## 9.3.9.2 Measurement period

The UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4, 10.1.5, 10.1.9, 10.1.10, 10.1.14 and 10.1.15, respectively, as shown in table 9.3.9.2-1 and 9.3.9.2-2, if UE supports inter-frequency measurement without measurement gaps. When highSpeedMeasInterFreq-r17 is configured and UE supports measurementEnhancementInterFreq-r17, $T_{SSB_measurement_period_inter}$ is specified in table 9.3.9.2-3.

**Table 9.3.9.2-1: Measurement period for inter-frequency measurements without gaps ((FR1)**

| DRX cycle | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | max(200 ms, ceil($M_{meas_period_inter}$ x $K_p$) x SMTC period)$^{Note\ 1}$ x $CSSF_{inter}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x $M_{meas_period_inter}$ x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle>320 ms | ceil( $M_{meas_period_inter}$ x $K_p$ ) x DRX cycle x $CSSF_{inter}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

### 9.3.9.3 Scheduling availability of UE during inter-frequency measurements when the SSB is completely contained in the active BWP of the UE

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE is required to be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols to be measured in the following clauses are the SSB symbols indicated by *SSB-ToMeasure* [2], if it is configured; otherwise, all L SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

For UE configured with measurement gap cancellation according to clause 9.1.14, for which the conditions in clause 9.1.14.3 are met, the UE is not required to perform measurements during the cancelled measurement gap occasions, and no restrictions on the scheduling availability during the cancelled gap occasions apply.

The scheduling availability requirements when UE performs inter-frequency measurements without measurement gaps in a TDD bands on FR1 and FR2 in clause 9.3.9.3.1~9.3.9.3.3 are valid under the following conditions:

- SFN and frame boundary across serving cell and inter-frequency neighbor cells is aligned

[For UE supporting MUSIM gaps, when MUSIM gaps are configured, the requirements in clause 9.3.9.3 are also applied to the slots that are not interrupted according to requirements in clause 9.1.10.x3.y2 and 9.1.10.x3.y3.]

#### 9.3.9.3.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When UE performs inter-frequency measurements without measurement gaps in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

When UE performs inter-frequency measurements without measurement gaps in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to one serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions due to one serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided

For UE indicating *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

#### 9.3.9.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology-Inter-r16* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If UE performs inter-frequency measurements without measurement gaps in a TDD band, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

- If UE performs inter-frequency measurements without measurement gaps in a FDD band, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

  - serving cell symbols fully or partially overlap with SSB symbols to be measured on MO i, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO i and UE supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9, or

  - serving cell symbols fully or partially overlap with SMTC window for MO i and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO i, or UE not supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

For UE indicating *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

#### 9.3.9.3.3 Scheduling availability of UE performing measurements on FR2

The following scheduling restriction applies due to SS-RSRP or SS-SINR measurement on an FR2 inter-frequency cell

The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 inter-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

If following conditions are met:

- The UE has been notified about system information update through paging,
- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots.

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE shall receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

#### 9.3.9.3.4 Scheduling availability of UE performing measurements on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to measurements performed on FR2 serving cell frequency layer.

There are no scheduling restrictions on FR2 serving cell(s) due to measurements performed on FR1 serving cell frequency layer.

### 9.3.9.4 Scheduling availability of UE during inter-frequency measurements when the SSB is not completely contained in the active BWP of the UE

If UE supports *nr-NeedForGapNCSG-reporting-r17* and indicates *nogap-noncsg* in *NeedForGapNCSG-InfoNR* for inter-frequency measurement, or if UE supports *nr-NeedForInterruptionReport-r18* and indicates *nogap* in *NeedforGap-InfoNR* and further indicates *no-gap-no-interruption* or *no-gap-with-interruption* via *NeedForInterruptionInfoNR-r18* for inter-frequency measurement, UE is required to be capable of measuring without measurement gaps when the SSB is not completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged [2], if it is configured; otherwise, all *L* SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

The requirements in clause 9.3.9.4 based on *deriveSSB-IndexFromCell-inter* apply provided that UE supports ncsg-*SymbolLevelScheduleRestrictionInter-r17*. If UE does not support *ncsg-SymbolLevelScheduleRestrictionInter-r17*, the requirements in clause 9.3.9.4.3 apply assuming *deriveSSB-IndexFromCell-inter* is not enabled.

#### 9.3.9.4.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When the UE performs inter-frequency measurements without MG and NCSG in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement when (1) *simultaneousRxTxInterBandCA* is not supported for the target measurement band and the serving cell's band, or (2) target measurement and the serving cell are on the same band or on the band with overlapping DL frequency with UE's serving cell(s).

The UE is not expected to transmit PUCCH/PUSCH/SRS on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

When the UE performs inter-frequency measurements without MG and NCSG in a TDD band, the following restrictions apply due to SS-RSRQ measurement when *simultaneousRxTxInterBandCA* is not supported for the target measurement band and the serving cell band

The UE is not expected to transmit PUCCH/PUSCH/SRS on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and RSSI measurement symbols, and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured and RSSI measurement symbols within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

#### 9.3.9.4.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement when the target inter-frequency layer to be measured is on the same band with UE's serving cell(s) or on the band with overlapping DL frequency with UE's serving cell(s).

- The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

  If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

#### 9.3.9.4.3 Scheduling availability of UE performing measurements on FR2

When (1) UE does not support IBM between target measurement band and serving cell's band(s) nor *simultaneousRxTxInterBandCA*, or (2) target measurement and a serving cell are on the same band, the following scheduling restriction applies to the serving cell due to SS-RSRP or SS-SINR measurement on an FR2 inter-frequency cell without MG and NCSG:

The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.8.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

and due to SS-RSRQ measurement on an FR2 inter-frequency cell without MG and NCSG

The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and RSSI measurement symbols, and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured and RSSI measurement symbols within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.8.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

When UE does not support IBM between target measurement band and serving cell's band(s) but supports *simultaneousRxTxInterBandCA*, the following scheduling restriction applies to the serving cell due to SS-RSRP or SS-SINR measurement on an FR2 inter-frequency cell without MG and NCSG

The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and △t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

and due to SS-RSRQ measurement on an FR2 inter-frequency cell without MG and NCSG

The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and RSSI measurement symbols, and △t serving cell symbol after each consecutive SSB symbols to be measured and RSSI measurement symbols within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.8.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

When UE supports IBM between target measurement band and serving cell's band(s) but not *simultaneousRxTxInterBandCA*, the following scheduling restriction applies to the serving cell due to SS-RSRP or SS-SINR measurement on an FR2 inter-frequency cell without MG and NCSG

The UE is not expected to transmit PUCCH/PUSCH/SRS on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and △t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9..

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

and due to SS-RSRQ measurement on an FR2 inter-frequency cell without MG and NCSG

The UE is not expected to transmit PUCCH/PUSCH/SRS on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and RSSI measurement symbols, and △t serving cell symbol after each consecutive SSB symbols to be measured and RSSI measurement symbols within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

When UE supports IBM between target measurement band and serving cell's band(s) and *simultaneousRxTxInterBandCA*, no scheduling restriction applies to the serving cell.

If following conditions are met:

- The UE has been notified about system information update through paging,
- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE shall receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

#### 9.3.9.4.4 Scheduling availability of UE performing measurements on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to measurements performed on FR2 frequency layer.

There are no scheduling restrictions on FR2 serving cell(s) due to measurements performed on FR1 frequency layer.

## 9.3.10 Inter-frequency measurement with NCSG

### 9.3.10.1 Inter-frequency cell identification

For the UE supporting NCSG, if NCSG is provided, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured) or *deriveSSB-IndexFromCellInter-r17* is configured. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_processing})\ ms$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})\ ms$$

Where:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3.10.1-1 and table 9.3.10.1-2.

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3.10.1-3 and table 9.3.10.1-4.

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3.10.2-1 and table 9.3.10.2-2.

$T_{SSB_processing}$: it is the time period used to process multiple beams received in one SMTC. $T_{SSB_processing}$ = 2 ms for UE supporting *FastRx-BSF-MeasDelayReduction-r19* when the conditions in clause 3.6.21 are fulfilled. Otherwise, $T_{SSB_processing}$ = 0.

$M_{pss/sss_sync_inter}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_inter}$ = 64 samples. For a UE supporting FR2 power class 2, $M_{pss/sss_sync_inter}$ = 40 samples. For a UE supporting FR2 power class 3, $M_{pss/sss_sync_inter}$ = 40 samples. For a UE supporting FR2 power class 4, $M_{pss/sss_sync_inter}$ = 40 samples.

$M_{SSB_index_inter}$: For a UE supporting FR2 power class 1 or 5, $M_{SSB_index_inter}$ = 40 samples. For a UE supporting FR2 power class 2, $M_{SSB_index_inter}$ = 24 samples. For a UE supporting FR2 power class 3, $M_{SSB_index_inter}$ = 24 samples. For a UE supporting FR2 power class 4, $M_{SSB_index_inter}$ = 24 samples.

$M_{meas_period_inter}$: For a UE supporting FR2 power class 1 or 5, $M_{meas_period_inter}$ =64 samples. For a UE supporting FR2 power class 2, $M_{meas_period_inter}$=40 samples. For a UE supporting FR2 power class 3, $M_{meas_period_inter}$ =40 samples. For a UE supporting FR2 power class 4, $M_{meas_period_inter}$ = 40 samples.

For a UE that supports *FastRx-BSF-MeasDelayReduction-r19*, when the conditions in clause 3.6.21 are fulfilled and when *highSpeedMeasFlagFR2-r17* is not configured, the following values shall apply for $M_{pss/sss_sync_inter}$, $M_{SSB_index_inter}$ and $M_{meas_period_inter}$:

$M_{pss/sss_sync_inter}$: For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_inter}$ =5* $N_{reduced_Rx_BSF}$.

$M_{SSB_index_inter}$: For a UE supporting FR2-1 power class 3, $M_{SSB_index_inter}$ = 3* $N_{reduced_Rx_BSF}$.

$M_{meas_period_inter}$: For a UE supporting FR2-1 power class 3, $M_{meas_period_inter}$ =5* $N_{reduced_Rx_BSF}$.

Where,

$N_{reduced_Rx_BSF}$ = reported value via UE capability *fastRx-BSF-MeasDelayReduction-r19* in FR2-1.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_ncsg,i}$ in clause 9.1.5.3 for measurement conducted within NCSG.

- $K_{NCSG}$ is the scaling factor for a SSB frequency layer to be measured within an associated NCSG pattern. $K_{NCSG}$ = 1 when the UE is not configured with concurrent GAPs. Otherwise, $K_{NCSG} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:
  - For a window W of duration max(SMTC period, xRP_max), where xRP_max is the maximum xRP across all configured per-UE GAPs and per-FR GAPs within the same FR as the SSB frequency layer, and starting from the beginning of any SMTC occasion:
    - $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated NCSG within the window W, including those overlapped with other GAP occasions within the window, and
    - $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated NCSG within the window W after accounting for GAP collisions by applying the GAP collision rule in clauses 9.1.8.3, 9.1.12.3, and 9.1.13.3.
    - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.
- When concurrent GAPs are configured, requirements in this clause do not apply if $N_{available}$ =0.

## 9.3.10.2 Measurement period

When NCSG are provided for inter-frequency measurements, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4, 10.1.5, 10.1.9, 10.1.10, 10.1.14 and 10.1.15, respectively, as shown in tables 9.3.10.2-1 and 9.3.10.2-2:

**Table 9.3.10.2-1: Measurement period for inter-frequency measurements with NCSG (FR1)**

| Condition NOTE1,2 | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | $Max(200\ ms, 8 \times K_{NCSG} \times Max(VIRP, SMTC\ period)) \times CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | $Max(200\ ms, Ceil(8 \times 1.5 \times K_{NCSG}) \times Max(VIRP, SMTC\ period, DRX\ cycle)) \times CSSF_{inter}$ |
| DRX cycle > 320 ms | $8 \times K_{NCSG} \times DRX\ cycle \times CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: In EN-DC operation, the parameters, timers and scheduling requests referred to in clause 3.6.1 are for the secondary cell group. The DRX cycle is the DRX cycle of the secondary cell group. | |

**Table 9.3.10.2-2: Measurement period for inter-frequency measurements with NCSG (FR2)**

| Condition NOTE1,2 | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | $Max(400\ ms, M_{meas_period_inter} \times K_{NCSG} \times Max(VIRP, SMTC\ period)) \times CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | $Max(400\ ms, (1.5 \times M_{meas_period_inter} \times K_{NCSG}) \times Max(VIRP, SMTC\ period, DRX\ cycle)) \times CSSF_{inter}$ |
| DRX cycle > 320 ms | $M_{meas_period_inter} \times K_{NCSG} \times DRX\ cycle \times CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: In EN-DC operation, the parameters, timers and scheduling requests referred to in clause 3.6.1 are for the secondary cell group. The DRX cycle is the DRX cycle of the secondary cell group. | |

## 9.3.10.3 Scheduling availability during inter-frequency measurement with NCSG

When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same serving carrier which can be merged [2], if it is configured; otherwise, all *L* SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

The requirements in clause 9.3.10.3.3 based on *deriveSSB-IndexFromCell-inter* apply provided that UE supports ncsg-*SymbolLevelScheduleRestrictionInter-r17*. If UE does not support *ncsg-SymbolLevelScheduleRestrictionInter-r17*, the requirements in clause 9.3.10.3.3 apply assuming *deriveSSB-IndexFromCell-inter* is not enabled.

### 9.3.10.3.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When the UE performs inter-frequency measurements with NCSG in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement when (1) *simultaneousRxTxInterBandCA* is not supported for the target measurement band and the serving cell's band, or (2) target measurement and the serving cell are on the same band on the band with overlapping DL frequency with UE's serving cell(s).

The UE is not expected to transmit PUCCH/PUSCH/SRS on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

When the UE performs inter-frequency measurements with NCSG in a TDD band, the following restrictions apply due to SS-RSRQ measurement when *simultaneousRxTxInterBandCA* is not supported for the target measurement band and the serving cell band

The UE is not expected to transmit PUCCH/PUSCH/SRS on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and RSSI measurement symbols, and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured and RSSI measurement symbols within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

### 9.3.10.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement when the target inter-frequency layer to be measured is on the same band with UE's serving cell(s) or on the band with overlapping DL frequency with UE's serving cell(s).

- The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

#### 9.3.10.3.3 Scheduling availability of UE performing measurements on FR2

When (1) UE does not support IBM between target measurement band and serving cell's band(s) nor *simultaneousRxTxInterBandCA*, or (2) target measurement and a serving cell are on the same band, the following scheduling restriction applies to the serving cell due to SS-RSRP or SS-SINR measurement on an FR2 inter-frequency cell with NCSG:

The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and △t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.8.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

and due to SS-RSRQ measurement on an FR2 inter-frequency cell with NCSG

The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and RSSI measurement symbols, and △t serving cell symbol after each consecutive SSB symbols to be measured and RSSI measurement symbols within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.8.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

When UE does not support IBM between target measurement band and serving cell's band(s) but supports *simultaneousRxTxInterBandCA*, the following scheduling restriction applies to the serving cell due to SS-RSRP or SS-SINR measurement on an FR2 inter-frequency cell with NCSG

The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and △t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

and due to SS-RSRQ measurement on an FR2 inter-frequency cell with NCSG

The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and RSSI measurement symbols, and △t

serving cell symbol after each consecutive SSB symbols to be measured and RSSI measurement symbols within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.8.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

When UE supports IBM between target measurement band and serving cell's band(s) but not *simultaneousRxTxInterBandCA*, the following scheduling restriction applies to the serving cell due to SS-RSRP or SS-SINR measurement on an FR2 inter-frequency cell with NCSG

The UE is not expected to transmit PUCCH/PUSCH/SRS on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and △t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9..

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*,

and due to SS-RSRQ measurement on an FR2 inter-frequency cell with NCSG

The UE is not expected to transmit PUCCH/PUSCH/SRS on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

- serving cell symbols fully or partially overlap with SSB symbols to be measured on MO *i*, and △t serving cell symbol before each consecutive SSB symbols to be measured and RSSI measurement symbols, and △t serving cell symbol after each consecutive SSB symbols to be measured and RSSI measurement symbols within SMTC window duration, if *deriveSSB-IndexFromCellInter-r17* is enabled for MO *i*. △t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9.

- serving cell symbols fully or partially overlap with SMTC window for MO *i* and on 1 serving cell symbol before and after the SMTC window, if *deriveSSB-IndexFromCellInter-r17* is not enabled for MO *i*.

If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

When UE supports IBM between target measurement band and serving cell's band(s) and *simultaneousRxTxInterBandCA*, no scheduling restriction applies to the serving cell.

If following conditions are met:

- The UE has been notified about system information update through paging,

- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE shall receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

#### 9.3.10.3.4 Scheduling availability of UE performing measurements on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to measurements performed on FR2 frequency layer.

There are no scheduling restrictions on FR2 serving cell(s) due to measurements performed on FR1 frequency layer.

# 9.3A NR inter-frequency measurements in carrier frequencies with CCA

## 9.3A.1 Introduction

The requirements in clause 9.3A apply for inter-frequency measurements on a carrier frequency with CCA. A measurement is defined as an SSB based inter-frequency measurement provided it is not defined as an intra-frequency measurement according to clause 9.2A.The UE shall be able to identify new inter-frequency cells in carrier frequencies with CCA and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified inter-frequency cells if carrier frequency information is provided by PCell or PSCell, even if no explicit neighbour list with physical layer cell identities is provided.

When the inter-frequency measurement is performed on a neighbour cell in FR2-2 with shared spectrum channel access, UE shall determine the CCA mode of the neighbour cell according to *channelAccessMode2-r17*of the cell configured in *MeasObjectNR*. If *channelAccessMode2-r17* of the cell is enabled, UE shall assume that CCA applies to the cell and perform measurement accordingly, and the requirements in clause 9.3A shall apply; otherwise, UE shall assume that CCA does not apply to the cell and perform measurement accordingly, and requirements in clause 9.3 shall apply.

SSB based measurements are configured along with a measurement timing configuration (SMTC) per carrier, which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements on the configured inter-frequency carrier are to be performed. For inter-frequency connected mode measurements, one measurement window periodicity may be configured per inter-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB on an inter-frequency measurement object which start earlier than the gap starting time + switching time, nor detect SSB which end later than the gap end – switching time.

In the requirements of clause 9.3A, the term SMTC occasion not available at the UE refers to when the SMTC contains SSBs configured by gNB in a cell on a carrier frequency subject to CCA, but N candidate SSB positions for the same SS/PBCH block index within the discovery burst transmission window are not available at the UE due to DL CCA failures at gNB during the corresponding evaluation or measurement period, where:

- For the cell detection procedure: N is at least one candidate SSB position (NOTE: the one candidate SSB position for the cell detection shall not be impacted by the set of candidate SSB positions which are already being measured by the UE within the current measurement period of the on-going measurements), and

- For other procedures in clause 9.3A: N are the first two successive candidate SSB positions when two or more candidate SSB positions are configured for this SSB index in one discovery burst transmission window, otherwise N is one candidate SSB position;

otherwise the SMTC occasion is considered as available at the UE.

For the FR2-2 requirements of clause 9.3A, an SMTC occasion group consists of N consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB.

## 9.3A.2 Requirements applicability

The requirements in clause 9.3A apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency CCA cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clause 10.1.28,

- SS-RSRQ related side conditions given in clause 10.1.30 and TBD for FR1 and FR2-2, respectively,

- SS-SINR related side conditions given in clause 10.1.32 and TBD for FR1 and FR2-2, respectively,

- SSB_RP and SSB Ês/Iot according to Annex B.2.9.

## 9.3A.3 Number of cells and number of SSB

### 9.3A.3.1 Requirements for FR1

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 7 SSBs with different SSB indexes and/or PCI on the inter-frequency layer.

### 9.3A.3.2 Requirements for FR2-2

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 10 SSBs with different SSB index and/or PCI on the inter-frequency layer, and
- 1 SSB per identified cell.

## 9.3A.4 Inter-frequency cell identification

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_cca_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise UE shall be able to identify a new detectable inter-frequency cell, in carrier frequencies with CCA, within $T_{identify_inter_cca_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block, in carrier frequencies with CCA, of an already detected cell within $T_{identify_inter_cca_without_index}$.

$$T_{identify_inter_cca_without_index} = (T_{PSS/SSS_sync_inter_cca} + T_{SSB_measurement_period_inter_cca}) \text{ ms}$$

$$T_{identify_inter_cca_with_index} = (T_{PSS/SSS_sync_inter_cca} + T_{SSB_measurement_period_inter_cca} + T_{SSB_time_index_inter_cca}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_inter_cca}$: it is the time period used in PSS/SSS detection given in table 9.3A.4-1 and table 9.3A.4-3.

$T_{SSB_time_index_inter_cca}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3A.4-2 and table 9.3A.4-4.

$T_{SSB_measurement_period_inter_cca}$: equal to a measurement period of SSB based measurement given in table 9.3A.5-1.

$CSSF_{inter}$ : it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

$M_{pss/sss_sync_inter_CCA}$: For a UE supporting FR2-2 power class 1, $M_{pss/sss_sync_inter\ CCA} = 96$. For a UE supporting FR2-2 power class 2, $M_{pss/sss_sync_inter\ CCA} = 60$. For a UE supporting FR2-2 power class 3, $M_{pss/sss_sync_inter\ CCA} = 60$.

$M_{SSB_index_inter_CCA}$: For a UE supporting FR2-2 power class 2 or 3, $M_{SSB_index_inter\ CCA} = 48$ samples. For a UE supporting FR2 power class 1, $M_{SSB_index_inter\ CCA} = 72$ samples

$M_{meas_period_inter_CCA}$: For a UE supporting FR2-2 power class 1, $M_{meas_period_inter\ CCA} = 96$. For a UE supporting FR2-2 power class 2, $M_{meas_period_inter\ CCA} = 60$. For a UE supporting FR2-2 power class 3, $M_{meas_period_inter\ CCA} = 60$

**Table 9.3A.4-1: Time period for PSS/SSS detection (FR1)**

| Condition NOTE1,2,3,4 | $T_{PSS/SSS_sync_inter_cca}$ |
|---|---|
| No DRX | max(600 ms, $(8+L_{PSS/SSS,gaps})$ x max(MGRP, SMTC period)) x $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | max(600 ms, ceil($(8+L_{PSS/SSS,gaps})$x1.5) x max(MGRP, SMTC period, DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle > 320 ms | $(8+L_{PSS/SSS,gaps})$ x DRX cycle x $CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |

NOTE 2: In EN-DC operation, the parameters, timers and scheduling requests referred to in clause 3.6.1 are for the secondary cell group. The DRX cycle is the DRX cycle of the secondary cell group.
NOTE 3: When DRX is not configured, $L_{PSS/SSS,gaps}$ is the number of SMTC occasions not available at the UE during $T_{PSS/SSS_sync_inter_cca}$, for PSS/SSS detection, where $L_{PSS/SSS,gaps} \leq L_{PSS/SSS,gaps,max}$. When DRX is configured, $L_{PSS/SSS,gaps}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{PSS/SSS_sync_inter_cca}$, for PSS/SSS detection, where $L_{PSS/SSS,gaps} \leq L_{PSS/SSS,gaps,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{inter}$.
NOTE 4: $L_{PSS/SSS,gaps,max} = 12$ for max(DRX cycle, SMTC period, MGRP) ≤ 40 ms $L_{PSS/SSS,gaps,max} = 8$ for 40 ms < max(DRX cycle, SMTC period, MGRP) ≤ 320 ms, and $L_{PSS/SSS,gaps,max} = 5$ for DRX cycle > 320 ms.

Upon exceeding $L_{PSS/SSS,gaps,max}$, the UE is not required to meet the corresponding PSS/SSS detection requirement. The requirements apply provided that any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known.

**Table 9.3A.4-2: Time period for time index detection (FR1)**

| Condition NOTE1,2,3,4 | $T_{SSB_time_index_inter_cca}$ |
|---|---|
| No DRX | max(120 ms, (3+ $L_{ind,gaps}$) x max(MGRP, SMTC period)) x $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | max(120 ms, ceil((3+ $L_{ind,gaps}$) x 1.5) x max(MGRP, SMTC period, DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle > 320 ms | (3 + $L_{ind,gaps}$) x DRX cycle x $CSSF_{inter}$ |

NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1
NOTE 2: In EN-DC operation, the parameters, timers and scheduling requests referred to in clause 3.6.1 are for the secondary cell group. The DRX cycle is the DRX cycle of the secondary cell group.
NOTE 3: When DRX is not configured, $L_{ind,gaps}$ is the number of SMTC occasions not available at the UE during $T_{SSB_time_index_inter_cca}$ for time index identification, where $L_{ind,gaps} \leq L_{ind,gaps,max}$. When DRX is configured, $L_{ind,gaps}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_inter_cca}$ for time index identification, where $L_{ind,gaps} \leq L_{ind,gaps,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{inter}$.
NOTE 4: $L_{ind,gaps,max} = 5$ for max(DRX cycle, SMTC period, MGRP) ≤ 40 ms, $L_{ind,gaps,max} = 3$ for 40 ms < max(DRX cycle, SMTC period, MGRP) ≤ 320 ms, and $L_{ind,gaps,max} = 2$ for DRX cycle > 320 ms.

The UE shall restart the time index detection upon exceeding $L_{ind,gaps,max}$. The requirements apply provided that any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known.

**Table 9.3A.4-3: Time period for PSS/SSS detection, (Frequency range FR2-2)**

| Condition NOTE | $T_{PSS/SSS_sync_inter}$ |
|---|---|
| No DRX | Max(600 ms, ceil($M_{pss/sss_sync_inter_CCA}$+ [$N_{RxBeam}$] x $L_{PSS/SSS,gaps}$))× Max(MGRP, SMTC period)) × $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | Max(600 ms, ceil(1.5 × $M_{pss/sss_sync_inter_CCA}$+ [$N_{RxBeam}$] x $L_{PSS/SSS,gaps}$)) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter}$ |
| DRX cycle > 320 ms | Ceil($M_{pss/sss_sync_inter_CCA}$+ [$N_{RxBeam}$] x $L_{PSS/SSS,gaps}$)× DRX cycle × $CSSF_{inter}$ |

NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1
NOTE 2: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified
NOTE 3: When DRX is not configured, $L_{PSS/SSS,gaps}$ is the number of SMTC occasion groups not available at the UE during $T_{PSS/SSS_sync_inter_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS,gaps} < L_{PSS/SSS,gaps,max}$. A SMTC occasion group consists of $N_{RxBeam}$ consecutive SMTC occasions. An SMTC occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB. When DRX is configured, $L_{PSS/SSS}$ is the number of [DRX cycle groups] in which at least one SMTC occasion is not available at the UE during $T_{PSS/SSS_sync_inter_CCA}$ for PSS/SSS detection, where $L_{PSS/SSS,gaps} < L_{PSS/SSS,gaps,max}$ . [A DRX occasion group consists of $N_{RxBeam}$ consecutive DRX cycles. A DRX occasion group occasion group is not available, when at least one SMTC occasion in the group is not transmitted by the gNB.] When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle.

NOTE 4: $L_{PSS/SSS,gaps,max}$ = 12 for max(DRX cycle, SMTC period, MGRP) ≤ 40 ms $L_{PSS/SSS,gaps}$ = 8 for 40 ms < max(DRX cycle, SMTC period, MGRP) ≤ 320 ms, and $L_{PSS/SSS,gaps}$ = 5 for DRX cycle > 320 ms

Upon exceeding $L_{PSS/SSS,gaps,max}$, the UE is not required to meet the corresponding PSS/SSS detection requirement. The requirements apply provided that any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known.

**Table 9.3A.4-4: Time period for time index detection (FR2-2)**

| Condition NOTE1,2,3,4 | $T_{SSB_time_index_inter_cca}$ |
|---|---|
| No DRX | max(120 ms, ceil($M_{SSB_index_inter_CCA}$ + [$N_{RxBeam}$] x $L_{ind,gaps}$) x max(MGRP, SMTC period)) x $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | max(120 ms, ceil($M_{SSB_index_inter_CCA}$ + [$N_{RxBeam}$] x $L_{ind,gaps}$) x 1.5) x max(MGRP, SMTC period, DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle > 320 ms | ceil($M_{SSB_index_inter_CCA}$ + [$N_{RxBeam}$] x $L_{ind,gaps}$) x DRX cycle x $CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |
| NOTE 2: When DRX is not configured, $L_{ind,gaps}$ is the number of SMTC occasions not available at the UE during $T_{SSB_time_index_inter_cca,\ for}$ for time index identification, where $L_{ind,gaps} \le L_{ind,gaps,max}$. When DRX is configured, $L_{ind,gaps}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_time_index_inter_cca,\ for}$ for time index identification, where $L_{ind,gaps} \le L_{ind,gaps,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{inter}$. | |
| NOTE 3: $L_{ind,gaps,max}$ = [5] for max(DRX cycle, SMTC period, MGRP) ≤ 40 ms, $L_{ind,gaps,max}$ = [3] for 40 ms < max(DRX cycle, SMTC period, MGRP) ≤ 320 ms, and $L_{ind,gaps,max}$ = [2] for DRX cycle > 320 ms. | |

The UE shall restart the time index detection upon exceeding $L_{ind,gaps,max}$. The requirements apply provided that any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known.

## 9.3A.5 Inter-frequency measurements

When measurement gaps are provided for inter-frequency measurements in carrier frequencies with CCA, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.28, 10.1.30, 10.1.32, respectively, as shown in table 9.3A.5-1.

**Table 9.3A.5-1: Measurement period for inter-frequency measurements with gaps**

| Condition NOTE1,2,3,4 | $T_{SSB_measurement_period_inter_cca}$ |
|---|---|
| No DRX | max(200 ms, (8+ $L_{meas}$) x max(MGRP, SMTC period)) x $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | max(200 ms, ceil((8+ $L_{meas}$) x 1.5) x max(MGRP, SMTC period, DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle > 320 ms | (8+ $L_{meas}$) x DRX cycle x $CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |
| NOTE 2: In EN-DC operation, the parameters, timers and scheduling requests referred to in clause 3.6.1 are for the secondary cell group. The DRX cycle is the DRX cycle of the secondary cell group. | |
| NOTE 3: When DRX is not configured, $L_{meas}$ is the number of SMTC occasions not available at the UE during $T_{SSB_measurement_period_inter_cca}$, for inter-frequency measurements with gaps, where $L_{meas} \le L_{meas,max}$. When DRX is configured, $L_{meas}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_measurement_period_inter_cca}$, for inter-frequency measurements with gaps, where $L_{meas} \le L_{meas,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP. FFS: The UE is not required to de | |
| NOTE 4: $L_{meas,max}$ = 12 for max(DRX cycle, SMTC period, MGRP) ≤ 40 ms, $L_{meas,max}$ = 8 for 40 ms < max(DRX cycle, SMTC period, MGRP) ≤ 320 ms, and $L_{meas,max}$ = 5 for DRX cycle > 320 ms. | |

The UE shall restart the measurement upon exceeding $L_{meas,max}$. The requirements apply provided that any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known.

The UE shall stop the measurement attempts on the SSB of a cell and perform the detection procedure again, like for any other SSB, when the following conditions are met:

- $L_{meas} > L_{meas,max}$, and
- The time period of unsuccessful measurement attempts exceeds the maximum time required for the cell to remain known as defined in clause 9.3A.6.3.

**Table 9.3A.5-2: Measurement period for inter-frequency measurements with gaps(FR2-2)**

| Condition NOTE1,2,3,4 | $T_{SSB_measurement_period_inter_cca}$ |
|---|---|
| No DRX | max(200 ms, ceil($M_{meas_period_inter_CCA}$ + [$N_{RxBeam}$] x $L_{meas,gaps}$) x max(MGRP, SMTC period)) x $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | max(200 ms, ceil($M_{meas_period_inter_CCA}$ + [$N_{RxBeam}$] x $L_{meas,gaps}$) x 1.5) x max(MGRP, SMTC period, DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle > 320 ms | ceil($M_{meas_period_inter_CCA}$ + [$N_{RxBeam}$] x $L_{meas,gaps}$) x DRX cycle x $CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |
| NOTE 2: In EN-DC operation, the parameters, timers and scheduling requests referred to in clause 3.6.1 are for the secondary cell group. The DRX cycle is the DRX cycle of the secondary cell group. | |
| NOTE 3: When DRX is not configured, $L_{meas,gaps}$ is the number of SMTC occasions not available at the UE during $T_{SSB_measurement_period_inter_cca}$, for inter-frequency measurements with gaps, where $L_{meas,gaps} \leq L_{meas,gaps,max}$. When DRX is configured, $L_{meas,gaps}$ is the number of DRX cycles in which at least one SMTC occasion is not available at the UE during $T_{SSB_measurement_period_NR_cca}$, for inter-frequency measurements with gaps, where $L_{meas,gaps} \leq L_{meas,gaps,max}$. When configured with DRX, the UE is not required to determine the availability of SMTC occasions more frequent than once per DRX cycle. When configured with measurement gaps, the UE is not required to determine the availability of SMTC occasions more frequent than once during MGRP. FFS: The UE is not required to determine the availability of SMTC occasions more frequent than what is required by $CSSF_{inter}$. | |
| NOTE 4: $L_{meas,gaps,max}$ = [12] for max(DRX cycle, SMTC period, MGRP) ≤ 40 ms, $L_{meas,gaps,max}$ = [8] for 40 ms < max(DRX cycle, SMTC period, MGRP) ≤ 320 ms, and $L_{meas,gaps,max}$ = [5] for DRX cycle > 320 ms. | |

The UE shall restart the measurement upon exceeding $L_{meas,gap,max}$. The requirements apply provided that any two closest SMTC occasions available at the UE for the measurement shall be separated by no more than the maximum time requirement for the cell to remain known.

## 9.3A.6 Inter-frequency measurements reporting requirements

### 9.3A.6.1 Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.28, 10.1.30, and 10.1.32, respectively.

### 9.3A.6.2 Event-triggered Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1.28, 10.1.30, and 10.1.32, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.3A.6.3.

### 9.3A.6.3 Event-triggered Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.28, 10.1.30, and 10.1.32, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report, and all delays due to UL CCA failures until the successful transmission of the report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within $T_{identify_inter_cca_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_cca_with_index}$. Both $T_{identify_inter_cca_without_index}$ and $T_{identify_inter_cca_with_index}$ are defined in clause 9.3A.4. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the cell being configured remains detectable during the time period $T_{identify_inter_cca_without_index}$ or $T_{identify_inter_cca_with_index}$ defined in clause 9.3A.4. If a cell which has been detectable at least for the time period $T_{identify_inter_cca_without_index}$ or $T_{identify_inter_cca_with_index}$ defined in clause 9.3A.4 becomes undetectable for a period $\leq 8$ seconds and then the cell becomes detectable again with the same spatial reception parameter and then triggers the measurement report as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_inter_cca}$ defined in clause 9.3A.5 provided the timing to that cell has not changed more than $\pm 3200/2^{\mu}$ Tc while measurement gap has not been available and the L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used an additional delay can be expected.

## 9.3A.8 Inter-frequency RSSI measurements

An RSSI measurement is defined as an inter-frequency measurement provided that the RSSI measurement bandwidth is not contained within the current carrier bandwidth of the UE.

The UE physical layer shall be capable of performing the RSSI measurements, defined in TS 38.215 [4] on one or more inter-frequency carriers operating with CCA, TS 37.213 [33], if the carrier(s) are indicated by higher layers [2], and report the RSSI measurements to higher layers. The UE physical layer shall provide to higher layers a single RSSI sample for each OFDM symbol within each configured RSSI measurement duration [2] occurring with a configured RSSI measurement timing configuration periodicity [2], *rmtc-Periodicity*. The requirements apply if *rmtc-SubframeOffset* [2] is configured.

For performing inter-frequency RSSI measurement in FR2-2,

- If a UE has serving cell in FR2-2,
  - If the TCI state is provided in RMTC configuration of FR2-2, the UE shall assume the configured RSSI measurement resources are QCL-ed with TypeD to the DL RS associated with the TCI state provided in the RMTC configuration. The UE does not expect to be configured with an explicit TCI-state in RMTC-Config with a reference serving cell in FR1 or FR2-1. If no TCI state is provided in the RMTC configuration, the UE shall assume the configured RSSI measurement resources are QCL-ed with TypeD to one of the latest received PDSCH and the latest monitored CORESET in the active BWP of a serving carrier in FR2-2.
- If a UE has no serving cell in FR2-2,
  - The UE does not expect that a TCI state is provided in RMTC configuration. It is up to UE implementation how to determine the spatial domain filter for the inter-frequency RSSI measurement in FR2-2, and no requirements are defined.

For RSSI measurement in FR2-2 with SCS of 480 kHz or 960 kHz, the RSSI measurement results shall be derived based on symbols configured by RMTC except for the first symbol and the last symbol in RMTC, and there is no requirements when *measDurationSymbols* is configured as 1.

**Table 9.3A.8-1: Measurement period for inter-frequency RSSI measurements with gaps**

| Condition NOTE1,2,3,4 | $T_{RSSI_measurement_period_inter_cca}$ |
|---|---|
| No DRX | max(*reportInterval*, max(*rmtc-Periodicity, MGRP*) x $CSSF_{inter}$) |
| DRX | max(*reportInterval*, max(*rmtc-Periodicity*, MGRP,DRX cycle) x $CSSF_{inter}$) |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: $CSSF_{inter}$ is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps. | |

If the UE requires measurement gaps to perform inter-frequency measurements, a single measurement gap pattern is used for all concurrent inter-frequency measurements, including inter-frequency RSSI measurements. The RSSI measurement duration and the measurement gap shall be aligned, and the following additional condition shall be fulfilled:

- Entire RSSI measurement duration is contained in the measurement gap.

The RSSI measurement performed and reported according to this clause shall meet the RSSI measurement accuracy requirement in clause 10.1.34.2. The reported RSSI measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.34.3.

## 9.3A.9 Inter-frequency channel occupancy measurements

The UE shall be capable of estimating the channel occupancy on one or more carrier frequencies indicated by higher layers [2], based on RSSI samples provided by the physical layer. The requirements apply if *rmtc-SubframeOffset* [2] is configured.

**Table 9.3A.9-1: Measurement period for inter-frequency Channel Occupancy measurements with gaps**

| Condition NOTE1,2,3,4 | $T_{CO_measurement_period_inter_cca}$ |
|---|---|
| No DRX | max(*reportInterval*, max(*rmtc-Periodicity, MGRP*) x $CSSF_{inter}$) |
| DRX | max(*reportInterval*, max(*rmtc-Periodicity*, MGRP,DRX cycle) x $CSSF_{inter}$) |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: $CSSF_{inter}$ is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps. | |

If the UE requires measurement gaps to perform inter-frequency measurements, a single measurement gap pattern is used for all concurrent inter-frequency measurements, including inter-frequency channel occupancy measurements. The RSSI measurement duration used for channel occupancy measurement and the measurement gap shall be aligned, and the following additional condition shall be fulfilled:

- Entire RSSI measurement duration is contained in the measurement gap.

The channel occupancy measurement performed and reported according to this clause shall meet the channel occupancy measurement accuracy requirements in clause 10.1.35.2. The reported channel occupancy measurement values contained in measurement reports shall be based on the measurement reporting range specified in TS 38.331 [2].

# 9.3B NR inter-frequency measurements for RedCap

## 9.3B.1 Introduction

A measurement is defined as an SSB based inter-frequency measurement provided it is not defined as an intra-frequency measurement according to clause 9.2B.

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified inter-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

A measurement is defined as an inter-frequency SSB based measurements without measurement gaps for UE capable of *interFrequencyMeas-NoGap* provided

- the UE supports *interFrequencyMeas-Nogap-r16* [15], and
- the SSB is completely contained in the active BWP of the UE.

For inter-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.3B.7.3.

SSB based measurements are configured along with a measurement timing configuration (SMTC) per carrier, which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements on the

configured inter-frequency carrier are to be performed. For inter-frequency connected mode measurements, one measurement window periodicity may be configured per inter-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB on an inter-frequency measurement object which start earlier than the gap starting time + switching time, nor detect SSB which ends later than the gap end – switching time. When the serving cells are in FR2, the inter-frequency cells are in FR2 and the per-UE gap or per-FR gap is configured to the UE in SA NR, the switching time is 0.25 ms. Otherwise the switching time is 0.5 ms.

Longer measurement period would be expected during the period $T_{identify_CGI_RedCap}$ when the UE is requested to decode an NR/E-UTRA CGI.

## 9.3B.2 Requirements applicability

The requirements in clause 9.3B apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency cell shall be considered detectable when for each relevant SSB:

- For 2 Rx RedCap UE:
  - SS-RSRP related side conditions given in clauses 10.1.4 and 10.1.5 for FR1 and FR2, respectively, for a corresponding band,
  - SS-RSRQ related side conditions given in clauses 10.1.9 and 10.1.10 for FR1 and FR2, respectively, for a corresponding band,
  - SS-SINR related side conditions given in clauses 10.1.14 and 10.1.15 for FR1 and FR2, respectively, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.3 for a corresponding band.
- For 1 Rx RedCap UE:
  - SS-RSRP related side conditions given in clauses 10.1A.4 for FR1 for a corresponding band,
  - SS-RSRQ related side conditions given in clauses 10.1A.8 for FR1 for a corresponding band,
  - SS-SINR related side conditions given in clauses 10.1A.12 for FR1, respectively, for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.16 for a corresponding band.

## 9.3B.3 Number of cells and number of SSB

### 9.3B.3.1 Requirements for FR1

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 7 SSBs with different SSB index and/or PCI on the inter-frequency layer.

### 9.3B.3.2 Requirements for FR2

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 10 SSBs with different SSB index and/or PCI on the inter-frequency layer, and
- 1 SSB per identified cell.

## 9.3B.4 Inter-frequency measurement with measurement gaps

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index_RedCap}$.

$$T_{identify_inter_without_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap})\ ms$$

$$T_{identify_inter_with_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap} + T_{SSB_time_index_inter_RedCap})\ ms$$

Where:

$T_{PSS/SSS_sync_inter_RedCap}$: it is the time period used in PSS/SSS detection given in table 9.3B.4-1, table 9.3B.4-2, table 9.3B.4-3.

$T_{SSB_time_index_inter_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3B.4-4, table 9.3B.4-5, table 9.3B.4-6.

$T_{SSB_measurement_period_inter_RedCap}$: equal to a measurement period of SSB based measurement given in table 9.3B.5-1, table 9.3B.5-2, table 9.3B.5-3.

For 2 Rx RedCap UE:

$M_{pss/sss_sync_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_inter_RedCap}$ = 64 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{pss/sss_sync_inter_RedCap}$ = 40 samples.

$M_{SSB_index_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{SSB_index_inter_RedCap}$ = 40 samples. For a UE supporting FR2 power class 2, 3,4 or 7, $M_{SSB_index_inter_RedCap}$ = 24 samples.

$M_{meas_period_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{meas_period_inter_RedCap}$ =64 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{meas_period_inter_RedCap}$ =40 samples.

$CSSF_{inter_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap_RedCap,i}$ in clause 9.1A.5.2 for measurement conducted within measurement gaps.

**Table 9.3B.4-1: Time period for PSS/SSS detection (FR1) for 2Rx RedCap UE**

| Condition NOTE1 | $T_{PSS/SSS_sync_inter_RedCap}$ |
|---|---|
| No DRX | $Max(600\ ms, 8 \times Max(MGRP, SMTC\ period)) \times CSSF_{inter_RedCap}$ |
| DRX cycle ≤ 320 ms | $Max(600\ ms, Ceil(8*1.5) \times Max(MGRP, SMTC\ period, DRX\ cycle)) \times CSSF_{inter_RedCap}$ |
| DRX cycle > 320 ms | $8 \times DRX\ cycle \times CSSF_{inter_RedCap}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |

| DRX cycle ≤ 320 ms | Max(160 ms, Ceil(6 × 1.5) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter_RedCap}$ |
| DRX cycle > 320 ms | 6 × DRX cycle × $CSSF_{inter_RedCap}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |

## 9.3B.5 Inter-frequency measurements

When measurement gaps are provided for inter-frequency measurements, the RedCap UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1A.4, 10.1A.5, 10.1A.8, 10.1A.9, 10.1A.12 and 10.1A.13, respectively, as shown in table 9.3B.5-1 and 9.3B.5-2 for 2Rx RedCap and 9.3B.5-3 for 1Rx RedCap, respectively.

**Table 9.3B.5-1: Measurement period for inter-frequency measurements with gaps (FR1) for 2Rx RedCap UE**

| Condition NOTE1 | $T_{SSB_measurement_period_inter_RedCap}$ |
|---|---|
| No DRX | Max(200 ms, 8 × Max(MGRP, SMTC period)) × $CSSF_{inter_RedCap}$ |
| DRX cycle ≤ 320 ms | Max(200 ms, Ceil(8 × 1.5) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter_RedCap}$ |
| DRX cycle > 320 ms | 8 × DRX cycle × $CSSF_{inter_RedCap}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |

**Table 9.3B.5-2: Measurement period for inter-frequency measurements with gaps (FR2) for 2Rx RedCap UE**

| Condition NOTE1 | $T_{SSB_measurement_period_inter_RedCap}$ |
|---|---|
| No DRX | Max(400 ms, $M_{meas_period_inter_RedCap}$ × Max(MGRP, SMTC period)) × $CSSF_{inter_RedCap}$ |
| DRX cycle ≤ 320 ms | Max(400 ms, (1.5 × $M_{meas_period_inter_RedCap}$) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter_RedCap}$ |
| DRX cycle > 320 ms | $M_{meas_period_inter_RedCap}$ × DRX cycle × $CSSF_{inter_RedCap}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |

**Table 9.3B.5-3: Measurement period for inter-frequency measurements with gaps (FR1) for 1Rx RedCap UE**

| Condition NOTE1 | $T_{SSB_measurement_period_inter_RedCap}$ |
|---|---|
| No DRX | Max(400 ms, 8 × Max(MGRP, SMTC period)) × $CSSF_{inter_RedCap}$ |
| DRX cycle ≤ 320 ms | Max(400 ms, ceil(1.5 × 8) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter_RedCap}$ |

| | |
|---|---|
| DRX cycle > 320 ms | 8 × DRX cycle × $CSSF_{inter_RedCap}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1 | |

## 9.3B.6 Inter-frequency measurements reporting requirements

### 9.3B.6.1 Periodic Reporting

For 2 Rx RedCap UE: The requirements in clause 9.3.6.1 shall apply.

For 1 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1A.4.1, 10.1A.8.1 and 10.1A.12.1, respectively.

### 9.3B.6.2 Event-triggered Periodic Reporting

For 2 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

For 1 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1A.4.1, 10.1A.8.1 and 10.1A.12.1, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.3B.6.3.

### 9.3B.6.3 Event-triggered Reporting

For 2 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.5.1, 10.1.9.1, 10.1.10.1, 10.1.14.1 and 10.1.15.1, respectively.

For 1 Rx RedCap UE: Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1A.4.1, 10.1A.8.1 and 10.1A.12.1, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. Both $T_{identify_inter_without_index_RedCap}$ and $T_{identify_inter_with_index_RedCap}$ are defined in clause 9.3B.4. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_inter_without_index_RedCap}$ or $T_{identify_inter_with_index_RedCap}$ as defined in clause 9.3B.4 or 9.3B.7.1. If a cell which has been detectable at least for the time period $T_{identify\ inter\ without\ index_RedCap}$ or $T_{identify\ inter\ with\ index_RedCap}$ defined in clause 9.3B.4 or 9.3B.7.1 becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_intra_RedCap}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

# 9.3B.7 Inter-frequency measurements without measurement gaps

## 9.3B.7.1 Inter-frequency Cell identification

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index_RedCap}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index_RedCap}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index_RedCap}$. It is assumed that when UE performs inter-frequency measurements without measurement gaps in a TDD bands on FR1 and FR2, the following conditions are met:

- SFN and frame boundary across serving cell and inter-frequency neighbor cells is aligned, and
- the timing of SSBs across serving cell and inter-frequency neighbor cells are aligned

$$T_{identify_inter_without_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap})\ ms$$

$$T_{identify_inter_with_index_RedCap} = (T_{PSS/SSS_sync_inter_RedCap} + T_{SSB_measurement_period_inter_RedCap} + T_{SSB_time_index_inter_RedCap})\ ms$$

Where:

$T_{PSS/SSS_sync_inter_RedCap}$: it is the time period used in PSS/SSS detection given in table 9.3B.7.1-1, table 9.3B.7.1-2 and table 9.3B.7.1-3.

$T_{SSB_time_index_inter_RedCap}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3B.7.1-4 and table 9.3B.7.1-5.

$T_{SSB_measurement_period_inter_RedCap}$: equal to a measurement period of SSB based measurement given in table 9.3B.7.2-1, table 9.3B.7.2-2 and table 9.3B.7.2-3.

$CSSF_{inter_RedCap}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap_RedCap,i}$ in clause 9.1A.5.1 for measurement conducted outside measurement gaps, i.e. when inter-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps or according to $CSSF_{within_gap_RedCap,i}$ in clause 9.1A.5.2 for measurement conducted within measurement gaps, i.e. when inter-frequency SMTC is fully overlapping with measurement gaps.

$M_{pss/sss_sync_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{pss/sss_sync_inter_RedCap}$ = 40 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{pss/sss_sync_inter_RedCap}$ = 24 samples.

$M_{SSB_index_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{SSB_index_inter_RedCap}$ = 40 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{SSB_index_inter_RedCap}$ = 24 samples.

$M_{meas_period_inter_RedCap}$: For a UE supporting FR2 power class 1 or 5, $M_{meas_period_inter_RedCap}$ =40 samples. For a UE supporting FR2 power class 2, 3, 4 or 7, $M_{meas_period_inter_RedCap}$ =24 samples.

When inter-frequency SMTC is fully non overlapping with measurement gaps or inter-frequency SMTC is fully overlapping with MGs, $K_p$=1.

When inter-frequency SMTC is partially overlapping with measurement gaps, $K_p$ = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP.

For FR2,

$K_{layer1_measurement}$ =1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by inter-frequency SMTC occasions, or
- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by inter-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured,

where SSB symbols are indicated by *SSB-ToMeasure* and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$=1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

**Table 9.3B.7.1-1: Time period for PSS/SSS detection (FR1) for 2Rx RedCap UE**

| DRX cycle | $T_{PSS/SSS_sync_inter_RedCap}$ |
|---|---|

| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

## 9.3B.7.2 Measurement period

The RedCap UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1A.4, 10.1A.5, 10.1A.8, 10.1A.9, 10.1A.12 and 10.1A.13, respectively, as shown in table 9.3B.7.2-1 and 9.3B.7.2-2 for 2Rx RedCap and table 9.3B.7.2-3 for 1Rx RedCap respectively, if UE supports inter-frequency measurement without measurement gaps:

**Table 9.3B.7.2-1: Measurement period for inter-frequency measurements without gaps ((FR1) for 2Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_p$) x SMTC period)[Note 1] x $CSSF_{inter_RedCap}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{inter_RedCap}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ ) x DRX cycle x $CSSF_{inter_RedCap}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

| DRX cycle≤ 320 ms | max(400 ms, ceil(1.5x $M_{meas_period_inter_RedCap}$ x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{inter_RedCap}$ |
| DRX cycle>320 ms | ceil($M_{meas_period_inter_RedCap}$ x$K_p$ x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{inter_RedCap}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.3B.7.2-3: Measurement period for inter-frequency measurements without gaps ((FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | max(200 ms, ceil(5 x $K_p$) x SMTC period)[Note 1] x $CSSF_{inter_RedCap}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{inter_RedCap}$ |
| DRX cycle>320 ms | ceil(5 x $K_p$ ) x DRX cycle x $CSSF_{inter_RedCap}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

## 9.3B.7.3 Scheduling availability of UE during inter-frequency measurements

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE is required to be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols to be measured in the following clauses are the SSB symbols indicated by *SSB-ToMeasure* [2], if it is configured; otherwise, all L SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

The scheduling availability requirements when UE performs inter-frequency measurements without measurement gaps in a TDD bands on FR1 and FR2 and HD-FDD UE performs inter-frequency measurements without measurement gaps on FR1 in clause 9.3B.7.3.1~9.3B.7.3.4 are valid under the following conditions:

- SFN and frame boundary across serving cell and inter-frequency neighbor cells is aligned, and
- the timing of SSBs across serving cell and inter-frequency neighbor cells are aligned

### 9.3B.7.3.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When UE performs inter-frequency measurements without measurement gaps in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

When UE performs inter-frequency measurements without measurement gaps in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

#### 9.3B.7.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology-Inter-r16* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If UE performs inter-frequency measurements without measurement gaps in a TDD band, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

- If UE performs inter-frequency measurements without measurement gaps in a FDD band, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

#### 9.3B.7.3.3 Scheduling availability of UE performing measurements on FR2

The following scheduling restriction applies due to SS-RSRP or SS-SINR measurement on an FR2 inter-frequency cell

> The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 inter-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

If following conditions are met:

- The UE has been notified about system information update through paging,

- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, the UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, the UE shall receive PDSCH that corresponds to the PDCCH that the UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured.

#### 9.3B.7.3.4 Scheduling availability of HD-FDD UE performing measurements on FR1

When HD-FDD UE performs inter-frequency measurements without measurement gaps in a FR1 band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

When HD-FDD UE performs inter-frequency measurements without measurement gaps in a FR1 band, the following restrictions apply due to SS-RSRQ measurement

- UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

# 9.3C NR inter-frequency measurements for SAN

## 9.3C.1 Introduction

A measurement is defined as an SSB based inter-frequency measurement provided it is not defined as an intra-frequency measurement according to clause 9.2C. The requirements apply provided the valid parameters of ephemeris information, epoch time of the ephemeris, common TA, validity timer information, downlink polarization information for target NR SAN cell are sent to UE.

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified inter-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

A measurement is defined as inter-frequency SSB based measurements without measurement gaps for UE capable of *interFrequencyMeas-NoGap* provided

- the UE supports *interFrequencyMeas-Nogap-r16* [15], and
- the SSB is completely contained in the active BWP of the UE, and
- the flag *interFrequencyConfig-NoGap-r16* is configured by the Network.

For inter-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.3C.7.3.

SSB based measurements are configured along with one or more measurement timing configurations (SMTC) which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements on the configured inter-frequency carrier are to be performed. For inter-frequency connected mode measurements, the measurement window periodicity may be configured per inter-frequency measurement object.

- when *SSB-MTC4List-r17* is not configured, one measurement window periodicity will be configured with *SSB-MTC*
- when *SSB-MTC4List-r17* is configured, multiple measurement window offsets may be configured with *SSB-MTC* and *SSB-MTC4List-r17*, and the requirements in 9.3C apply provided that the total number of measurement window offsets does not exceed the UE capability *parallelSMTC-r17*

When measurement gaps are needed, the UE is not expected to detect SSB on an inter-frequency measurement object which start earlier than the gap starting time + switching time, nor detect SSB which ends later than the gap end – switching time, and the switching time is 0.5 ms.

The requirements in this clause shall also apply, when the UE is configured to perform SRS carrier based switching and using measurement gaps.

The inter-frequency measurement requirements in clause 9.3C.4 and clause 9.3C.5 apply for the following scenarios:

- SSB-based inter-frequency measurement with measurement gap.
- SSB-based inter-frequency measurement with no measurement gap when
  - all of the SMTC occasions of this inter-frequency measurement object are overlapped with the measurement gap or associated measurement gap in concurrent measurement gaps, or
  - part of the SMTC occasions of this inter-frequency measurement object are overlapped with the associated measurement gap and all the SMTC occasions of this inter-frequency measurement object are overlapped with the union of concurrent measurement gaps.

The inter-frequency measurement requirements in clause 9.3C.7 apply for the following scenarios:

- SSB-based inter-frequency measurement with no measurement gap, when none of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gap.
- SSB-based inter-frequency measurement with no measurement gap, when part of the SMTC occasions of this inter-frequency measurement object are overlapped by the measurement gap or the union of concurrent measurement gaps.

The requirements in clause 9.3C.8, 9.3C.9 and 9.3C.10 apply provided that the measured NR SAN cell is served by the same satellite as the serving cell.

The requirements in clause 9.3C.4, 9.3C.5, 9.3C.8 and 9.3C.9 do not apply if the MG is fully overlapping with the serving cell SSB occasions, and the serving cell SSB is with a 160 ms periodicity.

If more than one SMTC periodicities are configured for an inter-frequency carrier, the SMTC periodicity in the requirement in clause 9.3C is the one used by the cell being identified.

## 9.3C.2 Requirements applicability

The requirements in clause 9.3C apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.4C for FR1-NTN and 10.1.5C for FR2-NTN, for a corresponding band,
- SS-RSRQ related side conditions given in clauses 10.1.9C for FR1-NTN and 10.1.10C for FR2-NTN, for a corresponding band,
- SS-SINR related side conditions given in clauses 10.1.14C for FR1-NTN and 10.1.15C for FR2-NTN, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.18 for a corresponding band.

## 9.3C.3 Number of cells and number of SSB

### 9.3C.3.1 Requirements for FR1-NTN

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 7 SSBs with different SSB index and/or PCI on the inter-frequency layer.
- 4 SSBs with different SSB index and/or PCI from neighbour cells in GEO deployment.
- In NGSO deployments: cells from 2 satellites if UE does not support the capability *maxNumber-NGSO-SatellitesPerCarrier-r17*; or cells from 3 or 4 satellites depending on the value indicated in *maxNumber-NGSO-SatellitesPerCarrier-r17*.

## 9.3C.4 Inter-frequency measurement with measurement gaps

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index.}$

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter})\ ms$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})\ ms$$

Where:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3C.4-1.

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in :

- Table 9.3C.4-2 for target cells operating with 20 PRB SSB BW in FR1-NTN;

- Table 9.3C.4-3 for target cells operating with 12 PRB SSB BW in FR1-NTN

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3C.5-1.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

$K_{gap}$ is the scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap}$ = 1 when the UE is not configured with concurrent measurement gaps. When the UE is configured with concurrent measurement gaps and the two measurement gaps are fully overlapping with MGRP=160 ms, $K_{gap}$ = 2. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

For a window W of duration max(SMTC period, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gap, and starting from the beginning of any SMTC occasion:

- $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other measurement gap occasions within the window, and

- $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1C.8.3.

$K_{gap}$ is only applicable for UE supporting *parallelMeasurementGap-r17*. When concurrent measurement gaps are configured, requirements in this clause do not apply if $N_{available}$ =0, or if one SMTC overlaps more than one MGs associated to the frequency layer. For calculation of $K_{gap}$, if the high layer signalling (TS 38.331 [2]) of *smtc4* or *smtc5* is configured, the SMTC occasions correspond to those used by the cell being identified.

K_satellite: it is a satellite specific scaling factor.

- If SMTCs within a measurement gap do not overlap with each other, and if LEO and/or GEO satellite(s) is/are required to be measured within SMTC
  - K_satellite = 1, if GSO satellites are measured on the carrier
  - $\text{K_satellite} = \left\lceil \frac{Num\ of\ LEO\ satellites\ to\ be\ measured\ in\ the\ SMTC}{number\ of\ LEO\ satellites\ UE\ is\ capable\ to\ measure\ in\ one\ SMTC} \right\rceil$, if LEO satellites are measured on the carrier.
- If SMTCs within a measurement gap partially overlap with each other, and if LEO and/or GEO satellite(s) is/are required to be measured within overlapped SMTCs
  - $\text{K_satellite} = number\ of\ overlapped\ SMTCs$, if only GEO satellites are measured on the carrier
  - $\text{K_satellite} = \sum_i \left\lceil \frac{Num\ of\ LEO\ satellites\ to\ be\ measured\ in\ the\ SMTC\ i}{number\ of\ LEO\ satellites\ UE\ is\ capable\ to\ measure\ in\ one\ SMTC} \right\rceil$, if only LEO satellites are measured on the carrier.

**Table 9.3C.4-1: Time period for PSS/SSS detection (FR1-NTN)**

| Condition NOTE1 | $T_{PSS/SSS_sync_inter}$ |
|---|---|
| No DRX | Max(600 ms, Ceil(8 x $K_{gap}$) × Max(MGRP, SMTC period NOTE2)) × $CSSF_{inter}$ × K_satellite |
| DRX cycle ≤ 320 ms | Max(600 ms, Ceil(8*1.5 x $K_{gap}$) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter}$ × K_satellite |
| DRX cycle > 320 ms | Ceil(8 x $K_{gap}$) × DRX cycle × $CSSF_{inter}$ × K_satellite |

NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1
NOTE 2: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*.

**Table 9.3C.4-2: Time period for time index detection (FR1-NTN)**

| No DRX | Max(120 ms, Ceil(6 x $K_{gap}$) × Max(MGRP, SMTC period NOTE2)) × $CSSF_{inter}$ × K_satellite |
| DRX cycle ≤ 320 ms | Max(120 ms, Ceil(6 × 1.5 x $K_{gap}$) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter}$ × K_satellite |
| DRX cycle > 320 ms | Ceil(6 x $K_{gap}$) × DRX cycle × $CSSF_{inter}$ × K_satellite |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*.<br>NOTE 3: The requirements in this table apply provided that the Ês/Iot on the target cell SSB is ≥-4 dB. | |

The UE is allowed to skip measurements on inter-frequency cells, in the interval between *t-serviceStart* and the satellite switch completion, when it is performing soft satellite switching with resynchronization. In this case, for the measurement initiated but not completed before the beginning of this interval, the total time to detection can be longer.

## 9.3C.5 Inter-frequency measurements

When measurement gaps are provided for inter-frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4C, 10.1.9C and 10.1.14C , respectively, as shown in table 9.3C.5-1.

**Table 9.3C.5-1: Measurement period for inter-frequency measurements with gaps (FR1-NTN)**

| Condition NOTE1 | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | Max(200 ms, Ceil(8 x $K_{gap}$) × Max(MGRP, SMTC period NOTE2)) × $CSSF_{inter}$ × K_satellite |
| DRX cycle ≤ 320 ms | Max(200 ms, Ceil(8 × 1.5 x $K_{gap}$) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter}$ × K_satellite |
| DRX cycle > 320 ms | Ceil(8 x $K_{gap}$) × DRX cycle × $CSSF_{inter}$ × K_satellite |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

The UE is allowed to skip measurements on inter-frequency cells, in the interval between *t-serviceStart* and the satellite switch completion, when it is performing soft satellite switching with resynchronization. In this case, for the measurement initiated but not completed before this interval, the total time to measure can be longer.

# 9.3C.6 Inter-frequency measurements reporting requirements

## 9.3C.6.1 Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4C, 10.1.9C and 10.1.14C, respectively.

## 9.3C.6.2 Event-triggered Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1.4C, 10.1.9C and 10.1.14C, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.3C.6.3.

## 9.3C.6.3 Event-triggered Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.4C, 10.1.9C and 10.1.14C, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. Both $T_{identify_inter_without_index}$ and $T_{identify_inter_with_index}$ are defined in clause 9.3C.4. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSB measured from the Cell being configured remains detectable during the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ as defined in clause 9.3C.4 or clause 9.3C.7. If a cell which has been detectable at least for the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ defined in clause 9.3C.4 or clause 9.3C.7 becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than $T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

# 9.3C.7 Inter-frequency measurements without measurement gaps

## 9.3C.7.1 Inter-frequency Cell identification

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter})$ ms

$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})$ ms

Where:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3C.7.1-1.

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in

Table 9.3C.7.1-2 for target cells operating with 20 PRB SSB BW in FR1-NTN;

Table 9.3C.7.1-3 for target cells operating with 12 PRB SSB BW in FR1-NTN.

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3C.7.2-1.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1.

$K_p$ is the scaling factor for a SSB frequency layer to be measured without measurement gaps. $K_p = N_{total_SAN} / N_{available_SAN}$, where $N_{available_SAN}$ and $N_{total_SAN}$ are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where
  - If UE supports *parallelMeasurementGap-r17* and is configured with concurrent measurement gaps, MGRP_max is the maximum MGRP across all configured per-UE measurement gap. Otherwise, MGRP_max is the MGRP of configured measurement gap.
  - Starting from the beginning of any SMTC occasion:
    - $N_{total_SAN}$ is the total number of SMTC occasions within the window, including those overlapped and non-overlapped with measurement gap occasions within the window, and
    - $N_{available_SAN}$ is the number of SMTC occasions within the window W that do not collide with any non-dropped MG occasion within the window W, after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1C.8.3. The collision rule between SMTC occasion and measurement gap occasion is defined in clause 9.1C.9.2

$K_p = 1$ when inter-frequency SMTC is fully non overlapping with measurement gaps.

For calculation of Kp, if the high layer signalling (TS 38.331 [2]) of *smtc4* or *smtc5* is configured, the SMTC occasions correspond to those used by the cell being identified.

$K_{layer1_measurement}$: it is scaling factor for sharing between L3 and L1 measurement, and $K_{layer1_measurement}$ =1, if GEO satellites are measured on the carrier, or if LEO satellites are measured on the carrier and UE supports *parallelMeasurementWithoutRestriction-r17*, otherwise

$K_{layer1_measurement}$ =1,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting outside measurement gap are not fully overlapped by the union of intra-frequency SMTC occasions, or
- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting outside measurement gap are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols in the intra-frequency SMTC occasions corresponding to those used by the cell being identified, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$ =1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

$K_{satellite}$: it is a satellite specific scaling factor.

- If SMTCs do not overlap with each other, and if LEO and/or GEO satellite(s) is/are required to be measured within SMTC
  - $K_{satellite}$ = 1, if GSO satellite(s) is/are measured on the carrier
  - $K_{satellite} = \left\lceil \frac{Num\ of\ LEO\ satellites\ to\ be\ measured\ in\ the\ SMTC}{number\ of\ LEO\ satellites\ UE\ is\ capable\ to\ measure\ in\ one\ SMTC} \right\rceil$, if LEO satellite(s) is/are measured on the carrier.

- If SMTCs partially overlap with each other, and if LEO and/or GEO satellite(s) is/are required to be measured within overlapped SMTCs
  - $K_{satellite} = number\ of\ overlapped\ SMTCs$, if only GEO satellite(s) is/are measured on the carrier
  - $K_{satellite} = \sum_i \left\lceil \frac{Num\ of\ LEO\ satellites\ to\ be\ measured\ in\ the\ SMTC\ i}{number\ of\ LEO\ satellites\ UE\ is\ capable\ to\ measure\ in\ one\ SMTC} \right\rceil$, if only LEO satellite(s) is/are measured on the carrier.

| NOTE 1: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*.<br>NOTE 2: The requirements in this table apply provided that the Ês/Iot on the target cell SSB is ≥-4 dB. | |

## 9.3C.7.2 Measurement period

The UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4C, 10.1.9C and 10.1.14C, respectively, as shown in table 9.3C.7.2-1, if UE supports inter-frequency measurement without measurement gaps.

**Table 9.3C.7.2-1: Measurement period for inter-frequency measurements without gaps (FR1-NTN)**

| DRX cycle | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | max(200ms, ceil( 5 x $K_{layer1_measurement}$ x $K_p$) x SMTC period)[Note 1] x $CSSF_{inter} \times K_{satellite}$ |
| DRX cycle≤ 320 ms | max(200ms, ceil(1.5x 5 x $K_{layer1_measurement}$ x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{inter} \times K_{satellite}$ |
| DRX cycle>320 ms | ceil( 5 x $K_{layer1_measurement}$ x $K_p$ ) x DRX cycle x $CSSF_{inter} \times K_{satellite}$ |
| NOTE 1: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

### 9.3C.7.3 Scheduling availability of UE during inter-frequency measurements

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE is required to be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols to be measured in the following clauses are the SSB symbols indicated by *SSB-ToMeasure* [2], if it is configured; otherwise, all L SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included. For UL, the scheduling restriction applies to UL symbols that fully or partially overlap with the restricted symbols as defined below.

#### 9.3C.7.3.1 Void

#### 9.3C.7.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1-NTN

For UE which do not support *simultaneousRxDataSSB-DiffNumerology-Inter-r16* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If UE performs inter-frequency measurements without measurement gaps in a FDD band, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

#### 9.3C.7.3.3 Scheduling availability of UE performing measurements on a neighbor cell served by a different satellite in LEO

For UE which do not support the capability *parallelMeasurementWithoutRestriction-r17* the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement on a neighbor cell served by a different satellite in LEO.

- If UE performs inter-frequency measurements without measurement gaps in a FDD band, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

## 9.3C.8 Inter-frequency measurement with measurement gaps for NTN band above 10 GHz

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter})\ ms$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})\ ms$$

Where:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3C.8-1.

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3C.8-2.

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3C.9-1.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps.

$K_{gap}$ is the scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap} = 1$ when the UE is not configured with concurrent measurement gaps. When the UE is configured with concurrent measurement gaps and the two measurement gaps are fully overlapping with MGRP=160 ms, $K_{gap} = 2$. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

For a window W of duration max(SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gap, and starting from the beginning of any SMTC occasion:

- $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other measurement gap occasions within the window, and

- $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1.8.3.

$K_{gap}$ is only applicable for UE supporting *parallelMeasurementGap-r17*. When concurrent measurement gaps are configured, requirements in this clause do not apply if $N_{available}$ =0, or if one SMTC overlaps more than one MGs associated to the frequency layer.

**Table 9.3C.8-1: Time period for PSS/SSS detection**

| Condition NOTE1 | $T_{PSS/SSS_sync_inter}$ |
|---|---|
| No DRX | Max(600 ms, Ceil(8 x $K_{gap}$) × Max(MGRP, SMTC period NOTE2)) × $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | Max(600 ms, Ceil(8*1.5 x $K_{gap}$) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter}$ |
| DRX cycle > 320 ms | Ceil(8 x $K_{gap}$) × DRX cycle × $CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

**Table 9.3C.8-2: Time period for time index detection**

| Condition NOTE1 | $T_{SSB_time_index_inter}$ |
|---|---|
| No DRX | Max(120 ms, Ceil(3 x $K_{gap}$) × Max(MGRP, SMTC period NOTE2)) × $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | Max(120 ms, Ceil(3 × 1.5 x $K_{gap}$) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter}$ |
| DRX cycle > 320 ms | Ceil(3 x $K_{gap}$) × DRX cycle × $CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

## 9.3C.9 Inter-frequency measurements for NTN band above 10 GHz

When measurement gaps are provided for inter-frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.5C, 10.1.10C and 10.1.15C, respectively, as shown in table 9.3C.5-1.

**Table 9.3C.9-1: Measurement period for inter-frequency measurements with gaps**

| Condition NOTE1 | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | Max(200 ms, Ceil(8 x $K_{gap}$) × Max(MGRP, SMTC period NOTE2)) × $CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | Max(200 ms, Ceil(8 × 1.5 x $K_{gap}$) × Max(MGRP, SMTC period, DRX cycle)) × $CSSF_{inter}$ |
| DRX cycle > 320 ms | Ceil(8 x $K_{gap}$) × DRX cycle × $CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

## 9.3C.10 Inter-frequency measurements without measurement gaps for NTN band above 10 GHz

## 9.3C.10.1 Inter-frequency Cell identification

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured). Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter})$ ms

$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})$ ms

Where:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3C.10.1-1.

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3C.10.1-2.

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3C.10.2-1.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1 for measurement conducted outside measurement gaps, i.e. when inter-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps or according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for measurement conducted within measurement gaps, i.e. when inter-frequency SMTC is fully overlapping with measurement gaps.

$K_p$ is the scaling factor for a SSB frequency layer to be measured without measurement gaps. $K_p = N_{total_SAN} / N_{available_SAN}$, where $N_{available_SAN}$ and $N_{total_SAN}$ are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where
  - If UE is configured with concurrent measurement gaps, MGRP_max is the maximum MGRP across all configured per-UE measurement gap. Otherwise, MGRP_max is the MGRP of configured measurement gap.
  - $N_{total_SAN}$ is the total number of SMTC occasions within the window, including those overlapped and non-overlapped with measurement gap occasions within the window, and
  - $N_{available_SAN}$ is the number of SMTC occasions within the window W that do not collide with any non-dropped MG occasion within or outside the window W, after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1C.8.3. The collision rule between SMTC occasion and measurement gap occasion is defined in clause 9.1C.9.1

$K_p = 1$ when $N_{available_SAN} = 0$ and measurement gap sharing in clause 9.1.2.1a shall apply.

$K_p = 1$ when inter-frequency SMTC is fully non overlapping with measurement gaps.

**Table 9.3C.10.1-1: Time period for PSS/SSS detection**

| DRX cycle | $T_{PSS/SSS_sync_inter}$ |
|---|---|
| No DRX | max( 600 ms, ceil( 5 x $K_p$) x SMTC period )[Note 1] x $CSSF_{inter}$ |
| DRX cycle≤ 320 ms | max( 600 ms, ceil(1.5x 5 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle>320 ms | ceil(5 x $K_p$) x DRX cycle x $CSSF_{inter}$ |
| NOTE 1: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

**Table 9.3C.10.1-2: Time period for time index detection**

| DRX cycle | $T_{SSB_time_index_inter}$ |
|---|---|
| No DRX | max(120 ms, ceil( 3 x $K_p$ ) x SMTC period)[Note 1] x $CSSF_{inter}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil (1.5 x 3 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle>320 ms | Ceil(3 x $K_p$) x DRX cycle x $CSSF_{inter}$ |

| |
|---|
| NOTE 1: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. |

### 9.3C.10.2 Measurement period

The UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.5C, 10.1.10C and 10.1.15C, respectively, as shown in table 9.3C.7.2-1, if UE supports inter-frequency measurement without measurement gaps:

**Table 9.3C.10.2-1: Measurement period for inter-frequency measurements without gaps**

| DRX cycle | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_p$) x SMTC period)[Note 1] x $CSSF_{inter}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ ) x DRX cycle x $CSSF_{inter}$ |
| NOTE 1: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

### 9.3C.10.3 Scheduling availability of UE during inter-frequency measurements

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE is required to be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols to be measured in the following clauses are the SSB symbols indicated by *SSB-ToMeasure* [2], if it is configured; otherwise, all L SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included. For UL, the scheduling restriction applies to UL symbols that fully or partially overlap with the restricted symbols as defined below.

#### 9.3C.10.3.1 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on NTN bands above 10 GHz

For UE which do not support *simultaneousRxDataSSB-DiffNumerology-Inter-r16* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If UE performs inter-frequency measurements without measurement gaps in a TDD band, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

- If UE performs inter-frequency measurements without measurement gaps in a FDD band, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

## 9.3D NR inter-frequency measurements for ATG

### 9.3D.1 Introduction

A measurement is defined as an SSB based inter-frequency measurement provided it is not defined as an intra-frequency measurement according to clause 9.2D.

The UE shall be able to identify new inter-frequency cells and perform SS-RSRP, SS-RSRQ, and SS-SINR measurements of identified inter-frequency cells if carrier frequency information is provided by PCell, even if no explicit neighbour list with physical layer cell identities is provided.

A measurement is defined as an inter-frequency SSB based measurements without measurement gaps for UE capable of *interFrequencyMeas-NoGap* provided

- the UE supports *interFrequencyMeas-Nogap-r16* [15], and
- the SSB is completely contained in the active BWP of the UE.

For inter-frequency SSB based measurements without measurement gaps, UE may cause scheduling restriction as specified in clause 9.3D.9.3.

SSB based measurements are configured along with a measurement timing configuration (SMTC) per carrier, which provides periodicity, duration and offset information on a window of up to 5 ms where the measurements on the configured inter-frequency carrier are to be performed. For inter-frequency connected mode measurements, one measurement window periodicity may be configured per inter-frequency measurement object.

When measurement gaps are needed, the UE is not expected to detect SSB and measure RSSI of RSRQ on an inter-frequency measurement object which start earlier than the gap starting time + switching time, nor detect SSB and measure RSSI of RSRQ which ends later than the gap end – switching time. The switching time is 0.5 ms.

The requirements in this clause shall also apply, when the UE is configured to perform SRS carrier based switching and using measurement gaps.

Longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

## 9.3D.2 Requirements applicability

The requirements in clause 9.3D apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency cell shall be considered detectable when for each relevant SSB:

- SS-RSRP related side conditions given in clauses 10.1.4 for FR1, for a corresponding band,
- SS-RSRQ related side conditions given in clauses 10.1.9 for FR1, for a corresponding band,
- SS-SINR related side conditions given in clauses 10.1.14 for FR1, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.3 for a corresponding band.

## 9.3D.3 Number of cells and number of SSB

### 9.3D.3.1 Requirements for FR1

For each inter-frequency layer, during each layer 1 measurement period, the UE shall be capable of performing SS-RSRP, SS-RSRQ, and SS-SINR measurements for at least:

- 4 identified cells, and
- 7 SSBs with different SSB index and/or PCI on the inter-frequency layer.

## 9.3D.4 Inter-frequency measurement with measurement gaps

When measurement gaps are provided, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured) or *deriveSSB-IndexFromCellInter-r17* is configured for the FR1 target frequency layers and UE supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter}) \text{ ms}$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})\ ms$$

Where:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3D.4-1.

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3D.4-2.

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3D.5-1.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1D.5.2 for measurement conducted within measurement gaps.

$K_{gap}$ is a scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap}$ = 1 when the UE is not configured with concurrent measurement gaps. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

- For a window W of duration max(SMTC period, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gap(s), and starting from the beginning of any SMTC occasion:
  - $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other measurement gap occasions within the window, and
  - $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W, after accounting for collisions between the measurement gaps by applying the measurement gap collision rule in clause 9.1.8.3.

$K_{gap}$ is only applicable for UE supporting *concurrentMeasGap-r17*. When concurrent measurement gaps are configured, requirements in this clause do not apply if $N_{available}$ =0.

**Table 9.3D.4-1: Time period for PSS/SSS detection (FR1)**

| Condition NOTE1 | $T_{PSS/SSS_sync_inter}$ |
|---|---|
| No DRX | $Max(600\ ms, Ceil(8 * K_{gap} \times N1^{Note\ 3}) \times Max(MGRP, SMTC\ period)) \times CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | $Max(600\ ms, Ceil(8*1.5 * K_{gap} \times N1^{Note\ 3}) \times Max(MGRP, SMTC\ period, DRX\ cycle)) \times CSSF_{inter}$ |
| DRX cycle > 320 ms | $Ceil(8 * K_{gap} \times N1^{Note\ 3}) \times DRX\ cycle \times CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: For a UE supporting concurrent gaps, the MRGP above is the MRGP of the measurement gap associated with the target frequency layer to be measured if concurrent measurement gaps are configured.<br>NOTE 3: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.<br>Otherwise, N1 = 1. | |

**Table 9.3D.4-2: Time period for time index detection (R1)**

| Condition NOTE1 | $T_{SSB_time_index_inter}$ |
|---|---|
| No DRX | $Max(120\ ms, Ceil(3 * K_{gap} \times N1^{Note\ 3}) \times Max(MGRP\ , SMTC\ period)) \times CSSF_{inter}$ |
| DRX cycle ≤ 320 ms | $Max(120\ ms, Ceil(3 \times 1.5 * K_{gap} \times N1^{Note\ 3}) \times Max(MGRP, SMTC\ period, DRX\ cycle)) \times CSSF_{inter}$ |
| DRX cycle > 320 ms | $Ceil(3 * K_{gap} \times N1^{Note\ 3}) \times DRX\ cycle \times CSSF_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: For a UE supporting concurrent gaps, the MRGP above is the MRGP of the measurement gap associated with the target frequency layer to be measured if concurrent measurement gaps are configured.<br>NOTE 3: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.<br>Otherwise, N1 = 1. | |

## 9.3D.5 Inter-frequency measurements

When measurement gaps are provided for inter-frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4, 10.1.9, and 10.1.14, respectively, as shown in table 9.3D.5-1.

**Table 9.3D.5-1: Measurement period for inter-frequency measurements with gaps (FR1)**

| Condition NOTE1,2 | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | $\text{Max}(200\text{ ms}, \text{Ceil}(8 * K_{gap} \times N1^{\text{Note 3}}) \times \text{Max}(\text{MGRP}, \text{SMTC period})) \times \text{CSSF}_{inter}$ |
| DRX cycle ≤ 320 ms | $\text{Max}(200\text{ ms}, \text{Ceil}(8 \times 1.5 * K_{gap} \times N1^{\text{Note 3}}) \times \text{Max}(\text{MGRP}, \text{SMTC period}, \text{DRX cycle})) \times \text{CSSF}_{inter}$ |
| DRX cycle > 320 ms | $\text{Ceil}(8 * K_{gap} \times N1^{\text{Note 3}}) \times \text{DRX cycle} \times \text{CSSF}_{inter}$ |
| NOTE 1: DRX or non DRX requirements apply according to the conditions described in clause 3.6.1<br>NOTE 2: For a UE supporting concurrent gaps, the MRGP above is the MRGP of the measurement gap associated with the target frequency layer to be measured if concurrent measurement gaps are configured.<br>NOTE 3: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.<br>Otherwise, N1 = 1. | |

## 9.3D.6 Inter-frequency measurements reporting requirements

### 9.3D.6.1 Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.9.1, and 10.1.14.1, respectively.

### 9.3D.6.2 Event-triggered Periodic Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.9.1, and 10.1.14.1, respectively.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.3D.6.3.

### 9.3D.6.3 Event-triggered Reporting

Reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.4.1, 10.1.9.1, and 10.1.14.1, respectively.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. Both $T_{identify_inter_without_index}$ and $T_{identify_inter_with_index}$ are defined in clause 9.3D.4. When L3 filtering is used an additional delay can be expected.

A cell is detectable only if at least one SSBs measured from the Cell being configured remains detectable during the time period $T_{identify_inter_without_index}$ or $T_{identify_inter_with_index}$ as defined in clause 9.3D.4 or clause 9.3D.9.1.If a cell which has been detectable at least for the time period $T_{identify\ inter\ without\ index}$ or $T_{identify\ inter\ with\ index}$ defined in clause 9.3D.4 or clause 9.3D.9.1 becomes undetectable for a period ≤ 5 seconds and then the cell becomes detectable again with the same spatial reception parameter and triggers an event, the event triggered measurement reporting delay shall be less than

$T_{SSB_measurement_period_inter}$ provided the timing to that cell has not changed more than ± 3200/2$^{\mu}$ $T_c$ while the measurement gap has not been available and L3 filtering has not been used, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3]. When L3 filtering is used, an additional delay can be expected.

## 9.3D.7 Void

## 9.3D.8 Void

## 9.3D.9 Inter-frequency measurements without measurement gaps

### 9.3D.9.1 Inter-frequency Cell identification

UE satisfying the applicability conditions specified in clause 9.3D.1 on the requirement in this clause shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_without_index}$ if UE is not indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured) or *deriveSSB-IndexFromCellInter-r17* is configured for the FR1 and UE supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*. Otherwise UE shall be able to identify a new detectable inter-frequency cell within $T_{identify_inter_with_index}$. The UE shall be able to identify a new detectable inter-frequency SS block of an already detected cell within $T_{identify_inter_without_index}$.

$$T_{identify_inter_without_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter})\ ms$$

$$T_{identify_inter_with_index} = (T_{PSS/SSS_sync_inter} + T_{SSB_measurement_period_inter} + T_{SSB_time_index_inter})\ ms$$

Where:

- $T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3D.9.1-1.
- $T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3D.9.1-3.
- $T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3D.9.2-1.
- $CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1D.5.1 for measurement conducted outside measurement gaps, i.e. when inter-frequency SMTC is fully non overlapping or partially overlapping with measurement gaps or according to $CSSF_{within_gap,i}$ in clause 9.1D.5.2 for measurement conducted within measurement gaps, i.e. when inter-frequency SMTC is fully overlapping with measurement gaps.

For inter-frequency SSB based measurements without measurement gaps in active BWP.

$M_{pss/sss_sync_inter}$: For FR1, $M_{pss/sss_sync_inter}$ = 5.

$M_{SSB_index_inter}$: For FR1, $M_{SSB_index_inter}$ = 3.

$M_{meas_period_inter}$: For FR1, $M_{meas_period_inter}$ = 5.

$K_p$ is a scaling factor for an SSB frequency layer to be measured without measurement gaps. $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

For a window W of duration max(SMTC period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE MG, and starting at the beginning of any SMTC occasion:

$N_{total}$ is the total number of SMTC occasions within the window, including those overlapped with MG occasions within the window, and

$N_{available}$ is the number of SMTC occasions that are not overlapped with any non-dropped MG occasion within the window W, after accounting for MG collisions by applying the selected gap collision rule provided that concurrent measurement gaps are configured.

Otherwise, when UE is not configured with or UE does not support concurrent measurement gaps:

When inter-frequency SMTC is fully non overlapping with measurement gaps, or inter-frequency SMTC is fully overlapping with MGs, $K_p$ =1.

When inter-frequency SMTC is partially overlapping with measurement gaps, $K_p$ = 1/(1- (SMTC period /MGRP)), where SMTC period < MGRP.

For UE capable of *antennaArrayType-r18* on the measured carrier,

$K_{layer1_measurement}$=1,

If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE supports two simultaneous separate Rx beams

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on one serving cell outside measurement gap are not fully overlapped by inter-frequency SMTC occasions of the same serving cell

Otherwise,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any serving frequency outside measurement gap are not fully overlapped by inter-frequency SMTC occasions

$K_{layer1_measurement}$=1.5, otherwise.

Otherwise, $K_{layer1_measurement}$=1.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

For calculation of $K_p$, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

**Table 9.3D.9.1-1: Time period for PSS/SSS detection, (FR1)**

| DRX cycle | $T_{PSS/SSS_sync_inter}$ |

NOTE 4: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.
Otherwise, N1 = 1.

## 9.3D.9.2 Measurement period

The UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4, 10.1.9, and 10.1.14, respectively, as shown in table 9.3D.9.2-1,if UE supports inter-frequency measurement without measurement gaps.

**Table 9.3D.9.2-1: Measurement period for inter-frequency measurements without gaps ((FR1)**

| DRX cycle | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | max(200 ms, ceil($M_{meas_period_inter}$ x $K_p$ x N1 [Note 2] x $K_{layer1_measurement}$) x SMTC period)[Note 1] x $CSSF_{inter}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x $M_{meas_period_inter}$ x $K_p$ x N1 [Note 2] x $K_{layer1_measurement}$) x max(SMTC period,DRX cycle)) x $CSSF_{inter}$ |
| DRX cycle>320 ms | ceil( $M_{meas_period_inter}$ x $K_p$ x N1 [Note 2] x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{inter}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: For ATG UE with the antenna array, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1. | |

## 9.3D.9.3 Scheduling availability of UE during inter-frequency measurements

If UE supports *interFrequencyMeas-NoGap-r16* and the flag *interFrequencyConfig-NoGap-r16* is configured by the Network, UE is required to be capable of measuring without measurement gaps when the SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that the SSB symbols to be measured in the following clauses are the SSB symbols indicated by *SSB-ToMeasure* [2], if it is configured; otherwise, all L SSB symbols within the SMTC window duration defined in clause 4.1 of TS 38.213 [3] are included.

### 9.3D.9.3.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When ATG UE performs inter-frequency measurements without measurement gaps in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- If *deriveSSB-IndexFromCellInter-r17* is enabled, UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

- If *deriveSSB-IndexFromCellInter-r17* is not enabled, UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration.

When ATG UE capable of *antennaArrayType-r18* performs inter-frequency measurements without measurement gaps, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- If *deriveSSB-IndexFromCellInter-r17* is enabled, UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

- If *deriveSSB-IndexFromCellInter-r17* is not enabled, UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

When ATG UE performs inter-frequency measurements without measurement gaps, the following restrictions apply due to SS-RSRQ measurement

- If *deriveSSB-IndexFromCellInter-r17* is enabled, UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be

measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

- If *deriveSSB-IndexFromCellInter-r17* is not enabled, UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When ATG UE capable of *antennaArrayType-r18* performs inter-frequency measurements without measurement gaps, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- If *deriveSSB-IndexFromCellInter-r17* is enabled, UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, and on 1 data symbol before each consecutive SSB symbols to be measured and 1 data symbol after each consecutive SSB symbols to be measured within SMTC window duration.

- If *deriveSSB-IndexFromCellInter-r17* is not enabled, UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

When intra-band carrier aggregation is performed and the ATG UE is capable of *antennaArrayType-r18*, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When inter-band carrier aggregation is performed and the ATG UE is capable of *common Rx beam between PCC band and SCC band*, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When ATG UE performs inter-frequency measurements without measurement gaps, the following restrictions apply due to SS-RSRQ measurement

- If *deriveSSB-IndexFromCellInter-r17* is enabled, UE is not expected to transmit PUCCH/PUSCH/SRS on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

- If *deriveSSB-IndexFromCellInter-r17* is not enabled, UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When ATG UE capable of *antennaArrayType-r18* performs inter-frequency measurements without measurement gaps, the following restrictions apply due to SS-RSRQ measurement

- If *deriveSSB-IndexFromCellInter-r17* is enabled, UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive SSB to be measured/RSSI symbols and 1 data symbol after each consecutive SSB to be measured/RSSI symbols within SMTC window duration.

- If *deriveSSB-IndexFromCellInter-r17* is not enabled, UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration.

When intra-band carrier aggregation is performed and the ATG UE is capable of *antennaArrayType-r18*, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When inter-band carrier aggregation is performed and the ATG UE is capable of *common Rx beam between PCC band and SCC band*, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

#### 9.3D.9.3.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which do not support *simultaneousRxDataSSB-DiffNumerology-Inter-r16* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If UE performs inter-frequency measurements without measurement gaps, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the union of restricted serving cell symbols due to measurement of all MOs, where the restricted serving cell symbols due to measurement of MO *i* include

  - serving cell symbols fully or partially overlap with SSB symbols to be measured on MO i, and $\triangle$t serving cell symbol before each consecutive SSB symbols to be measured and $\triangle$t serving cell symbol after each consecutive SSB symbols to be measured within SMTC window duration, if deriveSSB-IndexFromCellInter-r17 is enabled for MO i and UE supporting *deriveSSB-IndexFromCellInterNon-NCSG-r17*. $\triangle$t is defined as the minimum integer number of symbols with total duration no smaller than the tolerance specified in clause 7.9D, or

  - serving cell symbols fully or partially overlap with SMTC window for MO i and on 1 serving cell symbol before and after the SMTC window, if deriveSSB-IndexFromCellInter-r17 is not enabled for MO i, or UE not supporting deriveSSB-IndexFromCellInterNon-NCSG-r17.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

# 9.3E NR inter-frequency measurements for Redcap UEs with satellite access

## 9.3E.1 Introduction

The requirements in clause 9.3C.1 shall apply except that:

- clause 9.2C is replaced with clause 9.2E, and
- clause 9.3C.5.3 is replaced with clause 9.3E.5.3, and
- clause 9.3C.4 is replaced with clause 9.3E.4, and
- clause 9.3C.5 is replaced with clause 9.3E.5, and
- clause 9.3C.7 is replaced with clause 9.3E.7.

