured with MG timing advance of $T_{MG}$ ms, the measurement gap for FR2 starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among serving cells subframes in FR2.
$T_{MG}$ is the MG timing advance value provided in *mgta* according to [2].
In determining the measurement gap starting point, UE shall use the DL timing of the latest subframe occurring immediately before the configured measurement gap among serving cells.
NOTE 2: In RedCap, non-NR RAT means E-UTRA only.
NOTE 3: For UE only supporting *supportedGapPattern-NRonly* for any gap patterns among GP2-11, the corresponding gap patterns are not applicable to measurement of non-NR RAT as defined in NOTE 2.
NOTE 4: Measurement gap patterns #24 and #25 can be requested when the UE is configured at least with any of RSTD, UE Rx-Tx time difference, PRS-RSRP or PRS-RSRPP measurements requiring such gaps and can be used during the corresponding positioning measurement period.

If measurement gap is configured in one FR but measurement object is not configured in the FR, the scheduling opportunity in the FR depends on the configured measurement gap pattern.

For NR standalone operation (with single carrier), if UE is not capable of per-FR-gap, total interruption time on a serving cell during MGL is defined when MGL(N) = 20ms, 10ms, 6 ms, 5.5 ms, 4 ms, 3.5 ms, 3 ms, and 1.5 ms. And if UE is capable of per-FR-gap, total interruption time on FR1 serving cell during MGL is defined only when MGL(N) = 20ms, 10ms, 6 ms, 4 ms, and 3 ms, and total interruption time on FR2 serving cell during MGL is defined only when MGL(N) = 20ms, 10ms, 5.5 ms, 3.5 ms, and 1.5 ms.



(a) Measurement gap with MGL = N(ms) with MG timing advance of 0 ms for serving cell in synchronous NR standalone operation (with single carrier)



(b) Measurement gap with MGL = N(ms) with MG timing advance of 0.5 ms for serving cell in synchronous NR standalone operation (with single carrier)

**Figure 9.1A.2-1: Measurement GAP and total interruption time on serving cell for NR standalone operation (with single carrier)**

The corresponding total number of interrupted slots on serving cell is listed in table 9.1A.2-3 for serving cell in NR standalone (with single carrier).

**Table 9.1A.2-3: Total number of interrupted slots on serving cell during MGL for NR standalone operation (with single carrier) with per-UE measurement gap or per-FR measurement gap for FR1**

| NR SCS (kHz) | Total number of interrupted slots on serving cell | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | When MG timing advance of 0 ms is applied | | | | | When MG timing advance of 0.5 ms is applied | | | | |
| | MGL=20 ms | MGL=10 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms | MGL=20 ms | MGL=10 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms |
| 15 | 20 | 10 | 6 | 4 | 3 | 21 Note3 | 11 Note3 | 7 Note3 | 5 Note3 | 4 Note3 |
| 30 | 40 | 20 | 12 | 8 | 6 | 40 | 20 | 12 | 8 | 6 |
| 60 | 80 | 40 | 24 | 16 | 12 | 80 | 40 | 24 | 16 | 12 |
| 120 | 160 | 80 | 48 | 32 | 24 | 160 | 80 | 48 | 32 | 24 |
| NOTE 1: For Gap Pattern ID 0, 1, 2 and 3, total number of interrupted subframes on serving cell is MGL subframes when MG timing advance of 0 ms is applied, and (MGL+1) subframes when MG timing advance of 0.5 ms is applied. | | | | | | | | | | |
| NOTE 2: NR SCS of 120 kHz is only applicable to the case with per-UE measurement gap. | | | | | | | | | | |
| NOTE 3: Non-overlapped half-slots occur before and after the measurement gap. Whether a RedCap UE can receive and/or transmit in those half-slots is up to UE implementation. | | | | | | | | | | |

In case that UE capable of per-FR measurement gap is configured with per-UE measurement gap or per-FR measurement gap for FR2 serving cell, total number of interrupted slots on FR2 serving cells during MGL is listed in table 9.1A.2-3a.

**Table 9.1A.2-3a: Total number of interrupted slots on FR2 serving cell during MGL for NR standalone operation (with single carrier) with per-UE measurement gap or per-FR measurement gap for FR2**

| NR SCS (kHz) | Total number of interrupted slots on FR2 serving cell | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | When MG timing advance of 0 ms is applied | | | | | When MG timing advance of 0.25 ms is applied | | | | |
| | MGL= 20 ms | MGL= 10 ms | MGL= 5.5 ms | MGL= 3.5 ms | MGL= 1.5 ms | MGL= 20 ms | MGL= 10 ms | MGL= 5.5 ms | MGL= 3.5 ms | MGL= 1.5 ms |
| 60 | 80 | 40 | 22 | 14 | 6 | 80 | 40 | 22 | 14 | 6 |
| 120 | 160 | 80 | 44 | 28 | 12 | 160 | 80 | 44 | 28 | 12 |
| NOTE 1: The total number of interrupted slots is based on that SFN and subframe reference for per-FR gap in FR2 indicated by high layer parameter *refServCellIndicator* is an FR2 serving cell. | | | | | | | | | | |
| NOTE 2: Slot occurs before or after the measurement gap may be interrupted additionally if SFN and subframe reference for per-FR gap in FR2 indicated by high layer parameter refServCellIndicator is an FR1 serving cell. | | | | | | | | | | |

It is up to UE implementation whether or not the UE is able to conduct transmission in the following slot(s),

- when MGTA is not applied, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after measurement gap
- when MGTA is applied and the SCS of the UL carrier is other than 15 kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after measurement gap
- when MGTA is applied and the SCS of the UL carrier is 15 kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after the slot partially overlapped with measurement gap

where UL slot denotes that all the symbols in the slot are uplink symbols, and L=1 if $(N_{\mathrm{TA}} + N_{\mathrm{TA\,offset}}) \times T_{\mathrm{c}}$ for the UL transmission is less than the length of one slot; L=2 otherwise.

### 9.1A.2.1 SA: Measurement Gap Sharing

For NR standalone UE configured with per-UE measurement gap, measurement gap sharing shall be applies when UE requires measurement gaps to identify and measure cells on an intra-frequency carrier or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE requires measurement gaps to identify and measure cells on inter-frequency carriers for SSB based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-UE measurement gaps or per-FR measurement gap, and/or inter-RAT E-UTRAN carriers.

For NR standalone UE configured with per-FR1 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR1 intra-frequency carriers or when SMTC configured for FR1 intra-frequency measurement are fully overlapping with per-FR1 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR1 inter-frequency carriers for SSB based L3 measurement and/or inter-RAT E-UTRAN carriers, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-FR1 measurement gaps.

For NR standalone UE configured with per-FR2 measurement gap, measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on FR2 intra-frequency carriers or when SMTC configured for FR2 intra-frequency measurement are fully overlapping with per-FR2 measurement gaps, and when UE requires measurement gaps to identify and measure cells on FR2 inter-frequency carriers for SSB based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-UE measurement gaps.

When network signals “01”, “10” or “11” with RRC parameter *MeasGapSharingScheme* [2] and the value of X is defined as in table 9.1.2.1a-1, and

- $K_{intra} = 1 / X * 100$,
- $K_{inter} = 1 / (100 – X) * 100$,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1A.5.2.1.

## 9.1A.3 UE Measurement capability

### 9.1A.3.1 SA: Monitoring of multiple layers using gaps

The requirements in this clause are applicable for UE configured with SA NR operation mode.

When monitoring of multiple inter-RAT E-UTRAN carriers and inter-frequency NR carriers with gaps(or without using gaps provided the UE supports such capability or the effective MGRP is applied for per-FR measurement gap capable UE) is configured by PCell, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, E-UTRAN RSRP, E-UTRAN RSRQ, E-UTRAN RS-SINR measurements, etc.) of detected cells on all the layers.

For UE configured with the NR SA operation, the effective total number of frequencies, excluding the frequencies of the PCell being monitored, is $N_{freq, SA, RedCap}$, which is defined as:

$$N_{freq, SA, RedCap} = N_{freq, SA, NR, RedCap} + N_{freq, SA, E-UTRA, RedCap},$$

where

$N_{freq, SA, E-UTRA, RedCap}$ is the number of E-UTRA inter-RAT carriers being monitored (FDD and TDD) as configured by PCell,

$N_{freq, SA, NR, RedCap}$ is the number of NR inter-frequency carriers being monitored as configured by PCell.

### 9.1A.3.2 SA: Maximum allowed layers for multiple monitoring

If a UE is configured with SA NR operation mode, the UE shall be capable of monitoring at least:

- Depending on UE capability, 6 NR SSB inter-frequency carriers configured by PCell, and
- Depending on UE capability, 6 E-UTRA TDD inter-RAT carriers configured by PCell, and
- Depending on UE capability, 6 E-UTRA FDD inter-RAT carriers configured by PCell.

In addition to the requirements defined above, the UE shall be capable of monitoring a total of at least [10] effective carrier frequency layers comprising of any above defined combination of NR, E-UTRA FDD, and E-UTRA TDD layers.

If *ssbfrequency, smtc1, smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

## 9.1A.4 Capabilities for Support of Event Triggering and Reporting Criteria

### 9.1A.4.1 Introduction

This clause contains requirements on UE capabilities for support of event triggering and reporting criteria. As long as the measurement configuration does not exceed the requirements stated in clause 9.1A.4.2, the UE shall meet all other performance requirements defined in clause 9 and clause 10.

The UE can be requested to make measurements under different measurement identities defined in TS 38.331 [2]. Each measurement identity corresponds to either event-based reporting, periodic reporting, or no reporting. In case of event-based reporting, each measurement identity is associated with an event triggering criterion. In case of periodic reporting, a measurement identity is associated with one periodic reporting criterion. In case of no reporting, a measurement identity is associated with one no reporting criterion.

The purpose of this clause is to set some limits on the number of different event triggering, periodic, and no reporting criteria the UE may be requested to track in parallel.

### 9.1A.4.2 Requirements

In this clause a reporting criterion corresponds to either one event (in the case of event-based reporting), or one periodic reporting criterion (in case of periodic reporting), or one no reporting criterion (in case of no reporting). For event-based reporting, each instance of event, with the same or different event identities, is counted as separate reporting criterion in table 9.1A.4.2-1.

The UE shall be able to support in parallel per category up to $E_{cat}$ reporting criteria according to table [9.1A.4.2-1]. For the measurement categories belonging to intra-frequency, inter-frequency, and inter-RAT measurements (i.e. without counting other categories that the UE shall always support in parallel), the UE need not support more than the total number of reporting criteria as follows:

- For UE configured with SA operation mode: $E_{cat,SA,NR,redCap} + E_{cat,SA,E-UTRA,redCap}$, where

  $E_{cat,SA,NR,redCap} = 19$ is the total number of NR reporting criteria according to table 9.1A.4.2-1,

  $E_{cat,SA,E-UTRA,redCap}$ is the total number of inter-RAT E-UTRA reporting criteria according to table 9.1A.4.2-1.

**Table 9.1A.4.2-1: Requirements for reporting criteria per measurement category**

| Measurement category | $E_{cat}$ | Note |
|---|---|---|
| Intra-frequency Note 1 | 9 | Events for any one or a combination of intra-frequency SS-RSRP, SS-RSRQ, and SS-SINR for NG-RAN intra-frequency cells |
| Inter-frequency Note 1 | 10 | Events for any one or a combination of inter-frequency SS-RSRP, SS-RSRQ, and SS-SINRfor NG-RAN inter-frequency cells |
| Inter-RAT (E-UTRA FDD, E-UTRA TDD) Note 1 | 10 | Only applicable for UE with this (inter-RAT) capability. These reporting criteria apply for any E-UTRA carrier frequencies. |
| NOTE 1: Applicable for UE configured with SA NR operation mode. | | |

## 9.1A.5 Carrier-specific scaling factor

This clause specifies the derivation of carrier-specific scaling factor (CSSF) values, which scales the measurement delay requirements given in clauses 9.2B, 9.3Band 9.4A when UE is configured to monitor multiple measurement objects. The CSSF values are categorized into $CSSF_{outside_gap_RedCap,i}$ and $CSSF_{within_gap_RedCap,i}$, for the measurements conducted outside measurement gaps and within measurement gaps, respectively.

### 9.1A.5.1 Monitoring of multiple layers outside gaps

The carrier-specific scaling factor $CSSF_{outside_gap_RedCap,i}$ for measurement object *i* derived in this chapter is applied to following measurement types:

- SSB-based intra-frequency measurement with no measurement gap in clause 9.2B.5, when none of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- SSB-based intra-frequency measurement with no measurement gap in clause 9.2B.5, when part of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- SSB-based inter-frequency measurement with no measurement gap in clause 9.3B.7, when none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

- SSB-based inter-frequency measurement with no measurement gap in clause [9.3B.7], when part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

UE is expected to conduct the measurement of this measurement object *i* only outside the measurement gaps.

If *ssbfrequency*, *smtc1*, *smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, $CSSF_{outside_gap_RedCap,i}$ and requirements derived from $CSSF_{outside_gap_RedCap,i}$ are not specified.

#### 9.1A.5.1.1 SA mode: carrier-specific scaling factor for SSB-based measurements performed outside gaps

For UE in SA operation mode, the carrier-specific scaling factor $CSSF_{outside_gap_RedCap,i}$ for intra-frequency SSB-based measurements, inter-frequency SSB-based measurements performed outside measurements gaps, will be specified as follows:

$CSSF_{outside_gap\ RedCap,i}$ =1, if only one measurement object is configured to be measured outside of MG for RedCap.

$CSSF_{outside_gap\ RedCap,i}$ =2 for intra-frequency measurement, and $CSSF_{outside_gap,i}$ = 2*Y for inter-frequency measurement with no measurement gap, Y is the number of configured inter-frequency MOs without MG that are being measured outside of MG.

If intra-frequency measurement is with measurement gap, $CSSF_{outside_gap,i}$ = Y for inter-frequency measurement with no measurement gap, Y is the number of configured inter-frequency MOs without MG that are being measured outside of MG.

### 9.1A.5.2 Monitoring of multiple layers within gaps

The carrier-specific scaling factor $CSSF_{within_gap_RedCap,i}$ for a measurement object *i* derived in this chapter is applied to following measurement types:

- SSB-based intra-frequency measurement object with no measurement gap in clause 9.2B.5, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.

- SSB-based intra-frequency measurement object with measurement gap in clause 9.2B.6.
- SSB-based inter-frequency measurement object with measurement gap in clause 9.3B.4.
- SSB-based inter-frequency measurement object without measurement gap for UE capable of *interFrequencyMeas-NoGap* in clause 9.3B.7, when
  - all of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap but the flag *interFrequencyConfig-NoGap-r16* is not configured by the Network
- E-UTRA Inter-RAT measurement object in clauses 9.4A.2 and 9.4A.3.
- NR PRS-based measurements for positioning in clause 9.9A.

UE is expected to conduct the measurement of this measurement object *i* only within the measurement gaps.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, $CSSF_{within_gap_RedCap,i}$ and requirements derived from $CSSF_{outside_gap_RedCap,i}$ are not specified.

#### 9.1A.5.2.1 SA mode: carrier-specific scaling factor for SSB measurements performed within gaps

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index *i* is designated as $CSSF_{within_gap_RedCap,i}$ and is derived as described in this clause.

If measurement object *i* refers to a long-periodicity measurement which is any of:

- an NR measurement for positioning frequency layer *i* with $T_{available_PRS,i}$ >160 ms, where $T_{available_PRS,i}$ is defined in clauses 9.9A.2.5.1, 9.9A.3.5.1, 9.9A.4.5 and 9.9A.5.5 for RSTD, PRS-RSRP ,UE Rx-Tx time difference and PRS-RSRPP measurements without frequency hopping, respectively.
- an NR measurement for positioning frequency layer *i* with $T_{available_PRS,i}$ >160 ms, where $T_{available_PRS,i}$ is defined in clauses 9.9A.2.6.1, 9.9A.3.6.1, 9.9A.4.8 and 9.9A.5.8 for RSTD, PRS-RSRP ,UE Rx-Tx time difference and PRS-RSRPP measurements with frequency hopping, respectively.

then $CSSF_{within_gap_RedCap,i}$ =1. Otherwise, the $CSSF_{within_gap_RedCap,i}$ for other measurement objects participate in the gap competition and the $CSSF_{within_gap_RedCap,i}$ are derived as below.

When multiple positioning frequency layers are configured,

- for each positioning frequency layer *i*, $CSSF_{within_gap_RedCap,i}$ is derived with the following steps assuming no other positioning frequency layer is configured.
- for each RRM frequency layer *i*, $CSSF_{within_gap_RedCap,i}$ is derived as follows:
  - an intermediate $CSSF_{within_gap_RedCap,i,k}$ is derived with the following steps assuming only positioning frequency layer *k* is configured, and
  - $CSSF_{within_gap_RedCap,i} = \max(CSSF_{within_gap_RedCap,i,k})$, where $k$=0…K-1, and K is the number of configured positioning frequency layers.

For each measurement gap *j* not used for a long-periodicity measurement defined above, count the total number of intra-frequency measurement objects, inter-frequency/inter-RAT measurement objects and NR positioning frequency layers which are candidates to be measured within the gap *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement object, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An NR positioning frequency layer is counted as candidate for a MG occasion if at least one PRS resource on that positioning frequency layer is fully covered by the MGL excluding RF switching time.

- For UEs which support and are configured with per FR gaps, the counting is done on a per FR basis, and for UEs which are configured with per UE gaps the counting is done on a per UE basis.

- For UEs which support and are configured with per FR gaps, the CSSF requirements do not apply when NR PRS measurement in one FR gap collides with SSB/CSI-RS/PRS measurements in the other FR gap in time domain.

- $M_{intra_RedCap,i,j}$: Number of intra-frequency measurement objects, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{intra\ RedCap,i,j}$ equals 0.

- $M_{inter_RedCap,i,j}$ : Number of NR inter-frequency layers and E-UTRA inter-RAT, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{inter_RedCap,i,j}$ equals 0.

- $M_{tot_RedCap,i,j} = M_{intra_RedCap,i,j} + M_{inter_RedCap,i,j}$ : Total number of intra-frequency, inter-frequency and inter-RAT frequency layers, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{tot_RedCap,i,j}$ equals 0.

For each measurement gap *j* used for a long-periodicity measurement defined above, $M_{intra_RedCap,i,j} = M_{inter_RedCap,i,j} = M_{tot_RedCap,i,j} = 0$.

The carrier specific scaling factor $CSSF_{within_gap_RedCap,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_gap_RedCap,i} = \max(\text{ceil}(R_i \times M_{tot_RedCap,i,j}))$, where $j=0\ldots(160/MGRP)-1$

If *measGapSharingScheme* is not equal sharing and

- measurement object *i* is an intra-frequency measurement object, $CSSF_{within_gap_RedCap,i}$ is the maximum among
  - $\text{ceil}(R_i \times K_{intra} \times M_{intra_RedCap,i,j})$ in gaps where $M_{inter_RedCap,i,j} \neq 0$, where $j=0\ldots(160/MGRP)-1$
  - $\text{ceil}(R_i \times M_{intra_RedCap,i,j})$ in gaps where $M_{inter_RedCap,i,j}=0$, where $j=0\ldots(160/MGRP)-1$
- measurement object *i* is an inter-frequency or inter-RAT measurement object or NR PRS measurement on any one positioning frequency layer, $CSSF_{within_gap_RedCap,i}$ is the maximum among
  - $\text{ceil}(R_i \times K_{inter} \times M_{inter_RedCap,i,j})$ in gaps where $M_{intra_RedCap,i,j} \neq 0$, where $j=0\ldots(160/MGRP)-1$
  - $\text{ceil}(R_i \times M_{inter_RedCap,i,j})$ in gaps where $M_{intra_RedCap,i,j}=0$, where $j=0\ldots(160/MGRP)-1$

where $R_i$ is the maximal ratio of the number of measurement gap where measurement object *i* is a candidate to be measured over the number of measurement gap where measurement object *i* is a candidate and not used for a long-periodicity measurement defined above.

## 9.1A.6 Minimum requirement at transitions

When the measurement on one intra-frequency measurement object transitions from measurements performed outside gaps to measurements performed within gaps or vice versa during one measurement period, the cell identification and measurement period requirements with the longer delay apply.

The carrier-specific scaling factor specified in clause 9.1A.5 that applies to the other impacted measurement objects will also apply based on the longer measurement or cell identification delay before or after the transition.

When the UE transitions between DRX and non-DRX or when DRX cycle periodicity changes, the cell identification and measurement period requirements apply based on the longer delay before or after the transition.

When the intra-frequency measurement transitions from measurements performed on CD-SSB to measurements performed on NCD-SSB or vice versa due to BWP switching during one cell identification period, the UE shall use a cell identification period that is the maximum of the cell identification periods corresponding to the first SSB type and the second SSB type after the BWP switching.

When the intra-frequency measurement transitions from measurements performed on CD-SSB to measurements performed on NCD-SSB or vice versa due to BWP switching during one measurement period, the UE shall use a

measurement period that is the maximum of the measurement periods corresponding to the first SSB type and the second SSB type after the BWP switching.

When the measurement on one measurement object transitions from inter-frequency measurement to intra-frequency measurement or vice versa due to BWP switching during one cell identification period, the UE shall use a cell identification period that is the maximum of the cell identification periods corresponding to the first SSB type and the second SSB type after the BWP switching.

When the measurement on one measurement object transitions from inter-frequency measurement to intra-frequency measurement or vice versa due to BWP switching during one measurement period, the UE shall use a measurement period that is the maximum of the measurement periods corresponding to the first SSB type and the second SSB type after the BWP switching.

Subsequent to the above-mentioned measurement periods and/or cell identification periods, the cell identification and measurement period requirements on each measurement object are based on the SSB type after the BWP switch.

# 9.1C General measurement requirement for SAN

## 9.1C.1 Introduction

This clause contains general requirements on the UE regarding measurement reporting in RRC_CONNECTED state. The requirements are split in intra-frequency, inter-frequency and L1-RSRP measurements requirements. These measurements may be used by the NG-RAN. The measurement quantities are defined in TS 38.215 [4], the measurement model is defined in TS 38.300 [10], TS 37.340 [17] and measurement accuracies are specified in clause 10. Control of measurement reporting is specified in TS 38.331 [2].

## 9.1C.2 Measurement gap

For the UE configured with only PCell, which is served by SAN, if the UE requires measurement gaps to identify and measure cells operating in satellite access network and/or TN cells, in order for the requirements in the following clauses to apply the network must provide at least one per-UE measurement gap and the number of per-UE measurement gaps provided by the network must not exceed the number of measurement gaps supported by the UE, indicated by the capability *parallelMeasurementGap*.

If the UE is configured via LPP [34] to measure PRS for UE Rx-Tx time difference measurement defined in TS 38.215 [4], in order for the requirements in clauses 9.9C.4 to apply, the network must provide at least one per-UE measurement gap pattern for concurrent monitoring of all positioning frequency layers and intra-frequency and/or inter-frequency layers. The number of per-UE measurement gaps provided by the network must not exceed the number of measurement gaps supported by the UE, indicated by the capability *parallelMeasurementGap*.

During the per-UE measurement gaps the UE:

- is not required to conduct reception/transmission from/to the PCell except the reception of signals used for RRM measurement(s) and the signals used for random access procedure according to [7].

UEs shall support the measurement gap patterns listed in table 9.1C.2-1 based on the the applicability specified in table 9.1C.2-3. UE determines measurement gap timing based on gap offset configuration and measurement gap timing advance configuration provided by higher layer signalling as specified in TS 38.331 [2] and TS 36.331 [16].

**Table 9.1C.2-1: Gap Pattern Configurations**

| Gap Pattern Id | Measurement Gap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) |
|---|---|---|
| 0 | 6 | 40 |
| 1 | 6 | 80 |
| 2 | 3 | 40 |
| 3 | 3 | 80 |
| 4 | 6 | 20 |
| 5 | 6 | 160 |
| 6 | 4 | 20 |
| 7 | 4 | 40 |
| 8 | 4 | 80 |

| Gap Pattern Id | Measurement Gap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) |
|---|---|---|
| 9 | 4 | 160 |
| 10 | 3 | 20 |
| 11 | 3 | 160 |
| 12 | 5.5 | 20 |
| 13 | 5.5 | 40 |
| 14 | 5.5 | 80 |

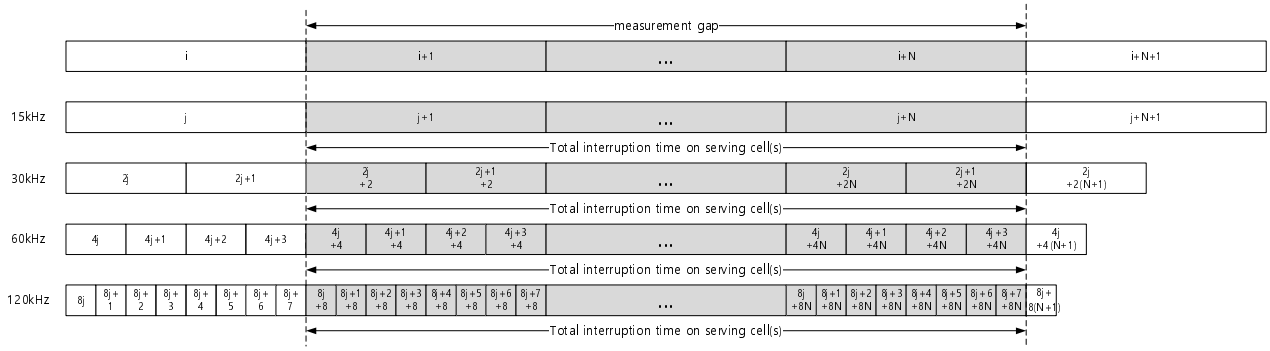
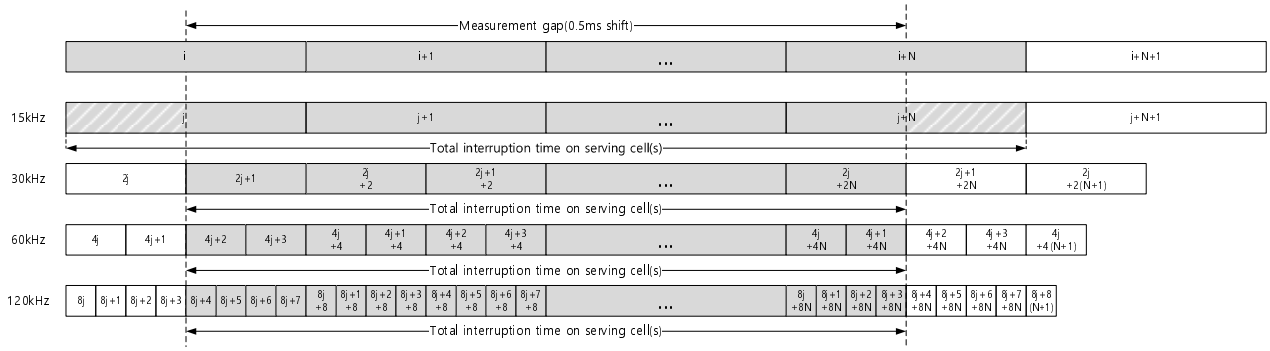
| 25 | 20 | 160 |



(a) Measurement gap with MGL = N(ms) with MG timing advance of 0 ms for NR standalone operation configured with only single carrier



(b) Measurement gap with MGL = N(ms) with MG timing advance of 0.5 ms for NR standalone operation configured with only single carrier

**Figure 9.1C.2-1: Measurement GAP and total interruption time for NR standalone operation confgigured with only single carrier**

In determining the measurement gap starting point, UE shall use the DL timing of the latest NR subframe occurring immediately before the configured measurement gap. If per-UE measurement gap is configured with MG timing advance of $T_{MG}$ ms, the measurement gap starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap. $T_{MG}$ is the MG timing advance value provided in *mgta* according to [2].

**Table 9.1C.2-2: Total number of interrupted slots on PCell in NR standalone operation configured with only single carrier in FR1-NTN**

| NR SCS (kHz) | Total number of interrupted slots on serving cells | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|
| | When MG timing advance of 0 ms is applied | | | | | When MG timing advance of 0.5 ms is applied | | | | |
| | MGL=20 ms | MGL=10 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms | MGL=20 ms | MGL=10 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms |

| 60 | 80 | 40 | 24 | 16 | 12 | 80 | 40 | 24 | 16 | 12 |

NOTE 1: Void
NOTE 2: Non-overlapped half-slots occur before and after the measurement gap. Whether a UE can receive and/or transmit in those half-slots is up to UE implementation.

**Table 9.1C.2-2a: Total number of interrupted slots on PCell in NR standalone operation configured with only single carrier in FR2-NTN**

| NR SCS (kHz) | Total number of interrupted slots on serving cells | | | | | |
|---|---|---|---|---|---|---|
| | When MG timing advance of 0 ms is applied | | | When MG timing advance of 0.25 ms is applied | | |
| | MGL=5.5 ms | MGL=3.5 ms | MGL=1.5 ms | MGL=5.5 ms | MGL=3.5 ms | MGL=1.5 ms |
| 60 | 22 | 14 | 6 | 22 | 14 | 6 |
| 120 | 44 | 28 | 12 | 44 | 28 | 12 |

**Table 9.1C.2-3: Applicability for Gap Pattern Configurations supported by the UE with NR standalone operation (with single carrier, NR CA and NR-DC configuration)**

| Measurement gap pattern configuration | Serving cell | Measurement Purpose NOTE 2 | Applicable Gap Pattern Id |
|---|---|---|---|
| Per-UE measurement | FR1-NTN | FR1-NTN | 0-11, 24, 25 NOTE 1 |
| | FR2-NTN | FR2-NTN | 12-25 NOTE 1 |

NOTE 1: Measurement gap patterns #24 and #25 can be requested [2] only when the UE is configured with UE Rx-Tx measurements requiring such gaps and can only be used during the corresponding positioning measurement period.
NOTE 2: Inclusion of positioning measurements for measurement gaps: Measurement purpose which includes FR1-NTN measurements includes also UE Rx-Tx measurements.

UL slots that are fully or partially overlapping with measurement gap, taking into account TA as defined in clause 7.1C.2, are interrupted.

NOTE: Network is supposed to take into account the possible difference between the estimated TA at network and actual TA at UE when scheduling UE in the above slot(s).

## 9.1C.8 Concurrent measurement gaps for SAN

### 9.1C.8.1 Introduction

When UE supports concurrent measurement gap pattern capability, network can provide multiple measurement gaps configured by RRC message(s) as specified in TS 38.331 [2].

### 9.1C.8.2 Requirements

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells, and the UE supports concurrent measurement gap patterns (*parallelMeasurementGap*), in order for the requirements in the following clauses to apply the network can provide at most two per-UE measurement gap patterns for monitoring of all frequency layers.

For UE configured with the SA operation, when monitoring of multiple intra-frequency and inter-frequency NR carrier frequency layers as configured by PCell using gaps, each monitored carrier frequency layer, including following measurement types:

- a measurement object with SSB based measurement,

can be associated to one or two measurement gap pattern(s) provided the network configures the concurrent measurement gap patterns. In addition, NR PRS-based positioning measurements can be associated to one measurement gap pattern when the network configures the concurrent measurement gap patterns.

When UE supports concurrent measurement gap patterns, each measurement gap pattern supported by the UE is listed in table 9.1C.2-1.

The requirements in clause 9.1C.2 are also applicable for the UE capable of and configured with multiple concurrent measurement gap patterns within each measurement gap pattern.

When UE supports concurrent measurement gap patterns and configured with more than 1 per-UE measurement gap patterns, requirements do not apply if the UE is configured with more than one measurement gap pattern (MGP) with measurement gap repetition period (MGRP) of 20 ms.

### 9.1C.8.3 Collision between concurrent measurement gaps

Collisions between occasions of two concurrent measurement gaps may occur as specified in this clause if the two measurement gaps are

- two per-UE measurement gaps.

When UE is configured with concurrent measurement gaps, two measurement gap occasions are considered colliding if at least one of the following conditions is met:

- the two occasions are fully or partially overlapping in time domain, or
- the distance between the two occasions is equal to or smaller than 4 ms.

The distance between two measurement gap occasions is defined as the time difference between the ending point of the first occasion and the starting point of the second occasion, where the first measurement gap occasion occurs earlier in time than the second measurement gap occasion.

If two colliding measurement gaps are not fully overlapping, in case of collision between two measurement gap occasions, the UE shall perform measurements in the occasion of the measurement gap with higher priority, and the occasion of the measurement gap with lower priority shall be dropped. The UE shall be able to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI in the corresponding NR serving cells in the slots that are not interrupted according to requirements in clause 9.1C.8.4.

If two colliding measurement gaps are fully overlapping with MGRP=160 ms, in case of collision between two measurement gap occasions, the UE shall perform measurements in the occasion of one of the measurement gaps, and it is up to UE implementation which occasion is used for measurement, provided that UE can meet the requirements in clause 9.2C and 9.3C.

If two measurement gaps are fully overlapping with MGRP<160 ms, no measurement requirements apply.

### 9.1C.8.4 Measurement gap related requirements of concurrent measurement gaps

A slot is considered as interrupted if it is interrupted by an occasion of any of the configured concurrent measurement gaps following the measurement gap interruption requirements in clause 9.1C.2, except for a dropped measurement gap occasion.

## 9.1C.9 Collision between SMTC and measurement gap for SAN

### 9.1C.9.1 Introduction

This clause contains definition of collision between SMTCs and measurement gap for SAN.

### 9.1C.9.2 Collision between SMTCs and measurement gap

Collision between occasions of SMTC and measurement gap may occur as specified in this clause.

When UE is configured with one or more than one measurement gap pattern, an SMTC occasion outside measurement gap and a measurement gap occasion are considered colliding if at least one of the following conditions is met:

- the SMTC occasion is fully or partially overlapping in time domain with the measurement gap occasion, or
- the magnitude of the distance between the SMTC occasion and the measurement gap occasion in time domain is less than or equals to 4 ms.