The requirements in clause 9.3C.8, 9.3C.9 and 9.3C.10 can not apply.

## 9.3E.2 Requirements applicability

The requirements in clause 9.3E apply, provided:

- The cell being identified or measured is detectable.

An inter-frequency cell shall be considered detectable when for each relevant SSB:

- For 2 Rx RedCap UE:
  - SS-RSRP related side conditions given in clauses 10.1.4D for FR1 for a corresponding band,
  - SS-RSRQ related side conditions given in clauses 10.1.9D for FR1 for a corresponding band,
  - SS-SINR related side conditions given in clauses 10.1.14D for FR1 for a corresponding band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.18 for a corresponding band.

- For 1 Rx RedCap UE:
  - SS-RSRP related side conditions given in clauses 10.1.4D for FR1 for a corresponding Band,
  - SS-RSRQ related side conditions given in clauses 10.1.9D for FR1 for a corresponding Band,
  - SS-SINR related side conditions given in clauses 10.1.14D for FR1 for a corresponding Band,
  - SSB_RP and SSB Ês/Iot according to Annex B.2.18 for a corresponding Band.

## 9.3E.3 Number of cells and number of SSB

### 9.3E.3.1 Requirements for FR1

The requirements in clause 9.3C.3.1 shall apply.

## 9.3E.4 Inter-frequency measurement with measurement gaps

The requirements in clause 9.3C.4 shall apply except that:

$T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3C.4-1 for 2Rx RedCap UE and table 9.3E.4-1 for 1Rx RedCap UE, and

$T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3C.4-2 for 2Rx RedCap UE and table 9.3E.4-2 for 1Rx RedCap UE, and

$T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3C.5-1 for 2Rx RedCap UE and table 9.3E.5-1 for 1Rx RedCap UE, and

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1A.5.1 for measurement conducted within measurement gaps, and

$K_{gap}$ is the scaling factor for a SSB frequency layer to be measured within an associated measurement gap pattern. $K_{gap}$ = 1 when the UE is not configured with concurrent measurement gaps. When the UE is configured with concurrent measurement gaps and the two measurement gaps are fully overlapping with MGRP=160 ms, $K_{gap}$ = 2. Otherwise, $K_{gap} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

For a window W of duration max(SMTC period, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gap, and starting from the beginning of any SMTC occasion:

- $N_{total}$ is the total number of SMTC occasions that are covered by instances of the associated measurement gap within the window W, including those overlapped with other measurement gap occasions within the window, and
- $N_{available}$ is the number of SMTC occasions that are covered by instances of the non-dropped associated measurement gap within the window W after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1E.8.3.

## 9.3E.5 Inter-frequency measurements

The requirements in clause 9.3C.5 shall apply except that:

When measurement gaps are provided for inter-frequency measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4D, 10.1.9D and 10.1.14D for 2Rx RedCap UE and clauses 10.1.4D, 10.1.9D and 10.1.14D for 1Rx RedCap UE, respectively, as shown in table 9.3C.5-1 for 2Rx RedCap UE and table 9.3E.5-1 for 1Rx RedCap UE.

**Table 9.3E.5-1: Measurement period for inter-frequency measurements with gaps (FR1) for 1Rx RedCap UE**

## 9.3E.6 Inter-frequency measurements reporting requirements

### 9.3E.6.1 Periodic Reporting

For 2Rx RedCap UE, reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4D, 10.1.9D and 10.1.14D, respectively, and

For 1Rx RedCap UE, reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4D, 10.1.9D and 10.1.14D, respectively.

### 9.3E.6.2 Event-triggered Periodic Reporting

For 2Rx RedCap UE, reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1.4D, 10.1.9D and 10.1.14D, respectively, and

For 1Rx RedCap UE, reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered periodic measurement reports shall meet the requirements in clauses 10.1.4D, 10.1.9D and 10.1.14D, respectively, and

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.3E.6.3.

### 9.3E.6.3 Event-triggered Reporting

The requirements in clause 9.3C.6.3 shall apply except that

For 2Rx Redcap UE, reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.4D, 10.1.9D and 10.1.14D, respectively, and

For 1Rx Redcap UE, reported SS-RSRP, SS-RSRQ, and SS-SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.4D, 10.1.9D and 10.1.14D, respectively, and

- clause 9.3C.4 is replaced with clause 9.3E.4, and
- clause 9.3C.7 is replaced with clause 9.3E.7.

## 9.3E.7 Inter-frequency measurements without measurement gaps

### 9.3E.7.1 Inter-frequency Cell identification

The requirements in clause 9.3C.7.1 shall apply except that:

- $T_{PSS/SSS_sync_inter}$: it is the time period used in PSS/SSS detection given in table 9.3C.7.1-1 for 2Rx RedCap UE and table 9.3E.7.1-1 for 1Rx RedCap UE, and
- $T_{SSB_time_index_inter}$: it is the time period used to acquire the index of the SSB being measured given in table 9.3C.7.1-2 for 2Rx RedCap UE and table 9.3E.7.1-2 for 1Rx RedCap UE, and
- $T_{SSB_measurement_period_inter}$: equal to a measurement period of SSB based measurement given in table 9.3C.7.2-1 for 2Rx RedCap UE and table 9.3E.7.2-1 for 1Rx RedCap UE, and
- $CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1A.5.1, and
- $K_p$ is the scaling factor for a SSB frequency layer to be measured without measurement gaps. $K_p = N_{total_SAN} / N_{available_SAN}$, where $N_{available_SAN}$ and $N_{total_SAN}$ are calculated as follows:
  - For a window W of duration max(SMTC period, MGRP_max), where
    - If UE supports *parallelMeasurementGap-r17* and is configured with concurrent measurement gaps, MGRP_max is the maximum MGRP across all configured per-UE measurement gap. Otherwise, MGRP_max is the MGRP of configured measurement gap.
    - Starting from the beginning of any SMTC occasion:
      - $N_{total_SAN}$ is the total number of SMTC occasions within the window, including those overlapped and non-overlapped with measurement gap occasions within the window, and
      - $N_{available_SAN}$ is the number of SMTC occasions within the window W that do not collide with any non-dropped MG occasion within or outside the window W, after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1E.8.3. The collision rule between SMTC occasion and measurement gap occasion is defined in clause 9.1E.9.1.

  $K_p = 1$ when $N_{available_SAN} = 0$ and measurement gap sharing in clause 9.1.2.1a shall apply.

  $K_p = 1$ when inter-frequency SMTC is fully non overlapping with measurement gaps.

**Table 9.3E.7.1-1: Time period for PSS/SSS detection, (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{PSS/SSS_sync_inter}$ |
|---|---|
| No DRX | max( 600 ms, ceil( 7 x $K_p$) x SMTC period )[Note 1] x $CSSF_{inter} \times K_{satellite}$ |
| DRX cycle≤ 320 ms | max( 600 ms, ceil(1.5x 7 x $K_p$) x max(SMTC period,DRX cycle)[Note 1]) x $CSSF_{inter} \times K_{satellite}$ |
| DRX cycle>320 ms | ceil(7 x $K_p$) x DRX cycle x $CSSF_{inter} \times K_{satellite}$ |
| NOTE 1: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

**Table 9.3E.7.1-2: Time period for time index detection (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{SSB_time_index_inter}$ |
|---|---|
| No DRX | max(160 ms, ceil( 6 x $K_p$ ) x SMTC period)[Note 1] x $CSSF_{inter} \times K_{satellite}$ |
| DRX cycle≤ 320 ms | max(160 ms, ceil (1.5 x 6 x $K_p$) x max(SMTC period,DRX cycle)) x $CSSF_{inter} \times K_{satellite}$ |

| | |
|---|---|
| DRX cycle>320 ms | Ceil(6 x $K_p$) x DRX cycle x $CSSF_{inter} \times K_{satellite}$ |
| NOTE 1: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

### 9.3E.7.2 Measurement period

The UE physical layer shall be capable of reporting SS-RSRP, SS-RSRQ and SS-SINR measurements to higher layers with measurement accuracy as specified in clauses 10.1.4D, 10.1.9D and 10.1.14D for 2Rx RedCap UE and clauses 10.1.4D, 10.1.9D and 10.1.14D for 1Rx RedCap UE, respectively, as shown in table 9.3C.7.2-1 for 2Rx RedCap UE and table 9.3E.7.2-1 for 1Rx RedCap UE, if UE supports inter-frequency measurement without measurement gaps.

**Table 9.3E.7.2-1: Measurement period for inter-frequency measurements without gaps (FR1) for 1Rx RedCap UE**

| DRX cycle | $T_{SSB_measurement_period_inter}$ |
|---|---|
| No DRX | max(200ms, ceil( 5 x $K_p$) x SMTC period)[Note 1] x $CSSF_{inter} \times K_{satellite}$ |
| DRX cycle≤ 320 ms | max(200ms, ceil(1.5x 5 x $K_p$) x max(SMTC period,DRX cycle)[Note 1]) x $CSSF_{inter} \times K_{satellite}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ ) x DRX cycle x $CSSF_{inter} \times K_{satellite}$ |
| NOTE 1: SMTC period is the SMTC period in SMTC configuration which is associated with the target cell to be measured configured in *SSB-MTC4List-r17*. | |

### 9.3E.7.3 Scheduling availability of UE during inter-frequency measurements

The requirements in clause 9.3C.7.3 shall apply.

#### 9.3E.7.3.1 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

The requirements in clause 9.3C.7.3.2 shall apply.

#### 9.3E.7.3.2 Scheduling availability of UE performing measurements in HD-FDD bands on FR1

When UE performs inter-frequency measurements without measurement gaps in a HD-FDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration.

When UE performs inter-frequency measurements without measurement gaps in a HD-FDD band, the following restrictions apply due to SS-RSRQ measurement

- UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within SMTC window duration.

## 9.4 Inter-RAT measurements

### 9.4.1 Introduction

The requirements in this clause are specified for NR−E-UTRAN FDD and NR−E-UTRAN TDD measurements and are applicable without an explicit E-UTRAN neighbour cell list containing physical layer cell identities, for a UE:

- in RRC_CONNECTED state, and
- configured
  - with SA or NR-DC operation mode or configured in NE-DC operation mode by PCell with NR−E-UTRAN FDD or TDD measurement (RSRP, RSRQ, RS-SINR, RSTD, or E-CID RSRP and RSRQ) on E-UTRA non-serving frequency carrier, or

- with SA operation mode on NR carrier frequencies with CCA by PCell with NR–E-UTRAN FDD or TDD measurement (RSRP, RSRQ, RS-SINR) on E-UTRA non-serving frequency carrier, and

- configured with an appropriate measurement gap pattern according to table 9.1.2-3.

The requirements in this clause for concurrent measurement gaps are only applied for UE in NR SA operation mode.

For UE supporting *eutra-NeedForGapNCSG-reporting-r17* and indicating *NeedForGapNCSG-InfoEUTRA* for inter-RAT measurement,

- An inter-RAT measurement is defined as measurement without gap if

  - the UE indicates 'nogap-noncsg' via *NeedForGapNCSG-InfoEUTRA* for the inter-RAT measurement

  - for UE support FG 32-4, the inter-RAT E-UTRAN measurements without gaps requirements are specified in clause 9.4.8.

- An inter-RAT measurement is defined as measurement with NCSG if

  - the UE indicates 'ncsg' via *NeedForGapNCSG-InfoEUTRA* for the inter-RAT measurement

  When network configures measurement gap or NCSG, the delay requirements are specified in clause 9.4.2 and 9.4.3.

- An inter-RAT measurement is defined as measurement with gap if

  - the UE indicates 'gap' via *NeedForGapNCSG-InfoEUTRA* for the inter-RAT measurement

  When network configures measurement gap, the delay requirements are specified in clauses 9.4.2 and 9.4.3.

- For inter-RAT measurements with NCSG, UE may cause scheduling restriction as specified in clause 9.4.2.5 and 9.4.3.5.

For UE not supporting *eutra-NeedForGapNCSG-reporting-r17*,

- An inter-RAT measurement is defined as measurement without gap if

  - the UE supports FG32-5 and the CRS is completely contained in the active BWP of the UE, and the inter-RAT EUTRAN measurements without gaps requirements are specified in clause 9.4.8.

For inter-RAT, when measurement is defined as measurement without gap the UE may cause scheduling restriction as specified in clause 9.4.8.3.5 and clause 9.4.8.4.5.

When the UE is in NE-DC operation mode and an NR–E-UTRAN FDD or TDD measurement (RSRP, RSRQ, RS-SINR, or E-CID RSRP and RSRQ) configured by NR PCell is on an E-UTRA serving frequency carrier, then the corresponding E-UTRA intra-frequency measurements requirements specified in clause 8.19 of TS 36.133 [15] shall apply.

When *highSpeedMeasFlag-r16* is configured but UE does not support either *measurementEnhancement-r16* or *interRAT-MeasurementEnhancement-r16*, the UE is not required to meet the requirements specified in table 9.4.2.3-1b and table 9.4.3.3-1b.

Parameter $T_{Inter1}$ used in inter-RAT requirements in clause 9.4 is specified in table 9.4.1-1 when measurement gap is used, and in table 9.4.1-2 when NCSG is used.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

**Table 9.4.1-1: Minimum available time for inter-RAT measurements when measurement gap is configured**

| Gap Pattern Id | MeasurementGap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) | Minimum available time for inter-frequency and inter-RAT measurements during 480 ms period (Tinter1, ms) |
|---|---|---|---|
| 0 | 6 | 40 | 60 |

| | | | |
|---|---|---|---|
| 1 | 6 | 80 | 30 |
| 2 | 3 | 40 | 24 Note 1 |
| 3 | 3 | 80 | 12 Note 1 |
| 4 | 6 | 20 | 120 Note 1 |
| 6 | 4 | 20 | 72 Note 1,3,6 |
| 7 | 4 | 40 | 36 Note 1,4,6 |
| 8 | 4 | 80 | 18 Note 1,5,6 |
| 10 | 3 | 20 | 48 Note 1 |

NOTE 1: When determining UE requirements using $T_{inter1}$ for gap pattern IDs 2, 3, 4, 6, 7, 8, 10, $T_{inter1}$ = 60 for gap pattern IDs 2, 4, 6, 7, 10, and $T_{inter1}$ = 30 for gap pattern IDs 3 and 8 shall be used.
NOTE 2: Measurement gaps pattern configurations applicability is as specified in Table 9.1.2-1.
NOTE 3: When this gap pattern is used, the $T_{inter1}$ for E-UTRA inter-frequency measurements is 48 ms corresponding to the first 3 ms of the 4 ms gap.
NOTE 4: When this gap pattern is used, the $T_{inter1}$ for E-UTRA inter-frequency measurements is 24 ms corresponding to the first 3 ms of the 4 ms gap.
NOTE 5: When this gap pattern is used, the $T_{inter1}$ for E-UTRA inter-frequency measurements is 12 ms corresponding to the first 3 ms of the 4 ms gap.
NOTE 6: This gap pattern is applicable for E-UTRA inter-frequency measurements only if gap based NR measurements are also configured.
NOTE 7: If multiple concurrent gaps are configured, the MGRP is the periodicity of the MG pattern associated to the E-UTRA inter-RAT frequency layers.

**Table 9.4.1-2: Minimum available time for inter-RAT measurements when NCSG is configured**

| NCSG Pattern Id | Measurement Length (ML, ms) | Visible Interruption Repetition Period (VIRP, ms) | Minimum available time for inter-frequency and inter-RAT measurements during 480 ms period ($T_{inter1}$, ms) |
|---|---|---|---|
| 0 | 5 | 40 | 60 |
| 1 | 5 | 80 | 30 |
| 2 | 2 | 40 | 24 Note 1 |
| 3 | 2 | 80 | 12 Note 1 |
| 4 | 5 | 20 | 120 Note 1 |
| 6 | 3 | 20 | 72 Note 1,3 |
| 7 | 3 | 40 | 36 Note 1,3 |
| 8 | 3 | 80 | 18 Note 1,3 |
| 10 | 2 | 20 | 48 Note 1 |

NOTE 1: When determining UE requirements using $T_{inter1}$ for NCSG pattern IDs 2, 3, 4, 6, 7, 8, 10, $T_{inter1}$ = 60 for NCSG pattern IDs 2, 4, 6, 7, 10, and $T_{inter1}$ = 30 for NCSG pattern IDs 3 and 8 shall be used.
NOTE 2: NCSG pattern configurations applicability is as specified in Table 9.1.2C-1.
NOTE 3: This NCSG pattern is applicable for E-UTRA inter-frequency measurements only if NCSG based NR measurements are also configured.

A UE configured with gap/NCSG pattern ID 2, 3 or 10 shall be able to detect a target cell, provided that

- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell begins not earlier than 500 μs from the start of the measurement gap, and

- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell ends not later than 500 μs before the end of the measurement gap in case of FDD and not later than 750 μs before the end of measurement gap in case of TDD.

A UE configured with gap/NCSG pattern ID 6, 7 or 8 shall be able to detect a target cell, provided that

- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell begins not earlier than 500 μs from the start of the measurement gap, and

- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell ends no later than 1500 μs before the end of the measurement gap in case of FDD and no later than 1750 μs before the end of measurement gap in case of TDD.

## 9.4.2 NR − E-UTRAN FDD measurements

### 9.4.2.1 Introduction

The requirements are applicable for NR−E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN FDD cell is considered to be detectable when:

- RSRP related conditions in the accuracy requirements in clause 10.2.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
- RSRQ related conditions in the accuracy requirements in clause 10.2.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
- RS-SINR related conditions in the accuracy requirements in clause 10.2.5 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [15].

### 9.4.2.2 Requirements when no DRX is used

When the UE requires measurement gaps or NCSG to identify and measure inter-RAT cells and an appropriate measurement gap pattern or NCSG is scheduled, or when the UE is capable of concurrent measurement gap patterns and concurrent measurement gap patterns are scheduled, or an appropriate pre-MG is scheduled and activated, or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable FDD cell within $T_{\text{Identify, E-UTRAN FDD}}$ according to the following expression, including UE not configured with measurement gap cancellation according to clause 9.1.14 and conditions in clause 9.1.14.3:

$$T_{\text{Identify,E-UTRAN FDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} \cdot \text{K}_{\text{gap}_{\text{EUTRA}}} \quad ms,$$

and for the UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3:

$$T_{\text{Identify,E-UTRAN FDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} \cdot \text{K}_{\text{gap}_{\text{EUTRA}}} + 480 * \text{ceil}( \text{T1} / 480 ) \times \text{CSSF}_{\text{interRAT}} \; ms,$$

where:

$T_{\text{BasicIdentify}}$ = 480 ms,

$T_{\text{Inter1}}$ is defined in clause 9.4.1,

$\text{CSSF}_{\text{interRAT}} = \text{CSSF}_{\text{within_gap,i}}$ when measurement gaps are configured, or $\text{CSSF}_{\text{within_ncsg,i}}$ when NCSGs are configured, is the scaling factor for the measured inter-RAT E-UTRA carrier *i* which is calculated as specified in clause 9.1.5.2.

For a UE supporting and configured with concurrent GAPs or MUSIM gaps or both concurrent GAPs and MUSIM gaps, $K_{\text{gap_EUTRA}}$: it is the scaling factor for an E-UTRAN frequency layer to be measured within the associated GAP pattern. $K_{\text{gap_EUTRA}} = 1$ when the UE is not configured with concurrent GAPs nor MUSIM gaps. Otherwise, $K_{\text{gap_EUTRA}} = N_{\text{total}} / N_{\text{available}}$ for UE configured with concurrent GAPs.

T1 = ceil( $L_{\text{cancel}} \times K_{\text{gapEUTRA}}$)×MGRP applies for the UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, $L_{\text{cancel}}$ is the number of gap occasions cancelled during measurement period during $T_{\text{Identify,E-UTRAN FDD}}$ for PSS/SSS detection.

For a UE supporting concurrent GAPs which is configured via *GapConfig-r17* without *preConfigInd-r17* or *ncsgInd-r17*, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the MG pattern associated to the inter-RAT layer. Otherwise, MGRP is the Measurement Gap Repetition Period of the configured MG.

For a window W of duration xRP_max, where xRP_max is the maximum xRP across all configured per-UE measurement GAPs, periodic MUSIM gaps, and per-FR measurement GAPs for FR1, and starting from the beginning of any associated gap occasion:

$N_{total}$ is the total number of associated GAP occasions within the window, including those dropped and non-dropped occasions within the window, and

$N_{available}$ is the number of non-dropped associated GAP occasions after accounting for measurement GAP and MUSIM gap collisions by applying the collision rules for the GAP and MUSIM gap in clause 9.1.8.3 and 9.1.10.5, respectively.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.

Requirements do not apply for UE configured with concurrent GAPs or MUSIM gaps, if $N_{available}$ =0

When UE supports *musim-GapPreference-r17* and if the configured aperiodic MUSIM gap collides with the measurement gap associated with the target frequency layer, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer cell identification period for the target inter-RAT carrier is expected.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of $T_{Measure, E\text{-}UTRAN\ FDD}$ defined in table 9.4.2.2-1, including UE not configured with measurement gap cancellation according to clause 9.1.14 and conditions in clause 9.1.14.3, and table 9.4.2.2-2 for the UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3.

**Table 9.4.2.2-1:** M**easurement period and measurement bandwidth**

| Configuration | Physical Layer Measurement period: $T_{Measure, E\text{-}UTRAN\ FDD}$ [ms] | Measurement bandwidth [RB] |
|---|---|---|
| 0 | 480 x [$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)] | 6 |
| 1 (Note 1) | 240 x [$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)] | 50 |
| NOTE 1: This configuration is optional.<br>NOTE 2: $K_{gap_EUTRA}$ is only applicable for a UE supporting concurrent measurement gaps. Otherwise $K_{gap_EUTRA}$ =1 | | |

**Table 9.4.2.2-2: Measurement period and measurement bandwidth with measurement gap cancellation**

| Configuration | Physical Layer Measurement period: $T_{Measure, E\text{-}UTRAN\ FDD}$ [ms] | Measurement bandwidth [RB] |
|---|---|---|
| 0 | 480 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) + 480 x ceil(T1/480) x CSSFinterRAT | 6 |
| 1 (Note 1) | 240 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) + 480 x ceil(T1/480) x CSSFinterRAT | 50 |
| NOTE 1: This configuration is optional.<br>NOTE 2: $K_{gap_EUTRA}$ is only applicable for a UE supporting concurrent measurement gaps. Otherwise $K_{gap_EUTRA}$ =1.<br>NOTE 3: T1 = ceil( $L_{cancel}$×$K_{gapEUTRA}$)×MGRP, where $L_{cancel}$ is the number of gap occasions cancelled during measurement period during $T_{Identify,E\text{-}UTRAN\ FDD}$ for PSS/SSS detection. | | |

When measurement gaps are scheduled for E-UTRAN FDD inter-RAT measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP, RSRQ, and RS-SINR measurements to higher layers with measurement period $T_{Measure, E\text{-}UTRAN\ FDD}$ given by table 9.4.2.2-1.

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.
The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.
The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.2.3 Requirements when DRX is used

When DRX is in use and an appropriate measurement gap pattern or NCSG is configured, or when the UE is capable of concurrent measurement gap patterns and concurrent measurement gap patterns are configured, or an appropriate pre-MG is scheduled and activated, the UE shall be able to identify a new detectable E-UTRAN FDD cell within $T_{Identify, E\text{-}UTRAN\ FDD}$ specified in table 9.4.2.3-1. When *highSpeedMeasFlag-r16* is configured and UE supports the enhanced inter-

RAT E-UTRAN measurement requirements, the UE shall be able to identify a new detectable E-UTRAN FDD cell within $T_{Identify, E\text{-}UTRAN\ FDD}$ specified in table 9.4.2.3-1b. When the UE is configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE shall be able to identify a new detectable E-UTRAN FDD cell within $T_{Identify, E\text{-}UTRAN\ FDD}$ specified in table 9.4.2.3-4.

For a UE supporting and configured with concurrent GAPs, or MUSIM gaps or both concurrent GAPs and MUSIM gaps, $K_{gap_EUTRA}$: it is the scaling factor for an E-UTRAN frequency layer to be measured within the associated GAP pattern. $K_{gap_EUTRA} = 1$ when the UE is not configured with concurrent GAPs nor MUSIM gaps. Otherwise, $K_{gap_EUTRA} = N_{total} / N_{available}$ for UE configured with concurrent GAPs.

For a window W of duration xRP_max, where xRP_max is the maximum xRP across all configured per-UE GAPs, periodic MUSIM gap(s), and per-FR GAPs for FR1, and starting from the beginning of any associated gap occasion:

$N_{total}$ is the total number of associated GAP occasions within the window, including both dropped and non-dropped instances of the associated GAP within the window, and

$N_{available}$ is the number of non-dropped associated GAP occasions after accounting for measurement gap and MUSIM gap collisions by applying the collision rules for the GAP and MUSIM gap in clauses 9.1.8.3 and 9.1.10.5, respectively.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.

Requirements do not apply for UE configured with concurrent GAPs, or MUSIM gaps, if $N_{available} = 0$

When UE supports *musim-GapPreference-r17* and if the configured aperiodic MUSIM gap collides with the measurement gap associated with the target frequency layer, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer cell identification period for the target inter-RAT carrier is expected.

**Table 9.4.2.3-1: Requirement to identify a newly detectable E-UTRAN FDD cell**

| DRX cycle length (s) | $T_{Identify, E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) | |
|---|---|---|
| | Gap/NCSG period = 40 ms, 20 ms | Gap/NCSG period = 80 ms |
| ≤0.16 | Non-DRX requirements in clause 9.4.2.2 apply | Non-DRX requirements in clause 9.4.2.2 apply |
| 0.256 | 5.12* $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) (20*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) | 7.68* $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) (30*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |
| 0.32 | 6.4* $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) (20*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) | 7.68* $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) (24*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |
| 0.32< DRX-cycle ≤10.24 | Note1 (20*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) | Note1 (20*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |

NOTE 1: The time depends on the DRX cycle length.
NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.2.2.
NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.2.2.
NOTE 3: $K_{gap_EUTRA}$ is only applicable for a UE supporting concurrent GAPs. Otherwise $K_{gap_EUTRA} = 1$
NOTE 4: If multiple concurrent gaps are configured, the gap period is the periodicity of the MG pattern associated to the E-UTRA inter-RAT frequency layer.

**Table 9.4.2.3-1b: Requirement to identify a newly detectable E-UTRAN FDD cell when *highSpeedMeasFlag-r16* is configured**

| DRX cycle length (s) | $T_{Identify, E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) | |
|---|---|---|
| | **Gap/NCSG period = 40 ms, 20 ms** | **Gap/NCSG period = 80 ms** |
| ≤0.16 | Non-DRX requirements in clause 9.4.2.2 apply | Non-DRX requirements in clause 9.4.2.2 apply |
| 0.16<DRX cycle≤0.32 | Note 1(15*$CSSF_{interRAT}$ x Ceil(($K_{gap_EUTRA}$)) | |
| 0.32<DRX cycle ≤ 0.64 | Note 1(10*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) | |
| DRX cycle = 1.024 | Note 1(10*$CSSF_{interRAT}$ x Ceil( $K_{gap_EUTRA}$)) | Note 1(10*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |
| DRX cycle = 1.28 | Note 1(8*$CSSF_{interRAT}$ x Ceil( $K_{gap_EUTRA}$)) | Note 1(8*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |
| 1.28< DRX-cycle ≤10.24 | Note1 (20*$CSSF_{interRAT}$ x Ceil( $K_{gap_EUTRA}$)) | Note1 (20*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |

NOTE 1: The time depends on the DRX cycle length.
NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.2.2.
NOTE 3: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *interRAT-MeasurementEnhancement-r16.*
NOTE 4: $K_{gap_EUTRA}$ is only applicable for a UE supporting concurrent GAPs. Otherwise $K_{gap_EUTRA} = 1$
NOTE 5: If multiple concurrent gaps are configured, the gap period is the periodicity of the MG pattern associated to the E-UTRA inter-RAT frequency layer.

When DRX is in use, the UE shall be capable of performing NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN FDD cells per E-UTRA FDD frequency layer during each layer 1 measurement period, for up to 7 E-UTRA FDD carrier frequency layers, and the UE physical layer shall be capable of reporting NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements to higher layers with the measurement period $T_{measure,\ E\text{-}UTRAN\ FDD}$ specified in table 9.4.2.3-3, including UE not configured with measurement gap cancellation according to clause 9.1.14 and conditions in clause 9.1.14.3, and table 9.4.2.3-5 for the UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3.

**Table 9.4.2.3-3: Requirement to measure E-UTRAN FDD cells**

| DRX cycle length (s) | $T_{measure,\ E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) |

| ≤0.16 | Non-DRX requirements in clause 9.4.2.2 apply | Non-DRX requirements in clause 9.4.2.2 apply |
| 0.256 | (5.12+$L_{cancel}$ *0.256)* $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)<br>((20+$L_{cancel}$ *0.256)*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) | (7.68+$L_{cancel}$ *0.256)* $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)<br>((30+$L_{cancel}$ *0.256)*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |
| 0.32 | (6.4+$L_{cancel}$ *0.32)* $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)<br>( (20+$L_{cancel}$ *0.32)*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) | (7.68+$L_{cancel}$ *0.32)* $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)<br>((24+$L_{cancel}$ *0.32)*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |
| 0.32< DRX-cycle ≤10.24 | Note1 ((20+$L_{cancel}$ *DRX-cycle)*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) | Note1 ((20+$L_{cancel}$ *DRX-cycle)*$CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.2.2.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.2.2.<br>NOTE 3: $K_{gap_EUTRA}$ is only applicable for a UE supporting concurrent GAPs. Otherwise $K_{gap_EUTRA} = 1$<br>NOTE 4: If multiple concurrent gaps are configured, the gap period is the periodicity of the MG pattern associated to the E-UTRA inter-RAT frequency layer.<br>NOTE 5: $L_{cancel}$ is the number of gap occasions cancelled during $T_{Identify,E-UTRAN\ FDD}$ for PSS/SSS detection. | | |

**Table 9.4.2.3-5: Requirement to measure E-UTRAN FDD cells with measurement gap cancellation**

| DRX cycle length (s) | $T_{measure,\ E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) |
|---|---|
| ≤0.08 | Non-DRX requirements in clause 9.4.2.2 apply |
| 0.08< DRX-cycle ≤ 10.24 | Note1 ((5*+ $L_{cancel}$ * DRX-cycle) $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$)) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.2.2.<br>NOTE 3: $K_{gap_EUTRA}$ is only applicable for a UE supporting concurrent GAPs. Otherwise $K_{gap_EUTRA}$ =1<br>NOTE 4: $L_{cancel}$ is the number of gap occasions cancelled during $T_{measure,\ E\text{-}UTRAN\ FDD}$ for measurement. | |

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.
The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.
The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.2.4 Measurement reporting requirements

#### 9.4.2.4.1 Periodic Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

#### 9.4.2.4.2 Event-Triggered Periodic Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The first report in event-triggered periodic measurement reporting shall meet the requirements specified in clause 9.4.2.4.3.

#### 9.4.2.4.3 Event-Triggered Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{Identify, E-UTRAN FDD}$ defined in clauses 9.4.2.2 and 9.4.2.3 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{Identify, E-UTRAN FDD}$ becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{Measure, E-UTRAN FDD}$ provided the timing to that cell has not changed more than ± 50 Ts while measurement gap or NCSG has not been available and the L3 filter has not been used.

### 9.4.2.5 Scheduling Availability During NR − E-UTRAN FDD measurements with NCSG

When a serving cell and an E-UTRA FDD measurement object are in bands with overlapping frequency with different subcarrier spacings, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within NCSG ML. Otherwise, no scheduling restriction to the serving cell is allowed due to NR − E-UTRAN FDD measurements with NCSG.

## 9.4.3 NR − E-UTRAN TDD measurements

### 9.4.3.1 Introduction

The requirements are applicable for NR−E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN TDD cell is considered to be detectable when:

- RSRP related conditions in the accuracy requirements in clause 10.2.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
- RSRQ related conditions in the accuracy requirements in clause 10.2.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],

  RS-SINR related conditions in the accuracy requirements in clause 10.2.5 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [15].

### 9.4.3.2 Requirements when no DRX is used

When the UE requires measurement gaps or NCSG to identify and measure inter-RAT cells and an appropriate measurement gap pattern or NCSG is scheduled, or when the UE is capable of concurrent measurement gap patterns and concurrent measurement gap patterns are scheduled, or an appropriate pre-MG is scheduled and activated or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable TDD cell within $T_{\text{Identify, E-UTRAN TDD}}$ according to the following expression:

- When configuration 0 or configuration 1 in table 9.4.3.2-1 is applied, including UE not configured with measurement gap cancellation according to clause 9.1.14 and conditions in clause 9.1.14.3:

$$T_{\text{Identify,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} \cdot \text{K}_{\text{gap}_{\text{EUTRA}}}\ ms,$$

- When configuration 2 or configuration 3 in table 9.4.3.2-1 is applied, including UE not configured with measurement gap cancellation according to clause 9.1.14 and conditions in clause 9.1.14.3:

$$T_{\text{Identify,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} \cdot \text{K}_{\text{gap}_{\text{EUTRA}}} + 240 \cdot \text{CSSF}_{\text{interRAT}} \cdot \text{K}_{\text{gap}_{\text{EUTRA}}}\ ms,$$

- When configuration 0 or configuration 1 in table 9.4.3.2-1 is applied for UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3:

$$T_{\text{Identify,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} \cdot \text{K}_{\text{gap}_{\text{EUTRA}}} + 480 * \text{ceil}(\text{T1} / 480) \times \text{CSSF}_{\text{interRAT}}\ ms,$$

- When configuration 2 or configuration 3 in table 9.4.3.2-1 is applied for UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3:

$$T_{\text{Identify,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1}}} \cdot \text{CSSF}_{\text{interRAT}} \cdot \text{K}_{\text{gap}_{\text{EUTRA}}} + 240 \cdot \text{CSSF}_{\text{interRAT}} \cdot \text{K}_{\text{gap}_{\text{EUTRA}}} + 480 * \text{ceil}(\text{T1} / 480) \times \text{CSSF}_{\text{interRAT}}\ ms,$$

where:

$T_{\text{BasicIdentify}}$ = 480 ms,

$T_{\text{Inter1}}$ is defined in clause 9.4.1,

$\text{CSSF}_{\text{interRAT}} = \text{CSSF}_{\text{within_gap,i}}$ when measurement gaps are configured, or $\text{CSSF}_{\text{within_ncsg,i}}$ when NCSGs are configured, is the scaling factor for the measured inter-RAT E-UTRA carrier *i* which is calculated as specified in clause 9.1.5.2.

$\text{T1} = \text{ceil}(\text{L}_{\text{cancel}} \times \text{K}_{\text{gapEUTRA}}) \times \text{MGRP}$, applies for the UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, $\text{L}_{\text{cancel}}$ is the number of gap occasions cancelled during measurement period during $T_{\text{Identify,E-UTRAN TDD}}$ for PSS/SSS detection.

For a UE supporting concurrent GAPs, if multiple concurrent GAPs are configured, the MGRP is the periodicity of the MG pattern associated to the inter-RAT layer. Otherwise, MGRP is the Measurement Gap Repetition Period of the configured MG.

For a UE supporting and configured with concurrent GAPs, or MUSIM gaps or both concurrent GAPs and MUSIM gaps, $\text{K}_{\text{gap_EUTRA}}$: it is the scaling factor for an E-UTRAN frequency layer to be measured within the associated GAP

pattern. $K_{gap_EUTRA}$ = 1 when the UE is not configured with concurrent GAPs nor MUSIM gaps. Otherwise, $K_{gap_EUTRA}$ = $N_{total}$ / $N_{available}$ for UE configured with concurrent GAPs or MUSIM gaps.

- For a window W of duration xRP_max , where xRP_max is the maximum xRP across all configured per-UE GAPs, periodic MUSIM gaps,and per-FR GAPs for FR1, and starting from the beginning of any associated gap occasion:
  - $N_{total}$ is the total number of associated GAP occasions within the window, including those overlapped with other GAPs and MUSIM gap ocassions within the window, and
  - $N_{available}$ is the number of non-dropped associated GAP occasions after accounting for GAPs and MUSIM gap collisions by applying the GAP and MUSIM gap in clauses 9.1.8.3 and 9.1.10.5, respectively.
    - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.
- Requirements do not apply for UE configured with concurrent GAPs or MUSIM gaps, if $N_{available}$ =0

When UE supports *musim-GapPreference-r17* and if the configured aperiodic MUSIM gap collides with the measurement gap associated with the target frequency layer, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer cell identification period for the target inter-RAT carrier is expected.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of $T_{Measure, E\text{-}UTRAN\ TDD}$ defined in table 9.4.3.2-1, including UE not configured with measurement gap cancellation according to clause 9.1.14 and conditions in clause 9.1.14.3, and table 9.4.3.2-2 for the UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3.

**Table 9.4.3.2-1: $T_{Measure, E\text{-}UTRAN\ TDD}$ for different configurations**

| Configuration | Measurement bandwidth (RB) | Number of UL/DL sub-frames per half frame (5 ms) | | DwPTS | | $T_{Measure, E\text{-}UTRAN\ TDD}$ (ms) |
|---|---|---|---|---|---|---|
| | | DL | UL | Normal CP | Extended CP | |
| 0 | 6 | 2 | 2 | 19760×$T_s$ | 20480×$T_s$ | 480 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) |
| 1 (Note 1) | 50 | 2 | 2 | 19760×$T_s$ | 20480×$T_s$ | 240 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) |
| 2 | 6 | 1 | 3 | 19760×$T_s$ | 20480×$T_s$ | 720 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) |
| 3 (Note 1) | 50 | 1 | 3 | 19760×$T_s$ | 20480×$T_s$ | 480 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) |
| NOTE 1: This configuration is optional.<br>NOTE 2: Void<br>NOTE 3: $K_{gap_EUTRA}$ is only applicable for a UE supporting concurrent GAPs and/or MUSIM gaps. Otherwise $K_{gap_EUTRA}$ =1 | | | | | | |

**Table 9.4.3.2-2: $T_{Measure, E\text{-}UTRAN\ TDD}$ for different configurations with measurement gap cancellation**

| Configuration | Measurement bandwidth (RB) | Number of UL/DL sub-frames per half frame (5 ms) | | DwPTS | | $T_{Measure, E\text{-}UTRAN\ TDD}$ (ms) |
|---|---|---|---|---|---|---|
| | | DL | UL | Normal CP | Extended CP | |
| 0 | 6 | 2 | 2 | 19760×$T_s$ | 20480×$T_s$ | 480 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) + 480 x ceil(T1/480) x $CSSF_{interRAT}$ |
| 1 (Note 1) | 50 | 2 | 2 | 19760×$T_s$ | 20480×$T_s$ | 240 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) + 480 x ceil(T1/480) x $CSSF_{interRAT}$ |

| | | | | | | |
|---|---|---|---|---|---|---|
| 2 | 6 | 1 | 3 | 19760×$T_s$ | 20480×$T_s$ | 720 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) + 480 x ceil(T1/480) x $CSSF_{interRAT}$ |
| 3 (Note 1) | 50 | 1 | 3 | 19760×$T_s$ | 20480×$T_s$ | 480 x $CSSF_{interRAT}$ x Ceil($K_{gap_EUTRA}$) + 480 x ceil(T1/480) x $CSSF_{interRAT}$ |
| NOTE 1: This configuration is optional.<br>NOTE 2: $K_{gap_EUTRA}$ is only applicable for a UE supporting concurrent GAPs. Otherwise $K_{gap_EUTRA}$ =1.<br>NOTE 3: T1 = ceil( $L_{cancel}$×$K_{gapEUTRA}$)×MGRP. $L_{cancel}$ is the number of gap occasions cancelled during measurement period during $T_{measure,\ E\text{-}UTRAN\ TDD}$ for measurement. | | | | | | |

When measurement gaps are scheduled for E-UTRAN TDD inter-RAT measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting RSRP, RSRQ, and RS-SINR measurements to higher layers with measurement period $T_{measure,\ E\text{-}UTRAN\ TDD}$ given by table 9.4.3.2-1.

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.
The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.
The NR – E-UTRAN TDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.3.3 Requirements when DRX is used

When DRX is in use and an appropriate measurement gap pattern or NCSG is configured, or when the UE is capable of concurrent measurement gap patterns and concurrent measurement gap patterns are configured, or an appropriate pre-MG is scheduled and activated, the UE shall be able to identify a new detectable E-UTRAN TDD cell within $T_{Identify,\ E\text{-}UTRAN\ TDD}$ specified in table 9.4.3.3-1. When *highSpeedMeasFlag-r16* is configured and UE supports the enhanced inter-RAT E-UTRAN measurement requirements, the UE shall be able to identify a new detectable E-UTRAN TDD cell within $T_{Identify,\ E\text{-}UTRAN\ TDD}$ specified in table 9.4.3.3-1b. When the UE is configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE shall be able to identify a new detectable E-UTRAN TDD cell within $T_{Identify,\ E\text{-}UTRAN\ TDD}$ specified in table 9.4.3.3-4.

For a UE supporting and configured with concurrent GAPs, or MUSIM gaps or both concurrent GAPs and MUSIM gaps, $K_{gap_EUTRA}$: it is the scaling factor for an E-UTRAN frequency layer to be measured within the associated GAP pattern. $K_{gap_EUTRA}$ = 1 when the UE is not configured with concurrent GAPs nor MUSIM gaps.. Otherwise, $K_{gap_EUTRA} = N_{total} / N_{available}$ for UE configured with concurrent GAPs or MUSIM gaps.

For a window W of duration xRP_max, where xRP_max is the maximum xRP across all configured per-UE GAPs s, periodic MUSIM gap(s), and per-FR measurement GAPs for FR1, and starting from the beginning of any associated gap occasion: GAPs

$N_{total}$ is the total number of associated GAP occasions within the window, including those overlapped with other measurement GAP and MUSIM gap instances within the window, and

$N_{available}$ is the number of non-dropped associated GAP occasions after accounting for measurement gap and MUSIM gap collisions by applying the collision rules for the GAP and MUSIM gap in clauses 9.1.8.3, 9.1.10.5, 9.1.12.3, and 9.1.13.3, respectively.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.

Requirements do not apply for UE configured with concurrent GAPs or MUSIM gaps, if $N_{available}$ = 0

When UE supports *musim-GapPreference-r17* and if the configured aperiodic MUSIM gap collides with the measurement gap associated with the target frequency layer, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer cell identification period for the target inter-RAT carrier is expected.

**Table 9.4.3.3-1: Requirement to identify a newly detectable E-UTRAN TDD cell**

| DRX cycle length (s) | $T_{Identify,\ E\text{-}UTRAN\ TDD}$ (s) (DRX cycles) | |

Otherwise $K_{gap_EUTRA}$ = 1.<br>NOTE 5: $L_{cancel,meas}$ is the number of gap occasions cancelled during $T_{measure,\ E\text{-}UTRAN\ TDD}$ for measurement. | |

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.
The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.
The NR – E-UTRAN TDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

## 9.4.3.4 Measurement reporting requirements

### 9.4.3.4.1 Periodic Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

### 9.4.3.4.2 Event-Triggered Periodic Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The first report in event-triggered periodic measurement reporting shall meet the requirements specified in clause 9.4.3.4.3.

#### 9.4.3.4.3 Event-Triggered Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{Identify, E-UTRAN TDD}$ defined in clauses 9.4.3.2 and 9.4.3.3 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{Identify, E-UTRAN TDD}$ becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{Measure, E-UTRAN TDD}$ provided the timing to that cell has not changed more than ± 50 Ts while measurement gap or NCSG has not been available and the L3 filter has not been used.

### 9.4.3.5 Scheduling Availability During NR − E-UTRAN TDD measurements with NCSG

When UE supports *simultaneousRxTxInterBandENDC* for a band combination, no scheduling restriction is applicable to NR − E-UTRAN TDD measurements with NCSG in this band combination; otherwise UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within NCSG ML.

When a serving cell and an E-UTRA TDD measurement object are in bands with overlapping frequency with different subcarrier spacings, UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within NCSG ML. Otherwise, no scheduling restriction to the serving cell is allowed due to NR − E-UTRAN TDD measurements with NCSG.

## 9.4.4 Inter-RAT RSTD measurements

### 9.4.4.1 NR − E-UTRAN FDD RSTD measurements

#### 9.4.4.1.1 Introduction

The requirements are applicable for NR−E-UTRAN FDD RSTD measurements requested via LPP [22, 27].

When the UE is in NE-DC operation mode and an NR–E-UTRAN FDD RSTD measurement configured by NR PCell is on a E-UTRA serving frequency carrier, then the corresponding E-UTRA intra-frequency measurements requirements as follows shall apply.

- Measurements configured on E-UTRA PSCC shall meet E-UTRAN OTDOA intra-frequency measurements requirements in clause 8.1.2.5. The applicable measurement accuracy requirements are in clause 9.1.10.
- Measurements configured on E-UTRA SCC shall meet all applicable requirements in clause 8.4, except that the terms PCell and primary component carrier shall be deemed to be swapped with PSCell and PSCC. The applicable measurement accuracy requirements are in clause 9.1.12, except that the terms PCell and primary component carrier shall be deemed to be swapped with PSCell and PSCC.

The requirements in clause 9.4.4.1 apply when:

- the UE is provided with the LTE timing information via LPP [27], including both *nr-LTE-SFN-Offset* and *nr-LTE-fineTiming-Offset*, or
- the UE is not provided with *nr-LTE-SFN-Offset* or *nr-LTE-fineTiming-Offset*, or

- the UE is provided with *nr-LTE-SFN-Offset* but not with *nr-LTE-fineTiming-Offset*.

When the UE is not aware of the SFN of at least one LTE cell in the OTDOA assistance data, the UE may be using autonomous gaps to acquire SFN of the OTDOA assistance data reference cell prior to requesting measurement gaps for performing the requested E-UTRA RSTD measurements before the $T_{RSTD_InterRAT,E-UTRAN_FDD}$ time period starts while meeting all the requirements in clause 9.4.4.1.2, provided that the OTDOA assistance data is provided to allow sufficient time for the UE to acquire the SFN before the $T_{RSTD_InterRAT,E-UTRAN_FDD}$ starts.

When the UE is not aware of and cannot derive the subframe timing difference between the NR serving cell and the OTDOA assistance data reference cell, the UE may need to request measurement gaps to perform cell detection for the OTDOA assistance data reference cell prior to requesting measurement gaps for performing the requested E-UTRA RSTD measurements before the $T_{RSTD_InterRAT,E-UTRAN_FDD}$ time period starts while meeting all the requirements in clause 9.4.4.1.2, provided that the OTDOA assistance data is provided to allow sufficient time for the UE to detect the cell before the $T_{RSTD_InterRAT,E-UTRAN_FDD}$ starts.

### 9.4.4.1.2 Requirements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure inter-RAT E-UTRAN FDD RSTD, specified in TS 38.215 [4], for at least *n*=16 cells, including the reference cell, within $T_{RSTD_InterRAT,E-UTRAN_FDD}$ ms as given below:

$$T_{InterRAT,E-UTRAN_FDD} = T_{PRS} \times (M - 1) + \Delta \ ,$$

where

$T_{RSTD_InterRAT,E-UTRAN_FDD}$ is the total time for detecting and measuring at least *n* cells,
$T_{PRS}$ is the largest value of the cell-specific positioning subframe configuration period, defined in TS 36.211 [23], among the measured *n* cells including the reference cell,
*M* is the number of PRS positioning occasions as defined in table 9.4.4.1.2-1, where each PRS positioning occasion comprises of $N_{PRS}$ ($1 \leq N_{PRS} \leq 6$) consecutive downlink positioning subframes defined in TS 36.211 [23],
$CSSF_{interRAT}=CSSF_{within_gap,i}$ is the scaling factor determined by the gap sharing scheme for the RSTD measurements on the carrier frequency *i* as defined in clause 9.1.5.2,

$\Delta = 160 \times \left\lceil \frac{n}{M} \right\rceil \Delta = 160 \cdot \left\lceil \frac{n}{M} \right\rceil$ ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time, and

the *n* cells are distributed on up to two E-UTRAN FDD carrier frequencies.

**Table 9.4.4.1.2-1: Number of PRS positioning occasions within $T_{RSTD_InterRAT,E-UTRAN_FDD}$**

| Positioning subframe configuration period, $T_{PRS}$ | Number of PRS positioning occasions, M | |
|---|---|---|
| | f2 Note1 | f1 and f2 Note2 |
| 160 ms | 16 × $CSSF_{interRAT}$ | 32 × $CSSF_{interRAT}$ |
| >160 ms | 8 × $CSSF_{interRAT}$ | 16 × $CSSF_{interRAT}$ |
| NOTE 1: When inter-RAT E-UTRAN FDD RSTD measurements are performed over the reference cell and neighbour cells, which belong to the E-UTRAN FDD carrier frequency f2. | | |
| NOTE 2: When inter-RAT E-UTRAN FDD RSTD measurements are performed over the reference cell and the neighbour cells, which belong to the E-UTRAN FDD carrier frequency f1 and the E-UTRAN FDD carrier frequency f2 respectively. | | |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells *i* out of at least (*n*-1) neighbor cells within $T_{RSTD_InterRAT,E-UTRAN_FDD}$ provided:

$(PRS\ \hat{E}s/Iot)_{ref} \geq -6$ dB for all Frequency Bands for the reference cell,
$(PRS\ \hat{E}s/Iot)_i \geq -13$ dB for all Frequency Bands for neighbour cell *i*,
$(PRS\ \hat{E}s/Iot)_{ref}$ and $(PRS\ \hat{E}s/Iot)_i$ conditions apply for all subframes of at least $L = \frac{M}{2}$ PRS positioning occasions,
$PRP\ 1,2|_{dBm}$ according to TS 36.133 [15, Annex B.2.6] for a corresponding band,

PRS Ês/Iot is defined as the ratio of the average received energy per PRS resource element during the useful part of the symbol to the average received power spectral density of the total noise and interference for this resource element, where the ratio is measured over all resource elements which carry PRS.

The time $T_{RSTD_InterRAT,E\text{-}UTRAN_FDD}$ starts from the first subframe of the PRS positioning occasion closest in time after both the *OTDOA-RequestLocationInformation* message and the OTDOA assistance data in the *OTDOA-ProvideAssistanceData* message via LPP as specified in TS 38.305 [22], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells *i* shall be fulfilled according to the accuracy as specified in clause 10.2.4.

#### 9.4.4.1.2.1 RSTD Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

#### 9.4.4.1.2.2 Requirements for acquiring the timing of the E-UTRA OTDOA reference cell

When the UE is not aware of the SFN of at least one LTE cell in the OTDOA assistance data, the UE supporting per-FR gaps may make autonomous gaps in downlink reception and uplink transmission of the PCell, PSCell, and each of the SCells in FR1 for acquiring SFN of the reference cell in the E-UTRA OTDOA assistance data, while no autonomous gaps in downlink reception or uplink transmission are allowed in any of the UE serving cells in FR2. The UE, which are only supporting per-UE gaps, may make autonomous gaps in downlink reception and uplink transmission of the PCell, PSCell, and each of the SCells for acquiring the SFN of the reference cell in the E-UTRA OTDOA assistance data.

When the UE is not aware of and cannot derive the subframe timing difference between the NR serving cell and the OTDOA assistance data reference cell, the UE may need to request measurement gaps while indicating *eutra-FineTimingDetection* according to TS 38.331 [2] for detecting the reference cell in the E-UTRA OTDOA assistance data.

When the UE is performing one or both of SFN acquisition or cell detection as specified above, the UE shall be able to determine the timing of the E-UTRA OTDOA assistance data reference cell during the time period

$$T_{RefCell,E\text{-}UTRAN} = T_{Detect,\ E\text{-}UTRAN\ FDD} + T_{MIB} + T_{ECGI}\ ,$$

where

$T_{Detect,\ E\text{-}UTRAN\ FDD} = T_{Identify,\ E\text{-}UTRAN\ FDD} - T_{measure,\ E\text{-}UTRAN\ FDD}$ is according to clause 9.4.2 assuming $CSSF_{interRAT} = 1$ and it is the time needed to detect the E-UTRA OTDOA assistance data reference cell when the UE needs to acquire the subframe and slot timing of the cell, provided the UE is configured with measurement gaps ($T_{Detect,\ E\text{-}UTRAN\ FDD} = 0$ when both *nr-LTE-SFN-Offset* and *nr-LTE-fineTiming-Offset* are provided in the E-UTRA OTDOA assistance data or the E-UTRA OTDOA assistance data reference cell is known to the UE), and

$T_{MIB}$ = 50 ms is the time required to acquire SFN and/or PHICH configuration of the E-UTRA OTDOA assistance data reference cell provided the OTDOA assistance data reference cell is decodable and at least all E-UTRA subframes #0 during $T_{MIB}$ are available at the UE receiver ($T_{MIB} = 0$ when *nr-LTE-SFN-Offset* is provided in the E-UTRA OTDOA assistance data and ECGI acquisition is not needed), and

$T_{ECGI}$ = 100 ms is the time required to acquire ECGI of the E-UTRA OTDOA assistance data reference cell when *cellGlobalId* is included in *OTDOA-ReferenceCellInfo* and the UE is not aware of the ECGI of this cell ($T_{ECGI} = 0$ when *cellGlobalId* is not included in *OTDOA-ReferenceCellInfo* or the UE is aware of the ECGI of the E-UTRA OTDOA assistance data reference cell).

When detecting the E-UTRAN OTDOA reference cell, the requirements in this clause shall be met, provided the conditions for the detectable cell are fulfilled according to clause 9.4.2.1. In addition, the MIB of the E-UTRA OTDOA reference cell whose SFN is acquired shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to TS 36.101 [25].

The requirement for acquiring the timing of the E-UTRA OTDOA reference cell within $T_{RefCell,E\text{-}UTRAN}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

When $T_{MIB} > 0$ and UE is using autonomous gaps during $T_{MIB}$, the UE shall transmit at least $N_{ACK/NACK, MIB, FDD}$ ACK/NACKs on PCell, PSCell, and each of activated SCell(s) in the frequency range where the autonomous gaps are created, specified in table 9.4.4.1.2.2-1. When both $T_{MIB} > 0$ and $T_{ECGI} > 0$ and UE is using autonomous gaps during $T_{MIB} + T_{ECGI}$, the UE shall transmit on PCell, PSCell, and each of activated SCell(s) in the frequency range where autonomous gaps are created at least $N_{ACK/NACK, MIB+ECGI, FDD}$ ACK/NACKs specified in table 9.4.4.1.2.2-3, provided the OTDOA reference cell bandwidth is configured in the OTDOA assistance data [22, 27]. The requirements in Tables 9.4.4.1.2.2-1, 9.4.4.1.2.2-2, and 9.4.4.1.2.2-3 apply, provided that:

- there is continuous DL data allocation,
- no DRX cycle is used,
- no measurement gaps are configured,
- only one code word is transmitted in each slot,
- 2 slot ACK/NACK feedback is configured,
- 20 ms SMTC period is configured,
- SSBs are transmitted in one slot within SMTC window.

## 9.4.4.2 NR − E-UTRAN TDD RSTD measurements

### 9.4.4.2.1 Introduction

The requirements are applicable for NR−E-UTRAN TDD RSTD measurements requested via LPP [22, 27].

When the UE is in NE-DC operation mode and an NR–E-UTRAN TDD RSTD measurement configured by NR PCell is on a E-UTRA serving frequency carrier, then the corresponding E-UTRA intra-frequency measurements requirements as follows shall apply.

- Measurements configured on E-UTRA PSCC shall meet E-UTRAN OTDOA intra-frequency measurements requirements in clause 8.1.2.5. The applicable measurement accuracy requirements are in clause 9.1.10.

- Measurements configured on E-UTRA SCC shall meet all applicable requirements in clause 8.4, except that the terms PCell and primary component carrier shall be deemed to be swapped with PSCell and PSCC. The applicable measurement accuracy requirements are in clause 9.1.12, except that the terms PCell and primary component carrier shall be deemed to be swapped with PSCell and PSCC.

The requirements in clause 9.4.4.1 apply when:

- the UE is provided with the LTE timing information via LPP [27], including both *nr-LTE-SFN-Offset* and *nr-LTE-fineTiming-Offset*, or

- the UE is not provided with *nr-LTE-SFN-Offset* or *nr-LTE-fineTiming-Offset*, or

- the UE is provided with *nr-LTE-SFN-Offset* but not with *nr-LTE-fineTiming-Offset*.

When the UE is not aware of the SFN of at least one LTE cell in the OTDOA assistance data, the UE may be using autonomous gaps to acquire SFN of the OTDOA assistance data reference cell prior to requesting measurement gaps for performing the requested E-UTRA RSTD measurements before the $T_{RSTD_InterRAT,E-UTRAN_TDD}$ time period starts while meeting all the requirements in clause 9.4.4.2.2, provided that the OTDOA assistance data is provided to allow sufficient time for the UE to acquire the SFN before the $T_{RSTD\ InterRAT,\ E-UTRAN\ TDD}$ starts. When the UE is not aware of and cannot derive the subframe timing difference between the NR serving cell and the OTDOA assistance data reference cell, the UE may need to request measurement gaps to perform cell detection for the OTDOA assistance data reference cell prior to requesting measurement gaps for performing the requested E-UTRA RSTD measurements before the $T_{RSTD_InterRAT,E-UTRAN_TDD}$ time period starts while meeting all the requirements in clause 9.4.4.2.2, provided that the OTDOA assistance data is provided to allow sufficient time for the UE to detect the cell before the $T_{RSTD_InterRAT,E-UTRAN_TDD}$ starts.

### 9.4.4.2.2 Requirements

When the physical layer cell identities of neighbour cells together with the OTDOA assistance data are provided, the UE shall be able to detect and measure inter-RAT -UTRAN TDD RSTD, specified in TS 38.215 [4], for at least *n*=16 cells, including the reference cell, within $T_{RSTD_InterRAT,E-UTRAN_TDD}$ ms as given below:

$$T_{InterRAT,E-UTRAN_TDD} = T_{PRS} \times (M-1) + \Delta \quad ,$$

where

$T_{RSTD_InterRAT,E-UTRAN_TDD}$ is the total time for detecting and measuring at least *n* cells,
$T_{PRS}$ is the largest value of the cell-specific positioning subframe configuration period, defined in TS 36.211 [23], among the measured *n* cells including the reference cell,

*M* is the number of PRS positioning occasions as defined in table 9.4.4.2.2-1, where a PRS positioning occasion is as defined in clause 9.4.4.1.2,

$CSSF_{interRAT}=CSSF_{within_gap,i}$ is the scaling factor determined by the gap sharing scheme for the RSTD measurements on the carrier frequency *i* as defined in clause 9.1.5.2,

$\Delta = 160 \times \frac{n}{M}$ ms is the measurement time for a single PRS positioning occasion which includes the sampling time and the processing time, and

the *n* cells are distributed on up to two E-UTRAN TDD carrier frequencies.

**Table 9.4.4.2.2-1: Number of PRS positioning occasions within $T_{RSTD_InterRAT,E-UTRAN_TDD}$**

| Positioning subframe $T_{PRS}$ configuration period, | Number of PRS positioning occasions, *M* | |
|---|---|---|
| | f2 Note1 | f1 and f2 Note2 |
| 160 ms | 16 × $CSSF_{interRAT}$ | 32 × $CSSF_{interRAT}$ |

| | | |
|---|---|---|
| > 160 ms | 8 × $CSSF_{interRAT}$ | 16 × $CSSF_{interRAT}$ |
| NOTE 1: When inter-RAT E-UTRAN TDD RSTD measurements are performed over the reference cell and neighbour cells, which belong to the E-UTRAN TDD carrier frequency f2. | | |
| NOTE 2: When inter-RAT E-UTRAN TDD RSTD measurements are performed over the reference cell and the neighbour cells, which belong to the E-UTRAN TDD carrier frequency f1 and the E-UTRAN TDD carrier frequency f2 respectively. | | |

The requirements in this clause shall apply for all TDD special subframe configurations specified in TS 36.211 [23] and for the TDD uplink-downlink configurations as specified in table 9.4.4.2.2-2 for UE requiring measurement gaps for these measurements. For UEs capable of performing inter-RAT RSTD measurements without measurement gaps, TDD uplink-downlink subframe configurations as specified in table 9.4.4.2.2-3 shall apply.

**Table 9.4.4.2.2-2: TDD uplink-downlink subframe configurations applicable for inter-RAT RSTD requirements**

| PRS Transmission Bandwidth (RB) | Applicable TDD uplink-downlink configurations |
|---|---|
| 6, 15 | 3, 4 and 5 |
| 25 | 1, 2, 3, 4, 5 and 6 |
| 50, 75, 100 | 0, 1, 2, 3, 4, 5 and 6 |
| NOTE 1: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [23]. | |

**Table 9.4.4.2.2-3: TDD uplink-downlink subframe configurations applicable for inter-RAT RSTD requirements without gaps**

| PRS Transmission Bandwidth (RB) | Applicable TDD uplink-downlink configurations |
|---|---|
| 6, 15 | 1, 2, 3, 4 and 5 |
| 25, 50, 75, 100 | 0, 1, 2, 3, 4, 5 and 6 |
| NOTE 1: Uplink-downlink configurations are specified in Table 4.2-2 in TS 36.211 [23]. | |

The UE physical layer shall be capable of reporting RSTD for the reference cell and all the neighbor cells *i* out of at least (*n*-1) neighbor cells within $T_{\text{RSTD InterRAT, E-UTRAN TDD}}$ provided:

$(\text{PRS } \hat{E}s/Iot)_{ref}$ $\left(\text{PRS } \hat{E}_s / \text{Iot}\right)_{ref}$ ≥-6 dB for all Frequency Bands for the reference cell,

$(\text{PRS } \hat{E}s/Iot)_i$ $\left(\text{PRS } \hat{E}_s / \text{Iot}\right)_i$ ≥-13 dB for all Frequency Bands for neighbour cell *i*,

$(\text{PRS } \hat{E}s/Iot)_{ref}$ $\left(\text{PRS } \hat{E}_s / \text{Iot}\right)_{ref}$ and $(\text{PRS } \hat{E}s/Iot)_i$ conditions apply for all subframes of at least $L = \frac{M}{2}$ PRS positioning occasions,

$PRP\ 1,2|_{dBm}$ according to TS 36.133 [15, Annex B.2.6] for a corresponding band,

PRS $\hat{E}s/Iot$ is as defined in clause 9.4.4.1.2.

The time $T_{RSTD_InterRAT,E\text{-}UTRAN_TDD}$ starts from the first subframe of the PRS positioning occasion closest in time after both the OTDOA-RequestLocationInformation message and the OTDOA assistance data in the OTDOA-ProvideAssistanceData message via LPP as specified in TS 38.305 [22], are delivered to the physical layer of the UE.

The RSTD measurement accuracy for all measured neighbor cells *i* shall be fulfilled according to the accuracy as specified in clause 10.2.4.

#### 9.4.4.2.2.1 RSTD Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

#### 9.4.4.2.2.2 Requirements for acquiring the timing of the E-UTRA OTDOA reference cell

When the UE is not aware of the SFN of at least one LTE cell in the OTDOA assistance data, the UE supporting per-FR gaps may make autonomous gaps in downlink reception and uplink transmission of the PCell, PSCell, and each of the SCells in FR1 for acquiring SFN of the reference cell in the E-UTRA OTDOA assistance data, while no autonomous gaps in downlink reception or uplink transmission are allowed in any of the UE serving cells in FR2. The UE, which are only supporting per-UE gaps, may make autonomous gaps in downlink reception and uplink transmission of the PCell, PSCell, and each of the SCells for acquiring the SFN of the reference cell in the E-UTRA OTDOA assistance data.

When the UE is not aware of and cannot derive the subframe timing difference between the NR serving cell and the OTDOA assistance data reference cell, the UE may need to request measurement gaps while indicating *eutra-FineTimingDetection* according to TS 38.331 [2] for detecting the reference cell in the E-UTRA OTDOA assistance data.

When the UE is performing one or both of SFN acquisition or cell detection as specified above, the UE shall be able to determine the timing of the E-UTRA OTDOA assistance data reference cell during the time period

$$T_{RefCell,E\text{-}UTRAN} = T_{Detect,\ E\text{-}UTRAN\ TDD} + T_{MIB} + T_{ECGI}\ ,$$

where

$T_{Detect,\ E\text{-}UTRAN\ TDD} = T_{Identify,\ E\text{-}UTRAN\ TDD} - T_{measure,\ E\text{-}UTRAN\ TDD}$ is according to clause 9.4.3 assuming $CSSF_{interRAT} = 1$ and it is the time needed to detect the E-UTRA OTDOA assistance data reference cell when the UE needs to acquire the subframe and slot timing of the cell, provided the UE is configured with measurement gaps ($T_{Detect,\ E\text{-}UTRAN\ TDD} = 0$ when both *nr-LTE-SFN-Offset* and *nr-LTE-fineTiming-Offset* are provided in the E-UTRA OTDOA assistance data or the E-UTRA OTDOA assistance data reference cell is known to the UE), and

$T_{MIB}$ = 50 ms is the time required to acquire SFN and/or PHICH configuration of the E-UTRA OTDOA assistance data reference cell provided the OTDOA assistance data reference cell is decodable and at least all E-UTRA subframes #0 during $T_{MIB}$ are available at the UE receiver ($T_{MIB} = 0$ when *nr-LTE-SFN-Offset* is provided in the E-UTRA OTDOA assistance data and ECGI acquisition is not needed), and

$T_{ECGI}$ = 100 ms is the time required to acquire ECGI of the E-UTRA OTDOA assistance data reference cell when *cellGlobalId* is included in *OTDOA-ReferenceCellInfo* and the UE is not aware of the ECGI of this cell ($T_{ECGI} = 0$ when *cellGlobalId* is not included in *OTDOA-ReferenceCellInfo* or the UE is aware of the ECGI of the E-UTRA OTDOA assistance data reference cell).

When detecting the E-UTRAN OTDOA reference cell, the requirements in this clause shall be met, provided the conditions for the detectable cell are fulfilled according to clause 9.4.3.1. In addition, the MIB of the E-UTRA OTDOA reference cell whose SFN is acquired shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to TS 36.101 [25].

The requirement for acquiring the timing of the E-UTRA OTDOA reference cell within $T_{RefCell,E\text{-}UTRAN}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

When $T_{MIB} > 0$ and UE is using autonomous gaps during $T_{MIB}$, the UE shall transmit at least $N_{ACK/NACK,\ MIB,\ TDD}$ ACK/NACKs on PCell, PSCell, and each of activated SCell(s) in the frequency range where the autonomous gaps are created, specified in table 9.4.4.2.2.2-1. When both $T_{MIB} > 0$ and $T_{ECGI} > 0$ and UE is using autonomous gaps during $T_{MIB}+T_{ECGI}$, the UE shall transmit on PCell, PSCell, and each of activated SCell(s) in the frequency range where autonomous gaps are created at least $N_{ACK/NACK,\ MIB+ECGI,\ TDD}$ ACK/NACKs specified in table 9.4.4.2.2.2-3, provided the OTDOA reference cell bandwidth is configured in the OTDOA assistance data [22, 27]. The requirements in Tables 9.4.4.2.2.2-1, and 9.4.4.2.2.2-3 apply, provided that:

- there is continuous DL data allocation,
- no DRX cycle is used,
- no measurement gaps are configured,
- only one code word is transmitted in each slot,
- 2 slot ACK/NACK feedback is configured,
- 20 ms SMTC period is configured,
- SSBs are transmitted in one slot within SMTC window.

**Table 9.4.4.2.2.2-1: Minimum number of ACK/NACKs transmitted by the UE during $T_{MIB}$**

| $N_{ACK/NACK, MIB, TDD}$ | Configuration of the serving cell in which the transmitted ACK/NACKs are counted | |
|---|---|---|
| | Duplex mode configuration | SCS |
| 15 | FDD | 15 kHz |
| 39 | FDD | 30 kHz |
| 85 | FDD | 60 kHz |
| 0 | TDD Note 1 | 15 kHz |
| 4 | TDD Note 1 | 30 kHz |
| 12 | TDD Note 1 | 60 kHz |
| 46 | TDD Note 2 | 60 kHz |
| 104 | TDD Note 2 | 120 kHz |
| NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [18]. NOTE 2: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-2 [19]. | | |

**Table 9.4.4.2.2.2-2: Void**

**Table 9.4.4.2.2.2-3: Minimum number of ACK/NACKs transmitted by the UE during $T_{MIB}$ + $T_{ECGI}$**

| $N_{ACK/NACK, MIB+ECGI, TDD}$ | Configuration of the serving cell in which the transmitted ACK/NACKs are counted | |
|---|---|---|
| | Duplex mode configuration | SCS |
| 84 | FDD | 15 kHz |
| 193 | FDD | 30 kHz |
| 402 | FDD | 60 kHz |
| 28 | TDD Note 1 | 15 kHz |
| 81 | TDD Note 1 | 30 kHz |
| 159 | TDD Note 1 | 60 kHz |
| 233 | TDD Note 2 | 60 kHz |
| 491 | TDD Note 2 | 120 kHz |
| NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [18]. NOTE 2: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-2 [19]. | | |

## 9.4.5 Inter-RAT E-CID measurements

### 9.4.5.1 NR−E-UTRAN FDD E-CID RSRP and RSRQ measurements

#### 9.4.5.1.1 Introduction

The requirements in clause 9.4.5.1. shall apply provided the UE has received *ECID-RequestLocationInformation* message from LMF via LPP requesting the UE to report inter-RAT E-UTRAN FDD E-CID RSRP and RSRQ measurements [22, 27].

#### 9.4.5.1.2 Requirements

The requirements in clause 9.4.2 also apply for this clause except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in clause 9.4.5.1.3.

#### 9.4.5.1.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2 and 10.2.3, respectively.

### 9.4.5.2 NR−E-UTRAN TDD E-CID RSRP and RSRQ measurements

#### 9.4.5.2.1 Introduction

The requirements in clause 9.4.5.2. shall apply provided the UE has received *ECID-RequestLocationInformation* message from LMF via LPP requesting the UE to report inter-RAT E-UTRAN TDD E-CID RSRP and RSRQ measurements [22, 27].

#### 9.4.5.2.2 Requirements

The requirements in clause 9.4.3 also apply for this clause except the measurement reporting requirements. The measurement reporting requirements for E-CID RSRP and RSRQ are defined in clause 9.4.5.2.3.

#### 9.4.5.2.3 Measurement Reporting Delay

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

Reported RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2 and 10.2.3, respectively.

## 9.4.6 NR − UTRAN FDD measurements

### 9.4.6.1 Introduction

The requirements are applicable for NR− UTRAN FDD CPICH RSCP and CPICH Ec/No measurements for SRVCC.

### 9.4.6.2 Requirements when no DRX is used

#### 9.4.6.2.1 Identification of a new UTRA FDD cell

When explicit neighbour list is provided and no DRX is used, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable cell belonging to the monitored set within

$$T_{identify,UTRA_FDD} = T_{basic_identify_UTRA_FDD} \times \frac{480}{T_{inter1}} \times CSSF_{interRAT}\ ms$$

A cell shall be considered detectable when

- CPICH Ec/Io $\geq$ -20 dB,
- SCH_Ec/Io $\geq$ -17 dB for at least one channel tap and SCH_Ec/Ior is equally divided between primary synchronisation code and secondary synchronisation code. When L3 filtering is used an additional delay can be expected.

#### 9.4.6.2.2 UE UTRA FDD CPICH measurement capability

When measurement gaps are scheduled for UTRA FDD inter RAT measurements, or the UE supports capability of conducting such measurements without gaps, the UE physical layer shall be capable of reporting measurements to higher layers with measurement accuracy as specified in Clause 10 with measurement period given by

$$T_{Measurement_UTRA_FDD} = Max\left\{T_{Measurement_Period_UTRA_FDD} \times CSSF_{interRAT}, T_{basic_measurement_UTRA_FDD} \times \frac{480}{T_{inter1}} \times CSSF_{interRAT}\right\} m$$

The UE shall be capable of performing UTRA FDD CPICH measurements for $X_{basic\ measurementUTRA_FDD}$ inter-frequency cells per FDD frequency and the UE physical layer shall be capable of reporting measurements to higher layers with the measurement period of $T_{Measurement_\ UTRA_FDD}$.

$X_{basic\ measurement\ UTRA_FDD} = 6$

$T_{Measurement_Period\ UTRA_FDD}$ = 480 ms. The period used for calculating the measurement period $T_{measurement_UTRA_FDD}$ for UTRA FDD CPICH measurements.

$T_{basic_identify_UTRA_FDD}$ = 300 ms. This is the time period used in the inter-RAT equation in clause 9.4.6.2.1 where the maximum allowed time for the UE to identify a new UTRA FDD cell is defined.

$T_{basic_measurement_UTRA_FDD}$ = 50 ms. This is the time period used in the equation for defining the measurement period for inter-RAT CPICH measurements.

$CSSF_{interRAT} = CSSF_{within_gap,i}$ is the scaling factor for the measured inter-RAT UTRA carrier *i* which is calculated as specified in clause 9.1.5.2.

$T_{inter1}$ is defined in clause 9.4.1.

#### 9.4.6.2.3 Periodic Reporting

Reported measurements in periodically triggered measurement reports shall meet the requirements in clause 10.

#### 9.4.6.2.4 Event Triggered Reporting

Reported measurements in event triggered measurement reports shall meet the requirements in clause 10.

The UE shall not send any event triggered measurement reports, as long as the reporting criteria is not fulfilled.

The measurement reporting delay is defined as the time between any event that will trigger a measurement report until the UE starts to transmit the measurement report over the Uu interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify,\ UTRA_FDD}$ defined in clause 9.4.6.2.1 for the minimum requirements. When L3 filtering is used an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{identify,\ UTRA_FDD}$ defined in clause 9.4.6.2.1 for the minimum requirements and then triggers the measurement report as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{measurement_UTRA_FDD}$ defined in clause 9.4.6.2.2 provided the timing to that cell has not changed more than ± 32 chips while measurement gap has not been available and the L3 filter has not been used. When L3 filtering is used, an additional delay can be expected.

#### 9.4.6.2.5 Event-triggered Periodic Reporting

Reported measurements contained in event triggered periodic measurement reports shall meet the requirements in clause 10.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.4.6.2.4 Event Triggered Reporting.

### 9.4.6.3 Requirements when DRX is used

When explicit neighbour list is provided and DRX is used, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps, the UE shall be able to identify a new detectable cell belonging to the neighbour cell list within $T_{identify,UTRA_FDD}$ as shown in table 9.4.6.3-1

**Table 9.4.6.3-1: Requirement to identify a newly detectable UTRA FDD cell**

| DRX cycle length (s) | $T_{identify,UTRA_FDD}$ (s) (DRX cycles) | |
|---|---|---|
| | Gap period = 40 ms | Gap period = 80 ms |

| | | |
|---|---|---|
| ≤ 0.04 | Non DRX Requirements in clause 9.4.6.2 are applicable | Non DRX Requirements in clause 9.4.6.2 are applicable |
| 0.064 | 2.56 *$CSSF_{interRAT}$ (40*$CSSF_{interRAT}$) | 4.8 *$CSSF_{interRAT}$ (75 *$CSSF_{interRAT}$) |
| 0.08 | 3.2 *$CSSF_{interRAT}$ (40 *$CSSF_{interRAT}$) | 4.8 *$CSSF_{interRAT}$ (60* $CSSF_{interRAT}$) |
| 0.128 | 3.2 *$CSSF_{interRAT}$ (25* $CSSF_{interRAT}$) | 4.8 *$CSSF_{interRAT}$ (37.5* $CSSF_{interRAT}$) |
| 0.16 | 3.2 *$CSSF_{interRAT}$ (20 *$CSSF_{interRAT}$) | 4.8 *$CSSF_{interRAT}$ (30 *$CSSF_{interRAT}$) |
| 0.16 < DRX-cycle ≤ 2.56 | Note1 (20 *$CSSF_{interRAT}$) | Note1 (20 *$CSSF_{interRAT}$) |
| NOTE 1: Time depends upon the DRX cycle in use.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.2.2. | | |

A cell shall be considered detectable provided following conditions are fulfilled: A cell shall be considered detectable when

- CPICH Ec/Io $\geq$ -20 dB,
- SCH_Ec/Io $\geq$ -17 dB for at least one channel tap and SCH_Ec/Ior is equally divided between primary synchronisation code and secondary synchronisation code. When L3 filtering is used an additional delay can be expected.

The UE shall be capable of performing RSCP and Ec/Io measurements of at least 6 UTRA cells per UTRA FDD carrier for up to 3 UTRA FDD carriers and the UE physical layer shall be capable of reporting RSCP and Ec/Io measurements to higher layers with the measurement period defined in table 9.4.6.3-2 when DRX is used, either measurement gaps are scheduled or the UE supports capability of conducting such measurements without gaps.

**Table 9.4.6.3-2: Requirement to measure UTRA FDD cells**

| DRX cycle length (s) | $T_{measurement_UTRA_FDD}$ (s) (DRX cycles) | |
|---|---|---|
| | **Gap period = 40 ms** | **Gap period = 80 ms** |
| ≤ 0.04 | Non DRX Requirements in clause 9.4.6.2 are applicable | Non DRX Requirements in clause 9.4.6.2 are applicable |
| 0.064 | 0.48* $CSSF_{interRAT}$ (7.5* $N_{freq}$*$CSSF_{interRAT}$) | 0.8 *$CSSF_{interRAT}$ (12.5 *$CSSF_{interRAT}$) |
| 0.08 | 0.48 *$CSSF_{interRAT}$ (6 *$CSSF_{interRAT}$) | 0. 8*$CSSF_{interRAT}$ (10 *$CSSF_{interRAT}$) |
| 0.128 | 0.64 *$CSSF_{interRAT}$ (5 *$CSSF_{interRAT}$) | 0. 8 *$CSSF_{interRAT}$ (6.25 *$CSSF_{interRAT}$) |
| 0.128 < DRX-cycle ≤ 2.56 | Note1 (5 *$CSSF_{interRAT}$) | Note1 (5 *$CSSF_{interRAT}$) |
| NOTE 1: Time depends upon the DRX cycle in use.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.2.2. | | |

The measurement accuracy for all measured cells shall be as specified in the clause 10.3.

#### 9.4.6.3.1 Periodic Reporting

Reported measurements in periodically triggered measurement reports shall meet the requirements in clause 10.

#### 9.4.6.3.2 Event Triggered Reporting

Reported measurements in event triggered measurement reports shall meet the requirements in clause 10.

The UE shall not send any event triggered measurement reports, as long as the reporting criteria is not fulfilled.

The measurement reporting delay is defined as the time between any event that will trigger a measurement report until the UE starts to transmit the measurement report over the Uu interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is twice the TTI of the uplink DCCH. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{identify,UTRA_FDD}$ defined in clause 9.4.6.3. When L3 filtering is used an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{identify, UTRA_FDD}$ defined in clause 9.4.6.3 and then triggers the measurement report as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{measurement_UTRA_FDD}$ defined in clause 9.4.6.3 provided the timing to that cell has not changed more than ± 32 chips while measurement gap has not been available and the L3 filter has not been used. When L3 filtering is used, an additional delay can be expected.

#### 9.4.6.3.3 Event-triggered Periodic Reporting

Reported measurements contained in event triggered periodic measurement reports shall meet the requirements in clause 10.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.4.6.3.2 Event Triggered Reporting.

## 9.4.7 NR – E-UTRAN measurements with autonomous gaps

### 9.4.7.1 CGI identification of an E-UTRA cell with autonomous gaps

The requirements in this clause apply when the UE is configured with standalone NR, NE-DC or NR-DC. The UE shall identify and report the CGI when requested by an NR PCell for the purpose 'reportCGI'. The UE may make autonomous gaps in downlink reception and uplink transmission for receiving MIB and SIB1 message according to clause 5.5.3.1 in TS 38.331 [2]. If autonomous gaps are used for measurement with the purpose of 'reportCGI', regardless of whether DRX is used or not, or regardless of whether SCell(s) are configured or not, the UE shall be able to identify a new CGI of E-UTRA cell within $T_{identify_CGI, E\text{-}UTRAN}$ = 150 ms. This is the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell, provided that the E-UTRA cell has been already identified by the UE.

A cell shall be considered identifiable following conditions are fulfilled:

- RSRP related side conditions given in clause 9.1 in [15] are fulfilled for a corresponding band,
- SCH_RP and SCH Ês/Iot according to Annex B.2.2 in [15] for a corresponding band

The MIB of an E-UTRA cell whose CGI is identified shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to [25].

The requirement for identifying a new CGI of an E-UTRA cell within $T_{identify_CGI, E\text{-}UTRAN}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

### 9.4.7.2 CGI reporting delay

The E-UTRA CGI reporting delay is defined as the time between a command that will trigger an E-UTRA CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of 2 x $TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI, E\text{-}UTRAN}$ plus RRC procedure delay defined in clause 12 in TS 38.331 [2], and an additional 30 ms margin.

## 9.4.8 NR – E-UTRAN measurements without measurement gaps

### 9.4.8.1 Introduction

The requirements in this clause are specified for NR−E-UTRAN FDD and NR−E-UTRAN TDD measurements and are applicable without an explicit E-UTRAN neighbour cell list containing physical layer cell identities, for a UE:

- in RRC_CONNECTED state, and configured with SA with NR−E-UTRAN FDD or TDD measurement (RSRP, RSRQ, RS-SINR, RSTD, or E-CID RSRP and RSRQ) on E-UTRA frequency carrier

The inter-RAT E-UTRA measurement requirements in this clause are applicable provided

- UE supports eutra-NeedForGapNCSG-reporting-r17 and indicates '*nogap-noncsg*' in the E-UTRA band in *NeedForGapNCSG-InfoEUTRA* for inter-RAT E-UTRA measurement, and UE supports 32-4, or

- UE supports [case b-2].

### 9.4.8.2 General requirements

If an NR – E-UTRAN measurement does not cause scheduling restriction as defined in clause 9.4.8.3.5 or 9.4.8.4.5, the measurement is performed outside measurement gaps.

If an NR – E-UTRAN measurement causes scheduling restriction as defined in clause 9.4.8.3.5 or 9.4.8.4.5, the measurement is performed within measurement gaps if one of the following conditions is met, and the requirements in clause 9.4.2 or 9.4.3 apply.

- EMW is configured and fully overlapped with measurement gap, and the periodicity of measurement gap and EMW is same, or

- EMW is not configured.

Otherwise, the measurement is performed within EMW occasions and requirements in clause 9.4.8 apply.

When UE is configured with EMW and measurement gap, EMW and measurement gap occasions are considered colliding if the two occasions are fully or partially overlapping in time domain.

When UE is configured with EMW and SMTC or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement, EMW and SMTC or SSB/CSI-RS occasions are considered colliding if the two occasions are fully or partially overlapping in time domain, provided that inter-RAT measurement during EMW would cause scheduling restriction.

In case of collision between EMW and measurement gap and EMW periodicity is smaller than MGRP, scheduling restriction specified in clause 9.4.8.2 does not apply in the EMW occasions colliding with measurement gap.

In case of collision between EMW and SMTC or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement, scheduling restriction specified in clause 9.4.8.2 does not apply in the EMW occasions colliding with SMTC or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement.

Parameter $T_{Inter1}$ used in inter-RAT requirements in clause 9.4.8 is [60]ms if the measurement is performed outside measurement gaps without EMW configuration. If the measurement is performed with EMW configuration, $T_{Inter1}$ is defined at table 9.4.8.2-1.

**Table 9.4.8.2-1: The effective measurement window**

| Configuration | [Effective measurement window periodicity] [ms] | [Effective measurement window duration] [ms] | $T_{inter1}$ |
|---|---|---|---|
| 0 | 40 | 5 | [60] |
| 1 | 80 | 5 | [30] |
| 2 | 40 | 2 | [60] |
| 3 | 80 | 2 | [30] |
| 4 | 40 | 5.5 | [60] |
| 5 | 80 | 5.5 | [30] |

### 9.4.8.3 NR − E-UTRAN FDD measurements

#### 9.4.8.3.1 Introduction

The requirements are applicable for NR−E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN FDD cell is considered to be detectable when:

- RSRP related conditions in the accuracy requirements in clause 10.2.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],

- RSRQ related conditions in the accuracy requirements in clause 10.2.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],

- RS-SINR related conditions in the accuracy requirements in clause 10.2.5 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [15].

#### 9.4.8.3.2 Requirements when no DRX is used

The UE shall be able to identify a new detectable FDD cell within $T_{Identify,\ E\text{-}UTRAN\ FDD}$ according to the following expression:

$$T_{\mathrm{Identify,E-UTRAN\ FDD}} = T_{\mathrm{BasicIdentify}} \cdot \frac{[480]}{T_{\mathrm{Inter1}}} \cdot \mathrm{CSSF}_{\mathrm{interRAT}} \cdot K_{\mathrm{P}} \quad ms,$$

where:

$T_{BasicIdentify}$ = [480 ms],

$T_{Inter1}$ is defined in clause 9.4.8.1,

$CSSF_{interRAT}$ = [$CSSF_{outside_gap,i}$ in clause 9.1.5.1].

- [$K_p$ is the scaling factor due to overlapping between EMW and SMTC, measurement gap, or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement. $K_p$ =1 if the measurement is performed outside EMW or if EMW is fully non-overlapped with SMTC, SSB/CSI-RS configured for RLM, BFD, CBD or L1-RSRP measurement and measurement gap. Otherwise, $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

  - For a window W of duration max(EMW period, SMTC period, MGRP, $T_{SSB}$, $T_{CSI\text{-}RS}$), where SMTC period follows *smtc1* if high layer in TS 38.331 [2] signaling of *smtc2* is not present on the same carrier frequency. Otherwise, SMTC period follows *smtc2*, $T_{SSB}$/$T_{CSI\text{-}RS}$ is the periodicity of SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement on the same carrier frequency, and starting from the beginning of any SMTC occasion.

  - $N_{total}$ is the total number of EMW occasions within the window W, including those overlapped with SMTC, measurement gap, or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement, and

  - $N_{available}$ is the number of EMW occasions that are not overlapped with any SMTC, measurement gap, or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement within the window W, after accounting for EMW collisions by applying the EMW collision rule in clause 9.4.8.2.

  - No requirement applies for the measurement when $N_{available}$ = 0.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of $T_{measure,\ E\text{-}UTRAN\ FDD}$ defined in table 9.4.8.3.2-1.

**Table 9.4.8.3.2-1: Measurement period and measurement bandwidth configuration**

| Configuration | Physical Layer Measurement period: $T_{measure,\ E\text{-}UTRAN\ FDD}$ [ms] | Measurement bandwidth [RB] |
|---|---|---|
| 0 | 480 x $CSSF_{interRAT}$ x $K_p$ | 6 |
| 1 (Note 1) | 240 x $CSSF_{interRAT}$ x $K_p$ | 50 |
| NOTE 1: This configuration is optional. | | |

The UE physical layer shall be capable of reporting RSRP, RSRQ, and RS-SINR measurements to higher layers with measurement period $T_{measure,\ E\text{-}UTRAN\ FDD}$ given by table 9.4.8.3.2-1.

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.
The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.
The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

#### 9.4.8.3.3 Requirements when DRX is used

When DRX is in use the UE shall be able to identify a new detectable E-UTRAN FDD cell within $T_{Identify,\ E\text{-}UTRAN\ FDD}$ specified in table 9.4.8.3.3-1.

**Table 9.4.8.3.3-1: Requirement to identify a newly detectable E-UTRAN FDD cell**

| DRX cycle length (s) | $T_{Identify,\ E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) | |
|---|---|---|
| | EMW period = 40 ms, or the measurement is performed without EMW | EMW period = 80 ms |
| ≤ 0.16 | Non-DRX requirements in clause 9.4.8.3.2 apply | Non-DRX requirements in clause 9.4.8.3.2 apply |
| 0.256 | $5.12*CSSF_{interRAT}*K_p$ ($20*CSSF_{interRAT}*K_p$) | $7.68*CSSF_{interRAT}*K_p$ ($30*CSSF_{interRAT}*K_p$) |
| 0.32 | $6.4*CSSF_{interRAT}*K_p$ ($20*CSSF_{interRAT}*K_p$) | $7.68*CSSF_{interRAT}*K_p$ ($24*CSSF_{interRAT}*K_p$) |
| 0.32 < DRX-cycle ≤ 10.24 | Note1 ($20*CSSF_{interRAT}*K_p$) | Note1 ($20*CSSF_{interRAT}*K_p$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.8.3.2.<br>NOTE 3: $K_p$ is as defined in clause 9.4.8.3.2.<br>NOTE 4: Void | | |

When DRX is in use, the UE shall be capable of performing NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN FDD cells per E-UTRA FDD frequency layer during each layer 1 measurement period, for up to 7 E-UTRA FDD carrier frequency layers, and the UE physical layer shall be capable of reporting NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements to higher layers with the measurement period $T_{measure,\ E\text{-}UTRAN\ FDD}$ specified in table 9.4.8.3.3-2.

**Table 9.4.8.3.3-2: Requirement to measure E-UTRAN FDD cells**

| DRX cycle length (s) | $T_{measure,\ E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) |
|---|---|
| ≤ 0.08 | [Non-DRX requirements in clause 9.4.8.3.2 apply] |
| 0.08 < DRX-cycle ≤ 10.24 | Note1 ($5*CSSF_{interRAT}*K_p$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.8.3.2. | |

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.
The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.
The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

#### 9.4.8.3.4 Measurement reporting requirements

##### 9.4.8.3.4.1 Periodic Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

##### 9.4.8.3.4.2 Event-Triggered Periodic Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The first report in event-triggered periodic measurement reporting shall meet the requirements specified in clause 9.4.8.3.4.3.