The distance between a SMTC occasion and a measurement gap occasion is defined as:

- the time difference between the ending point of the SMTC occasion and the starting point of the measurement gap occasion, where the SMTC occasion occurs earlier in time than the MG occasion, or
- the time difference between the ending point of the measurement gap occasion and the starting point of the SMTC occasion, where the measurement gap occasion occurs earlier in time than the SMTC occasion.

### 9.1C.9.3 Collision between multiple SMTCs on a SAN carrier

Collision between occasions of multiple SMTCs may occur as specified in this clause.

When UE is configured with more than one SMTC on a SAN carrier, two SMTC occasions outside measurement gap are considered colliding if at least one of the following conditions is met:

- the two SMTC occasions are fully or partially overlapping in time domain, or
- the magnitude of the distance between two SMTC occasions in time domain is less than or equals to 4 ms.

The distance between two SMTC occasions is defined as the time difference between the ending point of the earlier SMTC occasion and the starting point of the later SMTC occasion.

## 9.1D General measurement requirement for ATG

### 9.1D.1 Introduction

This clause contains general requirements on the ATG UE regarding measurement reporting in RRC_CONNECTED state. The requirements are split in intra-frequency, inter-frequency, and L1-RSRP measurements requirements. These measurements may be used by the NG-RAN. The measurement quantities are defined in TS 38.215 [4], the measurement model is defined in TS 38.300 [10], TS 37.340 [17] and measurement accuracies are specified in clause 10. Control of measurement reporting is specified in TS 38.331 [2].

In the requirements of clause 9.1D, the exceptions for side conditions apply as follows:

- for the UE capable of CA but not configured with any SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.1 for UE supporting CA in FR1;
- for the UE capable of CA and configured with one SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.2 for UE configured with CA in FR1;

### 9.1D.2 Measurement gap

If the UE requires measurement gaps to identify and measure intra-frequency cells and/or inter-frequency cells, and the UE does not support independent measurement gap patterns for different frequency ranges as specified in table 5.1-1 in [18, 19, 20], in order for the requirements in the following clauses to apply the network must provide a single per-UE measurement gap pattern for concurrent monitoring of all frequency layers.

During the per-UE measurement gaps an ATG UE, operating under SA (with single carrier or CA configured), is not required to conduct reception/transmission from/to the corresponding NR serving cells except the reception of signals used for RRM measurement(s).

UEs shall support the measurement gap patterns listed in table 9.1D.2-1 based on the applicability specified in table 9.1D.2-3. UE determines measurement gap timing based on gap offset configuration and measurement gap timing advance configuration provided by higher layer signalling as specified in TS 38.331.

**Table 9.1D.2-1: Gap Pattern Configurations**

| Gap Pattern Id | Measurement Gap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) |
|---|---|---|
| 0 | 6 | 40 |
| 1 | 6 | 80 |
| 2 | 3 | 40 |
| 3 | 3 | 80 |
| 4 | 6 | 20 |
| 5 | 6 | 160 |
| 6 | 4 | 20 |
| 7 | 4 | 40 |
| 8 | 4 | 80 |
| 9 | 4 | 160 |
| 10 | 3 | 20 |
| 11 | 3 | 160 |

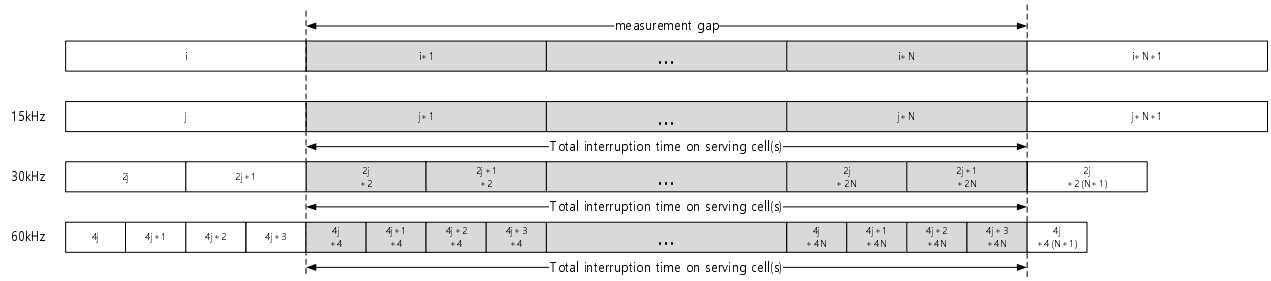
**Table 9.1D.2-2: Void**

**Table 9.1D.2-3: Applicability for Gap Pattern Configurations supported by the UE with NR standalone operation (with single carrier and NR CA configuration)**

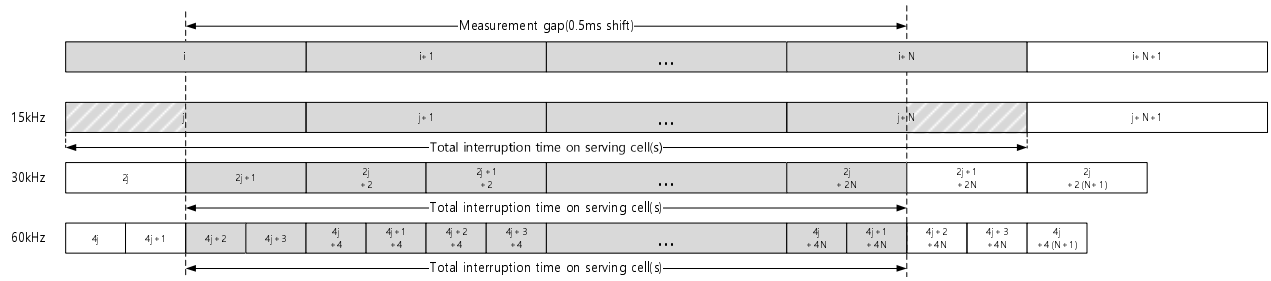
| Measurement gap pattern configuration | Serving cell | Measurement Purpose | Applicable Gap Pattern Id |
|---|---|---|---|
| Per-UE measurement gap | FR1 | FR1 | 0-11 |
| NOTE 1: Void<br>NOTE 2: Void<br>NOTE 3: Void<br>NOTE 4: If per-UE measurement gap is configured with MG timing advance of $T_{MG}$ ms, the measurement gap starts at time $T_{MG}$ ms advanced to the end of the latest subframe occurring immediately before the configured measurement gap among all serving cells subframes. $T_{MG}$ is the MG timing advance value provided in *mgta* according to [2].<br>In determining the measurement gap starting point, UE shall use the DL timing of the latest subframe occurring immediately before the configured measurement gap among serving cells. | | | |

For single carrier or CA with aligned frame boundaries,

For NR standalone operation (with single carrier or NR CA), total interruption time on a serving cell during MGL is defined when MGL(N) = 6 ms, 4 ms, 3 ms.



**(a) Measurement gap with MGL = N(ms) with MG timing advance of 0 ms for all serving cells in synchronous NR standalone operation (with single carrier and NR CA configuration)**



**b) Measurement gap with MGL = N(ms) with MG timing advance of 0.5 ms for all serving cells in synchronous NR standalone operation (with single carrier and NR CA configuration)**

**Figure 9.1D.2-1: Measurement GAP and total interruption time on serving cells for NR standalone operation (with single carrier and NR CA)**

The corresponding total number of interrupted slots on serving cells is listed in table 9.1D.2-4 for all serving cells in synchronous NR standalone (with single carrier and NR CA configuration).

**Table 9.1D.2-4: Total number of interrupted slots on all serving cells during MGL for Synchronous NR standalone operation (with single carrier and NR CA configuration) with per-UE measurement gap**

| NR SCS (kHz) | Total number of interrupted slots on serving cells | | | | | |
|---|---|---|---|---|---|---|
| | When MG timing advance of 0 ms is applied | | | When MG timing advance of 0.5 ms is applied | | |
| | MGL=6 ms | MGL=4 ms | MGL=3 ms | MGL=6 ms | MGL=4 ms | MGL=3 ms |
| 15 | 6 | 4 | 3 | 7[Note3] | 5[Note3] | 4[Note3] |
| 30 | 12 | 8 | 6 | 12 | 8 | 6 |

NOTE 1: For Gap Pattern ID 0, 1, 2 and 3, total number of interrupted subframes on the serving cell is MGL subframes when MG timing advance of 0 ms is applied, and (MGL+1) subframes when MG timing advance of 0.5 ms is applied.
NOTE 2: Void
NOTE 3: Non-overlapped half-slots occur before and after the measurement gap. Whether a Rel-15 UE can receive and/or transmit in those half-slots is up to UE implementation.

It is up to UE implementation whether or not the UE is able to conduct transmission in the following slot(s),

- when MGTA is not applied, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after measurement gap
- when MGTA is applied and the SCS of the UL carrier is other than 15 kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after measurement gap
- when MGTA is applied and the SCS of the UL carrier is 15 kHz, in the L consecutive UL slots with respect to the SCS of the UL carrier with the same slot indices as the DL slots occurring immediately after the slot partially overlapped with measurement gap

where UL slot denotes that all the symbols in the slot are uplink symbols, and L=1 if $(N_{\mathrm{TA}} + N_{\mathrm{TA\ offset}} + N_{TA,\mathrm{adj}}^{UE}) \times T_{\mathrm{c}}$ for the UL transmission is less than the length of one slot; L=2 otherwise.

NOTE: Network is supposed to take into account the possible difference between the estimated TA at network and actual TA at UE when scheduling UE in the above slot(s).

### 9.1D.2.1a SA: Measurement Gap Sharing

Measurement gap sharing shall be applied when UE requires measurement gaps to identify and measure cells on intra-frequency carriers or when SMTC configured for intra-frequency measurement are fully overlapping with per-UE measurement gaps, and when UE requires measurement gaps to identify and measure cells on inter-frequency carriers for both SSB and CSI-RS based L3 measurement, or when all of SMTC configured for inter-frequency SSB based measurement without measurement gaps are fully overlapping with per-UE measurement gaps.

When network signals “01”, “10” or “11” with RRC parameter *MeasGapSharingScheme* [2] and the value of X is defined as in table 9.1D.2.1A-1, and

- $K_{intra} = 1 / X * 100$,
- $K_{inter} = 1 / (100 – X) * 100$,

When network signals “00” indicating equal splitting gap sharing, X is not applied.

The RRC parameter *MeasGapSharingScheme* shall be applied to the calculation of carrier specific scaling factor as specified in clause 9.1D.5.2.2.

**Table 9.1D.2.1A-1: Value of parameter X for NR standalone measurement gap sharing**

| ***measGapSharingScheme*** | **Value of X (%)** |
|---|---|
| ‘00’ | Equal splitting |
| ‘01’ | 25 |
| ‘10’ | 50 |
| ‘11’ | 75 |
| NOTE: It is left to UE implementation to determine which measurement gap sharing scheme in the table to be applied, when *MeasGapSharingScheme* is absent and there is no stored value in the field. | |

## 9.1D.3 UE Measurement capability

### 9.1D.3.1 SA: Monitoring of multiple layers using gaps

When monitoring of multiple inter-frequency NR carriers is configured by PCell, the UE shall be capable of performing one measurement of the configured measurement type (SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, CSI-SINR etc.) of detected cells on all the layers configured for measurements by the PCell.

### 9.1D.3.2 SA: Maximum allowed layers for multiple monitoring

The UE shall be capable of monitoring at least:

- Depending on UE capability, 7 NR SSB inter-frequency carriers configured by PCell, and
- Depending on UE capability, 8 NR inter-frequency carriers including SSB and CSI-RS in total configured by PCell.

The number of SSB frequency layers equals to the total number of MOs with

- *ssb-ConfigMobility* configured, or
- *ssb-ConfigMobility* not configured but *csi-rs-ResourceConfigMobility* configured with *associatedSSB.*

If *ssbfrequency, smtc1, smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

The number of CSI-RS frequency layers equals to the number of MOs with *csi-rs-ResourceConfigMobility* configured assuming single MO is configured per frequency layer.

## 9.1D.4 Void

## 9.1D.5 Carrier-specific scaling factor

This clause specifies the derivation of carrier-specific scaling factor (CSSF) values, which scales the measurement delay requirements given in clause 9.2D, 9.3D, and CSI-RS based L3 measurement in clause 9.10D when UE is configured to monitor multiple measurement objects. The CSSF values are categorized into $CSSF_{outside_gap,i}$ and $CSSF_{within_gap,i}$, for the measurements conducted outside measurement gaps and within measurement gaps, respectively.

### 9.1D.5.1 Monitoring of multiple layers outside gaps

The carrier-specific scaling factor $CSSF_{outside_gap,i}$ for measurement object *i* derived in this chapter is applied to following measurement types:

- SSB-based intra-frequency measurement with no measurement gap in clause 9.2D.5, when none of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- SSB-based intra-frequency measurement with no measurement gap in clause 9.2D.5, when part of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- CSI-RS based intra-frequency measurement in clause 9.10D.2, when none of CSI-RS resources for L3 measurement of this intra-frequency measurement object are overlapped by the measurement gap.
- CSI-RS based intra-frequency measurement in clause 9.10D.2, when all CSI-RS resources for L3 measurement of this intra-frequency measurement object are partially overlapped by the measurement gap.
- SSB-based inter-frequency measurement with no measurement gap in clause 9.3D.9, when none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.
- SSB-based inter-frequency measurement with no measurement gap in clause 9.3D.9, when part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

The UE is expected to conduct the measurement of this measurement object *i* only outside the measurement gaps.

The number of frequency layers for SSB measurements shall include the total number of MOs with

- *ssb-ConfigMobility* configured, or
- *ssb-ConfigMobility* not configured but *csi-rs-ResourceConfigMobility* configured with *associatedSSB.*

If *ssbfrequency*, *smtc1*, *smtc2* and *ssbSubcarrierSpacing* are same in multiple MOs, the multiple MOs are counted as one SSB frequency layer.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, $CSSF_{outside_gap,i}$ and requirements derived from $CSSF_{outside_gap,i}$ are not specified.

#### 9.1D.5.1.1 Void

#### 9.1D.5.1.2 SA mode: carrier-specific scaling factor for SSB-based, CSI-RS based L3 measurements performed outside gaps

The carrier-specific scaling factor $CSSF_{outside_gap,i}$ for intra-frequency SSB-based measurements, inter-frequency SSB-based measurements performed outside measurements gaps, intra-frequency CSI-RS L3 measurement with no measurement gap is specified in table 9.1D.5.1.2-1.

**Table 9.1D.5.1.2-1: $CSSF_{outside_gap,i}$ scaling factor for SA mode**

| Scenario | $CSSF_{outside_gap,i}$ for FR1 PCC | $CSSF_{outside_gap,i}$ for FR1 SCC | $CSSF_{outside_gap,i}$ for inter-frequency MO with no measurement gap |
|---|---|---|---|

| | | | |
|---|---|---|---|
| **FR1 single carrier** | $1+N_{PCC_CSIRS}$ | N/A | Y |
| **FR1 only CA** | $1+N_{PCC_CSIRS}$ | $N_{SCC_SSB}$ +Y +2x $N_{SCC_CSIRS}$ | $N_{SCC_SSB}$ +Y +2x $N_{SCC_CSIRS}$ |

NOTE 1: Y is the number of configured inter-frequency MOs without MG that are being measured outside of MG; otherwise, it is 0.
NOTE 2: $N_{PCC_CSIRS}$=1 if PCC is with either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement configured; otherwise, $N_{PCC_CSIRS}$ =0.
NOTE 3: $CSSF_{outside_gap,i}$ =1 if only one SCell is configured and no inter-frequency MO without gap and only SSB based L3 measurement is configured on SCC; $CSSF_{outside_gap,i}$ =2 if only one SCell is configured and no inter-frequency MO without gap and either both SSB and CSI-RS based L3 configured or only CSI-RS based L3 measurement is configured on SCC.
NOTE 4: $N_{SCC_CSIRS}$=Number of configured SCell(s) with either both SSB and CSI-RS based L3 measurement configured or only CSI-RS based L3 measurement configured
NOTE 5: $N_{SCC_SSB}$=Number of configured SCell(s) with only SSB based L3 measurement configured, which is measured without MG.

### 9.1D.5.2 Monitoring of multiple layers within gaps

The carrier-specific scaling factor $CSSF_{within_gap,i}$ for a measurement object *i* derived in this chapter is applied to following measurement types:

- SSB-based intra-frequency measurement object with no measurement gap in clause 9.2D.5, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- SSB-based intra-frequency measurement object with measurement gap in clause 9.2D.6.
- CSI-RS based inter-frequency measurement in clause 9.10D.3, when CSI-RS resources for L3 measurement of this inter-frequency measurement object are overlapped by the measurement gap.
- CSI-RS based inter-frequency measurement in clause 9.10D.3, when CSI-RS resources for L3 measurement of this inter-frequency measurement object are partially overlapped by the measurement gap.
- SSB-based inter-frequency measurement object with measurement gap in clause 9.3D.4.
- SSB-based inter-frequency measurement object without measurement gap for UE capable of *interFrequencyMeas-NoGap* in clause 9.3D.9, when
  - all of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap, but the flag *interFrequencyConfig-NoGap-r16* is not configured by the Network.

The UE is expected to conduct the measurement of this measurement object *i* only within the measurement gaps.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, $CSSF_{within_gap,i}$ and requirements derived from $CSSF_{outside_gap,i}$ are not specified.

Number of SSB layers shall include SSB for mobility and that as associated SSB for CSI-RS mobility. The ssbfrequency is counted only once if the ssbfrequency for mobility and associated SSB are the same, or ssbfrequency and smtc in multiple MOs are the same.

SSB-based measurement and CSI-RS based measurement for mobility configured in the same measurement object are considered as different layers.

#### 9.1D.5.2.1 Void

#### 9.1D.5.2.2 SA mode: carrier-specific scaling factor for SSB, CSI-RS-based L3 measurements performed within gaps

When one or more measurement objects are monitored within measurement gaps, the carrier specific scaling factor for a target measurement object with index *i* is designated as $CSSF_{within_gap,i}$ and is derived as described in this clause.

For each measurement gap *j*, count the total number of intra-frequency measurement objects and inter-frequency measurement objects on all frequency layers which are candidates to be measured within the gap *j*.

- An NR measurement object with SSB measurement configured is a candidate to be measured in a gap if its SMTC duration is fully covered by the MGL excluding RF switching time. For intra-frequency NR measurement objects, if the higher layer in TS 38.331 [2] signaling of *smtc2* is configured, the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc2*; otherwise the assumed periodicity of SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

- An NR measurement object with CSI-RS measurement configured is a candidate to be measured in a gap if the window confining all CSI-RS resources is fully covered by the MGL excluding RF switching time.

- For UEs which are configured with per UE gaps the counting is done on a per UE basis.

- $M_{intra,i,j}$: Number of intra-frequency measurement objects, including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{intra,i,j}$ equals 0.

- $M_{inter,i,j}$ : Number of NR inter-frequency layers including both SSB and CSI-RS based, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{inter,i,j}$ equals 0.

- $M_{tot,i,j} = M_{intra,i,j} + M_{inter,i,j}$ : Total number of intra-frequency layers, inter-frequency, which are candidates to be measured in gap *j* where the measurement object *i* is also a candidate. Otherwise $M_{tot,i,j}$ equals 0.

The carrier specific scaling factor $CSSF_{within_gap,i}$ is given by:

If *measGapSharingScheme* is equal sharing, $CSSF_{within_gap,i} = \max(\text{ceil}(R_i \times M_{tot,i,j}))$, where $j=0\ldots(160/MGRP)-1$

If *measGapSharingScheme* is not equal sharing and

- measurement object *i* is an intra-frequency measurement object, $CSSF_{within_gap,i}$ is the maximum among
  - $\text{ceil}(R_i \times K_{intra} \times M_{intra,i,j})$ in gaps where $M_{inter,i,j} \neq 0$, where $j=0\ldots(160/MGRP)-1$
  - $\text{ceil}(R_i \times M_{intra,i,j})$ in gaps where $M_{inter,i,j}=0$, where $j=0\ldots(160/MGRP)-1$
- measurement object *i* is an inter-frequency measurement object on any one frequency layer, $CSSF_{within_gap,i}$ is the maximum among
  - $\text{ceil}(R_i \times K_{inter} \times M_{inter,i,j})$ in gaps where $M_{intra,i,j} \neq 0$, where $j=0\ldots(160/MGRP)-1$
  - $\text{ceil}(R_i \times M_{inter,i,j})$ in gaps where $M_{intra,i,j}=0$, where $j=0\ldots(160/MGRP)-1$

Where $R_i$ is the maximal ratio of the number of measurement gap where measurement object *i* is a candidate to be measured over the number of measurement gap where measurement object *i* is a candidate to be measured.

## 9.1D.6 Void

## 9.1D.7 Pre-configured measurement gap

### 9.1D.7.1 Introduction

A UE capable of Pre-configured measurement gap (Pre-MG) pattern can be configured with a Pre-MG pattern via RRC signalling [2].

The gap interruption requirements in clause 9.1D.2 apply to Pre-MG when Pre-MG is activated, and no gap interruption is expected when Pre-MG is deactivated.

- The requirements apply for NR standalone operation with single carrier and NR CA.

### 9.1D.7.2 Requirements applicability

The requirements related to pre-configured measurement gap apply provided:

- UE indicates support of *preconfiguredUE-AutonomousMeasGap* [2] and/or *preconfiguredNW-ControlledMeasGap* [2], and
- a single per-UE measurement gap is pre-configured by the network, and
- one of measurement gap patterns among measurement gap patterns #0 ~ #11 is configured for pre-configured measurement gap, and
- UE is in NR SA with single carrier or with NR CA.

A measurement gap is configured as pre-configured measurement gap if *preConfigInd* is indicated by network in the configuration message of the measurement gap.

If UE indicates support of only *preconfiguredNW-ControlledMeasGap* [2], UE can expect the network to configure *preConfGapStatus*.

If a measurement gap is configured as pre-configured measurement gap, the applicability of measurement gap patterns is defined in table 9.1D.2-3.

If the Pre-MG status changes during a measurement period of a measurement that can be performed without and within measurement gaps, the UE is allowed to restart the measurement.

If the Pre-MG status changes from activated to deactivated during a measurement period of a measurement that can only be performed within measurement gaps, the measurement requirements do not apply.

### 9.1D.7.3 Requirements

Any of the measurement Gap pattern defined in table 9.1D.2-1 can be configured as Pre-MG pattern.

The UE can determine the Pre-MG status based on autonomous activation/deactivation mechanism or based on network-controlled activation/deactivation mechanism.

A UE capable of both autonomous and network-controlled mechanisms for activation/deactivation of Pre-MG pattern will not use autonomous rules to determine the activation/deactivation status of the pre-configured MG if the network provides the activation/deactivation status via RRC indication *preConfGapStatus* for all the DL BWPs of all the activated CCs, and for all the deactivated SCCs.

#### 9.1D.7.3.1 Requirements for autonomous activation/deactivation mechanism

Requirements in this clause apply when autonomous mechanism [2] is used for activation/deactivation of Pre-MG pattern.

The UE can autonomously change the Pre-MG status from activation to deactivation or vice versa based on any of the following triggering conditions listed below. The UE shall also autonomously determine the Pre-MG status based on all the concurrent triggering conditions occurring jointly:

- DCI, timer or RRC based active BWP switching,
- Activation/deactivation of SCell(s),
- Addition/removal of any measurement object(s),
- Addition/release/change of a SCell in carrier aggregation

The UE shall autonomously determine the status of the per-UE Pre-MG pattern as deactivated immediately after the configuration of the per-UE Pre-MG pattern or when any of the triggering conditions above is satisfied provided that all the configured measurements can be performed without measurement gaps.

A measurement can be performed by the UE without measurement gaps if any of the following conditions is met:

- The UE is configured with SSB based intra-frequency measurements, and the conditions defined for SSB based intra-frequency measurement without gaps in clause 9.2D.1 are met, or
- The UE is configured with SSB based inter-frequency measurements, and the conditions defined for SSB based inter-frequency measurement without gaps in clause 9.3D.1 are met, or

- The UE is configured with CSI-RS based intra-frequency measurements.

The UE shall autonomously determine the status of the per-UE Pre-MG pattern as activated immediately after the configuration of the per-UE Pre-MG pattern or when any of the triggering conditions above is satisfied provided that at least one of the configured measurements cannot be performed without measurement gaps.

A measurement cannot be performed by the UE without measurement gaps if any of the following conditions is met:

- The UE is configured with SSB based intra-frequency measurements, and the conditions defined for SSB based intra-frequency measurement without gaps in clause 9.2D.1 are not met, or
- The UE is configured with SSB based inter-frequency measurements, and the conditions defined for SSB based inter-frequency measurement without gaps in clause 9.3D.1 are not met, or
- The UE is configured with CSI-RS based inter-frequency measurements.

#### 9.1D.7.3.2 Requirements for network-controlled activation/deactivation mechanism

The requirements in this clause apply when network-controlled mechanism [2] is used for activation/deactivation of Pre-MG pattern.

For per-UE Pre-configured MG,

- the UE determines that the Pre-configured MG is activated if *preConfGapStatus* is set to '1' for the corresponding gap ID for the active DL BWP of any of the activated CCs, or if *preConfGapStatus* is set to '1' for the corresponding gap ID for any of the deactivated SCCs,
- otherwise, the UE determines that the Pre-configured MG is deactivated

#### 9.1D.7.3.3 Requirements for reception/transmission during activation/deactivation

The requirements in this clause apply when autonomous mechanism or network-controlled mechanism is used for activation/deactivation [2] of Pre-MG pattern.

If per-UE Pre-MG pattern is activated then the UE is not required to conduct reception/transmission from/to the corresponding serving cells during the gap occasion according to the same principles as described for per-UE measurement gaps in clause 9.1D.2. Otherwise, the UE can be scheduled for reception/transmission of signals in all the serving cells during the gap occasion.

## 9.1D.8 Capabilities for Support of Event Triggering and Reporting Criteria

### 9.1D.8.1 Introduction

This clause contains requirements on UE capabilities for support of event triggering and reporting criteria. As long as the measurement configuration does not exceed the requirements stated in clause 9.1D.8.2, the UE shall meet all other performance requirements defined in clause 9 and clause 10.

The UE can be requested to make measurements under different measurement identities defined in TS 38.331 [2]. Each measurement identity corresponds to either event-based reporting, periodic reporting, or no reporting. In case of event-based reporting, each measurement identity is associated with an event triggering criterion. In case of periodic reporting, a measurement identity is associated with one periodic reporting criterion. In case of no reporting, a measurement identity is associated with one no reporting criterion.

The purpose of this clause is to set some limits on the number of different event triggering, periodic, and no reporting criteria the UE may be requested to track in parallel.

### 9.1D.8.2 Requirements

In this clause a reporting criterion corresponds to either one event (in the case of event-based reporting), or one periodic reporting criterion (in case of periodic reporting), or one no reporting criterion (in case of no reporting). For event-based reporting, each instance of event, with the same or different event identities, is counted as separate reporting criterion in table 9.1D.8.2-1.

The UE shall be able to support in parallel per category up to $E_{cat}$ reporting criteria according to table 9.1D.8.2-1. For the measurement categories belonging to intra-frequency, inter-frequency, the UE need not support more than the total number of reporting criteria as follows:

- For UE configured with SA operation mode: $E_{cat,SA,NR}$, where

  $E_{cat,SA,NR} = 10 + 9 \times n$ is the total number of NR reporting criteria according to table 9.1D.8.2-1, and n is the number of configured NR serving frequencies, including PCell and SCell carrier frequencies.

**Table 9.1D.8.2-1: Requirements for reporting criteria per measurement category**

| Measurement category | $E_{cat}$ | Note |
|---|---|---|
| Intra-frequency Note 1,2 | 9 | Events for any one or a combination of intra-frequency SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, and CSI-SINR for NG-RAN intra-frequency cells |
| Inter-frequency Note 2 | 10 | Events for any one or a combination of inter-frequency SS-RSRP, SS-RSRQ, SS-SINR, CSI-RSRP, CSI-RSRQ, and CSI-SINR for NG-RAN inter-frequency cells |
| NOTE 1: When the UE is configured with SCell carrier frequencies, Ecat for Intra-frequency is applied per corresponding NR serving frequency.<br>NOTE 2: Applicable for UE configured with SA NR operation mode. | | |

## 9.1D.9 Minimum requirement at transitions

When the measurement on one intra-frequency measurement object transitions from measurements performed outside gaps to measurements performed within gaps or vice versa during one measurement period, the cell identification and measurement period requirements with the longer delay apply.

The carrier-specific scaling factor specified in clause 9.1D.5 that applies to the other impacted measurement objects will also apply based on the longer measurement or cell identification delay before or after the transition.

When the UE transitions between DRX and non-DRX or when DRX cycle periodicity changes, the cell identification and measurement period requirements apply based on the longer delay before or after the transition.

Subsequent to this measurement period, the cell identification and measurement period requirements on each measurement object are corresponding to the second mode after transition.

# 9.1E General measurement requirement for RedCap with satellite access

## 9.1E.1 Introduction

This clause contains general requirements on the RedCap UE regarding measurement reporting in RRC_CONNECTED state. The requirements are split in intra-frequency, inter-frequency and L1-RSRP measurements requirements. These measurements may be used by the NG-RAN. The measurement quantities are defined in TS 38.215 [4], the measurement model is defined in TS 38.300 [10], TS 37.340 [17] and measurement accuracies are specified in clause 10. Control of measurement reporting is specified in TS 38.331 [2].

## 9.1E.2 Measurement gap

The requirements in clause 9.1C.2 shall apply.

## 9.1E.8 Concurrent measurement gaps for RedCap with SAN

### 9.1E.8.1 Introduction

When UE supports concurrent measurement gap pattern capability, network can provide multiple measurement gaps configured by RRC message(s) as specified in TS 38.331 [2].

### 9.1E.8.2 Requirements

The requirements in clause 9.1C.8.2 shall apply.

### 9.1E.8.3 Collision between concurrent measurement gaps

The requirements in clause 9.1C.8.3 shall apply except that

- If UE supports *parallelMeasurementWithoutRestriction-r17,*
  - If UE is configured to measure 1 satellite in each of the SMTC occasions, the distance between the two occasions is equal to or smaller than 4 ms.
  - Otherwise, the distance between the two occasions is equal to or smaller than 5 ms.
- If UE doesn't support *parallelMeasurementWithoutRestriction-r17,*
  - The distance between the two occasions is equal to or smaller than 5 ms.

### 9.1E.8.4 Measurement gap related requirements of concurrent measurement gaps

The requirements in clause 9.1C.8.4 shall apply.

## 9.1E.9 Collision between SMTC and measurement gap for RedCap with satellite access

### 9.1E.9.1 Introduction

This clause contains definition of collision between SMTCs and measurement gap for SAN.

### 9.1E.9.2 Collision between SMTCs and measurement gap

The requirements in clause 9.1C.9.2 shall apply except that

- If UE supports *parallelMeasurementWithoutRestriction-r17,*
  - If UE is configured to measure 1 satellite in each of the SMTC occasions, the magnitude of the distance between the SMTC occasion and the measurement gap occasion in time domain is less than or equals to 4 ms.
  - Otherwise, the magnitude of the distance between the SMTC occasion and the measurement gap occasion in time domain is less than or equals to 5 ms.
- If UE doesn't support *parallelMeasurementWithoutRestriction-r17,*
  - The magnitude of the distance between the SMTC occasion and the measurement gap occasion in time domain is less than or equals to 5 ms.

### 9.1E.9.3 Collision between multiple SMTCs on a SAN carrier

The requirements in clause 9.1C.9.2 shall apply except that

- If UE supports *parallelMeasurementWithoutRestriction-r17,*

- If UE is configured to measure 1 satellite in each of the SMTC occasions, the magnitude of the distance between two SMTC occasions in time domain is less than or equals to 4 ms.
- Otherwise, the magnitude of the distance between two SMTC occasions in time domain is less than or equals to 5 ms.

- If UE doesn't support *parallelMeasurementWithoutRestriction-r17,*
  - The magnitude of the distance between two SMTC occasions in time domain is less than or equals to 5 ms.

# 9.2 NR intra-frequency measurements

## 9.2.1 Introduction

A measurement is defined as a SSB based intra-frequency measurement provided the SSB frequency configured in the measurement object associated with the serving cell indicated for measurement and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same.

If the UE supports *ncd-SSB-BWP-Wor-r18*, a measurement is defined as a SSB based intra-frequency measurement provided the centre frequency of the reference SSB of the serving cell and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same. The reference SSB is the SSB defined in BWP-specific *servingCellMO* under *BWP-DownlinkDedicated* of active DL BWP. If the field is absent, the reference SSB is the SSB defined in *servingCellMO* under *ServingCellConfig* [2].

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell or the PSCell, even if no explicit neighbour list with physical layer cell identities is provided.

For UE supporting *ssb-BurstPeriodicityAdaptation-r19*, SMTC is associated with SSB adaptation for RRM measurement on SCell.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- CD-SSB is within the configured UE-specific CBW provided UE supports *bwpOperationMeasWithoutInterrupt-r18*, or
- NCD-SSB is completely contained in the active downlink BWP of the UE provided the UE supports *ncd-SSB-BWP-Wor-r18* and *servingCellMO* is present in the corresponding *BWP-DownlinkDedicated*, or
- the UE indicates 'no-gap' via *intraFreq-needForGap* for intra-frequency measurement, or
- the SSB is completely contained in the active BWP of the UE, or
- the active downlink BWP is initial BWP [3].