##### 9.4.8.3.4.3 Event-Triggered Reporting

The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{Identify, E-UTRAN FDD}$ defined in clauses 9.4.8.3.2 and 9.4.8.3.3 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{Identify, E-UTRAN FDD}$ becomes undetectable for a period ≤ 5 seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{Measure, E-UTRAN FDD}$ provided the timing to that cell has not changed more than ± 50 Ts while measurement gap or NCSG has not been available and the L3 filter has not been used.

#### 9.4.8.3.5 Scheduling availability during NR − E-UTRAN FDD measurements

When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction.

##### 9.4.8.3.5.1 Scheduling availability of UE performing inter-RAT measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

When UE performs inter-RAT measurement outside MG and the E-UTRA carrier is fully or partially overlapping with the DL active BWP of the serving cell, for UE which do not support [*FG32-7]* [14] the following restrictions apply due to RSRP/RSRQ/SINR measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on [all symbols within EMW duration].

### 9.4.8.4 NR − E-UTRAN TDD measurements

#### 9.4.8.4.1 Introduction

The requirements are applicable for NR−E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN TDD cell is considered to be detectable when:

- RSRP related conditions in the accuracy requirements in clause 10.2.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
- RSRQ related conditions in the accuracy requirements in clause 10.2.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],

  RS-SINR related conditions in the accuracy requirements in clause 10.2.5 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [15].

#### 9.4.8.4.2 Requirements when no DRX is used

The UE shall be able to identify a new detectable TDD cell within $T_{Identify, E-UTRAN TDD}$ according to the following expression:

- When configuration 0 or configuration 1 in table 9.4.8.4.2-1 is applied,

$$T_{\text{Identify,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{[480]}{T_{\text{Inter1}}} \cdot CSSF_{\text{interRAT}} \cdot K_{\text{P}} \quad ms,$$

- When configuration 2 or configuration 3 in table 9.4.8.4.2-1 is applied,

$$T_{\text{Identify,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{[480]}{T_{\text{Inter1}}} \cdot CSSF_{\text{interRAT}} \cdot K_{\text{P}} + 240 \cdot \text{CSSF}_{\text{interRAT}} \cdot K_{\text{P}} \quad ms,$$

where:

$T_{BasicIdentify}$ = [480 ms],

$T_{Inter1}$ is defined in clause 9.4.8.1,

$CSSF_{interRAT}$ = [$CSSF_{outside_gap,i}$ in clause 9.1.5.1].

$K_p$ is the scaling factor due to overlapping between EMW and SMTC, measurement gap, or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement. $K_p$ =1 if the measurement is performed outside EMW or if EMW is fully non-overlapped with SMTC, SSB/CSI-RS configured for RLM, BFD, CBD or L1-RSRP measurement and measurement gap. Otherwise, $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

- For a window W of duration max(EMW period, SMTC period, MGRP, $T_{SSB}$, $T_{CSI-RS}$), where SMTC period follows *smtc1* if high layer in TS 38.331 [2] signaling of *smtc2* is not present on the same carrier frequency. Otherwise, SMTC period follows *smtc2*, $T_{SSB}/T_{CSI-RS}$ is the periodicity of SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement on the same carrier frequency, and starting from the beginning of any SMTC occasion

- $N_{total}$ is the total number of EMW occasions within the window, including those overlapped with SMTC, measurement gap, or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement, and

- $N_{available}$ is the number of EMW occasions that are not overlapped with any SMTC, measurement gap, or SSB/CSI-RS configured for RLM/BFD/CBD/L1-RSRP measurement within the window W, after accounting for EMW collisions by applying the EMW collision rule in clause 9.4.8.2.

- No requirement applies for the measurement when $N_{available}$ = 0.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of $T_{Measure, E\text{-}UTRAN\ TDD}$ defined in table 9.4.8.4.2-1.

**Table 9.4.8.4.2-1: $T_{Measure, E\text{-}UTRAN\ TDD}$ for different configurations**

| Configuration | Measurement bandwidth (RB) | Number of UL/DL sub-frames per half frame (5 ms) | | DwPTS | | $T_{Measure, E\text{-}UTRAN\ TDD}$ (ms) |
|---|---|---|---|---|---|---|
| | | DL | UL | Normal CP | Extended CP | |
| 0 | 6 | 2 | 2 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | [480 x $CSSF_{interRAT}$ x $K_p$] |
| 1 (Note 1) | 50 | 2 | 2 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | [240 x $CSSF_{interRAT}$ x $K_p$] |
| 2 | 6 | 1 | 3 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | [720 x $CSSF_{interRAT}$ x $K_p$] |
| 3 (Note 1) | 50 | 1 | 3 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | [480 x $CSSF_{interRAT}$ x $K_p$] |
| NOTE 1: This configuration is optional.<br>NOTE 2: Void | | | | | | |

The UE physical layer shall be capable of reporting RSRP, RSRQ, and RS-SINR measurements to higher layers with measurement period $T_{measure, E\text{-}UTRAN\ TDD}$ given by table 9.4.8.4.2-1.

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.
The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.
The NR – E-UTRAN TDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.8.4.3 Requirements when DRX is used

When DRX is in use the UE shall be able to identify a new detectable E-UTRAN TDD cell within $T_{Identify, E\text{-}UTRAN\ TDD}$ specified in table 9.4.8.4.3-1.

**Table 9.4.8.4.3-1: Requirement to identify a newly detectable E-UTRAN TDD cell**

| DRX cycle length (s) | $T_{identify,\ E\text{-}UTRAN\ TDD}$ (s) (DRX cycles) | |
|---|---|---|
| | EMW period = 40 ms, or the measurement is performed without EMW | EMW period = 80 ms |
| ≤ 0.16 | Non-DRX requirements in clause 9.4.8.4.2 apply | Non-DRX requirements in clause 9.4.8.4.2 apply |
| 0.256 | [5.12* $CSSF_{interRAT}$*$K_p$ (20*$CSSF_{interRAT}$*$K_p$)] | [7.68* $CSSF_{interRAT}$*$K_p$ (30*$CSSF_{interRAT}$*$K_p$)] |
| 0.32 | [6.4* $CSSF_{interRAT}$*$K_p$ (20*$CSSF_{interRAT}$*$K_p$)] | [7.68* $CSSF_{interRAT}$*$K_p$ (24*$CSSF_{interRAT}$*$K_p$)] |
| 0.32 < DRX-cycle ≤ 10.24 | Note1 (20*$CSSF_{interRAT}$*$K_p$) | Note1 (20*$CSSF_{interRAT}$*$K_p$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.8.4.2.<br>NOTE 3: $K_p$ is as defined in clause 9.4.8.4.2.<br>NOTE 4: Void | | |

**Table 9.4.8.4.3-2: Void**

When DRX is in use, the UE shall be capable of performing NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN TDD cells per E-UTRA TDD frequency layer during each layer 1 measurement period, for up to 7 E-UTRA TDD carrier frequency layers, and the UE physical layer shall be capable of reporting NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements to higher layers with the measurement period $T_{measure,\ E\text{-}UTRAN\ TDD}$ specified in table 9.4.8.4.3-3.

**Table 9.4.8.4.3-3: Requirement to measure E-UTRAN TDD cells**

| DRX cycle length (s) | $T_{measure,\ E\text{-}UTRAN\ TDD}$ (s) (DRX cycles) |
|---|---|
| ≤ 0.08 | [Non-DRX Requirements in clause 9.4.8.4.2 apply] |
| 0.128 | [For configuration 2 Note3, non-DRX requirements in clause 9.4.8.4.2 apply,] Otherwise: Note1 (5*$CSSF_{interRAT}$*$K_p$) |
| 0.128 < DRX-cycle ≤ 10.24 | Note1 (5*$CSSF_{interRAT}$*$K_p$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT}$ is as defined in clause 9.4.8.4.2.<br>NOTE 3: See Table 9.4.8.4.2-1. | |

If higher layer filtering is used, an additional cell identification delay can be expected.

The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2.
The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3.
The NR – E-UTRAN TDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

### 9.4.8.4.4 Measurement reporting requirements

#### 9.4.8.4.4.1 Periodic Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

#### 9.4.8.4.4.2 Event-Triggered Periodic Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The first report in event-triggered periodic measurement reporting shall meet the requirements specified in clause 9.4.8.4.4.3.

#### 9.4.8.4.4.3 Event-Triggered Reporting

The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{Identify, E-UTRAN TDD}$ defined in clauses 9.4.8.4.2 and 9.4.8.4.3 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{Identify, E-UTRAN TDD}$ becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{Measure, E-UTRAN TDD}$ provided the timing to that cell has not changed more than $\pm$ 50 Ts while measurement gap or NCSG has not been available and the L3 filter has not been used.

### 9.4.8.4.5 Scheduling availability during NR − E-UTRAN TDD measurements

When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction.

#### 9.4.8.4.5.1 Scheduling availability of UE performing inter-RAT measurements in TDD bands on FR1

When the UE performs inter-RAT measurements in a TDD band outside MG and the E-UTRA carrier is within DL active BWP of the serving cell, the following restrictions apply on the NR serving cell due to RSRP, RS-SINR and RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within EMW duration.

When the UE performs inter-RAT measurement in a TDD band outside MG and the E-UTRA carrier is outside DL active BWP of the serving cell, the following restrictions apply on the NR serving cell due to RSRP/RSRQ/SINR measurement, when the NR serving cell and E-URTA carrier are in a band pair for which UE does not have the capability of supporting *simultaneousRxTxInterBandCA*

- The UE is not expected to transmit PUCCH/PUSCH/SRS on all symbols within EMW duration.

#### 9.4.8.4.5.2 Scheduling availability of UE performing inter-RAT measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

When UE performs inter-RAT measurement outside MG and the E-UTRA carrier is fully or partially overlapping with the DL active BWP of the serving cell, for UE which do not support [*FG32-7]* [14] the following restrictions apply due to RSRP/RSRQ/SINR measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within EMW duration.

# 9.4A Inter-RAT measurements for RedCap

## 9.4A.1 Introduction

The requirements in this clause are specified for NR−E-UTRAN FDD and NR−E-UTRAN TDD measurements and are applicable without an explicit E-UTRAN neighbour cell list containing physical layer cell identities, for a UE:

- in RRC_CONNECTED state, and
- configured
  - with SA operation mode by PCell with NR–E-UTRAN FDD or TDD measurement (RSRP, RSRQ, RS-SINR) on E-UTRA non-serving frequency carrier, and
- configured with an appropriate measurement gap pattern according to table 9.1A.2-1 and table 9.1A.2-2.

Parameter $T_{Inter1_RedCap}$ used in inter-RAT requirements in clause 9.4A is specified in table 9.4A.1-1.

**Table 9.4A.1-1: Minimum available time for inter-RAT measurements**

| Gap Pattern Id | MeasurementGap Length (MGL, ms) | Measurement Gap Repetition Period (MGRP, ms) | Minimum available time for inter-frequency and inter-RAT measurements during 480 ms period ($T_{inter1_RedCap}$, ms) |
|---|---|---|---|
| 0 | 6 | 40 | 60 |
| 1 | 6 | 80 | 30 |
| 2 | 3 | 40 | 24 Note 1 |
| 3 | 3 | 80 | 12 Note 1 |
| 4 | 6 | 20 | 120 Note 1 |
| 6 | 4 | 20 | 72 Note 1,3,6 |
| 7 | 4 | 40 | 36 Note 1,4,6 |
| 8 | 4 | 80 | 18 Note 1,5,6 |
| 10 | 3 | 20 | 48 Note 1 |

NOTE 1: When determining UE requirements using $T_{inter1_RedCap}$ for gap pattern IDs 2, 3, 4, 6, 7, 8, 10, $T_{inter1_RedCap}$ = 60 for gap pattern IDs 2, 4, 6, 7, 10, and $T_{inter1_RedCap}$ = 30 for gap pattern IDs 3 and 8 shall be used.
NOTE 2: Measurement gaps pattern configurations applicability is as specified in Table 9.1A.2-2.
NOTE 3: When this gap pattern is used, the $T_{inter1_RedCap}$ for E-UTRA inter-frequency measurements is 48 ms corresponding to the first 3 ms of the 4 ms gap.
NOTE 4: When this gap pattern is used, the $T_{inter1_RedCap}$ for E-UTRA inter-frequency measurements is 24 ms corresponding to the first 3 ms of the 4 ms gap.
NOTE 5: When this gap pattern is used, the $T_{inter1_RedCap}$ for E-UTRA inter-frequency measurements is 12 ms corresponding to the first 3 ms of the 4 ms gap.
NOTE 6: This gap pattern is applicable for E-UTRA inter-frequency measurements only if gap based NR measurements are also configured.

A UE configured with gap pattern ID 2, 3 or 10 shall be able to detect a target cell, provided that

- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell begins not earlier than 500 μs from the start of the measurement gap, and
- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell ends not later than 500 μs before the end of the measurement gap in case of FDD and not later than 750 μs before the end of measurement gap in case of TDD.

A UE configured with gap pattern ID 6, 7 or 8 shall be able to detect a target cell, provided that

- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell begins not earlier than 500 μs from the start of the measurement gap, and
- the E-UTRA subframe #0 or #5 of the target E-UTRAN cell ends no later than 1500 μs before the end of the measurement gap in case of FDD and no later than 1750 μs before the end of measurement gap in case of TDD.

In this clause, the SSB terminology applies for both CD-SSB and NCD-SSB.

## 9.4A.2 NR − E-UTRAN FDD measurements

### 9.4A.2.1 Introduction

The requirements are applicable for NR−E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN FDD cell is considered to be detectable when:

- For 2 Rx RedCap UE:
  - RSRP related conditions in the accuracy requirements in clause 10.2.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
  - RSRQ related conditions in the accuracy requirements in clause 10.2.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
  - RS-SINR related conditions in the accuracy requirements in clause 10.2.5 are fulfilled for a corresponding band, together with the corresponding side conditions in annex B.2.3 and Annex B.3.19 of TS 36.133 [15].
- For 1 Rx RedCap UE:
  - RSRP related conditions in the accuracy requirements in clause 10.2A.2 are fulfilled for a corresponding band, together with the corresponding side conditions in annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
  - RSRQ related conditions in the accuracy requirements in clause 10.2A.3 are fulfilled for a corresponding band, together with the corresponding side conditions in annex B.2.3 and annex B.3.3 of TS 36.133 [15],

### 9.4A.2.2 Requirements when no DRX is used

When the UE requires measurement gaps to identify and measure inter-RAT cells and an appropriate measurement gap pattern is scheduled, the UE shall be able to identify a new detectable FDD cell within $T_{Identify_RedCap,\ E\text{-}UTRAN\ FDD}$ according to the following expression:

$$T_{\text{Identify_RedCap,E-UTRAN FDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1_RedCap}}} \cdot \text{CSSF}_{\text{interRAT_RedCap}} \quad ms,$$

where:

$T_{BasicIdentify}$ = 480 ms,

$T_{Inter1_RedCap}$ is defined in clause 9.4A.1,

$CSSF_{interRAT_RedCap} = CSSF_{within_gap_RedCap,i}$ is the scaling factor for the measured inter-RAT E-UTRA carrier *i* which is calculated as specified in clause 9.1A.5.2.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of $T_{Measure_RedCap,\ E\text{-}UTRAN\ FDD}$ defined in table 9.4A.2.2-1 and table 9.4A.2.2-2 for 2 Rx RedCap UE and 1 Rx RedCap UE, respectively.

**Table 9.4A.2.2-1: Measurement period and measurement bandwidth for 2Rx RedCap UE**

| Configuration | Physical Layer Measurement period: $T_{Measure_RedCap,\ E\text{-}UTRAN\ FDD}$ [ms] | Measurement bandwidth [RB] |
|---|---|---|
| 0 | 480 x $CSSF_{interRAT_RedCap}$ | 6 |
| 1 (Note 1) | 240 x $CSSF_{interRAT_RedCap}$ | 50 |
| NOTE 1: This configuration is optional. | | |

**Table 9.4A.2.2-2: Measurement period and measurement bandwidth for 1Rx RedCap UE**

| Configuration | Physical Layer Measurement period: $T_{Measure_RedCap,\ E\text{-}UTRAN\ FDD}$ [ms] | Measurement bandwidth [RB] |
|---|---|---|
| 0 | 960 x $CSSF_{interRAT_RedCap}$ | 6 |
| 1 (Note 1) | 480 x $CSSF_{interRAT_RedCap}$ | 50 |
| NOTE 1: This configuration is optional. | | |

The UE shall be capable of identifying and performing NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN FDD cells per E-UTRA FDD carrier frequency layer during each layer 1 measurement period, for up to 7 E-UTRA FDD carrier frequency layers.

If higher layer filtering is used, an additional cell identification delay can be expected.

For 2 Rx RedCap UE:

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2. The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3. The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

For 1 Rx RedCap UE:

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2A.2. The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2A.3.

### 9.4A.2.3 Requirements when DRX is used

When DRX is in use and measurement gaps are configured, the UE shall be able to identify a new detectable E-UTRAN FDD cell within $T_{Identify_RedCap,\ E\text{-}UTRAN\ FDD}$ specified in table 9.4A.2.3-1.

**Table 9.4A.2.3-1: Requirement to identify a newly detectable E-UTRAN FDD cell**

| DRX cycle length (s) | $T_{Identify_RedCap,\ E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) | |
|---|---|---|
| | Gap period = 40 ms, 20 ms | Gap period = 80 ms |
| ≤ 0.16 | Non-DRX requirements in clause 9.4A.2.2 apply | Non-DRX requirements in clause 9.4A.2.2 apply |
| 0.256 | 5.12* $CSSF_{interRAT_RedCap}$ (20*$CSSF_{interRAT_RedCap}$) | 7.68* $CSSF_{interRAT_RedCap}$ (30*$CSSF_{interRAT_RedCap}$) |
| 0.32 | 6.4* $CSSF_{interRAT_RedCap}$ (20*$CSSF_{interRAT_RedCap}$) | 7.68* $CSSF_{interRAT_RedCap}$ (24*$CSSF_{interRAT_RedCap}$) |
| 0.32 < DRX-cycle ≤ 10.24 | Note1 (20*$CSSF_{interRAT_RedCap}$) | Note1 (20*$CSSF_{interRAT_RedCap}$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT_RedCap}$ is as defined in clause 9.4A.2.2. | | |

When DRX is in use, the UE shall be capable of performing NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN FDD cells per E-UTRA FDD frequency layer during each layer 1 measurement period, for up to 7 E-UTRA FDD carrier frequency layers, and the UE physical layer shall be capable of reporting NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements to higher layers with the measurement period $T_{measure_RedCap,\ E\text{-}UTRAN\ FDD}$ specified in table 9.4A.2.3-2 and table 9.4A.2.3-3.

**Table 9.4A.2.3-2: Requirement to measure E-UTRAN FDD cells for 2Rx RedCap UE**

| DRX cycle length (s) | $T_{measure_RedCap,\ E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) |
|---|---|
| ≤ 0.08 | Non-DRX requirements in clause 9.4A.2.2 apply |
| 0.08 < DRX-cycle ≤ 10.24 | Note1 (5* $CSSF_{interRAT_RedCap}$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT_RedCap}$ is as defined in clause 9.4A.2.2. | |

**Table 9.4A.2.3-3: Requirement to measure E-UTRAN FDD cells for 1Rx RedCap UE**

| DRX cycle length (s) | $T_{measure_RedCap,\ E\text{-}UTRAN\ FDD}$ (s) (DRX cycles) |
|---|---|
| ≤0.08 | Non-DRX requirements in clause 9.4A.2.2 apply |
| 0.08 < DRX-cycle ≤ 10.24 | Note1 (10* $CSSF_{interRAT_RedCap}$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT_RedCap}$ is as defined in clause 9.4A.2.2. | |

If higher layer filtering is used, an additional cell identification delay can be expected.

For 2 Rx RedCap UE:

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2. The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3. The NR – E-UTRAN FDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

For 1 Rx RedCap UE:

The NR – E-UTRAN FDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2A.2. The NR – E-UTRAN FDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2A.3.

### 9.4A.2.4 Measurement reporting requirements

#### 9.4A.2.4.1 Periodic Reporting

For 2 Rx RedCap UE: The requirements in clause 9.4.2.4.1 shall apply.

For 1 Rx RedCap UE: The reported NR – E-UTRAN FDD RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2A.2 and 10.2A.3, respectively.

#### 9.4A.2.4.2 Event-Triggered Periodic Reporting

For 2 Rx RedCap UE: The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

For 1 Rx RedCap UE: The reported NR – E-UTRAN FDD RSRP and RSRQ measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2A.2 and 10.2A.3, respectively.

The first report in event-triggered periodic measurement reporting shall meet the requirements specified in clause 9.4A.2.4.3.

#### 9.4A.2.4.3 Event-Triggered Reporting

For 2 Rx RedCap UE: The reported NR – E-UTRAN FDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

For 1 Rx RedCap UE: The reported NR – E-UTRAN FDD RSRP and RSRQ measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2A.2 and 10.2A.3, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{Identify_RedCap,\ E\text{-}UTRAN\ FDD}$ defined in clauses 9.4A.2.2 and 9.4A.2.3 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{Identify_RedCap,\ E\text{-}UTRAN\ FDD}$ becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{Measure_RedCap,\ E\text{-}UTRAN\ FDD}$ provided the timing to that cell has not changed more than ± 50 Ts while measurement gap has not been available and the L3 filter has not been used.

## 9.4A.3 NR − E-UTRAN TDD measurements

### 9.4A.3.1 Introduction

The requirements are applicable for NR−E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements.

In the requirements, an E-UTRAN TDD cell is considered to be detectable when:

- For 2 Rx RedCap UE:
  - RSRP related conditions in the accuracy requirements in clause 10.2.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
  - RSRQ related conditions in the accuracy requirements in clause 10.2.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],

    RS-SINR related conditions in the accuracy requirements in clause 10.2.5 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.19 of TS 36.133 [15].
- For 1 Rx RedCap UE:
  - RSRP related conditions in the accuracy requirements in clause 10.2A.2 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],
  - RSRQ related conditions in the accuracy requirements in clause 10.2A.3 are fulfilled for a corresponding band, together with the corresponding side conditions in Annex B.2.3 and Annex B.3.3 of TS 36.133 [15],

### 9.4A.3.2 Requirements when no DRX is used

When the UE requires measurement gaps to identify and measure inter-RAT cells and an appropriate measurement gap pattern is scheduled, the UE shall be able to identify a new detectable TDD cell within $T_{\text{Identify_RedCap, E-UTRAN TDD}}$ according to the following expression:

- When configuration 0 or configuration 1 in table 9.4A.3.2-1 is applied,

$$T_{\text{Identify_RedCap,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1_RedCap}}} \cdot \text{CSSF}_{\text{interRAT_RedCap}} \quad ms,$$

- When configuration 2 or configuration 3 in table 9.4A.3.2-1 is applied,

$$T_{\text{Identify_RedCap,E-UTRAN TDD}} = T_{\text{BasicIdentify}} \cdot \frac{480}{T_{\text{Inter1_RedCap}}} \cdot \text{CSSF}_{\text{interRAT_RedCap}} + 240 \cdot \text{CSSF}_{\text{interRAT_RedCap}} \quad ms,$$

where:

$T_{\text{BasicIdentify}}$ = 480 ms,

$T_{\text{Inter1_RedCap}}$ is defined in clause 9.4A.1,

$\text{CSSF}_{\text{interRAT_RedCap}} = \text{CSSF}_{\text{within_gap_RedCap,i}}$ is the scaling factor for the measured inter-RAT E-UTRA carrier *i* which is calculated as specified in clause 9.1A.5.2.

Identification of a cell shall include detection of the cell and additionally performing a single measurement with measurement period of $T_{\text{Measure_RedCap, E-UTRAN TDD}}$ defined in table 9.4A.3.2-1 and table 9.4A.3.2-2 for 2 Rx RedCap UE and 1 Rx RedCap UE, respectively.

**Table 9.4A.3.2-1: $T_{\text{Measure_RedCap, E-UTRAN TDD}}$ for different configurations for 2Rx RedCap UE**

| Configuration | Measurement bandwidth (RB) | Number of UL/DL sub-frames per half frame (5 ms) | | DwPTS | | $T_{\text{Measure_RedCap, E-UTRAN TDD}}$ (ms) |
|---|---|---|---|---|---|---|
| | | DL | UL | Normal CP | Extended CP | |
| 0 | 6 | 2 | 2 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 480 x $\text{CSSF}_{\text{interRAT_RedCap}}$ |
| 1 (Note 1) | 50 | 2 | 2 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 240 x $\text{CSSF}_{\text{interRAT_RedCap}}$ |
| 2 | 6 | 1 | 3 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 720 x $\text{CSSF}_{\text{interRAT_RedCap}}$ |
| 3 (Note 1) | 50 | 1 | 3 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 480 x $\text{CSSF}_{\text{interRAT_RedCap}}$ |

NOTE 1: This configuration is optional.

**Table 9.4A.3.2-2: $T_{Measure_RedCap,\ E\text{-}UTRAN\ TDD}$ for different configurations for 1Rx RedCap UE**

| Configuration | Measurement bandwidth (RB) | Number of UL/DL sub-frames per half frame (5 ms) | | DwPTS | | $T_{Measure_RedCap,\ E\text{-}UTRAN\ TDD}$ (ms) |
|---|---|---|---|---|---|---|
| | | DL | UL | Normal CP | Extended CP | |
| 0 | 6 | 2 | 2 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 960 x $CSSF_{interRAT_RedCap}$ |
| 1 (Note 1) | 50 | 2 | 2 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 480 x $CSSF_{interRAT_RedCap}$ |
| 2 | 6 | 1 | 3 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 1440 x $CSSF_{interRAT_RedCap}$ |
| 3 (Note 1) | 50 | 1 | 3 | $19760 \cdot T_s$ | $20480 \cdot T_s$ | 960 x $CSSF_{interRAT_RedCap}$ |
| NOTE 1: This configuration is optional. | | | | | | |

The UE shall be capable of identifying and performing NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN TDD cells per E-UTRA TDD carrier frequency layer during each layer 1 measurement period, for up to 7 E-UTRA TDD carrier frequency layers.

If higher layer filtering is used, an additional cell identification delay can be expected.

For 2 Rx RedCap UE:

- The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2. The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3. The NR – E-UTRAN TDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

For 1 Rx RedCap UE:

- The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2A.2. The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2A.3.

### 9.4A.3.3 Requirements when DRX is used

When DRX is in use and measurement gaps are configured, the UE shall be able to identify a new detectable E-UTRAN TDD cell within $T_{Identify_RedCap,\ E\text{-}UTRAN\ TDD}$ specified in table 9.4A.3.3-1.

**Table 9.4A.3.3-1: Requirement to identify a newly detectable E-UTRAN TDD cell**

| DRX cycle length (s) | $T_{Identify_RedCap,\ E\text{-}UTRAN\ TDD}$ (s) (DRX cycles) | |
|---|---|---|
| | Gap period = 40 ms, 20 ms | Gap period = 80 ms |
| ≤ 0.16 | Non-DRX requirements in clause 9.4A.3.2 apply | Non-DRX requirements in clause 9.4A.3.2 apply |
| 0.256 | 5.12* $CSSF_{interRAT_RedCap}$ (20*$CSSF_{interRAT_RedCap}$) | 7.68* $CSSF_{interRAT_RedCap}$ (30*$CSSF_{interRAT_RedCap}$) |
| 0.32 | 6.4* $CSSF_{interRAT_RedCap}$ (20*$CSSF_{interRAT_RedCap}$) | 7.68* $CSSF_{interRAT_RedCap}$ (24*$CSSF_{interRAT_RedCap}$) |
| 0.32 < DRX-cycle ≤ 10.24 | Note1 (20*$CSSF_{interRAT_RedCap}$) | Note1 (20*$CSSF_{interRAT_RedCap}$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT_RedCap}$ is as defined in clause 9.4A.3.2. | | |

When DRX is in use, the UE shall be capable of performing NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements of at least 4 identified E-UTRAN TDD cells per E-UTRA TDD frequency layer during each layer 1 measurement period, for up to 7 E-UTRA TDD carrier frequency layers, and the UE physical layer shall be capable of reporting NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements to higher layers with the measurement period $T_{measure_RedCap,\ E\text{-}UTRAN\ TDD}$ specified in table 9.4A.3.3-2 and table 9.4A.3.3-3 for 2 Rx RedCap UE and 1 Rx RedCap UE, respectively.

**Table 9.4A.3.3-2: Requirement to measure E-UTRAN TDD cells for 2Rx RedCap UE**

| DRX cycle length (s) | $T_{measure_RedCap,\ E\text{-}UTRAN\ TDD}$ (s) (DRX cycles) |
|---|---|
| ≤ 0.08 | Non-DRX Requirements in clause 9.4A.3.2 apply |
| 0.128 | For configuration 2 Note3, non-DRX requirements in clause 9.4A.3.2 apply,<br>Otherwise: Note1 ($5*CSSF_{interRAT_RedCap}$) |
| 0.128 < DRX-cycle ≤ 10.24 | Note1 ($5*CSSF_{interRAT_RedCap}$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT_RedCap}$ is as defined in clause 9.4A.3.2.<br>NOTE 3: See Table 9.4A.3.2-1. | |

**Table 9.4A.3.3-3: Requirement to measure E-UTRAN TDD cells for 1Rx RedCap UE**

| DRX cycle length (s) | $T_{measure_RedCap,\ E\text{-}UTRAN\ TDD}$ (s) (DRX cycles) |
|---|---|
| ≤ 0.08 | Non-DRX Requirements in clause [9.4A.3.2] apply |
| 0.128 | For configuration 2 Note3, non-DRX requirements in clause [9.4A.3.2] apply,<br>Otherwise: Note1 ($5*CSSF_{interRAT_RedCap}$) |
| 0.128 < DRX-cycle ≤ 10.24 | Note1 ($10*CSSF_{interRAT_RedCap}$) |
| NOTE 1: The time depends on the DRX cycle length.<br>NOTE 2: $CSSF_{interRAT_RedCap}$ is as defined in clause 9.4A.3.2.<br>NOTE 3: See Table 9.4A.3.2-2. | |

If higher layer filtering is used, an additional cell identification delay can be expected.

For 2 Rx RedCap UE:

- The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2.2. The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2.3. The NR – E-UTRAN TDD RS-SINR measurement accuracy for all measured cells shall be as specified in clause 10.2.5.

For 1 Rx RedCap UE:

- The NR – E-UTRAN TDD RSRP measurement accuracy for all measured cells shall be as specified in clause 10.2A.2. The NR – E-UTRAN TDD RSRQ measurement accuracy for all measured cells shall be as specified in clause 10.2A.3.

## 9.4A.3.4 Measurement reporting requirements

### 9.4A.3.4.1 Periodic Reporting

For 2 Rx RedCap UE: The requirements in clause 9.4.3.4.1 shall apply.

For 1 Rx RedCap UE: The reported NR – E-UTRAN TDD RSRP and RSRQ measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.2A.2 and 10.2A.3, respectively.

### 9.4A.3.4.2 Event-Triggered Periodic Reporting

For 2 Rx RedCap UE: The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

For 1 Rx RedCap UE: The reported NR – E-UTRAN TDD RSRP and RSRQ measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.2A.2 and 10.2A.3, respectively.

The first report in event-triggered periodic measurement reporting shall meet the requirements specified in clause 9.4A.3.4.3.

#### 9.4A.3.4.3 Event-Triggered Reporting

For 2 Rx RedCap UE: The reported NR – E-UTRAN TDD RSRP, RSRQ, and RS-SINR measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2.2, 10.2.3, and 10.2.5, respectively.

For 1 Rx RedCap UE: The reported NR – E-UTRAN TDD RSRP and RSRQ measurements contained in event-triggered measurement reports shall meet the requirements in clauses 10.2A.2 and 10.2A.3, respectively.

The UE shall not send any event-triggered measurement reports as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than $T_{Identify_RedCap,\ E\text{-}UTRAN\ TDD}$ defined in clauses 9.4A.3.2 and 9.4A.3.3 without DRX and with DRX, respectively. When L3 filtering is used, an additional delay can be expected.

If a cell which has been detectable at least for the time period $T_{Identify_RedCap,\ E\text{-}UTRAN\ TDD}$ becomes undetectable for a period $\leq 5$ seconds and then the cell becomes detectable again and triggers an event as per TS 38.331 [2], the event triggered measurement reporting delay shall be less than $T_{Measure_RedCap,\ E\text{-}UTRAN\ TDD}$ provided the timing to that cell has not changed more than ± 50 Ts while measurement gap has not been available and the L3 filter has not been used.

## 9.4A.4 NR – E-UTRAN measurements with autonomous gaps

### 9.4A.4.1 CGI identification of an E-UTRA cell with autonomous gaps

The requirements in this clause apply when the 1Rx RedCap UE or 2Rx RedCap UE is configured with standalone NR. The UE shall identify and report the CGI when requested by an NR PCell for the purpose '*reportCGI*'. The UE may make autonomous gaps in downlink reception and uplink transmission for receiving MIB and SIB1 message according to clause 5.5.3.1 in TS 38.331 [2].

For 2Rx RedCap UE: If autonomous gaps are used for measurement with the purpose of 'reportCGI', the UE shall be able to identify a new CGI of E-UTRA cell within $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ = 150 ms.

For 1Rx RedCap UE: If autonomous gaps are used for measurement with the purpose of 'reportCGI', the UE shall be able to identify a new CGI of E-UTRA cell within $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ = 190 ms.

This is the maximum allowed time for the UE to identify a new CGI of an E-UTRA cell, provided that the E-UTRA cell has been already identified by the UE.

A cell shall be considered identifiable following conditions are fulfilled:

- RSRP related side conditions given in Clause 9.1 in [15] are fulfilled for a corresponding band,
- SCH_RP and SCH Ês/Iot according to Annex B.2.2 in [15] for a corresponding band

The MIB of an E-UTRA cell whose CGI is identified shall be considered decodable by the UE provided the PBCH demodulation requirements are met according to [25].

The requirement for identifying a new CGI of an E-UTRA cell within $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

### 9.4A.4.2 CGI reporting delay

The E-UTRA CGI reporting delay is defined as the time between a command that will trigger an E-UTRA CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of 2 x $TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$ plus RRC procedure delay defined in clause 12 in TS 38.331 [2], and an additional 30 ms margin.

### 9.4A.4.3 CGI reporting scheduling restriction

When a UE is identifying CGI of an E-UTRA FDD cell or E-UTRA TDD cell with autonomous gaps, within time period $T_{identify_CGI_RedCap,\ E\text{-}UTRA}$ specified in clause 9.4A.4.1, the UE shall be able to transmit at least the number of ACK/NACKs specified in table 9.4A.4.3-1 on PCell in the frequency range where autonomous gaps are used, provided that:

- there is continuous DL data allocation,
- no DRX cycle is used,
- no measurement gaps are configured,
- only one code word is transmitted in each slot,
- 2 slot ACK/NACK feedback is configured,
- 20 ms SMTC period is configured.

**Table 9.4A.4.3-1: Minimum number of ACK/NACKs transmitted by the UE during $T_{identify_CGI_RedCap,\ E\text{-}UTRAN}$**

| Minimum number of transmitted ACK/NACKs | SCS | |
|---|---|---|
| | Duplex mode configuration | SCS |
| 84 | FDD | 15 kHz |
| 193 | FDD | 30 kHz |
| 402 | FDD | 60 kHz |
| 28 | TDD Note 1 | 15 kHz |
| 81 | TDD Note 1 | 30 kHz |
| 159 | TDD Note 1 | 60 kHz |
| 233 | TDD Note 2 | 60 kHz |
| 491 | TDD Note 2 | 120 kHz |
| NOTE 1: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-1 [18].<br>NOTE 2: TDD UL-DL configuration is as specified in Table A.3.3.1-1 of TS 38.101-2 [19]. | | |

## 9.5 L1-RSRP measurements for Reporting

### 9.5.1 Introduction

When configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP. The measurements shall be performed for a serving cell, including PCell, PSCell, or SCell, on the resources configured for L1-RSRP measurements within the active BWP. For UE supporting *bwpOperationMeasWithoutInterrupt-r18*, the UE shall additionally be able to perform L1-RSRP measurements for a serving cell, including PCell, PSCell, or SCell, on the configured SSB resources for L1-RSRP outside the active BWP, provided that the SSB is within the configured UE-specific CBW.

For UE supporting *ncd-SSB-BWP-Wor-r18*, the SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not explicitly specified otherwise. If SSB in the active DL BWP of serving cell *i* is NCD-SSB, for serving cell *i* the requirements in clause 9.5 apply provided that serving cell *i* is PCell or activated PSCell.

The UE shall be able to measure all CSI-RS resources and/or SSB resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet* within the *CSI-ResourceConfig* settings configured for L1-RSRP for the active BWP, provided that the number of resources, including the number of SSB resources of the cell with PCI different from serving cell configured for L1-RSRP measurements in clause 9.13, does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*. If the UE supports *bwpOperationMeasWithoutInterrupt-r18*, UE shall be able to measure the SSB reources of *csi-SSB-ResourceSet* within the *CSI-ResourceConfig* configured outside active BWP, provided that the SSB is within the configured UE-specific CBW.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

For UE supporting *On-demand SSB operation* and when OD-SSB transmission is indicated, the UE shall be able to perform L1-RSRP measurements of configured SSB resources, provided the following conditions are met:

- an OD-SSB transmission in a configured DL BWP without first SSB transmission, or

- an OD-SSB transmission in a configured DL BWP with a first SSB transmission which cannot be used to obtain SIB1 have the following relations:

  - are with the same Cell ID, and

  - are in the same frequency location, and

  - are with same sub-carrier spacing, and

  - are with the same downlink transmit power, and

  - are quasi co-located with respect to Doppler shift, Doppler spread, average gain, average delay, delay spread and, when applicable, spatial RX parameters, when they have a same SSB index.

## 9.5.2 Requirements applicability

The requirements in clause 9.5 apply, provided:

- The CSI-RS or SSB or CSI-RS and SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.1.19.1 and 10.1.20.1 for FR1 and FR2, respectively, for a corresponding band,

- SSB_RP and SSB Ês/Iot according to Annex B.2.4.1 for a corresponding band.

A CSI-RS resource configured for L1-RSRP shall be considered measurable when for each relevant CSI-RS the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.1.19.2 and 10.1.20.2 for FR1 and FR2, respectively, for a corresponding band,

- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.4.2 for a corresponding band.

A CSI-RS and SSB resource configured for L1-RSRP shall be considered measurable when the measurable resource conditions are met for both CSI-RS resource and SSB resource.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

In case the SSB resources configured for L1-RSRP measurements outside SMTCs are overlapped with the PDSCH/PDCCH that is associated to a PCI different from serving cell, L1-RSRP measurement performance degradation is expected.

If *groupBasedBeamReporting-r17* is configured, the requirements in clause 9.5 apply when all SSB resources of *csi-SSB-ResourceSet* or CSI-RS resources of *NZP-CSI-RS-ResourceSet* within the CSI-Resource*Config* settings are configured for L1-RSRP for the active BWP are from a serving cell, including a single PCell, PSCell, or SCell configured for L1-RSRP measurements, when the UE is configured with a single serving cell (PCell, PSCell, or SCell) in FR2-1.

Unless otherwise stated in other sub-clauses of 9.5,

- For a UE that supports both *multiDCI-IntraCellMultiTRP-TwoTA-r18* or *multiDCI-InterCellMultiTRP-TwoTA-r18* and *rxTimingDiff-r18*, the requirements apply when Rx timing difference is up to MRTD as specified in clause 7.6.8.

- For a UE which do not support *rxTimingDiff-r18*, the requirements apply when Rx timing difference is less than CP.

## 9.5.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP, unless the UE supports *bwpOperationMeasWithoutInterrupt-r18*, provided that the SSB is within the configured UE-specific CBW.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1 dB step size according to clause 10.1.19 for FR1 and 10.1.20 for FR2 if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, or if *groupBasedBeamReporting-r17* is configured, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19 for FR1 and 10.1.20 for FR2. The differential L1-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6.

In EN-DC and NE-DC operation, when the UE is configured to perform E-UTRA SRS carrier-based switching an additional delay can be expected in FR1 if the UE is capable of per-FR gap, or an additional delay can be expected in both FR1 and FR2 if the UE is not capable of per-FR gap.

### 9.5.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP, unless the UE supports *bwpOperationMeasWithoutInterrupt-r18*, provided that the SSB is within the configured UE-specific CBW.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send aperiodic L1-RSRP measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

### 9.5.3.4 Event Triggered Reporting for the UE initiated beam management

For a UE configured with a *CSI-ReportConfig* with *csi-ReportUE-IBR-r19* and with *dl-OrJointTCI-StateList*， with or without *eventCountWindow-r19* configuration, the reported L1-RSRP measurements contained in an event triggered L1-RSRP measurement report shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall not send any event triggered measurement reports if no reporting criteria is fulfilled.

The event triggered L1-RSRP measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE transmits first PUCCH over the air interface.

When *eventCountWindow-r19* is not configured,

The event triggered measurement reporting delay shall be no larger than $T_{L1\text{-}meas_basic} + T_{first_UL_channel}$, where:

$T_{L1\text{-}meas_basic}$ is the maximum of L1-RSRP measurement periods of the reference signals of the beams corresponding to the event

For a UE configured with a CSI-ReportConfig with the higher layer parameter *eventTypeUE-IBR-r19* set to '*event2-r19*', UE shall perform L1-RSRP measurement based on the L1-RSRP measurement period of current beam and new beam(s), respectively.

For a UE configured with a CSI-ReportConfig with the higher layer parameter *eventTypeUE-IBR-r19* set to '*event1-r19*', UE shall perform L1-RSRP measurement based on current beam L1-RSRP measurement period.

As defined in clause 5.2.1.5.4 TS 38.214 [26], if *newBeamResourceSet* is a *CSI-SSB-ResourceSet*:

the L1-RSRP measurement period of the current beam refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ as specified in table 9.5.4.1-1 or 9.5.4.1-2 where $T_{Report}$. = 0, and $T_{SSB}$ is the periodicity of the *SSB-Index* of the reference signal in the indicated TCI state or the SS/PBCH block which is QCLed with the reference signal in the indicated TCI state for the current beam.

the L1-RSRP measurement period of the new beam refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ as specified in table 9.5.4.1-1 or 9.5.4.1-2 where $T_{Report}$. = 0, and $T_{SSB}$ is the periodicity of the *SSB-Index* of the reference signal configured by the *newBeamResourceSet-r19*.

As defined in clause 5.2.1.5.4 TS 38.214 [26], if *newBeamResourceSet* is a *NZP-CSI-RS-ResourceSet* configured with *repetition*:

the L1-RSRP measurement period of the current beam refers to $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ as specified in table 9.5.4.2-1 or 9.5.4.2-2 where $T_{Report}$. = 0, and $T_{CSI\text{-}RS}$ is the periodicity of the reference signal in the indicated TCI state for the current beam.

the L1-RSRP measurement period of the new beam refers to $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ as specified in table 9.5.4.2-1 or 9.5.4.2-2 where $T_{Report}$. = 0, and $T_{CSI\text{-}RS}$ is the periodicity of the the reference signal configured by the *newBeamResourceSet-r19* for new beams.

For a UE configured with a *CSI-ReportConfig* with the higher layer parameter *eventTypeUE-IBR-r19* set to '*event7-r19*', UE shall perform L1-RSRP measurement based on L1-RSRP measurement period of the beams in active TCI state list and new beams.

As defined in clause 5.2.1.5.4 TS 38.214 [26], if *newBeamResourceSet* is a *CSI-SSB-ResourceSet*:

the L1-RSRP measurement period of each beam of activated TCI states refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ as specified in table 9.5.4.1-1 or 9.5.4.1-2 where $T_{Report}$. = 0, and $T_{SSB}$ is the periodicity of the *SSB-Index* of the reference signal in the activated TCI states or the SS/PBCH block which is QCLed with the reference signal in the activated TCI states.

the L1-RSRP measurement period of the new beam refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ as specified in table 9.5.4.1-1 or 9.5.4.1-2 where $T_{Report}$. = 0, and $T_{SSB}$ is the periodicity of the *SSB-Index* of the reference signal configured by the *newBeamResourceSet-r19*.

As defined in clause 5.2.1.5.4 TS 38.214 [26], if *newBeamResourceSet* is a *NZP-CSI-RS-ResourceSet* configured with *repetition*:

the L1-RSRP measurement period of each beam of activated TCI states refers to $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ as specified in table 9.5.4.2-1 or 9.5.4.2-2 where $T_{Report}$. = 0, and $T_{CSI\text{-}RS}$ is the periodicity of the reference signal in the activated TCI states.

the L1-RSRP measurement period of the new beam refers to $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ as specified in table 9.5.4.2-1 or 9.5.4.2-2 where $T_{Report}$. = 0, and $T_{CSI\text{-}RS}$ is the periodicity of the the reference signal configured by the *newBeamResourceSet-r19* for new beams.

$T_{first\ UL\ channel}$ is from the time point at RS which triggered the L1 reporting to the time point at next PUCCH transmission occasion

Otherwise, if *eventCountWindow-r19* is provided, the event triggered measurement reporting delay shall be no larger than (*eventInstanceCount-r19* + L) * $T_{L1\text{-}meas_basic}$ + $T_{first\ UL\ channel,}$ where

- *eventInstanceCount-r19* is configured by the network

- $T_{L1\text{-}meas_basic}$ is the measurment period above based on the configuration,

- L is the number of measurement instances ($T_{L1\text{-}meas_basic}$) that do not satisfy the event condition, counted after the event counter is started for the window that will trigger the measurement report and before the required number of events (eventInstanceCount-r19) are detected within the specified time window (*eventDetectionTimeWindow-r19*).

- The above requriement is applicable when *eventDetectionTimeWindow-r19* is not less than (*eventInstanceCount-r19* + L-1) * $T_{L1\text{-}meas_basic}$ . The requirement does not apply when *eventDetectionTimeWindow-r19* is less than (*eventInstanceCount-r19* + L-1) * $T_{L1\text{-}meas_basic}$.

## 9.5.4 L1-RSRP measurement requirements

### 9.5.4.1 SSB based L1-RSRP Reporting

When *groupBasedBeamReporting-r17* is not configured, the UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB}$.

When *groupBasedBeamReporting-r17* is configured, the UE shall be capable of performing L1-RSRP measurements based on the two configured SSB resource sets for L1-RSRP, and the UE physical layer shall be capable of reporting group-based L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB}$.

When there is no L1-RSRP measurement on LTM neighbor cell(s) to measure within active BWP, the value of $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ is defined in table 9.5.4.1-1 for FR1, the value of $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ is defined in table 9.5.4.1-2 for FR2 when *highSpeedMeasFlagFR2-r17* is not configured and if *groupBasedBeamReporting-r17* is not configured, and defined in table 9.5.4.1-2A for FR2-1 when *highSpeedMeasFlagFR2-r17* is not configured and if *groupBasedBeamReporting-r17* is configured, and defined in table 9.5.4.1-3 for FR2 power class 6 UE when *highSpeedMeasFlagFR2-r17* is configured, where

- M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise

- The value of N in table 9.5.4.1-2A is 2, 4 or 6 in FR2-1 for UE supporting *fastBeamSweepingMultiRx-r18* according to the conditions described in clause 3.6.19.

- The value of N in table 9.5.4.1-2 is 8.

- The value of N in table 9.5.4.1-3 is 8.

For UE supporting *On-demand SSB operation* and when OD-SSB transmission is indicated, the EMP for L1-RSRP are

- the periodicity of OD-SSBs in the configured DL BWP if no first SSB transmission is configured or if UE supports *timec1nc2* and OD-SSB transmission is indicated with first SSB transmission and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern, or

- the periodicity of the union of OD-SSBs and first SSBs if first SSBs are transmitted and the OD-SSB activation is indicated and the union of OD-SSBs and first SSBs has a periodic time domain pattern.

For a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, *or* for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG measurement gap(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both concurrent GAP and *musim-GapPreference-r17* and when concurrent gaps or periodic MUSIM gaps or both concurrent gaps and periodic MUSIM gaps are configured,

- an SSB or an SMTC occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clause 9.1.8 and 9.1.10,

- P value for SSB resource to be measured is defined as

  - $N_{total}$ / $N_{outside_MG}$ in FR1

  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0

  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0

- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE GAPs , periodic MUSIM gap(s) and per-FR GAPs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any SSB resource occasion:

  $N_{total}$ is the total number of SSB resource occasions within the window, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window.

  For UEs supporting featureSetCombinationLowBandSwitching-r19 and configured with LowBandCA-Switching-r19:

  - for the PCell L1-RSRP measurement, $N_{total}$ also includes SSB resource occasions that overlap with the SCell active periods of the *switchingPattern-r19* within the window,

  - for the SCell L1-RSRP measurement, $N_{total}$ also includes SSB resource occasions that overlap with the PCell active periods of the *switchingPattern-r19* within the window, as defined by *LowBandCA-Switching-r19*, and

  - $N_{outside_MG}$ is the number of SSB resource occasions within the window W

    - that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion or

    - that are not overlapped with SCell active periods of the *switchingPattern-r19*, for the PCell L1-RSRP measurement for a UE configured with *LowBandCA-Switching-r19* or

    - that are not overlapped with PCell active periods of the *switchingPattern-r19*, for the SCell L1-RSRP measurement for a UE configured with *LowBandCA-Switching-r19*, and

  - L1-RSRP requirement in this clause is not applied when $N_{outside_MG}$ = 0.

  - $N_{available}$ is the number of SSB resource occasions that are not overlapped with any non-dropped GAP occasion, non-dropped MUSIM gap occasion nor any SMTC occasion within the window W.

  - for UEs configured with *LowBandCA-Switching-r19*, switching pattern periodicity is the periodicity of *LowBandCA-Switching-r19*; otherwise, it is not applicable.

- an SSB or an SMTC occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion.

- $T_{L1}$ is periodicity of the target SSB.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG(s) and UE does not support *musim-GapPreference-r17* or when no MUSIM gaps are configured,

For FR1,

- $P=\frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB; and

- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB.

For FR2,

$P_1=\frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when SSB is not overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- $P_1$ is $P_{L1_sharing}*P_{sharing\ factor}$, when SSB is not overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).

- $P_1=\frac{1}{1-\frac{T_{SSB}}{xRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when SSB is partially overlapped with GAP and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and

  - $T_{SMTCperiod} \neq xRP$ or

  - $T_{SMTCperiod} = xRP$ and $T_{SSB} < 0.5*T_{SMTCperiod}$

- P is $\frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when SSB is partially overlapped with GAP and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = xRP$ and $T_{SSB} = 0.5*T_{SMTCperiod}$

- $P_1=\frac{1}{1-\frac{T_{SSB}}{min(T_{SMTCperiod},xRP)}}$, when SSB is partially overlapped with GAP ($T_{SSB} < xRP$) and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP.

- P is $P_{L1_sharing} * \frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{xRP}}$, when SSB is partially overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} < xRP$)

- If SSB resource from the cell with different PCI is configured for L1-RSRP measurement, and $P_2$ is valid accoding to clause 9.13.4.1, and any symbol of the SSBs from serving cell and cell with different PCI are overlapping or adjacent (in time domain)

  - $P = \frac{P_1}{1-\frac{P_1*T_{SSB}}{P_2*T_{SSB_CDP}}}$, if $P_1*T_{SSB} < P_2*T_{SSB_CDP}$.

  - $P = P_1$, if $P_1*T_{SSB} > P_2*T_{SSB_CDP}$.

  - $P = 2*P_1$, if $P_1*T_{SSB} = P_2*T_{SSB_CDP}$.

- Otherwise, $P = P_1$

Where:

- $T_{SSB}$ = *ssb-periodicityServingCell* of the serving cell
- $T_{SMTCperiod}$ = the configured SMTC period
- $T_{SSB_CDP}$ = SSB periodicity of the cell with PCI different from serving cell
- $P_{sharing\ factor}$ = 1, if the SSB configured for L1-RSRP measurement outside gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.
- $P_{sharing\ factor}$ = 3, otherwise.
- $P_{L1_sharing}$ = 2, if SSB resource from the cell with different PCI is configured for L1-RSRP measurement, and $P_{sharing_factor,CDP}$ is used in clause 9.13.4.1, and any symbol of the SSBs from serving cell and cell with different PCI are overlapping or adjacent (in time domain). $P_{L1_sharing}$ = 1, otherwise.
  - $T_{SSB}$ = *ssb-periodicityServingCell*
  - $T_{SMTCperiod}$ = the configured SMTC period
- When a measurement gap is configured and the measurement gap is not NCSG,
  - an SSB or an SMTC occasion is considered to be overlapped with the GAP if it overlaps a measurement gap occasion, and
  - xRP = MGRP
- If the UE is configured with Pre-MG, an SSB or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- Otherwise, when NCSG measurement gap only is configured,
  - an SSB or an SMTC occasion is considered to be overlapped with the GAP if
    - it overlaps the VIL1 or VIL2 of NCSG, or
    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,
- and
    - xRP = VIRP

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ is defined in table 9.5.4.1-4 for UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* in FR1, table 9.5.4.1-5 for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18* in FR1, table 9.5.4.1-6 for UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* in FR2 and table 9.5.4.1-7 for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18* in FR2 when there is L1-RSRP measurement on LTM neighbor cell(s) to measure within active BWP, where

- M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- N= 8 in table 9.5.4.1-6 and table 9.5.4.1-7.
- P value for SSB resource to be measured is defined as

- $N_{total}$ / $N_{outside_MG}$ in FR1
- $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
- $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0

For a window W of duration max ($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps and per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any SSB resource occasion:

- $N_{total}$ is the total number of SSB resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
- $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion within the window W
- $N_{available}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
- $T_{L1}$ is periodicity of the target SSB.

- $P_{sharing\ factor}$ = 1, if the SSB configured for L1-RSRP measurement outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,
- $P_{sharing\ factor}$ = 3, otherwise.
- $P_{L1_sharing}$ is defined as
  - When number of neighboring cells configured with SSB based L1-RSRP measurement is 1
    - $P_{L1_sharing}$ = 2, if any symbol of the SSBs from serving cell and neighbor cell are overlapping or adjacent (in time domain)
    - $P_{L1_sharing}$ = 1, otherwise
  - When number of neighboring cells configured with SSB based L1-RSRP measurement is more than 1
  - $P_{L1_sharing}$ = 3.

Note: RRM requirements are not applicable when L1 measurement on the cells with different PCI and LTM L1 measurement on neighbour cells are both configured.

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform SSB measurements during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and GAP configurations does not meet previous conditions.

When UE is configured with aperiodic MUSIM gap and the aperiodic MUSIM gap is overlapping with SSB resource occasion for L1-RSRP, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and SSB resource occasions for L1-RSRP are fully overlapped with MUSIM gap(s) or fully overlapped with the union of MUSIM gap(s) and GAPs, no requirement applies for the SSB based L1-RSRP measurement.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 9.5.4.1-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ for FR1**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{SSB})$ |

### 9.5.4.2 CSI-RS based L1-RSRP Reporting

When *groupBasedBeamReporting-r17* is not configured, the UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$.

When *groupBasedBeamReporting-r17* is configured, the UE shall be capable of performing L1-RSRP measurements based on the two configured CSI-RS resource sets for L1-RSRP, and the UE physical layer shall be capable of reporting group-based L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ is defined in table 9.5.4.2-1 for FR1 and in table 9.5.4.2-2 for FR2, where

- For periodic and semi-persistent CSI-RS resources, M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- For aperiodic CSI-RS resources M=1
- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply if *qcl-InfoPeriodicCSI-RS* is configured for all the resources in the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$) for table 9.5.4.2-2, where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured with QCL-TypeD for all resources in the resource set.
- For semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply provided TCI state is provided for all resources in the resource set in the MAC CE activating the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided TCI state is provided with QCL-TypeD for all resources in the resource set in the MAC CE activating the resource set.
- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply provided *qcl-info* is configured for all resources in the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=1. UE is not required to meet the accuracy requirements in clauses 10.1.19.2 and 10.1.20.2 if number of resources in the resource set is smaller than *maxNumberRxBeam*. The requirements apply provided *qcl-info* is configured with QCL-TypeD for all resources in the resource set.

For the value of L1,

1> If UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network

2> L1 is not applicable

1> else (if UE supports *sbfd-Aware-r19* and SBFD is configured by the network)

2> if UE is configured to report L1-RSRP for SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the CSI-RS resource that are overlapping with dynamic UL transmission or with non-SBFD symbols during $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$

3> When DRX is configured, L1 is the number of DRX cycles in which at least one occasion of the CSI-RS resource is overlapping with dynamic UL transmission or in which all occasions of the CSI-RS resource are overalapping with non-SBFD symbols during $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$

2> if UE is configured to report L1-RSRP for non-SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the CSI-RS resource that are overlapping with SBFD symbols during $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$, when DRX is not configured

3> When DRX is configured, L1 is the number of DRX cycles in which all occasions of the CSI-RS resource are overlapping with SBFD symbols during $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$

For a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG measurement gap(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both concurrent measurement gap and *musim-GapPreference-r17* and when concurrent gaps or periodic MUSIM gaps or both concurrent gaps and periodic MUSIM gaps are configured,

- a CSI-RS or an SMTC occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clauses 9.1.8 and 9.1.10,
- P value for a CSI-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0
- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or NCSGs, MUSIM gap(s)and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any CSI-RS resource occasion:
  - $N_{total}$ is the total number of CSI-RS resource occasions within the window W, including those overlapped with measurement gap occasions, MUSIM gap occasions or SMTC occasions within the window W.

    For UEs supporting featureSetCombinationLowBandSwitching-r19 and configured with LowBandCA-Switching-r19:

    - for the PCell L1-RSRP measurement, $N_{total}$ also includes CSI-RS resource occasions that overlap with the SCell active periods of the *switchingPattern-r19* within the window,
    - for the SCell L1-RSRP measurement, $N_{total}$ also includes CSI-RS resource occasions that overlap with the PCell active periods of the *switchingPattern-r19* within the window, as defined by *LowBandCA-Switching-r19*, and
  - $N_{outside_MG}$ is the number of CSI-RS resource occasions within the window W
    - that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion or
    - that are not overlapped with SCell active periods of the *switchingPattern-r19*, for the PCell L1-RSRP measurement for a UE configured with *LowBandCA-Switching-r19* or
    - that are not overlapped with PCell active periods of the *switchingPattern-r19*, for the SCell L1-RSRP measurement for a UE configured with *LowBandCA-Switching-r19*, and
  - L1-RSRP requirement in this clause is not applied when $N_{outside_MG}$ = 0.
  - $N_{available}$ is the number of CSI-RS resource occasions that are not overlapped with any non-dropped GAP occasions, non-dropped MUSIM gap occasion nor any SMTC occasion within the window W.
  - for UEs configured with *LowBandCA-Switching-r19*, switching pattern periodicity is the periodicity of *LowBandCA-Switching-r19*; otherwise, it is not applicable.
  - a CSI-RS or an SMTC occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

- $T_{L1}$ is periodicity of the target CSI-RS.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG measurement gap(s), and UE does not support *musim-GapPreference-r17* or when no MUSIM gaps are configured.

For FR1,

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and

- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the CSI-RS.

For FR2,

- P=1, when CSI-RS is not overlapped with a GAP and also not overlapped with SMTC occasion.

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when CSI-RS is partially overlapped with GAP and CSI-RS is not overlapped with SMTC occasion ($T_{CSI-RS} < xRP$)

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is not overlapped with GAP and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).

- $P=P_{sharing\ factor}$, when CSI-RS is not overlapped with GAP and CSI-RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).

- P=1, when aperiodic CSI-RS resource is not overlapped with GAP

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is partially overlapped with GAP and CSI-RS is partially overlapped with SMTC occasion (TCSI-RS < $T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and

  - $T_{SMTCperiod} \neq xRP$ or

  - $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} < 0.5*T_{SMTCperiod}$

- $P=\frac{3}{1-\frac{T_{CSI-RS}}{xRP}}$, when CSI-RS is partially overlapped with GAP and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} = 0.5*T_{SMTCperiod}$

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{\min(T_{SMTCperiod},xRP)}}$, when CSI-RS is partially overlapped with GAP ($T_{CSI-RS} < xRP$) and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP.

- $P=\frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{xRP}}$, when CSI-RS is partially overlapped with GAP and CSI-RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} < xRP$)

Where:

- $P_{sharing\ factor}$ = 1, if the CSI-RS configured for L1-RSRP measurement outside gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

- not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.

$T_{SMTCperiod}$ = the configured SMTC period.

$T_{CSI\text{-}RS}$ = the periodicity of CSI-RS configured for L1-RSRP measurement

- When a measurement gap is configured and the measurement gap is not NCSG,
  - a CSI-RS or an SMTC occasion is considered to be as overlapped with the GAP if it overlapps a measurement gap occasion, and
  - xRP = MGRP
- If the UE is configured with Pre-MG, a CSI-RS or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- Otherwise, when NCSG measurement gap only is configured,
  - a CSI-RS or an SMTC occasion is considered to be as overlapped with the GAP if
    - it overlaps the VIL1 or VIL2 of NCSG, or
    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,
  - and
    - xRP = VIRP

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform CSI-RS measurements during the cancelled gap occasions.

When UE is configured with aperiodic MUSIM gap and the aperiodic MUSIM gap is overlapping with CSI-RS resource occasion for L1-RSRP, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and CSI-RS resource occasions for L1-RSRP are fully overlapped with MUSIM gap(s) or fully overlapped with the union of MUSIM gap(s) and GAPs, no requirement applies for the CSI-RS based L1-RSRP measurement.

**Table 9.5.4.2-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ for FR1**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}((M+L1)*P)* \max(T_{CSI\text{-}RS}, T_{proc}))$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(K*(M+L1)*P)*\max(T_{DRX}, T_{CSI\text{-}RS}, T_{proc}))$ |
| DRX cycle > 320 ms | $\text{ceil}((M+L1)*P)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3. | |
| NOTE 3: K = 1 when $T_{CSI\text{-}RS}$ ≤ 40 ms and *highSpeedMeasFlag-r16 or highSpeedMeasCA-Scell-r17* are configured; otherwise K = 1.5. | |
| NOTE 4: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *intraNR-MeasurementEnhancement-r16 or measurementEnhancementCA-r17.* | |
| NOTE 5: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for CMR is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

|---|---|

| | |
|---|---|
| non-DRX | max($T_{Report}$, ceil((M+L1)*P*N)* max($T_{CSI-RS}$, $T_{proc}$) |
| DRX cycle ≤ 320 ms | max($T_{Report}$, ceil(1.5*(M+L1)*P*N)*max($T_{DRX}$,$T_{CSI-RS}$, $T_{proc}$)) |
| DRX cycle > 320 ms | ceil((M+L1)*P*N)*$T_{DRX}$ |
| NOTE 1: $T_{CSI-RS}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3. | |
| NOTE 3: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for CMR is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

**Table 9.5.4.2-2A: Void**

## 9.5.4A Void

### 9.5.4A.1 Void

**Table 9.5.4A.1-1:** Void

## 9.5.5 Measurement restriction for CSI-RS and SSB for L1-RSRP measurement

The UE is required to be capable of measuring SSB and CSI-RS for L1-RSRP without measurement gaps. The UE is required to perform the SSB and CSI-RS measurements with measurement restrictions as described in the following clauses.

### 9.5.5.1 Measurement restriction for SSB based L1-RSRP

For FR1, if UE does not support *rxTimingDiff-r18*, when the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR1, if UE support *rxTimingDiff-r18*, when [the SSB for L1-RSRP measurement and CSI-RS for RLM, BFD, CBD or L1-RSRP measurement are overlapping or partially overlapping in OFDM symbols],

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the SSB for L1-RSRP measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure

one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the SSB for L1-RSRP measurement on one CC is in the same OFDM symbol as SSB from cell with additional PCI for BFD, CBD measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the SSB for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both SSB and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, if the network configures same or mixed numerology between SSB for L1-RSRP measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, UE shall be able to perform the related SSB based measurements in one band without any measurement restrictions in the other band, provided that UE is capable of independent beam management on this FR2 band pair.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated without first SSB transmission, the measurement restriction is expected for OD-SSB occasions only.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated with first SSB transmission, no measurement restriction is expected for first SSB occasions if UE supports *Time-C1nC2* and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern. Otherwise, the measurement restriction is expected for both first SSB and OD-SSB occasions.

### 9.5.5.2 Measurement restriction for CSI-RS based L1-RSRP

The SSB mentioned in this clause can be associated with either the serving cell PCI or a PCI different from serving cell PCI or intra-frequency neighbor cell(s) configured with L1-RSRP measurement or inter-frequency neighbor cell(s) configured with L1-RSRP measurement without gap.

For both FR1 and FR2, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has same SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has different SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

For FR2, when the CSI-RS for L1-RSRP measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both CSI-RS from serving cell and neighbor cell. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for L1-RSRP measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and the other CSI-RS. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.
  - The CSI-RS for L1-RSRP measurement or the other CSI-RS in a resource set configured with repetition ON, or
  - The other CSI-RS is configured in q1 and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

For UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* and for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*,

- For both FR1 and FR2, when the CSI-RS for L1-RSRP measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.
- For FR1, when the CSI-RS for L1-RSRP measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP is expected, and no requirements are defined.
- For FR2, when the CSI-RS for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP is expected, and no requirements are defined.

For FR2-1, when the CSI-RS for L1-RSRP measurement on the one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD or L1-RSRP measurement on the same CC, UE supporting *schedulingMeasurementRelaxation-r18* according to the conditions described in clause 3.6.19 shall be able to measure the CSI-RS for L1-RSRP measurement without restriction when the following conditions are met:

- Both CSI-RSs are not in any CSI-RS resource set with repetition ON, and
- One CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to 38.214 clause 5.1.5, and
  - the other CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to 38.214 clause 5.1.5, and
- Resources of the active TCI states of the two PDSCHs, or QCL sources of the default QCL assumption, or the active TCI state of PDSCH and QCL source of the default QCL assumption have been reported as a resource group in Rel-17 group-based RSRP report.

## 9.5.6 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions described in the following clauses apply when the UE is performing L1-RSRP measurement on serving cell, and UE is receiving PDCCH/PDSCH from serving cell and/or cell(s) with different PCI.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated without first SSB transmission, the scheduling restriction is expected for OD-SSB occasions only.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated with first SSB transmission, no scheduling restriction is expected for first SSB occasions if UE supports *Time-C1nC2* and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern. Otherwise, the scheduling restriction is expected for both first SSB and OD-SSB occasions.

### 9.5.6.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.5.6.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] and do not support *rxTimingDiff-r18*, the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] but support *rxTimingDiff-r18*, the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI [on symbols that are overlapping or partially overlapping with the symbols corresponding to] the SSB indexes configured for L1-RSRP measurement.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on serving cell where L1-RSRP measurement is performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions on serving cell where L1-RSRP measurement is performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

For UE indicating *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-RSRP measurement is performed is configured.

When inter-band FR1+FR1 NR-DC is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-RSRP measurement is performed is configured.

### 9.5.6.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to L1-RSRP measurement.

- For the case where RS for L1-RSRP measurement is CSI-RS which is QCLed with active TCI state for PDCCH/PDSCH and not in a CSI-RS resource set with repetition ON, and N=1 applies as specified in clause 9.5.4.2
  - There are no scheduling restrictions due to L1-RSRP measurement performed based on the CSI-RS.
- For FR2-1 and the case where UE supporting *schedulingMeasurementRelaxation-r1*8 according to the conditions described in clause 3.6.19 is configured to receive two PDSCH transmission occasions from two different QCL sources, there are no scheduling restrictions for the PDSCHs due to L1-RSRP measurement performed based on the CSI-RS, when following conditions are met:
  - The CSI-RS configured for L1-RSRP is not in a CSI-RS resource set with repetition ON, and
  - The CSI-RS configured for L1-RSRP has same QCL source as the active TCI state of one of PDSCHs and has different QCL-TypeD from the other PDSCH, and
  - The CSI-RS configured for L1-RSRP and both PDSCHs are on the same OFDM symbol(s), or the CSI-RS and one of the PDSCHs with different QCL-typeD are on the same OFDM symbol(s) when partially overlapping PDSCHs are scheduled, and
  - Resources of the active TCI states for the two PDSCHs have been reported as a resource group in Rel-17 group-based RSRP report.
- Otherwise
  - For FR2 power class 6 UE which is not configured with *highSpeedMeasFlagFR2-r17*, and for the UE not supporting FR2 power class 6, for FR2-1 or the reference symbols to be measured for L1-RSRP is not using 480 kHz SCS or 960 kHz SCS on FR2-2, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on
    - symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and/or
    - symbols corresponding to the periodic CSI-RS resource configured for L1-RSRP measurement, and/or
    - symbols corresponding to the semi-persistent CSI-RS resource configured for L1-RSRP measurement when the resource is activated, and/or
    - symbols corresponding to the aperiodic CSI-RS resource configured for L1-RSRP measurement when the reporting is triggered.

- For FR2-2 and the reference symbols to be measured for L1-RSRP is using 480 kHz SCS or 960 kHz SCS, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on

  - symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and on one data symbol before and one data symbol after the symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and/or

  - symbols corresponding to the periodic CSI-RS resource configured for L1-RSRP measurement, and on one data symbol before and one data symbol after the symbols corresponding to the periodic CSI-RS resource configured for L1-RSRP measurement, and/or

  - symbols corresponding to the semi-perssitent CSI-RS resource configured for L1-RSRP measurement when the resource is activated, and on one data symbol before and one data symbol after the symbols corresponding to the semi-perssitent CSI-RS resource configured for L1-RSRP measurement when the resource is activated, and/or

  - symbols corresponding to the aperiodic CSI-RS resource configured for L1-RSRP measurement when the reporting is triggered, and on one data symbol before and one data symbol after the symbols corresponding to the aperiodic CSI-RS resource configured for L1-RSRP measurement when the reporting is triggered.

- For FR2 power class 6 UE configured with *highSpeedMeasFlagFR2-r17*, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on

  - symbols corresponding to the SSB indexes configured for L1-RSRP measurement and 1 data symbol before each consecutive SSB symbols to be measured for L1-RSRP and 1 data symbol after each consecutive SSB symbols to be measured for L1-RSRP, and/or

  - symbols corresponding to the periodic CSI-RS resource configured for L1-RSRP measurement and 1 data symbol before each periodic CSI-RS resource to be measured for L1-RSRP and 1 data symbol after each periodic CSI-RS for L1-RSRP measurement symbols to be measured for L1-RSRP, and/or

  - symbols corresponding to the semi-persistent CSI-RS resource configured for L1-RSRP measurement and 1 data symbol before each semi-persistent CSI-RS resource to be measured for L1-RSRP and 1 data symbol after each semi-persistent CSI-RS resource to be measured for L1-RSRP when the resource is activated, and/or

  - symbols corresponding to the aperiodic CSI-RS resource configured for L1-RSRP measurement and 1 data symbol before each aperiodic CSI-RS resource to be measured for L1-RSRP measurement and 1 data symbol after each aperiodic CSI-RS resource to be measured for L1-RSRP measurement when the reporting is triggered.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions on serving cell where L1-RSRP measurement is performed apply to all serving cells in the band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to L1-RSRP measurement performed on FR2 serving cell(s) in different band(s), provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

If following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for L1-RSRP measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for L1-RSRP measurement.

#### 9.5.6.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to L1-RSRP measurement performed on FR2 serving cell(s).

There are no scheduling restrictions on FR2 serving cell(s) due to L1-RSRP measurement performed on FR1 serving cell(s).

### 9.5.7 Minimum requirement at transitions

For UE supporting *ncd-SSB-BWP-Wor-r18*, when the L1-RSRP measurement transitions from measurements performed on CD-SSB to measurements performed on NCD-SSB or vice versa due to BWP switching during one measurement period, the UE shall use a L1-RSRP measurement period that is the maximum of the L1-RSRP measurement period corresponding to the first SSB type and the second SSB type after the BWP switching.

Subsequent to the above-mentioned measurement periods, the L1-RSRP measurement period requirements are based on the SSB type after the BWP switch.

For UE supporting *On-demand SSB operation*, when UE is indicated, by on-demand SSB Activation/Deactivation MAC CE, adaptation of periodicities for the activated transmission of OD-SSBs when the SCell is activated, the L1-RSRP measurement period requirements are based on the adapted OD-SSB burst periodicity which applies from the first OD-SSB burst after an additional processing time as 2ms or 5ms depending on *OD-SSB post processing time*.

For UE supporting *SSB adaptation*, when UE receives DCI format 2_9 that indicates a change in SSB burst periodicity of the SSB transmission during one mesauremnet period, the L1-RSRP measurement period requirements based on the indicated SSB burst periodicity applies from the first SSB burst after the time point as defined in TS 38.213 plus 2 ms and 3 ms for FR1 and FR2 respectively.

## 9.5A L1-RSRP measurements for Reporting under CCA

### 9.5A.1 Introduction

When configured by the network, the UE shall be able to perform L1-RSRP measurements of configured SSB resources for L1-RSRP. The measurements shall be performed for a serving cell under CCA operating mode, including PCell, PSCell, or SCell, on the resources configured for L1-RSRP measurements within the active BWP.

The UE shall be able to measure all SSB resources of the *csi-SSB-ResourceSet* within the *CSI-ResourceConfig* settings configured for L1-RSRP for the active BWP, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

During EN-DC operation in FR-1, when the UE is configured to perform E-UTRA SRS carrier-based switching, an additional delay can be expected.

The requirements in clause 9.5A apply for any *channelAccessMode* configuration [TS 38.331, 2].

In the requirements of clause 9.5A, the term SSB occasion not available at the UE refers to when the SSB is configured by gNB in a cell on a carrier frequency subject to CCA, but the first two successive candidate SSB positions for the same SS/PBCH block index within the set of configured SSB are not available at the UE due to DL CCA failures at gNB during the corresponding evaluation or measurement period; otherwise the SSB occasion is considered as available at the UE.

## 9.5A.2 Requirements applicability

The requirements in clause 9.5A apply, provided:

- The SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clause 10.1.19.1 for FR1 for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.4.1 for a corresponding band.

An SSB resource configured for L1-RSRP shall be considered measurable when the measurable resource conditions are met for SSB resource.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

## 9.5A.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1 dB step size according to clauses 10.1.19 for FR1 and 10.1.20 for FR2-2 if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19 for FR1 and 10.1.20 for FR2-2. The differential L1-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6.

During EN-DC operation, for FR1, when the UE is configured to perform E-UTRA SRS carrier-based switching an additional delay can be expected if the UE is capable of per-FR gap, or an additional delay can be expected.

### 9.5A.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2-2, respectively.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5A.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2-2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

When CCA is used on target frequency, if UE cannot transmit HARQ-ACK for the MAC CE activation command due to UL CCA failure, the UE shall not perform MAC CE activation at the MAC action time based on the originally scheduled HARQ-ACK transmission time specified in clause 5.2.1.5.2 in TS 38.214 [26].

When CCA is used on target frequency, if UE cannot transmit HARQ-ACK for the MAC CE deactivation command due to UL CCA failure, the UE shall perform MAC CE deactivation at the MAC action time based on the originally scheduled HARQ-ACK transmission time specified in clause 5.2.1.5.2 in TS 38.214 [26].

### 9.5A.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2-2, respectively.

The UE shall only send aperiodic L1-RSRP measurement reports if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

## 9.5A.4 L1-RSRP measurement requirements

### 9.5A.4.1 SSB based L1-RSRP Reporting

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$ is defined in table 9.5A.4.1-1 for FR1, and in table 9.5A.4.1-2 for FR2-2, where,

- M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- N = 8

For FR1, for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent measurement gap(s) with NCSG measurement gap(s) are configured, or a UE supporting *concurrentMeasGap-r17* and when concurrent gaps are configured,

- P value for an SSB resource to be measured is defined as $N_{total}$ / $N_{outside_MG}$
- For a window W of duration max($T_{L1}$, xRP_max), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or NCSGs and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any SSB resource occasion:
  - $N_{total}$ is the total number of SSB resource occasions within the window W, including those overlapped with GAP occasions within the window W, and
  - $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any GAP occasion within the window W
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG(s),

For FR1,

- $P=\frac{1}{1-\frac{T_{SSB}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB; and
- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB.

For FR2-2,

- $P=\frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when SSB is not overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- P is $P_{sharing\ factor}$, when SSB is not overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$).

- $P=\frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq$ MGRP or
  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$
- P is $\frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5*T_{SMTCperiod}$
- $P=\frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when S SSB is partially overlapped with measurement gap ($T_{SSB}$ <MGRP) and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.
- P is $\frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MRGP}}$, when SSB is partially overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod}$ < MGRP)

Where:

- $P_{sharing\ factor}$ = 1, if the SSB configured for L1-RSRP measurement outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,
- $P_{sharing\ factor}$ = 3, otherwise.

  $T_{SSB}$ = *ssb-periodicityServingCell*

  $T_{SMTCperiod}$ = the configured SMTC1 period or SMTC2 period if configured
- When a measurement gap only is configured,
  - an SSB is considered to be overlapped with the GAP if it overlaps a measurement gap occasion, and
  - xRP = MGRP
- If the UE is configured with Pre-MG, an SSB is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.
- When NCSG only is configured,
  - an SSB is considered to be overlapped with the GAP if it overlaps the VIL1 or VIL2 of NCSG, and
  - xRP = VIRP
- When concurrent gaps or concurrent measurement gap(s) with Pre-MG(s) or concurrent measurement gap(s) with NCSG(s) are configured, an SSB or an SMTC occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clause 9.1.8.

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

UE shall report RSRP_0 (Not valid) if L1>$L1_{max}$, where L1 and $L1_{max}$ are defined in table 9.5A.4.1-1.

**Table 9.5A.4.1-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$ for FR1**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$ (ms) |
|---|---|
| non-DRX | max($T_{Report}$, ceil((M+L1)*P)*$T_{SSB}$) |
| DRX cycle ≤ 320 ms | max($T_{Report}$, ceil(1.5*(M+L1)*P)*max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | ceil((M+L1)*P)*$T_{DRX}$ |
| Note 1: $T_{SSB}$ = *ssb-periodicityServingCell* is the periodicity of the SSB-Index configured for L1-RSRP measurement.<br>$T_{DRX}$ is the DRX cycle length.<br>$T_{Report}$ is configured periodicity for reporting. | |
| Note 2: L1=0 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured. Otherwise, when DRX is not configured L1 is the number of SSBs not available at the UE during $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$, and when DRX is configured L1 is the number of DRX cycles in which at least one SSB is not available at the UE during $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$, where L1 ≤ $L1_{max}$. The UE is not required to determine the availability of SSB occasions more frequent than<br>Once per Max($T_{Report}$, P * $T_{SSB}$) if no DRX is used,<br>Once per Max($T_{Report}$, Ceil(1.5 * P) * Max($T_{DRX}$, $T_{SSB}$)) if DRX cycle ≤ 320ms,<br>Once per P * $T_{DRX}$ if DRX cycle > 320ms. | |
| Note 3: $L1_{max}$ =7 for Max($T_{DRX}$,$T_{SSB}$) ≤ 40ms assuming $T_{DRX}$=0 for non-DRX,<br>$L1_{max}$ =5 for 40ms < Max($T_{DRX}$, $T_{SSB}$) ≤ 320ms,<br>$L1_{max}$ =3 for $T_{DRX}$ > 320ms. | |

**Table 9.5A.4.1-2: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$ for FR2-2**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$ (ms) |
|---|---|
| non-DRX | max($T_{Report}$, ceil((M+L1)*P*N)*$T_{SSB}$) |
| DRX cycle ≤ 320 ms | max($T_{Report}$, ceil(1.5*(M+L1)*P*N)*max($T_{DRX}$,$T_{SSB}$)) |
| DRX cycle > 320 ms | ceil(1.5*(M+L1)*P*N)*$T_{DRX}$ |
| Note 1: $T_{SSB}$ = *ssb-periodicityServingCell* is the periodicity of the SSB-Index configured for L1-RSRP measurement.<br>$T_{DRX}$ is the DRX cycle length.<br>$T_{Report}$ is configured periodicity for reporting. | |
| Note 2: L1=0 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured. Otherwise, when DRX is not configured L1 is the number of SSB occasion groups not available at the UE during $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$, where L1 ≤ $L1_{max}$. An SSB occasions group consists of N consecutive SSB occasions, and the SSB occasions group is not available at the UE when at least one SSB occasion in the group is not transmitted by the gNB. When DRX is configured, L1 is the number of DRX cycle groups in which at least one SSB occasion is not available at the UE during $T_{L1\text{-}RSRP_Measurement_Period_SSB_CCA}$, where L1 ≤ $L1_{max}$. A DRX group consists of N DRX cycles, and the DRX cycle group is not available when there is at least one DRX in which at least one SSB occasion is not available. The UE is not required to determine the availability of SSB occasions more frequent than once per DRX cycle length, when configured with DRX. | |
| Note 3: $L1_{max}$ =7 for Max($T_{DRX}$,$T_{SSB}$) ≤ 40ms assuming $T_{DRX}$=0 for non-DRX,<br>$L1_{max}$ =5 for 40ms < Max($T_{DRX}$, $T_{SSB}$) ≤ 320ms,<br>$L1_{max}$ =3 for $T_{DRX}$ > 320ms. | |

## 9.5A.5 Measurement restriction for L1-RSRP measurement

The UE is required to be capable of measuring SSB for L1-RSRP without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

### 9.5A.5.1 Measurement restriction for SSB based L1-RSRP

When the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;

- If SSB and CSI-RS have different SCS,

- If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;

- If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure SSB for L1-RSRP measurement.

## 9.5A.6 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions when the UE is performing L1-RSRP measurement are described in the following clauses.

### 9.5A.6.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.5A.6.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on serving cell where L1-RSRP measurement is performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols. When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-RSRP measurement is performed is configured.

### 9.5A.6.3 Void

### 9.5A.6.3A Scheduling availability of UE performing L1-RSRP measurement in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR2 serving cell(s) due to L1-RSRP measurement performed on serving cell(s) under CCA.

### 9.5A.6.3B Scheduling availability of UE performing L1-RSRP measurement on FR2-2

The following scheduling restriction applies due to L1-RSRP measurement on an FR2-2 serving PCell and/or PSCell.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on

  - symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and/or

  - symbols corresponding to the periodic CSI-RS resource configured for L1-RSRP measurement, and/or

  - symbols corresponding to the semi-persistent CSI-RS resource configured for L1-RSRP measurement when the resource is activated, and/or

  - symbols corresponding to the aperiodic CSI-RS resource configured for L1-RSRP measurement when the reporting is triggered.

When intra-band carrier aggregation in FR2-2 is performed, the scheduling restrictions on serving cell where L1-RSRP measurement is performed apply to all serving cells in the band on the symbols that fully or partially overlap with restricted symbols.

For FR2-2, if following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for L1-RSRP measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for L1-RSRP measurement.

#### 9.5A.6.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to L1-RSRP measurement performed on FR2-2 serving cell(s) under CCA.

There are no scheduling restrictions on FR2 serving cell(s) due to L1-RSRP measurement performed on FR1 serving cell(s) under CCA.

## 9.5B L1-RSRP measurements for Reporting for RedCap

### 9.5B.1 Introduction

The applicability of the requirements for performing L1-RSRP measurements for reporting in subclause 9.5B is defined in clause 3.6. The SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not additional specified.

When configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP. The measurements shall be performed for PCell, on the resources configured for L1-RSRP measurements within the active BWP.

The UE shall be able to measure all CSI-RS resources and/or SSB resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet* within the CSI-Resource*Config* settings configured for L1-RSRP for the active BWP, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

### 9.5B.2 Requirements applicability

The requirements in clause 9.5B apply, provided:

- The CSI-RS or SSB or CSI-RS and SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

For 1 Rx RedCap:

- L1-RSRP related side conditions given in clause 10.1A.14.1 for FR1, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.4.1 for a corresponding band.

For 2 Rx RedCap:

- L1-RSRP related side conditions given in clauses 10.1.19.1 and 10.1.20.1 for FR1 and FR2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.4.1 for a corresponding band.

A CSI-RS resource configured for L1-RSRP shall be considered measurable when for each relevant CSI-RS the following conditions are met:

For 1 Rx RedCap:

- L1-RSRP related side conditions given in clause 10.1A.14.2 for FR1, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.4.2 for a corresponding band.

For 2 Rx RedCap:

- L1-RSRP related side conditions given in clauses 10.1.19.2 and 10.1.20.2 for FR1 and FR2, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.4.2 for a corresponding band.

A CSI-RS and SSB resource configured for L1-RSRP shall be considered measurable when the measurable resource conditions are met for both CSI-RS resource and SSB resource.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

## 9.5B.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1dB step size according to clause 10.1A.14 for FR1, for 1 Rx RedCap, and clause 10.1.19 for FR1 and clause 10.1.20 for FR2 for 2 Rx RedCap, if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1A.14 for FR1, for 1 Rx RedCap, and clause 10.1.19 for FR1 and clause10.1.20 for FR2 for 2 Rx RedCap. The differential L1-RSRP is quantized to a 4-bit value with 2dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6.

### 9.5B.3.1 Periodic Reporting

For 1 Rx RedCap, reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clause 10.1A.14 for FR1.

For 2 Rx RedCap, reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5B.3.2 Semi-Persistent Reporting

For 1 Rx RedCap, reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clause 10.1A.14 for FR1. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

For 2 Rx RedCap, reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5B.3.3 Aperiodic Reporting

For 1 Rx RedCap, reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clause 10.1A.14.

For 2 Rx Redcap, reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send aperiodic L1-RSRP measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

## 9.5B.4 L1-RSRP measurement requirements

### 9.5B.4.1 SSB based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ is defined in table 9.5B.4.1-1 for FR1 and table 9.5B.4.1-2 for FR2, for 2 Rx RedCap, and table 9.5B.4.1-3 for FR1 for 1 Rx RedCap, where

- M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise.
- N= 8.

For FR1,

- $P=\frac{1}{1-\frac{T_{SSB}}{MRGP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB; and
- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- $P=\frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when SSB is not overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).
- P is $P_{sharing\ factor}$, when SSB is not overlapped with measurement gap and SSB is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).
- $P=\frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq MGRP$ or
  - $T_{SMTCperiod} = MGRP$ and $T_{SSB} < 0.5*T_{SMTCperiod}$
- P is $\frac{P_{sharing\ factor}}{1-\frac{T_{SSB}}{MGRP}}$, when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod} = MGRP$ and $T_{SSB} = 0.5*T_{SMTCperiod}$

- P= $\frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when S SSB is partially overlapped with measurement gap ($T_{SSB}$ <MGRP) and SSB is partially overlapped with SMTC occasion ($T_{SSB}$ < $T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.

- P is $\frac{P_{\text{sharing factor}}}{1-\frac{T_{SSB}}{MRGP}}$, when SSB is partially overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ($T_{SSB}$ = $T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod}$ < MGRP)

- $P_{\text{sharing factor}}$ = 1, if the SSB configured for L1-RSRP measurement outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,

- $P_{\text{sharing factor}}$ = 3, otherwise.

Where:

- $T_{SSB}$ = *ssb-periodicityServingCell*

- $T_{SMTCperiod}$ = the configured SMTC period

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 9.5B.4.1-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$ (FR1) for 2 Rx RedCap**

| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE: $T_{SSB}$ = *ssb-periodicityServingCell* is the periodicity of the SSB-Index configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |

## 9.5B.4.2 CSI-RS based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ is defined in table 9.5B.4.2-1 for FR1 and in table 9.5B.4.2-2 for FR2, for 2 Rx RedCap, and in table 9.5B.4.2-3 for 1 Rx RedCap, where

- For periodic and semi-persistent CSI-RS resources, M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- For aperiodic CSI-RS resources M=1
- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply if *qcl-InfoPeriodicCSI-RS* is configured for all the resources in the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured with QCL-TypeD for all resources in the resource set.
- For semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply provided TCI state is provided for all resources in the resource set in the MAC CE activating the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided TCI state is provided with QCL-TypeD for all resources in the resource set in the MAC CE activating the resource set.
- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply provided *qcl-info* is configured for all resources in the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=1. UE is not required to meet the accuracy requirements in clauses 10.1.19.2 and 10.1.20.2 if number of resources in the resource set is smaller than *maxNumberRxBeam*. The requirements apply provided *qcl-info* is configured with QCL-TypeD for all resources in the resource set.

For FR1,

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and

- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the CSI-RS.

For FR2,

- P=1, when CSI-RS is not overlapped with measurement gap and also not overlapped with SMTC occasion.

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when CSI-RS is partially overlapped with measurement gap and CSI-RS is not overlapped with SMTC occasion ($T_{CSI-RS} < MGRP$)

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is not overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).

- $P=P_{sharing\ factor}$, when CSI-RS is not overlapped with measurement gap and CSI-RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).

- P=1, when aperiodic CSI-RS resource is not overlapped with measurement gap

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is partially overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion (TCSI-RS < $T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq MGRP$ or

  - $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} < 0.5*T_{SMTCperiod}$

- $P=\frac{3}{1-\frac{T_{CSI-RS}}{MGRP}}$, when CSI-RS is partially overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod} = MGRP$ and $T_{CSI-RS} = 0.5*T_{SMTCperiod}$

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is partially overlapped with measurement gap ($T_{CSI-RS} < MGRP$) and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.

- $P=\frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{MGRP}}$, when CSI-RS is partially overlapped with measurement gap and CSI-RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} < MGRP$)

- $P_{sharing\ factor} = 1$, if the CSI-RS configured for L1-RSRP measurement outside measurement gap is

  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured

- $P_{sharing\ factor} = 3$, otherwise.

Where:

$T_{SMTCperiod}$ = the configured SMTC period.

$T_{CSI-RS}$ = the periodicity of CSI-RS configured for L1-RSRP measurement

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

NOTE: The overlap between CSI-RS for L1-RSRP measurement and SMTC means that CSI-RS for L1-RSRP measurement is within the SMTC window duration.

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 serving cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

## 9.5B.5 Measurement restriction for CSI-RS and SSB for L1-RSRP measurement

The UE is required to be capable of measuring SSB and CSI-RS for L1-RSRP without measurement gaps. The UE is required to perform the SSB and CSI-RS measurements with measurement restrictions as described in the following clauses.