Besides the conditions listed above,

For UE supporting *nr-NeedForGapNCSG-reporting-r17* and indicating *NeedForGapNCSG-InfoNR* for intra-frequency measurement,

- An intra-frequency SSB measurement is defined as measurement without gap if
  - the UE indicates 'nogap-noncsg' via *NeedForGapNCSG-InfoNR* for the intra-frequency measurement, and
  - the SSB is not completely contained in the active BWP of the UE, and
  - the active downlink BWP is not an initial BWP [3].
- An intra-frequency SSB measurement is defined as measurement with NCSG if
  - the UE indicates 'ncsg' via *NeedForGapNCSG-InfoNR* for the intra-frequency measurement, and
  - the SSB is not completely contained in the active BWP of the UE, and
  - the active downlink BWP is not an initial BWP [3]

- An intra-frequency SSB measurement is defined as measurement with gap if
  - the UE indicates 'gap' via *NeedForGapNCSG-InfoNR* for the intra-frequency measurement, and
  - the SSB is not completely contained in the active BWP of the UE, and
  - the active downlink BWP is not an initial BWP [3]

The UE can perform intra-frequency SSB based measurement corresponding to a deactivated SCell or dormant SCell with NCSG.

For intra-frequency SSB based measurements with NCSG, UE may cause scheduling restriction as specified in clause 9.2.7.3.

For UE supporting *nr-NeedForInterruptionReport-r18* and indicating *NeedForInterruptionInfoNR-r18* for intra-frequency measurement,

- an intra-frequency SSB measurement is defined as measurement without gap if
  - the UE indicates 'no-gap' via *intraFreq-needForGap* and the UE indicates '*no-gap-no-interruption*' or '*no-gap-with-interruption*' via *NeedForInterruptionInfoNR-r18* for the intra-frequency measurement, and- the SSB is not completely contained in the active BWP of the UE

- an intra-frequency SSB measurement is defined as measurement with gap if
  - the UE indicates 'gap' via *intraFreq-needForGap* for intra-frequency measurement.

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.2.5.3. SSB based measurements are configured along with one or two measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements are to be performed. For intra-frequency connected mode measurements, up to two measurement window periodicities may be configured. A single measurement window offset and measurement duration are configured per intra-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB and measure RSSI of RSRQ which start earlier than the gap starting time + switching time, nor detect SSB and measure RSSI of RSRQ which end later than the gap end – switching time. Switching time is 0.5 ms for frequency range FR1 and 0.25 ms for frequency range FR2.

The requirements in this clause shall also apply, when the UE is configured to perform SRS carrier based switching and using measurement gaps.

The measurement requirements defined for an activated SCell with a non-dormant active BWP defined in this clause shall also apply to an activated SCell with dormant BWP as active BWP.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

The measurement requirements defined in clause 9.2 do not apply if the UE is configured with *needForGapNCSG-ConfigNR-r17* and *needForInterruptionConfigNR-r18* at the same time.

*Editor Note: FFS the scenario when deactivated SCell measurement object is fully overlapping with measurement gap*

The intra-frequency measurement requirements in clause 9.2.5 applies for the following scenarios:

- SSB based intra-frequency measurements with no measurement gap,
  - for a UE supporting concurrent gaps and when concurrent gaps are configured:
    - When none of the SMTC occasions of this intra-frequency measurement object are overlapped by the union of concurrent measurement gaps.
    - When part of the SMTC occasions of this intra-frequency measurement object are overlapped by the union of concurrent measurement gaps.

- for a UE supporting MUSIM gaps or both concurrent measurement gaps and MUSIM gaps, and when periodic MUSIM gaps or both concurrent and periodic MUSIM gaps are configured:
  - When none of the SMTC occasions of this intra-frequency measurement object are overlapped by MUSIM gaps or the union of concurrent measurement gaps or the union of MUSIM gaps and concurrent measurement gaps.
  - When part of the SMTC occasions of this intra-frequency measurement object are overlapped by MUSIM gaps or the union of concurrent measurement gaps or the union of MUSIM gaps and concurrent measurement gaps.
- for a UE supporting MUSIM gaps and not supporting concurrent gaps or if concurrent gaps are not configured, and when periodic MUSIM gaps are configured:
  - When none of the SMTC occasions of this intra-frequency measurement object are overlapped by MUSIM gaps or the measurement gap or the union of MUSIM gaps and measurement gap.
  - When part of the SMTC occasions of this intra-frequency measurement object are overlapped by MUSIM gaps or the measurement gap or the union of MUSIM gaps and measurement gap.
- otherwise, for a UE not supporting concurrent gaps or if concurrent gaps are not configured:
  - When none of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
  - When part of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
- SSB based intra-frequency measurements object with no measurement gap for UE capable of *nr-NeedForInterruptionReport-r18*,
  - When UE indicates 'no-gap' via *intraFreq-needForGap* for intra-frequency measurement and indicates '*no-gap-with-interruption'* or '*no-gap-no-interruption'* via *NeedForInterruptionInfoNR-r18* for the intra-frequency measurement intra-frequency, and SMTC is fully non overlapping with GAP,
  - When UE indicates 'no-gap' via *intraFreq-needForGap* for intra-frequency measurement and indicates '*no-gap-no-interruption'* via *NeedForInterruptionInfoNR-r18* for the intra-frequency measurement, and SMTC is partially overlapping with GAP,
  - the UE is not allowed to cause interruption during intra-frequency measurement without gap when UE indicate '*no-gap-no-interruption'* via *NeedForInterruptionInfoNR-r18*
  - the UE is not allowed to cause interruption if the SSB is completely contained in the active BWP of the UE
  - the UE is allowed to cause interruption during intra-frequency measurement without gap when UE indicate '*no-gap-with-interruption'* via *NeedForInterruptionInfoNR-r18*, the interruption requirement is defined in clause 8.2.2.2.19.

The intra-frequency measurement requirements in clause 9.2.6 applies for the following scenarios:

- SSB based intra-frequency measurements with measurement gap,
- SSB based intra-frequency measurements with no measurement gap with the following condition,
  - for a UE supporting concurrent gaps and when concurrent gaps are configured:
    - when all of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated measurement gap in the concurrent measurement gaps, or
    - when part of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated measurement gap and all the SMTC occasions of this intra-frequency measurement object are overlapped with the union of concurrent measurement gaps.
  - for a UE supporting concurrent measurement gaps and when both concurrent and periodic MUSIM gaps are configured

  - when part of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated measurement gap in concurrent measurement gaps and all the SMTC occasions of this intra-frequency measurement object are overlapped with the union of concurrent measurement gaps and MUSIM gaps. No requirement applies if no concurrent measurement gap is assocated with that SSB based intra-frequency measurements.

- otherwise, for a UE not supporting concurrent gaps or if concurrent gaps are not configured:

  - when all of the SMTC occasions of this intra-frequency measurement object are overlapped with the measurement gap.

  - when part of the SMTC occasions of this intra-frequency measurement object are overlapped with the measurement gap and all the SMTC occasions of this intra-frequency measurement object are overlapped with the union of the measurement gap and MUSIM gaps if MUSIM gaps are configured.

- SSB-based intra-frequency measurement object with NCSG, and measurement gap is configured.

- SSB based intra-frequency measurements object with no measurement gap for UE capable of *nr-NeedForInterruptionReport-r18*,

  - When UE indicates ‘no-gap’ via *intraFreq-needForGap* for intra-frequency measurement and indicates ‘*no-gap-with-interruption’* via *NeedForInterruptionInfoNR-r18* for the intra-frequency measurement, and SMTC is partially overlapping with GAP

  - When UE indicates ‘no-gap’ via *intraFreq-needForGap* for intra-frequency measurement and indicates ‘*no-gap-no-interruption’* or ‘*no-gap-with-interruption’* via *NeedForInterruptionInfoNR-r18* for the intra-frequency measurement, and SMTC is fully overlapping with GAP

The intra-frequency measurement requirements in clause 9.2.7 applies for the following scenarios:

- SSB based intra-frequency measurements without measurement gaps corresponding to an activated serving cell, when all of the SMTC occasions of this intra-frequency measurement object are overlapped by the NCSG;

- SSB-based intra-frequency measurement object corresponding to an activated serving cell (in non-dormancy) when UE supports *nr-NeedForGapNCSG-reporting-r17* and indicates ‘ncsg’ in *NeedForGapNCSG-InfoNR* for intra-frequency measurement and all or part of the SMTC occasions of this intra-frequency measurement object are overlapped by the NCSG;

- SSB-based intra-frequency measurement object corresponding to a deactivated serving cell or to an activated serving cell in dormancy when all or part of the SMTC occasions of this intra-frequency measurement object are overlapped by the NCSG.

## 9.2.2 Requirements applicability

The requirements in clause 9.2 apply, provided:

- The cell being identified or measured is detectable.

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.2 and 10.1.3 for FR1 and FR2, respectively, for a corresponding band,

- SS-RSRQ related side conditions given in clauses 10.1.7 and 10.1.8 for FR1 and FR2, respectively, for a corresponding band,

- SS-SINR related side conditions given in clauses 10.1.12 and 10.1.13 for FR1 and FR2, respectively, for a corresponding band,

- SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding band.

## 9.2.3 Number of cells and number of SSB

### 9.2.3.1 Requirements for FR1

For each intra-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 8 identified cells, and
- 14 SSBs with different SSB index and/or PCI on the intra-frequency layer, where the number of SSBs in the serving cell (except for the SCell) is not smaller than the number of configured RLM-RS SSB resources.

### 9.2.3.2 Requirements for FR2

For UE supporting *multiCarrierSingleReportWithoutGap-r19*, if UE receives network indication via *cssf-Config* to enable one serving carrier measurement for an FR2 band,

For one single intra-frequency layer in a band, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 6 identified cells, and
- 24 SSBs with different SSB index and/or PCI,

where this single intra-frequency layer shall be:

- PCC, when UE is configured with SA NR or NE-DC operation mode with PCC in the band; or
- PSCC, when UE is configured with EN-DC with PSCC in the band; or
- PSCC, when UE is configured with NR-DC with PSCC in the band; or
- an SCC, if such SCC is the only one SCC on which UE is configured to report SSB based measurements when neither PCC nor PSCC is in the same band; or
- an SCC, indicated by network via *cssf-Config*, if such SCC is one of the SCCs on which UE is configured to report SSB based measurements when neither PCC nor PSCC is in the same band;
- otherwise
    - One of the SCCs on which UE is configured to report SSB based measurements when neither PCC nor PSCC is in the same band, so that the selected SCC shall be an SCC where the UE is configured with SS-RSRP measurement reporting if such SCC exists, otherwise one SCC determined by UE implementation.

UE is not required to perform SS-RSRP, SS-RSRQ, and SS-SINR measurements on both serving and neighbour cell for each of the other intra-frequency layer(s) in the same band.

For UE not supporting *multiCarrierSingleReportWithoutGap-r19*, or UE supporting *multiCarrierSingleReportWithoutGap-r19* but does not receive network indication via *cssf-Config* to enable one serving carrier measurement for each FR2 band,

For one single intra-frequency layer in a band, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 6 identified cells, and
- 24 SSBs with different SSB index and/or PCI,

where this single intra-frequency layer shall be:

- PCC when UE is configured with SA NR operation mode with PCC in the band; or
- PSCC when UE is configured with EN-DC with PSCC in the band; or

- PSCC when UE is configured with NR-DC with PSCC in the band; or
- One of the SCCs on which UE is configured to report SSB based measurements when neither PCC nor PSCC is in the same band, so that the selected SCC shall be an SCC where the UE is configured with SS-RSRP measurement reporting if such SCC exists, otherwise the selected SCC is determined by UE implementation.

The UE shall also be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least 2 SSBs on serving cell for each of the other intra-frequency layer(s) in the same band.

## 9.2.4 Measurement Reporting Requirements

### 9.2.4.1 Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.3.1 (RSRP for FR2), 10.1.7.1 (RSRQ for FR1), 10.1.8.1 (RSRQ for FR2), 10.1.12.1 (RS-SINR for FR1) and 10.1.13.1 (RS-SINR for FR2).

### 9.2.4.2 Event-triggered Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.3.1 (RSRP for FR2), 10.1.7.1 (RSRQ for FR1), 10.1.8.1 (RSRQ for FR2), 10.1.12.1 (RS-SINR for FR1) and 10.1.13.1 (RS-SINR for FR2).

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.2.4.3.

### 9.2.4.3 Event Triggered Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.3.1 (RSRP for FR2), 10.1.7.1 (RSRQ for FR1), 10.1.8.1 (RSRQ for FR2), 10.1.12.1 (RS-SINR for FR1) and 10.1.13.1 (RS-SINR for FR2).

The UE shall not send any event triggered measurement reports as long as no reporting criteria is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify_intra_with_index}$ or $T_{identify_intra_without_index}$ defined in clause 9.2.5.1 or clause 9.2.6.2. When L3 filtering is used an additional delay can be expected. In EN-DC and NE-DC operation, when the UE is configured to perform E-UTRA SRS carrier-based switching an additional delay can be expected in FR1 if the UE is capable of per-FR gap, or an additional delay can be expected in both FR1 and FR2 if the UE is not capable of per-FR gap.

A cell is detectable only if at least one SSBs measured from the cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ as defined in clause 9.2.5.1 or clause 9.2.6.2. If a cell which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ defined in clause 9.2.5.1 or clause 9.2.6.2 becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected. In EN-DC and NE-DC operation, when the UE is configured to perform E-UTRA SRS carrier-based switching an additional delay can be expected in FR1 if the UE is capable of per-FR gap, or an additional delay can be expected in both FR1 and FR2 if the UE is not capable of per-FR gap.

### 9.2.4.4 SCell activation Triggered Reporting

The requirements in this clause shall apply for the UE supporting *l3-MeasUnknownSCellActivation-r18* and reporting valid L3 measurement results after receiving the SCell activation command for unknown SCell.

Reported RSRP, RSRQ, and RS-SINR measurements contained in SCell activation triggered measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.3.1 (RSRP for FR2), 10.1.7.1 (RSRQ for FR1), 10.1.8.1 (RSRQ for FR2), 10.1.12.1 (RS-SINR for FR1) and 10.1.13.1 (RS-SINR for FR2).

The measurement reporting delay is defined as the time between the SCell activation command that will trigger a measurement report and the point when the UE starts to transmit the valid measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The SCell activation triggered measurement reporting delay shall be no larger than $T_{HARQ}$ + 3 ms + 4 ms, where

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement in ms as specified in TS 38.213 [3],
- 3 ms is the MAC CE decoding time.
- 4 ms is the processing time for preparing L3 report triggered by MAC CE.
- UE is expected to report the L3 results no earlier than 3 ms + $T_{HARQ}$ after receiving the SCell activation command.

The SCell activation triggered report is considered as valid if it fulfils the measurement requirements for a deactivated SCell as specified in table 9.2.5.2-3 (for FR1) and table 9.2.5.2-4 (for FR2).

A cell is detectable only if at least one SSBs measured from the SCell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ as defined in clause 9.2.5.1. If a SCell which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ defined in clause 9.2.5.1 becomes undetectable for a period $\leq 5$ seconds and then the SCell becomes detectable again with the same spatial reception parameter, this cell is considered as detected provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3].

## 9.2.5 Intrafrequency measurements without measurement gaps

### 9.2.5.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index(*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise the UE shall be able to identify a new detectable intra frequency cell within $T_{identify_intra_with_index}$. The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index}$. It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2 with SCS smaller or equal to 480 kHz.

$$T_{identify_intra_without_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} + T_{SSB_processing})\ ms$$

$$T_{identify_intra_with_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra})\ ms$$

Where:

$T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection

- For UE supporting power class 6 with *highSpeedMeasFlagFR2-r17* configured, if SMTC ≤ 40ms, $T_{PSS/SSS_sync_intra}$ is given in table 9.2.5.1-11; otherwise, $T_{PSS/SSS_sync_intra}$ is given in table 9.2.5.1-2.
- For UE indicating *no-gap-no-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{PSS/SSS_sync_intra}$ is given in table 9.2.5.1-1 for FR1 and table 9.2.5.1-2 for FR2. For UE indicating *no-gap-with-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{PSS/SSS_sync_intra}$ is given in table 9.2.5.1-17 for FR1 and table 9.2.5.1-18 for FR2.
- Otherwise, $T_{PSS/SSS_sync_intra}$ is given in tables 9.2.5.1-1, 9.2.5.1-2, 9.2.5.1-4 (CC with deactivated SCell) or 9.2.5.1-5 (CC with deactivated SCell) or 9.2.5.1-9 (CC with deactivated SCell) or 9.2.5.1-11 or 9.2.5.1-12 (CC with deactivated PSCell) or 9.2.5.1-13 (CC with deactivated PSCell).

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured

- For UE indicating *no-gap-no-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{SSB_time_index_intra}$ is given in table 9.2.5.1-3 for FR1 and table 9.2.5.1-15 for FR2-2. For UE indicating *no-gap-with-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{SSB_time_index_intra}$ is given in table 9.2.5.1-19 for FR1.
- For UE indicating *support3MHz-ChannelBW-Symmetric-r18* and configured to perform measurements on a target cell or a deactivated SCell or a deactivated PSCell with 12PRB SSB in FR1, $T_{SSB_time_index_intra_less_than_5MHz}$ is given in table 9.2.5.1-23 (target cell), table 9.2.5.1-24 (deactivated SCell), table 9.2.5.1-24a (deactivated SCell with *highSpeedMeasCA-Scell-r17*) or in table 9.2.5.1-25 (deactivated PSCell).
- Otherwise, $T_{SSB_time_index_intra}$ is given in tables 9.2.5.1-3, 9.2.5.1-15 (FR2-2), 9.2.5.1-6 (CC with deactivated SCell), 9.2.5.1-10 (CC with deactivated SCell) or 9.2.5.1-14 (CC with deactivated PSCell).

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement

- For UE supporting power class 6 with *highSpeedMeasFlagFR2-r17* configured, if SMTC ≤ 40ms, $T_{SSB_measurement_period_intra}$ is given in table 9.2.5.2-7; otherwise, $T_{SSB_measurement_period_intra}$ is given in table 9.2.5.2-2.
- For UE indicating *no-gap-no-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{SSB_measurement_period_intra}$ is given in table 9.2.5.2-1 for FR1 and table 9.2.5.2-2 for FR2. For UE indicating *no-gap-with-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{SSB_measurement_period_intra}$ is given in table 9.2.5.2-10 for FR1 and table table 9.2.5.2-11 for FR2.
- For power class 6 UE supporting *measEnhCAInterFreqFR2-r18* when *highSpeedMeasFlagFR2* is configured, the $T_{SSB_measurement_period_intra}$ given in table 9.2.5.2-7 (if SMTC ≤ 40ms) and table 9.2.5.2-2 (if SMTC > 40ms) shall apply for SCC.
- Otherwise, $T_{SSB_measurement_period_intra}$ is given in table 9.2.5.2-1, table 9.2.5.2-2, table 9.2.5.2-3 (CC with deactivated SCell), 9.2.5.2-4 (CC with deactivated SCell), 9.2.5.2-5 or 9.2.5.2-6 (CC with deactivated SCell), 9.2.5.2-8 (CC with deactivated PSCell) or 9.2.5.2-9 (CC with deactivated PSCell).

$T_{SSB_processing}$: it is the time period used to process multiple beams received in one SMTC. $T_{SSB_processing}$ = 2 ms for UE supporting *FastRx-BSF-MeasDelayReduction-r19* when the conditions in clause 3.6.21 are fulfilled. Otherwise $T_{SSB_processing}$ = 0.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined

- according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1 for measurement conducted outside measurement gaps, i.e.
  - when intra-frequency SMTC is fully non overlapping or partially overlapping with GAP, or
  - when intra-frequency SMTC is fully non overlapping with GAP for UE indicating *no-gap-with-interruption*, or

- when intra-frequency SMTC is fully non overlapping or partially overlapping with GAP for UE indicating *no-gap-no-interruption*, or

For a UE that supports Pre-MG, an SMTC occasion is only considered to be overlapped by Pre-MG if the Pre-MG is activated.

if the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

$M_{pss/sss_sync_w/o_gaps}$: For a UE supporting FR2-1 power class 1 or 5, $M_{pss/sss_sync_w/o_gaps}$ =40. For a UE supporting power class 2, $M_{pss/sss_sync_w/o_gaps}$ =24. For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_w/o_gaps}$ =24. For a UE supporting FR2-1 power class 4, $M_{pss/sss_sync_w/o_gaps}$ =24. For a UE supporting FR2-1 power class 6, $M_{pss/sss_sync_w/o_gaps}$ =24. For a UE supporting FR2-2 power class 1, $M_{pss/sss_sync_w/o_gaps}$ = 60. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync_w/o_gaps}$ = 36. For a UE supporting FR2-2 power class 3, $M_{pss/sss_sync_w/o_gaps}$ = 36.

$M_{meas_period_w/o_gaps}$: For a UE supporting FR2-1 power class 1 or 5, $M_{meas_period_w/o_gaps}$ =40. For a UE supporting FR2-1 power class 2, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting FR2-1 power class 3, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting power class 4, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting power class 6, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting FR2-2 power class 1, $M_{meas_period_w/o_gaps}$ = 60. For a UE supporting FR2-2 power class 2, $M_{meas_period_w/o_gaps}$ = 36. For a UE supporting FR2-2 power class 3, $M_{meas_period_w/o_gaps}$ = 36.

$M_{SSB_index_intra}$: For a UE supporting FR2-2 power class 1, $M_{SSB_index_intra}$ = 72 samples. For a UE supporting FR2-2 power class 2, $M_{SSB_index_intra}$ = 48 samples. For a UE supporting FR2 power class 3, $M_{SSB_index_intra}$ = 48 samples.

For a UE that supports *FastRx-BSF-MeasDelayReduction-r19,* when the conditions in clause 3.6.21 are fulfilled and when *highSpeedMeasFlagFR2-r17* is not configured, the following values shall apply for $M_{pss/sss_sync_w/o_gaps}$ and $M_{meas_period_w/o_gaps}$:

$M_{pss/sss_sync_w/o_gaps}$: For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_w/o_gaps}$ =3* $N_{reduced_Rx_BSF}$.

$M_{meas_period_w/o_gaps}$: For a UE supporting FR2-1 power class 3, $M_{meas_period_w/o_gaps}$ =3* $N_{reduced_Rx_BSF}$.

Where,

$N_{reduced_Rx_BSF}$ = reported value via UE capability *fastRx-BSF-MeasDelayReduction-r19* in FR2-1 reported by UE via *FastRx-BSF-MeasDelayReduction-r19*.

When UE supports concurrent GAPs, i.e., supports the following capability or capabilities' combination:

- concurrentMeasGap-r17, or
- concurrentMeasGapsPreMG-r18, or
- concurrentMeasGapsNCSG-r18,

Or when UE supports *musim-GapPreference-r17* or both concurrent measurement GAPs and *musim-GapPreference-r17* and UE concurrent GAPs or periodic MUSIM gaps or both concurrent GAPs and periodic MUSIM gaps are configured to UE,

$K_p$ is the scaling factor for an SSB frequency layer to be measured without GAP. $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

- For a window W of duration max(SMTC period, xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE GAPs, periodic MUSIM gaps, and/or per-FR GAPs within the same FR as the SSB frequency layer, and starting from the beginning of any SMTC occasion:
  - $N_{total}$ is the total number of SMTC occasions within the window, including those overlapped with GAP and MUSIM gap occasions and those overlapped and non-overlapped with the duration of serving CC to be measured based on the switching pattern within the window,

    For UEs supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19* in FR1:

- for the L3 measurement on PCell frequency layer, $N_{total}$ also includes SMTC occasions that overlapped with the SCell active periods of the *switchingPattern-r19* within the window,
- for the L3 measurement on SCell frequency layer, $N_{total}$ also includes SMTC occasions that overlapped with the PCell active periods of the *switchingPattern-r19* within the window, and

- $N_{available}$ is the number of SMTC occasions within the window W
  - that are not overlapped with any non-dropped GAP or non-dropped MUSIM gap occasions within the window W, after accounting for measurement GAP and MUSIM gap collisions by applying the collision rules for GAP and MUSIM gap in clauses 9.1.8.3, 9.1.10.4, 9.1.10.5, 9.1.12.3, and 9.1.13.3, respectively.
  - that are overlapped with PCell active periods of the *switchingPattern-r19*, for the L3 measurement on PCell frequency layer for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19* in FR1.
  - that are overlapped with SCell active periods of the *switchingPattern-r19*, for the L3 measurement on SCell frequency layer for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19* in FR1, and
- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.
- for UEs that support *featureSetCombinationLowBandSwitching-r19*, switching pattern periodicity is the periodicity of *LowBandCA-Switching-r19*; otherwise, it is not applicable.

  Requirements in this clause do not apply when $N_{available}$ = 0 due to fully overlapping between SMTC occasions and MUSIM gap occasions within the window W.

  No requirements apply when $N_{available}$ = 0 due to fully non-overlapping between SMTC occasions and the duration of serving CC to be measured based on *LowBandCA-Switching-r19* within the window W for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19* in FR1.

When UE supports *musim-GapPreference-r17* and the SMTC occasion of the target frequency layer is overlapping with the configured aperiodic MUSIM gap, longer cell identification period for the target frequency layer is expected.

Otherwise, when the UE is not configured with or UE does not support concurrent GAPs and the UE is not configured with periodic MUSIM gaps or UE does not support MUSIM gaps:

When intra-frequency SMTC is fully non overlapping with measurement gaps or NCSG, or intra-frequency SMTC is fully overlapping with MGs or NCSG, Kp=1

When intra-frequency SMTC is partially overlapping with measurement gaps, $K_p$ = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP. When intra-frequency SMTC is partially overlapping with NCSG, $K_p$ = 1/(1- (SMTC period /VIRP)), where SMTC period < VIRP. For calculation of $K_p$, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*. If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$

For FR2,

$K_{layer1_measurement}$=1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by intra-frequency SMTC occasions, or
- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by intra-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB

symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged. and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$=1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

If MCG DRX is in use, cell identification requirements for intra-frequency measurement in MCG specified in table 9.2.5.1-1, table 9.2.5.1-2, table 9.2.5.1-3, table 9.2.5.1-4, table 9.2.5.1-5 and table 9.2.5.1-6 shall depend on the MCG DRX cycle. If SCG DRX is in use, cell identification requirements for intra-frequency measurement in SCG specified in table 9.2.5.1-1, table 9.2.5.1-2, table 9.2.5.1-3, table 9.2.5.1-4, table 9.2.5.1-5, table 9.2.5.1-6, table 9.2.5.1-12, table 9.2.5.1-13 and table 9.2.5.1-14 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

- When the target SSB is completely contained in active BWP of UE or the active downlink BWP is initial BWP, the intra-frequency measurement shall be conducted without gap and without interruption regardless of the NeedForGaps' status reporting.

**Table 9.2.5.1-1: Time period for PSS/SSS detection, (Frequency range FR1)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max( 600 ms, ceil( 5 x $K_p$) x SMTC period )[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max( 600 ms, ceil(M2 [Note 2]x 5 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil(5 x $K_p$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: When *highSpeedMeasFlag-r16* is not configured, M2 = 1.5; When *highSpeedMeasFlag-r16* is configured, M2 = 1.5 if SMTC periodicity > 40 ms,otherwise M2=1. | |
| NOTE 3: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *intraNR-MeasurementEnhancement-r16* on measurements of the primary component carrier and do not apply to measurements of a secondary component carrier with active SCell. | |
| NOTE 4: When *highSpeedMeasCA-Scell-r17* is configured and UE supports *measurementEnhancementCA-r17*, M2 = 1.5 if SMTC periodicity > 40 ms; otherwise M2=1. | |

**Table 9.2.5.1-2: Time period for PSS/SSS detection, (Frequency range FR2)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max(600 ms, ceil($M_{pss/sss_sync_w/o_gaps}$ x $K_{FR}$ x $K_p$ x $K_{layer1_measurement}$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5 x $M_{pss/sss_sync_w/o_gaps}$ x $K_{FR}$ x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil($M_{pss/sss_sync_w/o_gaps}$ x $K_{FR}$ x $K_p$ x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: $K_{FR}$ is a scaling factor depending on the frequency range and the SSB SCS. For FR2-1, KFR = 1. For FR2-2: $K_{FR}$ = 1 if the SCS of the SSB of the cell being detected is 120 kHz, $K_{FR}$ = 2 if the SCS of the SSB of the cell being detected is 480 kHz, and $K_{FR}$ = 3 if the SCS of the SSB of the cell being detected is 960 kHz. | |

## 9.2.5.2 Measurement period

The measurement period for intra-frequency measurements without gaps is as shown in table 9.2.5.2-1, 9.2.5.2-2, 9.2.5.2-3 (CC with deactivated SCell), 9.2.5.2-4 (CC with deactivated SCell), 9.2.5.2-8 (deactivated SCG applicable for PSCell) or 9.2.5.2-9 (deactivated SCG applicable for PSCell). When *highSpeedMeasFlag-r16* is configured, $T_{SSB_measurement_period_intra}$ is specified in table 9.2.5.2-5. When UE *highSpeedMeasFlagFR2-r17* is configured, if SMTC ≤ 40ms, $T_{SSB_measurement_period_intra}$ is given in table 9.2.5.2-7; otherwise, $T_{SSB_measurement_period_intra}$ is given in table 9.2.5.2-2. For power class 6 UE supporting *measEnhCAInterFreqFR2-r18* when *highSpeedMeasFlagFR2-r17* is configured, the $T_{SSB_measurement_period_intra}$ is given in table 9.2.5.2-7 (if SMTC ≤ 40ms) and table 9.2.5.2-2 (if SMTC > 40ms) shall apply for SCC.

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and smtc1 is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{SSB_measurement_period_intra}$

For a UE that supports Pre-MG, an SMTC occasion is only considered to be overlapped by Pre-MG if the Pre-MG is activated.

If MCG DRX is in use, measurement period requirements for intra-frequency measurement in MCG specified in table 9.2.5.2-1, table 9.2.5.2-2, table 9.2.5.2-3 and table 9.2.5.2-4 shall depend on the MCG DRX cycle. If SCG DRX is in use, measurement period requirements for intra-frequency measurement in SCG specified in table 9.2.5.2-1, table 9.2.5.2-2, table 9.2.5.2-3, table 9.2.5.2-4, table 9.2.5.2-8 and table 9.2.5.2-9, shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

For FR2, a longer measurement period is allowed, if aperiodic CSI-RS resource is measured for L1-RSRP measurement on any FR2 serving frequency in the same band, and the CSI-RS resource is outside measurement gap and overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI

symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols. If *SSB-ToMeasure* or *SS-RSSI-Measurement* is configured, the SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same band which can be merged and the RSSI symbols are indicated by *SS-RSSI-Measurement*.

**Table 9.2.5.2-1: Measurement period for intra-frequency measurements without gaps (FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_p$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ ) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.2.5.2-2: Measurement period for intra-frequency measurements without gaps (FR2)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(400 ms, ceil($M_{meas_period_w/o_gaps}$ x $K_p$ x $K_{layer1_measurement}$) x SMTC period)[Note 1] x $CSSF_{intra}$ |

**Table 9.2.5.2-13: Void**

## 9.2.5.3 Scheduling availability of UE during intra-frequency measurements

UE shall be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE, or the UE indicates *no-gap-no-interruption* for intra-frequency measurement, or the UE indicates *no-gap-with-interruption* for intra-frequency measurement. For UE configured with measurement gap cancellation according to clause 9.1.14 provided that the configuration and conditions in clause 9.1.14.3 are met, the UE is not required to perform measurement during the cancelled gap occasions, and no restrictions on the scheduling availability at the cancelled gap occasions. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols indicated by the union set of SSB-ToMeasure from all the configured measurement objects on the same serving carrier which can be merged [2], if it is configured; otherwise, all *L* SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

For a UE that supports Pre-MG, the requirements in clause 9.2.5.3 also apply when a Pre-MG is deactivated.

For UE supporting concurrent measurement gaps, when concurrent gaps are configured, the requirements in clause 9.2.5.3 are also applied to the slots that are not interrupted according to requirements in clause 9.1.8.3.

[For UE supporting MUSIM gaps, when MUSIM gaps are configured, the requirements in clause 9.2.5.3 are also applied to the slots that are not interrupted according to requirements in clauses 9.1.10.5 and 9.1.10.6.]

#### 9.2.5.3.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

For UE indicating *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When TDD inter-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this band pair.

When inter-band FR1+FR1 NR-DC is performed, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this band pair.

#### 9.2.5.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which does not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer signalling of *smtc2* is configured(in TS 38.331 [2]), the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

If the following conditions are met:

- The UE has been notified about system information update through paging,

- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

The UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and/or the corresponding PDSCH, on SSB symbols to be measured.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

For UE indicating *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

#### 9.2.5.3.3 Scheduling availability of UE performing measurements on FR2

The following scheduling restriction applies due to SS-RSRP or SS-SINR measurement on an FR2 intra-frequency cell

- If *deriveSSB-IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on K data symbol(s) before each consecutive SSB symbols to be measured and K data symbol(s) after each consecutive SSB symbols to be measured within SMTC window duration.

- If *deriveSSB-IndexFromCell* is not enabled and the SCS of data and SSB symbols are smaller than 960 kHz, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

- If *deriveSSB-IndexFromCell* is not enabled and the SCS of data or SSB symbols is 960 kHz, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI SSB symbols to be measured, and on K' data symbol(s) before each consecutive SSB symbols to be measured and K' data symbol(s) after each consecutive SSB symbols to be measured within SMTC window duration.

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 intra-frequency cell

- If *deriveSSB-IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on K data symbol(s) before each consecutive SSB to be measured/RSSI symbols and K data symbol(s) after each consecutive SSB to be measured/RSSI symbols within SMTC window duration

- If *deriveSSB-IndexFromCell* is not enabled and the SCS of data and SSB symbols are smaller than 960 kHz, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

- If *deriveSSB-IndexFromCell* is not enabled and the SCS of SSB symbols is 960 kHz, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on K' data symbol(s) before each consecutive SSB to be measured/RSSI symbols and K' data symbol(s) after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

where

- If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- The signaling *deriveSSB-IndexFromCell* is always enabled for FR2-1 and FR2-2 when SSB is using 120 kHz SCS and 480 kHz SCS.

- K=1 for a serving cell with data symbols of 120 kHz SCS

- K=4 for a serving cell with data symbols of 480 kHz SCS and SSB symbols of 120 kHz or 480 kHz SCS

- K=3 for a serving cell with data symbols of 480 kHz SCS and SSB symbols of 960 kHz SCS

- K=7 for a serving cell with data symbols of 960 kHz SCS and SSB symbols of 120 kHz or 480 kHz SCS

- K=4 for a serving cell with data symbols of 960 kHz SCS and SSB symbols of 960 kHz SCS

- K'=2 for a serving cell with data symbols of 120 kHz SCS and SSB symbols of 960 kHz SCS

- K'=4 for a serving cell with data symbols of 480 kHz SCS and SSB symbols of 960 kHz SCS

- K'=7 for a serving cell with data symbols of 960 kHz SCS and SSB symbols of 960 kHz SCS

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to SS-RSRP, SS-RSRQ or SS-SINR measurement on an FR2 intra-frequency cell in different bands, provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

NOTE: When inter-band carrier aggregation in FR2 is performed, the scheduling restrictions as defined in clause 9.2.5.3.1 due to a given serving cell also apply to another serving cell in a different FR2 band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this FR2 band pair.

If following conditions are met:

- The UE has been notified about system information update through paging,
- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE shall receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

#### 9.2.5.3.4 Scheduling availability of UE performing measurements on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to measurements performed on FR2 serving cell frequency layer. However, the scheduling restrictions as defined in clause 9.2.5.3.1 due to a given serving cell in FR2 also apply to another serving cell in an FR1 band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this FR1-FR2 band pair.

There are no scheduling restrictions on FR2 serving cell(s) due to measurements performed on FR1 serving cell frequency layer. However, the scheduling restrictions as defined in clause 9.2.5.3.1 due to a given serving cell in FR1 also apply to another serving cell in an FR2 band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this FR1-FR2 band pair.

### 9.2.5.4 SFTD Measurements between PCell and PSCell

#### 9.2.5.4.1 Introduction

This clause contains SFTD measurement requirements for UE which supports NR-DC and is configured with a PSCell in RRC_CONNECTED state. The UE shall perform SFTD measurement between PCell and PSCell, and report the SFTD result with/without SS-RSRP after the network requests with *reportType* for the associated *reportConfig* set to *reportSFTD*. The overall delay includes RRC procedure delay defined in clause 12 in TS 38.331 [2], and SFTD measurement delay in clause 9.2.5.4.2.

#### 9.2.5.4.2 SFTD Measurement delay

When no DRX is used in either of PCell and PSCell, the physical layer measurement period of the SFTD measurement shall be $T_{measure_SFTD1}$ = max(200, 5 x SMTC period) ms, where the SMTC period refers to the maximum between the configured SMTC period in PCell and PSCell.

When DRX is used in either of the PCell or the PSCell, or in both PCell and PSCell, the physical layer measurement period ($T_{measure_SFTD1}$) of the SFTD measurement shall be as specified in table 9.2.5.4.2-1.

**Table 9.2.5.4.2-1: SFTD measurement requirement when DRX is used**

| DRX cycle length (s) Note 3 | $T_{measure_SFTD1}$ (s) |
|---|---|
| ≤0.04 | max(0.2, 5 x SMTC period) (Note 2) |
| 0.04<DRX cycle≤0.32 | 8 x max(DRX cycle, SMTC period) |
| 0.32<DRX cycle≤10.24 | 5 x DRX cycle |
| NOTE 1: SMTC period in this table refers to the maximum between the configured SMTC period in PCell and PSCell.<br>NOTE 2: Void<br>NOTE 3: DRX cycle length in this table refers to the DRX cycle length configured for PCell or PSCell. When DRX is used in both PCell and PSCell, DRX cycle length in this table refers to the longer of the DRX cycle lengths for PCell and PSCell. | |

If PSCell is changed without changing carrier frequency of PSCell, while the UE is performing SFTD measurements, the UE shall still meet SFTD measurement and accuracy requirements for the new PSCell. In this case the UE shall restart the SFTD measurement, and the total physical layer measurement period shall not exceed $T_{measure_SFTD2}$ as defined by the following expression:

$$T_{measure_SFTD2} = (M+1)*(T_{measure_SFTD1}) + M*T_{PSCell_change_NRDC}$$

where:

M is the number of times the NR PSCell is changed over the measurement period ($T_{measure_SFTD2}$), and

$T_{PSCell_change_NRDC}$ is the time necessary to change the PSCell; it can be up to 25 ms.

If PCell is changed, or if PSCell is changed with different carrier frequency from previous PSCell, the UE shall terminate SFTD measurements.

The measurement accuracy for the SFTD measurement when DRX is used as well as when no DRX is used shall be as specified in the clause 10.1.21.

#### 9.2.5.4.3 SFTD Measurement Reporting Delay

The SFTD measurement reporting delay is defined as the time between a command that will trigger an SFTD measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes any delay caused by no UL resources available for UE to send the measurement report.

The SFTD measurement reporting delay shall be less than measurement period defined in clause 9.2.5.4.2 plus the RRC procedure delay defined in clause 12 in TS 38.331 [2].

## 9.2.6 Intra-frequency measurements with measurement gaps

### 9.2.6.1 Void

### 9.2.6.2 Intra-frequency cell identification

When a measurement gap is provided or an activated Pre-MG is provided without any pre-MG status changed during the measurement period, the UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index.}$ The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index.}$ It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2 with SCS smaller or equal to 480 kHz.

$$T_{identify_intra_without_index} = T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} + T_{SSB_processing}\ ms$$

$$T_{identify_intra_with_index} = T_{PSS/SSS_sync_ntra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra}\ ms$$

Where:

$T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in tables 9.2.6.2-1, 9.2.6.2-2 or 9.2.6.2-9.

- For UEs supporting *FastRx-BSF-MeasDelayReduction-r19*, when the conditions in clause 3.6.21 are fulfilled, $T_{SSB_processing}$ = 2 ms; otherwise, $T_{SSB_processing}$ = 0.
- For UE supporting power class 6 with *highSpeedMeasFlagFR2-r17* configured, if SMTC ≤ 40ms, $T_{PSS/SSS_sync_intra}$ is given in table 9.2.6.2-9; otherwise, $T_{PSS/SSS_sync_intra}$ is given in table 9.2.6.2-2.
- For UE configured with measurement gap cancellation according to clause 9.1.14 provided that the configuration and conditions in clause 9.1.14.3 are met, the $T_{PSS/SSS_sync_intra}$ is given in table 9.2.6.2-13, 9.2.6.2-14, for FR1 and FR2-1 respectively.

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2.6.2-3 or 9.2.6.2-10 (for FR2-2).

- For UE configured with measurement gap cancellation according to clause 9.1.14 provided that the configuration and conditions in clause 9.1.14.3 are met, the $T_{SSB_time_index_intra}$ is given in table 9.2.6.2-15 for FR1.
- For UE indicating *support3MHz-ChannelBW-Symmetric-r18* and configured to operate on a target cell with 12 PRB SSB in FR1, $T_{SSB_time_index_intra_less_than_5Mhz}$ is given in table 9.2.6.2-12.

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2.6.3-1 or 9.2.6.3-2.

- For UE supporting power class 6 with *highSpeedMeasFlagFR2-r17* configured, if SMTC ≤ 40ms, $T_{SSB_measurement_period_intra}$ is given in table 9.2.6.3-4; otherwise, $T_{SSB_measurement_period_intra}$ is given in table 9.2.6.3-2.
- For power class 6 UE supporting *measEnhCAInterFreqFR2-r18* when *highSpeedMeasFlagFR2-r17* is configured, the $T_{SSB_measurement_period_intra}$ given in table 9.2.6.3-4 (if SMTC ≤ 40ms) and table 9.2.6.3-2 (if SMTC > 40ms) shall apply for SCC.
- For UE configured with measurement gap cancellation according to clause 9.1.14 provided that the configuration and conditions in clause 9.1.14.3 are met, the $T_{SSB_measurement_period_intra}$ is given in table 9.2.6.3-5, 9.2.6.3-6, for FR1 and FR2-1 respectively.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

$K_{gap}$ is the scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap}$ = 1 when the UE is not configured with or the UE does not support concurrent GAPs or MUSIM gaps. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

For a window W of duration max(SMTC period, xRP_max), where xRP_max is the maximum xRP across all configured per-UE GAPs, periodic MUSIM gaps and per-FR GAPs within the same FR as the SSB frequency layer, and starting from the beginning of any SMTC occasion:

- $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other GAP and MUSIM gap occasions within the window, and

  $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W after accounting for GAP and MUSIM gap collisions by applying the collision rules for GAP and MUSIM gap in clauses 9.1.8.3, 9.1.10.4, 9.1.10.5, 9.1.12.3, and 9.1.13.3, respectively.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.

When concurrent GAPs are configured, requirements in this clause do not apply if $N_{available}$ =0.

When UE supports *musim-GapPreference-r17* hand the configured aperiodic MUSIM gap collides with the measurement gap associated with the target frequency layer, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer cell identification period for the target intra-frequency is expected.

$M_{pss/sss_sync_with_gaps}$ : For a UE supporting FR2-1 power class 1 or 5, $M_{pss/sss_sync\ with_gaps}$=40. For a UE supporting FR2-1 power class 2, $M_{pss/sss_sync\ with_gaps}$ =24. For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync\ with_gaps}$ =24. For a UE supporting FR2-1 power class 4, $M_{pss/sss_sync\ with_gaps}$ =24. For a UE supporting FR2-1 power class 6, $M_{pss/sss_sync\ with_gaps}$ =24. For a UE supporting FR2-2 power class 1, $M_{pss/sss_sync\ with_gaps}$ = 60. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync\ with_gaps}$ = 36. For a UE supporting FR2-2 power class 3, $M_{pss/sss_sync\ with_gaps}$ = 36.

$M_{meas_period_with_gaps}$: For a UE supporting FR2-1 power class 1 or 5, $M_{meas_period_with_gaps}$ =40. For a UE supporting FR2-1 power class 2, $M_{meas_period_with_gaps}$ =24. For a UE supporting FR2-1 power class 3, $M_{meas_period_with_gaps}$ =24. For a UE supporting FR2-1 power class 4, $M_{meas_period\ with_gaps}$ =24. For a UE supporting FR2-1 power class 6, $M_{meas_period\ with_gaps}$ =24. For a UE supporting FR2-2 power class 1, $M_{meas_period_with_gaps}$ = 60. For a UE supporting FR2-2 power class 2, $M_{meas_period_with_gaps}$ = 36. For a UE supporting FR2-2 power class 3, $M_{meas_period_with_gaps}$ = 36.

- $M_{SSB_index_intra}$: For a UE supporting FR2-2 power class 1, $M_{SSB_index_intra}$ = 72. For a UE supporting FR2-2 power class 2, $M_{SSB_index_intra}$ = 48. For a UE supporting FR2 power class 3, $M_{SSB_index_intra}$ = 48.

  For a UE that supports *FastRx-BSF-MeasDelayReduction-r19* when the conditions in clause 3.6.21 are fulfilled and when *highSpeedMeasFlagFR2-r17* is not configured, the following values shall apply for $M_{pss/sss_sync_with_gaps}$ and $M_{meas_period_with_gaps}$:

  $M_{pss/sss_sync_with_gaps}$: For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_with_gaps}$ =3* $N_{reduced_Rx_BSF}$.

  $M_{meas_period_with_gaps}$: For a UE supporting FR2-1 power class 3, $M_{meas_period_with_gaps}$ =3* $N_{reduced_Rx_BSF}$.

  Where,

  $N_{reduced_Rx_BSF}$ = reported value by UE via *FastRx-BSF-MeasDelayReduction-r19*.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$.

If MCG DRX is in use, cell identification requirements for intra-frequency measurement in MCG specified in table 9.2.6.2-1, table 9.2.6.2-2, and table 9.2.6.2-3 shall depend on the MCG DRX cycle. If SCG DRX is in use, cell identification requirements for intra-frequency measurement in SCG specified in table 9.2.6.2-1, table 9.2.6.2-2, and table 9.2.6.2-3 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

**Table 9.2.6.2-1: Time period for PSS/SSS detection (FR1)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max(600 ms, 5 x $K_{gap}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil($M2^{Note\ 1}$x 5 x $K_{gap}$) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil( 5 x $K_{gap}$ ) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: When *highSpeedMeasFlag-r16* is not configured, M2 = 1.5; When *highSpeedMeasFlag-r16* is configured, M2 = 1.5 if SMTC periodicity > 40 ms, otherwise M2=1. | |
| NOTE 2: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *intraNR-MeasurementEnhancement-r16* on measurements of the primary component carrier and do not apply to measurements of a secondary component carrier with active SCell. | |
| NOTE 3: For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the activated Pre-MG or the MG pattern associated to the intra-frequency layer. | |
| NOTE 4: When *highSpeedMeasCA-Scell-r17* is configured, the requirements apply to UE on measurements of secondary component carrier with active SCell. | |

**Table 9.2.6.2-2: Time period for PSS/SSS detection (FR2)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max(600 ms, $M_{pss/sss_sync_with_gaps}$ x $K_{FR}$ x $K_{gap}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5x $M_{pss/sss_sync_with_gaps}$ x $K_{FR}$ x $K_{gap}$) x max(MGRP, SMTC period, DRX cycle)) x $CSSF_{intra}$ |

| | |
|---|---|
| DRX cycle>320 ms | Ceil($M_{pss/sss_sync_with_gaps}$ x $K_{FR}$ x $K_{gap}$ ) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the activated Pre-MG or the MG pattern associated to the intra-frequency layer. | |
| NOTE 2: $K_{FR}$ is a scaling factor depending on the frequency range and the SSB SCS. For FR2-1, $K_{FR}$ = 1. For FR2-2: $K_{FR}$ = 1 if the SCS of the SSB of the cell being detected is 120 kHz, $K_{FR}$ = 2 if the SCS of the SSB of the cell being detected is 480 kHz, and $K_{FR}$ = 3 if the SCS of the SSB of the cell being detected is 960 kHz. | |

**Table 9.2.6.2-3: Time period for time index detection (FR1)**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(120 ms, ceil(3 x $K_{gap}$ ) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil($M2^{Note\ 1}$x 3 x $K_{gap}$) x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra}$) |
| DRX cycle>320 ms | Ceil(3 x $K_{gap}$ )x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: When *highSpeedMeasFlag-r16* is not configured, M2 = 1.5; When *highSpeedMeasFlag-r16* is configured, M2 = 1.5 if SMTC periodicity > 40 ms, otherwise M2=1. | |
| NOTE 2: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *intraNR-MeasurementEnhancement-r16* on measurements of the primary component carrier and do not apply to measurements of a secondary component carrier with active SCell. | |
| NOTE 3: For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the activated Pre-MG or the MG pattern associated to the intra-frequency layer. | |
| NOTE 4: When *highSpeedMeasCA-Scell-r17* is configured, the requirements apply to UE on measurements of secondary component carrier with active SCell. | |

### 9.2.6.3 Intra-frequency Measurement Period

The requirements in this clause apply when a measurement gap is provided or when an activated Pre-MG is provided without any pre-MG status changed during the measurement period.

The measurement period for FR1 intra-frequency measurements with gaps is as shown in table 9.2.6.3-1.

The measurement period for FR2 intra-frequency measurements with gaps is as shown in table 9.2.6.3-2.

When *highSpeedMeasFlag-r16* is configured, $T_{SSB_measurement_period_intra}$ is specified in table 9.2.6.3-3.

For UE supporting power class 6 with *highSpeedMeasFlagFR2-r17* configured, if SMTC ≤ 40ms, $T_{SSB_measurement_period_intra}$ is given in table 9.2.6.3-4; otherwise, $T_{SSB_measurement_period_intra}$ is given in table 9.2.6.3-2.

For power class 6 UE supporting *measEnhCAInterFreqFR2-r18* when *highSpeedMeasFlagFR2-r17* is configured, the $T_{SSB_measurement_period_intra}$ is given in table 9.2.6.3-4 (if SMTC ≤ 40ms) and table 9.2.6.3-2 (if SMTC > 40ms) shall apply for SCC.

If MCG DRX is in use, measurement period requirements for intra-frequency measurement in MCG specified in table 9.2.6.3-1 and table 9.2.6.3-2, shall depend on the MCG DRX cycle. If SCG DRX is in use, measurement period requirements for intra-frequency measurement in SCG specified in table 9.2.6.3-1and table 9.2.6.3-2, shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

For either an FR1 or FR2 serving cell, longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For UE configured with measurement gap cancellation according to clause 9.1.14 meeting the conditions in clause 9.1.14.3, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.2, 10.1.3, 10.1.7, 10.1.8, 10.1.12 and 10.1.13 for FR1 and FR2-1, respectively, while meeting the measurement period requirements for FR1 and FR2-1 specified in tables 9.2.6.3-5 and 9.2.6.3-6, respectively.

**Table 9.2.6.3-1: Measurement period for intra-frequency measurements with gaps (FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil(5 x $K_{gap}$ )x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_{gap}$) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil(5 x $K_{gap}$ ) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the activated Pre-MG or the MG pattern associated to the intra-frequency layer. | |

**Table 9.2.6.3-2: Measurement period for intra-frequency measurements with gaps (FR2)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(400 ms, ceil($M_{meas_period\ with_gaps}$ x $K_{gap}$ ) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(400 ms, ceil(1.5 x $M_{meas_period\ with_gaps}$ x $K_{gap}$) x max(MGRP, SMTC period, DRX cycle)) [Note 1] x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil( $M_{meas_period\ with_gaps}$ x $K_{gap}$ ) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the activated Pre-MG or the MG pattern associated to the intra-frequency layer. | |

**Table 9.2.6.3-3: Measurement period When *highSpeedMeasFlag-r16* is configured (FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_{gap}$ ) x max(MGRP, SMTC period)) [Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 160 ms | max(200 ms, ceil($M2^{Note\ 2}$ x 5 x $K_{gap}$) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| 160 ms < DRX cycle≤ 320 ms | max(200 ms, ceil($M2^{Note\ 2}$ x 4 x $K_{gap}$) x max(MGRP, DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil($Y^{Note\ 3}$ x $K_{gap}$ ) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: M2 = 1.5 if SMTC periodicity > 40 ms, otherwise M2=1 | |
| NOTE 3: Y=3 when SMTC <= 40 ms, Y=5 when SMTC > 40 ms | |
| NOTE 4: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *intraNR-MeasurementEnhancement-r16* on measurements of the primary component carrier and do not apply to measurements of a secondary component carrier with active SCell. | |
| NOTE 5: For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the activated Pre-MG or the MG pattern associated to the intra-frequency layer. | |
| NOTE 6: When *highSpeedMeasCA-Scell-r17* is configured, the requirements also apply to UE on measurements of secondary component carrier with active SCell. | |

| NOTE 1: For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the activated Pre-MG or the MG pattern associated to the intra-frequency layer.<br>NOTE 2: $L_{cancel}$ is the number of cancelled gap occasions overlapping with SMTC in the measurement period. When DRX is configured, $L_{cancel}$ is the number of DRX cycles in which at least one measurement gap occasion overlapping with SMTC is cancelled during $T_{SSB_measurement_period_intra}$. | |

**Table 9.2.6.3-6: Measurement period for intra-frequency measurements with gaps (FR2-1)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(400 ms, ceil(($M_{meas_period\ with_gaps}$+$L_{cancel}$) x $K_{gap}$) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(400 ms, ceil((1.5 x ($M_{meas_period\ with_gaps}$+$L_{cancel}$) x $K_{gap}$) x max(MGRP, SMTC period, DRX cycle)) $^{Note\ 1}$ x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil(($M_{meas_period\ with_gaps}$+$L_{cancel}$) x $K_{gap}$) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the MG pattern associated to the intra-frequency layer.<br>NOTE 2: $L_{cancel}$ is the number of cancelled gap occasions overlapping with SMTC in the measurement period. When DRX is configured, $L_{cancel}$ is the number of DRX cycles in which at least one measurement gap occasion overlapping with SMTC is cancelled during $T_{SSB_measurement_period_intra}$. | |

## 9.2.7 Intra-frequency measurements with NCSG

### 9.2.7.1 Intra-frequency cell identification

For the UE supporting NCSG, if NCSG is provided, the UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise, UE shall be able to identify a new detectable intra frequency cell within $T_{identify_intra_with_index.}$ The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index.}$ It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2.

$$T_{identify_intra_without_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} + T_{SSB_processing}) \text{ ms}$$

$$T_{identify_intra_with_index} = (T_{PSS/SSS_sync_ntra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2.7.1-1, 9.2.7.1-2, 9.2.7.1-4 (deactivated Scell) or 9.2.7.1-5 (deactivated SCell).

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2.7.1-3 or 9.2.7.1-6 (deactivated SCell).

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2.7.2-1, 9.2.7.2-2, 9.2.7.2-3, 9.2.7.2-4 (deactivated SCell) or 9.2.7.2-5 (deactivated SCell).

$T_{SSB_processing}$: it is the time period used to process multiple beams received in one SMTC. $T_{SSB_processing}$ = 2 ms for UE supporting *FastRx-BSF-MeasDelayReduction-r19*, when he conditions in clause 3.6.21 are fulfilled. Otherwise, $T_{SSB_processing}$ = 0

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_ncsg,i}$ in clause 9.1.5.3 for measurement conducted within NCSG.

$K_{NCSG}$ is the scaling factor for a SSB frequency layer to be measured within an associated NCSG pattern. $K_{NCSG}$ = 1 when the UE is not configured with concurrent GAPs. Otherwise, $K_{NCSG} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

For a window W of duration max(SMTC period, xRP_max), where xRP_max is the maximum xRP across all configured per-UE GAP and per-FR GAP within the same FR as the SSB frequency layer, and starting from the beginning of any SMTC occasion:

- $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated NCSG within the window W, including those overlapped with other GAP occasions within the window, and
- $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated NCSG within the window W after accounting for GAP collisions by applying the GAP collision rule in clauses 9.1.8.3, 9.1.12.3, and 9.1.13.3.
- xRP = MGRP when configured GAP is MG, and xRP = VIRP when configured GAP is NCSG.

When concurrent GAPs are configured, requirements in this clause do not apply if $N_{available}$ =0.

$M_{pss/sss_sync_with_ncsg}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync\ with_ncsg}$=40. For a UE supporting FR2 power class 2, $M_{pss/sss_sync\ with_ncsg}$ =24. For a UE supporting FR2 power class 3, $M_{pss/sss_sync\ with_ncsg}$ =24. For a UE supporting power class 4, $M_{pss/sss_sync\ with_ncsg}$ =24

$M_{meas_period_with_ncsg}$: For a UE supporting power class 1 or 5, $M_{meas_period_with_ncsg}$ =40. For a UE supporting power class 2, $M_{meas_period_with_ncsg}$ =24. For a UE supporting power class 3, $M_{meas_period_with_ncsg}$ =24. For a UE supporting power class 4, $M_{meas_period\ with_ncsg}$ =24.

For a UE that supports *FastRx-BSF-MeasDelayReduction-r19,* when the conditions in clause 3.6.21 are fulfilled and when *highSpeedMeasFlagFR2-r17* is not configured, the following values shall apply for $M_{pss/sss_sync_with_ncsg}$ and $M_{meas_period_with_ncsg}$:

$M_{pss/sss_sync_with_ncsg}$: For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_with_ncsg} = 3 * N_{reduced_Rx_BSF}$.

$M_{meas_period_with_ncsg}$: For a UE supporting FR2-1 power class 3, $M_{meas_period_with_ncsg} = 3 * N_{reduced_Rx_BSF}$.

Where,

$N_{reduced_Rx_BSF}$ = reported value via UE capability *fastRx-BSF-MeasDelayReduction-r19* in FR2-1. If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and smtc1 is fully overlapping with NCSG and smtc2 is partially overlapping with NCSG, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$.

**Table 9.2.7.1-1: Time period for PSS/SSS detection with NCSG (FR1)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max(600 ms, 5 x $K_{NCSG}$ x max(VIRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil($M2^{Note\ 1}$x 5 x $K_{NCSG}$) x max(VIRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | 5 x $K_{NCSG}$ x max(VIRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: When *highSpeedMeasFlag-r16* is not configured, M2 = 1.5; When *highSpeedMeasFlag-r16* is configured, M2 = 1.5 if SMTC periodicity > 40 ms, otherwise M2=1. | |

NOTE 2: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *[intraRAT-MeasurementEnhancement-r16]* on measurements of the primary component carrier and do not apply to measurements of a secondary component carrier with active SCell.

**Table 9.2.7.1-2: Time period for PSS/SSS detection with NCSG (FR2)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |

| DRX cycle> 320 ms | 3 x $K_{NCSG}$ x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |

## 9.2.7.2 Measurement period

When *highSpeedMeasFlag-r16* is configured, the measurement period with NCSG is specified in table 9.2.7.2-3.

For either an FR1 or FR2 serving cell, longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

**Table 9.2.7.2-1: Measurement period for intra-frequency measurements with NCSG (FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, 5 x $K_{NCSG}$ x max(VIRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_{NCSG}$) x max(VIRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |

| | |
|---|---|
| DRX cycle>320 ms | 5 x $K_{NCSG}$ x max(VIRP, DRX cycle) x $CSSF_{intra}$ |

| DRX cycle≤ 320 ms | 5 x $K_{NCSG}$ x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320 ms | 5 x $K_{NCSG}$ x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |

**Table 9.2.7.2-5: Measurement period for intra-frequency measurements with NCSG (deactivated SCell) (FR2)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | $M_{meas_period\ with_ncsg}$ x $K_{NCSG}$ x measCycleSCellx $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | $M_{meas_period\ with_ncsg}$ x $K_{NCSG}$ x measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320 ms | $M_{meas_period\ with_ncsg}$ x $K_{NCSG}$ x measCycleSCell, DRX cycle) x $CSSF_{intra}$ |

NOTE: Requirements for measurement on deactivated SCC in this clause do not apply if SMTC on the deactivated SCC is fully non-overlapped with NCSG, and the requirements for measurement on deactivated SCC specified in clause 9.2.5 apply.

### 9.2.7.3 Scheduling availability during intra-frequency measurement with NCSG

Scheduling availability specified in clause 9.2.5.3 applies to scheduling availability during intra-frequency measurement with NCSG.

## 9.2A NR intra-frequency measurements with CCA

### 9.2A.1 Introduction

The requirements in clause 9.2.A apply for intra-frequency measurements on carrier frequency with CCA.

When the intra-frequency measurement is performed on a neighbour cell in FR2-2 with shared spectrum channel access, UE shall determine the CCA mode of the neighbour cell according to *channelAccessMode2-r17* of the cell configured in *MeasObjectNR*. If *channelAccessMode2-r17* of the cell is enabled, UE shall assume that CCA applies to the cell and perform measurement accordingly, and the requirements in clause 9.2A shall apply; otherwise, UE shall assume that CCA does not apply to the cell and perform measurement accordingly, and requirements in clause 9.2 shall apply.

A measurement is defined as a SSB based intra-frequency measurement provided the SSB frequency configured in the measurement object associated with the serving cell indicated for measurement and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same.

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell or the PSCell, even if no explicit neighbour list with physical layer cell identities is provided.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- the SSB is completely contained in the active BWP of the UE, or
- the active downlink BWP is initial BWP[3].

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.2A.5.3.

SSB based measurements are configured along with one or two measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements are to be performed. For intra-frequency connected mode measurements, up to two measurement window periodicities may be configured. A single measurement window offset and measurement duration are configured per intra-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB which start earlier than the gap starting time + switching time, nor detect SSB which end later than the gap end – switching time. Switching time is 0.5 ms for frequency range FR1 and 0.25 ms for frequency range FR2-2.

In the requirements of clause 9.2A, the term SMTC occasion not available at the UE refers to when the SMTC contains SSBs configured by gNB in a cell on a carrier frequency subject to CCA, but $N_{SSB}$ candidate SSB positions for the same SSB index within the discovery burst transmission window are not available at the UE due to DL CCA failures at gNB during the corresponding period, where:

- For the cell detection procedure: $N_{SSB}$ is at least one candidate SSB position (NOTE: the one candidate SSB position for the cell detection shall not be impacted by the set of candidate SSB positions which are already being measured by the UE within the current measurement period of the on-going measurements), and
- For other procedures in clause 9.2A: $N_{SSB}$ are the first two successive candidate SSB positions when two or more candidate SSB positions are configured for this SSB index in one discovery burst transmission window, otherwise $N_{SSB}$ is one candidate SSB position;

Otherwise, the SMTC occasion is considered as available at the UE.

For the FR2-2 requirements of clause 9.2A, an SMTC occasion group consists of N consecutive SMTC occasions, where N is the UE Rx beam sweeping scaling factor. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB.

## 9.2A.2 Requirements applicability

The requirements in clause 9.2A apply, provided:

- The cell being identified or measured is detectable.

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clause 10.1.27 and TBD for FR1 and FR2-2, respectively, for a corresponding band,
- SS-RSRQ related side conditions given in clause 10.1.29 and TBD for FR1 and FR2-2, respectively, for a corresponding band,

- SS-SINR related side conditions given in clause 10.1.31 and TBD for FR1 and FR2-2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.8 for a corresponding band.

## 9.2A.3 Number of cells and number of SSB

### 9.2A.3.1 Requirements for FR1

For each intra-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 8 identified cells, and
- 14 SSBs with different SSB index and/or PCI on the intra-frequency layer, where the number of SSBs in the serving cell (except for the SCell) is not smaller than the number of configured RLM-RS SSB resources.

### 9.2A.3.2 Requirements for FR2-2

For one single intra-frequency layer in a band, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 6 identified cells, and
- 24 SSBs with different SSB index and/or PCI,

where this single intra-frequency layer shall be:

- PCC when UE is configured with SA NR operation mode with PCC in the band; or
- PSCC when UE is configured with NR-DC with PSCC in the band; or
- One of the SCCs on which UE is configured to report SSB based measurements when neither PCC nor PSCC is in the same band, so that the selected SCC shall be an SCC where the UE is configured with SS-RSRP measurement reporting if such SCC exists, otherwise the selected SCC is determined by UE implementation.

The UE shall also be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least 2 SSBs on serving cell for each of the other intra-frequency layer(s) in the same band.

## 9.2A.4 Measurement Reporting Requirements

### 9.2A.4.1 Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1. 36 (RSRP for FR1), TBD (RSRP for FR2-2),10.1.29(RSRQ for FR1), TBD (RSRQ for FR2-2), 10.1.31 (RS-SINR for FR1) and TBD (RS-SINR for FR2-2), respectively.

### 9.2A.4.2 Event-triggered Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.36 (RSRP for FR1), TBD (RSRP for FR2-2), 10.1.29 (RSRQ for FR1), TBD (RSRQ for FR2-2), 10.1.31 (RS-SINR for FR1) and TBD (RS-SINR for FR2-2), respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.2A.4.3.

### 9.2A.4.3 Event Triggered Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.36 (RSRP for FR1), TBD (RSRP for FR2-2), 10.1.29 (RSRQ for FR1), TBD (RSRQ for FR2-2), 10.1.31 (RS-SINR for FR1) and TBD (RS-SINR for FR2-2), respectively.

The UE shall not send any event triggered measurement reports as long as no reporting criteria is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on, and all delays due to UL CCA failures until the successful transmission of the report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify\ intra\ with\ index_CCA}$ or $T_{identify\ intra\ without\ index_CCA}$ defined in clause 9.2A.5.1 or clause 9.2A.6.2. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_intra_without_index_CCA}$ or $T_{identify_intra_with_index_CCA}$ as defined in clause 9.2A.5.1 or clause 9.2A.6.2. If a cell which has been detectable at least for the time period $T_{identify\ intra\ without\ index_CCA}$ or $T_{identify\ intra\ with\ index_CCA}$ defined in clause 9.2A.5.1 or clause 9.2A.6.2 becomes undetectable for a period$\leq$ 8 seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_CCA}$ provided the timing to that cell has not changed more than $\pm$ 3200/$2^{\mu}$ Tc while the measurement gap has not been available and the L3 filter has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

## 9.2A.5 Intra-frequency measurements without measurement gaps

### 9.2A.5.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_CCA}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise, UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index_CCA}$. The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index_CCA}$.

$$T_{identify_intra_without_index_CCA} = (T_{PSS/SSS_sync_intra_CCA} + T_{SSB_measurement_period_intra_CCA})\ ms$$

$$T_{identify_intra_with_index\ CCA} = (T_{PSS/SSS_sync_intra_CCA} + T_{SSB_measurement_period_intra_CCA} + T_{SSB_time_index_intra_CCA})\ ms$$

Where:

$T_{PSS/SSS_sync_intra_CCA}$: it is the time period used in PSS/SSS detection given in table 9.2A.5.1-1, 9.2A.5.1-3 (deactivated Scell) .

$T_{SSB_time_index_intra_CCA}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2A.5.1-2 or 9.2A.5.1-4 (deactivated SCell).

$T_{SSB_measurement_period_intra_CCA}$: equal to a measurement period of SSB based measurement given in table 9.2A.5.2-1, 9.2A.5.2-2 (deactivated SCell).

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined

- according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps, or according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps.

- $M_{pss/sss_sync_w/o_gaps_CCA}$: For a UE supporting FR2-2 power class 1, $M_{pss/sss_sync_w/o_gaps\ CCA}$ = 60. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync_w/o_gaps\ CCA}$ = 36. For a UE supporting FR2-2 power class 3, $M_{pss/sss_sync_w/o_gaps\ CCA}$ = 36.

- $M_{meas_period_w/o_gaps_CCA}$: For a UE supporting FR2-2 power class 1, $M_{meas_period_w/o_gaps\ CCA}$ = 60. For a UE supporting FR2-2 power class 2, $M_{meas_period_w/o_gaps\ CCA}$ = 36. For a UE supporting FR2-2 power class 3, $M_{meas_period_w/o_gaps\ CCA}$ = 36.

- $M_{SSB_index_intra_CCA}$: For a UE supporting FR2-2 power class 1, $M_{SSB_index_intra\ CCA}$ = 72 samples. For a UE supporting FR2-2 power class 2, $M_{SSB_index_intra\ CCA}$ = 48 samples. For a UE supporting FR2 power class 3, $M_{SSB_index_intra\ CCA}$ = 48 samples.