### 9.5B.5.1 Measurement restriction for SSB based L1-RSRP

For FR1, when the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not *support simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the SSB for L1-RSRP measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

### 9.5B.5.2 Measurement restriction for CSI-RS based L1-RSRP

For both FR1 and FR2, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

## 9.5B.6 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions when the UE is performing L1-RSRP measurement are described in the following clauses.

### 9.5B.6.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

For FD-FDD and TDD RedCap UEs, there are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

For HD-FDD RedCap UE, scheduling restrictions apply for transmission on PUCCH/PUSCH/SRS during the CBD evaluation period, as CBD evaluation is prioritized over UL transmission. The CBD evaluation period equals the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$ in case L1-RSRP measurement is performed on SSB as defined in clause 9.5B.4.1, or $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ in case L1-RSRP measurement is performed on CSI-RS and/or SSB as defined in clause 9.5B.4.1.

### 9.5B.6.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- For FD-FDD and TDD RedCap UEs, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.
- For HD-FDD RedCap UE, scheduling restrictions apply for transmission on PUCCH/PUSCH/SRS during the CBD evaluation period, as CBD evaluation is prioritized over UL transmission. The CBD evaluation period equals the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_RedCap}$ in case L1-RSRP measurement is performed on SSB as defined in clause 9.5B.4.1, or $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_RedCap}$ in case L1-RSRP measurement is performed on CSI-RS and/or SSB as defined in clause 9.5B.4.1.

### 9.5B.6.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to L1-RSRP measurement.

- For the case where RS for L1-RSRP measurement is CSI-RS which is QCLed with active TCI state for PDCCH/PDSCH and not in a CSI-RS resource set with repetition ON, and N=1 applies as specified in clause 9.5B.4.2
  - There are no scheduling restrictions due to L1-RSRP measurement performed based on the CSI-RS.
- Otherwise
  - The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on
    - symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and/or
    - symbols corresponding to the periodic CSI-RS resource configured for L1-RSRP measurement, and/or
    - symbols corresponding to the semi-persistent CSI-RS resource configured for L1-RSRP measurement when the resource is activated, and/or
    - symbols corresponding to the aperiodic CSI-RS resource configured for L1-RSRP measurement when the reporting is triggered.

If following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE’s reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for L1-RSRP measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for L1-RSRP measurement.

# 9.5C L1-RSRP measurements for Reporting for satellite access

## 9.5C.1 Introduction

When configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP. The measurements shall be performed for PCell on the resources configured for L1-RSRP measurements within the active BWP.

The UE shall be able to measure all CSI-RS resources and/or SSB resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet* within the *CSI-ResourceConfig* settings configured for L1-RSRP for the active BWP, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

## 9.5C.2 Requirements applicability

The requirements in clause 9.5C apply, provided:

- The CSI-RS or SSB or CSI-RS and SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clause 10.1.19C.1 for FR1-NTN, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.19.1 for a corresponding band.

A CSI-RS resource configured for L1-RSRP shall be considered measurable when for each relevant CSI-RS the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.1.19C.2 for FR1-NTN, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.19.2 for a corresponding band.

A CSI-RS and SSB resource configured for L1-RSRP shall be considered measurable when the measurable resource conditions are met for both CSI-RS resource and SSB resource.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

## 9.5C.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1 dB step size according to clause 10.1.19C for FR1-NTN if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19C for FR1-NTN. The differential L1-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6.

### 9.5C.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clause 10.1.19C.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5C.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clause 10.1.19C. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5C.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clause 10.1.19C.

The UE shall only send aperiodic L1-RSRP measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

## 9.5C.4 L1-RSRP measurement requirements

### 9.5C.4.1 SSB based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_SAN}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_SAN}$ is defined in table 9.5C.4.1-1 for FR1-NTN, where

- M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- P value for SSB resource to be measured is defined as
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
- For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any SSB resource occasion:
  - $N_{total}$ is the total number of SSB resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is

- the number of SSB resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction-r17* and LEO satellites are measured for intra-frequency measurement, and
- same as $N_{outside_MG}$, otherwise

- $T_{L1}$ is periodicity of the target SSB.
- $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 9.5C.4.1-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_SAN}$ for FR1-NTN**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_SSB_SAN}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{SSB})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX},T_{SSB}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE: $T_{SSB}$ = *ssb-periodicityServingCell* is the periodicity of the SSB-Index configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |

## 9.5C.4.2 CSI-RS based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_SAN}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ is defined in table 9.5C.4.2-1 for FR1-NTN, where

- For periodic and semi-persistent CSI-RS resources, M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- For aperiodic CSI-RS resources M=1
- P value for a CSI-RS resource to be measured is defined as
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
- For a window W of duration $\max(T_{L1}, MGRP_max)$, where MGRP_max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any CSI-RS resource occasion:
  - $N_{total}$ is the total number of CSI-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{outside_MG}$ is the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is
    - the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction-r17* and LEO satellites are measured for intra-frequency measurement, and
    - same as $N_{outside_MG}$, otherwise
  - $T_{L1}$ is periodicity of the target CSI-RS.
  - $P_{sharing\ factor} = 3$.

NOTE: The overlap between CSI-RS for L1-RSRP measurement and SMTC means that CSI-RS for L1-RSRP measurement is within the SMTC window duration.

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 9.5C.4.2-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_SAN}$ for FR1-NTN**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_SAN}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{CSI\text{-}RS})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX}, T_{CSI\text{-}RS}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3. | |

## 9.5C.5 Measurement restriction for L1-RSRP measurement

The UE is required to be capable of measuring SSB and CSI-RS for L1-RSRP without measurement gaps. The UE is required to perform the SSB and CSI-RS measurements with measurement restrictions as described in the following clauses.

### 9.5C.5.1 Measurement restriction for SSB based L1-RSRP

For FR1-NTN, when the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

### 9.5C.5.2 Measurement restriction for CSI-RS based L1-RSRP

For FR1-NTN, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

For FR1-NTN, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1-NTN, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR1-NTN, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

## 9.5C.6 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions when the UE is performing L1-RSRP measurement are described in the following clauses. For UL, the scheduling restriction applies to UL symbols that fully or partially overlap with the restricted symbols as defined below.

### 9.5C.6.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1-NTN

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1-NTN.

### 9.5C.6.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1-NTN

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

## 9.5C.7 L1-RSRP measurement requirements for NTN band above 10 GHz

### 9.5C.7.1 SSB based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_SAN}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_SAN}$ is defined in table 9.5C.7.1-1, where

- M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- P value for SSB resource to be measured is defined as
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
- For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any SSB resource occasion:
  - $N_{total}$ is the total number of SSB resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is same as $N_{outside_MG}$
  - $T_{L1}$ is periodicity of the target SSB.
  - $P_{sharing\ factor} = 3$.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 9.5C.7.1-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_SAN}$**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_SSB_SAN}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{SSB})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX},T_{SSB}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE: $T_{SSB}$ = *ssb-periodicityServingCell* is the periodicity of the SSB-Index configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |

## 9.5C.7.2 CSI-RS based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_SAN}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ is defined in table 9.5C.7.2-1, where

- For periodic and semi-persistent CSI-RS resources, M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- For aperiodic CSI-RS resources M=1
- P value for a CSI-RS resource to be measured is defined as
  - $P_{sharing\ factor} * N_{total} / N_{outside_MG}$ with $N_{available} = 0$
  - $N_{total} / N_{available}$ with $N_{available} > 0$
- For a window W of duration $\max(T_{L1}, \text{MGRP_max})$, where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any CSI-RS resource occasion:
  - $N_{total}$ is the total number of CSI-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{outside_MG}$ is the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is
    - the number of SSB resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W, if UE does not support *parallelMeasurementWithoutRestriction-r17* and LEO satellites are measured for intra-frequency measurement, and
    - same as $N_{outside_MG}$, otherwise
  - $T_{L1}$ is periodicity of the target CSI-RS.
  - $P_{sharing\ factor} = 3$.

NOTE: The overlap between CSI-RS for L1-RSRP measurement and SMTC means that CSI-RS for L1-RSRP measurement is within the SMTC window duration.

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet previous conditions.

**Table 9.5C.7.2-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_SAN}$**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_SAN}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{CSI\text{-}RS})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX},T_{CSI\text{-}RS}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |

| | |
|---|---|
| NOTE 1: | $T_{CSI-RS}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. |
| NOTE 2: | the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3. |

## 9.5C.8 Measurement restriction for L1-RSRP measurement for NTN band above 10 GHz

The UE is required to be capable of measuring SSB and CSI-RS for L1-RSRP without measurement gaps. The UE is required to perform the SSB and CSI-RS measurements with measurement restrictions as described in the following clauses.

### 9.5C.8.1 Measurement restriction for SSB based L1-RSRP

L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

### 9.5C.8.2 Measurement restriction for CSI-RS based L1-RSRP

For NTN bands above 10 GHz, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

For NTN bands above 10 GHz, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For NTN bands above 10 GHz, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For NTN bands above 10 GHz, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

## 9.5C.9 Scheduling availability of UE during L1-RSRP measurement for NTN band above 10 GHz

Scheduling availability restrictions when the UE is performing L1-RSRP measurement are described in the following clauses. For UL, the scheduling restriction applies to UL symbols that fully or partially overlap with the restricted symbols as defined below.

### 9.5C.9.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on NTN bands above 10 GHz

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH.

### 9.5C.9.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on NTN bands above 10 GHz

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

## 9.5D L1-RSRP measurements for Reporting for ATG

### 9.5D.1 Introduction

When configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP. The measurements shall be performed for a serving cell, including PCell or SCell, on the resources configured for L1-RSRP measurements within the active BWP.

The UE shall be able to measure all CSI-RS resources and/or SSB resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet* within the *CSI-ResourceConfig* settings configured for L1-RSRP for the active BWP, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

### 9.5D.2 Requirements applicability

The requirements in clause 9.5D apply, provided:

- The CSI-RS or SSB or CSI-RS and SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clause 10.1.19.1 for FR1, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.4.1 for a corresponding band.

A CSI-RS resource configured for L1-RSRP shall be considered measurable when for each relevant CSI-RS the following conditions are met:

- L1-RSRP related side conditions given in clause 10.1.19.2 for FR1, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.4.2 for a corresponding band.

A CSI-RS and SSB resource configured for L1-RSRP shall be considered measurable when the measurable resource conditions are met for both CSI-RS resource and SSB resource.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

## 9.5D.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1 dB step size according to clause 10.1.19 for FR1 if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19 for FR1. The differential L1-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6.

### 9.5D.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clause 10.1.19 for FR1.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5D.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clause 10.1.19 for FR1. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5D.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clause 10.1.19 for FR1.

The UE shall only send aperiodic L1-RSRP measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

## 9.5D.4 L1-RSRP measurement requirements

### 9.5D.4.1 SSB based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_ATG}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_ATG}$ is defined in table 9.5D.4.1-1 for FR1, where

- M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise

For ATG UE with the capable of *antennaArrayType-r18* on the measured carrier,

P value for SSB resource to be measured is defined as

- $N_{total}$ / $N_{available}$ with $N_{available} > 0$
- $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ with $N_{available} = 0$

- For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any SSB resource occasion:
  - $N_{total}$ is the total number of SSB resource occasions within the window W, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
  - $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is
    - if the measured carrier is the SCC with *servingcellMO* configured, and the network indication *neighSCellMeasSkipping* is set to 'enable' to UE
      - if inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams
        - the number of SSB resource occasions that are not overlapped with any measurement gap occasion within the window W
      - otherwise,
        - the number of SSB resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements of other serving cell within the window W
    - otherwise,
      - if inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams
        - the number of SSB resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements of same serving cell within the window W
      - otherwise,
        - the number of SSB resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements within the window W
  - $T_{L1}$ is periodicity of the target SSB
  - $P_{sharing\ factor} = 3$.

Otherwise, for UE with one or multiple omni-directional antennas

For a UE supporting *concurrentMeasGap-r17* and when concurrent gaps are configured,

- P value for SSB resource to be measured is defined as
  - $N_{total} / N_{outside_MG}$
- For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any SSB resource occasion:
  - $N_{total}$ is the total number of SSB resource occasions within the window W, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
  - $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $T_{L1}$ is periodicity of the target SSB.

Otherwise, for a UE not supporting *concurrentMeasGap-r17* or when concurrent gaps are not configured,

- $P=\frac{1}{1-\frac{T_{SSB}}{xGP}}$, when in the monitored cell there are GAPs configured for intra-frequency or inter-frequency, which are overlapping with some but not all occasions of the SSB; and
- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the SSB.

Where:

- $T_{SSB}$ = *ssb-periodicityServingCell* of the serving cell
- an SSB or an SMTC occasion is considered to be overlapped with the GAP if it overlaps a measurement gap occasion, and
  - xRP = MGRP

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and GAP configurations does not meet previous conditions.

**Table 9.5D.4.1-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_ATG}$ for FR1**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_SSB_ATG}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{SSB})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX},T_{SSB}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE: $T_{SSB}$ = *ssb-periodicityServingCell* is the periodicity of the SSB-Index configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |

## 9.5D.4.2 CSI-RS based L1-RSRP Reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_ATG}$.

- For periodic and semi-persistent CSI-RS resources, M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- For aperiodic CSI-RS resources M=1

For ATG UE capable of *antennaArrayType-r18* on the measured carrier,

- P value for a CSI-RS resource to be measured is defined as
  - $N_{total}$ / $N_{available}$ with $N_{available}$ > 0
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ with $N_{available}$ = 0
  - For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any CSI-RS resource occasion:
    - $N_{total}$ is the total number of CSI-RS resource occasions within the window W, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
    - $N_{outside_MG}$ is the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
    - $N_{available}$ is
      - if the measured carrier is the SCC with *servingcellMO* configured, and the network indication *neighSCellMeasSkipping* is set to ‘enable’ to UE,

- if inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams

- the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W

- otherwise,

- the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements of other serving cell within the window W

- otherwise,

- if inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams

- the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements of same serving cell within the window W

- otherwise,

- the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements within the window W

- $T_{L1}$ is periodicity of the target CSI-RS

- $P_{sharing\ factor} = 3$.

Otherwise, for UE with one or multiple omni-directional antenna(s)

For a UE supporting *concurrentMeasGap-r17* and when concurrent gaps are configured,

- P value for a CSI-RS resource to be measured is defined as

  - $N_{total}$ / $N_{outside_MG}$ in FR1

- For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any CSI-RS resource occasion:

  - $N_{total}$ is the total number of CSI-RS resource occasions within the window W, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and

  - $N_{outside_MG}$ is the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W

  $T_{L1}$ is periodicity of the target CSI-RS.

Otherwise, for a UE not supporting *concurrentMeasGap-r17* or when concurrent gaps are not configured,

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and

- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the CSI-RS.

Where:

$T_{CSI-RS}$ = the periodicity of CSI-RS configured for L1-RSRP measurement

- a CSI-RS or an SMTC occasion is considered to be as overlapped with the GAP if it overlaps a measurement gap occasion, and

- xRP = MGRP

**Table 9.5D.4.2-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_ATG}$ for FR1**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_ATG}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{CSI\text{-}RS})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX},T_{CSI\text{-}RS}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting.<br>NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3. | |

## 9.5D.5 Measurement restriction for CSI-RS and SSB for L1-RSRP measurement

The UE is required to be capable of measuring SSB and CSI-RS for L1-RSRP without measurement gaps. The UE is required to perform the SSB and CSI-RS measurements with measurement restrictions as described in the following clauses.

### 9.5D.5.1 Measurement restriction for SSB based L1-RSRP

For FR1, when the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

### 9.5D.5.2 Measurement restriction for CSI-RS based L1-RSRP

The SSB mentioned in this clause can be associated with the serving cell PCI.

For FR1, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

## 9.5D.6 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions described in the following clauses apply when the UE is performing L1-RSRP measurement on serving cell, and UE is receiving PDCCH/PDSCH from serving cell and/or cell(s) with different PCI.

### 9.5D.6.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.5D.6.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on serving cell where L1-RSRP measurement is performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-RSRP measurement is performed is configured.

# 9.5E L1-RSRP measurements for Reporting for RedCap UEs with satellite access

## 9.5E.1 Introduction

The requirements in clause 9.5C.1 apply.

## 9.5E.2 Requirements applicability

The requirements in clause 9.5E apply, provided:

- The CSI-RS or SSB or CSI-RS and SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

For 1 Rx RedCap UE with NTN:

- L1-RSRP related side conditions given in clauses 10.1.19F.2 for FR1, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.19.2 for a corresponding band.

For 2 Rx RedCap UE with NTN:

- L1-RSRP related side conditions given in clauses 10.1.19F.2 for FR1, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.19.2 for a corresponding band.

A CSI-RS resource configured for L1-RSRP shall be considered measurable when for each relevant CSI-RS the following conditions are met:

For 1 Rx RedCap UE with NTN:

- L1-RSRP related side conditions given in clauses 10.1.19F.2 for FR1, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.19.2 for a corresponding band.

For 2 Rx RedCap UE with NTN:

- L1-RSRP related side conditions given in clauses 10.1.19F.2 for FR1, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.19.2 for a corresponding band.

A CSI-RS and SSB resource configured for L1-RSRP shall be considered measurable when the measurable resource conditions are met for both CSI-RS resource and SSB resource.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

## 9.5E.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1 dB step size according to clause 10.1.19F for FR1 for 2 Rx RedCap UE with NTN, and clause 10.1.19F for FR1 for 1 Rx RedCap UE with NTN, if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19F for FR1 for 2 Rx RedCap UE with NTN, and clause 10.1.19F for FR1 for 1 Rx RedCap UE with NTN. The differential L1-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6.

### 9.5E.3.1 Periodic Reporting

For 1 Rx RedCap UE with NTN, reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clause 10.1.19F for FR1.

For 2 Rx RedCap UE with NTN, reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clause 10.1.19F.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5E.3.2 Semi-Persistent Reporting

For 1 Rx RedCap UE with NTN, reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clause 10.1.19F. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

For 2 Rx RedCap UE with NTN, reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clause 10.1.19F. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5E.3.3 Aperiodic Reporting

For 1 Rx RedCap UE with NTN, reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clause 10.1.19F.

For 2 Rx RedCap UE with NTN, reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clause 10.1.19F.

The UE shall only send aperiodic L1-RSRP measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

## 9.5E.4 L1-RSRP measurement requirements

### 9.5E.4.1 SSB based L1-RSRP Reporting

The requirements in clause 9.5C.4.1 shall apply for both 1Rx and 2Rx RedCap UE.

### 9.5E.4.2 CSI-RS based L1-RSRP Reporting

For HD-FDD RedCap UE indicating *CollisionHandlingOfHDFDDOperation*, the requirements in clause 9.5C.4.2 shall apply, provided that the following conditions are met:

- there is no collision between the CSI-RS resources for L1-RSRP measurements and UL transmission when network indicates *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision*, or
- in case of collision between the CSI-RS resources for L1-RSRP measurements and UL transmission except PRACH, and *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* is not indicated by network.
- there is no collision between the CSI-RS resources for L1-RSRP measurements and PRACH.

Otherwise, the requirements in clause 9.5C.4.2 shall apply.

## 9.5E.5 Measurement restriction for L1-RSRP measurement

The requirements in clause 9.5C.5 shall apply for both 1Rx and 2Rx RedCap UE, when the L1-RSRP measurement requirements in 9.5E.4 are applicable.

## 9.5E.6 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions when the UE is performing L1-RSRP measurement are described in the following clauses. For UL, the scheduling restriction applies to UL symbols that fully or partially overlap with the restricted symbols as defined below.

### 9.5E.6.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

For FD-FDD and TDD RedCap UEs, there are no scheduling restrictions due to L1-RSRP measurement performed on SSB and CSI-RS configured as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

For HD-FDD RedCap UE, scheduling restrictions apply for transmission on PUCCH/PUSCH/SRS during L1-RSRP measurement period, except when UE indicates *CollisionHandlingOfHDFDDOperation* and is indicated that UL transmission is prioritized over L1-RSRP measurement via *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* in case of collision between CSI-RS resources to be measured and UL transmission. .

### 9.5E.6.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14], the requirements in clause 9.5E.6.1 shall apply.

For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement. The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

# 9.5F L1-RSRP measurements Reporting for Beam Prediction

## 9.5F.1 Introduction

For UE supporting *UE-sided RS- prediction for reportQuantity-r19 and nroftimeinstance-r19* is not configured, when configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP for determine the reported P-CRI. For UE supporting UE-sided RS prediction with p-cri-RSRP-r19 for *reportQuantity-r19* and *nroftimeinstance-r19* is not configured, when configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP for determine the reported P-CRI, and P-L1-RSRP.

For UE supporting *UE-sided RS- prediction for reportQuantity-r19 with 'p-cri-r19' or 'p-ssb-index-r19' and nroftimeinstance-r19* is configured, when configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP for determine the reported P-CRI, P-SSBRI. For UE supporting UE-sided RS prediction *for reportQuantity-r19* with '*p-cri-RSRP-r19*' or *'p-ssb-Index-RSRP-r19'* and *nroftimeinstance-r19* is configured, when configured by the network, the UE shall be able to perform L1-RSRP measurements of configured CSI-RS, SSB or CSI-RS and SSB resources for L1-RSRP for determine the reported P-CRI, and P-L1-RSRP.

The measurements shall be performed for a serving cell, including PCell, on the resources configured for L1-RSRP measurements within the active BWP.

The UE shall be able to measure all CSI-RS resources and/or SSB resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet* within the CSI-Resource*Config* settings configured for L1-RSRP for the active BWP, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity-r19 set to 'p-cri-r19', 'p-cri-RSRP-r19', 'p-ssb-index-r19' or 'p-ssb-index-RSRP-r19'*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

## 9.5F.2 Requirements applicability

The requirements in clause 9.5F apply, provided:

- The CSI-RS or SSB or CSI-RS and SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.x for FR2 for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.4.1 for a corresponding band.

A CSI-RS resource configured for L1-RSRP shall be considered measurable when for each relevant CSI-RS the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.x for FR2, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex [B.2x] for a corresponding band.

A CSI-RS and SSB resource configured for L1-RSRP shall be considered measurable when the measurable resource conditions are met for both CSI-RS resource and SSB resource.

Requirements are defined for periodic, semi-persistent and aperiodic resources, with the exception for UE sided RS prediction when *nroftimeinstance-r19* is configured, it is not applicable for aperiodic CSI-RS resources.

For UE sided RS prediction when *nroftimeinstance-r19* is not configured, there is no requirement if UE is configured with *reportQuantity-r19* set to 'p-ssb-index-r19' or 'p-ssb-index-RSRP-r19'.

For UE sided RS prediction when *nroftimeinstance-r19* is configured, there is no requirement if higher layer parameter *timeRestrictionForChannelMeasurement* is not configured.

## 9.5F.3 Measurement Reporting Requirements

For a *CSI-ReportConfig* with *reportQuantity-r19* set to 'p-cri-r19', 'p-ssb-index-r19', the UE shall send P-CRI, P-SSBRI reports only for report configurations configured for the active BWP.

For a *CSI-ReportConfig* with *reportQuantity-r19* set to 'p-cri-r19', 'p-cri-RSRP-r19', 'p-ssb-index-r19' or 'p-ssb-index-RSRP-r19', the UE shall send P-CRI, P-SSBRI, and P-L1-RSRP reports only for report configurations configured for the active BWP. The UE shall report the P-L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1dB step size according to clause 10.x for FR2 if *nroftimeinstance-r19* is not configured or *nroftimeinstance-r19* is configured with the value set to 1, and if *nrofreportedpredictedrs-r19* is configured to be one. If *nroftimeinstance-r19* is not configured or *nroftimeinstance-r19* is configured with the value set to 1, and if *nrofreportedpredictedrs-r19* is configured to be larger than 1, the UE shall use differential L1-RSRP based reporting as defined in clause 10.x for FR2. The largest predicted value of P-L1-RSRP is quantized to a 7-bit value in the range [-140, -44] dBm with 1dB step size and the differential P-L1-RSRP value is computed with 2 dB step size with a reference to the largest P-L1-RSRP value which is part of the same P-L1-RSRP reporting instance. The mapping between the reported P-L1-RSRP value and the predicted L1-RSRP quantity is described in 10.x.

### 9.5F.3.1 Periodic Reporting

Reported P-CRI, P-SSBRI, and/or P-L1-RSRP contained in periodic P-CRI, P-SSBRI, and/or P-L1-RSRP reports shall meet the requirements in clauses 10.x for P-CRI, P-SSBRI, and in clause 10.x for P-L1-RSRP, respectively.

The UE shall only send periodic P-CRI, P-SSBRI, and/or P-L1-RSRP reports for an active BWP.

The UE shall transmit the periodic P-CRI, P-SSBRI, and/or P-L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5F.3.2 Semi-Persistent Reporting

Reported P-CRI, P-SSBRI, and/or P-L1-RSRP contained in a Semi-Persistent P-CRI, P-SSBRI, and/or P-L1-RSRP report shall meet the requirements in clauses 10.1.20 for FR2. This requirement applies for semi-persistent P-CRI, P-SSBRI, and/or P-L1-RSRP P reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent P-CRI, P-SSBRI, and/or P-L1-RSRP reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent P-CRI, P-SSBRI, and/or P-L1-RSRP reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent P-CRI, P-SSBRI, and/or P-L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.5F.3.3 Aperiodic Reporting

Reported P-CRI, and/or P-L1-RSRP contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent reports shall meet the requirements in clauses 10.1.20 for P-CRI, and in clause 10.x for P-L1-RSRP, respectively.

The UE shall only send aperiodic P-CRI, and/or P-L1-RSRP reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic P-CRI, and/or P-L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

## 9.5F.4 L1-RSRP measurement and prediction requirements

### 9.5F.4.1 SSB based RS prediction reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting P-CRI, P-SSBRI, and/or P-L1-RSRP based on the L1-RSRP measurements over the prediction period of $T_{L1\text{-}RSRP_Prediction_Period_SSB}$.

The value of $T_{L1\text{-}RSRP_Prediction_Period_SSB}$ is defined in Table 9.5F.4.1-2 for FR2, where

- For UE sided RS prediction when *nroftimeinstance-r19* is not configured, M= 1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise; And for UE sided RS prediction when *nroftimeinstance-r19* is configured, M =1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured

- N= 8

- $K_{BM}$=1 for UE sided RS prediction when *nroftimeinstance-r19* is not configured. And for UE sided RS prediction when *nroftimeinstance-r19* is configured, $K_{BM}$ is indicated by *UE capability on number of latest consecutive transmission occasion*.

For FR2,

- $P=\frac{1}{1-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when SSB is not overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$).

- P is $P_{sharing\ factor}$, when SSB is not overlapped with measurement gap and SSB is fully overlapped with SMTC period ($T_{SSB} = T_{SMTCperiod}$).

- $P=\frac{1}{1-\frac{T_{SSB}}{MGRP}-\frac{T_{SSB}}{T_{SMTCperiod}}}$, when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB} < 0.5*T_{SMTCperiod}$

- P is $\frac{1}{1-\frac{T_{SSB}}{MGRP}}$* $P_{sharing\ factor}$, when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{SSB} = 0.5*T_{SMTCperiod}$

- $P=\frac{1}{1-\frac{T_{SSB}}{\min(T_{SMTCperiod},MGRP)}}$, when SSB is partially overlapped with measurement gap ($T_{SSB}$ <MGRP) and SSB is partially overlapped with SMTC occasion ($T_{SSB} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.

- P is $\frac{1}{1-\frac{T_{SSB}}{MRGP}}$* $P_{sharing\ factor}$, when SSB is partially overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} <$ MGRP)

- P is $\frac{1}{1-\frac{T_{SSB}}{MGRP}}$* $P_{sharing\ factor}$, when SSB is partially overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ($T_{SSB} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod} <$ MGRP)$P_{sharing\ factor}$ = 1

  - not overlapped with the SSB symbols indicated by SSB-ToMeasure and 1 data symbol before each consecutive SSB symbols indicated by SSB-ToMeasure and 1 data symbol after each consecutive SSB symbols indicated by SSB-ToMeasure, given that SSB-ToMeasure is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

  - not overlapped with the RSSI symbols indicated by ss-RSSI-Measurement and 1data symbol before each RSSI symbol indicated by ss-RSSI-Measurement and 1 data symbol after each RSSI symbol indicated by ss-RSSI-Measurement, given that ss-RSSI-Measurement is configured,

- $P_{sharing\ factor}$ = 3, otherwise.

Where:

$T_{SSB}$ = ssb-periodicityServingCell

$T_{SMTCperiod}$ = the configured SMTC period

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Longer prediction period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet pervious conditions.

**Table 9.5F.4.1-2: Prediction period $T_{L1\text{-}RSRP_Prediction_Period_SSB}$ for FR2**

| Configuration | $T_{L1\text{-}RSRP_Prediction_Period_SSB}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(K_{BM}*M*P*N)*T_{SSB}+\underline{T_{inference}})$ |
| DRX cycle ≤ 320ms | $\max(T_{Report}, \text{ceil}(1.5*K_{BM}*M*P*N)*\max(T_{DRX},T_{SSB})+\underline{T_{inference}})$ |
| DRX cycle > 320ms | $\text{ceil}(1.5*K_{BM}*M*P*N)*T_{DRX}+\underline{T_{inference}}$ |
| Note: $T_{SSB}$ = ssb-periodicityServingCell is the periodicity of the SSB-Index configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. $\underline{T_{inference}}$ is the time required for model inference, which is defined by d' as specified according to clause 5.4 in TS 38.214 [26]. | |

## 9.5F.4.2 CSI-RS based RS prediction reporting

The UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting P-CRI, and/or P-L1-RSRP based on the L1-RSRP measurements measured over the prediction period of $T_{L1\text{-}RSRP_Prediction_Period_CSI\text{-}RS}$.

The value of $T_{L1\text{-}RSRP_Prediction_Period_CSI\text{-}RS}$ is defined in in Table 9.5F.4.2-2 for FR2, where

- For periodic and semi-persistent CSI-RS resources, for UE sided RS prediction when *nroftimeinstance-r19* is not configured, M= 1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise. And for UE sided RS prediction when *nroftimeinstance-r19* is configured, M= 1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured.

- For aperiodic CSI-RS resources M= 1

- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured for all resources in the resource set.

  - SSB for L1-RSRP measurement, or

  - another CSI-RS in resource set configured with repetition ON.

- For periodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured for with QCL-TypeD all resources in the resource set.

- For semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply provided TCI state is provided for all resources in the resource set in the MAC CE activating the resource set and for each resource one RS has QCL-TypeD with

  - SSB for L1-RSRP measurement, or

  - another CSI-RS in resource set configured with repetition ON.

- For semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided TCI state is provided with QCL-TypeD for all resources in the resource set in the MAC CE activating the resource set.

- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply provided *qcl-info* is configured for all resources in the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For aperiodic CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to ON, N=1. UE is not required to meet the accuracy requirements in clause 10.1.19.2 and 10.1.20.2 if number of resources in the resource set is smaller than *maxNumberRxBeam*. The requirements apply provided *qcl-info* is configured with QCL-TypeD for all resources in the resource set.
- $K_{BM}$=1 for UE sided RS prediction when *nroftimeinstance-r19 is not configured.* And for UE sided RS prediction when *nroftimeinstance-r19 is configured*, $K_{BM}$ is indicated by *UE capability on number of latest consecutive transmission occasion*.

For FR2,

- P=1, when CSI-RS is not overlapped with measurement gap and also not overlapped with SMTC occasion.
- $P=\frac{1}{1-\frac{T_{CSI-RS}}{MGRP}}$, when CSI-RS is partially overlapped with measurement gap and CSI-RS is not overlapped with SMTC occasion ($T_{CSI-RS}$ < MGRP)
- $P=\frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is not overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).
- $P=P_{sharing\ factor}$, when CSI-RS is not overlapped with measurement gap and CSI-RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).
- P=1, when aperiodic CSI-RS resource is not overlapped with measurement gap.
- $P=\frac{1}{1-\frac{T_{CSI-RS}}{MGRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is partially overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion (TCSI-RS < $T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and
  - $T_{SMTCperiod} \neq$ MGRP or
  - $T_{SMTCperiod}$ = MGRP and $T_{CSI-RS} < 0.5*T_{SMTCperiod}$
- $P=\frac{3}{1-\frac{T_{CSI-RS}}{MGRP}}$, when CSI-RS is partially overlapped with measurement gap and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and $T_{SMTCperiod}$ = MGRP and $T_{CSI-RS} = 0.5*T_{SMTCperiod}$
- $P=\frac{1}{1-\frac{T_{CSI-RS}}{\min(T_{SMTCperiod},MGRP)}}$, when CSI-RS is partially overlapped with measurement gap ($T_{CSI-RS}$ < MGRP) and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.
- $P=\frac{3}{1-\frac{T_{CSI-RS}}{MGRP}}$, when CSI-RS is partially overlapped with measurement gap and CSI-RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with measurement gap ($T_{SMTCperiod}$ < MGRP)
- $P_{sharing\ factor}$ = 1, if the CSI-RS configured for L1-RSRP measurement outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

- not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured

- $P_{sharing\ factor} = 3$, otherwise.

Where:

$T_{SMTCperiod}$ = the configured SMTC period.

$T_{CSI-RS}$ = the periodicity of CSI-RS configured for L1-RSRP measurement

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Note: The overlap between CSI-RS for L1-RSRP measurement and SMTC means that CSI-RS for L1-RSRP measurement is within the SMTC window duration.

Longer prediction period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet pervious conditions.

**Table 9.5F.4.2-2: Prediction period $T_{L1\text{-}RSRP_Prediction_Period_CSI\text{-}RS}$ for FR2**

| Configuration | $T_{L1\text{-}RSRP_Prediction_Period_CSI\text{-}RS}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(K_{BM}*M*P*N)*T_{CSI\text{-}RS}+\underline{T_{inference}})$ |
| DRX cycle ≤ 320ms | $\max(T_{Report}, \text{ceil}(1.5*K_{BM}*M*P*N)*\max(T_{DRX},T_{CSI\text{-}RS}) +\underline{T_{inference}})$ |
| DRX cycle > 320ms | $\text{ceil}(K_{BM}*M*P*N)*T_{DRX}+\underline{T_{inference}}$ |
| Note 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. $\underline{T_{inference}}$ is the time required for model inference, which is defined by d' as specified according to clause 5.4 in TS 38.214 [26]. | |
| Note 2: the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3. | |

# 9.6 NE-DC: Measurements

## 9.6.1 Introduction

This clause contains requirements for UE supporting dual connectivity with NR PCell and E-UTRA FDD or TDD PSCell. The requirements apply to UEs that have been configured with NE-DC.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.6.2 SFTD Measurements

### 9.6.2.1 Introduction

This clause contains requirements on UE capabilities for reporting of SFN and frame time difference between NR PCell and E-UTRA PSCell in RRC_CONNECTED state. The requirements comprise measurement reporting delay and measurement accuracy. The overall measurement reporting delay includes an RRC procedure delay specified in TS 38.331 [2], and the SFTD measurement reporting delay specified below.

### 9.6.2.2 SFTD Measurement requirements

When no DRX is used in either of the NR PCell and E-UTRA PSCell, the physical layer measurement period of the SFTD measurement shall be $T_{measure_SFTD1}$ = max(0.2, 5 * SMTC period) s.

When DRX is used in either of the NR PCell or the E-UTRA PSCell, or in both PCell and PSCell, the physical layer measurement period ($T_{measure_SFTD1}$) of the SFTD measurement shall be as specified in table 9.6.2.2-1.

**Table 9.6.2.2-1: SFTD measurement requirement when DRX is used**

| DRX cycle length (s)[Note2] | $T_{measure_SFTD1}$ (s) |
|---|---|
| DRX cycle≤0.04 | max(0.2,5 x SMTC period) (Note1) |
| 0.04<DRX cycle≤0.32 | 8 x max(DRX cycle, SMTC period) |
| 0.32<DRX cycle≤10.24 | 5 x DRX cycle |
| Note1: Number of DRX cycles depends upon the DRX cycle in use<br>Note2: DRX cycle length in this table refers to the DRX cycle length configured for PCell or E-UTRA PSCell. When DRX is used in both PCell and E-UTRA PSCell, DRX cycle length in this table refers to the longer of the DRX cycle lengths for PCell and E-UTRA PSCell. | |

If E-UTRA PSCell is changed without changing carrier frequency of E-UTRA PSCell while the UE is performing SFTD measurements, the UE shall still meet SFTD measurement and accuracy requirements for the new E-UTRA PSCell. In this case the UE shall restart the SFTD measurement, and the total physical layer measurement period shall not exceed $T_{measure_SFTD2}$ as defined by the following expression:

$$T_{measure_SFTD2} = (M+1)*(T_{measure_SFTD1}) + M*T_{PSCell_change_NEDC}$$

where:

M is the number of times the E-UTRA PSCell is changed over the measurement period ($T_{measure_SFTD2}$), and

$T_{PSCell_change_NEDC}$ is the time necessary to change the E-UTRA PSCell; it can be up to 25 ms.

If PCell is changed, or if E-UTRA PSCell is changed to a different carrier frequency, the UE shall terminate the SFTD measurement.

The measurement accuracy for the SFTD measurement when DRX is used as well as when no DRX is used shall be as specified in clause 10.1.21.1.

## 9.7 Cross Link Interference measurements

### 9.7.1 Introduction

The UE capable of performing CLI measurements shall be able to measure SRS-RSRP and CLI-RSSI which are defined in TS 38.215 [4] within active DL BWP. The measurements requirements in this clause apply for TDD mode only.

CLI measurements are only applicable for RRC_CONNECTED intra-frequency:

- when SRS-RSRP measurement resource is fully confined within BW of DL active BWP
- when CLI-RSSI measurement resource is configured within active BWP

When the UE measures SRS-RSRP and CLI-RSSI, a constant offset relative to the downlink reference timing in the serving cell shall be applied. The constant offset value is derived by UE implementation and shall be at least $Tc*N_{TA_offset}$.

For performing CLI measurement in FR2, UE can assume the configured CLI measurement resources are QCL-ed with TypeD to one of the latest received PDSCH and the latest monitored CORESET.

CLI measurement requirements defined in clause 9.7 are applicable if

- CLI measurement is not performed on an NR carrier in the same band as E-UTRA serving carrier; and
- UE supports simultaneous Rx/Tx for inter-band CA, inter-band EN-DC, inter-band NE-DC, and NR-DC.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.7.2 SRS-RSRP measurements

### 9.7.2.1 Introduction

When configured by the network, the UE shall be able to perform SRS-RSRP measurements of configured *srs-ResourceConfigCLI*. The requirements apply when the subcarrier spacing for SRS-RSRP measurement resource configuration is the same as the subcarrier spacing of the active DL BWP of serving cell. The UE is not required to measure SRS using different SCS compared to the downlink active BWP SCS of the same carrier.

### 9.7.2.2 Requirements applicability

The requirements in clause 9.7.2 apply, provided:

- SRS resources configured for SRS-RSRP measurements are measurable.

An SRS resource configured for SRS-RSRP shall be considered measurable when for each relevant SRS the following conditions are met:

- SRS-RSRP related side conditions given in clauses 10.1.22.1 for FR1 and FR2 for a corresponding band,
- SRS_RP and SRS Ês/Iot according to Annex B.2.7 for a corresponding band.

### 9.7.2.3 Measurement Reporting Requirements

The UE shall send SRS-RSRP reports only for report configurations according to *reportType* which is *cliPeriodical* or *cliEventTriggered* when SRS-RSRP report is configured.

The UE shall report the SRS-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1 dB step size according to clause 10.1.22.1 for FR1 and FR2.

#### 9.7.2.3.1 Periodic Reporting

Reported SRS-RSRP measurements contained in periodically triggered measurement reports shall meet the requirements in clause 10.1.22.1.

#### 9.7.2.3.2 Event-triggered Periodic Reporting

Reported SRS-RSRP measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.22.1.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.7.2.3.3.

#### 9.7.2.3.3 Event Triggered Reporting

Reported SRS-RSRP measurements contained in periodically triggered measurement reports shall meet the requirements in clause 10.1.22.1.

The UE shall not send any event triggered measurement reports as long as no reporting criteria is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report on.

#### 9.7.2.4 Measurement capability

The UE shall be capable of performing SRS-RSRP measurements on the SRS resources configured for measurement, provided that the number of SRS to be monitored by UE does not exceed 8 within a slot, and the total number of SRSs to be monitored by the UE does not exceed 32.

#### 9.7.2.5 SRS-RSRP measurement period

The UE shall be capable of performing SRS-RSRP measurement based on the configured SRS resource, and the UE shall be capable of reporting SRS-RSRP measured over measurement period of $T_{SRS_RSRP_measurement_period}$ for FR1 and FR2.

**Table 9.7.2.5-1 Measurement period $T_{SRS_RSRP_measurement_period}$**

| Configuration | $T_{SRS_measurement_period}$ (ms) |
|---|---|
| No DRX | Max(60, 3 X $T_{SRS}$) |
| DRX cycle ≤ 320 ms | Max(60, Ceil(1.5 X 3) X max($T_{SRS}$, $T_{DRX}$)) |
| DRX cycle > 320 ms | 3 X $T_{DRX}$ |
| NOTE: $T_{SRS}$ is SRS measurement periodicity configured *SRS-PeriodicityAndOffset*, and $T_{DRX}$ is the DRX cycle length. | |

If the SRS resources configured for measurement are partially or fully overlapping with SMTC window, SSB or CSI-RS configured for RLM, BFD, CBD or L1-RSRP measurement or measurement gaps, requirements are not specified for $T_{SRS_RSRP_measurement_period}$.

### 9.7.3 CLI-RSSI measurements

#### 9.7.3.1 Introduction

When configured by the network, the UE shall be able to perform CLI-RSSI measurement of configured *rssi-ResourceConfigCLI*. The subcarrier spacing for CLI-RSSI measurement resource configuration can be same or different from the subcarrier spacing of active BWP. UE shall perform CLI-RSSI measurement with the SCS of the active BWP.

#### 9.7.3.2 Requirements applicability

The requirements in clause 9.7.3 apply, provided:

- The measurement resources configured for CLI-RSSI measurements are measurable.

A measurement resource configured for CLI-RSSI shall be considered measurable when for each relevant CLI-RSSI resource the following conditions are met:

- CLI-RSSI related side conditions given in clauses 10.1.22.2 for FR1 and FR2 for a corresponding band.

#### 9.7.3.3 Measurement Reporting Requirements

The UE shall send CLI-RSSI reports only for report configurations according to *reportType* which is *cliPeriodical* or *cliEventTriggered* when CLI-RSSI report is configured.

The UE shall report the CLI-RSSI value as a 7-bit value in the range [-100, -25] dBm with 1 dB step size according to clause 10.1.22.2 for FR1 and FR2.

##### 9.7.3.3.1 Periodic Reporting

Reported CLI-RSSI measurements contained in periodically triggered measurement reports shall meet the requirements in clause 10.1.22.2.

#### 9.7.3.3.2 Event-triggered Periodic Reporting

Reported CLI-RSSI measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.22.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.7.3.3.3.

#### 9.7.3.3.3 Event Triggered Reporting

Reported CLI-RSSI measurements contained in periodically triggered measurement reports shall meet the requirements in clause 10.1.22.2.

The UE shall not send any event triggered measurement reports as long as no reporting criteria is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report on.

### 9.7.3.4 Measurement capability

The UE shall be capable of performing CLI-RSSI measurement based on the configured resource, provided that the maximum number of CLI-RSSI measurement resources for the UE does not exceed 64.

### 9.7.3.5 CLI-RSSI measurement period

The UE shall be capable of performing CLI-RSSI measurement based on the configured measurement resource within $T_{CLI_RSSI_measurement_period}$. The UE shall be able to provide a single RSSI sample for each measurement resource configured for CLI-RSSI measurement occurring with a configured periodicity. The CLI-RSSI measurement period $T_{CLI_RSSI_measurement_period}$ corresponds to the CLI-RSSI measurement resource periodicity, which is configured for by higher layers via *RSSI-PeriodicityAndOffset*.

If the CLI-RSSI measurement resources configured for measurement are partially or fully overlapping with SMTC window, SSB or CSI-RS configured for RLM, BFD, CBD or L1-RSRP measurement or measurement gaps, requirements are not specified for $T_{CLI_RSSI_measurement_period}$.

## 9.7.4 Scheduling availability of UE during CLI measurements

Scheduling availability restrictions when the UE is performing CLI measurements which are SRS-RSRP and CLI-RSSI are described in the following clause.

### 9.7.4.1 Scheduling availability of UE performing measurement on FR1

The following scheduling restriction applies due to CLI measurements.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs CLI measurements, and on 1 data symbol before an OFDM symbol used for CLI measurements for 15 kHz and 30 kHz subcarrier spacing.

- For the UE which does not support *cli-SRS-RSRP-FDM_DL*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs SRS-RSRP measurements, and on 1 data symbol before an OFDM symbol used for SRS-RSRP measurements for 15 kHz and 30 kHz subcarrier spacing.

- For the UE which does not support *cli-RSSI-FDM-DL*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs CLI-RSSI measurements, and on 1 data symbol before an OFDM symbol used for CLI-RSSI measurements for 15 kHz and 30 kHz subcarrier spacing.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs CLI measurement, and on 2 data symbols before an OFDM symbol used for CLI measurements for 60 kHz subcarrier spacing.

- For the UE which does not support *cli-SRS-RSRP-FDM_DL*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs SRS-RSRP measurement, and on 2 data symbols before an OFDM symbol used for SRS-RSRP measurements for 60 kHz subcarrier spacing.

- For the UE which does not support *cli-RSSI-FDM-DL*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs CLI-RSSI measurement, and on 2 data symbols before an OFDM symbol used for CLI-RSSI measurements for 60 kHz subcarrier spacing.

When TDD intra-band carrier aggregation is configured, the scheduling restrictions on serving cell where CLI measurements are performed apply on all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions on serving cell where CLI measurements are performed apply on all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

For UE indicating *intraBandNR-CA-non-collocated-r19,*

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

### 9.7.4.2 Scheduling availability of UE performing measurement on FR2

The following scheduling restriction applies due to CLI measurements.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs CLI measurements, and on 1 data symbol before an OFDM symbol used for CLI measurements for 60 kHz subcarrier spacing.

- For the UE which does not support *cli-SRS-RSRP-FDM_DL*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs SRS-

RSRP measurements, and on 1 data symbol before an OFDM symbol used for SRS-RSRP measurements for 60 kHz subcarrier spacing.

- For the UE which does not support *cli-RSSI-FDM-DL*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs CLI-RSSI measurements, and on 1 data symbol before an OFDM symbol used for CLI-RSSI measurements for 60 kHz subcarrier spacing.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs CLI measurements, and on 2 data symbols before an OFDM symbol used for CLI measurements for 120 kHz subcarrier spacing.

- For the UE which does not support *cli-SRS-RSRP-FDM_DL*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs SRS-RSRP measurements, and on 2 data symbols before an OFDM symbol used for SRS-RSRP measurements for 120 kHz subcarrier spacing.

- For the UE which does not support *cli-RSSI-FDM-DL*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs CLI-RSSI measurements, and on 2 data symbols before an OFDM symbol used for CLI-RSSI measurements for 120 kHz subcarrier spacing.

When TDD intra-band carrier aggregation is configured, the scheduling restrictions on serving cell where CLI measurements are performed apply on all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

# 9.8 L1-SINR measurements for Reporting

## 9.8.1 Introduction

When configured by the network, the UE shall be able to perform L1-SINR measurements with the measurement resources configured as the selection of:

- CSI-RS based CMR and no dedicated IMR configured;

- SSB based CMR and dedicated IMR configured;

- CSI-RS based CMR and dedicated IMR configured.

For UE supporting *On-demand SSB operation* and when OD- SSB transmission is indicated, the UE shall be able to perform L1-SINR measurements of SSB resources based CMR and dedicated IMR configured, provided the following conditions are met:

- an OD-SSB transmission in a configured DL BWP without first SSB transmission, or

- an OD-SSB transmission in a configured DL BWP with a first SSB transmission which cannot be used to obtain SIB1 have the following relations:

  - are with the same Cell ID, and

  - are in the same frequency location, and

  - are with same sub-carrier spacing, and

  - are with the same downlink transmit power, and

  - are quasi co-located with respect to Doppler shift, Doppler spread, average gain, average delay, delay spread and, when applicable, spatial RX parameters, when they have a same SSB index.

The measurements shall be performed for a serving cell, including PCell, PSCell, or SCell, on the resources configured for L1-SINR measurements within the active BWP. For UE supporting *bwpOperationMeasWithoutInterrupt-r18*, the UE shall additionally be able to perform L1-SINR measurements for a serving cell, including PCell, PSCell, or SCell, on the resources configured for L1-SINR outside the active BWP, provided that the SSB is within the configured UE-specific CBW. For UE supporting *ncd-SSB-BWP-Wor-r18*, the SSB and SMTC in this clause applies for both CD-SSB and NCD-SSB if it is not explicitly specified otherwise. If SSB in the active DL BWP of serving cell *i* is NCD-SSB, for serving cell *i* the requirements in clause 9.8 apply provided that serving cell *i* is PCell or activated PSCell. For UE

supporting *On-demand SSB operation*, the UE shall additionally be able to perform L1-SINR measurements for a SCell on the OD-SSB resources configured for L1-SINR within the active BWP.

The UE shall be able to measure all CSI-RS resources and/or SSB resources and/or CSI-IM resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet and/or CSI-IM-ResourceSet* within the *CSI-ResourceConfig* settings for L1-SINR for the active BWP, and measure interference on corresponding NZP CSI-RS or CSI-IM resources if configured, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*. If the UE supports *bwpOperationMeasWithoutInterrupt-r18*, UE shall be able to measure the SSB reources of *csi-SSB-ResourceSet* within the *CSI-ResourceConfig* configured outside active BWP, provided that the SSB is within the configured UE-specific CBW.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.8.2 Requirements applicability

The requirements in clause 9.8 apply, provided:

- CMR resources configured for L1-SINR measurements are measurable, and
- NZP-IMR resources configured for L1-SINR measurements if applicable are measurable.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

For CSI-RS based CMR and no dedicated IMR configured, a CSI-RS resource configured for L1-SINR shall be considered measurable when for each relevant CSI-RS the following conditions are met:

- L1-SINR related side conditions given in clauses 10.1.27 and 10.1.28 for FR1 and FR2, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.8.1 for a corresponding band.

For SSB based CMR and dedicated IMR configured, a SSB and a dedicated IMR configured for L1-SINR shall be considered measurable when for each relevant SSB and IMR the following conditions are met:

- L1-SINR related side conditions given in clauses 10.1.27 and 10.1.28 for FR1 and FR2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.8.2 for a corresponding band.
- NZP-IMR Ês/Iot according to Annex B.2.8.2 for a corresponding band, if NZP-IMR is configured as dedicated IMR.

For CSI-RS based CMR and dedicated IMR configured, a CSI-RS and a dedicated IMR configured for L1-SINR shall be considered measurable when for each relevant CSI-RS and IMR the following conditions are met:

- L1-SINR related side conditions given in clauses 10.1.27 and 10.1.28 for FR1 and FR2, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.8.3 for a corresponding band
- NZP-IMR Ês/Iot according to Annex B.2.8.3 for a corresponding band, if NZP-IMR is configured as dedicated IMR.

## 9.8.3 Measurement Reporting Requirements

The UE shall send L1-SINR reports only for report configurations configured for the active BWP, unless the UE supports *bwpOperationMeasWithoutInterrupt-r18*, provided that the SSB is within the configured UE-specific CBW.

The UE shall report the L1-SINR value as a 7-bit value in the range [-23, 40] dB with 0.5 dB step size if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if

*groupBasedBeamReporting* is enabled, the UE shall use differential L1-SINR based reporting. The differential L1-SINR is quantized to a 4-bit value with 1 dB step size. The mapping between the reported L1-SINR value and the measured quantity is described in clause 10.1.16.

#### 9.8.3.1 Periodic Reporting

Reported L1-SINR measurements contained in periodic L1-SINR measurement reports shall meet the requirements in clauses 10.1.27 for FR1 and 10.1.28 for FR2, respectively.

The UE shall transmit the periodic L1-SINR reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

#### 9.8.3.2 Semi-Persistent Reporting

Reported L1-SINR measurements contained in a Semi-Persistent L1-SINR measurement report shall meet the requirements in clauses 10.1.27 for FR1 and 10.1.28 for FR2, respectively. This requirement applies for semi-persistent L1-SINR reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-SINR measurement reports on PUSCH, if a DCI for triggering report has been received.

The UE shall only send semi-persistent L1-SINR measurement reports on PUCCH, if an activation command as described in clause 6.1.3.16 in TS 38.321 [7] has been received.

The UE shall transmit the semi-persistent L1-SINR reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

#### 9.8.3.3 Aperiodic Reporting

Reported L1-SINR measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-SINR reports shall meet the requirements in clauses 10.1.27 for FR1 and 10.1.28 for FR2, respectively.

The UE shall only send aperiodic L1-SINR measurement reports, if a DCI for triggering report has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-SINR reporting on PUSCH over the air interface at the time specified according to clause 5.2.1.4 in TS 38.214 [26].

### 9.8.4 L1-SINR measurement requirements

#### 9.8.4.1 L1-SINR reporting with CSI-RS based CMR and no dedicated IMR configured

The UE shall be capable of performing L1-SINR measurements with the CSI-RS resource configured as CMR and no dedicated resource configured as IMR for L1-SINR computation, and the UE physical layer shall be capable of reporting L1-SINR measured over the measurement period of $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$.

The value of $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$ is defined in table 9.8.4.1-1 for FR1 and in table 9.8.4.1-2 for FR2, where

For the value of M,

- For periodic and semi-persistent CSI-RS resources as CMR, M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise;

- For aperiodic CSI-RS resources as CMR, M=1.

For the value of N in FR2

- For periodic CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply if *qcl-InfoPeriodicCSI-RS* is configured for all the resources in the resource set and for each resource one RS has QCL-TypeD with

- SSB for L1-RSRP or L1-SINR measurement, or
- another CSI-RS in resource set configured with repetition ON.

- For periodic CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured for all resources in the resource set.
- For semi-persistent CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply provided TCI state is provided for all resources in the resource set in the MAC CE activating the resource set and for each resource has QCL-TypeD with
  - SSB for L1-RSRP or L1-SINR measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For semi-persistent CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided TCI state is provided for all resources in the resource set in the MAC CE activating the resource set.
- For aperiodic CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requriements apply provided *qcl-info* is configured for all resources in the resource set and for each resource has QCL-TypeD with
  - SSB for L1-RSRP or L1-SINR measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For aperiodic CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to ON, N=1. UE is not required to meet the accuracy requirements in clauses 10.1.28.1 and 10.1.28.3 if number of resources in the resource set is smaller than *maxNumberRxBeam*. The requriements apply provided *qcl-info* is configured for all resources in the resource set.

For the value of L1,

1> If UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network

2> L1 is not applicable

1> else (if UE supports *sbfd-Aware-r19* and SBFD is configured by the network)

2> if UE is configured to report L1-SINR for SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the CSI-RS resource as CMR that are overlapping with dynamic UL transmission or with non-SBFD symbols during $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$

3> When DRX is configured, L1 is the number of DRX cycles in which at least one occasion of the CSI-RS resource as CMR is overlapping with dynamic UL transmission or in which all occasions of the CSI-RS resource as CMR are overalapping with non-SBFD symbols during $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$

2> if UE is configured to report L1-SINR for non-SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the CSI-RS resource as CMR that are overlapping with SBFD symbols during $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$

3> When DRX is configured, L1 is the number of DRX cycles in which all occasions of the CSI-RS resource as CMR are overlapping with SBFD symbols during $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$

For a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19*, or for a UE supporting *concurrentMeasGapsPreMG-r18* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *concurrentMeasGapsNCSG-r18* and when concurrent GAP(s) with NCSG(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both concurrent measurement gap and *musim-GapPreference-r17* and when concurrent GAPs or periodic MUSIM gaps or both concurrent gaps and periodic MUSIM gaps are configured,

- a CSI-RS or an SMTC occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to 9.1.8 and 9.1.10,

- P value for a CSI-RS resource to be measured is defined as

  - $N_{total}$ / $N_{outside_MG}$ in FR1

  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0

  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0

- For a window W of duration max($T_{L1,}$ xRP_max, switching pattern periodicity), where xRP_max is the maximum xRP across all configured per-UE GAPs or periodic MUSIM gap(s) and per-FR GAPs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any CSI-RS resource occasion:

  - $N_{total}$ is the total number of CSI-RS resource occasions within the window, including those overlapped with GAP occasions, MUSIM gap occasions or SMTC occasions within the window,

    For UEs supporting featureSetCombinationLowBandSwitching-r19 and configured with LowBandCA-Switching-r19:

    - for the PCell L1-SINR measurement, $N_{total}$ also includes CSI-RS resource occasions that overlap with the SCell active periods of the *switchingPattern-r19* within the window,

    - for the SCell L1-SINR measurement, $N_{total}$ also includes CSI-RS resource occasions that overlap with the PCell active periods of the *switchingPattern-r19* within the window, as defined by *LowBandCA-Switching-r19*, and

  - $N_{outside_MG}$ is the number of CSI-RS resource occasions within the window W

    - that are not overlapped with any non-dropped GAP occasion nor non-dropped MUSIM gap occasion or

    - that are not overlapped with SCell active periods of the *switchingPattern-r19*, for the PCell L1-SINR measurement for a UE supporting *featureSetCombinationLowBandSwitching-r19* and configured with *LowBandCA-Switching-r19* or

    - that are not overlapped with PCell active periods of the *switchingPattern-r19*, for the SCell L1-SINR measurement for a UE supporting *featureSetCombinationLowBandSwitching-r19* with *LowBandCA-Switching-r19* configured, and

  - L1-SINR requirement in this clause is not applied when $N_{outside_MG}$ = 0.

  - $N_{available}$ is the number of CSI-RS resource occasions that are not overlapped with any non-dropped GAP occasion, non-dropped MUSIM gap occasion nor any SMTC occasion within the window W.

  - for UEs configured with *LowBandCA-Switching-r19*, switching pattern periodicity is the periodicity of *LowBandCA-Switching-r19*; otherwise, it is not applicable.

  - a CSI-RS or an SMTC occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion.

  - $T_{L1}$ is periodicity of the target CSI-RS.

  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *concurrentMeasGapsPreMG-r18* nor *concurrentMeasGapsNCSG-r18* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent GAP(s) with NCSG(s) and UE does not support *musim-GapPreference-r17* or when no MUSIM gaps are configured,

For the value of P in FR1,

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when in the monitored cell there are GAP configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and
- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the CSI-RS.

For the value of P in FR2,

- P=1, when CSI-RS is not overlapped with GAP and also not overlapped with SMTC occasion.
- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when CSI-RS is partially overlapped with GAP and CSI-RS is not overlapped with SMTC occasion ($T_{CSI-RS} < xRP$)
- $P=\frac{1}{1-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is not overlapped with GAP and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$).
- P is $P_{sharing\ factor}$,, when CSI-RS is not overlapped with GAP and CSI-RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$).
- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xRP}-\frac{T_{CSI-RS}}{T_{SMTCperiod}}}$, when CSI-RS is partially overlapped with [measurement gap] and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and
  - $T_{SMTCperiod} \neq xRP$ or
  - $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} < 0.5*T_{SMTCperiod}$
- $P=\frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{xRP}}$, when CSI-RS is partially overlapped with GAP and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod} = xRP$ and $T_{CSI-RS} = 0.5*T_{SMTCperiod}$
- $P=\frac{1}{1-\frac{T_{CSI-RS}}{\min(T_{SMTCperiod},xRP)}}$, when CSI-RS is partially overlapped with GAP ($T_{CSI-RS} < xRP$) and CSI-RS is partially overlapped with SMTC occasion ($T_{CSI-RS} < T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with GAP.
- $P=\frac{P_{sharing\ factor}}{1-\frac{T_{CSI-RS}}{xRP}}$, when CSI-RS is partially overlapped with GAP and CSI-RS is fully overlapped with SMTC occasion ($T_{CSI-RS} = T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod} < xRP$)

Where:

$P_{sharing\ factor}$ = 1, if the CSI-RS configured for L1-SINR measurement outside gap is

not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

not overlapped by the RSSI symbols indicated by *ss-RSSI-Measurement* and 1 data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured.

- $P_{sharing\ factor}$ = 3, otherwise.
  - $T_{SMTCperiod}$ = the configured SMTC1 period or SMTC2 period if configured.
  - $T_{CSI-RS}$ = the periodicity of CSI-RS configured for L1-SINR measurement
- When a measurement gap is configured and the measurement gap is not NCSG,
  - a CSI-RS is considered to be overlapped with the GAP if it overlaps a measurement gap occasion, and

- xRP = MGRP

- If the UE is configured with Pre-MG, a CSI-RS reourse or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.

- Otherwise, when NCSG measurement gap only is configured,

  - a CSI-RS is considered to be overlapped with the GAP if

    - it overlaps the VIL1 or VIL2 of NCSG, or

    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,

  - and

    - xRP = VIRP

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Note: The overlap between CSI-RS for L1-SINR measurement and SMTC means that CSI-RS for L1-SINR measurement is within the SMTC window duration.

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform CSI-RS measurements during the cancelled gap occasions.

When UE is configured with aperiodic MUSIM gap and the aperiodic MUSIM gap is overlapping with CSI-RS resource occasion for L1-SINR, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and CSI-RS resource occasions for L1-SINR are fully overlapped with MUSIM gap(s) or fully overlapped with the union of MUSIM gap(s) and GAPs, no requirement applies for the CSI-RS based L1-SINR measurement.

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and GAP configurations does not meet previous conditions.

**Table 9.8.4.1-1: Measurement period $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$ for FR1**

| Configuration | $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}((M+L1)*P)* \max(T_{CSI\text{-}RS}, T_{proc}))$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*(M+L1)*P)*\max(T_{DRX},T_{CSI\text{-}RS}, T_{proc}))$ |
| DRX cycle > 320 ms | $\text{ceil}((M+L1)*P)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-SINR measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting.<br>NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-SINR measurement is transmitted with Density = 3.<br>NOTE 3: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for CMR is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

**Table 9.8.4.1-2: Measurement period $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$ for FR2**

| Configuration | $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only}$ (ms) |

| non-DRX | $\max(T_{Report}, \text{ceil}((M+L1)*P*N)* \max(T_{CSI\text{-}RS}, T_{proc}))$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*(M+L1)*P*N)*\max(T_{DRX},T_{CSI\text{-}RS}, T_{proc}))$ |
| DRX cycle > 320 ms | $\text{ceil}((M+L1)*P*N)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-SINR measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |

| | |
|---|---|
| NOTE 2: | the requirements are applicable provided that the CSI-RS resource configured for L1-SINR measurement is transmitted with Density = 3. |
| NOTE 3: | If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for CMR is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. |

### 9.8.4.2 L1-SINR reporting with SSB based CMR and dedicated IMR configured

The UE shall be capable of performing L1-SINR measurements with the SSB configured as CMR and dedicated resource configured as IMR for L1-SINR computation, in which the NZP-CSI-RS or CSI-IM resource configured as dedicated IMR shall be 1-to-1 mapped to SSB configured as CMR, with the same periodicity. The UE physical layer shall be capable of reporting L1-SINR measured over the measurement period of $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$.

The requirements in this clause are not applicable if NZP-CSI-RS or CSI-IM resource configured as dedicated IMR is scheduled with different periodicity as SSB configured as CMR.

For UE supporting *On-demand SSB operation* and when OD- SSB transmission is indicated, the EMP for L1-SINR are

- the periodicity of OD-SSBs in the configured DL BWP if no first SSB transmission is configured or if UE supports *timec1nc2* and OD-SSB transmission is indicated with first SSB transmission and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern, or
- the periodicity of the union of OD-SSBs and first SSBs if first SSBs are transmitted and the OD-SSB activation is indicated and the union of OD-SSBs and first SSBs has a periodic time domain pattern.

The value of $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$ is defined in table 9.8.4.2-1 for FR1 and in table 9.8.4.2-2 for FR2 when *highSpeedMeasFlagFR2-r17* is not configured, and defined in table 9.8.4.2-3 for FR2 power class 6 UE when *highSpeedMeasFlagFR2-r17* is configured, where

For the value of M

- For periodic or semi-persistent NZP CSI-RS or CSI-IM resource as dedicated IMR, M=1 if the higher layer parameters *timeRestrictionForChannelMeasurements* and/or *timeRestrictionForInterferenceMeasurements* are configured, and M=3 otherwise;

For the value of N in FR2

- N = 2, 4 or 6 in FR2-1 for UE supporting *fastBeamSweepingMultiRx-r1*8, according to the conditions described in clause 3.6.19,
- N = 8 otherwise.

For the value of L1,

1> If UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network

2> L1 is not applicable

1> else (if UE supports *sbfd-Aware-r19* and SBFD is configured by the network)

2> if UE is configured to report L1-SINR for SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the CSI-RS/CSI-IM resource as IMR that are overlapping with dynamic UL transmission or with non-SBFD symbols during $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$

3> When DRX is configured, L1 is the number of DRX cycles in which at least one occasion of the CSI-RS/CSI-IM resource as IMR is overlapping with dynamic UL transmission or in which all occasions of the CSI-RS/CSI-IM resource as IMR are overalapping with non-SBFD symbols during $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$

2> if UE is configured to report L1-SINR for non-SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the CSI-RS/CSI-IM resource as IMR that are overlapping with non-SBFD symbols, during $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$

3> When DRX is configured, L1 is the number of DRX cycles in which all occasions of the CSI-RS/CSI-IM resource as IMR are overlapping with non-SBFD symbols, during $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$

P is defined as the maximum value between $P_{CMR}$ and $P_{IMR}$, i.e., $P = \max(P_{CMR}, P_{IMR})$, where

- the value of $P_{CMR}$ shall be derived in the same way as the value of P used for SSB based L1-RSRP measurement in clause 9.5.4.1, in which the occasions and period of the SSB for CMR shall be used instead.

- the value of $P_{IMR}$ shall be derived in the same way as the value of P used for CSI-RS based L1-RSRP measurement in clause 9.5.4.2, in which the occasions and period of the NZP CSI-RS for NZP-IMR or CSI-IM for ZP-IMR shall be used instead.

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform SSB measurements during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

For L1-SINR measurement with SSB as CMR and CSI-RS or CSI-IM as IMR, the requirement shall apply if the CSI-RS is configured as IMR with repetition field as “repetition = OFF” or CSI-IM is configured as IMR.

For L1-SINR measurement with SSB as CMR and CSI-RS/CSI-IM as IMR, no requirement shall apply if SSB occasions for CMR or CSI-RS/CSI-IM occasions for IMR are fully overlapped with the configured measurement gap

**Table 9.8.4.2-1: Measurement period $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$ for FR1**

| Configuration | $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}((M+L1)*P)* \max(T_{SSB}, T_{proc}))$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*(M+L1)*P)*\max(T_{DRX}, T_{SSB}, T_{proc}))$ |
| DRX cycle > 320 ms | $\text{ceil}((M+L1)*P)*T_{DRX}$ |
| NOTE 1: $T_{SSB}$ = ssb-periodicityServingCell is the periodicity of the SSB-Index configured for L1-SINR channel measurement if UE not supporting *On-demand SSB operation* or when OD-SSB transmission is not indicated, otherwise, $T_{SSB}$ = EMP of the SSB index configured for L1-SINR channel measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: The requirements are applicable provided that the CSI-RS resource configured for interference measurement shall be 1-to-1 mapped to SSB configured for channel measurement, with the same periodicity. | |
| NOTE 3: If UE indicates *‘full’* or *‘partial’* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for IMR is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

**Table 9.8.4.2-2: Measurement period $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$ for FR2**

| Configuration | $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}((M+L1)*P*N)* \max(T_{SSB}, T_{proc}))$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*(M+L1)*P*N)*\max(T_{DRX}, T_{SSB}, T_{proc}))$ |
| DRX cycle > 320 ms | $\text{ceil}(1.5*(M+L1)*P*N)*T_{DRX}$ |
| NOTE 1: $T_{SSB}$ = ssb-periodicityServingCell is the periodicity of the SSB-Index configured for L1-SINR measurement if UE not supporting *On-demand SSB operation* or when OD-SSB transmission is not indicated, otherwise, $T_{SSB}$ = EMP of the SSB index configured for L1-SINR channel measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: The requirements are applicable provided that the CSI-RS resource configured for interference measurement shall be 1-to-1 mapped to SSB configured for channel measurement, with the same periodicity. | |
| NOTE 3: If UE indicates *‘full’* or *‘partial’* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for IMR is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

**Table 9.8.4.2-3: Measurement period $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$ configured with *highSpeedMeasFlagFR2-r17* for FR2-1**

| Configuration | $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}((M+L1)*P*N1^{Note\ 3})* \max(T_{SSB}, T_{proc}))$ |
| DRX cycle ≤ 80 ms | $\max(T_{Report}, \text{ceil}((M+L1)*P*N1^{Note\ 3}*M2)*\max(T_{DRX},T_{SSB}, T_{proc}))$ |
| 80 ms< DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*(M+L1)*P*N)*\max(T_{DRX},T_{SSB}))$ |
| DRX cycle > 320 ms | $\text{ceil}(1.5*(M+L1)*P*N)*T_{DRX}$ |
| NOTE 1: $T_{SSB}$ = ssb-periodicityServingCell is the periodicity of the SSB-Index configured for L1-SINR measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: The requirements are applicable provided that the CSI-RS resource configured for interference measurement shall be 1-to-1 mapped to SSB configured for channel measurement, with the same periodicity. | |
| NOTE 3: N1 = 2 when *highSpeedMeasFlagFR2-r17* = set1; N1 = 6 when *highSpeedMeasFlagFR2-r17* = set2. | |
| NOTE 4: M2 = 1.5 if SMTC periodicity > 40 ms; otherwise M2 = 1 | |
| NOTE 5: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for IMR is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

### 9.8.4.3 L1-SINR reporting with CSI-RS based CMR and dedicated IMR configured

The UE shall be capable of performing L1-SINR measurements with the CSI-RS resource configured as CMR and dedicated resource configured as IMR for L1-SINR computation, in which the NZP-CSI-RS or CSI-IM resource configured as dedicated IMR shall be 1-to-1 mapped to CSI-RS resource configured as CMR, with the same periodicity. The UE physical layer shall be capable of reporting L1-SINR measured over the measurement period of $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR}$.

The requirements in this clause are not applicable if NZP-CSI-RS or CSI-IM resource configured as dedicated IMR is scheduled with different periodicity as CSI-RS resource configured as CMR.

The value of $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR}$ is defined in table 9.8.4.3-1 for FR1 and in table 9.8.4.3-2 for FR2, where

For the value of M,

- M=1 shall be applied if
  - aperiodic NZP-CSI-RS as CMR or dedicated IMR, or
  - aperiodic CSI-IM as dedicated IMR, or
  - periodic and semi-persistent NZP-CSI-RS as CMR or dedicated IMR and the higher layer parameters *timeRestrictionForChannelMeasurement* and/or *timeRestrictionForInterferenceMeasurements* are configured, or
  - periodic and semi-persistent CSI-IM as dedicated IMR and the higher layer parameters *timeRestrictionForChannelMeasurement* and/or *timeRestrictionForInterferenceMeasurements* are configured;
- M=3 otherwise.

For the value of N in FR2

- For periodic CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply if *qcl-InfoPeriodicCSI-RS* is configured for all the resources in the resource set and for each resource one RS has QCL-TypeD with
  - SSB for L1-RSRP or L1-SINR measurement, or
  - another CSI-RS in resource set configured with repetition ON.

- For periodic CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided *qcl-InfoPeriodicCSI-RS* is configured for all resources in the resource set.
- For semi-persistent CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requirements apply provided TCI state is provided for all resources in the resource set in the MAC CE activating the resource set and for each resource has QCL-TypeD with
  - SSB for L1-RSRP or L1-SINR measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For semi-persistent CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to ON, N=ceil(*maxNumberRxBeam* / $N_{res_per_set}$), where $N_{res_per_set}$ is number of resources in the resource set. The requirements apply provided TCI state is provided for all resources in the resource set in the MAC CE activating the resource set.
- For aperiodic CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to OFF, N=1. The requriements apply provided *qcl-info* is configured for all resources in the resource set and for each resource has QCL-TypeD with
  - SSB for L1-RSRP or L1-SINR measurement, or
  - another CSI-RS in resource set configured with repetition ON.
- For aperiodic CSI-RS resources as CMR in a resource set configured with higher layer parameter *repetition* set to ON, N=1. UE is not required to meet the accuracy requirements in clause 10.1.28.1 and 10.1.28.3 if number of resources in the resource set is smaller than *maxNumberRxBeam*. The requriements apply provided *qcl-info* is configured for all resources in the resource set.

For the value of L1,

1> If UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network

2> L1 is not applicable

1> else (if UE supports *sbfd-Aware-r19* and SBFD is configured by the network)

2> if UE is configured to report L1-SINR for SBFD symbols

3> When DRX is not configured, L1 is the maximum between number of occasions of the CSI-RS resource as CMR that are overlapping with dynamic UL transmission or with non-SBFD symbols and number of occasions of the CSI-RS/CSI-IM resource as IMR that are overlapping with dynamic UL transmission or with non-SBFD symbols, during $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR}$

3> When DRX is configured, L1 is the number of DRX cycles in which at least one occasion of the CSI-RS resource as CMR or at least one occasion of the CSI-RS/CSI-IM resource as IMR is overlapping with dynamic UL transmission or in which all occasions of the CSI-RS resource as CMR or all occasions of the CSI-RS/CSI-IM resource as IMR are overalapping with non-SBFD symbols, during $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR}$

2> if UE is configured to report L1-SINR for non-SBFD symbols

3> When DRX is not configured, L1 is the maximum between number of occasions of the CSI-RS resource as CMR that are overlapping with non-SBFD symbols and number of occasions of the CSI-RS/CSI-IM resource as IMR that are overlapping with non-SBFD symbols, during $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR}$

3> When DRX is configured, L1 is the number of DRX cycles in which all occasions of the CSI-RS resource as CMR or at least one occasion of the CSI-RS/CSI-IM resource as IMR are overlapping with non-SBFD symbols, during $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR}$

P is defined as the maximum value between $P_{CMR}$ and $P_{IMR}$, i.e., $P = \max(P_{CMR}, P_{IMR})$, where

- The value of $P_{CMR}$ and $P_{IMR}$ shall be derived in the same way as the value of P used for CSI-RS based L1-RSRP measurement in clause 9.5.4.2, in which the occasions and period of the CSI-RS for CMR and NZP CSI-RS for NZP-IMR or CSI-IM for ZP-IMR shall be used instead respectively.

For UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, the UE is not required to perform CSI-RS measurements during the cancelled gap occasions.

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet previous conditions.

For L1-SINR measurement with CSI-RS as CMR and CSI-RS as IMR, the requirement shall apply only if CSI-RS resources as CMR and IMR are configured with the same repetition field and the number of CSI-RS resources in the resource sets for CMR and IMR are same.

For L1-SINR measurement with CSI-RS as CMR and CSI-IM as IMR, the requirement shall apply only if the number of CSI-RS resources in the resource set for CMR and the number of CSI-IM resources in the resource set for IMR are same.

For L1-SINR measurement with CSI-RS as CMR and CSI-RS/CSI-IM as IMR, no requirement shall apply if CSI-RS occasions for CMR or CSI-RS/CSI-IM occasions for IMR are fully overlapped with the configured measurement gap.

| DRX cycle > 320 ms | $\text{ceil}((M+L1)*P*N)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-SINR measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-SINR measurement is transmitted with Density = 3. | |
| NOTE 3: The requirements are applicable provided that the CSI-RS resource configured for interference measurement shall be 1-to-1 mapped to CSI-RS configured for channel measurement, with the same periodicity. | |
| NOTE 4: If UE indicates *'full'* or *'partial'* for *timeline-r19* in *sbfd-Aware-r19* and the CSI-RS resource for CMR or IMR is across 2 DL subbands, $T_{proc}$ = 8ms; otherwise $T_{proc}$ = 0. | |

## 9.8.5 Measurement restriction for L1-SINR measurement

The UE is required to be capable of measuring L1-SINR without measurement gaps. The UE is required to perform the SSB and CSI-RS/CSI-IM measurements with measurement restrictions as described in the following clauses.

### 9.8.5.1 Measurement restriction if SSB configured for L1-SINR Measurement

For FR1, when the SSB configured as CMR for L1-SINR measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-SINR measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-SINR measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-SINR measurement and CSI-RS. Longer measurement period for SSB based L1-SINR measurement is expected, and no requirements are defined.

For FR2, when the SSB configured as CMR for L1-SINR measurement on one CC is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for L1-SINR measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, there is no measurement restriction allowed when the network configures mixed numerology between SSB configured as CMR for L1-SINR measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, provided that UE is capable of independent beam management on this FR2 band pair.

For FR2, for UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* and for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*,when the SSB configured as CMR for L1-SINR measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both SSB for L1-SINR measurement and SSB for L1-RSRP measurement on neighbor cell. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated without first SSB transmission, the measurement restriction is expected for OD-SSB occasions only.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated with first SSB transmission, no measurement restriction is expected for first SSB occasions if UE supports *Time-C1nC2* and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern. Otherwise, the measurement restriction is expected for both first SSB and OD-SSB occasions.

### 9.8.5.2 Measurement restriction if CSI-RS configured for L1-SINR measurement

For both FR1 and FR2, when the CSI-RS configured for L1-SINR measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement, UE is not required to receive CSI-RS for L1-SINR measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement has same SCS than CSI-RS configured for L1-SINR measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement has different SCS than CSI-RS configured for L1-SINR me

- If the UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to perform CSI-RS measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-SINR measurement and SSB. Longer measurement period for CSI-RS based L1-SINR measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS configured for L1-SINR measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement, UE shall be able to measure the CSI-RS for L1-SINR measurement without any restriction.

For FR2, when the CSI-RS configured for L1-SINR measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, L1-RSRP or L1-SINR measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for L1-SINR measurement and SSB. Longer measurement period for CSI-RS based L1-SINR measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS configured for L1-SINR measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for L1-SINR measurement and the other CSI-RS. Longer measurement period for CSI-RS based L1-SINR measurement is expected, and no requirements are defined.
  - The CSI-RS for L1-SINR measurement or the other CSI-RS in a resource set configured with repetition ON, or
  - The CSI-RS or the other CSI-RS is configured as dedicated IMR for L1-SINR computation with SSB as CMR, or
  - The other CSI-RS is configured in q1 and beam failure is detected, or
  - The two CSI-RS-es are not QCL-ed with respect to QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-RS configured for L1-SINR measurement without any restriction.

For UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* and for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*,

- For both FR1 and FR2, when the CSI-RS configured for L1-SINR measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for L1-SINR measurement in the PRBs that overlap with an SSB.
- For FR1, when the CSI-RS configured for L1-SINR measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-SINR measurement and SSB. Longer measurement period for CSI-RS based L1-SINR measurement is expected, and no requirements are defined.
- For FR2, when the CSI-RS configured for L1-SINR measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for L1-SINR measurement and SSB. Longer measurement period for CSI-RS based L1-SINR measurement is expected, and no requirements are defined.

For FR2, when the UE is indicated with two TCI states for simultaneous PDSCH reception, when the CSI-RS configured for L1-SINR measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the same CC or different CCs in the same band, the UE supporting *schedulingMeasurementRelaxation-r1*8 according to the conditions described in clause 3.6.19 shall be able to measure the CSI-RS configured for L1-SINR measurement without any restriction under the following conditions:

- Both CSI-RSs are not in any CSI-RS resource set with repetition ON,
- One CSI-RS has same QCL source as either,

- the active TCI state of a PDSCH scheduled in the same OFDM symbol or
- the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to 38.214 clause 5.1.5, and

- the other CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to 38.214 clause 5.1.5.
- Resources of the active TCI states of the two PDSCHs, and or QCL sources of the default QCL assumption, or the active TCI state of PDSCH and QCL source of the default QCL assumption have been reported as a resource group in Rel-17 group-based RSRP report.

#### 9.8.5.3 Measurement restriction if CSI-IM configured for L1-SINR measurement

For both FR1 and FR2, when the CSI-IM configured for L1-SINR measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement, UE is not required to measure CSI-IM for L1-SINR measurement in the PRBs that overlap with an SSB.

For FR1, UE shall be able to measure the CSI-IM configured for L1-SINR measurement without any restriction.

For FR2, when the CSI-IM configured for L1-SINR measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD, L1-RSRP or L1-SINR measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-IM for L1-SINR measurement and SSB. Longer measurement period for L1-SINR measurement is expected, and no requirements are defined.

For FR2, when the CSI-IM configured for L1-SINR measurement on one CC is in the same OFDM symbol as the CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-IM for L1-SINR measurement and CSI-RS. Longer measurement period for L1-SINR measurement is expected, and no requirements are defined.
  - The CSI-RS in a resource set configured with repetition ON, or
  - The CSI-IM or the CSI-RS is configured as dedicated IMR for L1-SINR computation with SSB as CMR, or
  - The CSI-RS is configured in q1 and beam failure is detected, or
  - The CMR for L1-SINR measurement and the CSI-RS are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,
- Otherwise, UE shall be able to measure the CSI-IM configured for L1-SINR measurement without any restriction.

For UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* and for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*,

- For both FR1 and FR2, when the CSI-IM configured for L1-SINR measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-IM for L1-SINR measurement in the PRBs that overlap with an SSB.
- For FR2, when the CSI-IM configured for L1-SINR measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for L1-SINR measurement and SSB. Longer measurement period for CSI-IM based L1-SINR measurement is expected, and no requirements are defined.

## 9.8.6 Scheduling availability of UE during L1-SINR measurement

Scheduling availability restrictions when the UE is performing L1-SINR measurement are described in the following clauses.

For UE supporting On-demand SSB operation, when OD-SSB transmission is indicated without first SSB transmission, the scheduling restriction is expected for OD-SSB occasions only.

For UE supporting *On-demand SSB operation*, when OD-SSB transmission is indicated with first SSB transmission, no measurement restriction is expected for first SSB occasions if UE supports *Time-C1nC2* and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern. Otherwise, the measurement restriction is expected for both first SSB and OD-SSB occasions.

### 9.8.6.1 Scheduling availability of UE performing L1-SINR measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-SINR measurement performed on SSB and CSI-RS configured for L1-SINR measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.8.6.2 Scheduling availability of UE performing L1-SINR measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-SINR measurement based on SSB configured for L1-SINR measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-SINR measurement based on SSB configured for L1-SINR measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking /CSI-RS for CQI on SSB symbols to be measured for L1-SINR measurement.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on serving cell where L1-SINR measurement is performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions on serving cell where L1-SINR measurement is performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided

For UE indicating *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-SINR measurement is performed is configured.

### 9.8.6.3 Scheduling availability of UE performing L1-SINR measurement on FR2

The following scheduling restriction applies due to L1-SINR measurement.

- For UE not supporting *schedulingMeasurementRelaxation-r1*8, for the cases of CSI-RS used for L1-SINR measurement of CSI-RS based CMR only case and CSI-RS based CMR plus CSI-RS based ZP-IMR/NZP-IMR case and CSI-RS based CMR plus ZP-IMR case, where CSI-RS is QCLed with active TCI state for PDCCH/PDSCH and not in a CSI-RS resource set with repetition ON, and N=1 applies as specified in clause 9.8.4, or

- For FR2-1 for UE supporting *schedulingMeasurementRelaxation-r1*8 according to the conditions described in clause 3.6.19, there are no scheduling restrictions due to L1-SINR measurement performed based on the CSI-RS for the cases of CSI-RS used for L1-SINR measurement of CSI-RS based CMR only case and CSI-RS based CMR plus CSI-RS based ZP-IMR/NZP-IMR case and CSI-RS based CMR plus ZP-IMR case, where N=1 applies as specified in clause 9.8.4, and where the following additional conditions are met:

  - The CSI-RS is not in a CSI-RS resource set with repetition ON.

  - The CSI-RS has same QCL source as the active TCI state of one of the PDSCHs and has different QCL-TypeD from the other PDSCH.

  - The CSI-RS and both of the PDSCHs are on the same OFDM symbol(s), or the CSI-RS and one of the PDSCHs with different QCL-typeD are on the same OFDM symbol(s) when partially overlapping PDSCHs are scheduled, and

  - Resources of the active TCI states for the two PDSCHs have been reported as a resource group in Rel-17 group-based RSRP report.

- Otherwise

  - The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the symbols to be measured for L1-SINR for FR2 power class 6 UE which is not configured with *highSpeedMeasFlagFR2-r17*, and for the UE not supporting FR2 power class 6;

  - The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the symbols to be measured for L1-SINR, and on 1 data symbol before symbols to be measured for L1-SINR and 1 data symbol after symbols to be measured for L1-SINR for FR2 power class 6 UE configured with *highSpeedMeasFlagFR2-r17*.

When intra-band carrier aggregation is performed, the scheduling restrictions on serving cell where L1-SINR measurement is performed apply to all serving cells in the band on the symbols that fully or partially overlap with restricted symbols.

If following conditions are met,

- UE has been notified about system information update through paging,

- The gap between UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

for the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for L1-SINR measurement; and

for the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for L1-SINR measurement.

#### 9.8.6.4 Scheduling availability of UE performing L1-SINR measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to L1-SINR measurement performed on FR2 serving cell(s).

There are no scheduling restrictions on FR2 serving cell(s) due to L1-SINR measurement performed on FR1 serving cell(s).

### 9.8.7 Minimum requirement at transitions

For UE supporting *ncd-SSB-BWP-Wor-r18*, when the L1-SINR measurement transitions from measurements performed on CD-SSB to measurements performed on NCD-SSB or vice versa due to BWP switching during one measurement period, the UE shall use a L1-SINR measurement period that is the maximum of the L1-SINR measurement period corresponding to the first SSB type and the second SSB type after the BWP switching.

Subsequent to the above-mentioned measurement periods, the L1-SINR measurement period requirements are based on the SSB type after the BWP switch.

For UE supporting OD-SSB operation, when UE is indicated by an OD-SSB parameter update MAC-CE, adaptation of periodicities for the activated transmission of OD-SSBs when the SCell is activated, the L1-RSRP measurement period requirements are based on the EMP of adapted OD-SSB burst periodicity which applies from the first OD-SSB burst after the time point as defined in TS 38.213 for adaptation of the second SS/PBCH blocks transmission plus additional processing time of OD-SSB parameter update capability.

For UE supporting *ssb-BurstPeriodicityAdaptation-r19*, when UE receives DCI format 2_9 that indicates a change in SSB burst periodicity of the SSB transmission, the L1-SINR measurement period requirements based on the indicated SSB burst periodicity apply from the first SSB burst after the time point as defined in TS 38.213 plus 2 ms and 3 ms for FR1 and FR2, respectively.

## 9.8D L1-SINR measurements for Reporting for ATG

### 9.8D.1 Introduction

When configured by the network, the UE shall be able to perform L1-SINR measurements with the measurement resources configured as the selection of:

- CSI-RS based CMR and no dedicated IMR configured;
- SSB based CMR and dedicated IMR configured;
- CSI-RS based CMR and dedicated IMR configured.

The measurements shall be performed for a serving cell including PCell, or SCell, on the resources configured for L1-SINR measurements within the active BWP.

The UE shall be able to measure all CSI-RS resources and/or SSB resources and/or CSI-IM resources of the *nzp-CSI-RS-ResourceSet* and/or *csi-SSB-ResourceSet and/or CSI-IM-ResourceSet* within the *CSI-ResourceConfig* settings for L1-SINR for the active BWP and measure interference on corresponding NZP CSI-RS or CSI-IM resources if configured, provided that the number of resources does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the *reportConfigType* according to the CSI reporting configuration(s) (*CSI-ReportConfig*) for the active BWP.

## 9.8D.2 Requirements applicability

The requirements in clause 9.8D apply, provided:

- CMR resources configured for L1-SINR measurements are measurable, and
- NZP-IMR resources configured for L1-SINR measurements if applicable are measurable.

Requirements are defined for periodic, semi-persistent and aperiodic resources.

For CSI-RS based CMR and no dedicated IMR configured, a CSI-RS resource configured for L1-SINR shall be considered measurable when for each relevant CSI-RS the following conditions are met:

- L1-SINR related side conditions given in clauses 10.1.27, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.8.1 for a corresponding band.

For SSB based CMR and dedicated IMR configured, a SSB and a dedicated IMR configured for L1-SINR shall be considered measurable when for each relevant SSB and IMR the following conditions are met:

- L1-SINR related side conditions given in clauses 10.1.27, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.8.2 for a corresponding band.
- NZP-IMR Ês/Iot according to Annex B.2.8.2 for a corresponding band, if NZP-IMR is configured as dedicated IMR.

For CSI-RS based CMR and dedicated IMR configured, a CSI-RS and a dedicated IMR configured for L1-SINR shall be considered measurable when for each relevant CSI-RS and IMR the following conditions are met:

- L1-SINR related side conditions given in clauses 10.1.27, respectively, for a corresponding band,
- CSI-RS_RP and CSI-RS Ês/Iot according to Annex B.2.8.3 for a corresponding band
- NZP-IMR Ês/Iot according to Annex B.2.8.3 for a corresponding band, if NZP-IMR is configured as dedicated IMR.

## 9.8D.3 Measurement Reporting Requirements

The UE shall send L1-SINR reports only for report configurations configured for the active BWP.

The UE shall report the L1-SINR value as a 7-bit value in the range [-23, 40] dB with 0.5 dB step size if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting* is enabled, the UE shall use differential L1-SINR based reporting. The differential L1-SINR is quantized to a 4-bit value with 1 dB step size. The mapping between the reported L1-SINR value and the measured quantity is described in clause 10.1.16.

### 9.8D.3.1 Periodic Reporting

Reported L1-SINR measurements contained in periodic L1-SINR measurement reports shall meet the requirements in clauses 10.1.27.

The UE shall transmit the periodic L1-SINR reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.8D.3.2 Semi-Persistent Reporting

Reported L1-SINR measurements contained in a Semi-Persistent L1-SINR measurement report shall meet the requirements in clause 10.1.27. This requirement applies for semi-persistent L1-SINR reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-SINR measurement reports on PUSCH, if a DCI for triggering report has been received.

The UE shall only send semi-persistent L1-SINR measurement reports on PUCCH, if an activation command as described in clause 6.1.3.16 in TS 38.321 [7] has been received.

The UE shall transmit the semi-persistent L1-SINR reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.8D.3.3 Aperiodic Reporting

Reported L1-SINR measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-SINR reports shall meet the requirements in clauses 10.1.27.

The UE shall only send aperiodic L1-SINR measurement reports, if a DCI for triggering report has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-SINR reporting on PUSCH over the air interface at the time specified according to clause 5.2.1.4 in TS 38.214 [26].

## 9.8D.4 L1-SINR measurement requirements

### 9.8D.4.1 L1-SINR reporting with CSI-RS based CMR and no dedicated IMR configured

The UE shall be capable of performing L1-SINR measurements with the CSI-RS configured as CMR and no dedicated resource configured as IMR for L1-SINR computation, and the UE physical layer shall be capable of reporting L1-SINR measured over the measurement period of $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only_ATG}$.

The value of $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only_ATG}$ is defined in table 9.8D.4.1-1 for FR1, where

For the value of M,

- For periodic and semi-persistent CSI-RS resources as CMR, M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise;
- For aperiodic CSI-RS resources as CMR, M=1.

For ATG UE capable of *antennaArrayType-r18* on the measured carrier,

P value for a CSI-RS resource to be measured is defined as

- $N_{total}$ / $N_{available}$ with $N_{available}$ > 0
- $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ with $N_{available}$ = 0
- For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any CSI-RS resource occasion:
  - $N_{total}$ is the total number of CSI-RS resource occasions within the window W, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
  - $N_{outside_MG}$ is the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is
    - If the measured carrier is the SCC with *servingcellMO* configured, and the network indication *neighSCellMeasSkipping* is set to ‘enable’ to UE,
      - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier or UE support two simultaneous separate Rx beams,
        - the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W.

- Otherwise,
  - the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements of other serving cell within the window W.
- Otherwise,
  - If inter-band carrier aggregation within FR1 is configured, and UE not capable of *antennaArrayType-r18* on the other serving carrier or UE support two simultaneous separate Rx beams
    - the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements of same serving cell within the window W.
  - Otherwise,
    - the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion nor CSI-RS resource occasions for L3 measurements within the window W.

- $T_{L1}$ is periodicity of the target CSI-RS
- $P_{sharing\ factor} = 3$.

Otherwise, for UE with one or multiple omni-directional antenna(s)

For a UE supporting *concurrentMeasGap-r17* and when concurrent gaps are configured,

- P value for a CSI-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$
- For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gaps, and starting at the beginning of any CSI-RS resource occasion:
  - $N_{total}$ is the total number of CSI-RS resource occasions within the window W, including those overlapped with measurement gap occasions or SMTC occasions within the window W, and
  - $N_{outside_MG}$ is the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $T_{L1}$ is periodicity of the target CSI-RS.

Otherwise, for a UE not supporting *concurrentMeasGap-r17* or when concurrent gaps are not configured,

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xGP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency or inter-frequency, which are overlapping with some but not all occasions of the CSI-RS; and
- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the CSI-RS.

Where:

- $T_{CSI-RS}$ = the periodicity of CSI-RS configured for L1-SINR measurement
- a CSI-RS is considered to be overlapped with the GAP if it overlaps a measurement gap occasion, and
- xRP = MGRP

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Note: The overlap between CSI-RS for L1-SINR measurement and SMTC means that CSI-RS for L1-SINR measurement is within the SMTC window duration.

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and GAP configurations does not meet previous conditions.

**Table 9.8D.4.1-1: Measurement period $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only_ATG}$ for FR1**

| Configuration | $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_Only_ATG}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{CSI\text{-}RS})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX},T_{CSI\text{-}RS}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-SINR measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-SINR measurement is transmitted with Density = 3. | |

## 9.8D.4.2 L1-SINR reporting with SSB based CMR and dedicated IMR configured

The UE shall be capable of performing L1-SINR measurements with the SSB configured as CMR and dedicated resource configured as IMR for L1-SINR computation, in which the NZP-CSI-RS or CSI-IM resource configured as dedicated IMR shall be 1-to-1 mapped to SSB configured as CMR, with the same periodicity. The UE physical layer shall be capable of reporting L1-SINR measured over the measurement period of $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR_ATG}$.

The requirements in this clause are not applicable if NZP-CSI-RS or CSI-IM resource configured as dedicated IMR is scheduled with different periodicity as SSB configured as CMR.

The value of $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR_ATG}$ is defined in table 9.8D.4.2-1, where

For the value of M

- For periodic or semi-persistent NZP CSI-RS or CSI-IM resource as dedicated IMR, M=1 if the higher layer parameters *timeRestrictionForChannelMeasurements* and/or *timeRestrictionForInterferenceMeasurements* are configured, and M=3 otherwise;

P is defined as the maximum value between $P_{CMR}$ and $P_{IMR}$, i.e., $P = \max(P_{CMR}, P_{IMR})$, where

- the value of $P_{CMR}$ shall be derived in the same way as the value of P used for SSB based L1-RSRP measurement in clause 9.5D.4.1, in which the occasions and period of the SSB for CMR shall be used instead.

- the value of $P_{IMR}$ shall be derived in the same way as the value of P used for CSI-RS based L1-RSRP measurement in clause 9.5D.4.2, in which the occasions and period of the NZP CSI-RS for NZP-IMR or CSI-IM for ZP-IMR shall be used instead.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

For L1-SINR measurement with SSB as CMR and CSI-RS or CSI-IM as IMR, the requirement shall apply if the CSI-RS is configured as IMR with repetition field as “repetition = OFF” or CSI-IM is configured as IMR.

For L1-SINR measurement with SSB as CMR and CSI-RS/CSI-IM as IMR, no requirement shall apply if SSB occasions for CMR or CSI-RS/CSI-IM occasions for IMR are fully overlapped with the configured measurement gap

**Table 9.8D.4.2-1: Measurement period $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR_ATG}$ for FR1**

| Configuration | $T_{L1\text{-}SINR_Measurement_Period_SSB_CMR_IMR_ATG}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{SSB})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX},T_{SSB}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE 1: $T_{SSB}$ = ssb-periodicityServingCell is the periodicity of the SSB-Index configured for L1-SINR channel measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: The requirements are applicable provided that the CSI-RS resource configured for interference measurement shall be 1-to-1 mapped to SSB configured for channel measurement, with the same periodicity. | |

### 9.8D.4.3 L1-SINR reporting with CSI-RS based CMR and dedicated IMR configured

The UE shall be capable of performing L1-SINR measurements with the CSI-RS resource configured as CMR and dedicated resource configured as IMR for L1-SINR computation, in which the NZP-CSI-RS or CSI-IM resource configured as dedicated IMR shall be 1-to-1 mapped to CSI-RS resource configured as CMR, with the same periodicity. The UE physical layer shall be capable of reporting L1-SINR measured over the measurement period of $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR_ATG}$.

The requirements in this clause are not applicable if NZP-CSI-RS or CSI-IM resource configured as dedicated IMR is scheduled with different periodicity as CSI-RS resource configured as CMR.

The value of $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR_ATG}$ is defined in table 9.8D.4.3-1, where

For the value of M,

- M=1 shall be applied if
  - aperiodic NZP-CSI-RS as CMR or dedicated IMR, or
  - aperiodic CSI-IMR as dedicated IMR, or
  - periodic and semi-persistent NZP-CSI-RS as CMR or dedicated IMR and the higher layer parameters *timeRestrictionForChannelMeasurement* and/or *timeRestrictionForInterferenceMeasurements* are configured, or
  - periodic and semi-persistent CSI-IM as dedicated IMR and the higher layer parameters *timeRestrictionForChannelMeasurement* and/or *timeRestrictionForInterferenceMeasurements* are configured;
- M=3 otherwise.

P is defined as the maximum value between $P_{CMR}$ and $P_{IMR}$, i.e., $P = \max(P_{CMR}, P_{IMR})$, where

- The value of $P_{CMR}$ and $P_{IMR}$ shall be derived in the same way as the value of P used for CSI-RS based L1-RSRP measurement in clause 9.5D.4.2, in which the occasions and period of the CSI-RS for CMR and NZP CSI-RS for NZP-IMR or CSI-IM for ZP-IMR shall be used instead respectively.

Longer evaluation period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet previous conditions.

For L1-SINR measurement with CSI-RS as CMR and CSI-RS as IMR, the requirement shall apply only if CSI-RS resources as CMR and IMR are configured with the same repetition field and the number of CSI-RS resources in the resource sets for CMR and IMR are same.

For L1-SINR measurement with CSI-RS as CMR and CSI-IM as IMR, the requirement shall apply only if the number of CSI-RS resources in the resource set for CMR and the number of CSI-IM resources in the resource set for IMR are same.

For L1-SINR measurement with CSI-RS as CMR and CSI-RS/CSI-IM as IMR, no requirement shall apply if CSI-RS occasions for CMR or CSI-RS/CSI-IM occasions for IMR are fully overlapped with the configured measurement gap.

**Table 9.8D.4.3-1: Measurement period $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR_ATG}$ for FR1**

| Configuration | $T_{L1\text{-}SINR_Measurement_Period_CSI\text{-}RS_CMR_IMR_ATG}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{CSI\text{-}RS})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(1.5*M*P)*\max(T_{DRX}, T_{CSI\text{-}RS}))$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for L1-SINR measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |
| NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-SINR measurement is transmitted with Density = 3. | |
| NOTE 3: The requirements are applicable provided that the CSI-RS resource configured for interference measurement shall be 1-to-1 mapped to | |

| |
|---|
| CSI-RS configured for channel measurement, with the same periodicity. |

## 9.8D.5 Measurement restriction for L1-SINR measurement

The UE is required to be capable of measuring L1-SINR without measurement gaps. The UE is required to perform the SSB and CSI-RS/CSI-IM measurements with measurement restrictions as described in the following clauses.

### 9.8D.5.1 Measurement restriction if SSB configured for L1-SINR Measurement

For FR1, when the SSB configured as CMR for L1-SINR measurement is in the same OFDM symbol as CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-SINR measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-SINR measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-SINR measurement and CSI-RS. Longer measurement period for SSB based L1-SINR measurement is expected, and no requirements are defined.

### 9.8D.5.2 Measurement restriction if CSI-RS configured for L1-SINR measurement

When the CSI-RS configured for L1-SINR measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement, UE is not required to receive CSI-RS for L1-SINR measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement is within the active BWP and has same SCS than CSI-RS configured for L1-SINR measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement is within the active BWP and has different SCS than CSI-RS configured for L1-SINR measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-SINR measurement and SSB. Longer measurement period for CSI-RS based L1-SINR measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS configured for L1-SINR measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement, UE shall be able to measure the CSI-RS for L1-SINR measurement without any restriction.

### 9.8D.5.3 Measurement restriction if CSI-IM configured for L1-SINR measurement

When the CSI-IM configured for L1-SINR measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement, UE is not required to measure CSI-IM for L1-SINR measurement in the PRBs that overlap with an SSB.

For FR1, UE shall be able to measure the CSI-IM configured for L1-SINR measurement without any restriction.

## 9.8D.6 Scheduling availability of UE during L1-SINR measurement

Scheduling availability restrictions when the UE is performing L1-SINR measurement are described in the following clauses.

### 9.8D.6.1 Scheduling availability of UE performing L1-SINR measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-SINR measurement performed on SSB and CSI-RS configured for L1-SINR measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.8D.6.2 Scheduling availability of UE performing L1-SINR measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-SINR measurement based on SSB configured for L1-SINR measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-SINR measurement based on SSB configured for L1-SINR measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking /CSI-RS for CQI on SSB symbols to be measured for L1-SINR measurement.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions on serving cell where L1-SINR measurement is performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-SINR measurement is performed is configured.

# 9.9 NR measurements for positioning

## 9.9.1 Introduction

This clause contains requirements for UE capable of performing NR positioning measurements defined in TS 38.215 [4], including RSTD, PRS-RSRP, UE Rx-Tx time difference, NR E-CID, PRS-RSRPP, RSCPD with RSTD, and RSCP with UE Rx-Tx time difference measurements.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

### 9.9.1.1 General Aspects of Gap-based Measurement

For gap-based RSTD, RSTD based on aggregated PRS resources from multiple PFLs, PRS-RSRP, UE Rx-Tx time difference, UE Rx-Tx time difference based on aggregated PRS resources and aggregated SRS resources from multiple PFLs, PRS-RSRPP, DL RSCPD reported with RSTD, DL RSCP reported with UE Rx-Tx time difference measurements, the requirements in clauses 9.9.2.5, 9.9.2.10, 9.9.3.5, 9.9.4.5, 9.9.4.9, 9.9.6.5, 9.9.7, and 9.9.8 apply provided:

- the UE is configured or pre-configured with measurement gaps or configured with concurrent measurement gaps
  - all positioning frequency layers are measured or associated with only one per-UE measurement gap, or
  - for the UE supporting *independentGapConfigPRS-r17*, all positioning frequency layers in the same FR are measured or associated with only one per-FR measurement gap in the corresponding FR.
- if the measurement gap is pre-configured, the gap must be activated throughout the measurement period, and
- if concurrent measurement gaps are configured, one of the gap combinations specified in clause 9.1.8.2 is configured, and

- if the UE does not support *independentGapConfigPRS-r17*, the configured or pre-configured gap used to perform the PRS measurements must be of per-UE type, and

- No active BWP switching occurs during the measurement gaps for PRS measurement.

All measurement requirements specified in clauses 9.9.2.5, 9.9.2.10, 9.9.3.5, 9.9.4.5, 9.9.4.9, 9.9.6.5, 9.9.7 and 9.9.8 shall apply without DRX as well as for any DRX configuration specified in TS 38.331 [2].

UE is only required to measure PRS resources that are fully or partially overlapped with measurement gaps, and the requirements in clauses 9.9.2.5, 9.9.2.10, 9.9.3.5, 9.9.4.5, 9.9.4.9, 9.9.6.5, 9.9.7, and 9.9.8 are applicable to PRS resources that are fully or partially overlapped with measurement gaps.

A PRS resource is considered to be fully (partially) overlapped with measurement gaps if all (some) of its instances are overlapped with a measurement gap occasion. A PRS resource instance is considered to be overlapped with measurement gap occasion if the minimum number of unmuted repetitions of the instance taking into account *nr-DL-PRS-ExpectedRSTD-Uncertainty* and *nr-DL-PRS-ExpectedRSTD* is fully covered by the MGL excluding RF switching time, where the minimum number is given in the accuracy requirements in clause 10.1.23, 10.1.23A, 10.1.24, 10.1.25, 10.1.25A, and 10.1.38 for RSTD, RSTD based on aggregated PRS resources from multiple PFLs, PRS-RSRP, UE Rx-Tx time difference and UE Rx-Tx time difference based on aggregated PRS resources and aggregated SRS resources from multiple PFLs, PRS-RSRPP, respectively.

When UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

If a positioning measurement gap is configured via *PosGapConfig* and activated by MAC CE, the measurement requirements in clauses 9.9.2.5, 9.9.2.10, 9.9.3.5, 9.9.4.5, 9.9.4.9, 9.9.6.5, 9.9.7, and 9.9.8 apply provided that no other MGs are configured, and only one measurement gap configured via *PosGapConfig* is activated.

When UE supports *musim-GapPreference-r17* and if the configured aperiodic MUSIM gap collides with the measurement gap associated with PRS measurement, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer measurement period for the PRS measurement is expected than the requirements as defined in clauses 9.9.2.5, 9.9.2.10, 9.9.3.5, 9.9.4.5, 9.9.4.9, 9.9.6.5, 9.9.7, and 9.9.8.

### 9.9.1.2 General Aspects of Gapless Measurement

The requirements for RSTD, PRS-RSRP, UE Rx-Tx time difference, and PRS-RSRPP measurement without measurement gaps specified in clauses 9.9.2.7, 9.9.3.6, 9.9.4.6 and 9.9.6.6 shall apply provided that:

Positioning frequency layer to be measured is within an active BWP,

UE is configured with PPW, and the PPW for the active BWP containing the positioning frequency layer to be measured is activated,

No active BWP switching occurs during the measurement period specified in clauses 9.9.2.7, 9.9.3.6, 9.9.4.6, and 9.9.6.6,

PRS is within PPW and does not overlap with other signals/channels of higher priority,

- for PPW type 1A/1B, the PPW does not overlap with any symbol for SSB-based RLM/BFD/CBD/L1-RSRP/L1-SINR measurement on any CC or for SSB based RRM measurement on any MOs that are measured outside measurement gaps,

- for PPW type 2, PRS does not overlap with any symbol for SSB-based RLM/BFD/CBD/L1-RSRP/L1-SINR measurement on any CC or for SSB based RRM measurement on any MOs that are measured outside measurement gaps,

$\max |\Delta T| \leq THR$, where

$\Delta T$ is the time difference between the start of a slot containing PRS from the neighbor cell/TRP and the start of the closest slot from the serving cell;

the range of $\Delta T$ is determined by the expected RSTD and expected RSTD uncertainty in the assistance data;

THR is the threshold as reported in UE capability *prs-MeasurementWithoutMG-r17*.

SCS of PRS within PPW and SCS of DL active BWP are the same.

All measurement requirements specified in clauses 9.9.2.7, 9.9.3.6, 9.9.4.6 and 9.9.6.6 shall apply without DRX as well as for any DRX configuration specified in TS 38.331 [2].

The UE is not required to perform additional SSB measurement for the SSB configured as QCL source of PRS resources.

The UE is only required to measure PRS resources that are unmuted and fully or partially overlapped with PPW, and the requirements in clauses 9.9.2.7, 9.9.3.6, 9.9.4.6 and 9.9.6.6 are applicable to PRS resources that are unmuted and fully or partially overlapped with PPW.

A PRS resource is considered to be fully (partially) overlapped with PPW if all (some) of its instances are overlapped with a PPW occasion. A PRS resource instance is considered to be overlapped with PPW occasion if the minimum number of unmuted repetitions of the instance taking into account Rx time difference between serving and non-serving cell is fully covered by the PPW , where the minimum number is given in the accuracy requirements in clause 10.1.23, 10.1.24, 10.1.25 and 10.1.38 for RSTD, PRS-RSRP, UE Rx-Tx time difference and PRS-RSRPP, respectively.

When UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

When UE supports *MUSIM-GapConfig-17* and the PPW occasion of the target positioning frequency layer is overlapping with the configured aperiodic MUSIM gap, longer period for the PRS measurement is expected than the requirements as defined in clause 9.9.2.7, 9.9.3.6, 9.9.4.6 and 9.9.6.6.

### 9.9.1.3 Scheduling Availability of UE during PRS Measurement without Measurement Gaps

The requirements in this clause apply for UE performing RSTD, PRS-RSRP, UE Rx-Tx time difference and PRS-RSRPP measurement without measurement gaps.

If *prs-ProcessingWindowType1A-r17* UE capable of supporting priority options 1, 2 and 3 is configured with a *type1A* PRS processing window with priority value '*st1*' for PRS measurement, then UE is not expected to receive PDCCH/PDSCH/CSI-RS from any serving cell on all symbols within PRS processing window.

If *prs-ProcessingWindowType1A-r17* UE capable of supporting priority option 2 is configured with a *type1A* PRS processing window with priority value '*st2*' for PRS measurement, then UE is not expected to receive PDSCH/CSI-RS from any serving cell on all symbols within PRS processing window but shall receive PDCCH and URLLC PDSCH within PRS processing window.

If *prs-ProcessingWindowType1B-r17* UE capable of supporting priority options 1, 2 and 3 is configured with a *type1B* PRS processing window with priority value '*st1*' for PRS measurement, then UE is not expected to receive PDCCH/PDSCH/CSI-RS from serving cells in the same band as DL PRS on all symbols within PRS processing window.

If *prs-ProcessingWindowType1B-r17* UE capable of supporting priority option 2 is configured with a *type1B* PRS processing window with priority value '*st2*' for PRS measurement, then UE is not expected to receive PDSCH/CSI-RS from a certain band but shall receive PDCCH and URLLC PDSCH from serving cells in the same band as DL PRS on all symbols within PRS processing window.

If *prs-ProcessingWindowType2-r17* UE capable of supporting priority options 1, 2 and 3 is configured with a *type2* PRS processing window with priority value '*st1*' for PRS measurement, then the UE is not expected to receive PDCCH/PDSCH/CSI-RS from the serving cell containing DL PRS in case of FR1 or from serving cells in the same band as DL PRS in case of FR2 on the symbols overlapped with DL PRS within PRS processing window.

If *prs-ProcessingWindowType2-r17* UE capable of supporting priority option 2 is configured with a *type2* PRS processing window with priority value '*st2*' for PRS measurement, then UE is not expected to receive PDSCH/CSI-RS on the symbols overlapped with DL PRS within PRS processing window but shall receive PDCCH and URLLC PDSCH from the serving cell containing DL PRS in case of FR1 or from serving cells in the same band as DL PRS in case of FR2 on the symbols overlapped with DL PRS within PRS processing window.

When PRS is lower priority than the DL signals/channels the following applies when UEs have an activated PRS processing window with *type1A* or *type1B*:

- If UE determines the presence of other DL signals/channels except SSB of higher priority than PRS in the PPW no later than $N_2$ symbols, defined in clause 6.4 of TS 38.214 [26] for the subcarrier spacing μ of the DL PRS, before the start of the PPW, UE expects to receive the DL signals/channels and drop all DL PRS in the PPW.

- If UE determines the presence of other DL signals/channels except SSB of higher priority than PRS in the PPW later than $N_2$ symbols, defined in clause 6.4 of TS 38.214 [26] for the subcarrier spacing μ of the DL PRS, before the start of the PPW, UE is not required to receive the other DL signals/channels except SSB of higher priority and may receive the DL PRS in the PPW.

When PRS is lower priority than the DL signals/channels the following applies when UEs have an activated PRS processing window with *type2*:

- If UE determines the presence of other DL signals/channels except SSB of higher priority than PRS on a PRS symbol no later than $N_2$ symbols, defined in clause 6.4 of TS 38.214 [26] for the subcarrier spacing μ of the DL PRS, before the PRS symbol, UE expects to receive the DL signals/channels and drop the PRS symbol.

- If UE determines the presence of other DL signals/channels except SSB of higher priority than PRS on a PRS symbol later than $N_2$ symbols, defined in clause 6.4 of TS 38.214 [26] for the subcarrier spacing μ of the DL PRS, before the PRS symbol, UE is not required to receive the other DL signals/channels except SSB of higher priority and may receive the PRS symbol.

For inter-band case for FR2 for the DL signals/channels from a different FR2 band than the FR2 band of the DL PRS, if the same Rx beam is used for both FR2 bands and the DL PRS is determined to be higher priority, UEs are not expected to receive the DL signals/channels if they are expected to measurement the DL PRS in a configured DL PRS processing window with *type1B* or *type2*.

## 9.9.2 RSTD measurements

### 9.9.2.1 Introduction

The requirements in clause 9.9.2 shall apply provided the UE has received *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to measure and report DL RSTD measurements defined in TS 38.215 [4].

### 9.9.2.2 Requirements Applicability

The requirements in clause 9.9.2 apply for periodic and triggered RSTD measurements, provided:

- PRS-RSTD related side conditions given in clause 10.1.23 for FR1 and FR2 are fulfilled, for a corresponding band.

### 9.9.2.3 Measurement Capability

UE PRS RSTD measurement capability is as indicated by the UE in *NR-DL-TDOA-ProvideCapabilities*, according to TS 37.355[34].

### 9.9.2.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The reported RSTD measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clauses 10.1.23.3.

The RSTD measurements performed and reported according to this clause shall meet the RSTD measurement accuracy requirements in clause 10.1.23, for each measured DL PRS resource.

9.9.2.4.1 Void

9.9.2.4.2 Void

9.9.2.4.3 Void

### 9.9.2.5 Measurements Period Requirements

When physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD,i} + (L-1) * \max(T_{effect,i})$$

Where ,

$i$ is the index of positioning frequency layer,

$L$ is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$T_{RSTD,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer $i$ as specified below:

$$T_{RSTD,i} = \left(k_{multiTEG,i} * CSSF_{PRS,i} * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i},$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor. In FR1, $N_{RxBeam,i}$ = 1;

and in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$CSSF_{PRS,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in positioning frequency layer $i$ as defined in clause 9.1.5.2.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG,i} = N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i} = \left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-*

*RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap or MUSIM gap or both concurrent measurement gap and MUSIM gap. $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap and not configured with MUSIM gaps.

- For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer and periodic MUSIM gaps, and starting at the beginning of any associated gap occasions covering the PRS occasion:
  - $N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
  - $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG and MUSIM gaps collisions by applying the selected gap collision rule
  - Requirements do not apply if $N_{available}$ =0.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{sample}$ is the number of PRS RSTD measurement samples, where

- $N_{sample}$ = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 4 otherwise.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the

sampling time and processing time. If all of the PRS resources to be measured are available in the same MG occasion during $T_{availabe}$, $T_{last,i} = T_i$ +MGL. Otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$ ,

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

$T_i$ corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$.

$MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the PRS frequency layer i.

$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where

$T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$ which is given by the higher-layer parameter *NR-MutingPattern-r16* included in *DL-PRS-MutingOption1-r16*.

- Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

$\{N, T\}$ is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34].

$N'$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [34].

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{RSTD,Total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34].

For deferred MT-LR with other event than "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{RSTD,Total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the RSTD measurement in each reporting period and activate the location report at the time when the periodic timer expires.

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When PRS-RSRP is configured for DL-TDOA, RSTD and PRS-RSRP are performed over the measurement period defined in clause 9.9.2.5.

When PRS-RSRPP is configured for DL-TDOA, RSTD and PRS-RSRPP are performed over the measurement period defined in clause 9.9.2.5.

If during the measurement period of one or more positioning frequency layers, the MG pattern is reconfigured, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSTD,Total}$ within measurement gaps due to collisions with other signals; otherwise, the measurement period can be longer.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9.2 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements. The RSTD measurement period can be longer. The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23.

### 9.9.2.6 Void

### 9.9.2.7 Measurements Period Requirements without Measurement Gaps

When physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{RSTD,Total} = \max(T_{RSTD_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where,

$i$ is the index of positioning frequency layer, and

$L$ is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{RSTD,Total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{RSTD_wo_gap,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer *i* as specified below.

$$T_{RSTD_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i},$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor. In FR1, $N_{RxBeam,i}$ = 1; and in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not supported *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG,i}=N_{TEG,i}$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i}=\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,\mathrm{i}}$,

only the PRS resources unmuted and fully or partially overlapped with PPW are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{sample}$ is the number of PRS RSTD measurement samples, where

- $N_{sample}$= 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$=2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
- Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$=4 otherwise.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,\mathrm{i}} = T_{\mathrm{i}}$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

$T_i$ corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw*-durationOfPRS-*ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$.

$PPWRP_i$ is the repetition periodicity of the PRS processing window applicable for measurements in the positioning frequency layer *i*.

$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*,

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the conditions for PRS measurement outside measurement gaps as defined in clause 9.9.1.2 are considered.

$N$ is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer i is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer i is in Case 2.

$N'$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [34].

The time $T_{RSTD_wo_gap,i}$ starts from the first instance of the activated PPW for measurement of positioning frequency layer *i* aligned with a DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation*message are delivered from LMF to the physical layer of UE via LPP [34].

When PRS-RSRP is configured for DL-TDOA, RSTD and RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and RSRPP are performed over the same measurement period.

If during the measurement period of one or more positioning frequency layers, the PPW is re-configured or reactivated, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSTD_wo_gap,i}$ within PPW due to collisions with other signals; otherwise, the measurement period can be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9.2 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements. The RSTD measurement period can be longer. The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23.

If any positioning frequency layer is in Case 2, the requirements in this clause apply provided that the PPWL corresponding to the positioning frequency layer is larger than (T2+X) ms.

The requirements in this clause apply provided that a single positioning frequency layer is configured for measurement in each PPW.

### 9.9.2.8 Void

### 9.9.2.9 Measurements Period Requirements with both MG and PPW

If the UE is configured with both MG applicable to positioning measurement and PPW, the UE shall measure positioning frequency layer *i* within

- MG, if PRS resources on positioning frequency layer *i* are overlapped with MG, or
- PPW, if PRS resources on positioning frequency layer *i* are overlapped with PPW.

The measurement period $T_{RSTD,Total}$ is defined as:

$$T_{RSTD,Total} = T_{RSTD,Total,MG} + T_{RSTD,Total,PPW} + T_{guard},$$

Where

- $T_{RSTD,Total,MG}$ is defined in clause 9.9.2.5 and includes all positioning frequency layers to be measured within MG,
- $T_{RSTD,Total,PPW}$ is defined in clause 9.9.2.7 and includes all positioning frequency layers to be measured within PPW,
- $T_{guard}$ is the maximum $T_{effect}$ defined in clauses 9.9.2.5 and 9.9.2.7 among all PFLs.

The requirements apply provided the following conditions are satisfied:

- MGs and PPWs do not overlap in time;
- Each PFL in the assistance data can be measured completely (all PRS resources) either within MG or within activated PPW.

### 9.9.2.10 Measurements Period Requirements with Bandwidth Aggregation

When UE physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34] with a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequestedPFL-List*, the UE shall be able to perform RSTD measurement by aggregating PRS resources from multiple PFLs (up to the UE capability specified in clause 9.9.2.3) defined in TS 38.215 [4], during the measurement period $T_{RSTD_aggregate,\ Total}$ defined as:

$$T_{RSTD_aggregate,\ Total} = T_{non_aggregate_RSTD} + T_{aggregate_RSTD} + T_{margin},$$

where,

$T_{non_aggregate_RSTD}$ is the total measurement period for RSTD measurement on PFLs that do not contain PRS resources for aggregation.

Calculation of $T_{non_aggregate_RSTD}$ is based on clause 9.9.2.5 with the following exceptions,

- only PFLs containing resource set(s) not linked to any other resource set(s) are considered in $L$
- on each PFL $i$, only resource set(s) not linked to any other resource set(s) are considered in $T_{available_PRS,i}$, $N_{PRS,i}^{slot}$ and $L_{available_PRS,i}$
- $N_{sample} = 2$ if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* specified in TS 37.355 [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples,
- $(L-1) * \max(T_{effect,i})$ is replace by $(L-1) * T'_{margin}$.

$T_{non_aggregate_RSTD}$ is equal to zero if UE is not configured to perform non-aggregated measurements by the LMF.

If UE is configured to perform positioning measurements on PFLs that contain PRS resources for aggregation and on PFLs that do not contain PRS resources for aggregation, $T_{margin} = T'_{margin}$ is delay margin to account for delay between RSTD measurement performed by UE on PFLs that contain PRS resources for aggregation and RSTD measurement performed by UE on PFLs that do not contain PRS resources for aggregation.

If UE is only configured to perform measurements on PFLs that contain PRS resources for aggregation or if UE is only configured to perform measurements on PFLs that do not contain PRS resources for aggregation, then $T_{margin} = 0$.

$T'_{margin} = \max(Teffect, i)$, when both aggregated PFLs and non-aggregated PFLs are configured for positioning measurement.

If UE is capable of performing latency reduced positioning measurements and is configured to perform latency reduced positioning measurement by LMF via *reducedDL-PRS-ProcessingSamples-r17* [34], then $N_{sample} = 2$ shall be considered in calculations of $T_{aggregate_RSTD}$ and $T_{non\text{-}aggregate_RSTD}$.

If UE is not capable to perform latency reduced positioning measurements or is not configured to perform latency reduced positioning measurement by LMF via *reducedDL-PRS-ProcessingSamples-r17* [34], then $N_{sample} = 4$ shall be considered in calculations of $T_{aggregate_RSTD}$ and $T_{non\text{-}aggregate_RSTD}$.

$T_{aggregate_RSTD}$, total measurement period for RSTD measurements performed by UE by aggregating PRS resources from multiple PFLs as defined in TS 38.214 [26], is defined as:

$$T_{aggregate_RSTD} = \sum_{i=1}^{G} T_{RSTD_aggregate,i} + (G-1) * T'_{margin},$$

where

i is the index of effective PFL, corresponding to the group of PFLs containing linked PRS resource sets to be aggregated for RSTD measurement,

G denotes the number of effective PFLs that UE is configured to perform aggregated measurements on. G is configured by LMF and is provisioned to UE via *nr-DL-PRS-AggregationInfo.*

$T_{RSTD_aggregate,i}$ is the measurement period for PRS RSTD measurement in the effective PFL *i* as specified below:

$$T_{RSTD_aggregate,i} = \left(k_{multiTEG_agg,i} \times CSSF_{PRS_agg,i} \times ceil(K_{p,PRS_agg,i}) \times N_{RxBeam,i} \times \left\lceil \frac{N_{PRS_agg,i}^{slot}}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times N_{sample_agg} - 1\right) \times T_{effect_agg,i} + T_{last_agg,i},$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor.

In FR1, $N_{RxBeam,i} = 1$.

In FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing effective PFL i, and the LMF indicates

*lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$CSSF_{PRS_agg,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in effective PFL i as defined in clause 9.1.5.2.

$k_{multiTEG_agg,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG_agg,i}$ = 1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*;

Otherwise,

$k_{multiTEG_agg,i} = N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG_{agg},i}=\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure aggregated PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS_agg,i}$ is a scaling factor for effective PFL i to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS_agg,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS_agg,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS_agg,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the effective PFL, and starting at the beginning of any associated gap occasions covering the PRS occasion:

- $N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
- $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule
- Requirements do not apply if $N_{available} = 0$.

$N^{slot}_{PRS_agg,i}$ is the maximum number of DL PRS resources in effective PFL i configured in a slot.

$L_{available_PRS_agg,i}$ is the time duration of available PRS in the effective PFL i to be measured during $T_{available_PRS_agg,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS_agg,i}$, only the PRS resources unmuted and fully or partially overlapped with MG and satisfying the conditions for PRS BW aggregation are considered.

$N_{sample_agg}$ is the number of PRS RSTD measurement samples.

$T_{last_agg,i}$ is the measurement duration for the last PRS RSTD sample in the effective PFL i, including the sampling time and processing time. If all of the PRS resources to be measured are available in the same MG occasion during $T_{availabe_agg}$, $T_{last_agg,i} = T_{agg,i}$ + MGL. Otherwise, $T_{last_agg,i} = T_{agg,i} + T_{available_PRS_agg,i}$,

$T_{effect_agg,i}$ is the periodicity of the PRS RSTD measurement in the effective PFL i defined as:

$$T_{effect_agg,i} = \left\lceil \frac{T_{agg,i}}{T_{available_PRS_agg,i}} \right\rceil \times T_{available_PRS_agg,i}$$

where,

$T_{available_PRS_agg,i} = LCM(T_{PRS_agg,i}, MGRP_i)$, the least common multiple between $T_{PRS_agg,i}$ and $MGRP_i$. $MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the effective PFL i.

$T_{PRS_agg,i}$ is the periodicity of DL PRS resources meeting the bandwidth aggregation conditions with muting on effective PFL i. If more than one PRS periodicities are configured in effective PFL i, the least common multiple of PRS periodicities $T_{per_agg}^{PRS\ with\ muting}$ among all DL PRS resource sets in the effective PFL is used to derive $T_{PRS_agg,i}$, where,

$T_{per_agg}^{PRS\ with\ muting} = N_{muting} \times T_{per_agg}^{PRS}$, is the PRS periodicity with muting per PRS resource configured for aggregation,

$T_{per_agg}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS_agg} \times L_{muting}$, where $T_{muting}^{PRS_agg}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

- Note: For the purpose of calculating $T_{PRS_agg,i}$, only the PRS resources fully or partially covered by the MG and PRS resources that satisfy the conditions for PRS BW aggregation are considered.

$\{N_{agg}, T_{agg,i}\}$ is UE capability combination per band to aggregate PRS resources from multiple PFLs within an effective PFL where $N_{agg}$ is a duration of DL PRS symbols in ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsN-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsN-r18* in TS 37.355 [34] processed every $T_{agg,i}$ ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsT-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsT* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *maximumOfTwoAggregatedDL-PRS-Bandwidth* or *maximumOfThreeAggregatedDL-PRS-Bandwidth* in TS 37.355 [34]

$N'_{agg}$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR1-r18* for FR1 and *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR2-r18* for FR2 specified in TS 37.355 [34].

The requirements in this clause for aggregated measurements apply provided that the linked PRS resource sets on multiple PFLs for aggregated measurements satisfy all the conditions specified in clause 5.1.6.5.3 in TS 38.214 [26].

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{RSTD_aggregate,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data for aggregation after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34] including a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequestedPFL-List*.

For deferred MT-LR with other event than “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{RSTD_aggregate,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event “Periodic Location” as defined in clause 4.1a.5.1 TS 23.27] [44], the UE shall perform the aggregated RSTD measurement in each reporting period and activate the location report at the time when the periodic timer expires.

When PRS-RSRP is also reported by UE together with RSTD measurement based on aggregated DL-PRS resources from multiple-PFLs, PRS-RSRP are performed over the measurement period defined in clause 9.9.2.10.

When PRS-RSRPP is also reported by UE together with RSTD measurement based on aggregated DL-PRS resources from multiple-PFLs, PRS-RSRPP are performed over the measurement period defined in clause 9.9.2.10.

If during the measurement period of one or more effective PFLs, the MG pattern is reconfigured, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSTD_aggregate,Total}$ within measurement gaps due to collisions with other signals; otherwise, the measurement period can be longer.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for aggregated PRS resources, if the PRS resources to be aggregated are across two sampling duration of $N_{agg}$ within duration $L_{available_PRS_agg,i}$.

The measurement requirements do not apply, if time span of the instance of the PRS resources to be aggregated (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability $N_{agg}$.

The requirements in clause 9.9.2.10 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which aggregated PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while aggregated RSTD measurements are being performed, then the UE shall continue and complete the on-going aggregated RSTD measurements. The aggregated RSTD measurement period can be longer. The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23A.2.

## 9.9.3 PRS-RSRP measurements

### 9.9.3.1 Introduction

The requirements in clause 9.9.3.5 shall apply provided the UE has received a message from LMF via LPP [34] requesting the UE to measure and report PRS-RSRP measurements defined in TS 38.215 [4].

### 9.9.3.2 Requirements applicability

The requirements in clause 9.9.3 apply for periodic and triggered PRS-RSRP measurements, provided:

- PRS-RSRP related side conditions given in clause 10.1.24 are met for a corresponding band.

### 9.9.3.3 Measurement Capability

UE PRS-RSRP measurement capability is as indicated by the UE in *NR-DL-AoD-ProvideCapabilities* according to TS 37.355 [34].

### 9.9.3.4 Measurement Reporting Requirements

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The reported PRS-RSRP measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clauses 10.1.24.3.

The PRS-RSRP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requriements specified in the clauses 10.1.24.

### 9.9.3.5 Measurement Period Requirements

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

where

*i* is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(CSSF_i * ceil(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

where

$CSSF_i$ is the carrier specific scaling factor for PRS-RSRP measurements specified in clause 9.1.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap or MUSIM gap or both concurrent measurement gap and MUSIM gap. $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap and not configured with MUSIM gaps.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioining frequency layer and periodic MUSIM gaps, and starting at the beginning of any associated gap occasions covering the PRS occasion:

$N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG and MUSIM gaps collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and if positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

$N_{sample}$ is the number of PRS-RSRP measurement samples, where

- $N_{sample}$ = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 4 otherwise.

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time, if not all PRS resources to be measured are available in the same measurement gap occasion during $T_{available_PRS,i}$, otherwise $T_{last,i} = T_i + MGL$,

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

$T_i$ corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$ is the least common multiple between $T_{PRS,i}$ and $MGRP_i$ ,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_i$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$ which is given by the higher-layer parameter *NR-MutingPattern-r16* included in *DL-PRS-MutingOption1-r16*.

Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

When PRS-RSRP measurements are configured for DL-AoD, except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{PRS-RSRP,total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after both the *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

For deferred MT-LR with other event than "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{PRS-RSRP,total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the PRS-RSRP measurement in each reporting period and activate the location report at the time when the periodic timer expires.

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 9.9.2.

When the PRS-RSRP measurement is configured together with UE Rx-Tx time difference measurement then the PRS-RSRP measurement shall meet the UE Rx-Tx time difference measurement requirements defined in clause 9.9.4.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource:

– if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or

– if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period of one or more positioning frequency layers, the MG pattern is reconfigured either per UE request or not per UE request, the measurement period can be longer.

The requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{PRS-RSRP,total}$ within measurement gaps due to collisions with other signals; otherwise, a longer measurement period may be used.

The requirements in clause 9.9.3 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while PRS-RSRP measurements are being performed then the UE shall complete the ongoing PRS-RSRP measurements session. The PRS-RSRP measurement period can be longer. The UE shall meet the PRS-RSRP measurement accuracy requirements in clause 10.1.24.

### 9.9.3.6 Measurement Period Requirements without Measurement Gaps

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.3.3) PRS-RSRP measurements as defined in TS 38.215 [4] without measurement gap, on configured positioning frequency layer *i*, within $T_{PRS-RSRP,total}$ ms.

$T_{PRS-RSRP,\,total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$ if any of the positioning frequency layers are in Case 1, or

$T_{PRS-RSRP,\,total} = \max\left(T_{PRS-RSRP,i} + T_{uncertainty,i}\right)$, if all the positioning frequency layers are in Case 2,

Where,

$i$ is the index of positioning frequency layer, and

$L$ is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{PRS-RSRP,\,total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{PRS-RSRP,i}$ is the measurement period for PRS-RSRP measurement in positioning frequency layer *i* as specified below.

$$T_{PRS-RSRP,i} = \left(N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

where

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1. If positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only unmuted PRS resource instances that meet the applicability conditions and fully or partially overlapped with PRS processing window are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

N' is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

$N_{sample}$ is the number of PRS RSRP measurement samples, where

- $N_{sample}$ = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 4 otherwise.

$T_{last}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

$T_i$ corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$ is the least common multiple between $T_{PRS,i}$ and $PPWRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$PPWRP_i$ is the PRS processing window repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. If bitmap $\{b^1\}$ for higher-layer parameter *DL-*
$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the applicability conditions and fully or partially covered by the PRS processing window are considered.

When PRS-RSRP measurements are configured for DL-AoD, the time $T_{PRS-RSRP,i}$ starts from the first PRS processing window instance aligned with DL PRS resources in the assistance data after both the *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 9.9.2.

When the PRS-RSRP measurement is configured together with UE Rx-Tx time difference measurement then the PRS-RSRP measurement shall meet the UE Rx-Tx time difference measurement requirements defined in clause 9.9.4.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource:

if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or

if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9.3 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If during the measurement period of one or more positioning frequency layers, the PPW is reconfigured or reactivated, the PRS-RSRP measurement period can be longer.

If any positioning frequency layer is in Case 2, the requirements in this clause apply provided that the PPWL corresponding to the positioning frequency layer is larger than (T2+X) ms.

The requirements in this clause apply provided that a single positioning frequency layer is configured for measurement in each PPW.

### 9.9.3.7 Void

### 9.9.3.8 Measurements Period Requirements with both MG and PPW

If the UE is configured with both MG applicable to positioning measurement and PPW, the UE shall measure positioning frequency layer *i* within

- MG, if PRS resources on positioning frequency layer *i* are overlapped with MG, or
- PPW, if PRS resources on positioning frequency layer *i* are overlapped with PPW.

The measurement period $T_{PRS-RSRP,\ total}$ is defined as:

$$T_{PRS-RSRP,\ total} = T_{PRS-RSRP,Total,MG} + T_{PRS-RSRP,Total,PPW} + T_{guard},$$

Where

- $T_{PRS-RSRP,Total,MG}$ is defined in clause 9.9.3.5 and includes all positioning frequency layers to be measured within MG,
- $T_{PRS-RSRP,Total,PPW}$ is defined in clause 9.9.3.6 and includes all positioning frequency layers to be measured within PPW,
- $T_{guard}$ is the maximum $T_{effect}$ defined in clauses 9.9.3.5 and 9.9.3.6 among all PFLs.

The requirements apply provided the following conditions are satisfied:

- MGs and PPWs do not overlap in time;
- Each PFL in the assistance data can be measured completely (all PRS resources) either within MG or within activated PPW.

## 9.9.4 UE Rx-Tx time difference measurements

### 9.9.4.1 Introduction

The requirements in this clause shall apply, provided the UE has received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to measure and report one or more UE Rx-Tx time difference measurements defined in TS 38.215 [4].

### 9.9.4.2 Requirements Applicability

The requirements in clause 9.9.4 apply for periodic and triggered UE Rx-Tx time difference measurements, provided:

- UE Rx-Tx time difference measurement related side conditions given in clause 10.1.25 are met for a corresponding band.
- UE Rx-Tx time difference measurement related side conditions given in clause 10.1.25A are met for PRS aggregation from multiple PFLs.
- SRS is configured on at least one of the PCell, PSCell and SCell.
- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.

### 9.9.4.3 Measurement Capability

UE Rx-Tx time difference measurement capability is as indicated by the UE in *NR-Multi-RTT-ProvideCapabilities*, according to TS 37.355 [34].

### 9.9.4.4 Measurement Reporting Requirements

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The UE Rx-Tx time difference measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.25.

The UE Rx-Tx time difference measurement accuracy for all measured DL PRS resources shall be fulfilled according to the accuracy requirements specified in clause 10.1.25.

### 9.9.4.5 Measurement Period Requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx,Total}$ ms.

$$T_{UERxTx,\ Total} = \sum_{i=1}^{L} T_{UERxTx,i} + (L-1) * \max(T_{effect,i}).$$

where $i$ is the index of positioning frequency layer,

$T_{UERxTx,i}$ is the measurement period for UE Rx-Tx time difference measurements in positioning frequency layer $i$ as further defined in this clause,

L is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer $i$ as defined further in this clause.

$$T_{UERxTx,i} = \left( k_{multiTEG,i} * CSSF_i * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where

$CSSF_i$ is the carrier-specific scaling factor for NR PRS-based measurement in the positioning frequency layer $i$ as defined in clause 9.1.5.2,

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*;

otherwise,

$k_{multiTEG,i}$=$N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i}$=$\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap or MUSIM gap or both concurrent measurement gap and MUSIM gap. $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap and not configured with MUSIM gaps.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer and periodic MUSIM gaps, and starting at the beginning of any associated gap occasions covering the PRS occasion:

$N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG and MUSIM gaps collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available} = 0$.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 and if positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in clause 4.2.7.2 of TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [34],

$N_{sample}$ is the number of UE Rx-Tx time difference measurement samples:

- $N_{sample}$ = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34] and the following conditions are met:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34] but the following conditions are not met:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 4 otherwise.

$T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time, $T_{last,i} = T_i + T_{available_PRS,i}$,

$T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

where

$T_i$ corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$

$MGRP_i$ is the measurement gap repetition periodicity in positioning frequency layer *i*.

$T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$ which is given by the higher-layer parameter *NR-MutingPattern-r16* included in *DL-PRS-MutingOption1-r16*

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{UERxTx,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after both the *NR-Multi-RTT-RequestLocationInformation* message and *NR-Multi-RTT-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

For deferred MT-LR with other event than “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{UERxTx,Total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the PRS-RSRP measurement in each reporting period and activate the location report at the time when the periodic timer expires.

NOTE: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

The UE Rx-Tx time difference measurement period is restarted if HO occurs during the measurement period and after SRS reconfiguration on the target cell is complete.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or
- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period of one or more positioning frequency layers, the MG pattern is reconfigured either per UE request or not per UE request, the measurement period can be longer.

The requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{UERxTx,Total}$ within measurement gaps due to collisions with other signals; otherwise, a longer measurement period may be used.

When PRS-RSRP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period.

When PRS-RSRPP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRPP measurements are performed over the same measurement period.

The requirements in clause 9.9.4 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

When PSCell or SCell addition or release does not cause SRS reconfiguration during the measurement period, UE continues the UE Rx-Tx time difference measurement, and the measurement period requirements apply.

When PSCell or SCell addition or release causes SRS reconfiguration during the measurement period, UE shall restart the UE Rx-Tx time difference measurement after the SRS reconfiguration on the target cell is complete.

When SRS is reconfigured without serving cell change during the measurement period, UE shall restart the UE Rx-Tx time difference measurement after the SRS reconfiguration is complete.If UE uplink transmission timing changes due to the network-configured Timing Advance command during the UE Rx-Tx time difference measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

When a serving cell change occurs during the measurement period, the UE shall continue and complete the UE Rx-Tx time difference measurement provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx time difference measurement.

If UE uplink transmission timing changes due to the change in the $N_{TA_offset}$ defined in table 7.1.2-2 during the UE Rx-Tx time difference measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the UE autonomous timing adjustment defined in clause 7.1.2 during the UE Rx-Tx time difference measurement period, then:

- UE Rx-Tx time difference measurement period requirements in this clause shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1.1) for SRS transmission.
- UE Rx-Tx time difference measurement period requirements in this clause shall not apply for a cell, which is not the downlink reference cell (defined in clause 7.1.1) for SRS transmission. The UE Rx-Tx time difference measurement period may be restarted in such case.

### 9.9.4.6 Measurement Period Requirements without Measurement Gaps

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] in configured positioning frequency layers within the measurement period $T_{UERxTx_wo_gap,Total}$ ms.

$T_{UERxTx_wo_gap,\,Total} = \sum_{i=1}^{L} T_{UERxTx_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{UERxTx_wo_gap,\,Total} = \max(T_{UERxTx_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2.

Where,

$i$ is the index of positioning frequency layer, and

$L$ is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{UERxTx_wo_gap,\,Total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{UERxTx_wo_gap,i}$ is the measurement period for UE Rx-Tx time difference measurement in positioning frequency layer *i* as specified below.

$$T_{UERxTx_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i}$$

Where

$T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer *i* as defined further in this clause.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not supported *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*;

otherwise,

$k_{multiTEG,i}$ =$N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i}$ =$\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs or RxTx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1. If positioning frequency layer *i* is in FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only the unmuted PRS resources that meet the applicability conditions and fully or partially overlapped with PRS processing window are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or

corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

- N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [34],

- $N_{sample}$ is the number of UE Rx-Tx time difference measurement samples:

  - $N_{sample}$ = 1 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34] and LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34] and the following conditions are met:

    - PRS bandwidth is within the active BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

  - $N_{sample}$ = 2 if the UE is capable of *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* defined in [34] and the LMF requests the UE to perform positioning measurements with reduced number of samples by *reducedDL-PRS-ProcessingSamples* [34] but the following conditions are not met:

    - PRS bandwidth is within the active BWP and

    - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

  - $N_{sample}$ = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time.

  If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

  if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

  otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

- $T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_{PRS},i}} \right\rceil * T_{available_{PRS},i}$$

where

$T_i$ corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$

$PPWRP_i$ is the PRS processing window repetition periodicity in positioning frequency layer *i*.

$T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the applicability conditions and fully or partially covered by the PRS processing window are considered.

The time $T_{UERxTx_wo_gap,i}$ starts from the first PRS processing window instance aligned with DL PRS resources in the assistance data after both the *NR-Multi-RTT-RequestLocationInformation* message and *NR-Multi-RTT-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

The UE Rx-Tx time difference measurement period is restarted if HO occurs during the measurement period and after SRS reconfiguration on the target cell is complete.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or

- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period of one or more positioning frequency layers, the PRS processing window is reconfigured or reactivated either per UE request or not per UE request, the measurement period can be longer.

The requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{UERxTx_wo_gap,i}$ within PRS processing window due to collisions with other signals; otherwise, a longer measurement period may be used.

When PRS-RSRP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period.

When PRS-RSRPP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRPP measurements are performed over the same measurement period.

The requirements in clause 9.9.4.6 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

When PSCell or SCell addition or release does not cause SRS reconfiguration during the measurement period, UE continues the UE Rx-Tx time difference measurement, and the measurement period requirements apply.

When PSCell or SCell addition or release causes SRS reconfiguration during the measurement period, UE shall restart the UE Rx-Tx time difference measurement after the SRS reconfiguration on the target cell is complete.

When SRS is reconfigured without cell change during the measurement period, UE shall restart the UE Rx-Tx time difference measurement after the SRS reconfiguration on the target cell is complete.

If UE uplink transmission timing changes due to the network-configured Timing Advance command during the UE Rx-Tx measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the change in the $N_{TA_offset}$ defined in table 7.1.2-2 during the UE Rx-Tx measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the UE autonomous timing adjustment defined in clause 7.1.2 during the UE Rx-Tx time difference measurement period, then:

- UE Rx-Tx time difference measurement period requirements in this clause shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1.1) for SRS transmission.

- UE Rx-Tx time difference measurement period requirements in this clause shall not apply for a cell, which is not the downlink reference cell (defined in clause 7.1.1) for SRS transmission. The UE Rx-Tx time difference measurement period may be restarted in such case.

If any positioning frequency layer is in Case 2, the requirements in this clause apply provided that the PPWL corresponding to the positioning frequency layer is larger than (T2+X) ms.

The requirements in this clause apply provided that a single positioning frequency layer is configured for measurement in each PPW.

### 9.9.4.7 Void

### 9.9.4.8 Measurements Period Requirements with both MG and PPW

If the UE is configured with both MG applicable to positioning measurement and PPW, the UE shall measure positioning frequency layer *i* within

- MG, if PRS resources on positioning frequency layer *i* are overlapped with MG, or
- PPW, if PRS resources on positioning frequency layer *i* are overlapped with PPW.

The measurement period $T_{UERxTx,\ Total}$ is defined as:

$$T_{UERxTx,\ Total} = T_{UERxTx,Total,MG} + T_{UERxTx,Total,PPW} + T_{guard},$$

Where

- $T_{UERxTx,Total,MG}$ is defined in clause 9.9.4.5 and includes all positioning frequency layers to be measured within MG,
- $T_{UERxTx,Total,PPW}$ is defined in clause 9.9.4.6 and includes all positioning frequency layers to be measured within PPW,
- $T_{guard}$ is the maximum $T_{effect}$ defined in clauses 9.9.4.5 and 9.9.4.6 among all PFLs.

The requirements apply provided the following conditions are satisfied:

- MGs and PPWs do not overlap in time;
- Each PFL in the assistance data can be measured completely (all PRS resources) either within MG or within activated PPW.

### 9.9.4.9 Measurements Period Requirements with Bandwidth Aggregation

When UE physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34] with a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequestedPFL-List*, the UE shall be able to perform UE Rx-Tx time difference measurement by aggregating PRS resources from multiple PFLs (up to the UE capability specified in clause 9.9.2.3) defined in TS 38.215 [4], during the measurement period $T_{UE_RxTx_aggregated,\ Total}$ defined as:

$$T_{UE_RxTx_aggregated,\ Total} = T_{non\text{-}aggregate_RxTx} + T_{aggregated_RxTx} + T_{margin},$$

where,

$T_{non_aggregate_RxTx}$ is the total measurement period for UE Rx-Tx time difference measurement on PFLs that do not contain PRS resources for aggregation.

Calculation of $T_{non_aggregate}$ is based on clause 9.9.4.5 with the following exceptions,

- only PFLs containing resource set(s) not linked to any other resource set(s) are considered in $L$
- on each PFL $i$, only resource set(s) not linked to any other resource set(s) are considered in $T_{available_PRS,i}$, $N_{PRS,i}^{slot}$ and $L_{available_PRS,i}$
- $N_{sample} = 2$ if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* specified in TS 37.355 [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples,
- $(L-1) * \max(T_{effect,i})$ is replaced by $(L-1) * T'_{margin}$.

$T_{non_aggregate_RxTx}$ is equal to zero if UE is not configured to perform non-aggregated measurements by the LMF.

$T_{aggregate_RxTx}$ is the total measurement period for UE Rx-Tx time difference measurements performed by UE by aggregating PRS resources from multiple PFLs as defined in TS 38.214 [26].

If UE is configured to perform measurements on PFLs that contain PRS resources for aggregation and on PFLs that do not contain PRS resources for aggregation, $T_{margin} = T'_{margin}$ is delay margin to account for delay between Rx-Tx time difference measurement performed by UE on PFLs that contain PRS resources for aggregation and Rx-Tx time difference measurement performed by UE on PFLs that do not contain PRS resources for aggregation.

If UE is only configured to perform measurements on PFLs that contain PRS resources for aggregation or if UE is only configured to perform measurements on PFLs that do not contain PRS resources for aggregation, then $T_{margin} = 0$.

$T'_{margin} = \max(Teffect, i)$, by considering both aggregated PFLs and non-aggregated PFLs configured for positioning measurement.

If UE is capable of performing latency reduced positioning measurements and is configured to perform latency reduced positioning measurement by LMF via *reducedDL-PRS-ProcessingSamples-r17* [34], then $N_{sample} = 2$ shall be considered in calculations of $T_{aggregate_RxTx}$ and $T_{non\text{-}aggregate_RxTx}$.

If UE is not capable to perform latency reduced positioning measurements or is not configured to perform latency reduced positioning measurement by LMF via *reducedDL-PRS-ProcessingSamples-r17* [34], then $N_{sample} = 4$ shall be considered in calculations of $T_{aggregate_RxTx}$ and $T_{non\text{-}aggregate_RxTx}$.

$T_{aggregate_RxTx}$, total measurement period for UE Rx-Tx time difference measurements performed by UE by aggregating PRS resources from multiple PFLs as defined in TS 38.214 [26], is defined as:

$$T_{aggregate_RxTx} = \sum_{i=1}^{G} T_{RxTx_aggregate,i} + (G-1) * T'_{margin} \quad ,$$

where

i is the index of effective PFL, corresponding to the group of PFLs containing linked PRS resource sets to be aggregated for UE Rx-Tx time difference measurement,

G denotes the number of effective PFLs that UE is configured to perform aggregated measurements on. G is configured by LMF and is provisioned to UE via *nr-DL-PRS-AggregationInfo.*

$T_{RxTx_aggregate,i}$ is the measurement period for UE Rx-Tx time difference measurement in the effective positioning frequency layer *i* as specified below:

$$T_{RxTx_aggregate,i} = \left(k_{multiTEG_agg,i} \times CSSF_{PRS_agg,i} \times ceil(K_{p,PRS_agg,i}) \times N_{RxBeam_agg,i} \times \left\lceil \frac{N^{slot}_{PRS_agg,i}}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times N_{sample_agg} - 1\right) \times T_{effect_agg,i} + T_{last_agg,i} \,,$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor.

In FR1, $N_{RxBeam,i} = 1$.

In FR2, $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing effective positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-Multi-RTT-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$CSSF_{PRS_agg,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in effective positioning frequency layer i as defined in clause 9.1.5.2.

$k_{multiTEG_agg,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$ = 1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*;

Otherwise,

$k_{multiTEG,i} = N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG,i}=\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure aggregated PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or *measureSameDL-PRS-ResourceWithDifferentRxTxTEGs-r17* [34] in *NR-Multi-RTT-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS_agg,i}$ is a scaling factor for effective positioning frequency layer i to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS_agg,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS_agg,i}$ = 1 for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS_agg,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the effective positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

- $N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
- $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

- Requirements do not apply if $N_{available}$ = 0.

$N^{slot}_{PRS_agg,i}$ is the maximum number of DL PRS resources in effective positioning frequency layer i configured in a slot.

$L_{available_PRS_agg,i}$ is the time duration of available PRS in the effective positioning frequency layer i to be measured during $T_{available_PRS_agg,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS_agg,i}$, only the PRS resources unmuted and fully or partially overlapped with MG and satisfying the conditions for PRS BW aggregation are considered.

$N_{sample_agg}$ is the number of UE Rx-Tx time difference measurement samples.

$T_{last_agg,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the effective positioning frequency layer i, including the sampling time and processing time. If all of the PRS resources to be measured are available in the same MG occasion during $T_{availabe_agg}$, $T_{last_agg,i} = T_{agg,i}$ + MGL. Otherwise, $T_{last_agg,i} = T_{agg,i} + T_{available_PRS_agg,i}$,

$T_{effect_agg,i}$ is the periodicity of the UE Rx-Tx time difference measurement in the effective positioning frequency layer i defined as:

$$T_{effect_agg,i} = \left\lceil \frac{T_{agg,i}}{T_{available_PRS_agg,i}} \right\rceil \times T_{available_PRS_agg,i}$$

where,

$T_{available_PRS_agg,i} = LCM(T_{PRS_agg,i}, MGRP_i)$, the least common multiple between $T_{PRS_agg,i}$ and $MGRP_i$. $MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the effective PRS frequency layer i.

$T_{PRS_agg,i}$ is the periodicity of DL PRS resources meeting the bandwidth aggregation conditions with muting on effective positioning frequency layer i. If more than one PRS periodicities are configured in effective positioning frequency layer i, the least common multiple of PRS periodicities $T_{per_agg}^{PRS\ with\ muting}$ among all DL PRS resource sets in the effective positioning frequency layer is used to derive $T_{PRS_agg,i}$, where,

$T_{per_agg}^{PRS\ with\ muting} = N_{muting} \times T_{per_agg}^{PRS}$, is the PRS periodicity with muting per PRS resource configured for aggregation,

$T_{per_agg}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS_agg} \times L_{muting}$, where $T_{muting}^{PRS_agg}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS_agg,i}$, only the PRS resources fully or partially covered by the MG and PRS resources that satisfy the conditions for PRS BW aggregation are considered.

$\{N_{agg}, T_{agg,i}\}$ is UE capability combination per band to aggregate PRS resources from multiple PFLs within an effective PFL where $N_{agg}$ is a duration of DL PRS symbols in ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsN* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsN* in TS 37.355 [34] processed every $T_{agg,i}$ ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsT* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsT* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *maximumOfTwoAggregatedDL-PRS-Bandwidth* or *maximumOfThreeAggregatedDL-PRS-Bandwidth* in TS 37.355 [34]

$N'_{agg}$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfAggregatedDL-PRS-ResourcePerSlot* specified in TS 37.355 [34].

The requirements in this clause for aggregated measurements apply provided that the linked PRS resource sets on multiple PFLs for aggregated measurements satisfy all the conditions specified in clause 5.1.6.5.3 in TS 38.214 [26].

Except for deferred MT-LR as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{UE_RxTx_aggregated,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data for aggregation after both the *NR-Multi-RTT-RequestLocationInformation* message and *NR-Multi-RTT-ProvideAssistanceData* message are delivered from LMF to the physical layer of UE via LPP [34] including a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequested*.

For deferred MT-LR with other event than “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{UE_RxTx_aggregated,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the aggregated UE Rx-Tx time difference measurement in each reporting period and activate the location report at the time when the periodic timer expires.

When PRS-RSRP is also reported by UE together with UE RX-Tx time difference measurement based on aggregated DL-PRS resources from multiple-PFLs, PRS-RSRP are performed over the measurement period defined in 9.9.4.9.

When PRS-RSRPP is also reported by UE together with UE Rx-Tx time difference measurement based on aggregated DL-PRS resources from multiple-PFLs, PRS-RSRPP are performed over the measurement period defined in 9.9.4.9.

If during the measurement period of one or more effective positioning frequency layers, the MG pattern is reconfigured, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{UE_RxTx_aggregated,Total}$ within measurement gaps due to collisions with other signals; otherwise, the measurement period can be longer.

The requirements in clause 9.9.4.9 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which aggregated PRS resources are measured, subject to UE measurement capabilities.

When PSCell or SCell addition or release does not cause SRS reconfiguration during the measurement period, UE continues the UE Rx-Tx time difference measurement, and the measurement period requirements apply.

When PSCell or SCell addition or release causes SRS reconfiguration during the measurement period, UE shall restart the UE Rx-Tx time difference measurement after the SRS reconfiguration on the target cell is complete.

When SRS is reconfigured without serving cell change during the measurement period, UE shall restart the UE Rx-Tx time difference measurement after the SRS reconfiguration is complete. If UE uplink transmission timing changes due to the network-configured Timing Advance command during the UE Rx-Tx time difference measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

When a serving cell change occurs during the measurement period, the UE shall continue and complete the UE Rx-Tx time difference measurement provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx time difference measurement.

If UE uplink transmission timing changes due to the change in the $N_{TA_offset}$ defined in table 7.1.2-2 during the UE Rx-Tx time difference measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the UE autonomous timing adjustment defined in clause 7.1.2 during the UE Rx-Tx time difference measurement period, then:

- UE Rx-Tx time difference measurement period requirements in this clause shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1.1) for SRS transmission.
- UE Rx-Tx time difference measurement period requirements in this clause shall not apply for a cell, which is not the downlink reference cell (defined in clause 7.1.1) for SRS transmission. The UE Rx-Tx time difference measurement period may be restarted in such case.

The UE shall meet the UE Rx-Tx time difference measurement accuracy requirements in clause 10.1.25A.2.

## 9.9.5 E-CID measurements

### 9.9.5.1 Introduction

The requirements in clause 9.9.5 shall apply provided the UE has received *nr-ECID-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to report one or more of the following measurements for NR E-CID positioning [22]: SS-RSRP, SS-RSRQ, CSI-RSRP, and CSI-RSRQ.

### 9.9.5.2 Measurement Requirements

#### 9.9.5.2.1 Intra-frequency Measurement Requirements

The intra-frequency NR E-CID measurements shall meet the requirements in clause 9.2 and clause 9.10.2, except the measurement reporting requirements. The NR E-CID measurement reporting requirements are defined in clause 9.9.5.2.3.

The reported intra-frequency NR E-CID measurements shall also meet:

- for FR1 SS-RSRP, the accuracy requirements in clause 10.1.2.1,
- for FR1 SS-RSRQ, the accuracy requirements in clause 10.1.7.1,

- for FR1 CSI-RSRP, the accuracy requirements in clause 10.1.2.3,
- for FR1 CSI-RSRQ, the accuracy requirements in clause 10.1.7.2,
- for FR2 SS-RSRP, the accuracy requirements in clause 10.1.3.1,
- for FR2 SS-RSRQ, the accuracy requirements in clause 10.1.8.1,
- for FR2 CSI-RSRP, the accuracy requirements in clause 10.1.3.3,
- for FR2 CSI-RSRQ, the accuracy requirements in clause 10.1.8.2.

#### 9.9.5.2.2 Inter-frequency Measurement Requirements

The inter-frequency NR E-CID measurements shall meet the requirements in clause 9.3 and 9.10.4, except the measurement reporting requirements. The NR E-CID measurement reporting requirements are defined in clause 9.9.5.2.3.

The reported inter-frequency NR E-CID measurements shall also meet:

- for FR1 SS-RSRP, the accuracy requirements in clause 10.1.4.1,
- for FR1 SS-RSRQ, the accuracy requirements in clause 10.1.9.1,
- for FR1 CSI-RSRP, the accuracy requirements in clause 10.1.4.3,
- for FR1 CSI-RSRQ, the accuracy requirements in clause 10.1.9.2,
- for FR2 SS-RSRP, the accuracy requirements in clause 10.1.5.1,
- for FR2 SS-RSRQ, the accuracy requirements in clause 10.1.10.1,
- for FR2 CSI-RSRP, the accuracy requirements in clause 10.1.5.3,
- for FR2 CSI-RSRQ, the accuracy requirements in clause 10.1.10.2.

#### 9.9.5.2.3 Measurement Reporting Delay

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The reported NR E-CID measurement values contained in periodically triggered measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.6 for SS-RSRP and CSI-RSRP, and clause 10.1.11 for SS-RSRQ and CSI-RSRQ.

The UE shall not send any measurement reports as long as no corresponding reporting criteria specified in clause 9.1.4 are fulfilled.

## 9.9.6 PRS-RSRPP measurements

### 9.9.6.1 Introduction

The requirements in clause 9.9.6.5 shall apply when UE is performing PRS measurement in the configured MG and provided the UE has received a message from LMF via LPP requesting the UE to measure and report PRS-RSRPP measurements defined in TS 38.215 [4].

The requirements in clause 9.9.6.6 shall apply when UE is performing PRS measurement without gap and provided the UE has received a message from LMF via LPP requesting the UE to measure and report PRS-RSRPP measurements defined in TS 38.215 [4].

#### 9.9.6.2 Requirements applicability

The requirements in clause 9.9.6 apply for periodic and triggered PRS-RSRPP measurements, provided:

- PRS-RSRPP related side conditions given in clause 10.1.38 are met for a corresponding band.

#### 9.9.6.3 Measurement capability

UE PRS-RSRPP measurement capability is as indicated by the UE in *NR-DL-AoD-ProvideCapabilities* according to TS 37.355 [34].

#### 9.9.6.4 Measurement reporting requirements

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes the delay uncertainty caused by inserting the measurement report into the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The reported PRS-RSRPP measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clauses 10.1.38.3.

The PRS-RSRPP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requirements specified in the clauses 10.1.38.2.

#### 9.9.6.5 Measurement period requirements

For PRS measurement within MG configured to UE, measurement period requirements for PRS-RSRP defined in clause 9.9.3.5 is re-used for PRS-RSRPP.

#### 9.9.6.6 Measurement Period Requirements without Measurement Gaps

For PRS measurement without MG configured to UE, measurement period requirements for PRS-RSRP defined in clause 9.9.3.6 is re-used for PRS-RSRPP.

The PRS-RSRPP measurement requirements in this clause apply for the first path PRS-RSRP measurement.

#### 9.9.6.7 Void

#### 9.9.6.8 Measurements Period Requirements with both MG and PPW

If the UE is configured with both MG applicable to positioning measurement and PPW, the measurement period requirements for PRS-RSRP defined in clause 9.9.3.8 is re-used for PRS-RSRPP.

### 9.9.7 Measurement requirements for DL RSCPD reported with RSTD

#### 9.9.7.1 Introduction

The requirements in clause 9.9.7 shall apply provided the UE has received *NR-DL-TDOA-RequestLocationInformation* message with *dl-PRS-RSCPD-Request-r18* from LMF via LPP [34] requesting the UE to measure and report RSCPD measurement together with DL RSTD measurements defined in TS 38.215 [4].

#### 9.9.7.2 Requirements Applicability

The requirements in clause 9.9.7 apply for periodic and triggered reporting of RSCPD with RSTD measurements, provided:

- PRS-RSTD related side conditions given in clause 10.1.23 for FR1 and FR2 are fulfilled, for a corresponding band.

- RSCPD related side conditions given in clause 10.1.43.2 for FR1 and FR2 are fulfilled, for a corresponding band.

### 9.9.7.3 Measurement Capability

UE PRS RSTD and RSCPD measurement capabilities are as indicated by the UE in *NR-DL-TDOA-ProvideCapabilities*, according to TS 37.355[34].

### 9.9.7.4 Measurement Reporting Requirements

The measurement reporting delay is defined as the time between the moment when the periodic measurement report is triggered and the moment when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The reported RSTD measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.23.3.

The reported RSCPD measurement values contained in the measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.43.3.

The RSTD measurements performed and reported according to this clause shall meet the RSTD measurement accuracy requirements in clause 10.1.23, for the measured DL PRS resource.

The RSCPD measurements performed and reported according to this clause shall meet the RSCPD measurement accuracy requirements in clause 10.1.43.2, for the measured DL PRS resource.

### 9.9.7.5 Measurements Period Requirements for DL RSCPD reported with RSTD

After receiving both *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message with *dl-PRS-RSCPD-Request-r18* from the LMF via LPP [34], the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.7.3) DL RSTD and RSCPD measurements, defined in TS 38.215 [4], during the time window only.

When LMF does not configure measurement time window(s):

- When a single PFL, requirements in clause 9.9.2.5 apply to both RSCPD and RSTD measurements.

- When multiple PFLs are configured for legacy measurements, the UE performs RSCPD measurement on a single PFL that is common between the reference TRP and the target TRP. The requirement in clause 9.9.2.5 apply to both RSTD and RSCPD measurements.

When LMF configures measurement time window(s), but does not configure UE to perform RSCPD measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

- The UE performs RSCPD measurement on the indicated PFL by the network. The requirement in clause 9.9.2.5 apply to both RSTD and RSCPD measurements.

When LMF configures measurement time window(s), but subject to UE capability, configures UE to perform RSCPD but not RSTD measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

- The requirements in the clause 9.9.2.5 apply to RSTD measurements.

- The requirements in clause 9.9.7.5 apply to RSCPD measurement for the PRS resource(s) that have occasions only within the measurement time window.

When LMF configures measurement time window(s), and subject to UE capability, configures UE to perform both RSCPD and RSTD measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

- The requirements in Clause 9.9.7.5 apply to DL RSTD measurement and DL RSCPD measurement.

If a one-shot time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.7.3) DL RSTD and DL RSCPD measurements, defined in TS 38.215 [4], based on the indicated PRS resource sets occurring inside the one-shot time window during the measurement period $T_{RSCPD\ with\ RSTD,Total}$ defined as:

$$T_{RSCPD\ with\ RSTD,Total} = \min(L_{window}, \mathrm{MGL}) + T_i \ ,$$

and the UE shall be able to measure multiple DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total,with\ one\ shot\ window}$ defined as:

$$T_{RSTD,Total,with\ one\ shot\ window} = T_{RSCPD\ with\ RSTD,Total} + max\left(T_{effect,i}\right) + T_{RSTD,Total} \ ,$$

where:

- the start of the measurement is the start of the one-shot time window, and
- $L_{window}$ is the length of the one-shot window, and
- $\mathrm{T_{effect,}}_i$ and $T_i$ are defined in the following of this clause, and
- $T_{RSTD,Total}$ is defined in clause 9.9.2.5, and
- MGL is the measurement gap length.

The requirements with one-shot window assume scaling factors equal 1 for the PFLs, for which the one-shot time window is configured.

If a periodic time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.7.3) RSTD and DL RSCPD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSCPD\ with\ RSTD,Total}$ defined as:

$$\mathrm{T_{RSCPD\ with\ RSTD,Total}} = \sum_{\mathrm{i=1}}^{\mathrm{L}} \mathrm{T_{RSCPD\ with\ RSTD,i}} + \ (\mathrm{L} - 1) * \max\left(\mathrm{T_{effect,i}}\right)$$

where:

- $i$ is the index of positioning frequency layer,
- $L$ is total number of positioning frequency layers, and
- $\mathrm{T_{effect,}}_i$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$\mathrm{T_{RSCPD\ with\ RSTD,i}}$ is the measurement period for PRS RSTD with RSCPD measurement in positioning frequency layer *i* as specified below:

$$\mathrm{T_{RSCPD\ with\ RSTD,i}} = \left(k_{multiTEG,i} \times \mathrm{CSSF_{PRS,i}} \times \mathrm{ceil(\ K_{p,PRS,i})} \times N_{RxBeam,i} \times \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil \times N_{sample} - 1\right) \times \mathrm{T_{effect,i}} + \mathrm{T_{last,i}} \ ,$$

where:

DL-RSCPD measurement performed during $\mathrm{T_{RSCPD\ with\ RSTD,i}}$ is a single sample measurement. The DL-RSCPD measurement of reference TRP and the target TRP is performed on the same PFL.

$N_{RxBeam,i}$, $CSSF_{PRS,i}$, $k_{multiTEG,i}$, $N_{PRS,i}^{slot}$, $N$, $N'$, $\mathrm{T_{effect,i}}$, and $\mathrm{T_{last,i}}$ are defined in clause 9.9.2.5.

$N_{sample}$ = 1 or 2 or 4 as defined in clause 9.9.2.5.

$L_{available_{PRS},i}$ is the time duration of available PRS in the positioning frequency layer to be measured during $T_{available_{PRS},i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26].

When periodic time window(s) are configured by the LMF and PFL *i* is associated with the configured time window, $T_{available_{PRS},i} = LCM\left(T_{PRS,i}, MGRP, T_{window}\right)$, the least common multiple between $T_{PRS,i}$, $MGRP$ and $T_{window}$, $T_{window}$ being the maximum periodicity of the indicated time window(s).

When the periodic time window(s) are configured by the LMF and the PFL *i* is not associated with the configured time window, $T_{available_{PRS},i} = LCM\left(T_{PRS,i}, MGRP\right)$.

$T_{PRS,i}$ and $MGRP$ are defined in clause 9.9.2.5.

$L_{available_{PRS,i}}$ and $T_{PRS,i}$ are calculated by only considering the PRS resources in the indicated resources sets overlapping with both the MG and the indicated time window(s).

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

When periodic time window(s) are configured by the LMF, for a window W of duration max($T_{PRS,i}$, MGRP_max, $T_{window}$), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion and the periodic time window:

$N_{total}$ is the total number of associated gap occasions covering PRS occasions and the periodic time window(s) within the window W, including both dropped and non-dropped instances of the associated measurement gap within the window W, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions and the periodic time window(s) within the window W, after further accounting for MG collisions by applying the selected gap collision rule.

Requirements do not apply if $N_{available}$ =0.

Otherwise, for a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

$N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window W, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{RSCPD\ with\ RSTD}$ starts from the first time window ($T_{RSCPD}$) configured by LMF within MG instance aligned with a DL PRS resource(s) in the assistance data after both the *NR-TDOA-ProvideAssistanceData* message and *NR-TDOA-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34].

For deferred MT-LR with other event than “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{RSCPD\ with\ RSTD}$ starts from the first time window ($T_{RSCPD}$) configured by LMF within MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the RSCPD with RSTD measurement in each reporting period within the time window($T_{RSCPD}$) configured by LMF within MG instance and activate the location report at the time when the periodic timer expires.

If during the measurement period, the MG pattern is reconfigured or time window ($T_{RSCPD}$) for RSCPD measurement is reconfigured, the measurement period can be longer.

When PRS-RSRP is also configured to UE, RSCPD with RSTD and RSRP are performed over the same measurement period.

When PRS-RSRPP is also configured to UE, RSCPD with RSTD and RSRPP are performed over the same measurement period.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSCPD\ with\ RSTD,i}$ within measurement gaps due to collisions with other signals; otherwise, the measurement period can be longer.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_{PRS,i}}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9.7 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while RSTD and RSCPD measurements are being performed together by UE, then the UE shall continue and complete the on-going RSTD and RSCPD measurements. The measurement period for RSCPD with RSTD measurement can be longer. The UE shall meet the RSTD measurement accuracy requirements in clause 10.1.23. The UE shall also meet the RSCPD measurement accuracy requirements in clause 10.1.43.2.

## 9.9.8 Measurement requirements for DL RSCP reported with UE Rx-Tx time difference

### 9.9.8.1 Introduction

The requirements in this clause shall apply, provided the UE has received *nr-Multi-RTT-RequestLocationInformation* message with *dl-PRS-RSCP-Request-r18* from LMF via LPP [34] requesting the UE to measure and report one or more DL RSCP measurements together with UE Rx-Tx time difference measurements defined in TS 38.215 [4].

### 9.9.8.2 Requirements Applicability

The requirements in clause 9.9.8 apply for periodic and triggered UE Rx-Tx time difference measurements, provided:

- UE Rx-Tx time difference measurement related side conditions given in clause 10.1.25 are met for a corresponding band.
- DL RSCP related side conditions given in clause 10.1.44.2 for FR1 and FR2 are fulfilled, for a corresponding band.
- SRS is configured on at least one of the PCell, PSCell and SCell.
- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.

### 9.9.8.3 Measurement Capability

UE Rx-Tx time difference and DL-RSCP measurement capabilities are as indicated by the UE in *NR-Multi-RTT-ProvideCapabilities*, according to TS 37.355 [34].

### 9.9.8.4 Measurement Reporting Requirements

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The UE Rx-Tx time difference measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.25.

The DL RSCP measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.44.

The UE Rx-Tx time difference measurement accuracy for all measured DL PRS resources shall be fulfilled according to the accuracy requirements specified in clause 10.1.25.

The DL RSCP measurement accuracy for all measured DL PRS resources shall be fulfilled according to the accuracy requirements specified in clause 10.1.44.

### 9.9.8.5 Measurement Period Requirements for DL RSCP and UE Rx-Tx time difference

When the physical layer receives the last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34] with *dl-PRS-RSCP-Request-r18* and is configured with a measurement time window via *nr-DL-PRS-MeasurementTimeWindowsConfig*, subject to UE capabilities *supportOfMeasurementsInTimeWindow*, the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.8.3) UE Rx-Tx time difference and DL RSCP measurements, defined in TS 38.215 [4], during the time window only.

When LMF does not configure measurement time window(s):

- When a single PFL is configured, requirements in clause 9.9.4.5 apply to both RSCP and UE Rx-Tx time difference measurements.

- When multiple PFLs are configured for legacy measurements, the UE performs RSCP measurement on a single PFL that is common between the reference TRP and the target TRP. The requirement in clause 9.9.4.5 apply to both RSCP and UE Rx-Tx time difference measurements.

When LMF configures measurement time window(s), but does not configure UE to perform RSCP measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

– The UE performs RSCP measurement on the indicated PFL by the network. The requirement in clause 9.9.4.5 apply to both UE Rx-Tx and RSCP measurements.

When LMF configures measurement time window(s), but subject to UE capability, configures UE to perform RSCP but not UE Rx-Tx measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

The requirements in the clause 9.9.4.5 apply to UE Rx-Tx time difference measurement.

The requirements in clause 9.9.8.5 apply to RSCP measurement for the PRS resource(s) that have occasions only within the measurement time window.

When LMF configures measurement time window(s), and subject to UE capability, configures UE to perform both RSCP and UE Rx-Tx measurement inside time window as indicated in *nr-MeasurementsToPerformInTimeWindow-r18*:

- The requirements in Clause 9.9.8.5 apply to UE Rx-Tx time difference measurement and DL RSCP measurement.

If a one-shot time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.8.3) UE Rx-Tx time difference and DL RSCP measurements, defined in TS 38.215 [4], based on the indicated PRS resource sets occurring inside the one-shot time window during the measurement period $T_{\text{DL RSCP with UERxTx,Total}}$ defined as:

$$T_{\text{DL RSCP with UERxTx,Total}} = \min(L_{window}, \text{MGL}) + T_i \quad ,$$

and the UE shall be able to measure multiple UE Rx-Tx time difference measurements, defined in TS 38.215 [4], during the measurement period $T_{UERxTx,Total,with\ one\ shot\ window}$ defined as:

$$T_{UERxTx,Total,with\ one\ shot\ window} = T_{\text{DL RSCP with UERxTx,Total}} + max(T_{effect,i}) + T_{UERxTx,Total}$$

Where:

- the start of the measurement is the start of the one-shot time window, and

- $L_{window}$ is the length of the one-shot window, and

- $T_{\text{effect},i}$ and $T_i$ are defined in the following of this clause, and

- $T_{UERxTx,Total}$ is defined in clause 9.9.4.5, and
- MGL is the measurement gap length.

The requirements with one-shot window assume scaling factors equal to 1 for the PFLs, for which the one-shot time window is configured.

If a periodic time window is configured, the UE shall be able to measure multiple (up to the UE capability specified in clause 9.9.8.3) UE Rx-Tx and DL RSCP measurements, defined in TS 38.215 [4], during the measurement period $T_{RSCP\ with\ UERxTx,Total}$ defined as:

$$T_{\text{DL RSCP with UERxTx,Total}} = \sum_{i=1}^{L} T_{\text{DL RSCP with UERxTx,i}} + (L-1) * \max\left(T_{\text{effect,i}}\right),$$

where:

- $i$ is the index of positioning frequency layer,
- $L$ is total number of positioning frequency layers, and
- $T_{\text{effect},i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer $i$.

$T_{\text{DL RSCP with UERxTx,i}}$ is the measurement period for DL RSCP with UE Rx-Tx measurement in positioning frequency layer $i$ as specified below:

$$T_{\text{DL RSCP with UERxTx,i}} = \left(k_{multiTEG,i} * \text{CSSF}_{\text{PRS,i}} * \text{ceil}(K_{\text{p,PRS,i}}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_{PRS},i}}{N} \right\rceil * N_{sample} - 1\right) * T_{\text{effect,i}} + T_{\text{last,i}},$$

where:

- DL RSCP performed during $T_{\text{DL RSCP with UERxTx}}$ is a single sample measurement where DL RSCP and UE Rx-Tx measurements are performed on the same PFL.
- $N_{RxBeam,i}$, $CSSF_{PRS,i}$, $k_{multiTEG,i}$, $N_{sample}$, $N_{PRS,i}^{slot}$, $N$, $N'$, $T_{\text{effect,i}}$, and $T_{\text{last,i}}$ are defined in clause 9.9.4.5.
- $N_{sample}$ = 1 or 2 or 4 as defined in clause 9.9.4.
- $K_{\text{p,PRS,i}}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{\text{p,PRS,i}} = N_{\text{total}} / N_{\text{available}}$ for UE configured with concurrent measurement gap, and $K_{\text{p,PRS,i}} = 1$ for UE not configured with concurrent measurement gap.

  When periodic time window(s) are configured by the LMF, for a window W of duration max($T_{PRS,i}$, MGRP_max, $T_{window}$), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion and the periodic time window:

  $N_{\text{total}}$ is the total number of associated gap occasions covering PRS occasions and the periodic time window(s) within the window W, including both dropped and non-dropped instances of the associated measurement gap within the window W, and

  $N_{\text{available}}$ is the number of non-dropped associated gap occasions covering PRS occasions and the periodic time window(s) within the window W, after further accounting for MG collisions by applying the selected gap collision rule.

  Requirements do not apply if $N_{\text{available}}$ =0.

  Otherwise, for a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

  $N_{\text{total}}$ is the total number of associated gap occasions covering PRS occasions within the window W, including both dropped and non-dropped instances of the associated measurement gap within the window W, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

- $L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26].
- When periodic time window(s) are configured by the LMF and PFL *i* is associated with the configured time window, $T_{available_{PRS,i}} = LCM(T_{PRS,i}, MGRP, T_{window})$, the least common multiple between $T_{PRS,i}$, MGRP , and $T_{window}$, $T_{window}$ being the maximum periodicity of the indicated time window(s).
- When periodic time window(s) are configured by the LMF and the PFL *i* is not associated with the configured time window, $T_{available_{PRS,i}} = LCM(T_{PRS,i}, MGRP)$.
- $T_{PRS,i}$ and MGRP are defined in clause 9.9.8.5.
- $L_{available_PRS,i}$ and $T_{PRS,i}$ are calculated by only considering the PRS resources in the indicated resources sets overlapping with both the MG and the indicated time window(s).

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{\text{DL RSCP with UERxTx}}$ starts from the first time window ($T_{\text{DL RSCP}}$) configured by LMF within MG instance aligned with DL PRS resource(s) in the assistance data after both the *NR-Multi-RTT-RequestLocationInformation* message and *NR-Multi-RTT-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

For deferred MT-LR with other event than "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{\text{DL RSCP with UERxTx}}$ starts from the first time window ($T_{\text{DL RSCP}}$) configured by LMF within MG instance aligned with DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the DL RSCP with UE Rx-Tx time difference measurement in each reporting period and activate the location report at the time when the periodic timer expires.

The DL RSCP with UE Rx-Tx time difference measurement period is restarted if HO occurs during the measurement period and after SRS reconfiguration on the target cell is complete.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS}$ or
- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period of the positioning frequency layer, the MG pattern is reconfigured either per UE request or not per UE request, the measurement period can be longer.

The requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{\text{DL RSCP with UERxTx}}$ within measurement gaps due to collisions with other signals; otherwise, a longer measurement period may be used.

When PRS-RSRP is configured for multi-RTT,with a request to perform RSCP with UE Rx-Tx time difference measurement, the UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period.

When PRS-RSRPP is configured for multi-RTT with a request to perform RSCP with UE Rx-Tx time difference measurement, RSCP with UE Rx-Tx time difference measurements and PRS-RSRPP measurements are performed over the same measurement period.

The requirements in clause 9.9.8 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

When PSCell or SCell addition or release does not cause SRS reconfiguration during the measurement period, UE shall continue and complete the DL RSCP and UE Rx-Tx time difference measurements, and the measurement period requirements apply.

When PSCell or SCell addition or release causes SRS reconfiguration during the measurement period, UE shall restart the DL RSCP and UE Rx-Tx time difference measurement after the SRS reconfiguration on the target cell is complete.

When SRS is reconfigured without serving cell change during the measurement period, UE shall restart the DL RSCP and UE Rx-Tx time difference measurement after the SRS reconfiguration is complete.

When a serving cell change occurs during the measurement period, the UE shall restart DL RSCP and UE Rx-Tx time difference measurements.

If UE uplink transmission timing changes due to the network-configured Timing Advance command during the measurement period, then the DL RSCP with UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the DL RSCP and UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the change in the $N_{TA_offset}$ defined in table 7.1.2-2 during the measurement period, then the DL RSCP with UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the DL RSCP and UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the UE autonomous timing adjustment defined in clause 7.1.2 during the measurement period, then:

- DL RSCP and UE Rx-Tx measurement period requirements in this clause shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1.1) for SRS transmission.
- DL RSCP and UE Rx-Tx measurement period requirements in this clause shall not apply for a cell, which is not the downlink reference cell (defined in clause 7.1.1) for SRS transmission. The DL RSCP with UE Rx-Tx time difference measurement period may be restarted in such case.

# 9.9A NR measurements for positioning for RedCap

## 9.9A.1 Introduction

This clause contains requirements for RedCap UE capable of performing NR positioning measurements defined in TS 38.215 [4], including RSTD, PRS-RSRP, UE Rx-Tx time difference, and PRS-RSRPP measurements.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

This clause applies to both RedCap positioning with and without FH.

### 9.9A.1.1 General Aspects of Gap-based Measurement

For gap-based RSTD, PRS-RSRP, UE Rx-Tx time difference, and PRS-RSRPP measurements, the requirements in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5 apply provided:

- the RedCap UE is configured or pre-configured with measurement gaps or configured with concurrent measurement gaps
  - all positioning frequency layers are measured or associated with only one per-UE measurement gap, or
- for the RedCap UE supporting *independentGapConfigPRS-r17*, all positioning frequency layers in the same FR are measured or associated with only one per-FR measurement gap in the corresponding FR.
- if the measurement gap is pre-configured, the gap must be activated throughout the measurement period, and
- if concurrent measurement gaps are configured, one of the gap combinations specified in clause 9.1.8.2 is configured, and

- if the RedCap UE does not support *independentGapConfigPRS-r17*, the configured or pre-configured gap used to perform the PRS measurements must be of per-UE type, and

- No active BWP switching occurs during the measurement gaps for PRS measurement, and

All measurement requirements specified in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5 shall apply without DRX as well as for any DRX configuration specified in TS 38.331 [2].