  N: is the UE Rx beam sweeping scaling factor. N = 12.

  When intra-frequency SMTC is fully non overlapping with measurement gaps or intra-frequency SMTC is fully overlapping with MGs, $K_p$=1

  When intra-frequency SMTC is partially overlapping with measurement gaps, $K_p$ = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP.

For FR2-2,

$K_{layer1_measurement}$=TBD

If MCG DRX is in use, intra-frequency cell identification requirements specified in table 9.2A.5.1-1, table 9.2A.5.1-2, table 9.2A.5.1-3, table 9.2A.5.1-4, table 9.2A.5.1-5 and table 9.2A.5.1-6 shall depend on the MCG DRX cycle. If SCG DRX is in use, intra-frequency cell identification requirements specified in table 9.2A.5.1-1, table 9.2A.5.1-2, table 9.2A.5.1-3, table 9.2A.5.1-4, table 9.2A.5.1-5 and table 9.2A.5.1-6 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

The requirements apply provided any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known defined in clause 9.2A.4.3.

**Table 9.2A.5.1-1: Time period for PSS/SSS detection (FR1)**

| Condition | $T_{PSS/SSS_sync_intra_CCA}$ |
|---|---|
| No DRX | max( 600 ms, ceil((5+$L_{PSS/SSS}$) x $K_p$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max( 600 ms, ceil(1.5x (5+$L_{PSS/SSS}$) x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil((5+$L_{PSS/SSS}$) x $K_p$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: When DRX is not configured, $L_{PSS/SSS}$ is the number of SMTC occasions not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS}$< $L_{PSS/SSS,max}$. When DRX is configured, $L_{PSS/SSS}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS}$< $L_{PSS/SSS,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$. | |
| NOTE 3: $L_{PSS/SSS,max}$ =7 for Max(DRX cycle,SMTC period)≤40 ms where DRX cycle is 0 for non-DRX, $L_{PSS/SSS,max}$ =5 for 40 ms<Max(DRX cycle,SMTC period)≤320 ms, $L_{PSS/SSS,max}$ = 3 for DRX cycle>320 ms. | |
| NOTE 4: Upon exceeding $L_{PSS/SSS,max}$, the UE is not required to meet the requirements for PSS/SSS detection. | |

**Table 9.2A.5.1-2: Time period for time index detection (FR1)**

| Condition | $T_{SSB_time_index_intra_CCA}$ |
|---|---|
| No DRX | max(120 ms, ceil((3+$L_{ind}$) x $K_p$ ) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil (1.5 x (3+$L_{ind}$) x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil((3+$L_{ind}$) x $K_p$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: When DRX is not configured, $L_{ind}$ is the number of SMTC occasions not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind} \le L_{ind,max}$. When DRX is configured, $L_{ind}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind} \le L_{ind,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$. | |
| NOTE 3: $L_{ind,max}$ = 5 for Max(DRX cycle,SMTC period)≤40 ms where DRX cycle is 0 for non-DRX, $L_{ind,max}$ = 3 for 40 ms<Max(DRX cycle,SMTC period)≤320 ms, $L_{ind,max}$ =2 for DRX cycle>320 ms. | |
| NOTE 4: Upon exceeding $L_{ind,max}$ over the period of time $T_{SSB_time_index_intra_CCA}$, the UE has to restart the time index detection procedure. | |

**Table 9.2A.5.1-3: Time period for PSS/SSS detection, deactivated SCell (FR1)**

| Condition | $T_{PSS/SSS_sync_intra_CCA}$ |
|---|---|
| No DRX | $(5 + L_{PSS/SSS,deact}) \times measCycleSCell \times CSSF_{intra}$ |
| DRX cycle≤ 320 ms | $(5 + L_{PSS/SSS,\ deact}) \times \max(measCycleSCell, 1.5 \times DRX\ cycle) \times CSSF_{intra}$ |
| DRX cycle>320 ms | $(5 + L_{PSS/SSS,\ deact}) \times \max(measCycleSCell, DRX\ cycle) \times CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{PSS/SSS,\ deact}$ is the number of SMTC occasions not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS,\ deact} < L_{PSS/SSS,\ deact,max}$. When DRX is configured, $L_{PSS/SSS,\ deact}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS,\ deact} < L_{PSS/SSS,\ deact,max}$.When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement cycles, the UE is not required to determine the availability of SMTC occasions more frequent than once per measurement cycle. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$.

NOTE 2: $L_{PSS/SSS,\ deact,max,} = 7$ for non-DRX, $L_{PSS/SSS,\ deact,max} = 5$ for 40 ms<Max(DRX cycle, measCycleSCell)≤320 ms, $L_{PSS/SSS,\ deact,max} = 3$ for Max(DRX cycle, measCycleSCell)>320 ms.

NOTE 3: Upon exceeding $L_{PSS/SSS,\ deact,max,}$, the UE is not required to meet the requirements for PSS/SSS detection.

**Table 9.2A.5.1-4: Time period for time index detection, deactivated SCell (FR1)**

| Condition | $T_{SSB_time_index_intra_CCA}$ |
|---|---|
| No DRX | $(3+L_{ind,deact}) \times measCycleSCell \times CSSF_{intra}$ |
| DRX cycle≤ 320 ms | $(3+L_{ind,deact}) \times \max(measCycleSCell, 1.5 \times DRX\ cycle) \times CSSF_{intra}$ |
| DRX cycle>320 ms | $(3+L_{ind,deact}) \times \max(measCycleSCell, DRX\ cycle) \times CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{ind,deact}$ is the number of SMTC occasions not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind,deact} < L_{ind,deact,max}$. When DRX is configured, $L_{ind,deact}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind,deact} < L_{ind,deact,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement cycles, the UE is not required to determine the availability of SMTC occasions more frequent than once per measurement cycle. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$.

NOTE 2: $L_{ind,deact,max,} = 5$ for non-DRX, $L_{ind,deact,max} = 3$ for 40 ms<Max(DRX cycle, measCycleSCell)≤320 ms, $L_{ind,deact,max} = 2$ for Max(DRX cycle, measCycleSCell)>320 ms.

NOTE 3: Upon exceeding $L_{ind,deact,max}$ over the period of time $T_{SSB_time_index_intra_CCA}$, the UE has to restart the time index detection procedure.

**Table 9.2A.5.1-5: Time period for PSS/SSS detection, (FR2-2)**

| Condition | $T_{PSS/SSS_sync_intra_CCA}$ |
|---|---|
| No DRX | $\max(600\ ms, ceil((M_{pss/sss_sync_w/o_gaps_CCA} \times K_{FR} + N \times L_{PSS/SSS}) \times K_p \times K_{layer1_measurement}) \times SMTC\ period)^{Note\ 1} \times CSSF_{intra}$ |
| DRX cycle≤ 320 ms | $\max(600\ ms, ceil(1.5 \times (M_{pss/sss_sync_w/o_gaps_CCA} \times K_{FR} + N \times L_{PSS/SSS}) \times K_p \times K_{layer1_measurement}) \times \max(SMTC\ period, DRX\ cycle)) \times CSSF_{intra}$ |
| DRX cycle>320 ms | $ceil((M_{pss/sss_sync_w/o_gaps_CCA} \times K_{FR} + N \times L_{PSS/SSS}) \times K_p \times K_{layer1_measurement}) \times DRX\ cycle \times CSSF_{intra}$ |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified

NOTE 2: When DRX is not configured, $L_{PSS/SSS}$ is the number of SMTC occasion groups not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS} < L_{PSS/SSS,max}$. A SMTC occasion group consists of N consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{PSS/SSS}$ is the number of [DRX cycle groups] in which at least one SMTC occasion is not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS} < L_{PSS/SSS,max}$. [A [DRX occasion group consists of N consecutive DRX cycles. A DRX occasion group occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB.] When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle.

NOTE 3: $L_{PSS/SSS,max} = [7]$ for Max(DRX cycle,SMTC period)≤40 ms where DRX cycle is 0 for non-DRX, $L_{PSS/SSS,max} = [5]$ for 40 ms<Max(DRX cycle,SMTC period)≤320 ms, $L_{PSS/SSS,max} = [3]$ for DRX cycle>320 ms.

NOTE 4: Upon exceeding $L_{PSS/SSS,max}$, the UE is not required to meet the requirements for PSS/SSS detection.

NOTE 5: $K_{FR}$ is a scaling factor depending on the frequency range and SSB SCS. $K_{FR}$ = 1 if the SCS of the SSB of the cell being detected is 120 kHz, $K_{FR}$ = 2 if the SCS of the SSB of the cell being detected is 480 kHz, and $K_{FR}$= 3 if the SCS of the SSB of the cell being detected is 960 kHz.

**Table 9.2A.5.1-6: Time period for PSS/SSS detection, deactivated SCell (FR2-2)**

| DRX cycle | $T_{PSS/SSS_sync_intra_CCA}$ |
|---|---|
| No DRX | Ceil(($M_{pss/sss_sync_w/o_gaps}$ x $K_{FR}$ + N x $L_{PSS/SSS,deact}$) x $K_p$) x measCycleSCell x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Ceil(($M_{pss/sss_sync_w/o_gaps}$ x $K_{FR}$ + N x $L_{PSS/SSS,deact}$) x $K_p$) x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320 ms | Ceil(($M_{pss/sss_sync_w/o_gaps}$ x $K_{FR}$ + N x $L_{PSS/SSS,deact}$) x $K_p$) x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{PSS/SSS,\ deact}$ is the number of SMTC occasions groups not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS,\ deact} < L_{PSS/SSS,\ deact,max}$. A SMTC occasion group consists of N consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{PSS/SSS,\ deact}$ is the number of [DRX cycle groups] in which at least one SMTC occasion is not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS,\ deact} < L_{PSS/SSS,\ deact,max}$.When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. [A DRX occasion group consists of N consecutive DRX cycles. A DRX occasion group occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB.] When configured with measurement cycles, the UE is not required to determine the availability of SMTC occasions more frequent than once per measurement cycle.

NOTE 2: $L_{PSS/SSS,\ deact,max,}$ = [7] for Max(DRX cycle, measCycleSCell)≤40 ms where DRX cycle is 0 for non-DRX, $L_{PSS/SSS,\ deact,max}$ = [5] for 40 ms<Max(DRX cycle, measCycleSCell)≤320 ms, $L_{PSS/SSS,\ deact,max}$ = [3] for DRX cycle>320 ms.

NOTE 3: Upon exceeding $L_{PSS/SSS,\ deact,max,}$, the UE is not required to meet the requirements for PSS/SSS detection.

NOTE 4: Void

NOTE 5: $K_{FR}$ is a scaling factor depending on the frequency range and SSB SCS. $K_{FR}$ = 1 if the SCS of the SSB of the cell being detected is 120 kHz, $K_{FR}$ = 2 if the SCS of the SSB of the cell being detected is 480 kHz, and $K_{FR}$= 3 if the SCS of the SSB of the cell being detected is 960 kHz.

**Table 9.2A.5.1-7: Time period for time index detection (FR2-2)**

| DRX cycle | $T_{SSB_time_index_intra_CCA}$ |
|---|---|
| No DRX | Max(200 ms, ceil(($M_{SSB_index_intra_CCA}$ + N × $L_{ind}$) × $K_p$) × SMTC period) × $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Max(200 ms, ceil(1.5 × (($M_{SSB_index_intra}$ + N × $L_{ind}$) × $K_p$) × Max(SMTC period, DRX cycle)) × $CSSF_{intra}$ |
| DRX cycle> 320 ms | ceil(($M_{SSB_index_intra}$ + N × $L_{ind}$) × $K_p$) × DRX cycle × $CSSF_{intra}$ |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified

NOTE 2: When DRX is not configured, $L_{ind}$ is the number of SMTC occasion groups not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind} \le L_{ind,max}$. When DRX is configured, $L_{ind}$ is the number of DRX cycles groups in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind} \le L_{ind,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle.

NOTE 3: $L_{ind,max}$ = 5 for Max(DRX cycle,SMTC period)≤40 ms where DRX cycle is 0 for non-DRX, $L_{ind,max}$ = 3 for 40 ms<Max(DRX cycle,SMTC period)≤320 ms, $L_{ind,max}$ =2 for DRX cycle>320 ms.

NOTE 4: Upon exceeding $L_{ind,max}$ over the period of time $T_{SSB_time_index_intra_CCA}$, the UE has to restart the time index detection procedure.

**Table 9.2A.5.1-8: Time period for time index detection, deactivated SCell (FR2-2)**

| DRX cycle | $T_{SSB_time_index_intra_CCA}$ |
|---|---|
| No DRX | Max(200 ms, ceil(($M_{SSB_index_intra_CCA}$ + N × $L_{ind,deact}$) × $K_p$) × SMTC period) × $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Max(200 ms, ceil(1.5 × (($M_{SSB_index_intra}$ + N × $L_{ind,deact}$) × $K_p$) × Max(SMTC period, DRX cycle)) × $CSSF_{intra}$ |
| DRX cycle> 320 ms | ceil(($M_{SSB_index_intra}$ + N × $L_{ind,deact}$) × $K_p$) × DRX cycle × $CSSF_{intra}$ |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified
NOTE 2: When DRX is not configured, Lind,deact is the number of SMTC occasion groups not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind,deact} \leq L_{ind,deact,max}$. When DRX is configured, $L_{ind,deact}$ is the number of DRX cycles groups in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind,deact} \leq L_{ind,deact,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle.
NOTE 3: $L_{ind,deact,max}$ = 5 for Max(DRX cycle,SMTC period)≤40 ms where DRX cycle is 0 for non-DRX, $L_{ind,deact,max}$ = 3 for 40 ms<Max(DRX cycle,SMTC period)≤320 ms, $L_{ind,deact,max}$ =2 for DRX cycle>320 ms.
NOTE 4: Upon exceeding $L_{ind,deact,max}$ over the period of time $T_{SSB_time_index_intra_CCA}$, the UE has to restart the time index detection procedure.

## 9.2A.5.2 Measurement period

The measurement period for intra-frequency measurements without gaps is as shown in table 9.2A.5.2-1, 9.2A.5.2-2 (deactivated SCell).

If SCG DRX is in use, intra-frequency measurement period requirements specified in table 9.2A.5.2-1, table 9.2A.5.2-2 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

The requirements apply provided any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known defined in clause 9.2A.4.3.

When the time period of unsuccessful measurement attempts due to exceeding the maximum number of unavailable at the UE SMTC occasions of an already identified cell exceeds the maximum time requirement for the cell to remain known defined in clause 9.2A.4.3, UE shall stop the measurement attempts on this SSB and perform the detection procedure again like for any other SSB.

**Table 9.2A.5.2-1: Measurement period for intra-frequency measurements without gaps (FR1)**

| Condition | $T_{SSB_measurement_period_intra_CCA}$ |
|---|---|
| No DRX | max(200 ms, ceil((5+$L_{meas}$) x $K_p$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x (5+$L_{meas}$) x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil((5+$L_{meas}$) x $K_p$) x DRX cycle x $CSSF_{intra}$ |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified
NOTE 2: When DRX is not configured, $L_{meas}$ is the number of SMTC occasions not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement, where $L_{meas} < L_{meas,max}$. When DRX is configured, $L_{meas}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement, where $L_{meas} < L_{meas,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$.
NOTE 3: $L_{meas,max}$ = 7 for Max(DRX cycle,SMTC period)≤40 ms where DRX cycle is 0 for non-DRX, $L_{meas,max}$ = 5 for 40 ms<Max(DRX cycle,SMTC period)≤320 ms, $L_{meas,max}$ = 3 for DRX cycle>320 ms.
NOTE 4: Upon exceeding $L_{meas,max}$ over the period of time $T_{SSB_measurement_period_intra_CCA}$, the UE has to restart the measurement procedure.

**Table 9.2A.5.2-2: Measurement period for intra-frequency measurements without gaps, deactivated SCell (FR1)**

| Condition | $T_{SSB_measurement_period_intra_CCA}$ |
|---|---|
| No DRX | (5+$L_{meas,deact}$) x measCycleSCell x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | (5+$L_{meas,deact}$) x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle>320 ms | (5+$L_{meas,deact}$) x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{meas,deact}$ is the number of SMTC occasions not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement, where $L_{meas,deact} < L_{meas,,deact,max}$. When DRX is configured, $L_{meas,deact}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement, where $L_{meas,deact} < L_{meas,,deact,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement cycles, the UE is not required to determine the availability of SMTC occasions more frequent than once per measurement cycle. FFS:

| |
|---|
| The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$. |
| NOTE 2: $L_{meas,\ ,deact\ ,max,}$ = 7 for non-DRX, $L_{meas,\ ,deact\ ,max}$ = 5 for 40ms<Max(DRX cycle, measCycleSCell)≤320ms, $L_{meas,\ ,deact\ ,max}$ = 3 for Max(DRX cycle, measCycleSCell)>320ms. |
| NOTE 3: Upon exceeding $L_{meas,deact,max}$ over the period of time $T_{SSB_measurement_period_intra_CCA}$, the UE has to restart the measurement procedure. |

**Table 9.2A.5.2-3: Measurement period for intra-frequency measurements without gaps (FR2-2)**

| DRX cycle | $T_{SSB_measurement_period_intra_CCA}$ |
|---|---|
| No DRX | max(400 ms, ceil(($M_{meas_period_w/o_gaps_CCA}$ + N x $L_{meas}$) x $K_p$ x $K_{layer1_measurement}$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(400 ms, ceil(1.5x ($M_{meas_period_w/o_gaps_CCA}$ + N x $L_{meas}$) x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil(($M_{meas_period_w/o_gaps_CCA}$ + N x $L_{meas}$) x $K_p$ x $K_{layer1_measurement}$ ) x DRX cycle x $CSSF_{intra}$ |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified

NOTE 2: When DRX is not configured, $L_{meas}$ is the number of SMTC occasion groups not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement, where $L_{meas}$ <$L_{meas,max}$. A SMTC occasion group consists of N consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{meas}$ is the number of [DRX cycle groups] in which at least one SMTC occasion is not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement, where $L_{meas}$ <$L_{meas,max}$. . [A DRX occasion group consists of N consecutive DRX cycles. A DRX occasion group occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB.] When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle.

NOTE 3: $L_{meas,max}$ = [7] for Max(DRX cycle,SMTC period)≤40ms where DRX cycle is 0 for non-DRX, $L_{meas,max}$ = [5] for 40ms<Max(DRX cycle,SMTC period)≤320ms, $L_{meas,max}$ = [3] for DRX cycle>320ms.

NOTE 4: Upon exceeding $L_{meas,max}$ over the period of time $T_{SSB_measurement_period_intra_CCA}$, the UE has to restart the measurement procedure.

**Table 9.2.5.2-4: Measurement period for intra-frequency measurements without gaps, deactivated Scell (FR2-2)**

| DRX cycle | $T_{SSB_measurement_period_intra_CCA}$ |
|---|---|
| No DRX | Ceil(($M_{meas_period_w/o_gaps_CCA}$ + N x $L_{meas,deact}$) x $K_p$) x measCycleSCell x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Ceil(($M_{meas_period_w/o_gaps_CCA}$ + N x $L_{meas,deact}$) x $K_p$) x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320 ms | Ceil(($M_{meas_period_w/o_gaps_CCA}$ + N x $L_{meas,deact}$) x $K_p$) x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{meas,deact}$ is the number of SMTC occasion groups not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement, where $L_{meas,deact}$ <$L_{meas,\ ,deact\ ,max}$. A SMTC occasion group consists of N consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{meas,deact}$ is the number of [DRX cycle groups] in which at least one SMTC occasion is not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement, where $L_{meas,deact}$ <$L_{meas,\ ,deact\ ,max}$. [A DRX occasion group consists of N consecutive DRX cycles. A DRX occasion group occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB.] When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement cycles, the UE is not required to determine the availability of SMTC occasions more frequent than once per measurement cycle. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$.

NOTE 2: $L_{meas,\ ,deact\ ,max,}$ = [7] for Max(DRX cycle, measCycleSCell)≤40ms where DRX cycle is 0 for non-DRX, $L_{meas,\ ,deact\ ,max}$ = [5] for 40ms<Max(DRX cycle, measCycleSCell)≤320ms, $L_{meas,\ ,deact\ ,max}$ = [3] for DRX cycle>320ms.

NOTE 3: Upon exceeding $L_{meas,deact,max}$ over the period of time $T_{SSB_measurement_period_intra_CCA}$, the UE has to restart the measurement procedure.

### 9.2A.5.3 Scheduling availability of UE during intra-frequency measurements

UE shall be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged [2], if it is configured; otherwise, all *L* SSB symbols within SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

#### 9.2A.5.3.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols configured to be measured, and on 1 data symbol before each consecutive SSB symbols configured to be measured and 1 data symbol after each consecutive SSB symbols configured to be measured within SMTC window duration if *deriveSSB-IndexFromCell* is enabled. If the high layer in TS 38.331[2] signaling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration if *deriveSSB-IndexFromCell* is not enabled. If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols configured to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB configured to be measured/RSSI symbols and 1 data symbol after each consecutive SSB configured to be measured/RSSI symbols within SMTC window duration if *deriveSSB-IndexFromCell* is enabled. If the high layer signaling of *smtc2* is configured (in TS 38.331), the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration if *deriveSSB-IndexFromCell* is not enabled. If the high layer in TS 38.331 signaling of smtc2 is configured, the SMTC periodicity follows smtc2; Otherwise SMTC periodicity follows smtc1.

When intra-band carrier aggregation in unlicensed spectrum is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

#### 9.2A.5.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If *deriveSSB-IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

- If *deriveSSB-IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

#### 9.2A.5.3.3 Scheduling availability of UE performing measurements in TDD bands on FR2-2

The requirements in clause 9.2.5.3.3 apply.

# 9.2A.6 Intra-frequency measurements with measurement gaps

## 9.2A.6.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_CCA}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise, UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index_CCA}$. The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index\ CCA}$.

$$T_{identify_intra_without_index\ CCA} = T_{PSS/SSS_sync_intra_CCA} + T_{SSB_measurement_period_intra_CCA}\ ms$$

$$T_{identify_intra_with_index_CCA} = T_{PSS/SSS_sync_intra_CCA} + T_{SSB_measurement_period_intra_CCA} + T_{SSB_time_index_intra_CCA}$$

Where:

$T_{PSS/SSS_sync_intra_CCA}$: it is the time period used in PSS/SSS detection given in table 9.2A.6.1-1.

$T_{SSB_time_index_intra_CCA}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2A.6.1-2.

$T_{SSB_measurement_period_intra_CCA}$: equal to a measurement period of SSB based measurement given in table 9.2A.6.2-1 or 9.2A.6.1-3.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

$M_{pss/sss_sync_w/o_gaps_CCA}$: For a UE supporting FR2-2 power class 1, $M_{pss/sss_sync_w/o_gaps\ CCA} = 60$. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync_w/o_gaps\ CCA} = 36$. For a UE supporting FR2-2 power class 3, $M_{pss/sss_sync_w/o_gaps\ CCA} = 36$.

$M_{meas_period_w/o_gaps_CCA}$: For a UE supporting FR2-2 power class 1, $M_{meas_period_w/o_gaps\ CCA} = 60$. For a UE supporting FR2-2 power class 2, $M_{meas_period_w/o_gaps\ CCA} = 36$. For a UE supporting FR2-2 power class 3, $M_{meas_period_w/o_gaps\ CCA} = 36$.

- $M_{SSB_index_intra_CCA}$: For a UE supporting FR2-2 power class 1, $M_{SSB_index_intra\ CCA} = 72$ samples. For a UE supporting FR2-2 power class 2, $M_{SSB_index_intra\ CCA} = 48$ samples. For a UE supporting FR2 power class 3, $M_{SSB_index_intra\ CCA} = 48$ samples.

N: is the UE Rx beam sweeping scaling factor. N = 12.

If MCG DRX is in use, intra-frequency cell identification requirements specified in table 9.2A.6.1-1, table 9.2A.6.1-2 and table 9.2A.6.1-3 shall depend on the MCG DRX cycle. If SCG DRX is in use, intra-frequency cell identification requirements specified in table 9.2A.6.1-1, table 9.2A.6.1-2 and table 9.2A.6.1-3 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

The requirements apply provided any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known defined in clause 9.2A.4.3.

**Table 9.2A.6.1-1: Time period for PSS/SSS detection (FR1)**

| Condition | $T_{PSS/SSS_sync_intra_CCA}$ |
|---|---|
| No DRX | max(600 ms, (5+$L_{PSS/SSS,gaps}$) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5x (5+$L_{PSS/SSS,gaps}$)) x max(DRX cycle, MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle>320ms | (5+$L_{PSS/SSS,gaps}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: When DRX is not configured, $L_{PSS/SSS,gaps}$ is the number of SMTC occasions not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS,gaps} < L_{PSS/SSS,gaps,max}$. When DRX is configured, $L_{PSS/SSS,gaps}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{PSS/SSS_sync_intra_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS,gaps} < L_{PSS/SSS,gaps,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during | |

MGRP. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$.

NOTE 2: $L_{PSS/SSS,gaps,max}$ =7 for Max(DRX cycle, SMTC period, MGRP)≤40ms where DRX cycle is 0 for non-DRX, $L_{PSS/SSS,gaps,max}$ =5 for 40ms<Max(DRX cycle, SMTC period, MGRP)≤320ms, $L_{PSS/SSS,gaps,max}$ =3 for DRX cycle>320ms.

NOTE 3: Upon exceeding $L_{PSS/SSS,gaps,max}$, the UE is not required to meet the requirements for PSS/SSS detection.

**Table 9.2A.6.1-2: Time period for time index detection (FR1)**

| Condition | $T_{SSB_time_index_intra_CCA}$ |
|---|---|
| No DRX | max(120 ms, (3+$L_{ind,gaps}$) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil(1.5x (3+$L_{ind,gaps}$)) x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra}$) |
| DRX cycle>320ms | (3+$L_{ind,gaps}$) xDRX cycle x $CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{ind,gaps}$ is the number of SMTC occasions not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection where $L_{ind,gaps} < L_{ind,gaps,max}$. When DRX is configured, $L_{ind,gaps}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection where $L_{ind,gaps} < L_{ind,gaps,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$.

NOTE 2: $L_{ind,gaps,max}$ = 5 for Max(DRX cycle, SMTC period, MGRP)≤40ms where DRX cycle is 0 for non-DRX, $L_{ind,gaps,max}$ = 3 for 40ms<Max(DRX cycle, SMTC period, MGRP)≤320ms, $L_{ind,gaps,max}$ = 2 for DRX cycle>320ms.

NOTE 3: Upon exceeding $L_{ind,gaps,max}$ over the $T_{SSB_time_index_intra_CCA}$ period of time, the UE has to restart the time index detection procedure.

**Table 9.2A.6.1-3: Time period for PSS/SSS detection (FR2-2)**

| DRX cycle | $T_{PSS/SSS_sync_intra_CCA}$ |
|---|---|
| No DRX | max(600 ms, ($M_{pss/sss_sync_with_gaps_CCA}$ x $K_{FR}$ + N x $L_{ind,gaps}$ ) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5x ($M_{pss/sss_sync_with_gaps_CCA}$ x $K_{FR}$ + N x $L_{ind,gaps}$ )) x max(MGRP, SMTC period, DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ($M_{pss/sss_sync_with_gaps_CCA}$ x $K_{FR}$ + N x $L_{ind,gaps}$ ) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{ind,gaps}$ is the number of SMTC occasion groups not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection where $L_{ind,gaps} < L_{ind,gaps,max}$. A SMTC occasion group consists of N consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{ind,gaps}$ is the number of [DRX cycle groups] in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection where $L_{ind,gaps} < L_{ind,gaps,max}$.[A DRX occasion group consists of N consecutive DRX cycles. A DRX occasion group occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB.] When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP.

NOTE 2: $L_{ind,gaps,max,}$ = [5] for Max(DRX cycle, SMTC period, MGRP)≤40 ms where DRX cycle is 0 for non-DRX, $L_{ind,gaps,max}$ = [3] for 40 ms<Max(DRX cycle, SMTC period, MGRP)≤320 ms, $L_{ind,gaps,max}$ = [2] for DRX cycle>320 ms.

NOTE 3: Upon exceeding $L_{ind,gaps,max}$ over the $T_{SSB_time_index_intra_CCA}$ period of time, the UE has to restart the time index detection procedure.

NOTE 4: $K_{FR}$ is a scaling factor depending on the frequency range and SSB SCS. $K_{FR}$ = 1 if the SCS of the SSB of the cell being detected is 120 kHz, $K_{FR}$ = 2 if the SCS of the SSB of the cell being detected is 480 kHz, and $K_{FR}$ = 3 if the SCS of the SSB of the cell being detected is 960 kHz.

**Table 9.2A.5.1-7: Time period for time index detection (FR2-2)**

| DRX cycle | $T_{SSB_time_index_intra_CCA}$ |
|---|---|
| No DRX | Max(200ms, ceil(($M_{SSB_index_intra_CCA}$ + ($L_{ind,gaps}$ × N)) × $K_p$) × Max(MGRP, SMTC period)) × $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Max(200ms, ceil(1.5 × ($M_{SSB_index_intra_CCA}$ + ($L_{ind,gaps}$ × N)) × $K_p$) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{intra}$ |
| DRX cycle> 320 ms | ceil(($M_{SSB_index_intra_CCA}$ + ($L_{ind,gaps}$ × N)) × $K_p$) × DRX cycle × $CSSF_{intra}$ |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified
NOTE 2: When DRX is not configured, $L_{ind}$ is the number of SMTC occasion groups not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind,gaps} \leq L_{ind,gaps,max}$. When DRX is configured, $L_{ind,gaps}$ is the number of DRX cycles groups in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for index detection, where $L_{ind,gaps} \leq L_{ind,gaps,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle.
NOTE 3: $L_{ind,gaps,max}$ = 5 for Max(DRX cycle,SMTC period)≤40 ms where DRX cycle is 0 for non-DRX, $L_{ind,gaps,max}$ = 3 for 40 ms<Max(DRX cycle,SMTC period)≤320 ms, $L_{ind,max}$ =2 for DRX cycle>320 ms.
NOTE 4: Upon exceeding $L_{ind,gaps,max}$ over the period of time $T_{SSB_time_index_intra_CCA}$, the UE has to restart the time index detection procedure.

## 9.2A.6.2 Intra-frequency Measurement Period

The measurement period for intra-frequency measurements with gaps is as shown in table 9.2A.6.2-1.

If MCG DRX is in use, intra-frequency cell identification requirements specified in table 9.2A.6.2-1 and 9.2A.6.2-2 shall depend on the MCG DRX cycle. If SCG DRX is in use, intra-frequency measurement period requirements specified in table 9.2A.6.2-1 and 9.2A.6.2-2 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

The requirements apply provided any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known defined in clause 9.2A.4.3.

When the time period of unsuccessful measurement attempts due to exceeding the maximum number of unavailable at the UE SMTC occasions of an already identified cell exceeds the maximum time requirement for the cell to remain known defined in clause 9.2A.4.3, UE shall stop the measurement attempts on this SSB and perform the detection procedure again like for any other SSB.

**Table 9.2A.6.2-1: Measurement period for intra-frequency measurements with gaps (FR1)**

| Condition | $T_{SSB_measurement_period_intra_CCA}$ |
|---|---|
| No DRX | max(200 ms, (5+$L_{meas,gaps}$) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x (5+$L_{meas,gaps}$)) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320ms | (5+$L_{meas,gaps}$) x DRX cycle x $CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{meas,gaps}$ is the number of SMTC occasions not available at the UE during $T_{SSB_measurement_period_intra_CCA}$ for measurement where $L_{meas,gaps} < L_{meas,gaps,max}$. When DRX is configured, $L_{meas,gaps}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for measurement where $L_{meas,gaps} < L_{meas,gaps,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{intra}$.
NOTE 2: $L_{meas,gaps,max}$ = 7 for Max(DRX cycle, SMTC period, MGRP)≤40ms where DRX cycle is 0 for non-DRX, $L_{meas,gaps,max}$ = 5 for 40ms<Max(DRX cycle, SMTC period, MGRP)≤320ms, $L_{meas,gaps,max}$ = 3 for DRX cycle>320ms.
NOTE 3: Upon exceeding $L_{meas,gaps,max}$ over the $T_{SSB_measurement_period_intra_CCA}$ period of time, the UE has to restart the measurement procedure.

**Table 9.2A.6.2-2: Measurement period for intra-frequency measurements with gaps (FR2-2)**

| DRX cycle | $T_{SSB_measurement_period_intra_CCA}$ |
|---|---|
| No DRX | max(400 ms, ($M_{meas_period\ with_gaps_CCA}$ + N x $L_{meas,gaps}$ ) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(400 ms, ceil(1.5 x ($M_{meas_period\ with_gaps_CCA}$ + N x $L_{meas,gaps}$ )) x max(MGRP, SMTC period, DRX cycle)) [Note 1] x $CSSF_{intra}$ |
| DRX cycle>320 ms | ($M_{meas_period\ with_gaps_CCA}$ + N x $L_{meas,gaps}$ ) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

NOTE 1: When DRX is not configured, $L_{meas,gaps}$ is the number of SMTC occasion groups not available at the UE during $T_{SSB_time_index_intra_CCA}$ for measurement where $L_{meas,gaps} < L_{meas,gaps,max}$. A SMTC occasion group consists of N consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{meas,gaps}$ is the number of DRX cycle groups in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_intra_CCA}$ for measurement where $L_{meas,gaps} < L_{meas,gaps,max}$. A DRX occasion group consists

| | |
|---|---|
| | of N consecutive DRX cycles. A DRX occasion group occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP. |
| NOTE 2: | $L_{meas,gaps,max}$ = 7 for Max(DRX cycle, SMTC period, MGRP)≤40ms where DRX cycle is 0 for non-DRX, $L_{meas,gaps,max}$ = 5 for 40ms<Max(DRX cycle, SMTC period, MGRP)≤320ms, $L_{meas,gaps,max}$ = 3 for DRX cycle>320ms. |
| NOTE 3: | Upon exceeding $L_{meas,gaps,max}$ over the $T_{SSB_measurement_period_intra_CCA}$ period of time, the UE has to restart the measurement procedure. |

## 9.2A.7 Intra-frequency RSSI and Channel occupancy measurements

### 9.2A.7.1 Intra-frequency RSSI measurements

An RSSI measurement is defined as an intra-frequency measurement provided that the RSSI measurement bandwidth is fully contained within the current carrier bandwidth of the UE.