RedCap UE is only required to measure PRS resources that are fully or partially overlapped with measurement gaps, and the requirements in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5 are applicable to PRS resources that are fully or partially overlapped with measurement gaps.

A PRS resource is considered to be fully (partially) overlapped with measurement gaps if all (some) of its instances are overlapped with a measurement gap occasion. A PRS resource instance is considered to be overlapped with measurement gap occasion if the minimum number of unmuted repetitions of the instance taking into account *nr-DL-PRS-ExpectedRSTD-Uncertainty* and *nr-DL-PRS-ExpectedRSTD* is fully covered by the MGL excluding RF switching time, where

- the minimum number is given in the accuracy requirements without FH for 2Rx RedCap UEs in clause 10.1.23.2 for RSTD measurement, 10.1.24.2 for PRS-RSRP measurement, 10.1.25.2 for UE Rx-Tx time difference measurement, and 10.1.38.2 for PRS-RSRPP measurement,

- the minimum number is given in the accuracy requirements without FH for 1Rx RedCap UEs in clause 10.1A.16.2.1 for RSTD measurement, 10.1A.17.2 for PRS-RSRP measurement, 10.1A.18.2.2 for UE Rx-Tx time difference measurement, and 10.1A.19.2 for PRS-RSRPP measurement,

- the minimum number is given in the accuracy requirements with FH for 2Rx RedCap UEs in clause 10.1A.16.2.2 for RSTD measurement, 10.1A.17.2 for PRS-RSRP measurement, 10.1A.18.2.3 for UE Rx-Tx time difference measurement, and 10.1A.19.2 for PRS-RSRPP measurement,and

- the minimum number is given in the accuracy requirements with FH for 1Rx RedCap UEs in clause 10.1A.16.2.2 for RSTD measurement, 10.1A.17.2 for PRS-RSRP measurement, 10.1A.18.2.4 for UE Rx-Tx time difference measurement, and 10.1A.19.2 for PRS-RSRPP measurement.

When RedCap UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when RedCap UE is configured with measurement for single positioning request.

If a positioning measurement gap is configured via *PosGapConfig* and activated by MAC CE, the measurement requirements in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5 apply provided that no other MGs are configured, and only one measurement gap configured via *PosGapConfig* is activated.

### 9.9A.1.2 General Aspects of Gapless Measurement for RedCap positioning without FH

The requirements for RSTD, PRS-RSRP, UE Rx-Tx time difference, and PRS-RSRPP measurement without measurement gaps specified in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5 shall apply provided that:

- Positioning frequency layer to be measured is within an active BWP,

- UE is configured with PPW, and the PPW for the active BWP containing the positioning frequency layer to be measured is activated,

- No active BWP switching occurs during the measurement period specified in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5,

- PRS is within PPW and does not overlap with other signals/channels of higher priority,

  - for PPW type 1A/1B, the PPW does not overlap with any symbol for SSB-based RLM/BFD/CBD/L1-RSRP/L1-SINR measurement on any CC or for SSB based RRM measurement on any MOs that are measured outside measurement gaps,

  - for PPW type 2, PRS does not overlap with any symbol for SSB-based RLM/BFD/CBD/L1-RSRP/L1-SINR measurement on any CC or for SSB based RRM measurement on any MOs that are measured outside measurement gaps,

- max $|\Delta T| \leq$ THR, where
  - $\Delta T$ is the time difference between the start of a slot containing PRS from the neighbor cell/TRP and the start of the closest slot from the serving cell;
  - the range of $\Delta T$ is determined by the expected RSTD and expected RSTD uncertainty in the assistance data;
  - THR is the threshold as reported in UE capability *prs-MeasurementWithoutMG-r17*.
- SCS of PRS within PPW and SCS of DL active BWP are the same.

All measurement requirements specified in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5 shall apply without DRX as well as for any DRX configuration specified in TS 38.331 [2].

The UE is not required to perform additional SSB measurement for the SSB configured as QCL source of PRS resources.

The UE is only required to measure PRS resources that are unmuted and fully or partially overlapped with PPW, and the requirements in clauses 9.9A.2, 9.9A.3, 9.9A.4 and 9.9A.5 are applicable to PRS resources that are unmuted and fully or partially overlapped with PPW.

A PRS resource is considered to be fully (partially) overlapped with PPW if all (some) of its instances are overlapped with a PPW occasion. A PRS resource instance is considered to be overlapped with PPW occasion if the minimum number of unmuted repetitions of the instance taking into account Rx time difference between serving and non-serving cell is fully covered by the PPW , where

- the minimum number is given in the accuracy requirements without FH for 2Rx RedCap UEs in clauses 10.1.23.2 for RSTD measurement, 10.1.24.2 for PRS-RSRP measurement, 10.1.25.2 for UE Rx-Tx time difference measurement, and 10.1.38.2 for PRS-RSRPP measurement, and
- the minimum number is given in the accuracy requirements without FH for 1Rx RedCap UEs in clauses 10.1A.16.2.1 for RSTD measurement, 10.1A.17.2 for PRS-RSRP measurement, 10.1A.18.2.2 for UE Rx-Tx time difference measurement, and 10.1A.19.2 for PRS-RSRPP measurement.

When UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

### 9.9A.1.3 Scheduling Availability of UE during PRS Measurement without Measurement Gaps for RedCap positioning without FH

The requirements in this clause apply for RedCap UE performing RSTD, PRS-RSRP, UE Rx-Tx time difference and PRS-RSRPP measurement without measurement gaps.

If *prs-ProcessingWindowType1A-r17* UE capable of supporting priority options 1, 2 and 3 is configured with a *type1A* PRS processing window with priority value '*st1*' for PRS measurement, then UE is not expected to receive PDCCH/PDSCH/CSI-RS on all symbols within PRS processing window.

If *prs-ProcessingWindowType1A-r17* UE capable of supporting priority option 2 is configured with a *type1A* PRS processing window with priority state '*st2*' for PRS measurement, then UE is not expected to receive PDSCH/CSI-RS on all symbols within PRS processing window but shall receive PDCCH and URLLC PDSCH within PRS processing window.

If *prs-ProcessingWindowType1B-r17* UE capable of supporting priority options 1, 2 and 3 is configured with a *type1B* priority value '*st1*' for PRS measurement, then UE is not expected to receive PDCCH/PDSCH/CSI-RS from serving cells in the same band as DL PRS on all symbols within PRS processing window.

If *prs-ProcessingWindowType1B-r17* UE capable of supporting priority option 2 is configured with a *type1B* PRS processing window with priority value '*st2*' for PRS measurement, then UE is not expected to receive PDSCH/CSI-RS from a certain band but shall receive PDCCH and URLLC PDSCH from serving cells in the same band as DL PRS on all symbols within PRS processing window.

If *prs-ProcessingWindowType2-r17* UE capable of supporting priority options 1, 2 and 3 is configured with a *type2* PRS processing window with priority value '*st1*' for PRS measurement, then the UE is not expected to receive PDCCH/PDSCH/CSI-RS on the symbols overlapped with DL PRS within PRS processing window.

If *prs-ProcessingWindowType2-r17* UE capable of supporting priority option 2 is configured with a *type2* PRS processing window with priority value '*st2*' for PRS measurement, then UE is not expected to receive PDSCH/CSI-RS on the symbols overlapped with DL PRS within PRS processing window but shall receive PDCCH and URLLC PDSCH on the symbols overlapped with DL PRS within PRS processing window.

When PRS is lower priority than the DL signals/channels the following applies when UEs have an activated PRS processing window with *type1A* or *type1B*:

- If UE determines the presence of other DL signals/channels except SSB of higher priority than PRS in the PPW no later than $N_2$ symbols, defined in clause 6.4 of [26], for the subcarrier spacing μ of the DL PRS, before the start of the PPW, UE expects to receive the DL signals/channels and drop all DL PRS in the PPW.

- If UE determines the presence of other DL signals/channels except SSB of higher priority than PRS in the PPW later than $N_2$ symbols, defined in clause 6.4 of [26], for the subcarrier spacing μ of the DL PRS, before the start of the PPW, UE is not required to receive the other DL signals/channels except SSB of higher priority and may receive the DL PRS in the PPW.

When PRS is lower priority than the DL signals/channels the following applies when UEs have an activated PRS processing window with *type2*:

- If UE determines the presence of other DL signals/channels except SSB of higher priority than PRS on a PRS symbol no later than $N_2$ symbols, defined in clause 6.4 of [26] for the subcarrier spacing μ of the DL PRS, before the PRS symbol, UE expects to receive the DL signals/channels and drop the PRS symbol.

- If UE determines the presence of other DL signals/channels except SSB of higher priority than PRS on a PRS symbol later than $N_2$ symbols, defined in clause 6.4 of [26] for the subcarrier spacing μ of the DL PRS, before the PRS symbol, UE is not required to receive the other DL signals/channels except SSB of higher priority and may receive the PRS symbol.

For inter-band case for FR2 for the DL signals/channels from a different FR2 band than the FR2 band of the DL PRS, if the same Rx beam is used for both FR2 bands and the DL PRS is determined to be higher priority, UEs are not expected to receive the DL signals/channels if they are expected to measure the DL PRS in a configured DL PRS processing window with *type1B* or *type2*.

## 9.9A.2 RSTD measurements for RedCap

### 9.9A.2.1 Introduction

The requirements in clause 9.9A.2 shall apply provided the RedCap UE has received *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34] requesting the RedCap UE to measure and report DL RSTD measurements defined in TS 38.215 [4].

The requirements in clause 9.9A.2.5 shall apply provided the RedCap UE does not support, or support but not configured, to measure PRS resources with Frequency Hopping (FH), subject to UE capability indicated via *NR-DL-AoD-ProvideCapabilities.*

The requirements in clause 9.9A.2.6 shall apply provided the RedCap UE supports and is configured to measure PRS resources with Frequency Hopping (FH), subject to UE capability indicated via *NR-DL-AoD-ProvideCapabilities.*

### 9.9A.2.2 Requirements Applicability

The requirements in clause 9.9A.2.5 apply for periodic and triggered RSTD measurements without FH, provided:

- PRS-RSTD related side conditions for 2 Rx RedCap UE given in clause 10.1.23.2 for FR1 and FR2 are fulfilled, for a corresponding band, or

- PRS-RSTD related side conditions for 1 Rx RedCap UE given in clause 10.1A.16.2.1 for FR1 are fulfilled, for a corresponding band.

The requirements in clause 9.9A.2.6 apply for periodic and triggered RSTD measurements with FH, provided:

- PRS-RSTD related side conditions for 2 Rx RedCap UE given in clause 10.1A.16.2.2 for FR1 and FR2 are fulfilled, for a corresponding band. or
- PRS-RSTD related side conditions for 1 Rx RedCap UE given in clause 10.1A.16.2.2 for FR1 are fulfilled, for a corresponding band.

## 9.9A.2.3 Measurement Capability

RedCap UE PRS RSTD measurement capability is as indicated by the RedCap UE in *NR-DL-TDOA-ProvideCapabilities*, according to TS 37.355[34].

## 9.9A.2.4 Measurement Reporting Requirements

The requirements in clause 9.9.2.4 shall apply except for RSTD measurement accuracy. The RSTD measurements performed and reported according to this clause shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2 for each measured DL PRS resource.

## 9.9A.2.5 Measurements Period Requirements without FH

### 9.9A.2.5.1 Measurements Period Requirements without FH with MG

When physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34], the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 9.9A.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$$\mathrm{T_{RSTD,Total}} = \sum_{\mathrm{i=1}}^{\mathrm{L}} \mathrm{T_{RSTD,i}} + (\mathrm{L}-1) * \max\left(\mathrm{T_{effect,i}}\right),$$

where

$i$ is the index of positioning frequency layer,

$L$ is total number of positioning frequency layers, and

$\mathrm{T_{effect},i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i

$\mathrm{T_{RSTD,i}}$ is the measurement period for PRS RSTD measurement in positioning frequency layer $i$ as specified below:

$$\mathrm{T_{RSTD,i}} = \left(k_{multiTEG,i} * \mathrm{CSSF_{PRS_RedCap,i}} * \mathrm{ceil}(\mathrm{K_{p,PRS,i}}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * \mathrm{T_{effect,i}} + \mathrm{T_{last,i}},$$

where:

$N_{RxBeam,i}$ is the RedCap UE Rx beam sweeping factor. In FR1 (for 2 Rx or 1 Rx RedCap UE), $N_{RxBeam,i}$ = 1;

and in FR2 (for 2 Rx RedCap UE only), $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$CSSF_{PRS_RedCap,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in positioning frequency layer $i$ as defined in clause 9.1A.5.2.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG}=N_{TEG,i}$, if UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG}=\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

- For a window W of duration max($T_{PRS,i,}$ MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:
  - $N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
  - $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule
  - Requirements do not apply if $N_{available}$ =0.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{sample}$ is the number of PRS RSTD measurement samples, where

- $N_{sample}$ = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 4 otherwise.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the

sampling time and processing time. If all of the PRS resources to be measured are available in the same MG occasion during $T_{availabe}$, $T_{last,i} = T_i$ +MGL. Otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$ ,

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

$T_i$ corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$.

$MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the PRS frequency layer i.$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where

$T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

- Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

$\{N, T\}$ is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34].

$N'$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [34].

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{RSTD,Total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34].

For deferred MT-LR with other event than “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{RSTD,Total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the RSTD measurement in each reporting period and activate the location report at the time when the periodic timer expires.

Note: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When PRS-RSRP is configured for DL-TDOA, RSTD and RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and RSRPP are performed over the same measurement period.

If during the measurement period of one or more positioning frequency layers, the MG pattern is reconfigured, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSTD,Total}$ within measurement gaps due to collisions with other signals; otherwise, the measurement period can be longer.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9A.2 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements. The RSTD measurement period can be longer. The UE shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2.

### 9.9A.2.5.2 Measurements Period Requirements without FH without MG

When physical layer receives last of *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34], the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 9.9A.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined as:

$T_{RSTD,Total} = \sum_{i=1}^{L} T_{RSTD_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the positioning frequency layers are in Case 1, or

$T_{RSTD,Total} = \max(T_{RSTD_wo_gap,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where,

$i$ is the index of positioning frequency layer, and

$L$ is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{RSTD,Total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{RSTD_wo_gap,i}$ is the measurement period for PRS RSTD measurement in positioning frequency layer $i$ as specified below.

$$T_{RSTD_wo_gap,i} = \left(k_{multiTEG,i} * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last,i},$$

where:

$N_{RxBeam,i}$ is the UE Rx beam sweeping factor. In FR1 (for 2 Rx or 1 Rx RedCap UE), $N_{RxBeam,i}$ = 1; and in FR2 (for 2 Rx RedCap UE only), $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$k_{multiTEG,i}$ is the scaling factor for measurement of same PRS resource with multiple Rx TEGs.

$k_{multiTEG,i}$=1 if UE is not supported *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* or not requested by LMF to measure a PRS resource with multiple Rx TEGs via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*;

otherwise,

$k_{multiTEG}=N_{TEG,i}$, if the UE is not capable of receiving same DL PRS resource simultaneously from multiple Rx TEGs, and

$k_{multiTEG}=\left\lceil \frac{N_{TEG,i}}{k_{TEG,simul,i}} \right\rceil$ if the UE is capable of receiving the same DL PRS resource simultaneously from multiple Rx TEGs.

Where

$N_{TEG,i}$ is the number of Rx TEGs with which UE is requested to measure a PRS resource indicated via *measureSameDL-PRS-ResourceWithDifferentRxTEGs-r17* [34] in *NR-DL-TDOA-RequestLocationInformation*, and in case 'n0' is indicated, $N_{TEG,i}$ is the maximum number of Rx TEGs with which UE can support to measure the same PRS resource as reported in *NR-UE-TEG-Capability*, and

$k_{TEG,simul,i}$ is the number of Rx TEGs UE can measure simultaneously which is reported via *measureSameDL-PRS-ResourceWithDifferentRxTEGsSimul*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in positioning frequency layer *i* configured in a slot.

$L_{available_PRS,\mathrm{i}}$ is the time duration of available PRS in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,\mathrm{i}}$,

only the PRS resources unmuted and fully or partially overlapped with PPW are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{sample}$ is the number of PRS RSTD measurement samples, where

- $N_{sample}$= 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$=2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
- Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$= 4 otherwise.

$T_{last,i}$ is the measurement duration for the last PRS RSTD sample in positioning frequency layer *i*, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

Where,

$T_i$ corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw*-durationOfPRS-*ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$.

$PPWRP_i$ is the repetition periodicity of the PRS processing window applicable for measurements in the positioning frequency layer *i*.

$T_{PRS,i}$ is the periodicity of DL PRS resource with muting on positioning frequency layer *i*.

If more than one PRS periodicities are configured in positioning frequency layer *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the positioning frequency layer is used to derive $T_{PRS,i}$, where,

$T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*,

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the conditions for PRS measurement outside measurement gaps as defined in clause 9.9.1.2 are considered.

$N$ is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer i is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer i is in Case 2.

$N'$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [34].

The time $T_{RSTD_wo_gap,i}$ starts from the first instance of the activated PPW for measurement of positioning frequency layer *i* aligned with a DL PRS resource(s) in the assistance data after both the *NR-DL-TDOA-ProvideAssistanceData* message and *NR-DL-TDOA-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34].

When PRS-RSRP is configured for DL-TDOA, RSTD and RSRP are performed over the same measurement period.

When PRS-RSRPP is configured for DL-TDOA, RSTD and RSRPP are performed over the same measurement period.

If during the measurement period of one or more positioning frequency layers, the PPW is re-configured or reactivated, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{RSTD_wo_gap,i}$ within PPW due to collisions with other signals; otherwise, the measurement period can be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9A.2 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-TDOA-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while RSTD measurements are being performed, then the UE shall continue and complete the on-going RSTD measurements. The RSTD measurement period can be longer. The UE shall meet the RSTD measurement accuracy requirements in clause 10.1A.16.2.1.

If any positioning frequency layer is in Case 2, the requirements in this clause apply provided that the PPWL corresponding to the positioning frequency layer is larger than (T2+X) ms.

The requirements in this clause apply provided that a single positioning frequency layer is configured for measurement in each PPW.

#### 9.9A.2.5.3 Measurements Period Requirements without FH with both MG and PPW

If the RedCap UE is configured with both MG applicable to positioning measurement and PPW, the UE shall measure positioning frequency layer *i* within

- MG, if PRS resources on positioning frequency layer *i* are overlapped with MG, or
- PPW, if PRS resources on positioning frequency layer *i* are overlapped with PPW.

The measurement period $T_{RSTD,Total}$ is defined as:

$$T_{RSTD,Total} = T_{RSTD,Total,MG} + T_{RSTD,Total,PPW} + T_{guard},$$

Where

- $T_{RSTD,Total,MG}$ is defined in clause 9.9A.2.5.1 and includes all positioning frequency layers to be measured within MG,
- $T_{RSTD,Total,PPW}$ is defined in clause 9.9A.2.5.2 and includes all positioning frequency layers to be measured within PPW,
- $T_{guard}$ is the maximum $T_{effect}$ defined in clauses 9.9A.2.5.1 and 9.9A.2.5.2 among all PFLs.

The requirements apply provided the following conditions are satisfied:

- MGs and PPWs do not overlap in time;
- Each PFL in the assistance data can be measured completely (all PRS resources) either within MG or within activated PPW.

### 9.9A.2.6 Measurements Period Requirements with FH

#### 9.9A.2.6.1 Measurements Period Requirements with FH with MG

When UE physical layer receives last of *NR-TDOA-ProvideAssistanceData* message and *NR-TDOA-RequestLocationInformation* message from LMF via LPP [34], requesting RedCap UE to measure DL RSTD measurement with FH, the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 9.9A.2.3) DL RSTD measurements, defined in TS 38.215 [4], during the measurement period $T_{RSTD,Total}$ defined in clause 9.9A.2.5.1 with using the following definition for $N_{sample}$ and $L_{available_PRS,i}$:

- $N_{sample}$ is the number of PRS RSTD measurement samples, where
  - $N_{sample}$ = 2 if the RedCap UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.

- $N_{sample}$ = 4 otherwise.

- A measurement sample with FH is defined as a PRS measurement over multiple hops within a single measurement gap occasion.

- $L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during a MG, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

where,

- $N_{hop,i,j}$ is the number of hops that UE can do in an MG occasion *j* as defined in the following, and

- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in MG instance *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only the PRS resources unmuted and fully or partially overlapped with the sampling duration in each hop are considered;

- *J* is the number of MG instance during $T_{available_PRS,i}$.

The sampling window per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, $T_{hop}$ is the applicable length per hop as defined in table 9.9A.2.6.1-1, and $RRT_{FH}$ is the retuning time between Rx hops as reported by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop within a MG instance starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the MG instance taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

**Table 9.9A.2.6.1-1: Applicable number of hops per slot and applicable length of each hop**

| $RRT_{FH}$ | (comb size, Number of PRS symbols) | Applicable number of hops per slot ($N_{hops}^{slot}$) | Applicable length per hop ($T_{hop}$) in number of symbols |
|---|---|---|---|
| $RRT_{FH} \leq 2$ symbols | (2, 12) with SCS 15 kHz, 30 kHz, 60 kHz in FR2, 120 kHz | 2 | 7 |
| | All others | 1 | 14 |
| 2 symbols $< RRT_{FH} \leq 6$ symbols | (≤ 6, any) | 1 | 14 |
| | (12, 12) | ½ | 28 |
| $RRT_{FH} > 6$ symbols | Any combination | ½ | 28 |

The number of hops within a single MG occasion $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right)$$

where

- $N_{hop,max,i}$ is the maximum number of Rx hops signaled by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in [34] for positioning frequency layer *i*

- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*

- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a MG instance *j*,

- $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot}$ = 2,

- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot}$ = 1,

- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot}$ = 1/2 and $M_{rep}^{PRS}$ >1,

- $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot}$ = 1/2 and $M_{rep}^{PRS}$ =1,

- where $N_{rep}^{PRS}$ is the number of inter-slot PRS repetitions within the MG occasion, excluding the gap retuning times, which are unmuted and fully or partially overlapped with the sampling duration within each hop. $M_{rep}^{PRS}$ is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, $N_{hops}^{slot}$ is the applicable number of hops per slot as defined in table 9.9A.2.6.1-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within an MG instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of $BW_{total}$ defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop} * BW_{per-hop} - \left(N_{hop} - 1\right) * BW_{overlap}\right)$$

where

$BW_{PRS}$ is the minimum among

- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18* as specified in [34], and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18*.as specified in [34],

$N_{hop,i,j}$ is number of hops within a single MG occasion as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in [34],

$BW_{overlap}$ $BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in [34].

## 9.9A.3 PRS-RSRP measurements for RedCap

### 9.9A.3.1 Introduction

The requirements in clause 9.9A.3 shall apply provided the RedCap UE has received a message from LMF via LPP [34] requesting the RedCap UE to measure and report PRS-RSRP measurements defined in TS 38.215 [4].

The requirements in clause 9.9A.3.5 shall apply provided the RedCap UE does not support, or support but not configured, to measure PRS resources with Frequency Hopping (FH), subject to UE capability indicated in *NR-DL-AoD-ProvideCapabilities.*

The requirements in clause 9.9A.3.6 shall apply provided the RedCap UE supports and is configured to measure PRS resources with Frequency Hopping (FH), subject to UE capability indicated in *NR-DL-AoD-ProvideCapabilities*.

### 9.9A.3.2 Requirements applicability

The requirements in clause 9.9A.3.5 apply for periodic and triggered PRS-RSRP measurements without FH, provided:

- PRS-RSRP related side conditions for 2 Rx RedCap UE given in clause 10.1.24.2 for FR1 and FR2 are met for a corresponding band, or
- PRS-RSRP related side conditions for 1 Rx RedCap UE given in clause 10.1A.17.2 for FR1 are met for a corresponding band.

The requirements in clause 9.9A.3.6 apply for periodic and triggered PRS-RSRP measurements with FH, provided:

- PRS-RSRP related side conditions for 2 Rx RedCap UE given in clause 10.1.24.2 for FR1 and FR2 are met for a corresponding band, or
- PRS-RSRP related side conditions for 1 Rx RedCap UE given in clause 10.1A.17.2 for FR1 are met for a corresponding band.

### 9.9A.3.3 Measurement Capability

UE PRS-RSRP measurement capability is as indicated by the UE in *NR-DL-AoD-ProvideCapabilities* according to TS 37.355 [34].

### 9.9A.3.4 Measurement Reporting Requirements

The requirements in clause 9.9.3.4 shall apply except for PRS-RSRP measurement accuracy. The PRS-RSRP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requriements specified in the clauses 10.1A.17.2.

### 9.9A.3.5 Measurements Period Requirements without FH

#### 9.9A.3.5.1 Measurement Period Requirements without FH with MG

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the RedCap UE shall be able to measure multiple (up to the RedCapUE capability specified in clause 9.9A.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms.

$$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max\left(T_{effect,i}\right)$$

where

*i* is the index of positioning frequency layer,

L is total number of positioning frequency layers,

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$$T_{PRS-RSRP,i} = \left(CSSF_{PRS_RedCap,i} * \text{ceil}(K_{p,PRS,i}) * N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

where

$CSSF_{PRS_RedCap,i}$ is the carrier specific scaling factor for PRS-RSRP measurements specified in clause 9.1A.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioining frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

$N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 (for 2 Rx or 1 Rx RedCap UE) and if positioning frequency layer *i* is in FR2 (for 2 Rx RedCap UE only), $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

$N_{sample}$ is the number of PRS-RSRP measurement samples, where

- $N_{sample}$ = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 4 otherwise.

$T_{last,i} = T_i + T_{available_PRS,i}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time, if not all PRS resources to be measured are available in the same measurement gap occasion during $T_{available_PRS,i}$, otherwise $T_{last,i} = T_i + MGL$,

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

$T_i$ corresponds to durationOfPRS-ProcessingSymbolsInEveryTms in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$ is the least common multiple between $T_{PRS,i}$ and $MGRP_i$ ,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer i,

$MGRP_i$ is the measurement gap repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

When PRS-RSRP measurements are configured for DL-AoD, except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{PRS-RSRP,total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after both the *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

For deferred MT-LR with other event than "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{PRS-RSRP,total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event "Periodic Location" as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the PRS-RSRP measurement in each reporting period and activate the location report at the time when the periodic timer expires.

Note: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 9.9.2.

When the PRS-RSRP measurement is configured together with UE Rx-Tx time difference measurement then the PRS-RSRP measurement shall meet the UE Rx-Tx time difference measurement requirements defined in clause 9.9.4.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource:

if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or

if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period of one or more positioning frequency layers, the MG pattern is reconfigured either per UE request or not per UE request, the measurement period can be longer.

The requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{PRS-RSRP,total}$ within measurement gaps due to collisions with other signals; otherwise, a longer measurement period may be used.

The requirements in clause 9.9A.3 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If handover occurs while PRS-RSRP measurements are being performed then the UE shall complete the ongoing PRS-RSRP measurements session. The PRS-RSRP measurement period can be longer. The UE shall meet the PRS-RSRP measurement accuracy requirements in clause 10.1A.17.2.

### 9.9A.3.5.2 Measurement Period Requirements without FH without MG

When the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], the RedCap UE shall be able to measure multiple (up to the RedCap UE capability specified in clause 9.9A.3.3) PRS-RSRP measurements as defined in TS 38.215 [4] without measurement gap, on configured positioning frequency layer *i*, within $T_{PRS-RSRP,total}$ ms.

$T_{PRS-RSRP,\ total} = \sum_{i=1}^{L} T_{PRS-RSRP,i} + (L-1) * \max(T_{effect,i})$ if any of the positioning frequency layers are in Case 1, or

$T_{PRS-RSRP,\ total} = \max(T_{PRS-RSRP,i} + T_{uncertainty,i})$, if all the positioning frequency layers are in Case 2,

Where,

$i$ is the index of positioning frequency layer, and

$L$ is total number of positioning frequency layers, and

$T_{effect,i}$ is the periodicity of the PRS RSTD measurement in positioning frequency layer i, and

$T_{uncertainty,i}$ is the time from the start of the first PPW occasion for positioning frequency layer i to the start of measurement period $T_{PRS-RSRP,\ total}$.

A positioning frequency layer is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

$T_{PRS-RSRP,i}$ is the measurement period for PRS-RSRP measurement in positioning frequency layer *i* as specified below.

$$T_{PRS-RSRP,i} = \left(N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1\right) * T_{effect,i} + T_{last}$$

where

$T_{effect,i}$ is the periodicity of the PRS-RSRP measurement in positioning frequency layer *i*.

$N_{RxBeam,i}$ is the scaling factor for Rx beam sweeping, and $N_{RxBeam,i}$=1 if positioning frequency layer *i* is in FR1 (for 2 Rx or 1 Rx RedCap UE). If positioning frequency layer *i* is in FR2 (for 2 Rx RedCap UE only), $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-TDOA-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

$L_{available_PRS,i}$ is the time duration of available PRS to be measured in the positioning frequency layer i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only unmuted PRS resource instances that meet the applicability conditions and fully or partially overlapped with PRS processing window are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

N′ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* in clause 6.4.3 of TS 37.355 [34],

$N_{sample}$ is the number of PRS-RSRP measurement samples, where

- $N_{sample}$ = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.
- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:

- PRS bandwidth is within the active BWP and
- Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- $N_{sample}$ = 4 otherwise.

$T_{last}$ is the measurement duration for the last PRS-RSRP sample, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$ is the periodicity of PRS-RSRP measurement in positioning frequency layer *i*,

$T_i$ corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$ is the least common multiple between $T_{PRS,i}$ and $PPWRP_i$,

$T_{PRS,i}$ is the maximum PRS resource periodicity among all PRS resources in positioning frequency layer *i*,

$PPWRP_i$ is the PRS processing window repetition period in positioning frequency layer i.

If positioning frequency layer *i* has more than one DL PRS resource set with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among the DL PRS resource sets is used to derive $T_{PRS,i}$, where:

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. If bitmap $\{b^1\}$ for higher-layer parameter *DL-*
$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the applicability conditions and fully or partially covered by the PRS processing window are considered.

When PRS-RSRP measurements are configured for DL-AoD, the time $T_{PRS-RSRP,i}$ starts from the first PRS processing window instance aligned with DL PRS resources in the assistance data after both the *NR-DL-AoD-RequestLocationInformation* message and *NR-DL-AoD-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

Note: No per-positioning frequency layer requirement is applied in scenarios when multiple positioning frequency layers are configured.

When the PRS-RSRP measurement is configured together with RSTD measurement then the PRS-RSRP measurement shall meet the RSTD measurement requirements defined in clause 9.9A.2.

When the PRS-RSRP measurement is configured together with UE Rx-Tx time difference measurement then the PRS-RSRP measurement shall meet the UE Rx-Tx time difference measurement requirements defined in clause 9.9A.4.

If CSSF changes during the measurement period, the measurement period could be longer.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or

- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in clause 9.9A.3 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AoD-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

If during the measurement period of one or more positioning frequency layers, the PPW is reconfigured or reactivated, the PRS-RSRP measurement period can be longer.

If any positioning frequency layer is in Case 2, the requirements in this clause apply provided that the PPWL corresponding to the positioning frequency layer is larger than (T2+X) ms.

The requirements in this clause apply provided that a single positioning frequency layer is configured for measurement in each PPW.

#### 9.9A.3.5.3 Measurements Period Requirements without FH with both MG and PPW

If the RedCap UE is configured with both MG applicable to positioning measurement and PPW, the UE shall measure positioning frequency layer *i* within

- MG, if PRS resources on positioning frequency layer *i* are overlapped with MG, or
- PPW, if PRS resources on positioning frequency layer *i* are overlapped with PPW.

The measurement period $T_{PRS-RSRP,\ total}$ is defined as:

$$T_{PRS-RSRP,\ total} = T_{PRS-RSRP,Total,MG} + T_{PRS-RSRP,Total,PPW} + T_{guard},$$

Where

- $T_{PRS-RSRP,Total,MG}$ is defined in clause 9.9A.3.5.1 and includes all positioning frequency layers to be measured within MG,
- $T_{PRS-RSRP,Total,PPW}$ is defined in clause 9.9A.3.5.2 and includes all positioning frequency layers to be measured within PPW,
- $T_{guard}$ is the maximum $T_{effect}$ defined in clauses 9.9A.3.5.1 and 9.9A.3.5.2 among all PFLs.

The requirements apply provided the following conditions are satisfied:

- MGs and PPWs do not overlap in time;
- Each PFL in the assistance data can be measured completely (all PRS resources) either within MG or within activated PPW.

### 9.9A.3.6 Measurements Period Requirements with FH

#### 9.9A.3.6.1 Measurements Period Requirements with FH with MG

When the UE the physical layer receives *NR-DL-AoD-ProvideAssistanceData* message and *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34], requesting RedCap UE to measure PRS-RSRP measurement with FH, the RedCap UE shall be able to measure multiple (up to the RedCapUE capability specified in clause 9.9A.3.3) PRS-RSRP measurements, defined in TS 38.215 [4], from configured PRS resources for configured TRPs on configured positioning frequency layers, within $T_{PRS-RSRP,total}$ ms as defined clause 9.9A.3.5.1 with using the following definition for $N_{sample}$ and $L_{available_PRS,i}$:

- $N_{sample}$ is the number of PRS-RSRP measurement samples, where
  - $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples.
  - $N_{sample}$ = 4 otherwise.

- A measurement sample with FH is defined as a PRS measurement over multiple hops within a single measurement gap occasion.

- $L_{available_PRS,i}$ is the time duration of available PRS in the positioning frequency layer i to be measured during a MG, and is calculated by:

$$L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$$

where,

- $N_{hop,i,j}$ is the number of hops that UE can do in an MG occasion *j* as defined in the following, and

- $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in MG instance *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only the PRS resources unmuted and fully or partially overlapped with the sampling duration in each hop are considered;

- *J* is the number of MG instance during $T_{available_PRS,i}$.

The sampling window per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, $T_{hop}$ is the applicable length per hop as defined in table 9.9A.3.6.1-1, and $RRT_{FH}$ is the retuning time between Rx hops as reported by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* [34]. The first hop within a MG instance starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the MG instance taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

**Table 9.9A.3.6.1-1: Applicable number of hops per slot and applicable length of each hop**

| $RRT_{FH}$ | (comb size, Number of PRS symbols) | Applicable number of hops per slot ($N_{hops}^{slot}$) | Applicable length per hop ($T_{per}$) in number of symbols |
|---|---|---|---|
| $RRT_{FH} \leq 2$ symbols | (2, 12) with SCS 15 kHz, 30 kHz, 60 kHz in FR2, 120 kHz | 2 | 7 |
| | All others | 1 | 14 |
| 2 symbols $< RRT_{FH} \leq 6$ symbols | (≤ 6, any) | 1 | 14 |
| | (12, 12) | ½ | 28 |
| $RRT_{FH} > 6$ symbols | Any combination | ½ | 28 |

The number of hops within a single MG occasion $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right)$$

where

- $N_{hop,max}$ is the maximum number of Rx hops signaled by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in [34] for positioning frequency layer *i*

- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*

- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a MG instance *j*,

- $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,

- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,

- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,

- $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,

- where $N_{rep}^{PRS}$ is the number of inter-slot PRS repetitions within the MG occasion, excluding the gap retuning times, which are unmuted and fully or partially overlapped with the sampling duration within each hop. $M_{rep}^{PRS}$ is

the PRS repetition interval configured by *dl-PRS-ResourceTimeGap*, $N_{hops}^{slot}$ is the applicable number of hops per slot as defined in table 9.9A.3.6.1-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within an MG instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of $BW_{total}$ defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop} * BW_{per-hop} - \left(N_{hop} - 1\right) * BW_{overlap}\right)$$

where

- $BW_{PRS}$ is the minimum among
- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18*, and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18* as specified in [34],

$N_{hop,i,j}$ is number of hops within a single MG occasion as define above,

$BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in [34],

$BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in [34].

## 9.9A.4 UE Rx-Tx time difference measurements for RedCap

### 9.9A.4.1 Introduction

The requirements in this clause apply for RedCap UE, when the UE received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP specified in TS 37.355 [34] requesting the UE to measure and report one or more UE Rx-Tx time difference measurements defined in TS 38.215 [4].

If UE does not support RX FH for PRS measurement as indicated by UE capability *NR-DL-PRS-ProcessingCapability*, or if LMF does not request UE to use RX FH for PRS measurement as indicated via *NR-Multi-RTT-RequestLocationInformation* in the measurement request, the requirements in clauses 9.9A.4.5, 9.9A.4.6 and 9.9A.4.7 shall apply for applicable configurations.

If UE supports RX FH for PRS measurement as indicated by UE capability *NR-DL-PRS-ProcessingCapability*, and LMF requests UE to use RX FH for PRS measurement as indicated via *NR-Multi-RTT-RequestLocationInformation* in the measurement request, the requirements in clause 9.9A.4.8 shall apply.

### 9.9A.4.2 Requirements Applicability

The requirements in clause 9.9A.4 apply for periodic and triggered UE Rx-Tx time difference measurements, provided:

- UE Rx-Tx time difference measurement related side conditions given in clause 10.1A.18.2 are met for a corresponding band.
- SRS is configured on at least one of the PCell, PSCell and SCell.
- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.

### 9.9A.4.3 Measurement Capability

UE Rx-Tx time difference measurement capability is as indicated by the UE in *NR-Multi-RTT-ProvideCapabilities*, according to TS 37.355 [34].

### 9.9A.4.4 Measurement Reporting Requirements

The requirements in clause 9.9.4.4 shall apply except that the UE Rx-Tx time difference measurement accuracy for all measured DL PRS resources shall be fulfilled according to the accuracy requirements specified in clause 10.1A.18.2.

### 9.9A.4.5 Measurement Period Requirements without FH with MG

The requirements in clause 9.9.4.5 shall apply.

### 9.9A.4.6 Measurement Period Requirements without FH without MG

The requirements in clause 9.9.4.6 shall apply.

### 9.9A.4.7 Measurements Period Requirements without FH with both MG and PPW

The requirements in clause 9.9.4.8 shall apply.

### 9.9A.4.8 Measurements Period Requirements with FH

The requirements in this clause apply when a RedCap UE is requested by the LMF to perform measurements with FH, and UE reports measurement based on multiple hops.

The requirements in clause 9.9A.4.5 shall apply with the following modifications.

- $N_{sample}$ = 2 if the UE supports the capability of positioning measurements with reduced number of samples as indicated by *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* specified in TS 37.355 [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples. Otherwise, $N_{sample}$ = 4.
- A measurement sample with FH is defined as a PRS measurement over multiple hops within a single measurement gap.
- $L_{available_PRS,i} = \sum_{j=1}^{J} N_{hop,i,j} * L_{per-hop,i,j}$, where
  - $N_{hop,i,j}$ is the number of hops that UE can do in an MG occasion *j* as defined in the following, and
  - $L_{per-hop,i,j}$ is the time duration of available PRS resources in the positioning frequency layer *i* in each hop to be measured in MG instance *j* during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{per-hop,i,j}$, only the PRS resources unmuted and fully or partially overlapped with the sampling duration in each hop are considered;
  - *J* is the number of MG instance during $T_{available_PRS,i}$.

The sampling window per hop is the first $T_{sample,hop}$ symbols in each hop, where $T_{sample,hop} = T_{hop} - RRT_{FH}$, $T_{hop}$ is the applicable length per hop as defined in table 9.9A.4.8-1, and $RRT_{FH}$ is the retuning time between Rx hops as reported by UE in *rf-RxRetuneTimeFR1* or *rf-RxRetuneTimeFR2* via *NR-DL-PRS-ProcessingCapability* specified in TS 37.355 [34]. The first hop within a MG instance starts at no earlier than the earliest arrival time of the first unmuted PRS resource fully or partially overlapped with the MG instance taking into account the *expectedRSTD* and *expectedRSTD-uncertainty* in the PRS assistance data.

**Table 9.9A.4.8-1: Applicable number of hops per slot and applicable length of each hop**

| $RRT_{FH}$ | (comb size, Number of PRS symbols) | Applicable number of hops per slot $(N_{hops}^{slot})$ | Applicable length per hop ($T_{hop}$) in number of symbols |
|---|---|---|---|
| $RRT_{FH} \leq 2$ symbols | (2, 12) with SCS 15 kHz, 30 kHz, 60 kHz in FR2, 120 kHz | 2 | 7 |

| | | | |
|---|---|---|---|
| | All others | 1 | 14 |
| 2 symbols $< RRT_{FH}$ $\leq$ 6 symbols | (≤ 6, any) | 1 | 14 |
| | (12, 12) | ½ | 28 |
| $RRT_{FH} > 6$ symbols | Any combination | ½ | 28 |

The number of hops within a single MG occasion $N_{hop,i,j}$ is defined as

$$N_{hop,i,j} = min\left(N_{hops,effect,i,j}, \left\lfloor \frac{N3_i}{L_{per-hop,i,j}} \right\rfloor, N_{hop,max,i}\right)$$

where

- $N_{hop,max}$ is the maximum number of Rx hops signaled by UE in *maximumFH-Hops* via *NR-DL-PRS-ProcessingCapability* as specified in TS 37.355 [34] for positioning frequency layer *i*
- $N3_i$ is indicated via UE capability *processingPRS-SymbolsDurationN3-r18* for positioning frequency layer *i*
- $N_{hops,effect,i,j}$ is the effective number of Rx hops within a MG instance,
- $N_{hops,effect,i,j} = 2 * N_{rep}^{PRS}$, if $N_{hops}^{slot} = 2$,
- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1$,
- $N_{hops,effect,i,j} = N_{rep}^{PRS}$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} > 1$,
- $N_{hops,effect,i,j} = \left\lfloor \frac{(N_{rep}^{PRS}-1)}{2} \right\rfloor + 1$, if $N_{hops}^{slot} = 1/2$ and $M_{rep}^{PRS} = 1$,
- where $N_{rep}^{PRS}$ is the number of inter-slot PRS repetitions within the MG occasion excluding the gap retuning times, which are unmuted and fully or partially overlapped with the sampling duration within each hop. $M_{rep}^{PRS}$ is the PRS repetition interval configured by *dl-PRS-ResourceTimeGap* and $N_{hops}^{slot}$ is the applicable number of hops per slot as defined in table 9.9A.4.8-1.

The measurement period requirement with the above modifications applies provided all PRS resources in each PFL have the same number of PRS repetitions $\left(N_{rep}^{PRS}\right)$ within an MG instance and the same PRS repetition interval $\left(M_{rep}^{PRS}\right)$, otherwise the measurement period can be longer.

UE shall be able to measure PRS resources with multiple hops at least over the BW of $BW_{total}$ defined as

$$BW_{total} = min\left(BW_{PRS}, N_{hop,i,j} * BW_{per-hop} - \left(N_{hop} - 1\right) * BW_{overlap}\right)$$

where

- $BW_{PRS}$ is the minimum among
- configured PRS BW, and
- UE capability of maximum PRS BW across all hops indicated via *maximumPRS-BandwidthAcrossAllHopsFR1-r18* or *maximumPRS-BandwidthAcrossAllHopsFR2-r18*, and
- total BW of all hops requested by LMF via *nr-DL-PRS-RxHoppingTotalBandwidth-r18* as specified in TS 37.355 [34],

  $N_{hop,i,j}$ is number of hops within a single MG occasion as define above,

  $BW_{per-hop}$ is the UE capability on PRS BW per hop indicated via *supportedBandwidthPRS-r16* as specified in TS 37.355 [34],

  $BW_{overlap}$ is the UE capability on BW of the overlapping RB indicated via *numOfOverlappingPRB-r18* as specified in TS 37.355 [34].

# 9.9A.5 PRS-RSRPP measurements for RedCap

## 9.9A.5.1 Introduction

The requirements in this clause apply for RedCap UE, when the UE received *NR-DL-AoD-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to measure and report one or more PRS-RSRPP measurements defined in TS 38.215 [4].

If UE does not support FH for PRS measurement as indicated by UE capability *NR-DL-AoD-ProvideCapabilities*, or if LMF does not request UE to use FH for PRS measurement as indicated via *NR-DL-AoD-RequestLocationInformation* in the measurement request, the requirements in clauses 9.9A.5.5, 9.9A.5.6 and 9.9A.5.7 shall apply for applicable configurations.

If UE supports FH for PRS measurement as indicated by UE capability *NR-DL-AoD-ProvideCapabilities*, and LMF requests UE to use FH for PRS measurement as indicated via *NR-DL-AoD-RequestLocationInformation* in the measurement request, the requirements in clause 9.9A.5.8 shall apply.

## 9.9A.5.2 Requirements Applicability

The requirements in clause 9.9A.5 apply for periodic and triggered PRS-RSRPP measurements, provided:

- PRS-RSRPP related side conditions given in clause 10.1A.19.2 are met for a corresponding band.

## 9.9A.5.3 Measurement Capability

UE PRS-RSRPP measurement capability is as indicated by the UE in *NR-DL-AoD-ProvideCapabilities* according to TS 37.355 [34].

## 9.9A.5.4 Measurement Reporting Requirements

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes the delay uncertainty caused by inserting the measurement report into the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The reported PRS-RSRPP measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1A.19.3.

The PRS-RSRPP measurement accuracy for all measured PRS resources shall be fulfilled according to the accuracy requriements specified in the clause 10.1A.19.2.

## 9.9A.5.5 Measurement Period Requirements without FH with MG

For PRS measurement within MG configured to UE, measurement period requirements for PRS-RSRP defined in clause 9.9A.3.5.1 is re-used for PRS-RSRPP.

## 9.9A.5.6 Measurement Period Requirements without FH without MG

For PRS measurement without MG configured to UE, measurement period requirements for PRS-RSRP defined in clause 9.9A.3.5.2 is re-used for PRS-RSRPP.

The PRS-RSRPP measurement requirements in this clause apply for the first path PRS-RSRP measurement.

## 9.9A.5.7 Measurements Period Requirements without FH with both MG and PPW

If the UE is configured with both MG applicable to positioning measurement and PPW, the measurement period requirements for PRS-RSRP defined in clause 9.9A.3.5.3 is re-used for PRS-RSRPP.

### 9.9A.5.8 Measurements Period Requirements with FH

The measurement period requirements for PRS-RSRP defined in clause 9.9A.3.6 are re-used for PRS-RSRPP.

# 9.9C NR measurements for positioning in Satellite Access

## 9.9C.1 Introduction

This clause contains requirements for UE capable of performing NR positioning measurements defined in TS 38.215 [4], including UE Rx-Tx time difference , when the PCell is served by a Satellite Access Node (SAN).

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

### 9.9C.1.1 General Aspects of Gap-based Measurement

For gap-based UE Rx-Tx time difference, the requirements in clauses 9.9C.4.5 apply provided:

- the UE is configured with measurement gaps or configured with concurrent measurement gaps
  - all positioning frequency layers are measured or associated with only one measurement gap, or
- No active BWP switching occurs during the measurement gaps for PRS measurement, and

All measurement requirements specified in clause 9.9C.4.5 shall apply without DRX as well as for any DRX configuration specified in TS 38.331 [2].

UE is only required to measure PRS resources that are fully or partially overlapped with measurement gaps, and the requirements in clause 9.9C.4.5 and are applicable to PRS resources that are fully or partially overlapped with measurement gaps.

A PRS resource is considered to be fully (partially) overlapped with measurement gaps if all (some) of its instances are overlapped with a measurement gap occasion. A PRS resource instance is considered to be overlapped with measurement gap occasion if the minimum number of unmuted repetitions of the instance taking into account *nr-DL-PRS-ExpectedRSTD-Uncertainty* and *nr-DL-PRS-ExpectedRSTD* is fully covered by the MGL excluding RF switching time, where the minimum number is given in the accuracy requirements in clause 10.1.25C, for UE Rx-Tx time difference .

When UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

If a positioning measurement gap is configured via *PosGapConfig* and activated by MAC CE, the measurement requirements in clause 9.9.4C.5 apply provided that no other MGs are configured, and only one measurement gap configured via *PosGapConfig* is activated.

### 9.9C.1.2 General Aspects of Gapless Measurement

The requirements for UE Rx-Tx time difference measurement without measurement gaps specified in clause 9.9C.4.6 shall apply provided that:

Positioning frequency layer to be measured is within an active BWP,

UE is configured with PPW, and the PPW for the active BWP containing the positioning frequency layer to be measured is activated,

No active BWP switching occurs during the measurement period specified in clauses 9.9.2.7, 9.9.3.6, 9.9.4.6, and 9.9.6.6,

PRS is within PPW and does not overlap with other signals/channels of higher priority,

- for PPW type 1A/1B, the PPW does not overlap with any symbol for SSB-based RLM/BFD/CBD/L1-RSRP/L1-SINR measurement on any CC or for SSB based RRM measurement on any MOs that are measured outside measurement gaps,
- for PPW type 2, PRS does not overlap with any symbol for SSB-based RLM/BFD/CBD/L1-RSRP/L1-SINR measurement on any CC or for SSB based RRM measurement on any MOs that are measured outside measurement gaps,

SCS of PRS within PPW and SCS of DL active BWP are the same.

All measurement requirements specified in clause 9.9C.4.6 shall apply without DRX as well as for any DRX configuration specified in TS 38.331 [2].

The UE is not required to perform additional SSB measurement for the SSB configured as QCL source of PRS resources.

The UE is only required to measure PRS resources that are unmuted and fully or partially overlapped with PPW, and the requirements in clause 9.9C.4.6 are applicable to PRS resources that are unmuted and fully or partially overlapped with PPW.

A PRS resource is considered to be fully (partially) overlapped with PPW if all (some) of its instances are overlapped with a PPW occasion. A PRS resource instance is considered to be overlapped with PPW occasion if the minimum number of unmuted repetitions of the instance taking into account Rx time difference between serving and non-serving cell is fully covered by the PPW, where the minimum number is given in the accuracy requirements in clause 10.1.25C for UE Rx-Tx time difference.

When UE is configured with measurement for more than one positioning requests, the measurement period for each request may be longer than measurement period when UE is configured with measurement for single positioning request.

### 9.9C.1.3 Scheduling Availability of UE during PRS Measurement without Measurement Gaps

The requirements in clause 9.9.1.3 apply for UE performing UE Rx-Tx time difference measurement without measurement gaps according to clause 9.9C.4.6.

## 9.9C.2 Void

## 9.9C.3 Void

## 9.9C.4 UE Rx-Tx time difference measurements

### 9.9C.4.1 Introduction

The requirements in this clause shall apply, provided the UE has received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to measure and report one or more UE Rx-Tx time difference measurements defined in TS 38.215 [4].

### 9.9C.4.2 Requirements Applicability

The requirements in clause 9.9C.4 apply for periodic and triggered UE Rx-Tx time difference measurements, provided:

- UE Rx-Tx time difference measurement related side conditions given in clause 10.1.25C are met for a corresponding band.

- SRS is configured on the PCell.
- The UE transmits SRS within the range from -160 ms to 160 ms of the DL PRS resource of the TRP corresponding to the PCell in the assistance data.

### 9.9C.4.3 Measurement Capability

UE Rx-Tx time difference measurement capability is as indicated by the UE in *NR-Multi-RTT-ProvideCapabilities*, according to TS 37.355 [34].

### 9.9C.4.4 Measurement Reporting Requirements

This requirement assumes that the measurement report is not delayed by other LPP signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The UE Rx-Tx time difference measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.25C.

The UE Rx-Tx time difference measurement accuracy for all measured DL PRS resources shall be fulfilled according to the accuracy requirements specified in clause 10.1.25C.

### 9.9C.4.5 Measurement Period Requirements

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 9.9C.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] from its PCell in a single configured positioning frequency layer *i* within the measurement period $T_{UERxTx,i}$ ms.

Measurement period $T_{UERxTx,i}$ is defined as

$$T_{UERxTx,i} = \left( CSSF_i * \text{ceil}\left(K_{p,PRS,i}\right) * \left\lfloor \frac{N_{PRS,i}^{slot}}{N'} \right\rfloor \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where

$CSSF_i$ is the carrier-specific scaling factor for NR PRS-based measurement in the positioning frequency layer *i* as defined in clause 9.1.5.2,

$K_{p,PRS,i}$ is a scaling factor for a positioning frequency layer to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS,i} = 1$ for UE not configured with concurrent measurement gap.

For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE MG and per-FR MG within the same FR as the positioning frequency layer, and starting at the beginning of any associated gap occasions covering the PRS occasion:

$N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

$N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for MG collisions by applying the selected gap collision rule

Requirements do not apply if $N_{available}$ =0.

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with MG are considered.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T ms corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in clause 4.2.7.2 of TS 37.355 [34],

N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [34],

$N_{sample}$ is the number of UE Rx-Tx time difference measurement samples and $N_{sample} = 1$.

$T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time, $T_{last,i} = T_i + T_{available_PRS,i}$,

$T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil * T_{available_PRS,i}$$

where

$T_i$ corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34],

$T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$

$MGRP_i$ is the measurement gap repetition periodicity in positioning frequency layer *i*.

$T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the MG are considered.

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{UERxTx,Total}$ starts from the first MG instance aligned with DL PRS resources in the assistance data after both the *NR-Multi-RTT-RequestLocationInformation* message and *NR-Multi-RTT-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

For deferred MT-LR with other event than “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{UERxTx,Total}$ starts from the first MG instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event “Periodic Location” as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the PRS-RSRP measurement in each reporting period and activate the location report at the time when the periodic timer expires.

When HO occurs during the measurement period, UE shall stop PRS measurement for the source cell after HO occurs, and shall start PRS measurement for the target cell after SRS reconfiguration on the target cell is complete.

When satellite switch with re-sync occurs during the measurement period, UE shall stop PRS measurement at *t-Service* if hard switching is applicable, or at *t-ServiceStart* if soft switching is applicable, and shall start PRS measurement after the switch is complete.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or

- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period, the MG pattern is reconfigured either per UE request or not per UE request, the measurement period can be longer.

The requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{UERxTx,Total}$ within measurement gaps due to collisions with other signals; otherwise, a longer measurement period may be used.

When PRS-RSRP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period.

The requirements in clause 9.9C.4 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

When SRS is reconfigured without serving cell change during the measurement period, UE shall restart the UE Rx-Tx time difference measurement after the SRS reconfiguration is complete.

If UE uplink transmission timing changes due to the network-configured Timing Advance command during the UE Rx-Tx time difference measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the change in the $N_{TA_offset}$ defined in table 7.1.2-2 during the UE Rx-Tx time difference measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the UE autonomous timing adjustment defined in clause 7.1C.2 during the UE Rx-Tx time difference measurement period, then:

- UE Rx-Tx time difference measurement period requirements in this clause shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1C.1) for SRS transmission.

### 9.9C.4.6 Measurement Period Requirements without Measurement Gaps

When physical layer receives last of *NR-Multi-RTT-ProvideAssistanceData* message and *NR-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34], UE shall be able to measure multiple (up to the UE capability specified in clause 9.9C.4.3) UE Rx-Tx time difference measurements as defined in TS 38.215 [4] from its Pcell in a single configured positioning frequency layer *i* within the measurement period $T_{UERxTx_wo_gap,i}$ ms.

In the following requirements, a positioning frequency layer *i* is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the positioning frequency layer, and a positioning frequency layer is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the positioning frequency layer.

Measurement period $T_{UERxTx_wo_gap,i}$ is defined as

$$T_{UERxTx_wo_gap,i} = \left( \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil * N_{sample} - 1 \right) * T_{effect,i} + T_{last,i}$$

Where

$T_{effect,i}$ is the periodicity of the UE Rx-Tx time difference measurement in positioning frequency layer i as defined further in this clause.

$L_{available_PRS,i}$ is the time duration of available PRS resources in the positioning frequency layer *i*, to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,

only the unmuted PRS resources that meet the applicability conditions and fully or partially overlapped with PRS processing window are considered, if positioning frequency layer i is in Case 1, or

only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if positioning frequency layer i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

$N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources of positioning frequency layer i configured in a slot,

{N, T} is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* as specified in clause 6.4.3 of TS 37.355 [34],

$N_{sample}$ is the number of UE Rx-Tx time difference measurement samples, and $N_{sample} = 1$

$T_{last,i}$ is the measurement duration for the last UE Rx-Tx time difference measurement sample in the positioning layer i, including the sampling time and processing time.

If positioning frequency layer *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else

if positioning frequency layer *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;

otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

$T_{effect,i}$ is periodicity of UE Rx-Tx time difference measurement in positioning frequency layer *i*:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_{PRS},i}} \right\rceil * T_{available_{PRS},i}$$

where

$T_i$ corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if positioning frequency layer *i* is in Case 1, or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if positioning frequency layer *i* is in Case 2,

$T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$

$PPWRP_i$ is the PRS processing window repetition periodicity in positioning frequency layer *i*.

$T_{PRS,i}$ is the PRS resource periodicity in positioning frequency layer *i*. If the positioning frequency layer *i* has more than one DL PRS resource sets with different PRS periodicities with muting, $T_{per}^{PRS\ with\ muting} = N_{muting} * T_{per}^{PRS}$, the least common multiple of $T_{per}^{PRS\ with\ muting}$ among DL PRS resource sets is used to derive $T_{PRS,i}$, where

$T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

$N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} * L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the applicability conditions and fully or partially covered by the PRS processing window are considered.

The time $T_{UERxTx_wo_gap,i}$ starts from the first PRS processing window instance aligned with DL PRS resources in the assistance data after both the *NR-Multi-RTT-RequestLocationInformation* message and *NR-Multi-RTT-ProvideAssistanceData* message from LMF via LPP [34] are delivered to the physical layer of UE.

When HO occurs during the measurement period, UE shall stop PRS measurement for the source cell after HO occurs, and shall start PRS measurement for the target cell after SRS reconfiguration on the target cell is complete.

When satellite switch with re-sync occurs during the measurement period, UE shall stop PRS measurement at *t-Service* if hard switching is applicable, or at *t-ServiceStart* if soft switching is applicable, and shall start PRS measurement after the switch is complete.

The measurement requirements do not apply for a PRS resource:

- if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$ or
- if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

If during the measurement period, the PRS processing window is reconfigured or reactivated either per UE request or not per UE request, the measurement period can be longer.

The requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{UERxTx_wo_gap,i}$ within PRS processing window due to collisions with other signals; otherwise, a longer measurement period may be used.

When PRS-RSRP is configured for multi-RTT, the UE Rx-Tx time difference measurements and PRS-RSRP measurements are performed over the same measurement period.

The requirements in clause 9.9C.4.6 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-Multi-RTT-ProvideCapabilities*, and it is up to UE implementation which PRS resources are measured, subject to UE measurement capabilities.

When SRS is reconfigured without cell change during the measurement period, UE shall restart the UE Rx-Tx time difference measurement after the SRS reconfiguration on the target cell is complete.

If UE uplink transmission timing changes due to the network-configured Timing Advance command during the UE Rx-Tx time difference measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the change in the $N_{TA_offset}$ defined in table 7.1C.2-2 during the UE Rx-Tx time difference measurement period, then the UE Rx-Tx time difference measurement period is restarted after uplink transmission timing changes, and the UE Rx-Tx time difference measurement period requirements in this clause shall not apply.

If UE uplink transmission timing changes due to the UE autonomous timing adjustment defined in clause 7.1C.2 during the UE Rx-Tx time difference measurement period, then:

- UE Rx-Tx time difference measurement period requirements in this clause shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1C.1) for SRS transmission.

If any positioning frequency layer is in Case 2, the requirements in this clause apply provided that the PPWL corresponding to the positioning frequency layer is larger than (T2+X) ms.

The requirements in this clause apply provided that a single positioning frequency layer is configured for measurement in each PPW.

# 9.9D NR measurements for positioning for RedCap in Satellite Access

## 9.9D.1 Introduction

This clause contains requirements for RedCap UE capable of performing NR positioning measurements defined in TS 38.215 [4], including UE Rx-Tx time difference, when the PCell is served by a Satellite Access Node (SAN).

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

#### 9.9D.1.1 General Aspects of Gap-based Measurement

The requirements in clause 9.9C.1.1shall apply.

#### 9.9D.1.2 General Aspects of Gapless Measurement

The requirements in clause 9.9C.1.2 shall apply.

#### 9.9D.1.3 Scheduling Availability of UE during PRS Measurement without Measurement Gaps

The requirements in clause 9.9C.1.3 shall apply.

### 9.9D.2 Void

### 9.9D.3 Void

### 9.9D.4 UE Rx-Tx time difference measurements

#### 9.9D.4.1 Introduction

The requirements in this clause shall apply for RedCap UE, when the UE has received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to measure and report one or more UE Rx-Tx time difference measurements defined in TS 38.215 [4].

#### 9.9D.4.2 Requirements Applicability

For RedCap UE not in HD-FDD mode, the requirements in clause 9.9D.4 apply for periodic and triggered RedCap UE Rx-Tx time difference measurements, provided:

- RedCap UE Rx-Tx time difference measurement related side conditions given in clause 10.1.25D are met for a corresponding band.
- SRS is configured on the PCell.
- The RedCap UE transmits SRS within [-160, 160] msec of the DL PRS resource of the TRP corresponding to the PCell in the assistance data.

For RedCap UE in HD-FDD mode, the requirements in clause 9.9D.4 apply for periodic and triggered RedCap UE Rx-Tx time difference measurements, provided:

- RedCap UE Rx-Tx time difference measurement related side conditions given in clause 10.1.25D are met for a corresponding band.
- SRS is configured on the PCell.
- The RedCap UE transmits SRS within [-160, 160] msec of the DL PRS resource of the TRP corresponding to the PCell in the assistance data.
- For UE supporting Handling collision Case 3 and collision Case 4 for half-duplex FDD operation for (e)RedCap UE, when *ntn-PrioritizeUl-semiStatichalfDuplexRedCapcollision* is enabled, no collision occurs between PRS and UL transmission.

#### 9.9D.4.3 Measurement Capability

RedCap UE Rx-Tx time difference measurement capability is as indicated by the UE in *NR-Multi-RTT-ProvideCapabilities*, according to TS 37.355 [34].

### 9.9D.4.4 Measurement Reporting Requirements

The requirements in clause 9.9C.4.4 shall apply except that:

- the RedCap UE Rx-Tx time difference measurement accuracy for all measured DL PRS resources shall be fulfilled according to the accuracy requirements specified in clause 10.1.25D.2, and
- the RedCap UE Rx-Tx time difference measurement values contained in measurement reports shall be based on the measurement report mapping requirements specified in clause 10.1.25D.3.

### 9.9D.4.5 Measurement Period Requirements

The requirements in clause 9.9C.4.5 shall apply except that:

- clause identifier 9.1.5.2 is replaced with 9.1A.5.2
- clause identifier 9.9C.4 is replaced with 9.9D.4

### 9.9D.4.6 Measurement Period Requirements without Measurement Gaps

The requirements in clause 9.9C.4.6 shall apply.

clause identifier 9.9C.4.6 is replaced with 9.9D.4.6.

## 9.9E Reporting Delay Requirements for DL AI/ML Positioning

### 9.9E.1 Introduction

The reporting delay requirements in Clause 9.9E shall apply provided the UE supports DL AI/ML positioning specified in TS 38.305 [22] as indicated in *NR-DL-AIML-ProvideCapabilities*, and has received *NR-DL-AIML-RequestLocationInformation* message from LMF via LPP requesting UE to report its location based on DL AI/ML positioning [34].

The position reporting delay is the sum of measurement delay, inference delay and is defined as the time between the moment when the position report is triggered and the moment when the UE is ready to start to transmit the position report over the air interface. This requirement assumes that the position report is not delayed by other LPP signalling on the DCCH. This position reporting delay excludes a delay uncertainty resulted when inserting the position report to the TTI of the uplink DCCH. The delay uncertainty is $2\times TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the position report is transmitted on the PUSCH with subframe or slot or subslot duration. This position reporting delay excludes any delay caused by no UL resources for UE to send the report and is specified as:

$$T_{position_reporting_delay} = T_{measurement_delay} + T_{inference_delay}$$

Measurement delay, $T_{measurement_delay}$, for PRS measurement within measurement gap is defined in Clause 9.9E.5. Measurement delay, $T_{measurement_delay}$, for PRS measurement outside of measurement gap and within PPW is defined in Clause 9.9E.6. Measurement delay, $T_{measurement_delay}$, for PRS measurement by aggregating resources from multiple PFLs within measurement gap is defined in Clause 9.9E.7. Inference delay, $T_{inference_delay}$, is the sum of inference delays across the number of configured PFLs where inference delay per PFL is reported by UE for FG 59-3 and indicated to LMF. For bandwidth aggregation, the inference delay $T_{inference_delay}$ is the sum of inference delays across all effective PFLs where the UE performs aggregated measurements, with inference delay per effective PFL is equal to each per-PFL inference delay reported by the UE for FG 59-3 and indicated to the LMF.

The measurement delay requirements in Clauses 9.9E.5, 9.9E.6, and 9.9E.7 apply for periodic and triggered UE location reporting.

### 9.9E.2 General Aspects Relating to Gap-based Measurement

The requirements for gap-based measurement specified in Clauses 9.9E.5, and 9.9E.7 apply provided:

- the UE is configured or pre-configured with measurement gaps or configured with concurrent measurement gaps
    - all PFLs are measured or associated with only one per-UE measurement gap, or
    - for the UE supporting *independentGapConfigPRS-r17*, all PFLs in the same FR are measured or associated with only one per-FR measurement gap in the corresponding FR.
- if the measurement gap is pre-configured, the gap must be activated throughout the measurement period, and
- if concurrent measurement gaps are configured, one of the gap combinations specified in clause 9.1.8.2 is configured, and
- if the UE does not support *independentGapConfigPRS-r17*, the configured or pre-configured gap used to perform the PRS measurements must be of per-UE type, and
- No active BWP switching occurs during the measurement gaps for PRS measurement.

The requirements specified in Clauses 9.9E.5, and 9.9E.7 shall apply without DRX as well as for any DRX configuration specified in TS 38.331 [2].

UE is only required to measure PRS resources that are fully or particaly overlapped with measurement gaps. A PRS resources is considered to be fully (partially) overlapped with measurement gap if all (some) of its instances are overlapped with a measurement gap occasion.

If a positioning measurement gap is configured via *PosGapConfig* and activated by MAC CE, the requirements in Clauses 9.9E.5, and 9.9E.7 apply provided that no other measurement gaps are configured, and only one measurement gap configured via *PosGapConfig* is activated.

When UE supports *musim-GapPreference-r17* and if the configured aperiodic MUSIM gap collides with the measurement gap associated with PRS measurement, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer measurement period for the PRS measurement is expected than the requirements as defined in Clauses 9.9E.5, and 9.9E.7.

## 9.9E.3 General Aspects Relating to Gapless Measurement

The requirements for gapless measurement specified in Clauses 9.9E.6 apply provided:

- PFL to be measured is within an active BWP,
- UE is configured with PPW, and the PPW for the active BWP containing the PFL to be measured is activated,
- No active BWP switching occurs during the measurement period specified in Clauses 9.9E.6,
- PRS is within PPW and does not overlap with other signals/channels of higher priority,
    - for PPW type 1A/1B, the PPW does not overlap with any symbol for SSB-based RLM/BFD/CBD/L1-RSRP/L1-SINR measurement on any CC or for SSB based RRM measurement on any MOs that are measured outside measurement gaps,
    - for PPW type 2, PRS does not overlap with any symbol for SSB-based RLM/BFD/CBD/L1-RSRP/L1-SINR measurement on any CC or for SSB based RRM measurement on any MOs that are measured outside measurement gaps,
- $\max|\Delta T| \leq THR$, where
    - $\Delta T$ is the time difference between the start of a slot containing PRS from the neighbor cell/TRP and the start of the closest slot from the serving cell;
    - the range of $\Delta T$ is determined by the expected RSTD and expected RSTD uncertainty in the assistance data;
    - THR is the threshold as reported in UE capability *prs-MeasurementWithoutMG-r17*.

- SCS of PRS within PPW and SCS of DL active BWP are the same.

Measurement delay requirement specified in Clause 9.9E.6 shall apply without DRX as well as for any DRX configuration specified in TS 38.331 [2].

The UE is not required to perform additional SSB measurement for the SSB configured as QCL source of PRS resources.

The UE is only required to measure PRS resources that are unmuted and fully or partially overlap with PPW.

A PRS resource is considered to be fully (partially) overlapped with PPW if all (some) of its instances overlap with a PPW occasion.

When UE supports *MUSIM-GapConfig-17* and the PPW occasion of the target PFL is overlapping with the configured aperiodic MUSIM gap, longer period for the PRS measurement is expected than the requirements as defined in Clauses 9.9E.6.

## 9.9E.4 Scheduling Availability Relating to Gapless Measurement

Scheduling availability specified in Clause 9.9.1.3 for gapless NR positioning measurements apply to UE performing gapless measurement for UE based DL AI/ML positioning.

## 9.9E.5 Measurement Delay Requirement with Measurement Gaps

When physical layer receives last of *NR-DL-AIML-ProvideAssistanceData* message and *NR-DL-AIML-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure PRS resources within the measurement period $T_{measurement_delay}$ to produce inputs for its AI/ML model to infer its location for reporting. The measurement delay when UE performs PRS measurement within the measurement gap is defined as:

$$T_{measurement_delay} = \sum_{i=1}^{L} T_{measure,i} + (L-1) * \max\left(T_{effect,i}\right),$$

where

- i is the index of PFL,
- L is total number of PFLs,
- $T_{effect,i}$ is the periodicity of the PRS measurement in PFL i
- $T_{measure,i}$ is the PRS measurement period for PFL i as specified below:

$$T_{measure,i} = \left(k_{multiTEG,i} \times CSSF_{PRS,i} \times \text{ceil}(K_{p,PRS,i}) \times N_{RxBeam,i} * \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil \times N_{sample} - 1 \right) \times T_{effect,i} + T_{last,i},$$

where

- $k_{multiTEG,i}$ is the scaling factor for PRS measurement with multiple Rx TEGs.
    - $k_{multiTEG,i} = N_{TEG,i}$, where $N_{TEG,i}$ is the number of Rx TEGs configured by LMF for PRS measurement depending on the UE capability regarding the number of UE-RxTEG(s) that is supported by UE reported for FG 59-6.
- $CSSF_{PRS,i}$ is the carrier-specific scaling factor for PRS measurements in PFL i as defined in clause 9.1.5.2.
- $K_{p,PRS,i}$ is a scaling factor for a PFL to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS,i} = N_{total}/N_{available}$ for UE configured with concurrent measurement gap or MUSIM gap or both

concurrent measurement gap and MUSIM gap. $K_{p,PRS,i}$ = 1 for UE not configured with concurrent measurement gap and not configured with MUSIM gaps.

- For a window W of duration max($T_{PRS,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gap and per-FR measurement gap within the same FR as the PFL and periodic MUSIM gaps, and starting at the beginning of any associated gap occasions covering the PRS occasion:
  - $N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
  - $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for measurement gap and MUSIM gaps collisions by applying the selected gap collision rule
- Requirements do not apply if $N_{available}$ = 0.

- $N_{RxBeam,i}$ = 1 in FR1. $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-AIML-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

- $N_{sample}$ = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- $N_{sample}$ = 4 otherwise.

- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in PFL i configured in a slot.

- $L_{available_PRS,i}$ is the time duration of available PRS in the PFL i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$, only the PRS resources unmuted and fully or partially overlapped with measurement gap are considered.

- $T_{last,i}$ is the measurement duration for the last PRS measurement sample in PFL i, including the sampling time and processing time. If all of the PRS resources to be measured are available in the same measurement gap occasion during $T_{availabe}$, $T_{last,i} = T_i$ +MGL. Otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$ ,

- $T_{effect,i}$ is the periodicity of the PRS measurement in PFL i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil \times T_{available_PRS,i},$$

where

- $T_i$ corresponds to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34],

- $T_{available_PRS,i} = LCM(T_{PRS,i}, MGRP_i)$, the least common multiple between $T_{PRS,i}$ and $MGRP_i$.
- $MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the PRS frequency layer i.
- $T_{PRS,i}$ is the periodicity of DL PRS resource with muting on PFL i.
- If more than one PRS periodicities are configured in PFL i, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the PFL is used to derive $T_{PRS,i}$, where
  - $T_{per}^{PRS\ with\ muting} = N_{muting} \times T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource.
  - $T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.
  - $N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} \times L_{muting}$.
    - $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$ which is given by the higher-layer parameter *NR-MutingPattern-r16* included in *DL-PRS-MutingOption1-r16*.
  - For the purpose of calculating $T_{PRS,i}$, only the PRS resources fully or partially covered by the measurement gap are considered.
- $\{N, T\}$ is UE capability combination per band where N is a duration of DL PRS symbols in ms corresponding to *durationOfPRS-ProcessingSysmbols* in TS 37.355 [34] processed every T corresponding to *durationOfPRS-ProcessingSymbolsInEveryTms* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *supportedBandwidthPRS* in TS 37.355 [34].
- $N'$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [34].

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{meaurement_delay}$ starts from the first measurement gap instance aligned with a DL PRS resource(s) in the assistance data after both the *NR-DL-AIML-ProvideAssistanceData* message and *NR-DL-AIML-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34].

For deferred MT-LR with other event than "*Periodic Location*" as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{measurement_delay}$ starts from the first measurement gap instance aligned with a DL PRS resource(s) in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event "*Periodic Location*" as defined in clause 4.1a.5.1 TS 23.273 [44], the UE shall perform the PRS measurement in each reporting period and activate the position report at the time when the periodic timer expires.

## 9.9E.6 Measurement Delay Requirement without Measurement Gaps

When physical layer receives last of *NR-DL-AIML-ProvideAssistanceData* message and *NR-DL-AIML-RequestLocationInformation* message from LMF via LPP [34], the UE shall be able to measure PRS resources within the measurement period $T_{measurement_delay}$ to produce inputs for its AI/ML model to infer its location for reporting. The measurement delay when UE performs PRS measurement outside of the measurement gap and within PPW is defined as:

$T_{measurement_delay} = \sum_{i=1}^{L} T_{measurement_delay_wo_gap,i} + (L-1) * \max(T_{effect,i})$, if any of the PFLs are in Case 1, or

$T_{measurement_delay} = \max(T_{measurement_delay_wo_gap,i} + T_{uncertainty,i})$, if all the PFLs are in Case 2,

where,

- i is the index of PFL,

- L is total number of PFLs,
- $T_{effect,i}$ is the periodicity of the PRS measurement in PFL i, and
- $T_{uncertainty,i}$ is the time from the start of the first PPW occasion for PFL i to the start of measurement period $T_{measurement_delay}$.

A PFL is in Case 1 if UE reports *ppw-durationOfPRS-Processing1-r17* for the band containing the PFL, and a PFL is in Case 2 if UE reports *ppw-durationOfPRS-Processing2-r17* for the band containing the PFL.

$T_{measurement_delay_wo_gap,i}$ is the measurement period for PRS measurement in PFL *i* as specified below.

$$T_{measurement_delay_wo_gap,i} = \left(k_{multiTEG,i} \times N_{RxBeam,i} \times \left\lceil \frac{N_{PRS,i}^{slot}}{N'} \right\rceil \left\lceil \frac{L_{available_PRS,i}}{N} \right\rceil \times N_{sample} - 1\right) \times T_{effect,i} + T_{last,i},$$

where:

- $k_{multiTEG,i}$ is the scaling factor for PRS measurement with multiple Rx TEGs.
  - $k_{multiTEG,i} = N_{TEG,i}$, where $N_{TEG,i}$ is the number of Rx TEGs configured by LMF for PRS measurement depending on the UE capability regarding the number of UE-RxTEG(s) that is supported by UE reported for FG 59-6.
- $N_{RxBeam,i}$ = 1 in FR1. $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-AIML-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.
- $N_{PRS,i}^{slot}$ is the maximum number of DL PRS resources in PFL i configured in a slot.
- $L_{available_PRS,i}$ is the time duration of available PRS in the PFL i to be measured during $T_{available_PRS,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS,i}$,
  - only the PRS resources unmuted and fully or partially overlapped with PPW are considered, if PFL i is in Case 1, or
  - only the PRS resources unmuted and fully or partially overlapped with the first (PPWL-T2) ms of PPW are considered, if PFL i is in Case 2, where PPWL is the PPW length and T2 corresponds to *ppw-durationOfPRS-ProcessingSymbolsT2*.

- $N_{sample}$ = 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- $N_{sample}$ = 4 otherwise.

- $T_{last,i}$ is the measurement duration for the last PRS measurement sample in PFL i, including the sampling time and processing time.

- If PFL *i* is in Case 1 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i} = T_i$ +PPWL, else
- if PFL *i* is in Case 2 and all of the PRS resources to be measured are available in the same PPW occasion during $T_{available}$, then $T_{last,i}$ = PPWL;
- otherwise, $T_{last,i} = T_i + T_{available_PRS,i}$.

- $T_{effect,i}$ is the periodicity of the PRS measurement in PFL i defined as:

$$T_{effect,i} = \left\lceil \frac{T_i}{T_{available_PRS,i}} \right\rceil \times T_{available_PRS,i}$$

Where,

- $T_i$ corresponds to *ppw-durationOfPRS-ProcessingSymbolsT* in TS 37.355 [34] if PFL *i* is in Case 1 or corresponds to the sum of *ppw-durationOfPRS-ProcessingSymbolsT2* and *ppw*-durationOfPRS-*ProcessingSymbolsN2* in TS 37.355 [34] if PFL *i* is in Case 2,
- $T_{available_PRS,i} = LCM(T_{PRS,i}, PPWRP_i)$, the least common multiple between $T_{PRS,i}$ and $PPWRP_i$.
- $PPWRP_i$ is the repetition periodicity of the PRS processing window applicable for measurements in the PFL *i*.
- $T_{PRS,i}$ is the periodicity of DL PRS resource with muting on PFL *i*.

If more than one PRS periodicities are configured in PFL *i*, the least common multiple of PRS periodicities $T_{per}^{PRS\ with\ muting}$ among all DL PRS resource sets in the PFL is used to derive $T_{PRS,i}$, where,

- $T_{per}^{\text{PRS with muting}} = N_{muting} \times T_{per}^{PRS}$, is the PRS periodicity with muting per PRS resource,
- $T_{per}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*,
- $N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS} \times L_{muting}$, where $T_{muting}^{PRS}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

NOTE: For the purpose of calculating $T_{PRS,i}$, only the PRS resources that meet the conditions for PRS measurement outside measurement gaps as defined in clause 9.9E.2 are considered.

N is a duration of DL PRS symbols in ms corresponding to *ppw-durationOfPRS-ProcessingSymbolsN* in TS 37.355 [34] if PFL *i* is in Case 1 or corresponding to *ppw-durationOfPRS-ProcessingSymbolsN2* in TS 37.355 [34] if PFL *i* is in Case 2.

$N'$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *ppw-maxNumOfDL-PRS-ResProcessedPerSlot* specified in TS 37.355 [34].

The time $T_{measurement_delay_wo_gap,i}$ starts from the first instance of the activated PPW for measurement of PFL *i* aligned with a DL PRS resource(s) in the assistance data after both the *NR-DL-AIML-ProvideAssistanceData* message and *NR-DL-AIML-RequestLocationInformation*message are delivered from LMF to the physical layer of UE via LPP [34].

If during the measurement period of one or more PFLs, the PPW is re-configured or reactivated, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{measurement_delay_wo_gap,i}$ within PPW due to collisions with other signals; otherwise, the measurement period can be longer.

The measurement requirements do not apply for a PRS resource, if the PRS resource is across two sampling duration of N within duration $L_{available_PRS,i}$.

The measurement requirements do not apply for a PRS resource, if time span of the PRS resource instance (including at least the minimum number of repetitions specified in the accuracy requirements) is greater than UE reported capability N.

The requirements in Clause 9.9E.6 do not apply if the PRS configuration given by higher layer paramters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AIML-ProvideCapabilities.*

If any PFL is in Case 2, the requirements in this clause apply provided that the PPWL corresponding to the PFL is larger than (T2+X) ms.

## 9.9E.7 Measurement Delay Requirement with Bandwidth Aggregation

When UE physical layer receives last of *NR-DL-AIML-ProvideAssistanceData* message, *NR-DL-AIML-RequestLocationInformation* message from LMF via LPP [34] with an indication of PRS resources in multiple PFLs that can be aggregated in *nr-DL-PRS-AggregationInfo*, the UE shall be able to measure PRS resources within the measurement period $T_{measurement_delay}$ to produce inputs for its AI/ML model to infer its location for reporting. The measurement delay when UE performs PRS measurement by aggregating PRS resources in multiple PFLs within the measurement gap is defined as:

$$T_{measurement_delay} = T_{measurement_delay_without_aggregation} + T_{measurement_delay_with_aggregation} + T_{margin},$$

where,

- $T_{measurement_delay_without_aggregation}$ is the total measurement period for PRS resources on PFLs that do not contain PRS resources for aggregation.
    - Calculation of $T_{measurement_delay_without_aggregation}$ is based on Clause 9.9E.5 with the following exceptions,
        - only PFLs containing resource set(s) not linked to any other resource set(s) are considered in L
        - on each PFL i, only resource set(s) not linked to any other resource set(s) are considered in $T_{available_PRS,i}$, $N_{PRS,i}^{slot}$ and $L_{available_PRS,i}$
        - $(L-1)*\max(T_{effect,i})$ is replace by $(L-1)*T'_{margin}$.
- $T_{measurement_delay_without_aggregation}$ is equal to zero if UE is not provisioned with information on PRS resources that can be aggregated for measurement by the LMF.
- If UE performs measurements on PFLs that contain PRS resources for aggregation and on PFLs that do not contain PRS resources for aggregation, $T_{margin}= T'_{margin}$ is delay margin to account for delay between PRS measurement performed by UE on PFLs that contain PRS resources for aggregation and PRS measurement performed by UE on PFLs that do not contain PRS resources for aggregation.
- If UE performs measurements on PFLs that contain PRS resources for aggregation or if UE performs measurements on PFLs that do not contain PRS resources for aggregation, then $T_{margin} = 0$.
- $T'_{margin} = \max(Teffect, i)$, when both aggregated PFLs and non-aggregated PFLs are measured by UE.

$T_{measurement_delay_with_aggregation}$, is the measurement period for PRS measurements performed by UE by aggregating PRS resources from multiple PFLs and is defined as:

$$T_{measurement_delay_with_aggregation} = \sum_{i=1}^{G} T_{PRS_aggregate,i} + (G-1)*T'_{margin},$$

where

- i is the index of effective PFL, corresponding to the group of PFLs containing linked PRS resource sets that can be aggregated,

- G denotes the number of effective PFLs to perform aggregated measurements on. G is provisioned to UE by LMF in *nr-DL-PRS-AggregationInfo.*

- $T_{PRS_aggregate,i}$ is the measurement period for PRS measurement in the effective PFL *i* as specified below:

$$T_{PRS_aggregate,i} = \left(k_{multiTEG_agg,i} \times CSSF_{PRS_agg,i} \times ceil(K_{p,PRS_agg,i}) \times N_{RxBeam,i} \times \left\lceil \frac{N_{PRS_agg,i}^{slot}}{N'_{agg}} \right\rceil \left\lceil \frac{L_{available_PRS_agg,i}}{N_{agg}} \right\rceil \times N_{sample} - 1\right) \times T_{effect_agg,i} + T_{last_agg,i},$$

where

- $k_{multiTEG_agg,i}$ is the scaling factor for PRS measurement with multiple Rx TEGs.

  - $k_{multiTEG_agg,i} = N_{TEG,i}$, where $N_{TEG,i}$ is the number of Rx TEGs configured by LMF for PRS measurement depending on the UE capability regarding the number of UE-RxTEG(s) that is supported by UE reported for FG 59-6.

- $CSSF_{PRS_agg,i}$ is the carrier-specific scaling factor for NR PRS-based positioning measurements in effective PFL i as defined in clause 9.1.5.2.

- $K_{p,PRS_agg,i}$ is a scaling factor for effective PFL i to be measured within the associated measurement gap pattern, which is defined as $K_{p,PRS_agg,i} = N_{total} / N_{available}$ for UE configured with concurrent measurement gap, and $K_{p,PRS_agg,i} = 1$ for UE not configured with concurrent measurement gap.

  - For a window W of duration max($T_{PRS_agg,i}$, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE measurement gap and per-FR measurement gap within the same FR as the effective PFL, and starting at the beginning of any associated gap occasions covering the PRS occasion:

    - $N_{total}$ is the total number of associated gap occasions covering PRS occasions within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and

    - $N_{available}$ is the number of non-dropped associated gap occasions covering PRS occasions within the window W, after further accounting for measurement gap collisions by applying the selected gap collision rule

    - Requirements do not apply if $N_{available} = 0$.

- $N_{RxBeam,i} = 1$ in FR1. $N_{RxBeam,i}$ is equal to the value reported by the UE in *supportedLowerRxBeamSweepingFactor-FR2* if the UE supports the capability for the band containing positioning frequency layer i, and the LMF indicates *lowerRxBeamSweepingFactor-FR2* in *NR-DL-AIML-RequestLocationInformation*. $N_{RxBeam,i}$ is equal to 8, otherwise.

- $N_{PRS_agg,i}^{slot}$ is the maximum number of DL PRS resources in effective PFL i configured in a slot.

- $L_{available_PRS_agg,i}$ is the time duration of available PRS in the effective PFL i to be measured during $T_{available_PRS_agg,i}$, and is calculated in the same way as PRS duration K defined in clause 5.1.6.5 of TS 38.214 [26]. For calculation of $L_{available_PRS_agg,i}$, only the PRS resources unmuted and fully or partially overlapped with measurement gap and satisfying the conditions for PRS BW aggregation are considered.

- $N_{sample}$= 1 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and meets the following conditions:

  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- $N_{sample}$ = 2 if the UE supports *supportedDL-PRS-ProcessingSamples-RRC-CONNECTED* [34], and the LMF requests the UE to perform positioning measurements with reduced number of samples, and does not meet the following conditions:
  - PRS bandwidth is within the active BWP and
  - Magnitude of difference between the serving cell's SS-RSRP and the neighbor cell's PRS-RSRP is within 6 dB.

- $N_{sample}$ = 4 otherwise.

$T_{last_agg,i}$ is the measurement duration for the last PRS measurement sample in the effective PFL i, including the sampling time and processing time. If all of the PRS resources to be measured are available in the same measurement gap occasion during $T_{availabe_agg}$, $T_{last_agg,i} = T_{agg,i}$ + MGL. Otherwise, $T_{last_agg,i} = T_{agg,i} + T_{available_PRS_agg,i}$,

$T_{effect_agg,i}$ is the periodicity of the PRS measurement in the effective PFL i defined as:

$$T_{effect_agg,i} = \left\lceil \frac{T_{agg,i}}{T_{available_PRS_agg,i}} \right\rceil \times T_{available_PRS_agg,i}$$

where

- $T_{available_PRS_agg,i} = LCM(T_{PRS_agg,i}, MGRP_i)$, the least common multiple between $T_{PRS_agg,i}$ and $MGRP_i$. $MGRP_i$ is the repetition periodicity of the measurement gap applicable for measurement in the effective PFL i.

- $T_{PRS_agg,i}$ is the periodicity of DL PRS resources meeting the bandwidth aggregation conditions with muting on effective PFL i. If more than one PRS periodicities are configured in effective PFL i, the least common multiple of PRS periodicities $T_{per_agg}^{PRS\ with\ muting}$ among all DL PRS resource sets in the effective PFL is used to derive $T_{PRS_agg,i}$, where,

- $T_{per_agg}^{PRS\ with\ muting} = N_{muting} \times T_{per_agg}^{PRS}$, is the PRS periodicity with muting per PRS resource configured for aggregation,

- $T_{per_agg}^{PRS}$ is the periodicity of PRS resource sets given by the higher-layer parameter *DL-PRS-Periodicity*.

- $N_{muting}$ is the scaling factor considering PRS resource muting. $N_{muting} = T_{muting}^{PRS_agg} \times L_{muting}$, where $T_{muting}^{PRS_agg}$ is the muting repetition factor given by the higher-layer parameter *DL-PRS-MutingBitRepetitionFactor*, and $L_{muting}$ is the size of the bitmap $\{b^1\}$.

Note: For the purpose of calculating $T_{PRS_agg,i}$, only the PRS resources fully or partially covered by the measurement gap and PRS resources that satisfy the conditions for PRS BW aggregation are considered.

$\{N_{agg}, T_{agg,i}\}$ is UE capability combination per band to aggregate PRS resources from multiple PFLs within an effective PFL where $N_{agg}$ is a duration of DL PRS symbols in ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsN-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsN-r18* in TS 37.355 [34] processed every $T_{agg,i}$ ms corresponding to *prs-durationOfTwoPRS-BWA-ProcessingSymbolsT-r18* or *prs-durationOfThreePRS-BWA-ProcessingSymbolsT* in TS 37.355 [34] for a given maximum bandwidth supported by UE corresponding to *maximumOfTwoAggregatedDL-PRS-Bandwidth* or *maximumOfThreeAggregatedDL-PRS-Bandwidth* in TS 37.355 [34].

$N'_{agg}$ is UE capability for number of DL PRS resources that it can process in a slot as indicated by *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR1-r18* for FR1 and *maxNumOfAggregatedDL-PRS-ResourcePerSlot-FR2-r18* for FR2 specified in TS 37.355 [34].

The requirements in this clause for aggregated measurements apply provided that the linked PRS resource sets on multiple PFLs for aggregated measurements satisfy all the conditions specified in clause 5.1.6.5.3 in TS 38.214 [26].

Except for deferred MT-LR as defined in clause 4.1a.5 TS 23.273 [44], the time $T_{measurement_delay}$ starts from the first measurement gap instance aligned with DL PRS resources in the assistance data for aggregation after both the *NR-DL-AIML-ProvideAssistanceData* message and *NR-DL-AIML-RequestLocationInformation* message are delivered from LMF to the physical layer of UE via LPP [34] including a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequestedPFL-List*.

For deferred MT-LR with other event than "*Periodic Location*" as defined in clause 4.1a.5.1 TS 23.273 [44], the time $T_{measurement_delay}$ starts from the first measurement gap instance aligned with DL PRS resources in the assistance data after the associated event(s) occurs.

For deferred MT-LR with event "*Periodic Location*" as defined in clause 4.1a.5.1 TS 23.27] [44], the UE shall perform the aggregated PRS measurement in each reporting period and activate the location report at the time when the periodic timer expires.