The UE physical layer shall be capable of performing the RSSI measurements, defined in TS 38.215 [4] on one or more serving carriers operating with CCA, TS 37.213 [33], if the carrier(s) are indicated by higher layers [2], and report the RSSI measurements to higher layers. The UE physical layer shall provide to higher layers a single RSSI sample for each OFDM symbol within each configured RSSI measurement duration [2] occurring with a configured RSSI measurement timing configuration periodicity [2], *rmtc-Periodicity*.

The UE can perform RSSI measurements without measurement gaps if RSSI measurement bandwidth is fully within the active DL BWP of the UE.

For performing intra-frequency RSSI measurement in FR2-2, UE shall assume the configured RSSI measurement resources are QCL-ed with TypeD to the DL RS associated with the TCI state provided in the RMTC configuration. UE does not expect to be configured with an explicit TCI-state in RMTC-Config with a reference serving cell in FR1 or FR2-1. If no TCI state is provided in the RMTC configuration, UE shall assume the configured RSSI measurement resources are QCL-ed with TypeD to one of the latest received PDSCH and the latest monitored CORESET in the active BWP of the current carrier in FR2-2.

For RSSI measurement in FR2-2 with SCS of 480 kHz or 960 kHz, the RSSI measurement results shall be derived based on symbols configured by RMTC except for the first symbol and the last symbol in RMTC, and there is no requirement when *measDurationSymbols* is configured as 1.

The measurement period for intra-frequency RSSI measurements without measurement gaps is as shown in table 9.2A.7.1-1 and table 9.2A.7.1-2, for FR1, and in table 9.2A.7.4-1 and table 9.2A.7.5-1 for FR2-2. The measurement period for intra-frequency RSSI measurements with measurement gaps is as shown in table 9.2A.7.1-3, for FR1 and in table 9.2A.7.1-6 for FR2-2.

**Table 9.2A.7.1-1: Measurement period for intra-frequency RSSI measurements without measurement gaps when SMTC and RMTC are overlapping (FR1)**

| Condition NOTE1,2 | $T_{RSSI_measurement_period_intra_cca}$ |
|---|---|

|---|---|
| No DRX | max(*reportInt*erval, $N_{intra-MO}$**rmtc-Periodicity*) |
| DRX | max(*reportInt*erval, $N_{intra-MO}$*max(*rmtc-Periodicity*, DRX cycle)) |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: $N_{intra-MO}$ is defined as the number of measurement objects that can be measured without gaps | |

**Table 9.2A.7.1-6: Measurement period for intra-frequency RSSI measurements with measurement gaps (FR2-2)**

| Condition NOTE1,2 | $T_{RSSI_measurement_period_intra_cca}$ |
|---|---|
| No DRX | max(*reportInterval*, max(*rmtc-Periodicity, MGRP*) x $CSSF_{intra}$) |
| DRX | max(*reportInterval*, max(*rmtc-Periodicity*, MGRP,DRX cycle) x $CSSF_{intra}$) |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: $CSSF_{intra}$ is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps. | |

If the UE requires measurement gaps to perform intra-frequency measurements, a single measurement gap pattern is used for all concurrent intra-frequency measurements, including intra-frequency RSSI measurements. The RSSI measurement duration and the measurement gap shall be aligned, and the following additional condition shall be fulfilled:

- Entire RSSI measurement duration is contained in the measurement gap.

The RSSI measurement performed and reported according to this clause shall meet the RSSI measurement accuracy requirement in clause 10.1.34.1. The reported RSSI measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.34.3.

## 9.2A.7.2 Intra-frequency Channel occupancy measurements

The UE shall be capable of estimating the channel occupancy on one or more serving carrier frequencies indicated by higher layers [2], based on RSSI samples provided by the physical layer.

The UE can perform channel occupancy measurements without measurement gaps if RSSI measurement bandwidth is fully within the active DL BWP of the UE.

The measurement period for intra-frequency channel occupancy measurements without measurement gap is as shown in table 9.2A.7.2-1 and table 9.2A.7.1-2 for FR1, and in table 9.2A.7.2-4 and table 9.2A.7.1-5 for FR2-2. The

measurement period for intra-frequency RSSI measurements with measurement gaps is as shown in table 9.2A.7.2-3 for FR1, and in table 9.2A.7.2-6 for FR2-2.

**Table 9.2A.7.2-1: Measurement period for intra-frequency Channel Occupancy measurements without measurement gaps when SMTC and RMTC are overlapping (FR1)**

|---|---|
| No DRX | max(*reportInterval*, *rmtc-Periodicity**$CSSF_{outside_gap,i}$) |
| DRX | max(*reportInterval*, max(*rmtc-Periodicity*, DRX cycle) *$CSSF_{outside_gap,i}$) |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: $CSSF_{outside_gap,i}$ is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1 for measurement conducted outside measurement gap. | |

**Table 9.2A.7.2-5: Measurement period for intra-frequency Channel Occupancy measurements without measurement gaps when SMTC and RMTC are not overlapping (FR2-2)**

| Condition NOTE1,2 | $T_{RSSI_measurement_period_intra_cca}$ |
|---|---|
| No DRX | max(*reportInt*erval, $N_{intra-MO}$**rmtc-Periodicity*) |
| DRX | max(*reportInt*erval, $N_{intra-MO}$*max(*rmtc-Periodicity*, DRX cycle)) |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: $N_{intra-MO}$ is defined as the number of measurement objects that can be measured without gaps | |

**Table 9.2A.7.2-6: Measurement period for intra-frequency Channel Occupancy measurements with measurement gaps (FR2-2)**

| Condition NOTE1,2 | $T_{RSSI_measurement_period_intra_cca}$ |
|---|---|
| No DRX | max(*reportInterval*, max(*rmtc-Periodicity, MGRP*) x $CSSF_{intra}$) |
| DRX | max(*reportInterval*, max(*rmtc-Periodicity*, MGRP,DRX cycle) x $CSSF_{intra}$) |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: $CSSF_{intra}$ is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps. | |

If the UE requires measurement gaps to perform intra-frequency measurements, a single measurement gap pattern is used for all concurrent intra-frequency measurements, including intra-frequency RSSI measurements. The RSSI measurement duration and the measurement gap shall be aligned, and the following additional condition shall be fulfilled:

- Entire RSSI measurement duration is contained in the measurement gap.

The channel occupancy measurement performed and reported according to this clause shall meet the channel occupancy measurement accuracy requirements in clause 10.1.35.1. The reported channel occupancy measurement values contained in measurement reports shall be based on the measurement reporting range specified in TS 38.331 [2].

### 9.2A.7.3 Scheduling restriction during RSSI and Channel Occupancy measurements in FR1

When the UE performs intra-frequency RSSI/CO measurements in unlicensed spectrum, the following restrictions apply due to RSSI/CO measurements:

- The UE is not expected to transmit PUCCH/PUSCH/SRS on UL symbols which are overlapping in time with the RSSI measurement symbols configured by RMTC.

When intra-band carrier aggregation in unlicensed spectrum is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

### 9.2A.7.4 Scheduling restriction during RSSI measurements in FR2-2

When the UE performs intra-frequency RSSI measurements in unlicensed spectrum, the following restrictions apply due to RSSI measurements:

- The UE is not expected to transmit PUCCH/PUSCH/SRS on UL symbols which are overlapping in time with the RSSI measurement symbols configured by RMTC.
- The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on symbols which are overlapping in time with RSSI measurement symbols configured by RMTC if the RSSI measurement resources are not QCL-ed with typeD to the DL RS in the active TCI state of PDCCH/PDSCH.
- For 480 kHz and 960 kHz, The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on symbols which are overlapping in time with the first and last RSSI measurement symbols configured by RMTC.

When intra-band carrier aggregation in unlicensed spectrum is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

## 9.2B NR intra-frequency measurements for RedCap

### 9.2B.1 Introduction

A measurement is defined as a SSB based intra-frequency measurement provided the centre frequency of the reference SSB of the serving cell and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same. The reference SSB is the SSB defined in BWP-specific *servingCellMO* under *BWP-DownlinkDedicated* of active DL BWP. If the field is absent, the reference SSB is the SSB defined in *servingCellMO* under *ServingCellConfig* [2].

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- the SSB is completely contained in the active BWP of the UE, or

- the active downlink BWP is initial BWP [3].

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.2B.5.3.

SSB based measurements are configured along with one or two measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements are to be performed. For intra-frequency connected mode measurements, up to two measurement window periodicities may be configured. A single measurement window offset and measurement duration are configured per intra-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB which start earlier than the gap starting time + switching time, nor detect SSB which end later than the gap end – switching time. Switching time is 0.5 ms for frequency range FR1 and 0.25 ms for frequency range FR2.

## 9.2B.2 Requirements applicability

The requirements in clause 9.2B apply, provided:

- The cell being identified or measured is detectable.

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- For 2Rx RedCap:
  - SS-RSRP related side conditions given in clauses 10.1.2 and 10.1.3 for FR1 and FR2, respectively, for a corresponding band,
  - SS-RSRQ related side conditions given in clauses 10.1.7 and 10.1.8 for FR1 and FR2, respectively, for a corresponding band,
  - SS-SINR related side conditions given in clauses 10.1.12 and 10.1.13 for FR1 and FR2, respectively, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding band.
- For 1Rx RedCap:
  - SS-RSRP related side conditions given in clauses 10.1A.2 for FR1 for a corresponding band,
  - SS-RSRQ related side conditions given in clauses 10.1A.6 for FR1 for a corresponding band,
  - SS-SINR related side conditions given in clauses 10.1A.10 for FR1 for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.15 for a corresponding band.

## 9.2B.3 Number of cells and number of SSB

### 9.2B.3.1 Requirements for FR1

For each intra-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 8 identified cells, and
- 14 SSBs with different SSB index and/or PCI on the intra-frequency layer, where the number of SSBs in the serving cell is not smaller than the number of configured RLM-RS SSB resources.

### 9.2B.3.2 Requirements for FR2

For one single intra-frequency layer in a band, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 6 identified cells, and

- 24 SSBs with different SSB index and/or PCI,

where this single intra-frequency layer shall be:

- PCC when UE is configured with SA NR operation mode with PCC in the band.

## 9.2B.4 Measurement Reporting Requirements

### 9.2B.4.1 Periodic Reporting

For 2Rx RedCap: The requirements in clause 9.2.4.1 shall apply.

For 1Rx RedCap: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1A.2.1 (SS-RSRP for FR1), 10.1A.6.1 (SS-RSRQ for FR1) and 10.1A.10.1 (SS-SINR for FR1), respectively.

### 9.2B.4.2 Event-triggered Periodic Reporting

For 2Rx RedCap: The requirements in clause 9.2.4.2 shall apply.

For 1Rx RedCap: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.1A.2.1 (SS-RSRP for FR1), 10.1A.6.1 (SS-RSRQ for FR1) and 10.1A.10.1 (SS-SINR for FR1), respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.2B.4.3.

### 9.2B.4.3 Event Triggered Reporting

For 2Rx RedCap: The requirements in clause 9.2.4.3 shall apply.

For 1Rx RedCap: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1A.2.1 (SS-RSRP for FR1), 10.1A.6.1 (SS-RSRQ for FR1) and 10.1A.10.1 (SS-SINR for FR1), respectively.

The UE shall not send any event triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify\ intra\ with\ index_RedCap}$ or $T_{identify\ intra\ without\ index_RedCap}$ defined in clause 9.2B.5.1 or clause 9.2B.6.1. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_intra_without_index_RedCap}$ or $T_{identify_intra_with_index_RedCap}$ as defined in clause 9.2B.5.1 or clause 9.2B.6.1. If a cell which has been detectable at least for the time period $T_{identify\ intra\ without\ index_RedCap}$ or $T_{identify\ intra\ with\ index_RedCap}$ defined in clause 9.2B.5.1 or clause 9.2B.6.1 becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_RedCap}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

# 9.2B.5 Intra-frequency measurements without measurement gaps

## 9.2B.5.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_RedCap}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index(*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra frequency cell within $T_{identify_intra_with_index_RedCap}$. The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index_RedCap.}$ It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2.

$$T_{identify_intra_without_index_RedCap} = (T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap})\ ms$$

$$T_{identify_intra_with_index_RedCap} = (T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap} + T_{SSB_time_index_intra_RedCap})\ ms$$

Where:

$T_{PSS/SSS_sync_intra_RedCap}$: it is the time period used in PSS/SSS detection given in tables 9.2B.5.1-1, 9.2B.5.1-2, 9.2B.5.1-3.

$T_{SSB_time_index_intra_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in tables 9.2B.5.1-4, 9.2B.5.1-5

$T_{SSB_measurement_period_intra_RedCap}$: equal to a measurement period of SSB based measurement given in table 9.2B.5.2-1, table 9.2B.5.2-2, table 9.2B.5.2-3.

$CSSF_{intra_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap_RedCap,i}$ in clause 9.1A.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps, or according to $CSSF_{within_gap_RedCap,i}$ in clause 9.1A.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps.

If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

For 2Rx RedCap:

$M_{pss/sss_sync_w/o_gaps_RedCap}$ : For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_w/o_gaps_RedCap}$ =40. For a UE supporting power class 2, 3, 4 or 7, $M_{pss/sss_sync_w/o_gaps_RedCap}$ =24.

$M_{meas_period_w/o_gaps_RedCap}$ : For a UE supporting power class 1 or 5, $M_{meas_period_w/o_gaps_RedCap}$ =40. For a UE supporting FR2 power class 2, 3, 4, or 7, $M_{meas_period_w/o_gaps_RedCap}$ =24.

When intra-frequency SMTC is fully non overlapping with measurement gaps or intra-frequency SMTC is fully overlapping with MGs, $K_p$=1.

When intra-frequency SMTC is partially overlapping with measurement gaps, $K_p$ = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP. For calculation of $K_p$, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index_RedCap}$ or $T_{identify_intra_with_index_RedCap}$

For FR2,

$K_{layer1_measurement}$=1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by intra-frequency SMTC occasions, or

- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by intra-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged. and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$=1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

**Table 9.2B.5.1-1: Time period for PSS/SSS detection, (FR1) for 2Rx RedCap UE**

| DRX cycle | $T_{PSS/SSS_sync_intra_RedCap}$ |
|---|---|

| |
|---|
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified |

### 9.2B.5.2 Measurement period

The measurement period for intra-frequency measurements without gaps is as shown in table 9.2B.5.2-1, 9.2B.5.2-2, 9.2B.5.2-3.

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and smtc2 is partially overlapping with measurement gaps, requirements are not specified for $T_{SSB_measurement_period_intra_RedCap}$.

For FR2, a longer measurement period is allowed, if aperiodic CSI-RS resource is measured for L1-RSRP measurement on any FR2 serving frequency in the same band, and the CSI-RS resource is outside measurement gap and overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols. If *SSB-ToMeasure* or *SS-RSSI-Measurement* is configured, the SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same band which can be merged and the RSSI symbols are indicated by *SS-RSSI-Measurement*.

**Table 9.2B.5.2-1: Measurement period for intra-frequency measurements without gaps (FR1) for 2Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_intra_RedCap}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_p$) x SMTC period)[Note 1] x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ ) x DRX cycle x $CSSF_{intra_RedCap}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.2B.5.2-2: Measurement period for intra-frequency measurements without gaps (FR2) for 2Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_intra_RedCap}$ |
|---|---|
| No DRX | max(400 ms, ceil($M_{meas_period_w/o_gaps_RedCap}$ x $K_p$ x $K_{layer1_measurement}$) x SMTC period)[Note 1] x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(400 ms, ceil(1.5x $M_{meas_period_w/o_gaps_RedCap}$ x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | ceil($M_{meas_period_w/o_gaps_RedCap}$ x$K_p$ x $K_{layer1_measurement}$ ) x DRX cycle x $CSSF_{intra_RedCap}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.2B.5.2-3: Measurement period for intra-frequency measurements without gaps (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_intra_RedCap}$ |
|---|---|
| No DRX | max([200]ms, ceil( [5] x $K_p$) x SMTC period)[Note 1] x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max([200]ms, ceil(1.5x [5] x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | ceil( [5] x $K_p$ ) x DRX cycle x $CSSF_{intra_RedCap}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

### 9.2B.5.3 Scheduling availability of UE during intra-frequency measurements

UE shall be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged

[2], if it is configured; otherwise, all *L* SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

#### 9.2B.5.3.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

#### 9.2B.5.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If the following conditions are met:

  - The UE has been notified about system information update through paging,

  - The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

- The UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and/or the corresponding PDSCH, on SSB symbols to be measured.

#### 9.2B.5.3.3 Scheduling availability of UE performing measurements on FR2

The following scheduling restriction applies due to SS-RSRP or SS-SINR measurement on an FR2 intra-frequency cell

> The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration (The signaling *deriveSSB_IndexFromCell* is always enabled for FR2). If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 intra-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB

to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration (The signaling *deriveSSB_IndexFromCellc* is always enabled for FR2). If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

If following conditions are met:

- The UE has been notified about system information update through paging,
- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots.

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE shall receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

#### 9.2B.5.3.4 Scheduling availability of HD-FDD UE performing measurements on FR1

When the HD-FDD UE performs intra-frequency measurements in a FR1 band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- If *deriveSSB-IndexFromCell* is enabled, the UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.
- If *deriveSSB-IndexFromCell* is not enabled, the UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When the HD-FDD UE performs intra-frequency measurements in a FR1 band, the following restrictions apply due to SS-RSRQ measurement

- If *deriveSSB-IndexFromCell* is enabled, the UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.
- If *deriveSSB-IndexFromCell* is not enabled, the UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

## 9.2B.6 Intra-frequency measurements with measurement gaps

### 9.2B.6.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index_RedCap.}$ The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index_RedCap.}$ It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2.

$$T_{identify_intra_without_index_RedCap} = T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap}\ ms$$

$$T_{identify_intra_with_index_RedCap} = T_{PSS/SSS_sync_intra_RedCap} + T_{SSB_measurement_period_intra_RedCap} + T_{SSB_time_index_intra_RedCap}\ ms$$

Where:

$T_{PSS/SSS_sync_intra_RedCap}$: it is the time period used in PSS/SSS detection given in table 9.2B.6.1-1 or 9.2B.6.1-2 or 9.2B.6.1-3.

$T_{SSB_time_index_intra_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2B.6.1-4 or 9.2B.6.1-5.

$T_{SSB_measurement_period_intra_RedCap}$: equal to a measurement period of SSB based measurement given in table 9.2B.6.2-1 or 9.2B.6.2-2 or 9.2B.6.2-3.

$CSSF_{intra_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap_RedCap,i}$ in clause 9.1A.5.2 for measurement conducted within measurement gaps.

For 2Rx RedCap:

$M_{pss/sss_sync_with_gaps_RedCap}$ : For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync\ with_gaps_RedCap}$ =40. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{pss/sss_sync\ with_gaps_RedCap}$ =24.

$M_{meas_period_with_gaps_RedCap}$: For a UE supporting power class 1 or 5, $M_{meas_period_with_gaps_RedCap}$ =40. For a UE supporting power class 2, 3, 4, or 7, $M_{meas_period_with_gaps_RedCap}$ =24.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index_RedCap}$ or $T_{identify_intra_with_index_RedCap}$.

**Table 9.2B.6.1-1: Time period for PSS/SSS detection (FR1) for 2Rx RedCap UE**

| DRX cycle | $T_{PSS/SSS_sync_intra_RedCap}$ |
|---|---|
| No DRX | max(600 ms, 5 x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5 x 5) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | 5 x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

**Table 9.2B.6.1-2: Time period for PSS/SSS detection (FR2) for 2Rx RedCap UE**

| DRX cycle | $T_{PSS/SSS_sync_intra_RedCap}$ |
|---|---|
| No DRX | max(600 ms, $M_{pss/sss_sync_with_gaps_RedCap}$ x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5x $M_{pss/sss_sync_with_gaps_RedCap}$) x max(MGRP, SMTC period, DRX cycle)) x $CSSF_{intra_RedCap_RedCap}$ |
| DRX cycle>320 ms | $M_{pss/sss_sync_with_gaps_RedCap}$ x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

**Table 9.2B.6.1-3: Time period for PSS/SSS detection (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{PSS/SSS_sync_intra_RedCap}$ |
|---|---|
| No DRX | max(600 ms, 7 x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5 x 7) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | 7 x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

**Table 9.2B.6.1-4: Time period for time index detection (FR1) for 2Rx RedCap UE**

| DRX cycle | $T_{SSB_time_index_intra_RedCap}$ |
|---|---|
| No DRX | max(120 ms, 3 x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil(1.5 x 3) x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra_RedCap}$) |
| DRX cycle>320 ms | 3 x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

**Table 9.2B.6.1-5: Time period for time index detection (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{SSB_time_index_intra_RedCap}$ |
|---|---|
| No DRX | max(160 ms, 6 x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(160 ms, ceil(1.5 x 6) x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra_RedCap}$) |
| DRX cycle>320 ms | [6] x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

### 9.2B.6.2 Intra-frequency Measurement Period

The measurement period for FR1 intra-frequency measurements with gaps is as shown in table 9.2B.6.2-1 and in table 9.2B.6.2-3.

The measurement period for FR2 intra-frequency measurements with gaps is as shown in table 9.2B.6.2-2.

For either an FR1 or FR2 serving cell, longer measurement period would be expected during the period $T_{identify_CGI_RedCap}$ when the UE is requested to decode an NR CGI.

**Table 9.2B.6.2-1: Measurement period for intra-frequency measurements with gaps (FR1) for 2Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_intra_RedCap}$ |
|---|---|
| No DRX | max(200 ms, 5 x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | 5 x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

**Table 9.2B.6.2-2: Measurement period for intra-frequency measurements with gaps (FR2) for 2Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_intra_RedCap}$ |
|---|---|
| No DRX | max(400 ms, $M_{meas_period\ with_gaps_RedCap}$ x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(400 ms, ceil(1.5 x $M_{meas_period\ with_gaps_RedCap}$) x max(MGRP, SMTC period, DRX cycle)) [Note 1] x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | $M_{meas_period\ with_gaps_RedCap}$ x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

**Table 9.2B.6.2-3: Measurement period for intra-frequency measurements with gaps (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_intra_RedCap}$ |
|---|---|
| No DRX | max([200] ms, [5] x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max([200] ms, ceil(1.5x [5]) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | [5] x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

## 9.2C NR intra-frequency measurements for SAN

### 9.2C.1 Introduction

The requirements in clause 9.2C apply for intra-frequency measurements on an SAN carrier frequency. The requirements apply provided that the valid parameters of ephemeris information, epoch time of the ephemeris, common TA, validity timer information, downlink polarization information for target NR SAN cell are sent to UE.

A measurement is defined as a SSB based intra-frequency measurement provided the centre frequency of the SSB of the serving cell indicated for measurement and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same.

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- the UE indicates ‘no-gap’ via *intraFreq-needForGap* for intra-frequency measurement, or
- the SSB is completely contained in the active BWP of the UE, or
- the active downlink BWP is initial BWP[3].

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.2C.5.3.

SSB based measurements are configured along with one or more measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements are to be performed. For intra-frequency connected mode measurements,

- when *SSB-MTC4List-r17* is not configured, up to two measurement window periodicities may be configured with *SSB-MTC* and *SSB-MTC2*
- when *SSB-MTC4List-r17* is configured, multiple measurement window offsets may be configured with *SSB-MTC* and *SSB-MTC4List-r17*, and the requirements in clause 9.2C apply provided that the total number of measurement window offsets does not exceed the UE capability *parallelSMTC-r17*

When measurement gaps are needed, the UE is not expected to detect SSB which start earlier than the gap starting time + switching time, nor detect SSB which end later than the gap end – switching time. Switching time is 0.5 ms for frequency range FR1-NTN.

The intra-frequency measurement requirements in clause 9.2C.5 applies for the following scenarios:

- SSB based intra-frequency measurements with no measurement gap,
- for a UE supporting concurrent gaps and when concurrent gaps are configured:
  - When none of the SMTC occasions of this intra-frequency measurement object are overlapped by the union of concurrent measurement gaps.
  - When part of the SMTC occasions of this intra-frequency measurement object are overlapped by the union of concurrent measurement gaps.
- otherwise, for a UE not supporting concurrent gaps or if concurrent gaps are not configured:
  - When none of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.
  - When part of the SMTC occasions of this intra-frequency measurement object are overlapped by the measurement gap.

The intra-frequency measurement requirements in clause 9.2C.6 applies for the following scenarios:

- SSB based intra-frequency measurements with measurement gap,
- SSB based intra-frequency measurements with no measurement gap,
- for a UE supporting concurrent gaps and when concurrent gaps are configured:
  - when all of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated measurement gap in the concurrent measurement gaps, or
  - when part of the SMTC occasions of this intra-frequency measurement object are overlapped with the associated measurement gap and all the SMTC occasions of this intra-frequency measurement object are overlapped with the union of concurrent measurement gaps.
- otherwise, for a UE not supporting concurrent gaps or if concurrent gaps are not configured:
- when all of the SMTC occasions of this intra-frequency measurement object are overlapped with the measurement gap.

The requirements in clause 9.2C.7 and 9.2C.8 apply provided that the measured NR SAN cell is served by the same satellite as the serving cell.

The requirements in clause 9.2C.6 and 9.2C.8 do not apply if the MG is fully overlapping with the serving cell SSB occasions, and the serving cell SSB is with a 160 ms periodicity.

If more than one SMTC periodicities are configured for an intra-frequency carrier, the SMTC periodicity in the requirement in clause 9.2C is the one used by the cell being identified.

## 9.2C.2 Requirements applicability

The requirements in clause 9.2C apply, provided:

- The cell being identified or measured is detectable.
- Valid information for the satellite serving the target cell has been provided

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.2C for FR1-NTN and 10.1.3C for FR2-NTN, for a corresponding band,
- SS-RSRQ related side conditions given in clauses 10.1.7C for FR1-NTN and 10.1.8C for FR2-NTN, for a corresponding band,
- SS-SINR related side conditions given in clauses 10.1.12C for FR1-NTN and 10.1.13C for FR2-NTN, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.17 for a corresponding band.

## 9.2C.3 Number of cells and number of SSB

### 9.2C.3.1 Requirements for FR1-NTN

For each intra-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 8 identified cells, and
- 8 SSBs with different SSB index and/or PCI on the intra-frequency layer, where the number of SSBs in the serving cell (except for the SCell) is not smaller than the number of configured RLM-RS SSB resources.
- 4 SSBs with different SSB index and/or PCI from neighbour cells in GEO deployment.
- In NGSO deployments: cells from 2 satellites including the satellite serving the PCell if UE does not support the capability *maxNumber-NGSO-SatellitesPerCarrier-r17*; or cells from 3 or 4 satellites including the satellite serving the PCell, depending on the value indicated in *maxNumber-NGSO-SatellitesPerCarrier-r17*.

## 9.2C.4 Measurement Reporting Requirements

### 9.2C.4.1 Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2C.1 (RSRP for FR1-NTN) , 10.1.3C (RSRP for FR2-NTN), 10.1.7C.1 (RSRQ for FR1-NTN), 10.1.8C (RSRQ for FR2-NTN), 10.1.12C.1 (RS-SINR for FR1-NTN) and 10.1.13C (RS-SINR for FR2-NTN).

### 9.2C.4.2 Event-triggered Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.1.2C.1 (RSRP for FR1-NTN), 10.1.3C (RSRP for FR2-NTN), 10.1.7C.1 (RSRQ for FR1-NTN), 10.1.8C (RSRQ for FR2-NTN), 10.1.12C.1 (RS-SINR for FR1-NTN) and 10.1.13C (RS-SINR for FR2-NTN).

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.2C.4.3.

### 9.2C.4.3 Event Triggered Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.2C.1 (RSRP for FR1-NTN), 10.1.3C (RSRP for FR2-NTN), 10.1.7C.1 (RSRQ for FR1-NTN), 10.1.8C (RSRQ for FR2-NTN), 10.1.12C.1 (RS-SINR for FR1-NTN) and 10.1.13C (RS-SINR for FR2-NTN).

The UE shall not send any event triggered measurement reports as long as no reporting criteria is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify\ intra\ with\ index}$ or $T_{identify\ intra\ without\ index}$ defined in clause 9.2C.5.1 or clause 9.2C.6.2. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ as defined in clause 9.2C.5.1 or clause 9.2C.6.2. When L3 filtering is used, an additional delay can be expected.

## 9.2C.5 Intra-frequency measurements without measurement gaps

### 9.2C.5.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index(*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra frequency cell within $T_{identify_intra_with_index}$. The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index}$.

$$T_{identify_intra_without_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra})\ ms$$

$$T_{identify_intra_with_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra})\ ms$$

Where:

$T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2C.5.1-1

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2C.5.1-2 , and 9.2C.5.1-3 with 12 PRB SSB BW.

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2C.5.2-1

$K_{multi_SMTC}$ is the scaling factor for measurement of multiple SMTCs or multiple satellites, and

if SMTCs do not overlap with each other,

- $K_{multi_SMTC} = 1$, if GEO satellites are measured on the carrier;
- $K_{multi_SMTC} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;

if SMTCs partially overlap with each other,

- $K_{multi_SMTC} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
- $K_{multi_SMTC} = \max_j (\sum_{i=1}^{N_{SMTC,overlap,j}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil)$, if only LEO satellites are measured on the carrier;

where

- $N_{LEO,i}$ is the number of LEO satellites to be measured within i-th SMTC,
- $N_{LEO,simul}$ is the number of LEO satellites that UE can measure in parallel within an SMTC,
- $N_{SMTC,overlap,j}$ is the number of j-th occasion of SMTCs that partially overlap with each other.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined

according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1.

if the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

$K_p$ is the scaling factor for an SSB frequency layer to be measured without measurement gaps. $K_p = N_{total_SAN} / N_{available_SAN}$, where $N_{available_SAN}$ and $N_{total_SAN}$ are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where
  - If UE supports *parallelMeasurementGap-r17* and is configured with concurrent measurement gaps, MGRP_max is the maximum MGRP across all configured per-UE measurement gap. Otherwise, MGRP_max is the MGRP of configured measurement gap.
  - Starting from the beginning of any SMTC occasion:
    - $N_{total_SAN}$ is the total number of SMTC occasions within the window, including those overlapped and non-overlapped with measurement gap occasions within the window, and
    - $N_{available_SAN}$ is the number of SMTC occasions within the window W that do not collide with any non-dropped MG occasion within the window W, after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1C.8.3. The collision rule between SMTC occasion and measurement gap occasion is defined in clause 9.1C.9.2

$K_p = 1$ when intra-frequency SMTC is fully non overlapping with measurement gaps.

For calculation of $K_p$, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*. If the high layer signalling (TS 38.331 [2]) of *smtc4* or *smtc5* is configured, the SMTC occasions correspond to those used by the cell being identified.

$K_{layer1_measurement}$: it is scaling factor for sharing between L3 and L1 measurement, and $K_{layer1_measurement}$ =1, if GEO satellites are measured on the carrier, or if LEO satellites are measured on the carrier and UE supports *parallelMeasurementWithoutRestriction-r17*, otherwise

$K_{layer1_measurement}$ =1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting outside measurement gap are not fully overlapped by the union of intra-frequency SMTC occasions, or
- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting outside measurement gap are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols in the intra-frequency SMTC occasions corresponding to those used by the cell being identified, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$ =1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$

**Table 9.2C.5.1-1: Time period for PSS/SSS detection, (Frequency range FR1-NTN)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max( 600 ms, ceil( 5 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x SMTC period )[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max( 600 ms, ceil(1.5 x 5 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil(5 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.2C.5.1-2: Time period for time index detection (FR1-NTN)**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(120 ms, ceil( 3 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil (1.5 x 3 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil(3 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.2C.5.1-3: Time period for time index detection (FR1) for a target cell with 12 PRB SSB**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(120ms, ceil(7 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320ms | max(120ms, ceil (1.5 x 7 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320ms | Ceil (7 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

The UE is allowed to skip measurements on intra-frequency cells, in the interval between *t-serviceStart* and the satellite switch completion, when it is performing soft satellite switching with resynchronization. In this case, for the measurement initiated but not completed before the beginning interval, the total time to detection can be longer.

The requirements in clause 9.2C.5.1 and 9.2C.5.2 are not applicable when the overall overhead ratio due to scheduling restriction caused by all configured SMTCs (i.e. scheduling restriction overhead of all SMTCs in one SMTC periodicity), is larger than 75%.

## 9.2C.5.2 Measurement period

The measurement period for intra-frequency measurements without gaps is as shown in table 9.2C.5.2-1.

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{SSB_measurement_period_intra}$

**Table 9.2C.5.2-1: Measurement period for intra-frequency measurements without gaps (FR1-NTN)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

### 9.2C.5.3 Scheduling availability of UE during intra-frequency measurements

When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged [2], if it is configured; otherwise, all *L* SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included. For UL, the scheduling restriction applies to UL symbols that fully or partially overlap with the restricted symbols as defined below.

#### 9.2C.5.3.1 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1-NTN

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If *deriveSSB-IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer signalling of *smtc2* is configured(in TS 38.331 [2]), the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB-IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

The UE is expected to receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and/or the corresponding PDSCH, on SSB symbols to be measured. if the following conditions are met:

- The UE has been notified about system information update through paging,

- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

#### 9.2C.5.3.2 Scheduling availability of UE performing measurements on a neighbor cell served by a different satellite in LEO

For UE which does not support the capability *parallelMeasurementWithoutRestriction-r17* the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement on a neighbor cell served by a different satellite in LEO.