If during the measurement period of one or more effective PFLs, the measurement gap pattern is reconfigured, the measurement period can be longer.

The measurement requirements in this clause apply, provided no PRS symbols are dropped during the measurement period $T_{measurement_delay}$ within measurement gaps due to collisions with other signals; otherwise, the measurement period can be longer.

If CSSF changes during the measurement period, the measurement period could be longer.

The requirements in this Clause 9.9E.7 do not apply if the PRS configuration given by higher layer parameters *NR-DL-PRS-AssistanceData* exceeds any of the UE measurement capabilities given by *NR-DL-PRS-ResourcesCapability* in *NR-DL-AIML-ProvideCapabilities*.

# 9.10 CSI-RS based L3 measurements

## 9.10.1 Introduction

This clause contains general requirements on the UE regarding CSI-RS based measurement reporting in RRC_CONNECTED state. The requirements are split in intra-frequency and inter-frequency measurements requirements.

The requirements in this clause apply, provided:

- Only one MO is configured per CSI-RS frequency layer, and
- all CSI-RS resources in the same MO are configured with the same *csi-rs-MeasurementBW*, and
- *associatedSSB* is configured in *CSI-RS-Resource-Mobility* and detectable, and
- all CSI-RS resources in the same MO are configured with the same periodicity, and
- the associated SSB is QCLed with the corresponding CSI-RS resources in FR2, and
- the number of CSI-RS resources in any duration that equals to the length of a slot is no larger than UE capability *maxNumberCSI-RS-RRM-RS-SINR*.
- When there are mixed numerologies, the length of a slot is defined based on the smallest SCS
- For a UE capable of supporting *sbfd-Aware-r19*,
    - Measurement requirements are applicable provided that all CSI-RS resources configured for measurement are available in one DL subband of SBFD symbols and/or on non-SBFD DL symbols of the cell transmitting the CSI-RS.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.10.2 CSI-RS based intra-frequency measurements

### 9.10.2.1 Introduction

A measurement is defined as a CSI-RS based intra-frequency measurement provided that:

- the SCS of the CSI-RS resource of the neighbour cell configured for measurement is the same as the SCS of the CSI-RS resource on the serving cell indicated for measurement, and
- the CP type of the CSI-RS resource of neighbour cell configured for measurement is the same as the CP type of the CSI-RS resource of the serving cell indicated for measurement, and
  - It is applied for SCS = 60KHz
- the centre frequency of the CSI-RS resource of the neighbour cell configured for measurement is the same as the centre frequency of the CSI-RS resource of the serving cell indicated for measurement

The UE shall be able to identify new intra-frequency cells and perform CSI-RSRP, CSI-RSRQ and CSI-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell or the PSCell.

No measurement gap is needed for intra-frequency CSI-RS resources measurements.

For intra-frequency CSI-RS based measurements, UE may cause scheduling restriction as specified in clause 9.10.2.6.

Note: Extended CP for CSI-RS based measurement is not supported in this release.

### 9.10.2.2 Requirements applicability

The measurement of the associated SSB follows the same requirements as SSB based measurements defined in clause 9.2.

The requirements in clause 9.10.2 apply, provided:

- Only one intra-frequency CSI-RS layer per serving cell is configured, and
- The BW of the CSI-RS on the intra-frequency neighbor cell is within the active BWP of the UE, and
- The associated SSB of the CSI-RS resources being identified or measured are detectable, and the CSI-RS resources configured for CSI-RS based L3 measurements are measurable, and
- The bandwidth of CSI-RS resources of intra-MO is the same as that of the CSI-RS resources configured for the serving cell, and
- All CSI-RS resources on one intra-frequency layer are configured within up to two separate windows where each window is up to 5 ms, and
- for the case of single window further provided
  - The periodicity of the configured CSI-RS resources is 10 ms, 20 ms or 40 ms
- for the case of two separate windows further provided
  - The two windows are either both fully non-overlapped with MG or both partially overlapped with MG
    - The periodicity of the configured CSI-RS resources is 20 ms or 40 ms
  - The starting point of the first window is the slot boundary of the serving cell, where the corresponding slot contains the configured L3 CSI-RS resource of the serving cell in the servingCellMO with the smallest offset, and
  - The starting point of the second window if configured is determined by an offset of half of the CSI-RS periodicity in slots with regards to the starting point of the first window, and
- Numerology for intra-frequency CSI-RS and data of serving cell are the same.

An intra-frequency cell shall be considered detectable when for each relevant associated SSB:

- SS-RSRP related side conditions given in clauses 10.1.2.1 and 10.1.3.1 for FR1 and FR2, respectively, for a corresponding band,
- SS-RSRQ related side conditions given in clauses 10.1.7.1 and 10.1.8.1 for FR1 and FR2, respectively, for a corresponding band,
- SS-SINR related side conditions given in clauses 10.1.12.1 and 10.1.13.1 for FR1 and FR2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding band.

A CSI-RS resource shall be considered measurable when for each relevant CSI-RS resource:

- CSI-RSRP related side conditions given in clauses 10.1.2.3 and 10.1.3.3 for FR1 and FR2, respectively, for a corresponding band,
- CSI-RSRQ related side conditions given in clauses 10.1.7.2 and 10.1.8.2 for FR1 and FR2, respectively, for a corresponding band,
- CSI-SINR related side conditions given in clauses 10.1.12.2 and 10.1.13.2 for FR1 and FR2, respectively, for a corresponding band,
- CSI_RP and CSI-RS Ês/Iot according to Annex B.2.12 for a corresponding band.

### 9.10.2.3 Number of cells and number of CSI-RS

#### 9.10.2.3.1 Requirements for FR1

For each intra-frequency CSI-RS layer, during each layer 1 measurement period, the UE shall be capable of performing CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements for at least:

- 32 CSI-RSs with different CSI-RS index and/or PCI on the intra-frequency layer, and
- the cells to be monitored based on CSI-RS are the same set or a subset of the cells monitored based on the layer of the associated SSB

#### 9.10.2.3.2 Requirements for FR2

For one single intra-frequency CSI-RS layer in a band, during each layer 1 measurement period, the UE shall be capable of performing CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements for at least:

- 32 CSI-RSs with different CSI-RS index and/or PCI, and
- the cells to be monitored based on CSI-RS are the same set or a subset of the cells monitored based on the layer of the associated SSB.

where this single intra-frequency layer shall be:

- PCC on which UE is configured to report CSI-RS measurement when UE is configured with SA NR operation mode with PCC in the band; or
- PSCC on which UE is configured to report CSI-RS measurement when UE is configured with EN-DC with PSCC in the band; or
- One of the SCCs on which UE is configured to report CSI-RS based measurements when neither PCC nor PSCC is in the same band, so that the selected SCC shall be an SCC where the UE is configured with CSI-RSRP measurement reporting if such SCC exists, otherwise the selected SCC is determined by UE implementation.

The UE shall also be capable of performing CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements for at least 2 CSI-RSs on serving cell for each of the other intra-frequency layer(s) in the same band.

For each FR2 band, UE is only required to measure neighbour cell CSI-RS on the CSI-RS layer, whose associated SSB is on the same SSB layer as the one where UE is required to measure neighbour cell SSB.

### 9.10.2.4 Measurement Reporting Requirements

Note: The UE is not required to report CSI-RS based L3 measurements when the timing offset between the reference measurement timing and the target CSI-RS in one layer is larger than one CP. If the UE reports CSI-RS based L3 measurements when the timing offset exceeds one CP, the UE is not required to meet the CSI-RS based L3 measurement accuracy requirements for CSI-RSRP, CSI-RSRQ and CSI-SINR in TS 38.133 [2] clause 10.1, which apply only when the timing offset is no larger than one CP.

#### 9.10.2.4.1 Periodic Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2.3, 10.1.3.3, 10.1.7.2, 10.1.8.2, 10.1.12.2 and 10.1.13.2.

#### 9.10.2.4.2 Event-triggered Periodic Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.1.2.3, 10.1.3.3, 10.1.7.2, 10.1.8.2, 10.1.12.2 and 10.1.13.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.10.2.4.3.

#### 9.10.2.4.3 Event Triggered Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI- SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.2.3, 10.1.3.3, 10.1.7.2, 10.1.8.2, 10.1.12.2 and 10.1.13.2.

The UE shall not send any event triggered measurement reports as long as no reporting criterion is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than the CSI-RS based measurement defined in clause 9.10.2.5. When L3 filtering is used an additional delay can be expected.

### 9.10.2.5 Intra-frequency measurements without measurement gaps

If a UE is configured with the higher layer parameters *CSI-RS-Resource-Mobility* and *associatedSSB*, the CSI-RS based measurement shall include PSS/SSS detection time of associatedSSB, the time period used to acquire the SFN information and CSI-RS based measurement period without gap.

- PSS/SSS detection time of associatedSSB is the intra-frequency $T_{PSS/SSS_sync_intra}$ in clause 9.2.5.1.
- The time period used to acquire the SFN information is equal to 0 if the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise, the time period used to acquire the SFN information is $T_{CSI\text{-}RS_SFN_intra}$ as shown in table 9.10.2.5-3 for FR1. It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2.
- If the associatedSSB, which has been detectable at least for the time period $T_{identify_intra_with_index}$ defined in clause 9.2.5.1, becomes undetectable for a period $\leq$ 5 seconds and then the associatedSSB becomes detectable again with the same spatial reception parameter provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3], PSS/SSS detection time and time period used to acquire the SFN information are equal to 0.

The measurement period for CSI- RS based intra-frequency measurements without gaps is as shown in table 9.10.2.5-1and table 9.10.2.5-2.

Additionally, for a given CSI-RS resource, if the associated SS/PBCH block is configured but not detected by the UE, or if CSI-RS is configured with associated SSB but not QCL-ed to the associated SSB, the UE is not required to monitor the corresponding CSI-RS resource.

**Table 9.10.2.5-1: Measurement period for intra-frequency CSI-RS based measurements without gaps(FR1)**

| DRX cycle | $T_{CSI\text{-}RS_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_{p_CSI\text{-}RS}$) x CSI-RS period) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_{p_CSI\text{-}RS}$) x max(CSI-RS period, DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil( 5 x $K_{p_CSI\text{-}RS}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: The requirements apply assuming CSI-RS configuration with {D=3 with PRBs ≥ 48}. D is frequency domain density for the 1-port CSI-RS for L3 mobility defined in clause 7.4.1 of TS 38.211 [6]. | |

**Table 9.10.2.5-2: Measurement period for intra-frequency CSI-RS based measurements without gaps(FR2)**

| DRX cycle | $T_{CSI\text{-}RS_measurement_period_intra}$ |
|---|---|
| No DRX | max(400 ms, ceil($M_{meas_period_w/o_gaps}$ x $K_{p_CSI\text{-}RS}$) x CSI-RS period) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(400 ms, ceil(1.5x $M_{meas_period_w/o_gaps}$ x $K_{p_CSI\text{-}RS}$) x max(CSI-RS period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | $M_{meas_period_w/o_gaps}$ x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: The requirements apply assuming CSI-RS configuration with {D=3 with PRBs ≥ 48}. D is frequency domain density for the 1-port CSI-RS for L3 mobility defined in clause 7.4.1 of TS 38.211 [6]. | |

$M_{meas_period_w/o_gaps}$ : For a UE supporting power class 1, $M_{meas_period_w/o_gaps}$ =40. For a UE supporting FR2 power class 2, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting power class 3, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting power class 4, $M_{meas_period_w/o_gaps}$ =24.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1.5.

For a UE not supporting *concurrentMeasGap-r17* or for a UE is supporting *concurrentMeasGap-r17* but not configured with concurrent measurement gaps, and the UE does not support *musim-GapPreference-r17* or is supporting *musim-GapPreference-r17* but not configured with periodic MUSIM gaps,

- if the intra-frequency CSI-RS resource does not overlap with any measurement gaps, $K_{p_CSI\text{-}RS}$=1;
- if some occasions of the intra-frequency CSI-RS resource is overlapped with any measurement gaps, $K_{p_CSI\text{-}RS}$ = 1/(1- (CSI-RS resource period /MGRP)) , where CSI-RS resource period < MGRP, and the MGRP is the periodicity of the measurement gap.
- Otherwise, when UE supports concurrent measurement gaps or *musim-GapPreference-r17* or both concurrent measurement gaps and *musim-GapPreference-r17,* and concurrent measurement gaps or periodic MUSIM gaps or both concurrent gaps and periodic MUSIM gaps are configured, $K_{p_CSI\text{-}RS}$ is the scaling factor for a CSI-RS frequency layer to be measured outside gap which is defined as $K_{p_CSI\text{-}RS} = N_{total} / N_{available}$

  For a window W of duration max(CSI-RS period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE MG, periodic MUSIM gaps, and per-FR MG within the same FR as the CSI-RS frequency layer, and starting at the beginning of any gap occasions covering the CSI-RS resources:

  $N_{total}$ is the total number of CSI-RS resource occasions within the window, including those overlapped with other MG and MUSIM gap occasions within the window, and

  $N_{available}$ is the number of CSI-RS resource occasions that are not overlapped with any other non-dropped MG or non-dropped MUSIM gap occasions within the window W, after accounting for MG and MUSIM gap collisions by applying the collision rules for the measurement gap and MUSIM gap in clauses 9.1.8.3, 9.1.10.4 and 9.1.10.5, respectively.

  $K_{p_CSI\text{-}RS}$ = 1 when $N_{available}$ = 0

  Requirements in this clause do not apply when $N_{available}$ = 0 due to fully overlapping between CSI-RS occasions and MUSIM gap occasions within the window W.

When UE supports *musim-GapPreference-r17* and the CSI-RS occasions of the target frequency layer is overlapping with the configured aperiodic MUSIM gap, longer cell identification period for the target frequency layer is expected.

**Table 9.10.2.5-3: Time period for SFN acquisition for intra-frequency CSI-RS based measurements without gaps(FR1)**

| DRX cycle | $T_{CSI\text{-}RS_SFN_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil(5 x $K_{p_CSI\text{-}RS}$) x SMTC period)[Note 1] x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(2000 ms, ceil (1.5 x 5 x $K_{p_CSI\text{-}RS}$) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil(5 x $K_{p_CSI\text{-}RS}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified<br>NOTE 2: $K_{p_CSI\text{-}RS}$ is applicable for a UE supporting concurrent gaps and/or MUSIM gaps. | |

## 9.10.2.6 Scheduling availability of UE during CSI-RS based intra-frequency measurements

UE is required to be capable of measuring without measurement gaps when CSI-RS resources are completely contained in the active BWP of the UE. Note the configured CSI-RS symbol is indicated in *firstOFDMSymbolInTimeDomain* included in *CSI-RS-ResourceConfigMobility* for RRM. When UE is required to perform CSI-RS based RRM measurements, and any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note same numerology for intra-frequency CSI-RS and data of serving cell is considered in this release.

### 9.10.2.6.1 Scheduling availability of UE performing CSI-RS based measurements in TDD bands

When UE performs CSI-RS intra-frequency measurements in a TDD band,

- UE is not expected to transmit PUCCH/PUSCH/SRS on configured CSI-RS resource symbols, and on 1 OFDM symbol before and after each consecutively configured CSI-RS symbols.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) configured on the non-contiguous CC(s) in the same band. Ohterwise, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

For UE indicating *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

#### 9.10.2.6.2 Scheduling availability of UE performing CSI-RS based measurements in FR2

When the UE performs CSI-RS based intra-frequency measurements for L3 mobility management in FR2, the following restrictions apply.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on the configured CSI-RS symbol within the configured slot as indicated in *slotConfig* of the corresponding CSI-RS resource to be measured for mobility.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to CSI-RSRP, CSI-RSRQ or CSI-SINR measurement on an FR2 intra-frequency cell in different bands, provided that UE is capable of independent beam management on this FR2 band pair.

## 9.10.3 CSI-RS based Inter-frequency measurements

### 9.10.3.1 Introduction

A measurement is defined as a CSI-RS based inter-frequency measurement provided it is not defined as an intra-frequency measurement according to clause 9.10.2.

If a UE is configured with the higher layer parameter *CSI-RS-Resource-Mobility* and the higher layer parameter *associatedSSB* is configured, the UE shall be able to identify inter-frequency cells indicated for measurement and perform CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements of identified inter-frequency cells.

When measurement gaps are needed, the UE is not expected to detect the associated SSB nor perform measurement of the CSI-RS resource configured in *CSI-RS-Resource-Mobility* on an inter-frequency measurement object which start earlier than the gap starting time + switching time, and ends later than the gap end – switching time. When the inter-frequency cells are in FR2 and the per-FR gap is configured to the UE in EN-DC, SA NR, NE-DC and NR-DC, or the serving cells are in FR2, the inter-frequency cells are in FR2 and the per-UE gap is configured to the UE in SA NR and NR-DC, the switching time is 0.25 ms. Otherwise the switching time is 0.5 ms.

If a UE is configured with multiple concurrent gaps, the requirements in this clause shall apply when the measurement gap pattern is configured to be associated to the CSI-RS resources of the inter-frequency layer.

### 9.10.3.2 Requirements applicability

The associated SSB layer of the CSI-RS follows the same requirements as SSB based measurements defined in clause 9.3.

The requirements in clause 9.10.3 apply, provided:

- The associated SSB of the cell being identified or measured is detectable, and
- All CSI-RS resources on one inter-frequency layer are configured within a window of up to 5 ms, and
- The periodicity of the configured CSI-RS resources is 10 ms, 20 ms or 40 ms, and
- CSI-RS resources for measurements and the associated SSB for cell identification are configured within measurement gap.

An inter-frequency cell shall be considered detectable when for each relevant associated SSB:

- SS-RSRP related side conditions given in clauses 10.1.4.1 and 10.1.5.1 for FR1 and FR2, respectively, for a corresponding band,
- SS-RSRQ related side conditions given in clauses 10.1.9.1 and 10.1.10.1 for FR1 and FR2, respectively, for a corresponding band,
- SS-SINR related side conditions given in clauses 10.1.14.1 and 10.1.15.1 for FR1 and FR2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.3 for a corresponding band.

A CSI-RS resource shall be considered measurable when for each relevant CSI-RS resource:

- CSI-RSRP related side conditions given in clauses 10.1.4.3 and 10.1.5.3 for FR1 and FR2, respectively, for a corresponding band,
- CSI-RSRQ related side conditions given in clauses 10.1.9.2 and 10.1.10.2 for FR1 and FR2, respectively, for a corresponding band,
- CSI-SINR related side conditions given in clauses 10.1.14.2 and 10.1.15.2 for FR1 and FR2, respectively, for a corresponding band,
- CSI _RP and CSI-RS Ês/Iot according to Annex B.2.13 for a corresponding band.

### 9.10.3.3 Number of cells and number of CSI-RS resources

#### 9.10.3.3.1 Requirements for FR1

For each inter-frequency CSI-RS layer, during each layer 1 measurement period, the UE shall be capable of performing CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements for at least:

- 14 CSI-RSs with different CSI-RS index and/or PCI , and
- The cells to be monitored based on CSI-RS are the same set or a subset of the cells monitored based on the layer of the associated SSB.

#### 9.10.3.3.2 Requirements for FR2

For each inter-frequency CSI-RS layer, during each layer 1 measurement period, the UE shall be capable of performing CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements for at least:

- 24 CSI-RSs with different CSI-RS index and/or PCI, and
- The cells to be monitored based on CSI-RS are the same set or a subset of the cells monitored based on the layer the associated SSB.

### 9.10.3.4 Measurements reporting requirements

Note: The UE is not required to report CSI-RS based L3 measurements when the timing offset between the reference measurement timing and the target CSI-RS in one layer is larger than one CP. If the UE reports CSI-RS based L3 measurements when the timing offset exceeds one CP, the UE is not required to meet the CSI-RS based L3 measurement accuracy requirements for CSI-RSRP, CSI-RSRQ and CSI-SINR in TS 38.133 [2] clause 10.1, which apply only when the timing offset is no larger than one CP.

#### 9.10.3.4.1 Periodic Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.2, 10.1.5.2, 10.1.9.2, 10.1.10.2, 10.1.14.2 and 10.1.15.2.

#### 9.10.3.4.2 Event-triggered Periodic Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.2, 10.1.5.2, 10.1.9.2, 10.1.10.2, 10.1.14.2 and 10.1.15.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.10.3.4.3.

#### 9.10.3.4.3 Event-triggered Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.2, 10.1.5.2, 10.1.9.2, 10.1.10.2, 10.1.14.2 and 10.1.15.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within CSI-RS based measurement defined in clause 9.10.3.5. When L3 filtering is used an additional delay can be expected.

### 9.10.3.5 Inter-frequency measurements with measurement gaps

When measurement gaps are provided, if configured with the higher layer parameters *CSI-RS-Resource-Mobility* and *associatedSSB*, the UE shall be able to identify a new detectable CSI-RS based inter-frequency cell within $T_{CSI-RS_identify_inter}$,

$$T_{CSI-RS_identify_inter} = (T_{PSS/SSS_sync} + T_{CSI-RS_measurement_period_inter} + T_{CSI-RS_SFN_inter})\ ms$$

Where:

$T_{PSS/SSS_sync}$ is the time period used in PSS/SSS detection which is determined according to $T_{PSS/SSS_sync_inter}$ in clause 9.3.4,

$T_{CSI-RS_SFN_inter}$ is the time period used to acquire the SFN information of the cell being measured, which is shown in table 9.10.3.5-3 for FR1 and equals inter-frequency $T_{SSB_time_index_inter}$ in clause 9.3.4 for FR2,

$T_{CSI-RS_measurement_period_inter}$: equal to a measurement period of CSI-RS based measurement given in table 9.10.3.5-1 and table 9.10.3.5-2.

$M_{meas_period_inter}$: For a UE supporting FR2 power class 1 or 5, $M_{meas_period_inter}$ =8×N samples. For a UE supporting FR2 power class 2, $M_{meas_period_inter}$=5×N samples. For a UE supporting FR2 power class 3, $M_{meas_period_inter}$ =5×N samples. For a UE supporting FR2 power class 4, $M_{meas_period_inter}$ = 5×N samples. Note that scaling factor N = [8].

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5 for measurement conducted within measurement gaps.

When UE supports concurrent measurement gaps or *musim-GapPreference-r17* or both concurrent measurement gap and *musim-GapPreference-r17*, and concurrent measurement gaps or periodic MUSIM gaps or both concurrent gaps and periodic MUSIM gaps are configured, $K_{p_CSI-RS}$ is the scaling factor for a CSI-RS frequency layer to be measured within the associated measurement gap which is defined as $K_{p_CSI-RS} = N_{total} / N_{available}$. $K_{p_CSI-RS}$ = 1 for UE not configured with concurrent measurement gaps and MUSIM gaps.

- For a window W of duration max(CSI-RS period, MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE MG, periodic MUSIM gaps, and per-FR MG within the same FR as the CSI-RS frequency layer, and starting at the beginning of any gap occasions covering the CSI-RS resources.
  - $N_{total}$ is the total number of associated gap occasions covering CSI-RS resources within the window, including those overlapped with other measurement gap and MUSIM gap instances within the window, and
  - $N_{available}$ is the number of non-dropped associated gap occasions covering CSI-RS resources within the window W, after accounting for MG and MUSIM gap collisions by applying the collision rules for the measurement gap and MUSIM gap in clause 9.1.8.3 and 9.1.10.5, respectively.

- Requirements do not apply if $N_{available} = 0$

When UE supports *musim-GapPreference-r17* and if the configured aperiodic MUSIM gap collides with the measurement gap associated with the target frequency layer, where MUSIM gap collision rule in clause 9.1.10.4 is applied, longer cell identification period for the target inter-frequency is expected.

Additionally, for a given CSI-RS resource, if the associated SSB is configured but not detected by the UE, or if CSI-RS configured with associated SSB but not QCL-ed to the associated SSB, the UE is not required to monitor the corresponding CSI-RS resource.

**Table 9.10.3.5-1: Measurement period for CSI-RS based inter-frequency measurements with gaps (FR1)**

| Condition NOTE1,2 | $T_{CSI\text{-}RS_measurement_period_inter}$ |

# 9.10D CSI-RS based L3 measurements for ATG

## 9.10D.1 Introduction

This clause contains general requirements on the ATG UE regarding CSI-RS based measurement reporting in RRC_CONNECTED state. The requirements are split in intra-frequency and inter-frequency measurements requirements.

The requirements in this clause apply, provided:

- Only one MO is configured per CSI-RS frequency layer, and
- all CSI-RS resources in the same MO are configured with the same csi-rs-MeasurementBW, and
- *associatedSSB* is configured in *CSI-RS-Resource-Mobility* and detectable, and
- all CSI-RS resources in the same MO are configured with the same periodicity, and
- the number of CSI-RS resources in any duration that equals to the length of a slot is no larger than UE capability *maxNumberCSI-RS-RRM-RS-SINR*.
- When there are mixed numerologies, the length of a slot is defined based on the smallest SCS

## 9.10D.2 CSI-RS based intra-frequency measurements

### 9.10D.2.1 Introduction

A measurement is defined as a CSI-RS based intra-frequency measurement provided that:

- the SCS of the CSI-RS resource of the neighbour cell configured for measurement is the same as the SCS of the CSI-RS resource on the serving cell indicated for measurement, and
- the CP type of the CSI-RS resource of neighbour cell configured for measurement is the same as the CP type of the CSI-RS resource of the serving cell indicated for measurement, and
  - It is applied for SCS = 60KHz
- the centre frequency of the CSI-RS resource of the neighbour cell configured for measurement is the same as the centre frequency of the CSI-RS resource of the serving cell indicated for measurement

The UE shall be able to identify new intra-frequency cells and perform CSI-RSRP, CSI-RSRQ and CSI-SINR measurements of identified intra-frequency cells if carrier frequency information is provided by PCell.

No measurement gap is needed for intra-frequency CSI-RS resources measurements.

For intra-frequency CSI-RS based measurements, UE may cause scheduling restriction as specified in clause 9.10D.2.6.

Note: Extended CP for CSI-RS based measurement is not supported in this release.

### 9.10D.2.2 Requirements applicability

The measurement of the associated SSB follows the same requirements as SSB based measurements defined in clause 9.2D.

The requirements in clause 9.10D.2 apply, provided:

- Only one intra-frequency CSI-RS layer per serving cell is configured, and
- The BW of the CSI-RS on the intra-frequency neighbor cell is within the active BWP of the UE, and
- The associated SSB of the CSI-RS resources being identified or measured are detectable, and the CSI-RS resources configured for CSI-RS based L3 measurements are measurable, and

- The bandwidth of CSI-RS resources of intra-MO is the same as that of the CSI-RS resources configured for the serving cell, and
- All CSI-RS resources on one intra-frequency layer are configured within up to two separate windows where each window is up to 5 ms, and
- for the case of single window further provided
- The periodicity of the configured CSI-RS resources is 10 ms, 20 ms or 40 ms
- for the case of two separate windows further provided
  - The two windows are either both fully non-overlapped with MG or both partially overlapped with MG
    - The periodicity of the configured CSI-RS resources is 20 ms or 40 ms
  - The starting point of the first window is the slot boundary of the serving cell, where the corresponding slot contains the configured L3 CSI-RS resource of the serving cell in the servingCellMO with the smallest offset, and
  - The starting point of the second window if configured is determined by an offset of half of the CSI-RS periodicity in slots with regards to the starting point of the first window, and
- Numerology for intra-frequency CSI-RS and data of serving cell are the same.

An intra-frequency cell shall be considered detectable when for each relevant associated SSB:

- SS-RSRP related side conditions given in clauses 10.1.2.1 for FR1, for a corresponding band,
- SS-RSRQ related side conditions given in clauses 10.1.7.1 for FR1, for a corresponding band,
- SS-SINR related side conditions given in clauses 10.1.12.1 for FR1, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.2 for a corresponding band.

A CSI-RS resource shall be considered measurable when for each relevant CSI-RS resource:

- CSI-RSRP related side conditions given in clauses 10.1.2.3 for FR1, for a corresponding band,
- CSI-RSRQ related side conditions given in clauses 10.1.7.2 for FR1, for a corresponding band,
- CSI-SINR related side conditions given in clauses 10.1.12.2 for FR1, for a corresponding band,
- CSI_RP and CSI-RS Ês/Iot according to Annex B.2.12 for a corresponding band.

### 9.10D.2.3 Number of cells and number of CSI-RS

#### 9.10D.2.3.1 Requirements for FR1

For each intra-frequency CSI-RS layer, during each layer 1 measurement period, the UE shall be capable of performing CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements for at least:

- 32 CSI-RSs with different CSI-RS index and/or PCI on the intra-frequency layer, and
- the cells to be monitored based on CSI-RS are the same set or a subset of the cells monitored based on the layer of the associated SSB

### 9.10D.2.4 Measurement Reporting Requirements

Note: The UE is not required to report CSI-RS based L3 measurements when the timing offset between the reference measurement timing and the target CSI-RS in one layer is larger than one CP. If the UE reports CSI-RS based L3 measurements when the timing offset exceeds one CP, the UE may not meet the CSI-RS based L3 measurement accuracy requirements for CSI-RSRP, CSI-RSRQ and CSI-SINR in TS 38.133 [2] clause 10.1, which apply only when the timing offset is no larger than one CP.

#### 9.10D.2.4.1 Periodic Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in periodic measurement reports shall meet the requirements in clauses 10.1.2.3, 10.1.7.2, and 10.1.12.2.

#### 9.10D.2.4.2 Event-triggered Periodic Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.1.2.3, 10.1.7.2, and 10.1.12.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.10D.2.4.3.

#### 9.10D.2.4.3 Event Triggered Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI- SINR measurements contained in event triggered measurement reports shall meet the requirements in clauses 10.1.2.3, 10.1.7.2, and 10.1.12.2.

The UE shall not send any event triggered measurement reports as long as no reporting criterion is fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay, measured without L3 filtering shall be less than the CSI-RS based measurement defined in clause 9.10D.2.5. When L3 filtering is used an additional delay can be expected.

### 9.10D.2.5 Intra-frequency measurements without measurement gaps

If a UE is configured with the higher layer parameters *CSI-RS-Resource-Mobility* and *associatedSSB*, the CSI-RS based measurement shall include PSS/SSS detection time of associatedSSB, the time period used to acquire the SFN information and CSI-RS based measurement period without gap.

- PSS/SSS detection time of associatedSSB is the intra-frequency $T_{PSS/SSS_sync_intra}$ in clause 9.2D.5.1.
- The time period used to acquire the SFN information is equal to 0 if the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise, the time period used to acquire the SFN information is $T_{CSI\text{-}RS_SFN_intra}$ as shown in table 9.10D.2.5-3 for FR1.
- If the associatedSSB, which has been detectable at least for the time period $T_{identify_intra_with_index}$ defined in clause 9.2D.5.1, becomes undetectable for a period ≤ 5 seconds and then the associatedSSB becomes detectable again with the same spatial reception parameter provided the timing to that cell has not changed more than $\pm 3200/2^{\mu} T_c$, where $\mu$ is the SCS configuration as defined in clause 4.2 of TS 38.211 [3], PSS/SSS detection time and time period used to acquire the SFN information are equal to 0.

The measurement period for CSI-RS based intra-frequency measurements without gaps is as shown in table 9.10D.2.5-1.

Additionally, for a given CSI-RS resource, if the associated SS/PBCH block is configured but not detected by the UE, or if CSI-RS is configured with associated SSB but not QCL-ed to the associated SSB, the UE is not required to monitor the corresponding CSI-RS resource.

**Table 9.10D.2.5-1: Measurement period for intra-frequency CSI-RS based measurements without gaps(FR1)**

| DRX cycle | $T_{CSI\text{-}RS_measurement_period_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_{p_CSI\text{-}RS}$ x $N1^{Note\ 3}$ x $K_{layer1_measurement}$ ) x CSI-RS period) x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_{p_CSI\text{-}RS}$ x $N1^{Note\ 3}$ x $K_{layer1_measurement}$ ) x max(CSI-RS period, DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil( 5 x $K_{p_CSI\text{-}RS}$ x $N1^{Note\ 3}$ x $K_{layer1_measurement}$ ) x DRX cycle x $CSSF_{intra}$ |

NOTE 1: The requirements apply assuming CSI-RS configuration with {D=3 with PRBs ≥ 48}. D is frequency domain density for the 1-port CSI-RS for L3 mobility defined in clause 7.4.1 of TS 38.211 [6].
NOTE 2: $K_{p_CSI\text{-}RS}$ is applicable for a UE supporting concurrent gaps
NOTE 3: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4.
Otherwise, N1 = 1.
NOTE 4: For ATG UE capable of *antennaArrayType-r18*, for the SCC measurement, N1=1 when the network indication *neighSCellMeasSkipping* is set to 'enable' to UE and inter-band carrier aggregation within FR1 is configured and UE not capable of antennaArrayType-r18 on the other serving carrier or UE support two simultaneous separate Rx beams, or when the network indication *neighSCellMeasSkipping* is set to 'enable' to UE and SMTC occasion for PCC and SCC are not overlapped in the time domain and intra-band carrier aggregation within FR1 is configured or inter-band carrier aggregation within FR1 is configured and UE support one common Rx beam.
Otherwise, N1 = 3 when network assistance information on ATG cells reference locations is provided, N1 = 4 when network assistance information on ATG cells reference locations is not provided.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1D.5.

For a UE not supporting *concurrentMeasGap-r17* or for a UE is supporting *concurrentMeasGap-r17* but not configured with concurrent measurement gaps,

- if the intra-frequency CSI-RS resource does not overlap with any measurement gaps, $K_{p_CSI\text{-}RS}=1$;
- if some occasions of the intra-frequency CSI-RS resource is overlapped with measurement gaps, $K_{p_CSI\text{-}RS}$ = 1/(1-(CSI-RS resource period /MGRP)) , where CSI-RS resource period < MGRP, and the MGRP is the periodicity of the measurement gap.
- Otherwise, when UE supports concurrent measurement gaps, and concurrent measurement gaps are configured, $K_{p_CSI\text{-}RS}$ is the scaling factor for a CSI-RS frequency layer to be measured outside gap which is defined as $K_{p_CSI\text{-}RS} = N_{total} / N_{available}$

  For a window W of duration max(CSI-RS period, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG, and starting at the beginning of any gap occasions covering the CSI-RS resources:

  $N_{total}$ is the total number of CSI-RS resources within the window, including those overlapped with other MG occasions within the window, and

  $N_{available}$ is the number of CSI-RS resources that are not overlapped with any other non-dropped MG occasion within the window W, after accounting for MG collisions by applying the selected gap collision rule.

  $K_{p_CSI\text{-}RS}$ = 1 when $N_{available}$ = 0

For UE supporting *antennaArrayType-r18* on the measured carrier,

$K_{layer1_measurement}=1$,

If inter-band carrier aggregation within FR1 is configured and UE not capable of *antennaArrayType-r18* on the other serving carrier, or UE support two simultaneous separate Rx beams

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on one serving cell outside measurement gap are not fully overlapped by intra-frequency SMTC occasions and CSI-RSs occasions of same serving cell, or
- if the measured carrier is the SCC with servingcellMO configured, and the network indication *neighSCellMeasSkipping* is set to 'enable' to UE

Otherwise,

If the measured carrier is the SCC with servingcellMO configured, and the network indication *neighSCellMeasSkipping* is set to 'enable' to UE

- If SMTC occasion and CSI-RSs occasions for PCC and SCC are not overlapped in the time domain, or

- If SMTC occasion and CSI-RSs occasions for PCC and SCC are overlapped in the time domain, and all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any serving frequency outside measurement gap are not fully overlapped by overlapped SMTC occasions and CSI-RSs occasions of serving cells

Otherwise

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any serving frequency outside measurement gap are not fully overlapped by intra-frequency SMTC occasions and CSI-RSs occasions

$K_{layer1_measurement}$=1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

For UE not supporting *antennaArrayType-r18* on the measured carrier, $K_{layer1_measurement}$=1.

**Table 9.10D.2.5-2: Void**

**Table 9.10D.2.5-3: Time period for SFN acquisition for intra-frequency CSI-RS based measurements without gaps(FR1)**

| DRX cycle | $T_{CSI\text{-}RS_SFN_intra}$ |
|---|---|
| No DRX | max(200 ms, ceil(5 x $K_{p_CSI\text{-}RS}$ x $N1^{Note\ 2}$ x $K_{layer1_measurement}$ ) x SMTC period)$^{Note\ 1}$ x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(2000 ms, ceil (1.5 x 5 x $K_{p_CSI\text{-}RS}$ x $N1^{Note\ 2}$ x $K_{layer1_measurement}$ ) x max(SMTC period,DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil(5 x $K_{p_CSI\text{-}RS}$ x $N1^{Note\ 2}$ x $K_{layer1_measurement}$ ) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: For ATG UE capable of *antennaArrayType-r18*, N1 = 3 when network assistance on ATG cells reference locations is provided, otherwise N1 = 4. Otherwise, N1 = 1. | |
| NOTE 3: For ATG UE capable of *antennaArrayType-r18*, for the SCC measurement, N1=1 when the network indication *neighSCellMeasSkipping* is set to 'enable' to UE and inter-band carrier aggregation within FR1 is configured and UE not capable of antennaArrayType-r18 on the other serving carrier or UE support two simultaneous separate Rx beams, or when the network indication *neighSCellMeasSkipping* is set to 'enable' to UE and SMTC occasion for PCC and SCC are not overlapped in the time domain and intra-band carrier aggregation within FR1 is configured or inter-band carrier aggregation within FR1 is configured and UE support one common Rx beam. Otherwise, N1 = 3 when network assistance information on ATG cells reference locations is provided, N1 = 4 when network assistance information on ATG cells reference locations is not provided. | |

## 9.10D.2.6 Scheduling availability of UE during CSI-RS based intra-frequency measurements

UE is required to be capable of measuring without measurement gaps when CSI-RS resources are completely contained in the active BWP of the UE. Note the configured CSI-RS symbol is indicated in *firstOFDMSymbolInTimeDomain* included in *CSI-RS-ResourceConfigMobility* for RRM. When UE is required to perform CSI-RS based RRM measurements, and any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note same numerology for intra-frequency CSI-RS and data of serving cell is considered in this release.

### 9.10D.2.6.1 Scheduling availability of UE performing CSI-RS based measurements in TDD bands

When ATG UE performs CSI-RS intra-frequency measurements in a TDD band,

- The UE is not expected to transmit PUCCH/PUSCH/SRS on configured CSI-RS resource symbols, and on 1 OFDM symbol before and after each consecutively configured CSI-RS symbols.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When the ATG UE capable of *antennaArrayType-r18* performs intra-frequency neighbouring cell measurements in a TDD band,

- The UE is not expected to receive PDCCH/PDSCH/TRS/CSI-RS for CQI on configured CSI-RS resource symbols, and on 1 OFDM symbol before and after each consecutively configured CSI-RS symbols.

When intra-band carrier aggregation is performed and the ATG UE is capable of *antennaArrayType-r18*, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When inter-band carrier aggregation is performed and the ATG UE supporting one common Rx beam, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

## 9.10D.3 CSI-RS based Inter-frequency measurements

### 9.10D.3.1 Introduction

A measurement is defined as a CSI-RS based inter-frequency measurement provided it is not defined as an intra-frequency measurement according to clause 9.10D.2.

If a UE is configured with the higher layer parameter *CSI-RS-Resource-Mobility* and the higher layer parameter *associatedSSB* is configured, the UE shall be able to identify inter-frequency cells indicated for measurement and perform CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements of identified inter-frequency cells.

When measurement gaps are needed, the UE is not expected to detect the associated SSB nor perform measurement of the CSI-RS resource configured in *CSI-RS-Resource-Mobility* on an inter-frequency measurement object which start earlier than the gap starting time + switching time, and ends later than the gap end – switching time. The switching time is 0.5 ms.

### 9.10D.3.2 Requirements applicability

The associated SSB layer of the CSI-RS follows the same requirements as SSB based measurements defined in clause 9.3D.

The requirements in clause 9.10D.3 apply, provided:

- The associated SSB of the cell being identified or measured is detectable, and
- All CSI-RS resources on one inter-frequency layer are configured within a window of up to 5 ms, and
- The periodicity of the configured CSI-RS resources is 10 ms, 20 ms or 40 ms, and
- CSI-RS resources for measurements and the associated SSB for cell identification are configured within measurement gap.

An inter-frequency cell shall be considered detectable when for each relevant associated SSB:

- SS-RSRP related side conditions given in clauses 10.1.4.1 for FR1, for a corresponding band,
- SS-RSRQ related side conditions given in clauses 10.1.9.1 for FR1, for a corresponding band,
- SS-SINR related side conditions given in clauses 10.1.14.1 for FR1, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.3 for a corresponding band.

A CSI-RS resource shall be considered measurable when for each relevant CSI-RS resource:

- CSI-RSRP related side conditions given in clauses 10.1.4.3 for FR1, for a corresponding band,

- CSI-RSRQ related side conditions given in clauses 10.1.9.2 for FR1, for a corresponding band,
- CSI-SINR related side conditions given in clauses 10.1.14.2 for FR1, for a corresponding band,
- CSI _RP and CSI-RS Ês/Iot according to Annex B.2.13 for a corresponding band.

### 9.10D.3.3 Number of cells and number of CSI-RS resources

#### 9.10D.3.3.1 Requirements for FR1

For each inter-frequency CSI-RS layer, during each layer 1 measurement period, the UE shall be capable of performing CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements for at least:

- 14 CSI-RSs with different CSI-RS index and/or PCI , and
- The cells to be monitored based on CSI-RS are the same set or a subset of the cells monitored based on the layer of the associated SSB.

### 9.10D.3.4 Measurements reporting requirements

NOTE: The UE is not required to report CSI-RS based L3 measurements when the timing offset between the reference measurement timing and the target CSI-RS in one layer is larger than one CP. If the UE reports CSI-RS based L3 measurements when the timing offset exceeds one CP, the UE may not meet the CSI-RS based L3 measurement accuracy requirements for CSI-RSRP, CSI-RSRQ and CSI-SINR in TS 38.133 [2] clause 10.1, which apply only when the timing offset is no larger than one CP.

#### 9.10D.3.4.1 Periodic Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.3, 10.1.9.2 and 10.1.14.2.

#### 9.10D.3.4.2 Event-triggered Periodic Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.3, 10.1.9.2, and 10.1.14.2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.10D.3.4.3.

#### 9.10D.3.4.3 Event-triggered Reporting

Reported CSI-RSRP, CSI-RSRQ, and CSI-SINR measurements contained in periodically triggered measurement reports shall meet the requirements in clauses 10.1.4.3, 10.1.9.2 and 10.1.14.2.

The UE shall not send any event triggered measurement reports, as long as no reporting criteria are fulfilled.

The measurement reporting delay is defined as the time between an event that will trigger a measurement report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty resulted when inserting the measurement report to the TTI of the uplink DCCH. The delay uncertainty is: $2 \times TTI_{DCCH}$. This measurement reporting delay excludes a delay which caused by no UL resources for UE to send the measurement report.

The event triggered measurement reporting delay, measured without L3 filtering shall be within CSI-RS based measurement defined in clause. When L3 filtering is used an additional delay can be expected.

### 9.10D.3.5 Inter-frequency measurements with measurement gaps

When measurement gaps are provided, if configured with the higher layer parameters *CSI-RS-Resource-Mobility* and *associatedSSB*, the UE shall be able to identify a new detectable CSI-RS based inter-frequency cell within $T_{CSI-RS_identify_inter}$,

$$T_{CSI\text{-}RS_identify_inter} = (T_{PSS/SSS_sync} + T_{CSI\text{-}RS_measurement_period_inter} + T_{CSI\text{-}RS_SFN_inter})\ ms$$

Where:

$T_{PSS/SSS_sync}$ is the time period used in PSS/SSS detection which is determined according to $T_{PSS/SSS_sync_inter}$ in clause 9.3D.4,

$T_{CSI\text{-}RS_SFN_inter}$ is the time period used to acquire the SFN information of the cell being measured, which is shown in table 9.10D.3.5-3 for FR1,

$T_{CSI\text{-}RS_measurement_period_inter}$: equal to a measurement period of CSI-RS based measurement given in table 9.10D.3.5-1.

$CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1D.5 for measurement conducted within measurement gaps.

If a UE which supports concurrent measurement gaps has been configured with concurrent measurement gaps, $K_{p_CSI\text{-}RS}$ is the scaling factor for a CSI-RS frequency layer to be measured within the associated measurement gap which is defined as $K_{p_CSI\text{-}RS} = N_{total} / N_{available}$. $K_{p_CSI\text{-}RS} = 1$ for for UE not configured with concurrent measurement gaps.

- For a window W of duration max(CSI-RS period, MGRP_max), where MGRP_max is the maximum MGRP across all configured per-UE MG and per-FR1 MG within the same FR as the CSI-RS frequency layer, and starting at the beginning of any gap occasions covering the CSI-RS resources.:
  - $N_{total}$ is the total number of associated gap occasions covering CSI-RS resources within the window, including both dropped and non-dropped instances of the associated measurement gap within the window, and
  - $N_{available}$ is the number of non-dropped associated gap occasions covering CSI-RS resources within the window W, after accounting for MG collisions by applying the selected gap collision rule.
  - Requirements do not apply if $N_{available} = 0$

Additionally, for a given CSI-RS resource, if the associated SSB is configured but not detected by the UE, or if CSI-RS configured with associated SSB but not QCL-ed to the associated SSB, the UE is not required to monitor the corresponding CSI-RS resource.

**Table 9.10D.3.5-1: Measurement period for CSI-RS based inter-frequency measurements with gaps (FR1)**

| Condition NOTE1 | $T_{CSI\text{-}RS_measurement_period_inter}$ |

# 9.11 NR measurements with autonomous gaps

## 9.11.1 Introduction

The requirements in this clause are applicable for CGI identification of an intra frequency and inter-frequency NR target cell.

The requirements in this clause are specified for CGI identification of an NR target cell and are applicable for a UE:

- in RRC_CONNECTED state, and
- configured with SA or NR-DC or NE-DC operation mode, or with EN-DC operation mode for CGI identification requested by NR PSCell.

The overall CGI reporting delay is defined in clause 9.11.3.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.11.2 CGI identification of an NR cell with autonomous gaps

The UE shall identify and report the CGI of a known NR target cell when requested by the network for the purpose of reportCGI. Only one cell is provided to the UE with *cellForWhichToReportCGI* for identifying the CGI.The UE may make autonomous gaps in both downlink reception and uplink transmission for receiving MIB and SIB1 message according to clause 5.5.3 of TS 38.331 [2]. Note that a UE is not required to use autonomous gap if *useAutonomousGaps* is set to false. If autonomous gaps are used for measurement with the purpose of reportCGI, regardless of whether DRX is used or not, or whether SCell(s) are configured or not, the UE shall be able to identify a new CGI of NR cell within:

$$T_{identify_CGI} = (T_{MIB} + T_{SIB1})\ ms$$

Where:

$T_{MIB}$ is the time period used to acquire MIB message. $T_{MIB} = 6 * T_{SMTC}$ ms for target cell carrier frequency on FR1 and $T_{MIB} = 25 * T_{SMTC}$ ms for target cell carrier frequency on FR2.

$T_{SIB1}$ is the time period used to acquire SIB1 message. $T_{SIB1} = 6 * T_{RMSI\text{-}scheduling}$ ms.

Where $T_{SMTC}$ is the SMTC periodicity configured for the target cell measurement, and $T_{RMSI\text{-}scheduling}$ is

- the maximum between the periodicity with which the SIB1 is actually transmitted by the NR target cell and 20 ms when SSB and RMSI CORESET multiplexing pattern is 1
- the maximum between the periodicity with which the SIB1 is actually transmitted by the NR target cell and $T_{SMTC}$ when SSB and RMSI CORESET multiplexing pattern is 2 or 3.

The requirement for identifying the CGI of an NR cell within $T_{identify_CGI}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

Within the time $T_{identify_CGI}$, over which the UE identifies the CGI of an NR cell, the UE shall fulfil interruption requirements specified in,

- clause 8.2.1.2.16 for NR serving cells and clause 7.32.2.15 in TS 36.133 [15] for E-UTRA serving cells if the UE is configured with EN-DC operation mode,
- clause 8.2.2.2.14 if the UE is configured with SA operation mode,
- clause 8.2.3.2.14 for NR serving cells and clause 7.36.2.14 in TS 36.133 [15] for E-UTRA serving cells if the UE is configured with NE-DC operation mode,
- clause 8.2.4.2.11 if the UE is configured with NR-DC operation mode.

In the requirement a cell is known if,

- During the last 5 seconds for FR1 or 3 seconds for FR2 before the reception of the report CGI command:
  - The UE has sent a valid L3-RSRP measurement report with SSB index for the target cell and
- During MIB decoding at least reported SSBs remains detectable according to the cell identification conditions specified in clauses 9.2 or 9.3 of TS 38.133, and
- During SIB1 decoding the SSB used for MIB decoding remains detectable according to the cell identification conditions specified in clauses 9.2 or 9.3 of TS 38.133, and
- During MIB decoding, the SSB for MIB decoding remains detectable with SNR $\geqslant$-3 dB
- During SIB1 decoding, the PDSCH for SIB1 decoding remains detectable with SNR $\geqslant$-3 dB

### 9.11.3 CGI reporting delay

The CGI reporting delay is defined as the time between a command that will trigger a CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of 2 x $TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI}$ defined in clause 9.11.2 plus RRC procedure delay defined in clause 12 in TS 38.331 [2], and additional 20 ms margin if target cell is on FR2.

## 9.11A NR measurements with autonomous gaps for RedCap

### 9.11A.1 Introduction

The requirements in this clause are applicable for CGI identification of an intra frequency and inter-frequency NR target cell.

The requirements in this clause are specified for CGI identification of an NR target cell and are applicable for a UE:

- in RRC_CONNECTED state, and
- configured with SA operation mode.

The overall CGI reporting delay is defined in clause 9.11A.3.

### 9.11A.2 CGI identification of an NR cell with autonomous gaps

The UE shall identify and report the CGI of a known NR target cell when requested by the network for the purpose of reportCGI. Only one cell is provided to the UE with *cellForWhichToReportCGI* for identifying the CGI.The UE may make autonomous gaps in both downlink reception and uplink transmission for receiving MIB and SIB1 message according to clause 5.5.3 of TS 38.331 [2]. Note that a UE is not required to use autonomous gap if *useAutonomousGaps* is set to false. If autonomous gaps are used for measurement with the purpose of reportCGI, regardless of whether DRX is used or not, the UE shall be able to identify a new CGI of NR cell within:

$$T_{identify_CGI_redcap} = (T_{MIB_redcap} + T_{SIB1_redcap})\ ms$$

Where:

For 2 Rx RedCap UE:

$T_{MIB_redcap}$ is the time period used to acquire MIB message. $T_{MIB_redcap} = 6 * T_{SMTC}$ ms for target cell carrier frequency on FR1 and $T_{MIB_redcap} = 25 * T_{SMTC}$ ms for target cell carrier frequency on FR2.

$T_{SIB1_redcap}$ is the time period used to acquire SIB1 message. $T_{SIB1_redcap} = 6 * T_{RMSI\text{-}scheduling}$ ms.

For 1 Rx RedCap UE:

$T_{MIB_redcap}$ is the time period used to acquire MIB message. $T_{MIB_redcap} = 6 * T_{SMTC}$ ms for target cell carrier frequency on FR1.

$T_{SIB1_redcap}$ is the time period used to acquire SIB1 message. $T_{SIB1_redcap} = 12 * T_{RMSI\text{-}scheduling}$ ms.

Where $T_{SMTC}$ is the SMTC periodicity configured for the target cell measurement, and $T_{RMSI\text{-}scheduling}$ is

- the periodicity with which the SIB1 is actually transmitted by the NR target cell when SSB and RMSI CORESET multiplexing pattern is 1
- the maximum between the periodicity with which the SIB1 is actually transmitted by the NR target cell and $T_{SMTC}$ when SSB and RMSI CORESET multiplexing pattern is 2 or 3.

The requirement for identifying the CGI of an NR cell within $T_{identify_CGI_redcap}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

Within the time $T_{identify_CGI_redcap}$, over which the UE identifies the CGI of an NR cell, the UE shall fulfil interruption requirements specified in,

- clause 9.11A.4if the UE is configured with SA operation mode.

In the requirement a cell is known if,

- During the last 5 seconds for FR1 or 3 seconds for FR2 before the reception of the report CGI command:
  - The UE has sent a valid L3-RSRP measurement report with SSB index for the target cell and
- During MIB decoding at least reported SSBs remains detectable according to the cell identification conditions specified in clauses 9.2B or 9.3B of TS 38.133, and
- During SIB1 decoding the SSB used for MIB decoding remains detectable according to the cell identification conditions specified in clauses 9.2B or 9.3B of TS 38.133, and
- During MIB decoding, the SSB for MIB decoding remains detectable with SNR $\geqslant$-3 dB
- During SIB1 decoding, the PDSCH for SIB1 decoding remains detectable with SNR $\geqslant$-3 dB

## 9.11A.3 CGI reporting delay

The CGI reporting delay is defined as the time between a command that will trigger a CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of 2 x $TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI_redcap}$ defined in clause 9.11A.2 plus RRC procedure delay defined in clause 12 in TS 38.331 [2], and additional 20 ms margin if target cell is on FR2.

## 9.11A.4 CGI reporting scheduling restriction

When a RedCap UE is identifying CGI of an NR cell with autonomous gaps, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on PCell for the following slots:

- with up to K1 interruptions with interrupted slots up to X1 specified in table 9.11A.4-1 for each interruption during MIB decoding time period $T_{MIB_redcap}$ (ms) specified in clause 9.11A.2.
- with up to L1 interruptions with interrupted slots up to Y1 specified in table 9.11A.4-1 during SIB1 decoding time period $T_{SIB1_redcap}$ (ms) specified in clause 9.11A.2 for SSB and CORESET for RMSI scheduling multiplexing patterns 1.
- with up to L2 interruptions with interrupted slots up to interruption length Y2 specified in table 9.11A.4-1 during SIB1 decoding time period $T_{SIB1_redcap}$ (ms) specified in clause 9.11A.2 for SSB and CORESET for RMSI scheduling multiplexing patterns 2 and 3.

Where:

- K1 = 6 for the target cell carrier frequency on FR1 and K1 = 25 for the target cell carrier frequency on FR2, and
- L1 = $T_{SIB1_redcap}$ /20 and
- L2 = $T_{SIB1_redcap}$ /$T_{SMTC}$, where $T_{SMTC}$ is the periodicity of the SMTC occasion configured for the target cell carrier.

**Table 9.11A.4-1: Interruption length X1, Y1 and Y2 during measurements with autonomous gaps**

| $\mu$ | NR Slot length (ms) of victim cell | Interruption length X1 (slots) | Interruption length Y1 (slots) | Interruption length Y2 (slots) |
|---|---|---|---|---|
| 0 | 1 | 6 | 7 | 6 |
| 1 | 0.5 | 12 | 13 | 10 |
| 2 | 0.25 | 24 | 25 | 19 |
| 3 | 0.125 | 48 | 49 | 37 |

# 9.11D NR measurements with autonomous gaps for ATG

The requirements in clause 9.11 shall apply only for FR1 without considering CA/DC and inter-RAT measurement.

## 9.11D.1 Introduction

The requirements in this clause are applicable for CGI identification of an intra frequency and inter-frequency NR target cell.

The requirements in this clause are specified for CGI identification of an NR target cell and are applicable for a UE:

- in RRC_CONNECTED state, and
- configured with SA for CGI identification requested by NR PSCell.

The overall CGI reporting delay is defined in clause 9.11D.3.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.11D.2 CGI identification of an NR cell with autonomous gaps

The UE shall identify and report the CGI of a known NR target cell when requested by the network for the purpose of reportCGI. Only one cell is provided to the UE with *cellForWhichToReportCGI* for identifying the CGI.The UE may make autonomous gaps in both downlink reception and uplink transmission for receiving MIB and SIB1 message according to clause 5.5.3 of TS 38.331 [2]. Note that a UE is not required to use autonomous gap if *useAutonomousGaps* is set to false. If autonomous gaps are used for measurement with the purpose of reportCGI,

regardless of whether DRX is used or not, or whether SCell(s) are configured or not, the UE shall be able to identify a new CGI of NR cell within:

$$T_{identify_CGI} = (T_{MIB} + T_{SIB1})\ ms$$

Where:

$T_{MIB}$ is the time period used to acquire MIB message. $T_{MIB} = 6 * T_{SMTC}$ ms for target cell carrier frequency on FR1.

$T_{SIB1}$ is the time period used to acquire SIB1 message. $T_{SIB1} = 6 * T_{RMSI\text{-}scheduling}$ ms.

Where $T_{SMTC}$ is the SMTC periodicity configured for the target cell measurement, and $T_{RMSI\text{-}scheduling}$ is

- the maximum between the periodicity with which the SIB1 is actually transmitted by the NR target cell and 20 ms when SSB and RMSI CORESET multiplexing pattern is 1.

The requirement for identifying the CGI of an NR cell within $T_{identify_CGI}$ is applicable when no DRX is used as well as when any of the DRX cycles specified in TS 38.331 [2] is used.

Within the time $T_{identify_CGI}$, over which the UE identifies the CGI of an NR cell, the UE shall fulfil interruption requirements specified in clause 8.2.2.2.14.

In the requirement a cell is known if,

- During the last 5 seconds for FR1 before the reception of the report CGI command:
  - The UE has sent a valid L3-RSRP measurement report with SSB index for the target cell and
- During MIB decoding at least reported SSBs remains detectable according to the cell identification conditions specified in clauses 9.2D or 9.3D of TS 38.133, and
- During SIB1 decoding the SSB used for MIB decoding remains detectable according to the cell identification conditions specified in clauses 9.2D or 9.3D of TS 38.133, and
- During MIB decoding, the SSB for MIB decoding remains detectable with SNR $\geqslant$-3 dB
- During SIB1 decoding, the PDSCH for SIB1 decoding remains detectable with SNR $\geqslant$-3 dB

### 9.11D.3 CGI reporting delay

The CGI reporting delay is defined as the time between a command that will trigger a CGI report and the point when the UE starts to transmit the measurement report over the air interface. This requirement assumes that the measurement report is not delayed by other RRC signalling on the DCCH. This measurement reporting delay excludes a delay uncertainty of 2 x $TTI_{DCCH}$ resulting when inserting the measurement report to the TTI of the uplink DCCH. This measurement reporting delay excludes any delay caused by lack of UL resources for UE to send the measurement report.

The CGI reporting delay shall be less than $T_{identify_CGI}$ defined in clause 9.11.2 plus RRC procedure delay defined in clause 12 in TS 38.331 [2].

## 9.12 Measurement for Propagation Delay Compensation

### 9.12.1 Introduction

The requirements in this clause are applicable for UE capable of RTT-based propagation delay compensation based on PRS/TRS and SRS, where the UE is configured with *measObjectRxTxDiff* in *MeasObjectToAddModList* defined in TS 38.331 [2].

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.12.2 Requirements Applicability

The requirements in clause 9.12 apply for periodic triggered UE Rx-Tx time difference measurements, provided:

- If UE Rx-Tx time difference measurement is based on PRS, the related side conditions given in clause 10.1.39.2 are met for a corresponding band.
- If UE Rx-Tx time difference measurement is based on TRS, the related side conditions given in clause 10.1.39.3 are met for a corresponding band.
- SRS is configured on at least one of the PCell.

All measurement requirements specified in clause 9.12.4 shall apply when no DRX is in use as well as for when DRX is in use (clause 3.6.1) for any DRX configuration specified in TS 38.331 [2].

## 9.12.3 Measurement Capability

If UE Rx-Tx time difference measurement is based on PRS, the capability is as indicated by the UE in *rtt-BasedPDC-PRS-r17* in TS 38.331 [2].

If UE Rx-Tx time difference measurement is based on TRS, the capability is as indicated by the UE in *rtt-BasedPDC-CSI-RS-ForTracking-r17* in TS 38.331 [2].

## 9.12.4 Measurement period requirements

### 9.12.4.1 PRS Measurement Period

When UE is configured with *prs-Ref-r17* in *MeasObjectRxTxDiff*-r17 defined in TS 38.331 [2] and provided with PRS resource configuration, the UE shall be able to measure UE Rx-Tx time difference on PCell within the measurement period $T_{UERx-Tx_PRS}$, where:

$$T_{UERxTx,PRS} = \left\lceil \frac{N_{PRS}^{slot}}{N'} \right\rceil * N_{sample} * K_{layer3} * LCM(T_{PRS}, T_{DRX})$$

Where:

$N_{PRS}^{slot}$ is the maximum number of DL PRS resources configured in a slot,

N′ is UE capability for number of DL PRS resources that it can process in a slot corresponding to *maxNumberPRS-ResourceProcessedPerSlot-r17* as specified in TS 38.331 [2],

$N_{sample}$ is the number of UE Rx-Tx time difference measurement samples and $N_{sample}$ = 4,

$T_{PRS}$ is the PRS resource periodicity specific for RTT-based propagation delay compensation,

$T_{DRX}$ is the DRX cycle length when DRX is in use, 1 ms otherwise.

$K_{layer3}$ is

$N_{total}$ / $N_{available}$, when $N_{available}$>0

Where,

- For a window W of duration LCM($T_{PRS}$, MGRP_max, $T_{SMTC}$) and starting at the beginning of any PRS resource occasion, where $T_{SMTC}$ is the periodicity of SMTC for intra-frequency measurement without gap and MGRP_max is the maximum MGRP across all configured per-UE measurement gaps and per-FR measurement gaps within the same FR as PCell for a UE that support *concurrentMeasGap-r17* and is configured with concurrent measurement gaps, otherwise MGRP_max is the MGRP of configured per-UE measurement gap or per-FR measurement gap within the same FR as PCell:
  - $N_{total}$ is the total number of PRS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{available}$ is the number of PRS resource occasions that are not overlapped with:

- For FR1: any measurement gap occasions within window W. And for a UE supporting *concurrentMeasGap-r17* after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1.8.3 within the window W
- For FR2: any measurement gap occasions nor any SMTC occasions within window W. And for a UE supporting *concurrentMeasGap-r17* after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1.8.3 nor any SMTC occasions within the window W.

No requirements shall apply if $N_{available}$=0.

UE is only required to perform UE Rx-Tx time difference on PRS within the active DL BWP.

When UE is configured to perform UE Rx-Tx time difference measurement based on PRS, the requirements apply provided that the SCS of the PRS is same as that of the active BWP on PCell.

For FR2, the requirements apply if QCL information is provided for all the PRS resources in the resource set and for each resource one RS has QCL-TypeD.

If PRS resources overlap with Type 1A/1B/2 PPW, the UE is allowed longer measurement period to measure UE Rx-Tx time difference on PCell.

### 9.12.4.2 TRS Measurement Period

When UE is configured with *csi-RS-Ref-r17* in *MeasObjectRxTxDiff*-r17 defined in TS 38.331 [2] and provided with TRS resource configuration, the UE shall be able to measure UE Rx-Tx time difference on PCell within the measurement period $T_{UERx-Tx_TRS}$, where:

$$T_{UERxTx,TRS} = N_{sample} * K_{layer3} * LCM(T_{TRS}, T_{DRX})$$

Where

$N_{sample}$ is the number of UE Rx-Tx time difference measurement samples and $N_{sample}$ is [4],

$T_{TRS}$ is the TRS resource periodicity specific for RTT-based propagation delay compensation,

$T_{DRX}$ is the DRX cycle length when DRX is in use, 1 ms otherwise.

$K_{layer3}$ is

$N_{total}$ / $N_{available}$ when $N_{available}$>0

Where,

- For a window W of duration LCM($T_{TRS}$, MGRP_max, $T_{SMTC}$) and starting at the beginning of any TRS resource occasion, where $T_{SMTC}$ is the periodicity of SMTC for intra-frequency measurement without gap and MGRP_max is the maximum MGRP across all configured per-UE measurement gaps and per-FR measurement gaps within the same FR as PCell for a UE that support *concurrentMeasGap-r17* and is configured with concurrent measurement gaps, otherwise MGRP_max is the MGRP of configured per-UE measurement gap or per-FR measurement gap within the same FR as PCell:
  - $N_{total}$ is the total number of TRS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{available}$ is the number of TRS resource occasions that are not overlapped with
    - For FR1: any measurement gap occasions within window W. And for a UE supporting *concurrentMeasGap-r17* after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1.8.3 within the window W
    - For FR2: any measurement gap occasions nor any SMTC occasions within window W. And for a UE supporting *concurrentMeasGap-r17* after accounting for measurement gap collisions by applying the measurement gap collision rule in clause 9.1.8.3 nor any SMTC occasions within the window W.

No requirements shall apply if $N_{available}$=0.

UE is only required to perform UE Rx-Tx time difference on TRS within the active DL BWP. When UE is configured to perform UE Rx-Tx time difference measurement based on TRS, the requirements apply provided that the SCS of the TRS is same as that of the active BWP on PCell.

For FR2, the requirements apply if QCL information is provided for all the TRS resources in the resource set and for each resource one RS has QCL-TypeD.

If TRS resources overlap with Type 1A/1B/2 PPW, the UE is allowed longer measurement period to measure UE Rx-Tx time difference on PCell.

## 9.12.5 Measurement Reporting Requirements

The UE shall report UE Rx-Tx time difference measurement results if UE supports *gNB-SideRTT-BasedPDC-r17*.

The measurement reporting delay excludes the delay uncertainty caused by inserting the measurement report into the TTI of the uplink DCCH. The delay uncertainty is: 2 x $TTI_{DCCH}$ where $TTI_{DCCH}$ is the duration of subframe or slot or subslot when the measurement report is transmitted on the PUSCH with subframe or slot or subslot duration. This measurement reporting delay excludes any delay caused by no UL resources for UE to send the measurement report.

The UE Rx-Tx time difference measurement values contained in measurement report shall be based on the measurement report mapping requirements specified in clause 10.1.25.3, with k = 5.

The UE Rx-Tx time difference measurement accuracy shall be fulfilled according to the accuracy requirements specified in clause 10.1.39.2 and 10.1.39.3 for PRS and TRS, respectively.

## 9.12.6 Scheduling availability during measurement for Propagation Delay Compensation

During measurement for Propagation Delay Compensation in an FR2 cell,

- For the case where the PRS or TRS for PDC measurement is QCLed with active TCI state for PDCCH/PDSCH, there are no scheduling restrictions due to PDC measurement performed based on PRS or TRS.
- Otherwise, the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the PRS or TRS resource configured for PDC measurement.

## 9.12.7 Measurement restriction for measurement for Propagation Delay Compensation

During measurement for Propagation Delay Compensation in an FR2 cell, when the PRS or TRS for PDC measurement on one CC is in the same OFDM symbol as SSB or CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both PRS or TRS for PDC measurement and the other RS if they are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE. Longer measurement period for PRS or TRS for PDC measurement is expected.

## 9.12.8 Measurement requirement for Propagation Delay Compensation with MUSIM gaps

The measurement requirement defined for measurement for Propagation Delay Compensation in this clause 9.12 applies, if there is no overlap between MUSIM gaps and PRS or TRS for propagation delay compensation measurements.

# 9.13 L1-RSRP measurements for a cell with different PCI from serving cell

## 9.13.1 Introduction

When configured by the network, the UE shall be able to perform L1-RSRP measurements of configured measurement resources from a cell with different PCI in addition to serving cell (PCI indicated in *additionalPCI-r17*), with the measurement resources configured as SSBs of the cell with different PCI.

The UE shall be able to measure all SSB resources of the cell with different PCI in *csi-SSB-ResourceSet* within the CSI-Resource*Config* settings for the active BWP, while the *additionalPCI-r17* of the SSB resources are different from serving cell PCI. The number of resources, including the number of resources configured for serving cell L1-RSRP measurement in clause 9.5, does not exceed the UE capability indicated by *beamManagementSSB-CSI-RS*.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the higher layer parameter *reportConfigType* of each reporting setting *CSI-ReportConfig* for the active BWP.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.13.2 Requirements Applicability

The requirements in the clause 9.13 are applicable to inter-cell beam management and inter-cell multi-TRP scenarios.

The requirements in clause 9.13 apply, provided the SSB from cell with PCI different from serving cell configured for L1-RSRP if the following conditions are met:

- the number of cells with PCI different from seving cells $N_{max}$ = 1 for FR2 and $N_{max}$ = maxNrofAdditionalPCI for FR1. Where, maxNrofAdditionalPCI is defined in TS 38.331 [2].
- The SSB from the cell with different PCI completely contained in the active BWP or associated with initial downlink BWP of the UE
- The SSB of the cell with different PCI from serving cell has the same SCS, SFN offset and center frequency as the SSB of the serving cell
- For a UE that supports both *multiDCI-IntraCellMultiTRP-TwoTA-r18* or *multiDCI-InterCellMultiTRP-TwoTA-r18* and *rxTimingDiff-r18*, the requirements apply when RX timing difference is up to MRTD as specified in clause 7.6.8.
- For a UE which does not support *rxTimingDiff-r18*, the requirements apply when RX timing difference is less than CP
- The cell with different PCI from serving cell is known
- The SSB resources configured for L1-RSRP measurements are measurable

An SSB resource configured for L1-RSRP for cell with different PCI from serving cell shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.1.19.1 and 10.1.20.1 for FR1 and FR2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to Annex B.2.4.1 for a corresponding band.

The cell with different PCI from serving cell is considered as known if the following conditions are met in this requirement:

- The UE has sent a valid L3 measurement report during the last 5 seconds, and
- The SSB from the cell with different PCI remains detectable according to the cell identification requirements specified in clause 9.2.

Otherwise, the cell is unknown.

In case the SSB resources configured for L1-RSRP measurements outside SMTCs are overlapped with PDSCH/PDCCH that is associated to serving cell, L1-RSRP measurement performance degradation is expected.

## 9.13.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports only for report configurations configured for the active BWP.

The UE shall report the L1-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1dB step size according to clauses 10.1.19 for FR1 and 10.1.20 for FR2 if *nrofReportedRS* is configured to one. If *nrofReportedRS* is configured to be larger than one, or if *groupBasedBeamReporting-r17* is enabled, the UE shall use differential L1-RSRP based reporting as defined in clauses 10.1.19 for FR1 and 10.1.20 for FR2. The differential L1-RSRP is quantized to a 4-bit value with 2dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6.

In EN-DC and NE-DC operation, when the UE is configured to perform E-UTRA SRS carrier-based switching an additional delay can be expected in FR1 if the UE is capable of per-FR gap, or an additional delay can be expected in both FR1 and FR2 if the UE is not capable of per-FR gap.

### 9.13.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send periodic L1-RSRP measurement reports for an active BWP.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.13.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.13.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2, respectively.

The UE shall only send aperiodic L1-RSRP measurement report if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

### 9.13.3.4 Event triggered reporting for UE initiated beam management

For a UE configured with a *CSI-ReportConfig* with *csi-ReportUE-IBR-r19* and with *dl-OrJointTCI-StateList,* with or without *eventCountWindow-r19* configuration the reported L1-RSRP measurements contained in an event triggered L1-RSRP measurement report shall meet the requirements in clauses 10.1.19 for FR1 and 10.1.20 for FR2.

The UE shall not send any event triggered measurement reports if no reporting criteria is fulfilled.

The event triggered L1-RSRP measurement reporting delay is defined as the time between an event that will trigger a measurement report after condition is met over the air and the point when the UE transmits first PUCCH over the air interface.

When *eventCountWindow-r19* is not configured,

The event triggered measurement reporting delay shall be no larger than $T_{L1\text{-}meas_basic} + T_{first_UL_channel}$.

$T_{L1\text{-}meas_basic}$ is the maximum of L1-RSRP measurement periods of the reference signals of beams corresponding to the event

For a UE configured with a *CSI-ReportConfig* with the higher layer parameter *eventTypeUE-IBR-r19* set to '*event2-r19*', UE shall perform L1-RSRP measurement based on the L1-RSRP measurement period of current beam and new beam(s) respectively.

For a UE configured with a *CSI-ReportConfig* with the higher layer parameter *eventTypeUE-IBR-r19* set to '*event1-r19*', UE shall perform L1-RSRP measurement based on the L1-RSRP measurement period of current beam.

If the SS/PBCH block is QCLed with the reference signal in the indicated TCI state, the L1-RSRP measurement period of the current beam refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$ in Table 9.13.4.1-1 or 9.13.4.1-2 where $T_{Report.} = 0$, and $T_{SSB_CDP}$ is the periodicity of the SS/PBCH block which is QCLed with the reference signal in the indicated TCI state for the current beam

If the reference signals in *newBeamResourceSet-r19* are based on SSB for a cell with additional PCI, the L1-RSRP measurement period of the new beam refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$ in Table 9.13.4.1-1 or 9.13.4.1-2 where $T_{Report.} = 0$, and $T_{SSB_CDP}$ is the periodicity of the *SSB-Index* of the reference signal configured by the *newBeamResourceSet-r19*.

For a UE configured with a CSI-ReportConfig with the higher layer parameter *eventTypeUE-IBR-r19* set to '*event7-r19*', UE shall perform L1-RSRP measurement based on L1-RSRP measurement period of beams in active TCI state lists and new beams respectively.

If the SS/PBCH block is QCLed with the reference signal corresponding to the activated TCI states with the *valueOfQ-r19*-th highest L1-RSRP, the L1-RSRP measurement period of the beam refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$ as specified in table 9.13.4.1-1 or 9.13.4.1-2 where $T_{Report.} = 0$, and $T_{SSB}$ is the periodicity of the *SSB-Index* of the SS/PBCH block s QCLed with the the reference signal corresponding to the activated TCI states with the *valueOfQ-r19*-th highest L1-RSRP.

If the reference signals in *newBeamResourceSet-r19* are based on SSB for a cell with additional PCI, the L1-RSRP measurement period of the new beam refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$ in Table 9.13.4.1-1 or 9.13.4.1-2 where $T_{Report.} = 0$, and $T_{SSB_CDP}$ is the periodicity of the *SSB-Index* of the reference signal configured by the *newBeamResourceSet-r19*.

$T_{first\ UL\ channel}$ is the time to first PUCCH after L1 reporting condition is triggered

Otherwise, if *eventCountWindow-r19* is provided, the event triggered measurement reporting delay shall be no larger than (*eventInstanceCount-r19* + L) * $T_{L1\text{-}meas_basic} + T_{first\ UL\ channel,}$ where

- *eventInstanceCount-r19* is configured by the network

- $T_{L1\text{-}meas_basic}$ is the measurement period above based on the configuration

- L is the number of measurement instances ($T_{L1\text{-}meas_basic}$) that do not satisfy the event condition, counted after the event counter is started for the window that will trigger the measurement report and before the required number of events (eventInstanceCount-r19) are detected within the specified time window (*eventDetectionTimeWindow-r19*).

- The above requriement is applicable when *eventDetectionTimeWindow-r19* is not less than (*eventInstanceCount-r19* + L-1) * $T_{L1\text{-}meas_basic}$ . The requirement does not apply when *eventDetectionTimeWindow-r19* is less than (*eventInstanceCount-r19* + L-1) * $T_{L1\text{-}meas_basic}$.

## 9.13.4 L1-RSRP measurement requirements

### 9.13.4.1 Inter-cell SSB based L1-RSRP Reporting

If a cell with PCI different from serving cell is known according to clause 9.13.2, the UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$. The requirements specified in this clause are only applicable when

- *highSpeedMeasFlag-r16* is not configured, and
- *highSpeedMeasFlagFR2-r17* is not configured, and
- *highSpeedMeasCA-Scell-r17* is not configured, and
- SSBs of CDP outside SMTCs for L1-RSRP measurement are not overlapped with concurrent gaps.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$ is defined in table 9.13.4.1-1 for FR1, The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$ is defined in table 9.13.4.1-2 for FR2 when *highSpeedMeasFlagFR2-r17* is not configured, where

- M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise
- N= 8.

When UE supports *musim-GapPreference-r17*, and periodic MUSIM gaps are configured,

- an SSB or an SMTC occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to 9.1.10,
- P value for SSB resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P = P_{L1_sharing\ factor} * P_{sharing\ factor} * N_{total} / N_{outside_MG}$ in FR2, if $N_{available} = 0$
  - P is defined as below based on $P_2$, where $P_2 = N_{total} / N_{available}$ in FR2, if $N_{available} > 0$
- For a window W of duration max($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps, MUSIM gap(s) and/or per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any SSB resource occasion:
  - $N_{total}$ is the total number of SSB resource occasions within the window, including those overlapped with measurement gap occasions, MUSIM gap occasions or SMTC occasions within the window, and
  - $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any non-dropped measurement gap occasion nor non-dropped MUSIM gap occasion within the window W, and
  - $N_{available}$ is the number of SSB resource occasions that are not overlapped with any non-dropped measurement gap occasion, non-dropped MUSIM gap occasion nor any SMTC occasion within the window W.
  - an SSB or an SMTC occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion.
  - $T_{L1}$ is periodicity of the target SSB.

Otherwise, when UE does not support *musim-GapPreference-r17* or when no MUSIM gaps are configured,

For FR1,

- $P=\frac{1}{1-\frac{T_{SSB_CDP}}{MRGP}}$, when in the monitored cell there are measurement gaps configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the SSB; and
- P=1 when in the monitored cell there are no measurement gaps overlapping with any occasion of the SSB.

For FR2,

- P is $P_{L1_sharing}$*$P_{sharing\ factor,\ CDP}$, when SSB is not overlapped with measurement gap and SSB is fully overlapped with SMTC period ($T_{SSB_CDP}$ = $T_{SMTCperiod}$), and $T_{SSB_SC}$ = $T_{SMTCperiod}$.

- P is $P_{L1_sharing} * \frac{P_{\text{sharing factor}}}{1-\frac{T_{SSB_CDP}}{MGRP}}$, when SSB is partially overlapped with measurement gap and SSB is fully overlapped with SMTC occasion ($T_{SSB_CDP}$ = $T_{SMTCperiod}$) and SMTC occasion is partially overlapped with GAP ($T_{SMTCperiod}$ < MGRP).

- $P_2=\frac{1}{1-\frac{T_{SSB_CDP}}{T_{SMTCperiod}}}$, when SSB is not overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB_CDP}$ < $T_{SMTCperiod}$).

- $P_2=\frac{1}{1-\frac{T_{SSB_CDP}}{MGRP}-\frac{T_{SSB_CDP}}{T_{SMTCperiod}}}$, when SSB is partially overlapped with measurement gap and SSB is partially overlapped with SMTC occasion ($T_{SSB_CDP}$ < $T_{SMTCperiod}$) and SMTC occasion is not overlapped with measurement gap and

  - $T_{SMTCperiod} \neq$ MGRP or

  - $T_{SMTCperiod}$ = MGRP and $T_{SSB_CDP}$ < 0.5*$T_{SMTCperiod}$

- $P_2$ is $\frac{P_{\text{sharing factor}}}{1-\frac{T_{SSB_CDP}}{MGRP}}$, when SSB is partially overlapped with GAP and SSB is partially overlapped with SMTC occasion ($T_{SSB_CDP}$ < $T_{SMTCperiod}$) and SMTC occasion is not overlapped with GAP and $T_{SMTCperiod}$ = MGRP and $T_{SSB_CDP}$ = 0.5*$T_{SMTCperiod}$

- $P_2=\frac{1}{1-\frac{T_{SSB_CDP}}{min(T_{SMTCperiod},MGRP)}}$,when SSB is partially overlapped with measurement gap ($T_{SSB_CDP}$ <MGRP) and SSB is partially overlapped with SMTC occasion ($T_{SSB_CDP}$ < $T_{SMTCperiod}$) and SMTC occasion is partially or fully overlapped with measurement gap.

- If SSB resource from serving cell is configured for L1-RSRP measurements, and $P_1$ is valid accoding to 9.5.4.1, and any symbol of the SSBs from serving cell and cell with different PCI are overlapping or adjacent (in time domain)

  - $P = \frac{P_2}{1-\frac{P_2*T_{SSB_CDP}}{P_1*T_{SSB_SC}}}$, if $P_2$*$T_{SSB_CDP}$ < $P_1$*$T_{SSB_SC}$.

  - P = $P_2$, if $P_2$*$T_{SSB_CDP}$> $P_1$*$T_{SSB_SC}$.

  - P = 2*$P_2$, if $P_1$*$T_{SSB_SC}$ = $P_2$*$T_{SSB_CDP}$.

- Otherwise, P = $P_2$

- $T_{SSB_CDP}$ = SSB periodicity of the cell with PCI different from serving cell

- $T_{SMTCperiod}$ = the configured SMTC period

- $T_{SSB_SC}$ = ssb-periodicityServingCell of the serving cell

$P_{sharing\ factor}$ = 1, if the SSB configured for L1-RSRP measurement outside measurement gap is

- not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

- not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,

$P_{sharing\ factor}$ = 3, otherwise.

$P_{L1_sharing}$ = 2, if SSB resource from serving cell is configured for L1-RSRP measurements, and $P_{sharing_factor}$ is used in clause 9.5.4.1, and any symbol of the SSBs from serving cell and cell with different PCI are overlapping or adjacent (in time domain). $P_{L1_sharing}$ = 1, otherwise.

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Longer evaluation period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 cell with PCI different from serving cell, longer evaluation period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

When UE is configured with aperiodic MUSIM gap and the aperiodic MUSIM gap is overlapping with SSB resource occasion for inter-cell L1-RSRP, longer evaluation period would be expected.

When UE is configured with MUSIM gap(s), and SSB resource occasions for inter-cell L1-RSRP are fully overlapped with MUSIM gap(s) or fully overlapped with the union of MUSIM gap(s) and GAPs, no requirement applies for the SSB based inter-cell L1-RSRP measurement.

For either an FR1 or FR2 cell with PCI different from serving cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 9.13.4.1-1: Inter-cell L1-RSRP measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$ for known cells with different PCIs in FR1**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_SSB_CDP}$ (ms) |
|---|---|

| NOTE: $T_{SSB_CDP}$ is the periodicity of the SSB-Index configured for inter-cell L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting. | |

## 9.13.5 Measurement restriction for L1-RSRP measurement

The UE is required to be capable of measuring SSB for L1-RSRP without measurement gaps. The UE is required to perform the SSB measurements with measurement restrictions as described in the following clauses.

Unless explicitly stated, the SSB to be measured for L1-RSRP measurement is transmitted from cell(s) with PCI different from serving cell(s).

### 9.13.5.1 Measurement restriction for SSB based L1-RSRP

For FR1,

If UE does not support [*multiDCI-InterCellMultiTRP-TwoTA-r18* or *multiDCI-IntraCellMultiTRP-TwoTA-r18* and *rxTimingDiff-r18*],

when the SSB for L1-RSRP measurement is in the same OFDM symbol as SSB transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement,

- UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;

when the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

If UE supports [*multiDCI-InterCellMultiTRP-TwoTA-r18* or *multiDCI-IntraCellMultiTRP-TwoTA-r18* and *rxTimingDiff-r18*],

when the SSB for L1-RSRP measurement and SSB transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement are overlapping or partially overlapping in OFDM symbols,

- UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;

when the SSB for L1-RSRP measurement and CSI-RS transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement are overlapping or partially overlapping in OFDM symbols,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2,

when the SSB for L1-RSRP measurement on one CC is in the same OFDM symbol as SSB transmitted from serving cell(s) for RLM, BFD, or CBD measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both the two SSBs. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

when the SSB for L1-RSRP measurement on one CC is in the same OFDM symbol as SSB for L1-RSRP measurement on the different CCs in the same band, UE is required to measure one of but not both the two SSBs. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

when the SSB for L1-RSRP measurement on one CC is in the same OFDM symbol as CSI-RS transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, if the network configures same or mixed numerology between SSB for L1-RSRP measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, UE shall be able to perform the related SSB based measurements in one band without any measurement restrictions in the other band, provided that UE is capable of independent beam management on this FR2 band pair.

## 9.13.6 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions described in the following clauses apply when UE is performing L1-RSRP measurement on cell(s) with PCI different from serving cell, and UE is receiving PDCCH/PDSCH from serving cell and/or cell(s) with different PCI.

### 9.13.6.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.13.6.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

If UE does not support [*multiDCI-InterCellMultiTRP-TwoTA-r18* or *multiDCI-IntraCellMultiTRP-TwoTA-r18* and *rxTimingDiff-r18*],

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

If UE supports [*multiDCI-InterCellMultiTRP-TwoTA-r18* or *multiDCI-IntraCellMultiTRP-TwoTA-r18* and *rxTimingDiff-r18*],

- For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols which are overlapped or partially overlapped with SSB symbols configured for L1-RSRP measurement

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions apply to cell(s) in the same band on the symbols that fully or partially overlap with restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions apply to cell(s) in the same band on the symbols that fully or partially overlap with restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

For UE indicating *intraBandNR-CA-non-collocated-r19*,

1> when UE is configured with maxMIMO-Layers with value equal to 4 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 4"*

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2> if *nonCollocatedTypeNR-CA-v1900* is *"type 1"*

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

2> else if *nonCollocatedTypeNR-CA-v1900* is not provided

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

1> when UE is configured with maxMIMO-Layers with value equal to 2 for the configured FR1 intra-band non-contiguous CA

2> if *nonCollocatedTypeNR-CA-r18* is not provided

3> there is no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band.

2>else

3> the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 cells configured in other bands than the bands in which the cell where L1-RSRP measurement is performed is configured.

### 9.13.6.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions is performed apply to cell(s) in the band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 cells in the bands due to L1-RSRP measurement performed on FR2 cell(s) in different band(s), provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

If following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE’s reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for L1-RSRP measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for L1-RSRP measurement.

### 9.13.6.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 cell(s) due to L1-RSRP measurement performed on FR2 cell(s).

There are no scheduling restrictions on FR2 cell(s) due to L1-RSRP measurement performed on FR1 cell(s).

### 9.13.6.5 Scheduling availability of UE performing L1-RSRP measurement in TDD bands on FR1

When UE performs L1-RSRP measurement on cell with different PCI from serving cell in a TDD band, the following restrictions apply due to L1-RSRP measurement

If UE does not support [*multiDCI-InterCellMultiTRP-TwoTA-r18* or *multiDCI-IntraCellMultiTRP-TwoTA-r18* and *rxTimingDiff-r18*],

- The UE is not expected to transmit PUCCH/PUSCH/SRS on symbols corresponding to the SSB indexes configured for L1-RSRP measurement, where the transmission of PUCCH/PUSCH/SRS may be on serving cell(s) and cell(s) with PCI different from serving cell(s), and restricted symbols may partially or fully overlap with UL symbols

If UE supports [*multiDCI-InterCellMultiTRP-TwoTA-r18* or *multiDCI-IntraCellMultiTRP-TwoTA-r18* and *rxTimingDiff-r18*],

- The UE is not expected to transmit PUCCH/PUSCH/SRS on the symbols configured for L1-RSRP measurement which are overlapped or partially overlapped with SSB symbols configured for L1-RSRP measurement

# 9.14 NR intra-frequency L1-RSRP measurements for neighbor cell

## 9.14.1 Introduction

A measurement is defined as an SSB based intra-frequency L1-RSRP measurement provided the centre frequency of the SSB of the serving cell and the centre frequency of the SSB of the neighbour cell are the same, and the subcarrier spacing of the two SSBs are also the same.

When configured with *LTM-CSI-ResourceConfig-r18* by the network, the UE shall be able to perform L1-RSRP measurements of configured measurement resources from a neighbor cell, with the measurement resources configured as SSBs of the neighbor cell.

If the number of resources/cells, including the number of resources/cells configured for L1-RSRP measurement in clause 9.14 exceeds the UE capability specified in clause 9.14.4, it is up to UE implementation on how to choose cells/SSB to measure, and the cells which have TCI state(s) in the LTM candidate cell active TCI state list shall be prioritized.

The UE shall report the measurement quantity and send periodic, semi-persistent or aperiodic reports, according to the higher layer parameter *reportConfigType-r18* of each reporting setting *LTM-CSI-ReportConfig-r18*.

## 9.14.2 Requirements Applicability

The requirements in the clause 9.14 are applicable to FR1 and FR2-1 for LTM.

The requirements in clause 9.14 apply, provided for the SSB from the neighbor cell configured for intra-frequency L1-RSRP measurement, the following conditions are met:

- The cell is known

- The SSB configured for intra-frequency L1-RSRP measurement is on the same carrier frequency of SSB configured for L3 intra-frequency measurement.

- The SSB resources configured for L1-RSRP measurements are measurable.

An SSB resource configured for L1-RSRP for neighbor cell shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clause 10.1.19D for FR1 and 10.1.20A for FR2-1, respectively, for a corresponding band,

- SSB_RP and SSB Ês/Iot according to annex B.2.4.1 for a corresponding band.

The cell is considered as known if the following conditions are met in this requirement:

- The UE has performed L3 measurement on the target cell during the last 5 seconds, and

- The SSB from the target cell configured for L1 measurement remains detectable according to the cell identification requirements specified in clause 9.2.

Otherwise, the cell is unknown.

## 9.14.3 Measurement Reporting Requirements

The UE shall report the L1-RSRP value as a 7-bit value in the range -140, -44 dBm with 1 dB step size according to clauses 10.1.19D for FR1 and 10.1.20A for FR2 if *noOfReportedRS-PerCell-r18* and *noOfReportedCells-r18* are both configured to one. If *noOfReportedRS-PerCell-r18* and/or *noOfReportedCells-r18* are configured to be larger than one, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19D for FR1 and 10.1.20A for FR2. The differential L1-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6, where the reported differential value for unmeasured LTM L1-RSRP resources is DIFFRSRP_15 in table 10.1.6.1.

### 9.14.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19D for FR1 and 10.1.20A for FR2, respectively. The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.14.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19D for FR1 and 10.1.20A for FR2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.14.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clauses 10.1.19D for FR1 and 10.1.20A for FR2, respectively.

The UE shall only send aperiodic L1-RSRP measurement report if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

### 9.14.3.4 Event Triggered Reporting

Reported L1-RSRP measurements contained in an event triggered L1-RSRP measurement report shall meet the requirements in clauses 10.1.19/10.1.19D for FR1 and 10.1.20/10.1.20A for FR2, respectively. This requirement applies for event triggered L1-RSRP reports sent on PUSCH using the MAC CE specified in clause 6.1.3.84 of TS 38.321 [7].

The UE shall not send any event triggered measurement reports if no reporting criteria is fulfilled.