- If *deriveSSB-IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer signalling of *smtc2* is configured(in TS 38.331 [2]), the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB-IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If the following conditions are met:

  - The UE has been notified about system information update through paging,

  - The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

- The UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and/or the corresponding PDSCH, on SSB symbols to be measured.

# 9.2C.6 Intra-frequency measurements with measurement gaps

## 9.2C.6.1 Void

## 9.2C.6.2 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index}$. The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index}$.

$$T_{identify_intra_without_index} = T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} \text{ ms}$$

$$T_{identify_intra_with_index} = T_{PSS/SSS_sync_ntra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra} \text{ ms}$$

Where:

$T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2C.6.2-1.

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2C.6.2-2 , and 9.2C.6.2-3 with 12 PRB SSB BW..

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2C.6.3-1.

$K_{gap}$ is the scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap}$ = 1 when the UE is not configured with concurrent measurement gaps. When the UE is configured with concurrent measurement gaps and the two measurement gaps are fully overlapping with MGRP=160ms, $K_{gap}$ = 2. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

For a window W of duration max(SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gap, and starting from the beginning of any SMTC occasion:

- $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other measurement gap occasions within the window, and
- $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1C.8.3.

$K_{gap}$ is only applicable for UE supporting *parallelMeasurementGap-r17*. When concurrent measurement gaps are configured, requirements in this clause do not apply if $N_{available}$ =0, or if one SMTC overlaps with more than one MGs associated to the frequency layer. For calculation of $K_{gap}$, if the high layer signalling (TS 38.331 [2]) of *smtc4* or *smtc5* is configured, the SMTC occasions correspond to those used by the cell being identified.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

$K_{multi_SMTC}$ is the scaling factor for measurement of multiple SMTCs or multiple satellites, and

if SMTCs within a measurement gap do not overlap with each other,

- $K_{multi_SMTC} = 1$, if GEO satellites are measured on the carrier;
- $K_{multi_SMTC} = \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil$, if LEO satellites are measured on the carrier;

if SMTCs within a measurement gap partially overlap with each other,

- $K_{multi_SMTC} = N_{SMTC,overlap}$, if only GEO satellites are measured on the carrier;
- $K_{multi_SMTC} = \max_j \left( \sum_{i=1}^{N_{SMTC,overlap,j}} \left\lceil \frac{N_{LEO,i}}{N_{LEO,simul}} \right\rceil \right)$, if only LEO satellites are measured on the carrier;

where

- $N_{LEO,i}$ is the number of LEO satellites to be measured within i-th SMTC,
- $N_{LEO,simul}$ is the number of LEO satellites that UE can measure in parallel within an SMTC,
- $N_{SMTC,overlap,j}$ is the number of j-th occasion of SMTCs that partially overlap with each other.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$.

**Table 9.2C.6.2-1: Time period for PSS/SSS detection (FR1-NTN)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max(600 ms, 5 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5 x 5) x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | 5 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

**Table 9.2C.6.2-2: Time period for time index detection (FR1-NTN)**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(120 ms, 3 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil(1.5 x 3) x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra}$) |
| DRX cycle>320 ms | 3 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

**Table 9.2C.6.2-3: Time period for time index detection (Frequency range FR1) for a target cell with 12 PRB SSB**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(120ms, 7 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320ms | max(120ms, ceil(1.5 x 7) x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra}$) |
| DRX cycle>320ms | 7 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

### 9.2C.6.3 Intrafrequency Measurement Period

The measurement period for FR1 intrafrequency measurements with gaps is as shown in table 9.2C.6.3-1.

**Table 9.2C.6.3-1: Measurement period for intra-frequency measurements with gaps (FR1-NTN)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, 5 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5) x $K_{multi_SMTC}$ x $K_{gap}$ x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | 5 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

The UE is allowed to skip measurements on intra-frequency cells, in the interval between *t-serviceStart* and the satellite switch completion, when it is performing soft satellite switching with resynchronization. In this case, for the measurement initiated but not completed before the beginning of this interval, the total time to measure can be longer.

## 9.2C.7 Intra-frequency measurements without measurement gaps for NTN band above 10 GHz

### 9.2C.7.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index(*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index}$. The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index}$.

$$T_{identify_intra_without_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra})\ ms$$

$$T_{identify_intra_with_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra})\ ms$$

Where:

$T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2C.7.1-1

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2C.7.1-2

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2C.7.2-1

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined

according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps, or according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps.

if the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

$K_p$ is the scaling factor for an SSB frequency layer to be measured without measurement gaps. $K_p = N_{total_SAN} / N_{available_SAN}$, where $N_{available_SAN}$ and $N_{total_SAN}$ are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where
  - If UE is configured with concurrent measurement gaps, MGRP max is the maximum MGRP across all configured per-UE measurement gap. Otherwise, MGRP max is the MGRP of configured measurement gap.
  - $N_{total_SAN}$ is the total number of SMTC occasions within the window, including those overlapped and non-overlapped with measurement gap occasions within the window, and
  - $N_{available_SAN}$ is the number of SMTC occasions within the window W that do not collide with any non-dropped MG occasion within or outside the window W, after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1C.8.3. The collision rule between SMTC occasion and measurement gap occasion is defined in clause 9.1C.9.1

$K_p$ = [1] when $N_{available_SAN} = 0$ and measurement gap sharing in clause 9.1.2.1a shall apply.

$K_p = 1$ when intra-frequency SMTC is fully non overlapping with measurement gaps.

For calculation of $K_p$, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

$K_{layer1_measurement}$: it is scaling factor for sharing between L3 and L1 measurement, and $K_{layer1_measurement} = 1$

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and smtc2 is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$

**Table 9.2C.7.1-1: Time period for PSS/SSS detection**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max( 600 ms, ceil( 5 x $K_p$ x $K_{layer1_measurement}$) x SMTC period )[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max( 600 ms, ceil(1.5 x 5 x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil(5 x $K_p$ x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.2C.7.1-2: Time period for time index detection**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(120 ms, ceil( 3 x $K_p$ x $K_{layer1_measurement}$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil (1.5 x 3 x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil(3 x $K_p$ x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

## 9.2C.7.2 Measurement period

The measurement period for intra-frequency measurements without gaps is as shown in table 9.2C.7.2-1.

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{SSB_measurement_period_intra}$

**Table 9.2C.7.2-1: Measurement period for intra-frequency measurements without gaps**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_p$ x $K_{layer1_measurement}$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

## 9.2C.7.3 Scheduling availability of UE during intra-frequency measurements

When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged [2], if it is configured; otherwise, all *L* SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included. For UL, the scheduling restriction applies to UL symbols that fully or partially overlap with the restricted symbols as defined below.

### 9.2C.7.3.1 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on NTN bands above 10 GHz

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured within SMTC window duration. If the high layer signalling of *smtc2* is configured(in TS 38.331 [2]), the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

## 9.2C.8 Intra-frequency measurements with measurement gaps for NTN band above 10 GHz

### 9.2C.8.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index}$. The UE shall be able to identify a new detectable intra frequency SS block of an already detected cell within $T_{identify_intra_without_index}$.

$$T_{identify_intra_without_index} = T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} \text{ ms}$$

$$T_{identify_intra_with_index} = T_{PSS/SSS_sync_ntra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra} \text{ ms}$$

Where:

$T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2C.8.2-1.

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2C.8.2-2.

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2C.8.3-1.

$K_{gap}$ is the scaling factor for a SSB frequency layer to be measured within an associated a measurement gap pattern. $K_{gap}$ = 1 when the UE is not configured with concurrent measurement gaps. When the UE is configured with concurrent measurement gaps and the two measurement gaps are fully overlapping with MGRP=160ms, $K_{gap}$ = 2. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where
  - If UE is configured with concurrent measurement gaps, MGRP max is the maximum MGRP across all configured per-UE measurement gap. Otherwise, MGRP max is the MGRP of configured measurement gap.
  - $N_{total}$ is the total number of SMTC occasions within the window, including those overlapped and non-overlapped with measurement gap occasions within the window, and
  - $N_{available}$ is the number of SMTC occasions within the window W that do not collide with any non-dropped MG occasion within or outside the window W, after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1C.8.3. The collision rule between SMTC occasion and measurement gap occasion is defined in clause 9.1C.9.1

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$.

**Table 9.2C.8.2-1: Time period for PSS/SSS detection**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max(600 ms, 5 x $K_{gap}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |

| | |
|---|---|
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5 x 5) x $K_{gap}$ x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | 5 x $K_{gap}$ x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

**Table 9.2C.8.2-2: Time period for time index detection**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(120 ms, 3 x $K_{gap}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil(1.5 x 3) x $K_{gap}$ x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra}$) |
| DRX cycle>320 ms | 3 x $K_{gap}$ x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

### 9.2C.8.3 Intra-frequency Measurement Period

The measurement period for intra-frequency measurements with gaps is as shown in table 9.2C.8.3-1.

**Table 9.2C.8.3-1: Measurement period for intra-frequency measurements with gaps**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, 5 x $K_{gap}$ x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5) x $K_{gap}$ x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | 5 x $K_{gap}$ x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

## 9.2D NR intra-frequency measurements for ATG

### 9.2D.1 Introduction

A measurement is defined as a SSB based intra-frequency measurement provided the SSB frequency configured in the measurement object associated with the serving cell indicated for measurement and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same.

The UE shall be able to identify new intra-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

The UE can perform intra-frequency SSB based measurements without measurement gaps if

- the UE indicates 'no-gap' via *intraFreq-needForGap* for intra-frequency measurement, or
- the SSB is completely contained in the active BWP of the UE, or
- the active downlink BWP is initial BWP[3].

The UE can perform intra-frequency SSB based measurement corresponding to a deactivated SCell with NCSG.

For intra-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.2D.5.3. SSB based measurements are configured along with one or two measurement timing configuration(s) (SMTC(s)) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements are to be performed. For intra-frequency connected mode measurements, up to two measurement window periodicities may be configured. A single measurement window offset and measurement duration are configured per intra-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB and measure RSSI of RSRQ which start earlier than the gap starting time + switching time, nor detect SSB and measure RSSI of RSRQ which end later than the gap end – switching time. Switching time is 0.5 ms for frequency range FR1.

The requirements in this clause shall also apply, when the UE is configured to perform SRS carrier based switching and using measurement gaps.

The measurement requirements defined for an activated SCell with a non-dormant active BWP defined in this clause shall also apply to an activated SCell with dormant BWP as active BWP.

## 9.2D.2 Requirements applicability

The requirements in clause 9.2D apply, provided:

- The cell being identified or measured is detectable.

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.2 for FR1, for a corresponding band,
- SS-RSRQ related side conditions given in clauses 10.1.7 for FR1, for a corresponding band,
- SS-SINR related side conditions given in clauses 10.1.12 for FR1, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding band.

## 9.2D.3 Number of cells and number of SSB

### 9.2D.3.1 Requirements for FR1

For each intra-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 8 identified cells, and
- 14 SSBs with different SSB index and/or PCI on the intra-frequency layer, where the number of SSBs in the serving cell (except for the SCell) is not smaller than the number of configured RLM-RS SSB resources.

## 9.2D.4 Measurement Reporting Requirements

### 9.2D.4.1 Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.7.1 (RSRQ for FR1) and 10.1.12.1 (RS-SINR for FR1).

### 9.2D.4.2 Event-triggered Periodic Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.7.1 (RSRQ for FR1) and 10.1.12.1 (RS-SINR for FR1).

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.2D.4.3.

### 9.2D.4.3 Event Triggered Reporting

Reported RSRP, RSRQ, and RS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.7.1 (RSRQ for FR1) and 10.1.12.1 (RS-SINR for FR1).

The UE shall not send any event triggered measurement reports as long as no reporting criteria is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify\ intra\ with\ index}$ or $T_{identify\ intra\ without\ index}$ defined in clause 9.2D.5.1 or clause 9.2D.6.2. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ as defined in clause 9.2D.5.1 or clause 9.2D.6.2. If a cell which has been detectable at least for the time period $T_{identify\ intra\ without\ index}$ or $T_{identify\ intra\ with\ index}$ defined in clause 9.2D.5.1 or clause 9.2D.6.2 becomes undetectable for a period ≤ 5 seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

### 9.2D.4.4 SCell activation Triggered Reporting

The requirements in this clause shall apply for the UE supporting *l3-MeasUnknownSCellActivation-r18* and reporting valid L3 measurement results after receiving the SCell activation command for unknown SCell.

Reported RSRP, RSRQ, and RS-SINR measurements contained in SCell activation triggered measurement reports shall meet the requirements in clauses 10.1.2.1 (RSRP for FR1), 10.1.7.1 (RSRQ for FR1) and 10.1.12.1 (RS-SINR for FR1).

The measurement reporting delay is defined as the time between the SCell activation command that will trigger a measurement report and the point when the UE starts to transmit the valid measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The SCell activation triggered measurement reporting delay shall be no larger than $T_{HARQ}$ + 3 ms + 4 ms, where

- $T_{HARQ}$ is the timing between DL data transmission and acknowledgement in ms as specified in TS 38.213 [3],
- 3 ms is the MAC CE decoding time.
- 4 ms is the processing time for preparing L3 report triggered by MAC CE.
- UE is expected to report the L3 results no earlier than 3 ms + $T_{HARQ}$ after receiving the SCell activation command.

The SCell activation triggered report is considered as valid if it fulfils the measurement requirements for a deactivated SCell as specified in table 9.2.5.2-3 (for FR1).

A cell is detectable only if at least one SSBs measured from the SCell being configured remains detectable during the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ as defined in clause 9.2.5.1. If a SCell which has been detectable at least for the time period $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$ defined in clause 9.2.5.1 becomes undetectable for a period ≤ 5 seconds and then the SCell becomes detectable again with the same spatial reception parameter, this cell is considered as detected provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3].

## 9.2D.5 Intra-frequency measurements without measurement gaps

### 9.2D.5.1 Intra-frequency cell identification

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index(*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra frequency cell within $T_{identify_intra_with_index}$. The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index}$.

$$T_{identify_intra_without_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra})\ ms$$

$$T_{identify_intra_with_index} = (T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra})\ ms$$

Where:

$T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2D.5.1-1 or table 9.2D.5.1-2 (CC with deactivated SCell).

$T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2D.5.1-3 or table 9.2D.5.1-4 (CC with deactivated SCell).

$T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2D.5.2-1 or table 9.2D.5.2-2 (CC with deactivated SCell).

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1D.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps, or according to $CSSF_{within_gap,i}$ in clause 9.1D.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps.

For a UE that supports Pre-MG, an SMTC occasion is only considered to be overlapped by Pre-MG if the Pre-MG is activated.

If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

When UE supports *concurrentMeasGap-r17* and is configured with concurrent measurement gaps,

$K_p$ is the scaling factor for an SSB frequency layer to be measured without measurement gaps. $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gap, and starting from the beginning of any SMTC occasion:
  - $N_{total}$ is the total number of SMTC occasions within the window, including those overlapped with measurement gap occasions within the window, and
  - $N_{available}$ is the number of SMTC occasions that are not overlapped with any non-dropped MG occasion within the window W, after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1.8.3.
- Otherwise, when UE is not configured with or UE does not support concurrent measurement gaps:

  When intra-frequency SMTC is fully non overlapping with measurement gaps, or intra-frequency SMTC is fully overlapping with MGs or NCSG, $K_p$=1

  When intra-frequency SMTC is partially overlapping with measurement gaps, $K_p$ = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP. For calculation of $K_p$, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*. If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$

For UE capable of *antennaArrayType-r18* on the measured carrier,

$K_{layer1_measurement}$=1,

If inter-band carrier aggregation within FR1 is configured, and UE not capable of antennaArrayType-r18 on the other serving carrier, or UE capable of antennaArrayType-r18 on the other serving carrier and UE support two simultaneous separate Rx beams

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on one serving cell outside measurement gap are not fully overlapped by intra-frequency SMTC occasions of the same serving cell, or
- if the measured carrier is the SCC with servingcellMO configured, and the network indication *neighSCellMeasSkipping* is set to 'enable' to UE

Otherwise,

If the measured carrier is the SCC with servingcellMO configured, and the network indication *neighSCellMeasSkipping* is set to 'enable' to UE

- if SMTC occasion for PCC and SCC are not overlapped in the time domain, or
- if SMTC occasion for PCC and SCC are overlapped in the time domain, and all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any serving frequency outside measurement gap are not fully overlapped by overlapped SMTC occasions of serving cells

Otherwise,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any serving frequency outside measurement gap are not fully overlapped by intra-frequency SMTC occasions

$K_{layer1_measurement}$=1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

Otherwise, $K_{layer1_measurement}$=1

**Table 9.2D.5.1-1: Time period for PSS/SSS detection, (FR1)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|

## 9.2D.5.2 Measurement period

The measurement period for intra-frequency measurements without gaps is as shown in table 9.2D.5.2-1, 9.2D.5.2-2(CC with deactivated SCell).

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{SSB_measurement_period_intra}$

For a UE that supports Pre-MG, an SMTC occasion is only considered to be overlapped by Pre-MG if the Pre-MG is activated.

**Table 9.2D.5.2-1: Measurement period for intra-frequency measurements without gaps (FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_p$ x N1 [Note 2,3] x $K_{layer1_measurement}$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$ x N1 [Note 2,3] x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ x N1 [Note 2,3] x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

NOTE 2: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.
Otherwise, N1 = 1.
NOTE 3: For ATG UE capable of *antennaArrayType-r18*, for the SCC measurement, N1=1 when the network indication *neighSCellMeasSkipping* is set to 'enable' to UE and inter-band carrier aggregation within FR1 is configured and UE not capable of antennaArrayType-r18 on the other serving carrier or UE support two simultaneous separate Rx beams, or when the network indication *neighSCellMeasSkipping* is set to 'enable' to UE and SMTC occasion for PCC and SCC are not overlapped in the time domain and intra-band carrier aggregation within FR1 is configured or inter-band carrier aggregation within FR1 is configured and UE support one common Rx beam.
Otherwise, N1 = 3 when network assistance information on ATG cells reference locations is provided, N1 = 4 when network assistance information on ATG cells reference locations is not provided.

**Table 9.2D.5.2-2: Measurement period for intra-frequency measurements without gaps (CC with deactivated SCell) (FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | Ceil(5 x $K_p$ x N1 [Note 2,3]) x measCycleSCell x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Ceil(1.5x 5 x $K_p$ x N1 [Note 2,3]) x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320 ms | Ceil(5 x $K_p$ x N1 [Note 2,3]) x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.<br>Otherwise, N1 = 1. | |
| NOTE 3: For ATG UE capable of *antennaArrayType-r18*, N1=1 when the network indication *skippingSCCneighbourCellMeas* is set to 'enable' to UE.<br>Otherwise, N1 = 3 when network assistance information on ATG cells reference locations is provided, N1 = 4 when network assistance information on ATG cells reference locations is not provided. | |

## 9.2D.5.3 Scheduling availability of UE during intra-frequency measurements

UE shall be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged [2], if it is configured; otherwise, all *L* SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

For a UE that supports Pre-MG, the requirements in clause 9.2D.5.3 also apply when a Pre-MG is deactivated.

### 9.2D.5.3.1 Scheduling availability of UE performing measurements on FR1

When the ATG UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- If *deriveSSB-IndexFromCell* is enabled, the UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

- If *deriveSSB-IndexFromCell* is not enabled, the UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration. If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When TDD inter-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this band pair.

When the ATG UE capable of *antennaArrayType-r18* performs intra-frequency neighbouring cell measurements, the following restrictions apply due to SS-RSRP or SS-SINR measurement:

- If *deriveSSB-IndexFromCell* is enabled, the UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, the SMTC periodicity follows smtc2; Otherwise SMTC periodicity follows *smtc1*.

- If *deriveSSB-IndexFromCell* is not enabled, the UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When intra-band carrier aggregation is performed and the ATG UE is capable of *antennaArrayType-r18*, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When inter-band carrier aggregation is performed and the ATG UE is capable of *common Rx beam between PCC band and SCC band*, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When the ATG UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- If *deriveSSB-IndexFromCell* is enabled, the UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB-IndexFromCell* is not enabled, the UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When TDD inter-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this band pair.

When the ATG UE capable of *antennaArrayType-r18* performs intra-frequency neighbouring cell measurements, the following restrictions apply due to SS-RSRQ measurement:

- If *deriveSSB-IndexFromCell* is enabled, the UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration. If the high layer signaling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB-IndexFromCell* is not enabled, the UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When intra-band carrier aggregation is performed and the ATG UE is capable of *antennaArrayType-r18*, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When inter-band carrier aggregation is performed and the ATG UE is capable of *common Rx beam between PCC band and SCC band*, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

#### 9.2D.5.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which does not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If *deriveSSB-IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration. If the high layer signalling of *smtc2* is configured(in TS 38.331 [2]), the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB-IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

If the following conditions are met:

- The UE has been notified about system information update through paging,

- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

The UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and/or the corresponding PDSCH, on SSB symbols to be measured.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

## 9.2D.6 Intra-frequency measurements with measurement gaps

### 9.2D.6.1 Void

### 9.2D.6.2 Intra-frequency cell identification

When a measurement gap is provided or an activated Pre-MG is provided without any pre-MG status changed during the measurement period, the UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE has been indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_with_index.}$ The UE shall be able to identify a new detectable intra-frequency SS block of an already detected cell within $T_{identify_intra_without_index.}$

$$T_{identify_intra_without_index} = T_{PSS/SSS_sync_intra} + T_{SSB_measurement_period_intra}\ ms$$

$$T_{identify_intra_with_index} = T_{PSS/SSS_sync_ntra} + T_{SSB_measurement_period_intra} + T_{SSB_time_index_intra}\ ms$$

Where:

- $T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2D.6.2-1.

- $T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2D.6.2-3.

- $T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2D.6.3-1.

- $CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1D.5.2 for measurement conducted within measurement gaps.

- $K_{gap}$ is the scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap}$ = 1 when the UE is not configured with concurrent measurement gaps. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

  - For a window W of duration max(SMTC period, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gap, and starting from the beginning of any SMTC occasion:

  - $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other measurement gap occasions within the window, and

  - $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1.8.3.

  When concurrent measurement gaps are configured, requirements in this clause do not apply if $N_{available}$ =0.

If the higher layer signaling in TS 38.331 [2] of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index}$ or $T_{identify_intra_with_index}$.

**Table 9.2D.6.2-1: Time period for PSS/SSS detection (FR1)**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max(600 ms, 5 x $K_{gap}$ x N1 [Note 2] x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5 x 5 x $K_{gap}$ x N1 [Note 2]) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil( 5 x $K_{gap}$ x N1 [Note 2]) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: void.<br>NOTE 2: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.<br>Otherwise, N1 = 1. | |

**Table 9.2D.6.2-2: void**

**Table 9.2D.6.2-3: Time period for time index detection (Frequency range FR1)**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(120 ms, ceil(3 x $K_{gap}$ x N1 [Note 2]) x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil(1.5 x 3 x $K_{gap}$ x N1 [Note 2]) x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra}$) |
| DRX cycle>320 ms | Ceil(3 x $K_{gap}$ x N1 [Note 2] )x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: void.<br>NOTE 2: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.<br>Otherwise, N1 = 1. | |

## 9.2D.6.3 Intra-frequency Measurement Period

The requirements in this clause apply when a measurement gap is provided or when an activated Pre-MG is provided without any pre-MG status changed during the measurement period.

The measurement period for FR1 intra frequency measurements with gaps is as shown in table 9.2D.6.3-1.

Longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

**Table 9.2D.6.3-1: Measurement period for intra-frequency measurements with gaps(FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|

| | |
|---|---|
| No DRX | max(200 ms, ceil(5 x $K_{gap}$ x N1 [Note 1])x max(MGRP, SMTC period)) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Max(200 ms, ceil(1.5x 5 x $K_{gap}$ x N1 [Note 1]) x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil(5 x $K_{gap}$ x N1 [Note 1]) x max(MGRP, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1. | |

# 9.2E NR intra-frequency measurements for RedCap with SAN

## 9.2E.1 Introduction

The requirements in clause 9.2E apply for intra-frequency measurements for RedCap on an SAN carrier frequency. The requirements apply provided that the valid parameters of ephemeris information, epoch time of the ephemeris, common TA, validity timer information, downlink polarization information for target NR SAN cell are send to UE.

The requirements in clause 9.2C.1 shall apply except that

- clause 9.2C is replaced with clause 9.2E, and
- clause 9.2C.4 is replaced with clause 9.2E.4, and
- clause 9.2C.5 is replaced with clause 9.2E.5, and
- clause 9.2C.6 is replaced with clause 9.2E.6

## 9.2E.2 Requirements applicability

The requirements in clause 9.2E apply, provided:

- The cell being identified or measured is detectable.
- Valid information for the satellite serving the target cell has been provided

An intra-frequency cell shall be considered detectable when for each relevant SSB:

- For 2Rx RedCap with NTN:
  - SS-RSRP related side conditions given in clauses 10.1.2C for FR1 and 10.1.3C for FR2-NTN, for a corresponding band,
  - SS-RSRQ related side conditions given in clauses 10.1.7C for FR1 and 10.1.8C for FR2-NTN, for a corresponding band,
  - SS-SINR related side conditions given in clauses 10.1.12C for FR1 and 10.1.13C for FR2-NTN, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.17 for a corresponding band.
- For 1Rx RedCap with NTN:
  - SS-RSRP related side conditions given in clause 10.1.2D for FR1 for a corresponding band,
  - SS-RSRQ related side conditions given in clause 10.1.6D for FR1 for a corresponding band,
  - SS-SINR related side conditions given in clause 10.1.10D for FR1 for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.15 for a corresponding band.

## 9.2E.3 Number of cells and number of SSB

### 9.2E.3.1 Requirements for FR1

The requirements in clause 9.2C.3.1 shall apply.

## 9.2E.4 Measurement Reporting Requirements

### 9.2E.4.1 Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2D.1 (SS-RSRP for FR1), 10.1.6D.1 (SS-RSRQ for FR1) and 10.1.10D.1 (SS-SINR for FR1).

### 9.2E.4.2 Event-triggered Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2D.1 (SS-RSRP for FR1), 10.1.6D.1 (SS-RSRQ for FR1) and 10.1.10D.1 (SS-SINR for FR1).

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.2E.4.3.

### 9.2E.4.3 Event Triggered Reporting

The requirements for FR1 in clause 9.2C.4.3 shall apply except that

- Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2D.1 (SS-RSRP for FR1), 10.1.6D.1 (SS-RSRQ for FR1) and 10.1.10D.1 (SS-SINR for FR1), and
- clause 9.2C.5.1 is replaced with 9.2E.5.1, and
- clause 9.2C.6.2 is replaced with 9.2E.6.2.

## 9.2E.5 Intra-frequency measurements without measurement gaps

### 9.2E.5.1 Intra-frequency cell identification

The requirements in clause 9.2C.5.1 shall apply except that:

- $T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2C.5.1-1 for 2Rx RedCap UE and table 9.2E.5.1-1 for 1Rx RedCap UE, and
- $T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2C.5.1-2 for 2Rx RedCap UE and table 9.2E.5.1-2 for 1Rx RedCap UE, and
- $T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2C.5.2-1 for 2Rx RedCap UE and table 9.2E.5.2-1 for 1Rx RedCap UE, and
- $CSSF_{intra_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap_RedCap,i}$ in clause 9.1A.5.1 for measurement conducted outside measurement gaps, i.e. when intra-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps, or according to $CSSF_{within_gap_RedCap,i}$ in clause 9.1A.5.2 for measurement conducted within measurement gaps, i.e. when intra-frequency SMTC is fully overlapping with measurement gaps, and
- clause 9.1C.8.3 is replaced with 9.1E.8.3, and
- clause 9.1C.9.1 is replaced with 9.1E.9.1, and
- clause 9.2C.5.1 is replaced with 9.2E.5.1, and

- clause 9.2C.5.2 is replaced with 9.2E.5.2.

**Table 9.2E.5.1-1: Time period for PSS/SSS detection, (Frequency range FR1) for 1Rx RedCap UE with NTN**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max( 600 ms, ceil( 7 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x SMTC period )[Note 1] x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max( 600 ms, ceil(1.5 x 7 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x max(SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | ceil(7 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x DRX cycle x $CSSF_{intra_RedCap}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.2E.5.1-2: Time period for time index detection (FR1) for 1Rx RedCap UE with NTN**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(160 ms, ceil( 6 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x SMTC period)[Note 1] x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(160 ms, ceil (1.5 x 6 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x max(SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | Ceil( 6 x $K_p$ x $K_{layer1_measurement}$) x $K_{multi_SMTC}$ x DRX cycle x $CSSF_{intra_RedCap}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

### 9.2E.5.2 Measurement period

The requirements in clause 9.2C.5.2 shall apply except that:

- The measurement period for intra-frequency measurements without gaps is as shown in table 9.2C.5.2-1 for 1Rx RedCap UE and 2Rx RedCap UE.

### 9.2E.5.3 Scheduling availability of UE during intra-frequency measurements

The requirements in clause 9.2C.5.3 shall apply.

#### 9.2E.5.3.1 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

The requirements in clause 9.2C.5.3.1 shall apply.

#### 9.2E.5.3.2 Scheduling availability of UE performing measurements on a neighbor cell served by a different satellite in LEO

The requirements in clause 9.2C.5.3.2 shall apply.

#### 9.2E.5.3.4 Scheduling availability of UE performing measurements in HD-FDD bands on FR1

The requirements in clause 9.2B.5.3.4 shall apply.

## 9.2E.6 Intra-frequency measurements with measurement gaps

### 9.2E.6.1 Intra-frequency cell identification

The requirements in clause 9.2C.6.1 shall apply except that:

- $T_{PSS/SSS_sync_intra}$: it is the time period used in PSS/SSS detection given in table 9.2C.6.1-1 for 2Rx RedCap UE and table 9.2E.6.1-1 for 1Rx RedCap UE, and

- $T_{SSB_time_index_intra}$: it is the time period used to acquire the index of the SSB being measured given in table 9.2C.6.1-2 for 2Rx RedCap UE and table 9.2E.6.1-2 for 1Rx RedCap UE, and

- $T_{SSB_measurement_period_intra}$: equal to a measurement period of SSB based measurement given in table 9.2C.6.2-1 for 2Rx RedCap UE and table 9.2E.6.1-1for 1Rx RedCap UE, and

- clause 9.1.5.2 is replaced with 9.1E.5.2, and

- clause 9.1C.8.3 is replaced with 9.1E.8.3.

**Table 9.2E.6.1-1: Time period for PSS/SSS detection (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{PSS/SSS_sync_intra}$ |
|---|---|
| No DRX | max(600 ms, 7 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5 x 7) x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | 7 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

**Table 9.2E.6.1-2: Time period for time index detection (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{SSB_time_index_intra}$ |
|---|---|
| No DRX | max(160 ms, 6 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(160 ms, ceil(1.5 x 6) x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period,DRX cycle) x $CSSF_{intra}$) |
| DRX cycle>320 ms | 6 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, DRX cycle) x $CSSF_{intra}$ |

### 9.2E.6.2 Intra-frequency Measurement Period

The requirements in clause 9.2C.6.3 shall apply except that:

**- The measurement period for intra-frequency measurements without gaps is as shown in table 9.2E.6.2-1 for 1Rx RedCap UE and 2Rx RedCap UE.Table 9.2E.6.2-1: Measurement period for intra-frequency measurements with gaps (FR1) for RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, 5 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, SMTC period)) x $CSSF_{intra_RedCap}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5) x $K_{multi_SMTC}$ x $K_{gap}$ x max(MGRP, SMTC period,DRX cycle)) x $CSSF_{intra_RedCap}$ |
| DRX cycle>320 ms | 5 x $K_{gap}$ x $K_{multi_SMTC}$ x max(MGRP, DRX cycle) x $CSSF_{intra_RedCap}$ |

## 9.3 NR inter-frequency measurements

### 9.3.1 Introduction

A measurement is defined as an SSB based inter-frequency measurement provided it is not defined as an intra-frequency measurement according to clause 9.2.

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified inter-frequency cells if carrier frequency information is provided by PCell or PSCell, even if no explicit neighbour list with physical layer cell identities is provided.

A measurement is defined as an inter-frequency SSB based measurements without measurement gaps (either legacy measurement gap or NCSG) in active BWP, for UE capable of *interFrequencyMeas-NoGap* provided that

- the UE supports *interFrequencyMeas-Nogap-r16* [15], and

- the SSB is completely contained in the active BWP of the UE.

    - For inter-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.3.9.3.

- Note: Non-CA capable UE is not expected to indicate support of *interFrequencyMeas-Nogap-r16* [15].

Besides the conditions listed above,

- for UE supporting *nr-NeedForGapNCSG-reporting-r17* and indicating *NeedForGapNCSG-InfoNR* for inter-frequency measurement,
  - An inter-frequency SSB measurement is defined as measurement without gap if
    - the UE indicates 'nogap-noncsg' via *NeedForGapNCSG-InfoNR* for the inter-frequency measurement, and
    - the SSB is not completely contained in the active BWP of the UE
    - For inter-frequency SSB based measurements without MG and NCSG, UE may cause scheduling restriction as specified in clause 9.3.9.4.
  - An inter-frequency SSB measurement is defined as measurement with NCSG if
    - the UE indicates 'ncsg' via *NeedForGapNCSG-InfoNR* for the inter-frequency measurement, and
    - the SSB is not completely contained in the active BWP of the UE
    - For inter-frequency SSB based measurements with NCSG, UE may cause scheduling restriction as specified in clause 9.3.10.3.
  - An inter-frequency SSB measurement is defined as measurement with gap if
    - the UE indicates 'gap' via *NeedForGapNCSG-InfoNR* for the inter-frequency measurement, and
    - the SSB is not completely contained in the active BWP of the UE
- for UE supporting *nr-NeedForInterruptionReport-r18* and indicating *NeedForInterruptionInfoNR* for inter-frequency measurement,
  - An inter-frequency SSB measurement is defined as measurement without gap if
    - the UE indicates 'no-gap' via *NeedForGapsInfoNR* and the UE indicates '*no-gap-no-interruption*' or *no-gap-with-interruption* via *NeedForInterruptionInfoNR-r18* for the inter-frequency measurement, and
    - the SSB is not completely contained in the active BWP of the UE

      During inter-frequency SSB based measurements without gap, UE may cause scheduling restriction as specified in clause 9.3.9.4.
  - An inter-frequency SSB measurement is defined as measurement with gap if
    - the UE indicates 'gap' via *NeedForGap-InfoNR* for the inter-frequency measurement.

SSB based measurements are configured along with a measurement timing configuration (SMTC) per carrier, which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements on the configured inter-frequency carrier are to be performed. For inter-frequency connected mode measurements, one measurement window periodicity may be configured per inter-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB and measure RSSI of RSRQ on an inter-frequency measurement object which start earlier than the gap starting time + switching time, nor detect SSB and measure RSSI of RSRQ which ends later than the gap end – switching time. When the inter-frequency cells are in FR2 and the per-FR gap is configured to the UE in EN-DC, SA NR, NE-DC and NR-DC, or the serving cells are in FR2, the inter-frequency cells are in FR2 and the per-UE gap is configured to the UE in SA NR and NR-DC, the switching time is 0.25 ms. Otherwise the switching time is 0.5 ms.

The requirements in this clause shall also apply, when the UE is configured to perform SRS carrier based switching and using measurement gaps.

Longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

The measurement requirements defined in clause 9.3 do not apply if the UE is configured with *needForGapNCSG-ConfigNR-r17* and *needForInterruptionConfigNR-r18* at the same time.

The inter-frequency measurement requirements in clause 9.3.4 and clause 9.3.5 applies for the following scenarios:

- SSB-based inter-frequency measurement object with measurement gap.
- SSB-based inter-frequency measurement object without measurement gap for UE capable of *interFrequencyMeas-NoGap*, when
  - all of the SMTC occasions of this inter-frequency measurement object are overlapped with the measurement gap or associated measurement gap in concurrent measurement gaps, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped with the associated measurement gap and all the SMTC occasions of this inter-frequency measurement object are overlapped with the union of concurrent measurement gaps, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or associated measurement gap in concurrent measurement gaps and the flag *interFrequencyConfig-NoGap-r16* is not configured by the Network.
- part of the SMTC occasions of this inter-frequency measurement object are overlapped with the associated measurement gap and all the SMTC occasions of this inter-frequency measurement object are overlapped with the union of concurrent measurement gaps or the union of concurrent measurement gaps and MUSIM gaps if MUSIM gaps are configured.
  - no requirement applies if all of the SMTC occasions of this inter-frequency measurement object are overlapped with MUSIM gaps if MUSIM gaps are configured.
- SSB-based inter-frequency measurement object without measurement gap for UE capable of *NeedForInterruptionInfoNR-r18*, when
  - all of the SMTC occasions of this inter-frequency measurement object are overlapped with the measurement gap or associated measurement gap in concurrent measurement gaps for the UE indicating 'no-gap' via *NeedForGapsInfoNR* and '*no-gap-with-interruption*' or '*no-gap-no-interruption*' via *NeedForInterruptionInfoNR-r18* for the inter-frequency measurement, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped with the measurement gap or associated measurement gap in concurrent measurement gaps for the UE indicates 'no-gap' via *NeedForGapsInfoNR* and '*no-gap-with-interruption*' via *NeedForInterruptionInfoNR-r18* for the inter-frequency measurement.

The inter-frequency measurement requirements in clause 9.3.9 applies for the following scenarios:

- SSB-based inter-frequency measurement with no measurement gap, when none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.
- SSB-based inter-frequency measurement with no measurement gap, when part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.
- SSB-based inter-frequency measurement with no measurement gap, when none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps or MUSIM gaps if MUSIM gaps are configured, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

- SSB-based inter-frequency measurement with no measurement gap, when part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps or MUSIM gaps if MUSIM gaps are configured, if UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

- for UE indicating *NeedForInterruptionInfoNR-r18*, when

  - none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps for the UE indicates 'no-gap' via *NeedForGapsInfoNR* and '*no-gap-with-interruption*' or '*no-gap-no-interruption*' via *NeedForInterruptionInfoNR* for the inter-frequency measurement.

  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps, for the UE indicates 'no-gap' via *NeedForGapsInfoNR* and '*no-gap-no-interruption*' via *NeedForInterruptionInfoNR* for the inter-frequency measurement.

  - none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps or MUSIM gaps if MUSIM gaps are configured, for the UE indicates 'no-gap' via *NeedForGap-InfoNR* and '*no-gap-with-interruption*' or '*no-gap-no-interruption*' via *NeedForInterruptionInfoNR-r18* for the inter-frequency measurement.

  - part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps or MUSIM gaps if MUSIM gaps are configured, for the UE indicates 'no-gap' via *NeedForGap-InfoNR* and '*no-gap-no-interruption*' via *NeedForInterruptionInfoNR* for the inter-frequency measurement.

    The interruption requirement during inter-frequency measurement without gap is defined in clause 8.2.2.2.19 when UE indicate '*no-gap-with-interruption*' via *NeedForInterruptionInfoNR-r18*.

    No interruption is allowed due to inter-frequency measurement without gap when following conditions are met:

    - the SSB is completely contained in the active BWP of the UE, or

    - UE indicates "*no-gap-no-interruption*", or

    - UE indicates "*no-gap-with-interruption*" but inter-frequency SMTC is partially or fully overlapping with measurement gaps,

The inter-frequency measurement requirements in clause 9.3.10 applies for the following scenarios:

- SSB-based inter-frequency measurement object without measurement gap, when all of the SMTC occasions of this inter-frequency measurement object are overlapped by the NCSG;

- SSB-based inter-frequency measurement object with NCSG.

## 9.3.2 Requirements applicability

The requirements in clause 9.3 apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.4 and 10.1.5 for FR1 and FR2, respectively, for a corresponding band,

- SS-RSRQ related side conditions given in clauses 10.1.9 and 10.1.10 for FR1 and FR2, respectively, for a corresponding band,

- SS-SINR related side conditions given in clauses 10.1.14 and 10.1.15 for FR1 and FR2, respectively, for a corresponding band,

- SSB_RP and SSB Ês/Iot according to Annex B.2.3 for a corresponding band.

#### 9.3.2.1 Void

#### 9.3.2.2 Void

### 9.3.3 Number of cells and number of SSB

#### 9.3.3.1 Requirements for FR1

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 7 SSBs with different SSB index and/or PCI on the inter-frequency layer.

#### 9.3.3.2 Requirements for FR2

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 10 SSBs with different SSB index and/or PCI on the inter-frequency layer, and
- 1 SSB per identified cell.

### 9.3.4 Inter-frequency measurement with measurement gaps

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured) or *deriveSSB-IndexFromCellInter-r17* is configured for the FR1 and FR2-1 target frequency layers and UE supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_processing}) \text{ ms}$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3.4-1, table 9.3.4-2, table 9.3.4-5 when *highSpeedMeasInterFreq-r17* is configured and UE supports measurementEnhancementInterFreq-r17 and table 9.3.4-9 when *highSpeedMeasFlagFR2-r17* is configured and UE supports *measEnhCAInterFreqFR2-r18*. When the SCG is deactivated, table 9.3.4-7 applies for an inter-frequency carrier configured by SCG and not configured by MCG and table 9.3.4-2 applies for an inter-frequency carrier configured by both SCG and MCG. Regardless of whether the SCG is activated or deactivated, table 9.3.4-2 applies for an inter-frequency carrier configured only by MCG.

- For UE supporting power class 6 and *measEnhCAInterFreqFR2-r18* with *highSpeedMeasFlagFR2-r17* configured, if SMTC $\leq$ 40ms, $T_{PSS/SSS_sync_inter}$ is given in table 9.3.4-9; otherwise, $T_{PSS/SSS_sync_inter}$ is given in table 9.3.4-2.
- For UE configured with measurement gap cancellation according to clause 9.1.14, the $T_{PSS/SSS_sync_inter}$ is given in tables 9.3.4-12 and 9.3.4-13, for FR1 and FR2-1, respectively, provided the configurations and conditions in clause 9.1.14.3 are met.

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3.4-3, table 9.3.4-6 when *highSpeedMeasInterFreq* is configured and UE supports measurementEnhancementInterFreq-r17, and table 9.3.4-10 when *highSpeedMeasFlagFR2-r17* is configured and UE supports *measEnhCAInterFreqFR2-r18*. When the SCG is deactivated, table 9.3.4-8 applies for an inter-frequency carrier configured by SCG and not configured by MCG and table 9.3.4-4 applies for an inter-frequency carrier configured by both SCG and MCG. Regardless of whether the SCG is activated or deactivated, table 9.3.4-4 applies for an inter-frequency carrier configured only by MCG.

- For UE supporting power class 6 and *measEnhCAInterFreqFR2-r18* with *highSpeedMeasFlagFR2-r17* configured, if SMTC $\leq$ 40ms, $T_{SSB_measurement_period_inter}$ is given in table 9.3.5-5; otherwise, $T_{SSB_measurement_period_inter}$ is given in table 9.3.5-2.

- For UE configured with measurement gap cancellation according to clause 9.1.14, the $T_{SSB_time_index_inter}$ is given in tables 9.3.4-14 and 9.3.4-15, for FR1 and FR2-1, respectively, provided the configurations and conditions in clause 9.1.14.3 are met.

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3.5-1, table 9.3.5-2, table 9.3.5-3 when *highSpeedMeasInterFreq* is configured and UE supports measurementEnhancementInterFreq-r17, and in table 9.3.5-5 when *highSpeedMeasFlagFR2-r17* is configured and UE supports *measEnhCAInterFreqFR2-r18.* When the SCG is deactivated, table 9.3.5-4 applies for an inter-frequency carrier configured by SCG and not configured by MCG and table 9.3.5-2 applies for an inter-frequency carrier configured by both SCG and MCG. Regardless of whether the SCG is activated or deactivated, table 9.3.5-2 applies for an inter-frequency carrier configured only by MCG.

$T_{SSB_processing}$: the time period used to process multiple beams received in one SMTC. $T_{SSB_processing}$ = 2 ms for UE supporting *FastRx-BSF-MeasDelayReduction-r19,* when the conditions in clause 3.6.21 are fulfilled. Otherwise, $T_{SSB_processing}$ = 0.

- For UE indicating *support3MHz-ChannelBW-Symmetric-r18* and configured to operate on a target cell with 12 PRB SSB in FR1, $T_{SSB_time_index_intra_less_than_5Mhz}$ is given in table 9.3.4-11.

- For UE supporting power class 6 and *measEnhCAInterFreqFR2-r18* with *highSpeedMeasFlagFR2-r17* configured, $T_{SSB_measurement_period_inter}$ is given in table 9.3.5-5; otherwise, $T_{SSB_measurement_period_inter}$ is given in table 9.3.5-2.

- For UE configured with measurement gap cancellation according to clause 9.1.14, the $T_{SSB_measurement_period_inter}$ is given in section 9.3.5, tables 9.3.5-6 and 9.3.5-7, for FR1 and FR2-1, respectively, provided the configurations and conditions in clause 9.1.14.3 are met.

$M_{pss/sss_sync_inter}$: For a UE supporting FR2-1 power class 1 or 5, $M_{pss/sss_sync_inter}$ = 64 samples. For a UE supporting FR2-1 power class 2, $M_{pss/sss_sync_inter}$ = 40 samples. For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_inter}$ = 40 samples. For a UE supporting FR2-1 power class 4, $M_{pss/sss_sync_inter}$ = 40 samples. For a UE supporting FR2-2 power class 1, $M_{pss/sss_sync_inter}$ = 96. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync_inter}$ = 60. For a UE supporting FR2-2 power class 3, $M_{pss/sss_sync_inter}$ = 60.

$M_{SSB_index_inter}$: For a UE supporting FR2-1 power class 1 or 5, $M_{SSB_index_inter}$ = 40 samples. For a UE supporting FR2 power class 2, $M_{SSB_index_inter}$ = 24 samples. For a UE supporting FR2-1 power class 3, $M_{SSB_index_inter}$ = 24 samples. For a UE supporting FR2-1 power class 4, $M_{SSB_index_inter}$ = 24 samples. For a UE supporting FR2-2 power class 2 or 3, $M_{SSB_index_inter}$ = 48 samples. For a UE supporting FR2 power class 1, $M_{SSB_index_inter}$ = 72 samples.

$M_{meas_period_inter}$: For a UE supporting FR2-1 power class 1 or 5, $M_{meas_period_inter}$ =64. For a UE supporting FR2-1 power class 2, $M_{meas_period_inter}$=40. For a UE supporting FR2-1 power class 3, $M_{meas_period_inter}$ =40. For a UE supporting FR2-1 power class 4, $M_{meas_period_inter}$ = 40. For a UE supporting FR2-2 power class 1, $M_{meas_period_inter}$ = 96. For a UE supporting FR2-2 power class 2, $M_{meas_period_inter}$ = 60. For a UE supporting FR2-2 power class 3, $M_{meas_period_inter}$ = 60.

For a UE that supports *FastRx-BSF-MeasDelayReduction-r19,* when the conditions in clause 3.6.21 are fulfilled and when *highSpeedMeasFlagFR2-r17* is not configured, the following values shall apply for $M_{pss/sss_sync_inter}$, $M_{SSB_index_inter}$ and $M_{meas_period_inter}$:

$M_{pss/sss_sync_inter}$: For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_inter}$ =5* $N_{reduced_Rx_BSF}$.

$M_{SSB_index_inter}$: For a UE supporting FR2-1 power class 3, $M_{SSB_index_inter}$ = 3* $N_{reduced_Rx_BSF}$.

$M_{meas_period_inter}$: For a UE supporting FR2-1 power class 3, $M_{meas_period_inter}$ =5* $N_{reduced_Rx_BSF}$.

Where,

$N_{reduced_Rx_BSF}$ = reported value via UE capability *fastRx-BSF-MeasDelayReduction-r19* in FR2-1.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

$K_{gap}$ is a scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap}$ = 1 when the UE is not configured with concurrent GAPs or MUSIM gaps. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

- For a window W of duration max(SMTC period, xRP_max), where xRP_max is the maximum xRP across all configured per-UE measurement GAPs, periodic MUSIM gaps, and/or per-FR measurement GAPs within the same FR, and starting from the beginning of any SMTC occasion:
  - $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other GAP occasions and MUSIM gap occasions within the window, and
  - $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W, after accounting for measurement GAP and MUSIM gap collisions by applying the collision rules for the GAP and MUSIM gap in clauses 9.1.8.3, 9.1.10.5, 9.1.12.3, and 9.1.13.3, respectively.
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.

$K_{gap}$ is only applicable for UE supporting concurrent GAPs or MUSIM gaps. When concurrent GAPs or MUSIM gaps are configured, requirements in this clause do not apply if $N_{available}$ =0.

When UE supports *musim-GapPreference-r17* and if the configured aperiodic MUSIM gap collides with the measurement gap associated with the target frequency layer, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer cell identification period for the target inter-frequency is expected.

**Table 9.3.4-1: Time period for PSS/SSS detection (FR1)**

| Condition NOTE1,2 | $T_{PSS/SSS_sync_inter}$ |
|---|---|

### 9.3.4.1 Void

### 9.3.4.2 Void

## 9.3.5 Inter-frequency measurements

When measurement gaps are provided for inter frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4, 10.1.5, 10.1.9, 10.1.10, 10.1.14 and 10.1.15, respectively, as shown in table 9.3.5-1 and 9.3.5-2. When *highSpeedMeasInterFreq-r17* is configured, and UE supports *measurementEnhancementInterFreq-r17*, $T_{SSB_measurement_period_inter}$ is specified in table 9.3.5-3. When SCG is deactivated, $T_{SSB_measurement_period_inter}$ is specified in table 9.3.5-4 applies for inter-frequency carrier configured by SCG and not configured by MCG and table 9.3.5-2 applies for inter-frequency carrier configured by both SCG and MCG. Regardless of whether the SCG is activated or deactivated, table 9.3.5-2 applies for an inter-frequency carrier configured only by MCG.

For UE configured with measurement gap cancellation according to clause 9.1.14 meeting the conditions in clause 9.1.14.3, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4, 10.1.5, 10.1.9, 10.1.10, 10.1.14 and 10.1.15 for FR1 and FR2-1, respectively, while meeting the measurement period requirements for FR1 and FR2-1 specified in tables 9.3.5-6 and 9.3.5-7, respectively.

**Table 9.3.5-1: Measurement period for inter-frequency measurements with gaps (FR1)**

#### 9.3.5.1 Void

#### 9.3.5.2 Void

#### 9.3.5.3 Void

### 9.3.6 Inter-frequency measurements reporting requirements

#### 9.3.6.1 Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

#### 9.3.6.2 Event-triggered Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.3.6.3.

#### 9.3.6.3 Event-triggered Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a

delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. Both $T_{identify_inter_without_index}$ and $T_{identify_inter_with_index}$ are defined in clause 9.3.4. When L3 filtering is used an additional delay can be expected. In EN-DC and NE-DC operation, when the UE is configured to perform E-UTRA SRS carrier-based switching an additional delay can be expected in FR1 if the UE is capable of per-FR gap, or in both FR1 and FR2 if the UE is not capable of per-FR gap.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ as defined in clause 9.3.4 or clause 9.3.9.1 or clause 9.3.10.1.. If a cell which has been detectable at least for the time period $T_{identify\ inter\ without\ index}$ or $T_{identify\ inter\ with\ index}$ defined in clause 9.3.4 or clause 9.3.9.1 or clause 9.3.10.1. becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected. In EN-DC and NE-DC operation, when the UE is configured to perform E-UTRA SRS carrier-based switching an additional delay can be expected in FR1 if the UE is capable of per-FR gap, or an additional delay can be expected in both FR1 and FR2 if the UE is not capable of per-FR gap.

## 9.3.7 Void

## 9.3.8 Inter-frequency SFTD measurement requirements

### 9.3.8.1 Introduction

This clause contains requirements for a UE supporting NR inter-frequency SFTD measurement and is applicable in RRC_CONNECTED state. The UE shall, depending on network request, perform inter-frequency SFTD measurement and report SFTD result with or without SS-RSRP. The overall delay includes RRC procedure delay defined in clause 12 in TS 38.331 [2] and SFTD measurement delay in clause 9.3.8.2.

UE which fulfils the requirements in clause 9.3.8 is not supposed to fulfil the requirements defined in clause 9.2.5.4.

### 9.3.8.2 SFTD Measurement delay

The requirements on SFTD measurement delay defined in this clause are applicable under the side condition SCH $\hat{E}s/Iot \geq$ -3 dB for the inter-frequency neighbour cell. Depending on configuration, the SFTD measurement may be carried out with or without the support of configured measurement gaps. In the current release, indication on whether to carry out the SFTD measurement with or without measurement gaps is implicit and depending on whether measurement gaps are configured.

The UE shall be able to detect, identify and measure SFTD of up to 3 of the strongest applicable inter-frequency neighbour cells on the carrier frequency provided in the SFTD measurement configuration. Further depending on the SFTD measurement configuration, the UE shall additionally report SS-RSRP for the one or more strongest cells. The UE may or may not be configured with *cellsForWhichToReportSFTD*. The UE does not expect *cellsForWhichToReportSFTD* to change during an ongoing SFTD measurement.

When no measurement gaps are provided, the UE shall be capable of finding the inter-frequency neighbour cell regardless of its SSB position in the SMTC period, provided that the carrier frequency where SFTD measurement is configured and the serving carrier(s) form a supported CA or NR-DC band combination of the UE. The SFTD measurement shall be conducted with sustained connection to the PCell and activated SCell(s) in MCG. Depending on capability, the UE may be allowed to cause a certain amount of interruptions for reconfiguration of the radio receiver, as specified in clause 8.2.2.2.6.

When measurement gaps are provided, the UE shall be capable of finding the inter-frequency neighbour cell under the additional condition that the SSB at least occasionally falls within the measurement gap.

When no DRX is used, the UE shall be capable of determining SFTD within a physical layer measurement period of $T_{measure_SFTD1}$ as follows:

- For SFTD measurements without measurement gaps, and without additional SS-RSRP reporting:
  - For carrier frequency in FR1: $T_{measure_SFTD1}$ = 14 SMTC periods
  - For carrier frequency in FR2: $T_{measure_SFTD1}$ = 112 SMTC periods
- For SFTD measurements in measurement gaps, and without additional SS-RSRP reporting:
  - For carrier frequency in FR1: $T_{measure_SFTD1} = CSSF_{inter} \times 8 \times$ Max(MGRP, SMTC period)
  - For carrier frequency in FR2: $T_{measure_SFTD1} = CSSF_{inter} \times 64 \times$ Max(MGRP, SMTC period))
- For SFTD measurements without measurement gaps, and with additional SS-RSRP reporting:
  - For carrier frequency in FR1: $T_{measure_SFTD1}$ = 19 SMTC periods
  - For carrier frequency in FR2: $T_{measure_SFTD1}$ = 152 SMTC periods
- For SFTD measurements in measurement gaps, and with additional SS-RSRP reporting:
  - For carrier frequency in FR1: $T_{measure_SFTD1} = CSSF_{inter} \times 13 \times$ Max(MGRP, SMTC period)
  - For carrier frequency in FR2: $T_{measure_SFTD1} = CSSF_{inter} \times 104 \times$ Max(MGRP, SMTC period)

where $CSSF_{inter}$ is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

When DRX is used, the same $T_{measure_SFTD1}$ as for non-DRX applies, but the reporting delay depends on the DRX cycle length in use.

In case PCell is changed due to handover, the UE shall terminate the inter-frequency SFTD measurement.

The measurement accuracy for the SFTD measurement shall fulfil the requirement in clause 10.1.21.3. The measurement accuracy for additionally reported SS-RSRP shall fulfil the requirement in clauses 10.1.4.1 and 10.1.5.1 for neighbour cell in FR1 and FR2, respectively.

### 9.3.8.3 SFTD Measurement reporting delay

The SFTD measurement reporting delay is defined as the time between a command that will trigger an SFTD measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of $2 \times TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The SFTD measurement reporting delay shall be less than $T_{measure_SFTD1}$ defined in clause 9.3.8.2 plus the RRC procedure delay defined in clause 12 in TS 38.331 [2].

## 9.3.9 Inter-frequency measurements without measurement gaps

### 9.3.9.1 Inter-frequency Cell identification

UE satisfying the applicability conditions specified in clause 9.3.1 on the requirement in this clause shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured) or *deriveSSB-IndexFromCellInter-r17* is configured for the FR1 and FR2-1 target frequency layers and UE supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

- For inter-frequency SSB based measurements without measurement gaps in active BWP, it is assumed that when UE performs inter-frequency measurements without measurement gaps in a TDD bands on FR1 and FR2, SFN and frame boundary across serving cell and inter-frequency neighbor cells is aligned

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter})\ ms$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})\ ms$$

Where:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection

- For inter-frequency SSB based measurements without measurement gaps in active BWP, and UE supports *interFrequencyMeas-Nogap-r16*, $T_{PSS/SSS_sync_inter}$ is given in table 9.3.9.1-1 and table 9.3.9.1-2.
- For UE supporting measEnhCAInterFreqFR2-r18:
  - If *highSpeedMeasFlagFR2-r17* is configured, and SMTC $\leq$ 40ms, $T_{PSS/SSS_sync_inter}$ is given in table 9.3.9.1-6.
  - If *highSpeedMeasFlagFR2-r17* is configured, and SMTC >40ms, $T_{PSS/SSS_sync_inter}$ is given in table 9.3.9.1-2.
  - If *highSpeedMeasFlagFR2-r17* is not configured, $T_{PSS/SSS_sync_inter}$ is given in table 9.3.9.1-2.
- For UE indicating *no-gap-no-interruption*, $T_{PSS/SSS_sync_inter}$ is given in table 9.3.9.1-1 for FR1 and table 9.3.9.1-2 for FR2
- For UE indicating *no-gap-with-interruption*, $T_{PSS/SSS_sync_inter}$ is given in table 9.3.9.1-1a for FR1 and table 9.3.9.1-2a for FR2.
- For UE indicating *support3MHz-ChannelBW-Symmetric-r18* and configured to operate on a target cell with 12 PRB SSB in FR1, $T_{SSB_time_index_intra_less_than_5MHz}$ is given in table 9.3.9.1-5.

- $T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured
  - For inter-frequency SSB based measurements without measurement gaps in active BWP, and UE supports *interFrequencyMeas-Nogap-r16*, $T_{SSB_time_index_inter}$ is given in table 9.3.9.1-3 and table 9.3.9.1-4.
  - For UE supporting measEnhCAInterFreqFR2-r18:
    - If *highSpeedMeasFlagFR2-r17* is configured, and SMTC $\leq$ 40ms, $T_{SSB_time_index_inter}$ is given in table 9.3.9.1-7.
    - If *highSpeedMeasFlagFR2-r17* is configured, and SMTC >40ms, $T_{SSB_time_index_inter}$ is given in table 9.3.9.1-4.
    - If *highSpeedMeasFlagFR2-r17* is not configured, $T_{SSB_time_index_inter}$ is given in table 9.3.9.1-4.
  - For UE *indicating no-gap-no-interruption*, $T_{SSB_time_index_inter}$ is given in table 9.3.9.1-3 for FR1 and table 9.3.9.1-4 for FR2
  - For UE indicating *no-gap-with-interruption*, $T_{SSB_time_index_inter}$ is given in table 9.3.9.1-3a for FR1 and table 9.3.9.1-4a for FR2.

- $T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement

  - For inter-frequency SSB based measurements without measurement gaps in active BWP, and UE supports *interFrequencyMeas-Nogap-r16*, $T_{SSB_measurement_period_inter}$ is given in table 9.3.9.2-1, table 9.3.9.2-2, table 9.3.9.2-3 and table 9.3.9.2-3a when *highSpeedMeasInterFreq-r17* is configured and UE supports *measurementEnhancementInterFreq-r17*, and table 9.3.9.2-4 when *highSpeedMeasFlagFR2-r17* is configured and UE supports *measEnhCAInterFreqFR2-r18*.

  - For UE indicating *no-gap-no-interruption*, $T_{SSB_measurement_period_inter}$ is given in table 9.3.9.2-1 for FR1, table 9.3.9.2-2 for FR2, and table 9.3.9.2-3 when *highSpeedMeasInterFreq-r17* is configured and UE supports *measurementEnhancementInterFreq-r17*.

  - For UE indicating *no-gap-with-interruption*, $T_{SSB_measurement_period_inter}$ is given in table 9.3.9.2-1a for FR1 and table 9.3.9.2-2a for FR2, and table 9.3.9.2-3b when *highSpeedMeasInterFreq-r17* is configured and UE supports *measurementEnhancementInterFreq-r17*.

- For UE supporting power class 6 and *measEnhCAInterFreqFR2-r18* with *highSpeedMeasFlagFR2-r17* configured, if SMTC $\leq$ 40ms, $T_{SSB_measurement_period_inter}$ is given in table 9.3.9.2-x; otherwise, $T_{SSB_measurement_period_inter}$ is given in table 9.3.9.2-2.

  $CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1 for measurement conducted outside GAP, i.e. when inter-frequency SMTC is fully non overlapping or partially overlapping with GAPs.

  - when inter-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps for UE *indicating no-gap-no-interruption* or

  - when inter-frequency SMTC is fully non overlapping with measurement gaps for UE indicating *no-gap-with-interruption*.

For inter-frequency SSB based measurements without measurement gaps in active BWP

$M_{pss/sss_sync_inter}$: For a UE supporting FR2-1 power class 1 or 5, $M_{pss/sss_sync_inter}$ = 40. For a UE supporting FR2-1 power class 2, $M_{pss/sss_sync_inter}$ = 24. For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_inter}$ = 24. For a UE supporting FR2-1 power class 4, $M_{pss/sss_sync}$ = 24. For a UE supporting FR2-2 power class 1, $M_{pss/sss_sync_inter}$ = 60. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync_inter}$ = 36. For a UE supporting FR2-2 power class 3, $M_{pss/sss_sync_inter}$ = 36. For FR1, $M_{pss/sss_sync_inter}$ = 5.

$M_{SSB_index_inter}$: For a UE supporting FR2-2 power class 1, $M_{SSB_index_inter}$ = 72. For a UE supporting FR2-2 power class 2, $M_{SSB_index_inter}$ = 48. For a UE supporting FR2-2 power class 3, $M_{SSB_index_inter}$ = 48. For FR1, $M_{SSB_index_inter}$ = 3.

$M_{meas_period_inter}$: For a UE supporting FR2-1 power class 1 or 5, $M_{meas_period_inter}$ = 40. For a vehicle mounted UE supporting FR2-1 power class 2, $M_{pss/sss_sync_inter}$=24. For a UE supporting FR2-1 power class 3, $M_{meas_period_inter}$ = 24. For a UE supporting FR2-1 power class 4, $M_{meas_period_inter}$ = 24. For a UE supporting FR2-2 power class 1, $M_{meas_period_inter}$ = 60. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync_inter}$ = 36. For a UE supporting FR2-2 power class 3, $M_{meas_period_inter}$ = 36. For FR1, $M_{meas_period_inter}$ = 5.

If the UE indicates 'nogap-noncsg' via *NeedForGapNCSG-InfoNR* for the inter-frequency measurement or the UE indicates either *no-gap-with-interruption* or *no-gap-no-interruption* via *NeedForInterruptionInfoNR-r18*,

$M_{pss/sss_sync_inter}$: For a UE supporting FR2-1 power class 1 or 5, $M_{pss/sss_sync_inter}$ = 64 samples. For a UE supporting FR2-1 power class 2, $M_{pss/sss_sync_inter}$ = 40 samples. For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_inter}$ = 40 samples. For a UE supporting FR2-1 power class 4, $M_{pss/sss_sync_inter}$ = 40 samples. For a UE supporting FR2-2 power class 1, $M_{pss/sss_sync_inter}$ = 96. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync_inter}$ = 60. For a UE supporting FR2-2 power class 3, $M_{pss/sss_sync_inter}$ = 60. For FR1, $M_{pss/sss_sync_inter}$ = 8.

$M_{SSB_index_inter}$: For a UE supporting FR2-1 power class 1 or 5, $M_{SSB_index_inter}$ = 40 samples. For a UE supporting FR2 power class 2, $M_{SSB_index_inter}$ = 24 samples. For a UE supporting FR2-1 power class 3, $M_{SSB_index_inter}$ = 24 samples. For a UE supporting FR2-1 power class 4, $M_{SSB_index_inter}$ = 24 samples. For a UE supporting FR2-2 power class 2 or 3, $M_{SSB_index_inter}$ = 48 samples. For a UE supporting FR2 power class 1, $M_{SSB_index_inter}$ = 72 samples. For FR1, $M_{SSB_index_inter}$ = 3.

$M_{meas_period_inter}$: For a UE supporting FR2-1 power class 1 or 5, $M_{meas_period_inter}$ =64. For a UE supporting FR2-1 power class 2, $M_{meas_period_inter}$=40. For a UE supporting FR2-1 power class 3, $M_{meas_period_inter}$ =40. For a UE

supporting FR2-1 power class 4, $M_{meas_period_inter}$ = 40. For a UE supporting FR2-2 power class 1, $M_{meas_period_inter}$ = 96. For a UE supporting FR2-2 power class 2, $M_{meas_period_inter}$ = 60. For a UE supporting FR2-2 power class 3, $M_{meas_period_inter}$ = 60. For FR1, $M_{meas_period_inter}$ = 8.

When UE supports *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both concurrent measurement GAP and *musim-GapPreference-r17* and the UE is configured with concurrent GAPs or periodic MUSIM gaps or both concurrent gaps and periodic MUSIM gaps,

$K_p$ is a scaling factor for an SSB frequency layer to be measured without GAP. $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

For a window W of duration max(SMTC period, xRP_max), where xRP_max is the maximum xRP across all configured per-UE GAPs, periodic MUSIM gaps, and per-FR GAPs within the same FR as the SSB frequency layer, and starting at the beginning of any SMTC occasion:

$N_{total}$ is the total number of SMTC occasions within the window, including those overlapped with GAP and MUSIM gap occasions within the window, and

$N_{available}$ is the number of SMTC occasions that are not overlapped with any non-dropped GAP or non-dropped MUSIM gap occasions within the window W, after accounting for GAP and MUSIM gap collisions by applying the collision rules for the measurement GAP and MUSIM gap in clauses 9.1.8.3, 9.1.10.4 and 9.1.10.5, respectively.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.

Requirements in this clause do not apply when $N_{available}$ = 0 due to fully overlapping between SMTC occasions and MUSIM gap occasions within the window W.

Editor Note: FSS for the case when $N_{available}$ = 0 due to fully overlapping between SMTC occasions and the union of MUSIM gap and measurement gap occasions within the window W.

When UE supports *musim-GapPreference-r17* and the SMTC occasions of the target frequency layer is fully or partially overlapping with the configured aperiodic MUSIM gap, longer cell identification period for the target frequency layer is expected.

Otherwise, when UE is not configured with or UE does not support concurrent GAPs and the UE is not configured with MUSIM gaps:

When inter-frequency SMTC is fully non overlapping with measurement gaps or NCSG, or interfrequency SMTC is fully overlapping with MGs or NCSG, $K_p$ =1.

When inter-frequency SMTC is partially overlapping with measurement gaps, $K_p$ = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP. When inter-frequency SMTC is partially overlapping with NCSG, $K_p$ = 1/(1- (SMTC period /VIRP)), where SMTC period < VIRP.

For FR2,

$K_{layer1_measurement}$=1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by inter-frequency SMTC occasions, or

- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by inter-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are indicated by *SSB-ToMeasure* and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$=1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

For calculation of $K_p$, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

**Table 9.3.9.1-1: Time period for PSS/SSS detection, (FR1)**

| DRX cycle | $T_{PSS/SSS_sync_inter}$ |