The event triggered measurement reporting delay is defined as the time between an event that will trigger an event triggered measurement report and the point when the UE starts to transmit the first UL transmission to report the measurement results over the air interface. This measurement reporting delay excludes a delay which is caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay shall be no larger than the maximum L1-RSRP measurement period of the cells corresponding to the event.

If serving cell is involved in event evaluation, L1-RSRP measurement period of serving cell refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ as defined in 9.5, assuming $T_{Report} = 0$ and $T_{SSB}$ is the periodicity of the serving cell SSB-Index configured for event triggered L1-RSRP measurement report, which is indicated by the *ssb-periodicityServingCell*

If neighbor cell is involved in event evaluation, L1-RSRP measurement period of neighbor cell refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB_intra}$ for SSB based intra-frequency measurement, as defined in 9.14, assuming $T_{Report} = 0$ and $T_{SSB_NBC}$ is the periodicity of the neighbor cell SSB-Index configured for intra-frequency event-triggered L1-RSRP measurement report.

#### 9.14.3.5 Event-triggered Periodic Reporting

Reported L1-RSRP measurements contained in an event triggered L1-RSRP measurement report shall meet the requirements in clauses 10.1.19/10.1.19D for FR1 and 10.1.20/10.1.20A for FR2, respectively. This requirement applies for event triggered L1-RSRP reports sent on PUSCH using the MAC CE specified in clause 6.1.3.84 of TS 38.321 [7].

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.14.3.4. For the subsequent reports in the event triggered periodic report, UE follows the reportInterval-r19 and reportAmount-r19 as specified in TS 38.331.

### 9.14.4 Number of SSB frequency layers, number of cells and number of SSBs

The number of intra-frequency layers, number of cells and number of SSBs that UE shall be capable of performing L1-RSRP measurements on are reported by the capabilities *supportedMaxIntraInterFreqLayersWithoutGaps-r18, supportedMaxNeighCellsPerFreqLayersWithoutGaps-r18, supportedMaxSSB-PerFreqLayersWithoutGaps-r18, supportedMaxCellsWithoutGapsL1-Meas-r18, supportedMaxSSB-L1-Meas-r18, and supportedMaxSSB-WithinSlotL1-Meas-r18.*

For L1-RSRP measurement on neighbour cell, UE measures only one intra-frequency layer on each FR2 band in CA scenario, where this single intra-frequency layer shall be the same frequency layer that UE performs L3 intra-frequency layer measurement in that FR2 band.

### 9.14.5 L1-RSRP intra-frequency measurement requirements without measurement gaps

#### 9.14.5.1 SSB based L1-RSRP reporting

The requirements specified in this clause are only applicable when

- *highSpeedMeasFlag-r16* is not configured, and
- *highSpeedMeasFlagFR2-r17* is not configured, and
- *highSpeedMeasCA-Scell-r17* is not configured.
- The SSB from the neighbor cell is completely contained in the active BWP of the UE

If a neighbor cell is known according to clause 9.14.2, the UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_intra}$ if *deriveSSB-IndexFromCell* is enabled or UE has reported SSB index in L3 measurement report of the same cell. Otherwise, UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_intra} + T_{SSB_time_index_intra}$, where $T_{SSB_time_index_intra}$ is the time period used to acquire the index of the SSB being measured given in table 9.2.5.1-3.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_intra}$ is defined for FR1 in table 9.14.5.1-1 for UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* and in table 9.14.5.1-2 for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*. The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_intra}$ is defined for FR2 in table 9.14.5.1-3 for UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* and in table 9.14.5.1-4 for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*, where

- M=1.
- N= 8.
- P value for SSB resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0

  For a window W of duration max ($T_{L1,\ MGRP_max}$), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps and per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any SSB resource occasion:
  - $N_{total}$ is the total number of SSB resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
  - $T_{L1}$ is periodicity of the target SSB.
- $P_{sharing\ factor}$ = 1, if the SSB configured for L1-RSRP measurement outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,
- $P_{sharing\ factor}$ = 3, otherwise.
- $P_{L1_sharing}$ is defined as
  - When number of neighboring cells configured with SSB based L1-RSRP measurement is 1
    - $P_{L1_sharing}$ = 2, if any symbol of the SSBs from serving cell and neighbor cell are overlapping or adjacent (in time domain)
    - $P_{L1_sharing}$ = 1, otherwise
  - When number of neighboring cells configured with SSB based L1-RSRP measurement is more than 1
    - When none of TCI state(s) of the intra-frequency neighbor cells or inter-frequency neighbor cells without gap are in the LTM candidate cell active TCI state list
      - $P_{L1_sharing}$ = 3*$N_{Neighbor_Cell}$, where $N_{Neighbor_Cell}$ is the number of neighbor cells to measure on intra-frequency and inter-frequency without gap
    - Otherwise
      - $P_{L1_sharing}$ = 3*$N_{Neighbor_Cell_in_list}$, where $N_{Neighbor_Cell_in_list}$ is the number of neigbour cells including intra-frequency neighbor cell(s) and inter-frequency neighbor cell(s) without gap which have TCI state(s) in the LTM candidate cell active TCI state list. No requirements are defined for the cell(s) which do not have TCI state(s) in the LTM candidate cell active TCI state list

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the

shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Longer measurement period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 cell, longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E-UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 9.14.5.1-1: Intra-frequency L1-RSRP measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_intra}$ in FR1 for UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18***

## 9.14.6 Measurement restriction for L1-RSRP measurement

Measurement restrictions described in the following clauses apply when UE is performing L1-RSRP measurement on neighbor cell(s) without measurement gap.

Unless explicitly stated, the SSB to be measured for L1-RSRP measurement is transmitted from neighbor cell(s).

### 9.14.6.1 Measurement restriction for SSB based L1-RSRP

For FR1,

when the SSB for L1-RSRP measurement fully or partially overlaps with the OFDM symbol as SSB transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement,

- UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;

when the SSB for L1-RSRP measurement is in the same OFDM symbol as CSI-RS transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, for UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* and for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*,

when the SSB for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as SSB transmitted from serving cell(s) for RLM, BFD, or CBD measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based L1-RSRP is expected, and no requirements are defined.

when the SSB for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS transmitted from serving cell(s) for RLM, BFD, or CBD measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the SSB for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS from candidate LTM neighbour cell for intra-frequency L1-RSRP measurement, UE is required to measure one of but not both SSB and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, if the network configures same or mixed numerology between SSB for L1-RSRP measurement on one FR2 band and CSI-RS from serving cell(s) for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, UE shall be able to perform the related SSB based measurements in one band without any measurement restrictions in the other band, provided that UE is capable of independent beam management on this FR2 band pair.

## 9.14.7 Scheduling availability of UE during L1-RSRP measurement

Scheduling availability restrictions described in the following clauses apply when UE is performing L1-RSRP measurement on neighbor cell(s) without measurement gap.

Unless explicitly stated, the SSB to be measured for L1-RSRP measurement is transmitted from neigbor cell(s).

### 9.14.7.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.14.7.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the concerned OFDM symbols, where the concerned OFDM symbols are
  - the same and 1 OFDM symbol before or after the OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, if UE supports *multiCellL1-measRTD-greaterThan-CP-r18*,
  - the same OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, if UE does not support *multiCellL1-measRTD-greaterThan-CP-r18*,

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions apply to cell(s) in the same band on the symbols that fully or partially overlap with restricted symbols. When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 cells configured in other bands than the bands in which the cell where L1-RSRP measurement is performed.

### 9.14.7.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the concerned OFDM symbols, where the concerned OFDM symbols are
  - the same and 1 OFDM symbol before or after the OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, if UE supports *multiCellL1-measRTD-greaterThan-CP-r18*,
  - the same OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, if UE does not support *multiCellL1-measRTD-greaterThan-CP-r18*,

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions apply to cell(s) in the band on the symbols that fully or partially overlap with restricted symbols..

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 cells in the bands due to L1-RSRP measurement performed on FR2 cell(s) in different band(s), provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

If following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for L1-RSRP measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for L1-RSRP measurement.

### 9.14.7.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 cell(s) due to L1-RSRP measurement performed on FR2 cell(s).

There are no scheduling restrictions on FR2 cell(s) due to L1-RSRP measurement performed on FR1 cell(s).

### 9.14.7.5 Scheduling availability of UE performing L1-RSRP measurement in TDD bands on FR1

When UE performs L1-RSRP measurement on neighbor cell in a TDD band, the following restrictions apply due to L1-RSRP measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on the concerned OFDM symbols and restricted symbols may partially or fully overlap with UL symbols, where the concerned OFDM symbols are
  - the same and 1 OFDM symbol before or after the OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, if UE supports *multiCellL1-measRTD-greaterThan-CP-r18*,
  - the same OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, if UE does not support *multiCellL1-measRTD-greaterThan-CP-r18*.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When TDD inter-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this band pair.

When inter-band FR1+FR1 NR-DC is performed, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this band pair.

# 9.14a CSI-RS based Intra-frequency L1-RSRP measurements for neighbour cell

## 9.14a.1 Introduction

A measurement is defined as a CSI-RS based intra-frequency L1-RSRP measurement provided that:

- the SCS of the CSI-RS resource of LTM candidate cell(s) configured for L1 measurement is the same as the SCS of active DL BWP, and
- for SCS of 60KHz, the CP type of the CSI-RS resource of LTM candidate cell(s) configured for L1 measurement is the same as the CP type of active DL BWP, and
- at least 48 RBs of the CSI-RS resource of LTM candidate cell(s) configured for L1 measurement is included within the active DL BWP.

Otherwise, a measurement is defined as a CSI-RS based inter-frequency L1 measurement.

When configured by the network, the UE shall be able to perform CSI-RS based L1-RSRP measurements for neighbour cell, on the intra-frequency CSI-RS resources configured for L1-RSRP measurements.

The UE shall report the measurement quantity and send periodic, semi-persistent or aperiodic reports, according to the higher layer parameter ltm-ReportConfigType of each reporting setting LTM-CSI-ReportConfig.

## 9.14a.2 Requirements Applicability

The requirements in the clause 9.14a are applicable to FR1 and FR2-1 for LTM.

The requirements in clause 9.14a apply for CSI-RS L1-RSRP measurements for configured LTM candidate cell, provided the following conditions are met:

- The cell is known,
- The CSI-RS L1-RSRP measurement is configured as periodic CSI-RS or semi-persistent CSI-RS measurement, and
- at least 48 RBs of the CSI-RS configured for measurement is within the active BWP, and
- repetition is set to “OFF” or not configured.
- UE observed RTD <= CP
- All CSI-RS resources are configured within up to two separate windows where each window is up to 5 ms
- When the configured CSI-RS based L1 RSRP measurement for LTM candidate cell does not exceed UE measurement capability.
- For FR1 and FR2-1 when there are scheduling restrictions according to 9.14a.7, the requirements apply provided all CSI-RS resources within a 40 ms window on one intra-frequency layer are configured within up to two separate windows, each lasting up to 5 ms. The separation of the two 5ms windows is at least 4ms.

## 9.14a.3 Measurement Reporting Requirements

The UE shall report the L1-RSRP value as a 7-bit value in the range -140, -44 dBm with 1 dB step size according to clauses 10.1.19D.2 for FR1 and 10.1.20A.2 for FR2 if *noOfReportedRS-PerCell-r18* and *noOfReportedCells-r18* are both configured to one. If *noOfReportedRS-PerCell-r18* and/or *noOfReportedCells-r18* are configured to be larger than one, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19D.2 for FR1 and 10.1.20A.2 for FR2. The differential L1-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6, where the reported differential value for unmeasured LTM L1-RSRP resources is DIFFRSRP_15 in table 10.1.6.1.

### 9.14a.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19D.2 for FR1 and 10.1.20A.2 for FR2, respectively. The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.14a.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19D.2 for FR1 and 10.1.20A.2 for FR2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.14a.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in aperiodic triggered, aperiodic triggered periodic and aperiodic triggered semi-persistent L1-RSRP reports shall meet the requirements in clauses 10.1.19D.2 for FR1 and 10.1.20A.2 for FR2, respectively.

The UE shall only send aperiodic L1-RSRP measurement report if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

### 9.14a.3.4 Event-triggered Periodic Reporting

Reported CSI-RS based L1-RSRP measurements contained in event-triggered periodic measurement reports shall meet the requirements in clauses 10.1.19D.2 for FR1 and 10.1.20A.2 for FR2.

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.14a.3.5.

### 9.14a.3.5 Event Triggered Reporting

Reported CSI-RS based L1-RSRP measurements contained in event triggered measurement reports shall meet the requirements in clauses clauses 10.1.19D.2 for FR1 and 10.1.20A.2 for FR2.

The UE shall not send any event triggered measurement reports as long as no reporting criteria is fulfilled.

The event triggered measurement reporting delay is defined as the time between an event that will trigger an event triggered measurement report and the point when the UE starts to transmit the first UL transmission to report the measurement results over the air interface. This measurement reporting delay excludes a delay which is caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay shall be no larger than the maximum L1-RSRP measurement period of the cells corresponding to the event.

If serving cell is involved in event evaluation, L1-RSRP measurement period of serving cell refers to $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ as defined in 9.5, assuming $T_{Report} = 0$ and $T_{CSI\text{-}RS}$ is the periodicity of the serving cell CSI-RS configured for event triggered L1-RSRP measurement report.

If neighbor cell is involved in event evaluation, L1-RSRP measurement period of neighbor cell refers to $T_{L1\text{-}RSRP_Measurement_Period_CSI_intra}$ defined in 9.14a.5, assuming $T_{Report} = 0$, and $T_{CSI\text{-}RS}$ is the periodicity of the neighbor cell CSI-RS configured for intra-frequency event-triggered L1-RSRP measurement report.

## 9.14a.4 Number of CSI-RS resources, number of cells

The number of cells and number of CSI-RS resources that UE shall be capable of performing L1-RSRP measurements on are reported by the capabilities.

## 9.14a.5 CSI-RS based L1-RSRP measurement requirements without measurement gaps

The requirements specified in this clause are only applicable when

- maximum RTD between cells are within CP.
- *highSpeedMeasFlag-r16* is not configured, and
- *highSpeedMeasFlagFR2-r17* is not configured, and
- *highSpeedMeasCA-Scell-r17* is not configured.
- At least 48 RBs of the CSI-RS configured for measurement is confined within the active BWP of the UE.

If a neighbor cell is known according to 9.14a.2, the UE shall be capable of performing L1-RSRP measurements based on the configured CSI-RS resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_intra}$.

The value of $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_intra}$ is defined in table 9.14a.5-1 for FR1 and in table 9.14a.5-2 for FR2, where

- For periodic and semi-persistent CSI-RS resources in a resource set configured with higher layer parameter *repetition* set to OFF or repetition RRC object is not configured,
  - N=8 if UE is capable of *skippingSSBbasedL1mesurement-R19 and* the CSI-RS resources shall be Type-D QCL'ed with the associated SSB for L3 measurement and the CSI-RS resource is configured with *LTM-CSI-ResourceConfig*; Otherwise,
  - N=1 if *qcl-InfoPeriodicCSI-RS* is configured for all the resources in the resource set and for each resource one RS has QCL-TypeD with SSB for L1-RSRP measurement.
- P value for CSI-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0

  For a window W of duration max ($T_{L1,}$ MGRP_max), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps and per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any CSI-RS resource occasion:
  - $N_{total}$ is the total number of CSI-RS resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{outside_MG}$ is the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is the number of CSI-RS resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
  - $T_{L1}$ is periodicity of the target CSI-RS resource.
- $P_{sharing\ factor}$ = 1, if the CSI-RS configured for L1-RSRP measurement outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure*

is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,

- not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,

- $P_{sharing\ factor} = 3$, otherwise.

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*. $T_{SMTCperiod}$ is the shortest SMTC period among all CCs in the same FR2 band, provided the SMTC offset of all CCs in FR2 have the same offset.

Longer measurement period would be expected if the combination of CSI-RS, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 cell, longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 9.14a.5-1: Intra-frequency L1-RSRP measurement period $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_intra}$ in FR1**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, ceil(P)*T_{CSI\text{-}RS_NBC})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, ceil(K*P)*\max(T_{DRX},T_{CSI\text{-}RS_NBC}))$ |
| DRX cycle > 320 ms | $ceil(P)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS_NBC}$ is the periodicity of neighbor cell CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting.<br>NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3.<br>NOTE 3: K = 1.5. | |

**Table 9.14a.5-2: Intra-frequency L1-RSRP measurement period $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS_intra}$ in FR2**

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_CSI\text{-}RS}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, ceil(P*N)*T_{CSI\text{-}RS_NBC})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, ceil(1.5*P*N)*\max(T_{DRX},T_{CSI\text{-}RS_NBC}))$ |
| DRX cycle > 320 ms | $ceil(M*P*N)*T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS_NBC}$ is the periodicity of neighbor cell CSI-RS configured for L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting.<br>NOTE 2: The requirements are applicable provided that the CSI-RS resource configured for L1-RSRP measurement is transmitted with Density = 3. | |

## 9.14a.6 Measurement restriction for CSI-RS based L1-RSRP measurement

Measurement restrictions described in the following clauses apply when UE is performing L1-RSRP measurement on neighbor cell(s) without measurement gap.

Unless explicitly stated, the CSI-RS to be measured for L1-RSRP measurement is transmitted from neighbor cell(s).

### 9.14a.6.1 Measurement restriction for CSI-RS based L1-RSRP measurement

The SSB mentioned in this clause can be associated with either the serving cell PCI or a PCI different from serving cell PCI or intra-frequency neighbor cell(s) configured with L1-RSRP measurement or inter-frequency neighbor cell(s) configured with L1-RSRP measurement without gap.

For both FR1 and FR2, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as SSB for RLM, BFD, CBD or L1-RSRP measurement, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has same SCS as the CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement is within the active BWP and has different SCS than CSI-RS for L1-RSRP measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.

- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR1, when the CSI-RS for L1-RSRP measurement is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

For FR2, when the CSI-RS for L1-RSRP measurement on one CC is in the same OFDM symbol as SSB for RLM, BFD or L1-RSRP measurement on the same CC or different CCs in the same band, or in the same symbol as SSB for CBD measurement on the same CC or different CCs in the same band when beam failure is detected, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, when the CSI-RS for L1-RSRP measurement on one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD, CBD or L1-RSRP measurement on the same CC or different CCs in the same band,

- In the following cases, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and the other CSI-RS. Longer measurement period for CSI-RS based L1-RSRP measurement is expected, and no requirements are defined.

  - The CSI-RS for L1-RSRP measurement or the other CSI-RS in a resource set configured with repetition ON, or

  - The other CSI-RS is configured in q1 and beam failure is detected, or

  - The two CSI-RS-es are not QCL-ed w.r.t. QCL-TypeD, or the QCL information is not known to UE,

- Otherwise, UE shall be able to measure the CSI-RS for L1-RSRP measurement without any restriction.

For UE incapable of *multiCellL1-measRTD-greaterThan-CP-r18* and for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*,

- For both FR1 and FR2, when the CSI-RS for L1-RSRP measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, UE is not required to receive CSI-RS for L1-RSRP measurement in the PRBs that overlap with an SSB.

- For FR1, when the CSI-RS for L1-RSRP measurement fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap, if CSI-RS and SSB have different SCS and UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP is expected, and no requirements are defined.

- For FR2, when the CSI-RS for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as SSB from candidate LTM neighbor cell for intra-frequency L1-RSRP measurement or inter-frequency L1-RSRP measurement without gap in the same band, UE is required to measure one of but not both CSI-RS for L1-RSRP measurement and SSB. Longer measurement period for CSI-RS based L1-RSRP is expected, and no requirements are defined.

For FR2-1, when the CSI-RS for L1-RSRP measurement on the one CC is in the same OFDM symbol as another CSI-RS for RLM, BFD or L1-RSRP measurement on the same CC, UE supporting *schedulingMeasurementRelaxation-r18* according to the conditions described in clause 3.6.19 shall be able to measure the CSI-RS for L1-RSRP measurement without restriction when the following conditions are met:

- Both CSI-RSs are not in any CSI-RS resource set with repetition ON, and
- One CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 clause 5.1.5, and
  - the other CSI-RS has same QCL source as either
  - the active TCI state of a PDSCH scheduled in the same OFDM symbol or
  - the QCL source based on the default QCL assumption to be applied in the same OFDM symbol according to TS 38.214 clause 5.1.5, and
- Resources of the active TCI states of the two PDSCHs, or QCL sources of the default QCL assumption, or the active TCI state of PDSCH and QCL source of the default QCL assumption have been reported as a resource group in Rel-17 group-based RSRP report.

## 9.14a.7 Scheduling availability of UE during CSI-RS based L1-RSRP measurement

Scheduling availability restrictions described in the following clauses apply when UE is performing CSI-based L1-RSRP measurement on neighbor cell(s) without measurement gap.

Unless explicitly stated, the CSI-RS resource to be measured for L1-RSRP measurement is transmitted from neigbor cell(s).

### 9.14a.7.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on CSI-RS as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

### 9.14a.7.2 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to CSI-RS based L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the concerned OFDM symbols, where the concern OFDM symbols are
  - the same OFDM symbols corresponding to the CSI-RS resources configured for L1-RSRP measurement.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions is performed apply to cell(s) in the band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 cells in the bands due to L1-RSRP measurement performed on FR2 cell(s) in different band(s), provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between CSI-RS resources on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

### 9.14a.7.3 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 cell(s) due to CSI-RS based L1-RSRP measurement performed on FR2 cell(s).

There are no scheduling restrictions on FR2 cell(s) due to CSI-RS based L1-RSRP measurement performed on FR1 cell(s).

### 9.14a.7.4 Scheduling availability of UE performing L1-RSRP measurement in TDD bands on FR1

When UE performs CSI-RS based L1-RSRP measurement on neighbor cell in a TDD band, the following restrictions apply due to L1-RSRP measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on the concerned OFDM symbols and restricted symbols may partially or fully overlap with UL symbols, where the concern OFDM symbols are the same OFDM symbols corresponding to the CSI-RS resources configured for L1-RSRP measurement.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

## 9.15 NR inter-frequency L1-RSRP measurements for neighbor cell

### 9.15.1 Introduction

A L1-RSRP measurement is defined as an inter-frequency L1-RSRP measurement provided it is not defined as an intra-frequency L1-RSRP measurement according to clause 9.14.

For UE supporting *ltm-InterFreqMeasGap-r18*, when measurement gaps are configured, the UE shall be able to perform inter-frequency L1-RSRP measurements of SSBs from inter-frequency neighbor cells. For UE supporting *interFreqSSB-L1-MeasWithoutGaps-r18*, the UE shall perform inter-frequency L1-RSRP measurements of SSBs from inter-frequency neighbor cells without gaps if SSBs are within active BWPs.

The UE shall measure SSB resources within the *LTM-CSI-ResourceConfig-r18* settings configured for L1-RSRP measurement on inter-frequency neighbor cells with measurement gaps according to UE capability specified in clause 9.15.4. If the number of resources configured exceeds the UE capability specified in clause 9.15.4, it is up to UE implementation on how to choose resources to measure, and the cell(s) which have TCI state(s) in the LTM candidate cell active TCI state list shall be prioritized.

The UE shall report the measurement quantity (*reportQuantity*) and send periodic, semi-persistent or aperiodic reports, according to the higher layer parameter *reportConfigType-r18*of each reporting setting *LTM-CSI-ReportConfig-r18*.

For UE supporting *interFreqL1-OnlyInBC-r18,* for each BC in which the UE indicates in *interFreqL1-MeasConfig-r18* capability, the UE is only required to measure and report L1-RSRP SSB measurements configured for the indicated BC.

### 9.15.2 Requirements Applicability

The requirements in clause 9.15 apply if the following conditions are met:

- The SSB configured for inter-frequency L1-RSRP measurement is on the same carrier frequency of SSB configured for RRM measurement in one of the measurement objects configured in the measObjectNR.
- The inter-frequency neighbor cell is known.
- The SSB resources configured for inter-frequency L1-RSRP measurements are measurable.

An SSB resource configured for inter-frequency L1-RSRP shall be considered measurable when for each relevant SSB the following conditions are met:

- L1-RSRP related side conditions given in clauses 10.1.19E.1 and 10.1.20B.1 for FR1 and FR2, respectively, for a corresponding band,
- SSB_RP and SSB Ês/Iot according to annex B.2.4.1 for a corresponding band.

The inter-frequency neighbor cell is considered as known if the following conditions are met in this requirement:

- The UE has performed L3 measurement on the target cell during the last 5 seconds, and
- The SSB from the target cell configured for L1 measurement remains detectable according to the cell identification requirements specified in clause 9.3.

Otherwise, the cell is unknown.

## 9.15.3 Measurement Reporting Requirements

The UE shall send L1-RSRP reports for report configurations configured for the inter-frequency L1 measurement on neighbor cell.

The UE shall report the L1-RSRP value as a 7-bit value in the range -140, -44 dBm with 1dB step size according to clause 10.1.19E for FR1 and 10.1.20B for FR2 if *noOfReportedRS-PerCell-r18* and *noOfReportedCells-r18* are both configured to one. If *noOfReportedRS-PerCell-r18* and/or *noOfReportedCells-r18* is configured to be larger than one, the UE shall use differential L1-RSRP based reporting as defined in clause 10.1.19E for FR1 and 10.1.20B for FR2. The differential L1-RSRP is quantized to a 4-bit value with 2dB step size. The mapping between the reported L1-RSRP value and the measured quantity is described in clause 10.1.6, where the reported differential value for unmeasured LTM L1-RSRP resources is DIFFRSRP_15 in table 10.1.6.1.

In EN-DC and NE-DC operation, when the UE is configured to perform E-UTRA SRS carrier-based switching an additional delay can be expected in FR1 if the UE is capable of per-FR gap, or an additional delay can be expected in both FR1 and FR2 if the UE is not capable of per-FR gap.

### 9.15.3.1 Periodic Reporting

Reported L1-RSRP measurements contained in periodic L1-RSRP measurement reports shall meet the requirements in clauses 10.1.19E for FR1 and 10.1.20B for FR2, respectively.

The UE shall transmit the periodic L1-RSRP reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.15.3.2 Semi-Persistent Reporting

Reported L1-RSRP measurements contained in a Semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19E for FR1 and 10.1.20B for FR2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUSCH, if a DCI request has been received.

The UE shall only send semi-persistent L1-RSRP measurement reports on PUCCH, if an activation command [7] has been received.

The UE shall transmit the semi-persistent L1-RSRP reporting on PUSCH or PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

### 9.15.3.3 Aperiodic Reporting

Reported L1-RSRP measurements contained in a semi-Persistent L1-RSRP measurement report shall meet the requirements in clauses 10.1.19E for FR1 and 10.1.20B for FR2, respectively. This requirement applies for semi-persistent L1-RSRP reports send on PUSCH or PUCCH.

The UE shall only send aperiodic L1-RSRP measurement report if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

#### 9.15.3.4 Event Triggered Reporting

Reported L1-RSRP measurements contained in an event triggered L1-RSRP measurement report shall meet the requirements in clauses 10.1.19/10.1.19E for FR1 and 10.1.20/10.1.20B for FR2, respectively. This requirement applies for event triggered L1-RSRP reports sent on PUSCH using the MAC CE specified in clause 6.1.3.84 of TS 38.321 [7].

The UE shall not send any event triggered measurement reports if no reporting criteria is fulfilled.

The event triggered measurement reporting delay is defined as the time between an event that will trigger an event triggered measurement report and the point when the UE starts to transmit the first UL transmission to report measurement result over the air interfac. This measurement reporting delay excludes a delay which is caused by no UL resources being available for UE to send the measurement report on.

The event triggered measurement reporting delay shall be no larger than the maximum L1-RSRP measurement period of the cells corresponding to the event.

If serving cell is involved in event evaluation, L1-RSRP measurement period of the serving cell refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB}$ as defined in clause 9.5, where $T_{Report} = 0$ and $T_{SSB}$ is the periodicity of the serving cell SSB-Index configured for event triggered L1-RSRP measurement report, which is indicated by the *ssb-periodicityServingCell*.

If an inter-frequency neighbor cell is involved in event evaluation, L1-RSRP measurement period of the neighbor cell refers to $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter}$ as defined in clause 9.15, where $T_{Report} = 0$ and $T_{SSB_NBC}$ is the periodicity of the neighbor cell SSB-Index configured for inter-frequency event-triggered L1-RSRP measurement report.

#### 9.15.3.5 Event Triggered Periodic Reporting

Reported L1-RSRP measurements contained in an event triggered L1-RSRP measurement report shall meet the requirements in clauses 10.1.19/10.1.19E for FR1 and 10.1.20/10.1.20B for FR2, respectively. This requirement applies for event triggered L1-RSRP reports sent on PUSCH using the MAC CE specified in clause 6.1.3.84 of TS 38.321 [7].

The first report in event triggered periodic measurement reporting shall meet the requirements specified in clause 9.15.3.4. For the subsequent reports in the event triggered periodic report, UE follows the *reportInterval-r19* and reportAmount-r19 as specified in TS 38.331.

### 9.15.4 Number of SSB frequency layers, number of cells and number of SSBs

The number of inter-frequency layers, number of cells and number of SSBs that UE shall be capable of performing L1-RSRP measurements on are reported in *maxFreqLayersL1-Meas-r18, maxNeighCellsPerFreqLayerL1-Meas-r18, maxSSB-PerFreqLayerL1-Meas-r18, supportedMaxCellsWithoutGapsL1-Meas-r18, supportedMaxSSB-L1-Meas-r18,* and *supportedMaxSSB-WithinSlotL1-Meas-r18*.

### 9.15.5 L1-RSRP inter-frequency measurement requirements with measurement gaps

#### 9.15.5.1 Inter-frequency SSB based L1-RSRP reporting

The requirements specified in this clause are only applicable when

- *highSpeedMeasFlag-r16* is not configured, and
- *highSpeedMeasFlagFR2-r17* is not configured, and
- highSpeedMeasCA-Scell-r17 is not configured, and
- Concurrent gaps are not configured, and
- SSBs of the neighbor cell configured for inter-frequency L1-RSRP measurement are fully or partially overlapped with measurement gaps.

If an inter-frequency neighbor cell is known according to clause 9.15.2, the UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_Inter}$ if *deriveSSB-IndexFromCellInter-r17* is enabled on target frequency layers or UE is indicated to report SSB based RRM measurement result with the associated SSB index (*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured) of the same cell. Otherwise, UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter}+T_{SSB_time_index_inter}$, where $T_{SSB_time_index_inter}$ is the time period used to acquire the index of the SSB being measured given in table 9.3.4.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_Inter}$ is defined in table 9.15.5.1-1 for FR1 and in table 9.15.5.1-3 for FR1 for the UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3. The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_Inter}$ is defined in table 9.15.5.1-2 for FR2 and in table 9.15.5.1-4 for FR2 for the UE configured with measurement gap cancellation according to clause 9.1.14 and meeting all conditions in clause 9.1.14.3, where

- M= 2
- N = 8.
- $CSSF_{inter}$: it is a carrier specific scaling factor and is determined according to $CSSF_{within_gap,i}$ in clause 9.1.5.2 for L1-RSRP measurement conducted within measurement gaps.

**Table 9.15.5.1-1: Inter-frequency L1-RSRP measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_Inter}$ with measurement gaps in FR1**

| Condition | $T_{L1\text{-}RSRP_Measurement_Period_SSB_Inter}$ |
|---|---|
| No DRX | $Max(T_{report}, Ceil(M * K_{gap}) \times Max(MGRP, T_{SSB_NBC}) \times CSSF_{inter})$ |

SSB period is the periodicity of the neighbor cell SSB-Index configured for inter-frequency L1-RSRP measurement. $T_{Report}$ is the configured periodicity for reporting. | |

## 9.15.6 L1-RSRP inter-frequency L1-RSRP measurement requirements without measurement gaps

### 9.15.6.1 Inter-frequency L1-RSRP measurement requirements

#### 9.15.6.1.1 Inter-frequency SSB based L1-RSRP measurement

When configured by the network and the inter-frequency cell's SSB is completely contained in the DL active BWP, the UE shall be able to perform L1-RSRP measurements without gaps and without interruptions based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter_withoutGap}$.

If a neighbor cell is known according to clause 9.15.2, the UE shall be capable of performing L1-RSRP measurements based on the configured SSB resource for L1-RSRP computation, and the UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter_withoutGap}$ if *deriveSSB-IndexFromCellInter-r17* is enabled or UE has reported SSB index in L3 measurement report of the same cell. Otherwise, UE physical layer shall be capable of reporting L1-RSRP measured over the measurement period of $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter_withoutGap}+T_{SSB_time_index_inter}$, where $T_{SSB_time_index_inter}$ is the time period used to acquire the index of the SSB being measured given in table 9.3.9.1-3 for FR1 and in table 9.3.9.1-4 for FR2.

The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter_withoutGap}$ is defined for FR1 in table 9.15.6.1.1-1. The value of $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter_withoutGap}$ is defined for FR2 in table 9.15.6.1.1-2, where

- M=1
- N= 8.
- P value for SSB resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
  - $P_{sharing\ factor}$ * $N_{total}$ / $N_{outside_MG}$ in FR2 with $N_{available}$ = 0
  - $N_{total}$ / $N_{available}$ in FR2 with $N_{available}$ > 0

  For a window W of duration max($T_{L1,\ MGRP_max}$), where MGRP max is the maximum MGRP across all configured per-UE measurement gaps and per-FR measurement gaps within the same FR as serving cell, and starting at the beginning of any SSB resource occasion:
  - $N_{total}$ is the total number of SSB resource occasions within the window, including those overlapped with measurement gap occasions or SMTC occasions within the window, and
  - $N_{outside_MG}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion within the window W
  - $N_{available}$ is the number of SSB resource occasions that are not overlapped with any measurement gap occasion nor any SMTC occasion within the window W
  - $T_{L1}$ is periodicity of the target SSB.
- $P_{sharing\ factor}$ = 1, if the SSB configured for L1-RSRP measurement outside measurement gap is
  - not overlapped with the SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol before each consecutive SSB symbols indicated by *SSB-ToMeasure* and 1 data symbol after each consecutive SSB symbols indicated by *SSB-ToMeasure*, given that *SSB-ToMeasure* is configured, where the *SSB-ToMeasure* is the union set of *SSB-ToMeasure* from all the configured measurement objects merged on the same serving carrier, and,
  - not overlapped with the RSSI symbols indicated by *ss-RSSI-Measurement* and 1data symbol before each RSSI symbol indicated by *ss-RSSI-Measurement* and 1 data symbol after each RSSI symbol indicated by *ss-RSSI-Measurement*, given that *ss-RSSI-Measurement* is configured,
- $P_{sharing\ factor}$ = 3, otherwise.
- $P_{L1_sharing}$ is defined as
  - When number of neighboring cells to be measured is 1
    - $P_{L1_sharing}$ = 2, if any symbol of the SSBs from serving cell and neighbor cell are overlapping or adjacent (in time domain)
    - $P_{L1_sharing}$ = 1, otherwise
  - When number of neighboring cells to be measured is more than 1
  - When none of the TCI state(s) of the intra-frequency neighbor cells or inter-frequency neighbor cells without gap are in the LTM candidate cell active TCI state list
    - $P_{L1_sharing}$ = 3*$N_{Neighbor_Cell}$, where $N_{Neighbor_Cell}$ is the number of neighbor cells to measure on intra-frequency and inter-frequency without gap
  - Otherwise
    - $P_{L1_sharing}$ = 3*$N_{Neighbor_Cell_in_list}$, where $N_{Neighbor_Cell_in_list}$ is the number of neigbour cells (including intra-frequency neighbour cell(s) and inter-frequency neighbor cell(s) without gap) which have TCI state(s) in the LTM candidate cell active TCI state list. No requirements are defined for the neighbor cell(s) which do not have TCI state(s) in the LTM candidate cell active TCI state list.

If the high layer in TS 38.331 [2] signaling of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc2*; Otherwise $T_{SMTCperiod}$ corresponds to the value of higher layer parameter *smtc1*.

Longer measurement period would be expected if the combination of SSB, SMTC occasion and measurement gap configurations does not meet previous conditions.

For either an FR1 or FR2 cell, longer measurement period would be expected during the period $T_{identify_CGI}$ when the UE is requested to decode an NR CGI.

For either an FR1 or FR2 cell, longer L1 RSRP measurement period would be expected during the period $T_{identify_CGI,E\text{-}UTRAN}$ when the UE is requested to decode an LTE CGI.

**Table 9.15.6.1.1-1: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter_withoutGap}$ for inter-frequency L1-RSRP measurement without measurement gaps in FR1 for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18***

| Configuration | $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter_withoutGap}$ (ms) |
|---|---|
| non-DRX | $\max(T_{Report}, \text{ceil}(M*P)*T_{SSB_NBC}*N_{Layer})$ |
| DRX cycle ≤ 320 ms | $\max(T_{Report}, \text{ceil}(K*M*P)*\max(T_{DRX},T_{SSB_NBC})*N_{Layer})$ |
| DRX cycle > 320 ms | $\text{ceil}(M*P)*T_{DRX}*N_{Layer}$ |
| NOTE 1: $T_{SSB_NBC}$ is the periodicity of the neighbor cell SSB-Index configured for inter-frequency L1-RSRP measurement. $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is the configured periodicity for reporting. $N_{Layer}$ = the number of inter-frequency layers which are configured for L1-RSRP measurement with *LTM-CSI-ResourceConfig-r18* and measured without measurement gaps + the number of intra-frequency layers configured for L1-RSRP measurement with *LTM-CSI-ResourceConfig-r18*. | |
| NOTE 2: K = 1.5. | |
| NOTE 3: Void. | |

**Table 9.15.6.1.1-2: Measurement period $T_{L1\text{-}RSRP_Measurement_Period_SSB_inter_withoutGap}$ for inter-frequency L1-RSRP measurement without measurement gaps in FR2 for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18***

## 9.15.6.2 Measurement restriction for inter-frequency L1-RSRP measurement

Measurement restrictions described in the following clauses apply when UE is performing L1-RSRP measurement on neighbor cell(s) without measurement gap.

Unless explicitly stated, the SSB to be measured for L1-RSRP measurement is transmitted from neigbor cell(s).

### 9.15.6.2.1 Measurement restriction for SSB based L1-RSRP

For FR1,

when the SSB for L1-RSRP measurement fully or partially overlaps with the OFDM symbol as SSB transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement,

- UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;

when the SSB for L1-RSRP measurement fully or partially overlaps with the OFDM symbol of CSI-RS transmitted from serving cell(s) for RLM, BFD, CBD or L1-RSRP measurement,

- If SSB and CSI-RS have same SCS, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
- If SSB and CSI-RS have different SCS,
  - If UE supports *simultaneousRxDataSSB-DiffNumerology*, UE shall be able to measure the SSB for L1-RSRP measurement without any restriction;
  - If UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, for UE incapable of *multiCellL1-measRTD-greaterThan-CP*-r18 and for UE capable of *multiCellL1-measRTD-greaterThan-CP-r18*,

when the SSB for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as SSB transmitted from serving cell(s) for RLM, BFD, or CBD measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSBs. Longer measurement period for SSB based L1-RSRP is expected, and no requirements are defined.

when the SSB for L1-RSRP measurement on one CC fully or partially overlaps with the OFDM symbol as CSI-RS transmitted from serving cell(s) for RLM, BFD, or CBD measurement on the same CC or different CCs in the same band, UE is required to measure one of but not both SSB for L1-RSRP measurement and CSI-RS. Longer measurement period for SSB based L1-RSRP measurement is expected, and no requirements are defined.

For FR2, if the network configures same or mixed numerology between SSB for L1-RSRP measurement on one FR2 band and CSI-RS for RLM, BFD, CBD, L1-RSRP or L1-SINR measurement on the other FR2 band, UE shall be able to perform the related SSB based measurements in one band without any measurement restrictions in the other band, provided that UE is capable of independent beam management on this FR2 band pair.

### 9.15.6.3 Scheduling availability of UE during inter-frequency L1-RSRP measurements

Scheduling availability restrictions described in the following clauses apply when UE is performing L1-RSRP measurement on inter-frequency cell(s), and UE is receiving PDCCH/PDSCH from serving cell.

Unless explicitly stated, the SSB to be measured for L1-RSRP measurement is transmitted from neighbor cell(s).

#### 9.15.6.3.1 Scheduling availability of UE performing L1-RSRP measurement with a same subcarrier spacing as PDSCH/PDCCH on FR1

There are no scheduling restrictions due to L1-RSRP measurement performed on SSB as RS for L1-RSRP measurement with the same SCS as PDSCH/PDCCH in FR1.

#### 9.15.6.3.2 Scheduling availability of UE performing L1-RSRP measurement with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to L1-RSRP measurement based on SSB as RS for L1-RSRP measurement. For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to L1-RSRP measurement based on SSB configured for L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the concerned OFDM symbols, where the concerned OFDM symbols are
  - the same OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and
  - If UE supports *multiCellL1-measRTD-greaterThan-CP-r18* capability, 1 OFDM symbol before or after the OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

When intra-band carrier aggregation in FR1 is configured, the scheduling restrictions apply to cell(s) in the same band on the symbols that fully or partially overlap with restricted symbols. When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 cells configured in other bands than the bands in which the cell where L1-RSRP measurement is performed is configured.

#### 9.15.6.3.3 Scheduling availability of UE performing L1-RSRP measurement on FR2

The following scheduling restriction applies due to L1-RSRP measurement.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the concerned OFDM symbols, where the concerned OFDM symbols are:
  - the same OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and
  - if UE supports *multiCellL1-measRTD-greaterThan-CP-r18* capability, 1 OFDM symbol before or after the OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions is performed apply to cell(s) in the band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 cells in the bands due to L1-RSRP measurement performed on FR2 cell(s) in different band(s), provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

If following conditions are met,

- UE has been notified about system information update through paging,
- The gap between UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set and that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots,

For the SSB and CORESET for RMSI scheduling multiplexing patterns 3, UE shall receive the PDCCH that UE monitors in the Type0-PDCCH CSS set, and the corresponding PDSCH, on SSB symbols to be measured for L1-RSRP measurement; and

For the SSB and CORESET for RMSI scheduling multiplexing patterns 2, UE shall receive PDSCH that corresponds to the PDCCH that UE monitors in the Type0-PDCCH CSS set, on SSB symbols to be measured for L1-RSRP measurement.

#### 9.15.6.3.4 Scheduling availability of UE performing L1-RSRP measurement on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 cell(s) due to L1-RSRP measurement performed on FR2 cell(s).

There are no scheduling restrictions on FR2 cell(s) due to L1-RSRP measurement performed on FR1 cell(s).

#### 9.15.6.3.5 Scheduling availability of UE performing L1-RSRP measurement in TDD bands on FR1

When UE performs L1-RSRP measurement on neighbor cell in a TDD band, the following restrictions apply due to L1-RSRP measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on the concerned OFDM symbols and restricted symbols may partially or fully overlap with UL symbols, where the concerned OFDM symbols are:
  - the same OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement, and- if UE supports *multiCellL1-measRTD-greaterThan-CP-r18* capability, 1 OFDM symbol before or after the OFDM symbols corresponding to the SSB indexes configured for L1-RSRP measurement

## 9.16 CJT calibration reporting for Delay offset and Frequency offset

### 9.16.1 Introduction

When configured with a CSI-ReportConfig where reportQuantity is set to 'CJTC-Dd', or ' CJTC -F', the UE shall perform CJT calibration measurements for delay offset, and frequency offset, respectively, on the configured CSI-RS resources. The UE shall measure all CSI-RS resources indicated by the higher layer parameter resourcesForChannelMeasurement.

For CJT reporting types (CJTC-Dd, CJTC-F), the UE shall be capable of measuring $\mathbf{N_{TRP} \in \{2, 3, 4\}}$ CSI-RS Resource Sets within a single CSI Resource Setting, all of which shall be associated with the higher layer parameter trs-Info.

The UE shall report the configured measurement quantity and transmit aperiodic CSI reports according to the CSI-ReportConfig for the active BWP.

## 9.16.2 Requirements applicability

The requirements in clause 9.16 apply, provided:

- The CSI-RS resources configured for CJTC measurements are measurable.

A CSI-RS resource configured for CJTC report shall be considered measurable when for each relevant CSI-RS the following conditions are met:

- CJTC reporting related side conditions given in clauses B,
- CSI-RS Ês/Iot is greater than or equal to the level described in clause B.

CJTC requirements are defined for periodic measurement resources and aperiodic reporting resources.

## 9.16.3 Measurement Reporting Requirements

The UE shall send CJTC reports only for report configurations configured for the active BWP.

The UE shall report the quantised CJTC value as a n-bit value ranging from 0 to $2^n - 1$ with the step size as described in clause 10; where the n is determined based on higher layer parameter.

### 9.16.3.1 Aperiodic Reporting

Reported CJTC measurements contained in aperiodic triggered but measured over periodic resources shall meet the accuracy requirements specified in clause 10.

The UE shall only send aperiodic CJTC measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI with (*reportQuantity* set to 'cjtc-Dd', 'cjtc-F'), the UE shall transmit the aperiodic CJTC reporting on PUSCH over the air interface at the time specified according to relevant clause in [26].9.16.4 Measurement Requirements

### 9.16.4.1 CSI -RS based delay and frequency offset reporting

UE shall be capable of performing CJT calibration reporting measurements based on the configured CSI-RS resource for inter-TRP delay and frequency misalignment computation, and the UE physical layer shall be capable of reporting CJT calibration measured over the measurement period of $T_{CJTC_Measurement_Period_CSI-RS}$.

The value of $T_{CJTC_Measurement_Period_CSI-RS}$ is defined in table 9.16.4.1-1 for FR1, where

- For periodic, aperiodic and semi-persistent CSI-RS resources M=1

For a UE supporting *support for Case 1 requirements* and when concurrent measurement gap(s) with Pre-MG(s) are configured, or a UE supporting *support for Case 2 requirements* and when concurrent measurement gap(s) with NCSG measurement gap(s) are configured, or a UE supporting *concurrentMeasGap-r17* or *musim-GapPreference-r17* or both concurrent measurement gap and *musim-GapPreference-r17* and when concurrent gaps or periodic MUSIM gaps or both concurrent gaps and periodic MUSIM gaps are configured,

- A CSI-RS or an SMTC occasion is not considered to be overlapped by a gap occasion if the gap occasion is dropped according to clauses 9.1.8 and 9.1.10,
- P value for a CSI-RS resource to be measured is defined as
  - $N_{total}$ / $N_{outside_MG}$ in FR1
- For a window W of duration max($T_{L1,}$ xRP_max), where xRP_max is the maximum xRP across all configured per-UE measurement gaps or NCSGs, MUSIM gap(s)and per-FR measurement gaps or NCSGs, and, in case of Pre-MG, all activated per-UE measurement gaps and per-FR measurement gaps, within the same FR as serving cell, and starting at the beginning of any CSI-RS resource occasion:

- $N_{total}$ is the total number of CSI-RS resource occasions within the window W, including those overlapped with measurement gap occasions, MUSIM gap occasions or SMTC occasions within the window W, and

- $N_{outside_MG}$ is the number of CSI-RS resource occasions that are not overlapped with any non-dropped GAP occasions nor non-dropped MUSIM gap occasion within the window W, and

- $N_{available}$ is the number of CSI-RS resource occasions that are not overlapped with any non-dropped GAP occasions, non-dropped MUSIM gap occasion nor any SMTC occasion within the window W.

- a CSI-RS or an SMTC occasion is considered to be overlapped with the MUSIM gap if it overlaps a MUSIM gap occasion.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG.

$T_{L1}$ is periodicity of the target CSI-RS.

Otherwise, for a UE neither supporting *concurrentMeasGap-r17* nor *support for Case 1 requirements* nor *support for Case 2 requirements* or when neither of the above configurations applies, i.e. concurrent measurement gaps, concurrent measurement gap(s) with Pre-MG(s) and concurrent measurement gap(s) with NCSG measurement gap(s), and UE does not support *musim-GapPreference-r17* or when no MUSIM gaps are configured.

For FR1,

- $P=\frac{1}{1-\frac{T_{CSI-RS}}{xRP}}$, when in the monitored cell there are GAPs configured for intra-frequency, inter-frequency or inter-RAT measurements, which are overlapping with some but not all occasions of the CSI-RS; and

- P=1 when in the monitored cell there are no GAPs overlapping with any occasion of the CSI-RS.

Where:

$T_{CSI-RS}$ = the periodicity of CSI-RS configured for CJTC measurement

- When a measurement gap is configured and the measurement gap is not NCSG,

  - a CSI-RS or an SMTC occasion is considered to be as overlapped with the GAP if it overlaps a measurement gap occasion, and

  - xRP = MGRP

- If the UE is configured with Pre-MG, a CSI-RS or an SMTC occasion is only considered to be overlapped by the Pre-MG if the Pre-MG is activated.

- Otherwise, when NCSG measurement gap only is configured,

  - a CSI-RS or an SMTC occasion is considered to be as overlapped with the GAP if

    - it overlaps the VIL1 or VIL2 of NCSG, or

    - it overlaps the ML of NCSG in FR2, and there exists a target carrier to be measured within NCSG that is intra-frequency carrier or inter-frequency carrier in the same band as the serving cell, or inter-frequency carrier in different band as the serving cell and UE does not support IBM between the target carrier and the serving cell,

  - and

    - xRP = VIRP

  When UE is configured with aperiodic MUSIM gap and the aperiodic MUSIM gap is overlapping with CSI-RS resource occasion for CJTC, longer evaluation period would be expected.

  When UE is configured with MUSIM gap(s), and CSI-RS resource occasions for CJTC are fully overlapped with MUSIM gap(s) or fully overlapped with the union of MUSIM gap(s) and GAPs, no requirement applies for the CSI-RS based CJTC measurement.

**Table 9.16.4.1-1: Measurement period $T_{CJTC_Measurement_Period_CSI\text{-}RS}$ for FR1**

| Configuration | $T_{CJTC_Measurement_Period_CSI\text{-}RS}$ (ms) |
|---|---|
| non-DRX | ceil(M*P)*$T_{CSI\text{-}RS}$ |
| DRX cycle ≤ 320 ms | ceil(M*P)*max($T_{DRX}$,$T_{CSI\text{-}RS}$) |
| DRX cycle > 320 ms | ceil(M*P)*$T_{DRX}$ |
| NOTE 1: $T_{CSI\text{-}RS}$ is the periodicity of CSI-RS configured for CJTC measurement. $T_{DRX}$ is the DRX cycle length. | |
| NOTE 2: the requirements are applicable provided that the CSI-RS resource configured for CJTC measurement is transmitted with Density = 3. | |

## 9.16.5 Measurement restriction for UE during CJT calibration reporting

### 9.16.5.1 Measurement restriction for CJT calibration reporting

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has same SCS than CSI-RS for CJTC-Dd or CJTC-F measurement, the UE shall be able to perform CSI-RS measurement without restrictions.

For FR1, when the SSB for RLM, BFD, CBD or L1-RSRP measurement has different SCS than CSI-RS for CJTC-Dd or CJTC-F measurement, the UE shall be able to perform CSI-RS measurement with restrictions according to its capabilities:

- If the UE supports *simultaneousRxDataSSB-DiffNumerology* the UE shall be able to perform CSI-RS measurement without restrictions.
- If the UE does not support *simultaneousRxDataSSB-DiffNumerology*, UE is required to measure one of but not both CSI-RS for CJTC-Dd or CJTC-F measurement and SSB. Longer measurement period for CSI-RS based CJTC-Dd or CJTC-F measurement is expected, and no requirements are defined.

## 9.16.6 Scheduling availability of UE during CJT calibration reporting

Scheduling availability restrictions described in the following clauses apply when the UE is performing CJTC calibration of delay offset, CJT calibration of frequency offset by measuring different CSI-RS Resource Sets.

### 9.16.6.1 Scheduling availability of UE performing measurement for CJT calibration reporting on FR1

There are no scheduling restrictions due to delay and frequency offset measurement performed on CSI-RS with the same SCS as PDSCH/PDCCH in FR1.

For UEs which support *simultaneousRxDataSSB-DiffNumerology* [14] there are no restrictions on scheduling availability due to delay and frequency offset measurement based on CSI-RS.

For UEs which do not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to delay and frequency offset measurement based on CSI-RS.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on symbols corresponding to the CSI-RS indexes configured for delay and frequency offset measurement.

# 9.17 OD-SSB based L3 measurement for an SCell

## 9.17.1 Introduction

A UE can be indicated, by *od-ssb-config* TS 38.331[2] or by a MAC CE TS 38.321[7], activation of transmission for OD-SSB in a configured DL BWP of an SCell TS 38.300[10] if UE supports *On-demand SSB operation*.

The requirements in clause 9.17 apply, provided the following conditions are met:

- an OD-SSB transmission is activated in a configured DL BWP where a first SSB transmission is not configured, or

- an OD-SSB transmission is activated in a configured DL BWP where a first SSB transmission is configured which cannot be used to obtain SIB1.

Where the first SSB transmission is specified as in TS 38.213[3] have the following relations:

- are with the same Cell ID, and
- are in the same frequency location, and
- are with same sub-carrier spacing, and
- are with the same downlink transmit power, and
- are quasi co-located with respect to Doppler shift, Doppler spread, average gain, average delay, delay spread and, when applicable, spatial RX parameters, when they have a same SSB index.

For UE supporting *On-demand SSB operation* and when OD- SSB transmission is indicated, the EMP for OD-SSB based intra-frequency measurement are

- the periodicity of OD-SSBs in the configured DL BWP if no first SSB transmission is configured or if UE supports *timec1nc2* and OD-SSB transmission is indicated with first SSB transmission and the union of the first SSB transmission and OD-SSB transmission has a non-periodic time domain pattern, or

- the periodicity of the union of OD-SSBs and first SSBs if first SSBs are transmitted and the OD-SSB activation is indicated and the union of OD-SSBs and first SSBs has a periodic time domain pattern.

For UE supports OD-SSB operation capability and when OD-SSB activation is indicated,

- the SMTC for OD-SSB based intra-frequency measurement for serving cell is OD-SMTC;
- the SMTC for OD-SSB based intra-frequency measurement for neighbor cell is the first SMTC.

Otherwise, the SMTC for OD-SSB based intra-frequency measurement is the first SMTC.

## 9.17.2 Requirements Applicability

The accuracy requirements in clause 9.2.2 shall be applied to OD-SSB based intra-frequency measurement.

## 9.17.3 Number of cells and number of SSB

The requirements of number of cells and number of SSB in clause 9.2.3 shall be applied to OD-SSB based intra-frequency measurement.

## 9.17.4 Measurement Reporting Requirements

The measurement reporting requirements in clause 9.2.4 shall be applied to OD-SSB based intra-frequency measurement.

## 9.17.5 OD-SSB based Intra-frequency measurements without measurement gaps

### 9.17.5.1 Intra-frequency cell identification for active SCell

The UE shall be able to identify a new detectable intra-frequency cell within $T_{identify_intra_without_index_ODSSB}$ if the UE is not indicated to report SSB based RRM measurement result with the associated SSB index(*reportQuantityRsIndexes* or *maxNrofRSIndexesToReport* is not configured), or the UE is indicated that the neighbour cell is synchronous with the serving cell (*deriveSSB-IndexFromCell* is enabled). Otherwise the UE shall be able to identify a new detectable intra frequency cell within $T_{identify_intra_with_index_ODSSB}$. The UE shall be able to identify a new detectable intra frequency SS

block of an already detected cell within $T_{identify_intra_without_index_ODSSB}$. It is assumed that *deriveSSB-IndexFromCell* is always enabled for FR1 TDD and FR2 with SCS smaller or equal to 480 kHz.

$$T_{identify_intra_without_index_ODSSB} = (T_{PSS/SSS_sync_intra_ODSSB} + T_{SSB_measurement_period_intra_ODSSB}) \text{ ms}$$

$$T_{identify_intra_with_index_ODSSB} = (T_{PSS/SSS_sync_intra_ODSSB} + T_{SSB_measurement_period_intra_ODSSB} + T_{SSB_time_index_intra_ODSSB}) \text{ ms}$$

Where:

$T_{PSS/SSS_sync_intra_ODSSB}$: it is the time period used in PSS/SSS detection

- For UE supporting power class 6 with *highSpeedMeasFlagFR2-r17* configured, if SMTC ≤ 40ms, $T_{PSS/SSS_sync_intra_ODSSB}$ is given in table 9.17.5.1-4; otherwise, $T_{PSS/SSS_sync_intra_ODSSB}$ is given in table 9.17.5.1-2.
- For UE indicating *no-gap-no-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{PSS/SSS_sync_intra_ODSSB}$ is given in table 9.2.5.1-1 for FR1 and table 9.2.5.1-2 for FR2. For UE indicating *no-gap-with-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{PSS/SSS_sync_intra_ODSSB}$ is given in table 9.17.5.1-5 for FR1 and table 9.17.5.1-6 for FR2.
- Otherwise, $T_{PSS/SSS_sync_intra_ODSSB}$ is given in tables 9.17.5.1-1, 9. x.5.1-2, or 9.17.5.1-3.

$T_{SSB_time_index_intra_ODSSB}$: it is the time period used to acquire the index of the SSB being measured

- For UE indicating *no-gap-no-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{SSB_time_index_intra_ODSSB}$ is given in table 9.2.17.1-3 for FR1. For UE indicating *no-gap-with-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{SSB_time_index_intra_ODSSB}$ is given in table 9.17.5.1-7 for FR1.
- Otherwise, $T_{SSB_time_index_intra_ODSSB}$ is given in table 9.17.5.1-3.

$T_{SSB_measurement_period_intra_ODSSB}$: equal to a measurement period of SSB based measurement

- For UE supporting power class 6 with *highSpeedMeasFlagFR2-r17* configured, if SMTC ≤ 40ms, $T_{SSB_measurement_period_intra_ODSSB}$ is given in table 9.17.5.2-4; otherwise, $T_{SSB_measurement_period_intra_ODSSB}$ is given in table 9.17.5.2-2.
- For UE indicating *no-gap-no-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{SSB_measurement_period_intra_ODSSB}$ is given in table 9.17.5.2-1 for FR1 and table 9.17.5.2-2 for FR2. For UE indicating *no-gap-with-interruption* via *NeedForInterruptionInfoNR-r18*, $T_{SSB_measurement_period_intra_ODSSB}$ is given in table 9.17.5.2-5 for FR1 and table 9.17.5.2-6 for FR2.
- For power class 6 UE supporting *measEnhCAInterFreqFR2-r18* when *highSpeedMeasFlagFR2* is configured, the $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.2-4 (if SMTC ≤ 40ms) and table 9.17.5.2-2 (if SMTC > 40ms) shall apply for SCC.
- Otherwise, $T_{SSB_measurement_period_intra_ODSSB}$ is given in table 9.17.5.2-1, 9.17.5.2-2, 9.17.5.2-3 or 9.17.5.2-4.

$CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1 for measurement conducted outside measurement gaps, i.e.

- when intra-frequency SMTC is fully non overlapping or partially overlapping with GAP, or
- when intra-frequency SMTC is fully non overlapping with GAP for UE indicating *no-gap-with-interruption*, or
- when intra-frequency SMTC is fully non overlapping or partially overlapping with GAP for UE indicating *no-gap-no-interruption*

$M_{pss/sss_sync_w/o_gaps}$: For a UE supporting FR2-1 power class 1 or 5, $M_{pss/sss_sync_w/o_gaps}$ =40. For a UE supporting power class 2, $M_{pss/sss_sync_w/o_gaps}$ =24. For a UE supporting FR2-1 power class 3, $M_{pss/sss_sync_w/o_gaps}$ =24. For a UE supporting FR2-1 power class 4, $M_{pss/sss_sync_w/o_gaps}$ =24. For a UE supporting FR2-1 power class 6, $M_{pss/sss_sync_w/o_gaps}$ =24.

$M_{meas_period_w/o_gaps}$: For a UE supporting FR2-1 power class 1 or 5, $M_{meas_period_w/o_gaps}$ =40. For a UE supporting FR2-1 power class 2, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting FR2-1 power class 3, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting power class 4, $M_{meas_period_w/o_gaps}$ =24. For a UE supporting power class 6, $M_{meas_period_w/o_gaps}$ =24.

For a UE that supports Pre-MG, an SMTC occasion is only considered to be overlapped by Pre-MG if the Pre-MG is activated.

When UE supports concurrent GAPs and UE concurrent GAPs, i.e., supports the following capability or capabilities' combination:

- concurrentMeasGap-r17, or
- concurrentMeasGapsPreMG-r18, or
- concurrentMeasGapsNCSG-r18,

Or when UE supports *musim-GapPreference-r17* or both concurrent measurement GAPs and *musim-GapPreference-r17* and UE concurrent GAPs or periodic MUSIM gaps or both concurrent gaps and periodic MUSIM gaps are configured,

$K_p$ is the scaling factor for an SSB frequency layer to be measured without GAP. $K_p = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

- For a window W of duration max(SMTC period, xRP_max), where xRP_max is the maximum xRP across all configured per-UE GAPs, periodic MUSIM gaps, and/or per-FR GAPs within the same FR as the SSB frequency layer, and starting from the beginning of any SMTC occasion:
  - $N_{total}$ is the total number of SMTC occasions within the window, including those overlapped with GAP and MUSIM gap occasions within the window, and
  - $N_{available}$ is the number of SMTC occasions that are not overlapped with any non-dropped GAP or non-dropped MUSIM gap occasions within the window W, after accounting for measurement GAP and MUSIM gap collisions by applying the collision rules for GAP and MUSIM gap in clauses 9.1.8.3, 9.1.10.4, 9.1.10.5, 9.1.12.3, and 9.1.13.3, respectively.

    $K_p = 1$ when $N_{available} = 0$.
  - xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.

    Requirements in this clause do not apply when $N_{available} = 0$ due to fully overlapping between SMTC occasions and MUSIM gap occasions within the window W.

Otherwise, when the UE is not configured with or UE does not support concurrent GAPs and the UE is not configured with periodic MUSIM gaps or UE does not support MUSIM gaps:

When intra-frequency SMTC is fully non overlapping with measurement gaps or NCSG, or intra-frequency SMTC is fully overlapping with MGs or NCSG, Kp=1

When intra-frequency SMTC is partially overlapping with measurement gaps, $K_p = 1/(1- (\text{SMTC period} /\text{MGRP}))$, where SMTC period < MGRP. When intra-frequency SMTC is partially overlapping with NCSG, $K_p = 1/(1- (\text{SMTC period} /\text{VIRP}))$, where SMTC period < VIRP. For calculation of $K_p$, if the high layer signalling (TS 38.331 [2]) of *smtc2* is configured, for cells indicated in the *pci-List* parameter in *smtc2*, the SMTC periodicity corresponds to the value of higher layer parameter *smtc2*; for the other cells, the SMTC periodicity corresponds to the value of higher layer parameter *smtc1*.

For FR2,

$K_{layer1_measurement} = 1$,

- if all of the reference signals configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap are not fully overlapped by intra-frequency SMTC occasions, or
- if all of the reference signal configured for RLM, BFD, CBD or L1-RSRP for beam reporting on any FR2 serving frequency in the same band outside measurement gap and fully-overlapped by intra-frequency SMTC occasions are not overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols, given that *SSB-ToMeasure* and *SS-RSSI-Measurement* are configured, where SSB symbols are

indicated by the union set of SSB-ToMeasure from all the configured measurement objects on the same serving carrier which can be merged. and RSSI symbols are indicated by *SS-RSSI-Measurement*;

$K_{layer1_measurement}$ =1.5, otherwise.

If the above-mentioned reference signal configured for L1-RSRP measurement is aperiodic CSI-RS resource, longer cell identification delay would be expected.

When UE supports *MUSIM-GapConfig-17* and the SMTC occasion of the target frequency layer is overlapping with the configured aperiodic MUSIM gap, longer cell identification period for the target frequency layer is expected.

If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

If the higher layer signaling in TS 38.331 [2] signalling of *smtc2* is present and *smtc1* is fully overlapping with measurement gaps and *smtc2* is partially overlapping with measurement gaps, requirements are not specified for $T_{identify_intra_without_index_ODSSB}$ or $T_{identify_intra_with_index_ODSSB}$.

If MCG DRX is in use, cell identification requirements for intra-frequency measurement in MCG specified in Table 9.17.5.1-1, Table 9.17.5.1-2, Table 9.17.5.1-3, and Table 9.17.5.1-4 shall depend on the MCG DRX cycle. If SCG DRX is in use, cell identification requirements for intra-frequency measurement in SCG specified in Table 9.17.5.1-1, Table 9.17.5.1-2, Table 9.17.5.1-3 and Table 9.17.5.1-4 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

When the target SSB is completely contained in active BWP of UE or the active downlink BWP is initial BWP, the intra-frequency measurement shall be conducted without gap and without interruption regardless of the NeedForGaps' status reporting.

**Table 9.17.5.1-1: Time period for OD-SSB based PSS/SSS detection (Frequency range FR1)**

| DRX cycle | $T_{PSS/SSS_sync_intra_ODSSB}$ |
|---|---|
| No DRX | max( 600 ms, ceil( 5 x $K_p$) x SMTC period )$^{Note\ 1}$ x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max( 600 ms, ceil(M2 $^{Note\ 2}$x 5 x $K_p$) x max(SMTC period, DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil(5 x $K_p$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |
| NOTE 2: When *highSpeedMeasFlag-r16* is not configured, M2 = 1.5; When *highSpeedMeasFlag-r16* is configured, M2 = 1.5 if SMTC periodicity > 40 ms, otherwise M2=1. | |
| NOTE 3: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *intraNR-MeasurementEnhancement-r16* on measurements of the primary component carrier and do not apply to measurements of a secondary component carrier with active SCell. | |
| NOTE 4: When *highSpeedMeasCA-Scell-r17* is configured and UE supports *measurementEnhancementCA-r17*, M2 = 1.5 if SMTC periodicity > 40 ms; otherwise M2=1. | |

**Table 9.17.5.1-2: Time period for OD-SSB based PSS/SSS detection (Frequency range FR2)**

| DRX cycle | $T_{PSS/SSS_sync_intra_ODSSB}$ |
|---|---|
| No DRX | max(600 ms, ceil($M_{pss/sss_sync_w/o_gaps}$ x $K_p$ x $K_{layer1_measurement}$) x SMTC period)$^{Note\ 1}$ x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(600 ms, ceil(1.5 x $M_{pss/sss_sync_w/o_gaps}$ x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period, DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil($M_{pss/sss_sync_w/o_gaps}$ x $K_p$ x $K_{layer1_measurement}$) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

**Table 9.17.5.1-3: Time period for OD-SSB based time index detection (FR1)**

| DRX cycle | $T_{SSB_time_index_intra_ODSSB}$ |
|---|---|
| No DRX | max(120 ms, ceil( 3 x $K_p$ ) x SMTC period)$^{Note\ 1}$ x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(120 ms, ceil (M2 $^{Note\ 2}$ x 3 x $K_p$) x max(SMTC period, DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | Ceil(3 x $K_p$) x DRX cycle x $CSSF_{intra}$ |

NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified
NOTE 2: When *highSpeedMeasFlag-r16* is not configured, M2 = 1.5; When *highSpeedMeasFlag-r16* is configured, M2 = 1.5 if SMTC periodicity > 40 ms,otherwise M2=1
NOTE 3: When *highSpeedMeasFlag-r16* is configured, the requirements apply only to UE supporting either *measurementEnhancement-r16* or *intraNR-MeasurementEnhancement-r16* on measurements of the primary component carrier and do not apply to measurements of a secondary component carrier with active SCell.
NOTE 4: When *highSpeedMeasCA-Scell-r17* is configured and UE supports *measurementEnhancementCA-r17*, M2 = 1.5 if SMTC periodicity > 40 ms; otherwise M2=1

**Table 9.17.5.1-4: Time period for OD-SSB based PSS/SSS detection when *highSpeedMeasFlagFR2-r17* is configured, (FR2) when SMTC period ≤ 40ms**

| DRX cycle | $T_{PSS/SSS_sync_intra_ODSSB}$ |
|---|---|
| No DRX | max(600 ms, ceil($M1^{Note\ 2}$ x $K_p$ x $K_{layer1_measurement}$) x SMTC period)$^{Note\ 1}$ x $CSSF_{intra}$ |
| DRX cycle≤ 80 ms | max(600 ms, ceil($M1^{Note\ 2}$ x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period, DRX cycle)) x $CSSF_{intra}$ |
| 80 ms< DRX cycle≤ 320 ms | ceil(1.5 x $M_{pss/sss_sync_w/o_gaps}$ x $K_p$ x $K_{layer1_measurement}$) x max(SMTC period, DRX cycle) x $CSSF_{intra}$ |

## 9.17.5.2 Measurement period for active SCell

The measurement period for intra-frequency measurements without gaps is as shown in table 9.17.5.2-1, 9.17.5.2-2, 9.17.5.2-3, 9.17.5.2-4.

When UE *highSpeedMeasFlagFR2-r17* is configured, if SMTC $\leq$ 40ms, $T_{SSB_measurement_period_intra_ODSSB}$ is given in table 9.17.5.2-3; otherwise, $T_{SSB_measurement_period_intra_ODSSB}$ is given in table 9.17.5.2-2. For power class 6 UE supporting *measEnhCAInterFreqFR2-r18* when *highSpeedMeasFlagFR2-r17* is configured, the $T_{SSB_measurement_period_intra_ODSSB}$ is given in table 9.2.5.2-3 (if SMTC $\leq$ 40ms) and table 9.2.5.2-2 (if SMTC > 40ms) shall apply for SCC.

If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc2*; Otherwise the assumed periodicity of intra-frequency SMTC occasions corresponds to the value of higher layer parameter *smtc1*.

For a UE that supports Pre-MG, an SMTC occasion is only considered to be overlapped by Pre-MG if the Pre-MG is activated.

If MCG DRX is in use, measurement period requirements for intra-frequency measurement in MCG specified in table 9.17.5.2-1, table 9.17.5.2-2, table 9.17.5.2-3 and table 9.17.5.2-4 shall depend on the MCG DRX cycle. If SCG DRX is in use, measurement period requirements for intra-frequency measurement in SCG specified in table 9.17.5.2-1, table 9.17.5.2-2, table 9.17.5.2-3 and table 9.17.5.2-4, shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

For FR2, a longer measurement period is allowed, if aperiodic CSI-RS resource is measured for L1-RSRP measurement on any FR2 serving frequency in the same band, and the CSI-RS resource is outside measurement gap and overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols. If *SSB-ToMeasure* or *SS-RSSI-Measurement* is configured, the SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same band which can be merged and the RSSI symbols are indicated by *SS-RSSI-Measurement*.

**Table 9.17.5.2-1: Measurement period for OD-SSB based intra-frequency measurements without gaps (FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra_ODSSB}$ |
|---|---|
| No DRX | max(200 ms, ceil( 5 x $K_p$) x SMTC period)$^{Note\ 1}$ x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | max(200 ms, ceil(1.5x 5 x $K_p$) x max(SMTC period, DRX cycle)) x $CSSF_{intra}$ |
| DRX cycle>320 ms | ceil( 5 x $K_p$ ) x DRX cycle x $CSSF_{intra}$ |
| NOTE 1: If different SMTC periodicities are configured for different cells, the SMTC period in the requirement is the one used by the cell being identified | |

### 9.17.5.3 Intra-frequency cell identification for deactivated SCell

When UE is indicated the activation of OD-SSB transmission in slot *n* in a configured DL BWP of an SCell without a first SSB transmission before SCell activation command,

- After slot $n+\frac{T_{HARQ}+3ms+T_{processing}}{NR\ slot\ length}$, UE shall perform the deactivated SCell measurement with $T_{PSS/SSS_sync_intra_ODSSB}$, $T_{SSB_time_index_intra_ODSSB}$, $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.3-1, 9.17.5.3-2 and 9.17.5.4-1 regardless of configured DRX and *measCycleSCell* till slot $n+\frac{T_{HARQ}+3ms+T_{processing}+T_{FMW}}{NR\ slot\ length}$, where:

- $T_{FMW}$ equals $\min(T_{report}, T_{First,OD-SSB} + T_{identify_intra})$, which is the duration of the fast measurement window(FMW).

- $T_{First,OD-SSB}$ is the time to the end of the first complete transmitted SSB burst after slot n + $\frac{T_{HARQ}+3ms+T_{processing}}{NR\ slot\ length}$.

- $T_{identify_intra}$ equals $T_{identify_intra_without_index_ODSSB}$ or $T_{identify_intra_with_index_ODSSB}$ if the cell is a newly detectable cell or $T_{SSB_measurement_period_intra_ODSSB}$ if the cell has been detected for a period less than 5 seconds.

- $T_{processing}$ is the additional processing time as 2ms or 5ms depending on *OD-SSB post processing time*.

- $T_{report}$ is the duration after slot $n+\frac{T_{HARQ}+3ms+T_{processing}}{NR\ slot\ length}$ to the earliest OD-SSB based L3 measurement reporting.

- $CSSF_{intra}$: it is a carrier specific scaling factor and is determined according to $CSSF_{outside_gap,i}$ in clause 9.1.5.1 for measurement conducted outside measurement gaps. When single OD-SSB carrier is configured with multiple SCCs without OD-SSB, $CSSF_{intra}$ equals 1 for OD-SSB carrier during the FMW.

- $K_{p_OD-SSB}$ is the scaling factor for an OD-SSB based deactivated SCell to be measured. $K_{p_OD-SSB} = N_{total} / N_{available}$, where $N_{available}$ and $N_{total}$ are calculated as follows:

  - For a window W of duration max(SMTC period, xRP_max), where xRP_max is the maximum xRP across all configured per-UE GAPs, periodic MUSIM gaps, and/or per-FR GAPs within the same FR as the OD-SSB frequency layer, and starting from the beginning of any OD-SSB occasion:

    - $N_{total}$ is the total number of OD-SSB occasions within the window, including those overlapped with GAP and MUSIM gap occasions within the window, and

    - $N_{available}$ is the number of OD-SSB occasions that are not overlapped with any non-dropped GAP or non-dropped MUSIM gap occasions within the window W, after accounting for measurement GAP and

MUSIM gap collisions by applying the collision rules for GAP and MUSIM gap in clauses 9.1.8.3, 9.1.10.4, 9.1.10.5, 9.1.12.3, and 9.1.13.3, respectively.

$K_{p_OD\text{-}SSB}$ = 1 when $N_{available}$ = 0.

- xRP = MGRP when configured GAP is activated Pre-MG or MG, and xRP = VIRP when configured GAP is NCSG, also xRP = MGRP for periodic MUSIM gap.

  Requirements in this clause do not apply when $N_{available}$ = 0 due to fully overlapping between SMTC occasions and MUSIM gap occasions within the window W.

Otherwise, when the UE is not configured with or UE does not support concurrent GAPs and the UE is not configured with periodic MUSIM gaps or UE does not support MUSIM gaps:

When OD-SSB is fully non overlapping with measurement gaps or NCSG, $K_{p_OD\text{-}SSB}$ =1;

When OD-SSB is partially overlapping with measurement gaps, $K_{p_OD\text{-}SSB}$ = 1/(1- (OD-SSB period /MGRP)), where OD-SSB period < MGRP. When OD-SSB is partially overlapping with NCSG, $K_{p_OD\text{-}SSB}$ = 1/(1- (OD-SSB period /VIRP)), where OD-SSB period < VIRP.

- When UE is indicated the activation of another OD-SSB transmission in a configured DL BWP of an SCell within the T2 after the previous OD-SSB deactivation and before the SCell activation command, the UE shall perform the deactivated SCell measurement with $T_{PSS/SSS_sync_intra_ODSSB}$, $T_{SSB_time_index_intra_ODSSB}$, $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.3-3, 9.17.5.3-4, 9.17.5.3-5, 9.17.5.4-2 and 9.17.5.4-3 if OD-SSB is transmitted, where T2 is 5*max (measCycleSCell, DRX cycles) in FR1 and 4s for power class 1/5 and 3s for power class 2/3/4 in FR2.
- When UE is indicated the activation of another OD-SSB transmission in a configured DL BWP of an SCell after previous OD-SSB deactivation plus T2 and before the SCell activation command, UE shall perform the deactivated SCell measurement with $T_{PSS/SSS_sync_intra_ODSSB}$, $T_{SSB_time_index_intra_ODSSB}$, $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.3-1, 9.17.5.3-2 and 9.17.5.4-1 regardless of configured DRX and *measCycleSCell* till slot $n+\frac{T_{HARQ}+3ms+T_{processing}+T_{FMW}}{NR\ slot\ length}$.

- When UE is indicated the activation of another OD-SSB transmission with the same spatial reception parameter and same frequency as the previously deactivated OD-SSB in a configured DL BWP of an SCell, and the indication occurs within 5 seconds after the previous OD-SSB deactivation before the SCell activation command, and the SCell remains detectable during the time period $T_{identify_intra_without_index_ODSSB}$ or $T_{identify_intra_with_index_ODSSB}$ measured from previously transmitted OD-SSB, the UE shall skip the OD-SSB identification provided that the SCell is detectable and the timing that the cell has not been changed more than $\pm 3200/2^{\mu} T_c$.

- After the FMW, UE shall follow the legacy deactivated SCC measurement with $T_{PSS/SSS_sync_intra_ODSSB}$, $T_{SSB_time_index_intra_ODSSB}$, $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.3-3, 9.17.5.3-4, 9.17.5.3-5 9.17.5.4-2 and 9.17.5.4-3 if the OD-SSB transmission is not deactivated.

No OD-SSB based deactivated SCell requirement applies if NW deactivates the OD-SSB earlier than the time slot $n+\frac{T_{HARQ}+3ms+T_{processing}+\min(T_{report},T_{identify_intra})}{NR\ slot\ length}$.

When UE is indicated the activation of OD-SSB transmission in slot *n* in a configured DL BWP of an SCell with a first SSB transmission before SCell activation command, after slot $n+\frac{T_{HARQ}+3ms+T_{processing}}{NR\ slot\ length}$,

- UE shall perform the deactivated SCC measurement with $T_{PSS/SSS_sync_intra_ODSSB}$, $T_{SSB_time_index_intra_ODSSB}$, $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.3-3, 9.17.5.3-4, 9.17.5.3-5, 9.17.5.4-2 and 9.17.5.4-3 if UE has sent a valid measurement report before receiving the activation of OD-SSB transmission during the period equal to max(5*measCycleSCell, 5*DRX cycles) in FR1 or 4s for UE supporting power class1 and 3s for UE supporting power class 2/3/4 in FR2.
- Otherwise, UE shall perform the deactivated SCell measurement with $T_{PSS/SSS_sync_intra_ODSSB}$, $T_{SSB_time_index_intra_ODSSB}$, $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.3-1, 9.17.5.3-2 and 9.17.5.4-1 regardless of configured DRX and *measCycleSCell* till slot $n+\frac{T_{HARQ}+3ms+T_{processing}+T_{FMW}}{NR\ slot\ length}$..
- Before UE receiving the activation of OD-SSB transmission or after OD-SSB deactivation in a deactivated SCell, UE shall perform deactivated SCC measurement with $T_{PSS/SSS_sync_intra_ODSSB}$, $T_{SSB_time_index_intra_ODSSB}$, $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.3-3, 9.17.5.3-4, 9.17.5.3-5, 9.17.5.4-2 and 9.17.5.4-3 if OD-SSB is transmitted.

- Before UE receiving the activation of OD-SSB transmission or after OD-SSB deactivation in a deactivated SCell, for UE indicating *support3MHz-ChannelBW-Symmetric-r18* and configured to perform measurements on a deactivated SCell with 12PRB SSB in FR1, $T_{SSB_time_index_intra_less_than_5MHz_ODSSB}$ is given in table 9.17.5.3-6.

UE shall perform the deactivated SCC neighbour cell measurement with $T_{PSS/SSS_sync_intra_ODSSB}$, $T_{SSB_time_index_intra_ODSSB}$, $T_{SSB_measurement_period_intra_ODSSB}$ given in table 9.17.5.3-3, 9.17.5.3-4, 9.17.5.3-5, 9.17.5.3-6, 9.17.5.4-2 and 9.17.5.4-3 regardless of OD-SSB activation/deactivation.

If MCG DRX is in use, cell identification requirements for intra-frequency measurement in MCG specified in Table 9.17.5.3-2, Table 9.17.5.3-3, Table 9.17.5.3-4, 9.17.5.3-5 and Table 9.17.5.3-6 shall depend on the MCG DRX cycle. If SCG DRX is in use, cell identification requirements for intra-frequency measurement in SCG specified in Table 9.17.5.3-2, Table 9.17.5.3-3, Table 9.17.5.3-4, 9.17.5.3-5 and Table 9.17.5.3-6 shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

When NW indicates OD-SSB transmission in one of the deactivated SCell, the longer cell identification or measurement delay for other frequency layers being measured would be expected during the $T_{FMW}$.

When more than one deactivated SCells are configured with OD-SSB transmission, the requirements in this clause shall be also applied provided that the time periods between OD-SSB activation and OD-SSB deactivation among multiple OD-SSBs' frequency layers are non-overlapping.

**Table 9.17.5.3-1: Time period for OD-SSB based PSS/SSS detection in FMW, deactivated SCell**

| Frequency range | $T_{PSS/SSS_sync_intra_ODSSB}$ |
|---|---|
| FR1 | $ceil(M^{Note\ 2} \times K_{p_OD\text{-}SSB}) \times \max(T_{lower}^{Note\ 1}, EMP) \times CSSF_{intra}$ |
| FR2 | $ceil(M^{Note\ 2} \times K_{FR} \times K_{p_OD\text{-}SSB} \times K_{layer1_measurement}) \times \max(T_{lower}^{Note\ 1}, EMP) \times CSSF_{intra}$ |
| NOTE 1: When UE reports not supporting *lower bound capability*, the $T_{lower}$ equals 10ms; Otherwise, $T_{lower}$ equals 0ms. | |
| NOTE 2: When multiple frequency layers are configured, M equals 6 in FR1 and $M_{pss/sss_sync_w/o_gaps}$+1 in FR2. Otherwise, M equals 5 in FR1 and $M_{pss/sss_sync_w/o_gaps}$ in FR2. | |

| DRX cycle≤ 320 ms | Ceil(3 x $K_{p_OD\text{-}SSB}$) x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320 ms | Ceil(3 x $K_{p_OD\text{-}SSB}$) x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: The requirements also apply to CC with deactivated SCell in SCG. | |

**Table 9.17.5.3-6: Time period for time index detection for a UE operating on a target cell with 12PRB SSB, deactivated SCC (FR1)**

| DRX cycle | $T_{SSB_time_index_intra_less_than_5MHz}$ |
|---|---|
| No DRX | Ceil(7 x $K_{p_OD\text{-}SSB}$) x measCycleSCell x $CSSF_{intra}$ |
| DRX cycle≤ 320ms | Ceil(7 x $K_{p_OD\text{-}SSB}$) x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320ms | Ceil(7 x $K_{p_OD\text{-}SSB}$) x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: The requirements apply to CC with deactivated SCG SCell. | |

## 9.17.5.4 Measurement period for deactivated SCell

The measurement period for deactivated SCell measurements is as shown in table 9.17.5.4-1, 9.17.5.4-2, 9.17.5.4-3.

If MCG DRX is in use, measurement period requirements for intra-frequency measurement in MCG specified in Table 9.17.5.4-2, and Table 9.17.5.4-3 shall depend on the MCG DRX cycle. If SCG DRX is in use, measurement period requirements for intra-frequency measurement in SCG specified in 9.17.5.4-2, and Table 9.17.5.4-3, shall depend on the SCG DRX cycle. Otherwise, the requirements for when DRX is not in use shall apply.

For FR2, a longer measurement period is allowed, if aperiodic CSI-RS resource is measured for L1-RSRP measurement on any FR2 serving frequency in the same band, and the CSI-RS resource is outside measurement gap and overlapped with any of the SSB symbols and the RSSI symbols, and 1 symbol before each consecutive SSB symbols and the RSSI symbols, and 1 symbol after each consecutive SSB symbols and the RSSI symbols. If *SSB-ToMeasure* or *SS-RSSI-Measurement* is configured, the SSB symbols are indicated by the union set of *SSB-ToMeasure* from all the configured measurement objects on the same band which can be merged and the RSSI symbols are indicated by *SS-RSSI-Measurement*.

When NW indicates OD-SSB transmission in one of the deactivated SCell, the longer cell identification or measurement delay for other frequency layers being measured would be expected during the $T_{FMW}$.

**Table 9.17.5.4-1: Measurement period for OD-SSB based intra-frequency measurements without gaps (deactivated SCC)**

| FR | $T_{SSB_measurement_period_intra_ODSSB}$ |
|---|---|
| FR1 | ceil($M^{Note\ 2}$ x $K_p$) x max($T_{lower}^{Note\ 1}$, EMP) x $CSSF_{intra}$ |
| FR2 | ceil($M^{Note\ 2}$ x $K_{FR}$ x $K_p$ x $K_{layer1_measurement}$) x max($T_{lower}^{Note\ 1}$, EMP) x $CSSF_{intra}$ |
| NOTE 1: When UE reports not supporting *lower bound capability*, the $T_{lower}$ equals 10ms; Otherwise, $T_{lower}$ equals 0ms. | |
| NOTE 2: When multiple frequency layers are configured, M equals 6 in FR1 and $M_{pss/sss_sync_w/o_gaps}$+1 in FR2 if the deactivated SCell is a detected Scell. Otherwise, M equals 5 in FR1 and $M_{pss/sss_sync_w/o_gaps}$ in FR2. | |

**Table 9.17.5.4-2: Measurement period for OD-SSB based intra-frequency measurements without gaps (deactivated SCC) (FR1)**

| DRX cycle | $T_{SSB_measurement_period_intra_ODSSB}$ |
|---|---|
| No DRX | Ceil(5 x $K_p$) x measCycleSCell x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Ceil(5 x $K_p$) x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320 ms | Ceil(5 x $K_p$) x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: The requirements also apply to CC with deactivated SCell in SCG | |

**Table 9.17.5.4-3: Measurement period for OD-SSB based intra-frequency measurements without gaps (deactivated SCC) (FR2)**

| DRX cycle | $T_{SSB_measurement_period_intra_ODSSB}$ |
|---|---|

| | |
|---|---|
| No DRX | Ceil($M_{meas_period_w/o_gaps}$ x $K_p$) x measCycleSCell x $CSSF_{intra}$ |
| DRX cycle≤ 320 ms | Ceil($M_{meas_period_w/o_gaps}$ x $K_p$) x max(measCycleSCell, 1.5xDRX cycle) x $CSSF_{intra}$ |
| DRX cycle> 320 ms | Ceil($M_{meas_period_w/o_gaps}$ x $K_p$) x max(measCycleSCell, DRX cycle) x $CSSF_{intra}$ |
| NOTE 1: The requirements also apply to CC with deactivated SCell in SCG. | |

### 9.17.5.5 Scheduling availability of UE during intra-frequency measurements based on On-demand SSB

UE shall be capable of measuring without measurement gaps when the OD-SSB is completely contained in the active bandwidth part of the UE. When any of the conditions in the following clauses is met, there are restrictions on the scheduling availability; otherwise, there is no scheduling restriction. Note that all the configured OD-SSB symbols on the target carrier are referred to in this clause.

#### 9.17.5.5.1 Scheduling availability of UE performing measurements in TDD bands on FR1

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRP or SS-SINR measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OD-SSB symbols to be measured, and on 1 data symbol before each consecutive OD-SSB symbols to be measured and 1 data symbol after each consecutive OD-SSB symbols to be measured within the Fast Measurement window duration.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OD-SSB symbols to be measured, and on 1 data symbol before each consecutive OD-SSB symbols to be measured and 1 data symbol after each consecutive OD-SSB symbols to be measured within SMTC window duration outside the Fast Measurement window duration. If the high layer in TS 38.331 [2] signalling of *smtc2* is configured, the SMTC periodicity follows *smtc2*; Otherwise SMTC periodicity follows *smtc1*.

When the UE performs intra-frequency measurements in a TDD band, the following restrictions apply due to SS-RSRQ measurement

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OD-SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive OD-SSB to be measured/RSSI symbols and 1 data symbol after each consecutive OD-SSB to be measured/RSSI symbols within the Fast Measurement window duration.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OD-SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol before each consecutive OD-SSB to be measured/RSSI symbols and 1 data symbol after each consecutive OD-SSB to be measured/RSSI symbols within SMTC window duration outside Fast measurement window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

When TDD intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

When TDD inter-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this band pair.

When inter-band FR1+FR1 NR-DC is performed, the scheduling restrictions due to a given serving cell also apply to another serving cell in a different band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this band pair.

#### 9.17.5.5.2 Scheduling availability of UE performing measurements with a different subcarrier spacing than PDSCH/PDCCH on FR1

For UE which does not support *simultaneousRxDataSSB-DiffNumerology* [14] the following restrictions apply due to SS-RSRP/RSRQ/SINR measurement

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on OD-SSB symbols to be measured, and on 1 data symbol before each consecutive OD-SSB symbols to be measured and 1 data symbol after each consecutive OD-SSB symbols to be measured within the Fast Measurement window duration.

- If *deriveSSB_IndexFromCell* is enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on OD-SSB symbols to be measured, and on 1 data symbol before each consecutive OD-SSB symbols to be measured and 1 data symbol after each consecutive OD-SSB symbols to be measured within SMTC window duration outside the Fast Measurement window duration. If the high layer signalling of *smtc2* is configured (in TS 38.331 [2]), the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within Fast Measurement window duration.

- If *deriveSSB_IndexFromCell* is not enabled the UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on all symbols within SMTC window duration outside Fast Measurement window duration. If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

If the following conditions are met:

- The UE has been notified about system information update through paging,

- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

The UE shall receive the PDCCH that the UE monitors in the Type0-PDCCH CSS set, and/or the corresponding PDSCH, on SSB symbols to be measured.

When intra-band carrier aggregation is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with the aforementioned restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

#### 9.17.5.5.3 Scheduling availability of UE performing measurements on FR2-1

The following scheduling restriction applies due to SS-RSRP or SS-SINR measurement on an FR2 intra-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on OD-SSB symbols to be measured, and on 1 data symbol(s) before each consecutive OD-SSB symbols to be measured and 1 data symbol(s) after each consecutive OD-SSB symbols to be measured within Fast Measurement window duration.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on OD-SSB symbols to be measured, and on 1 data symbol(s) before each consecutive OD-SSB symbols to be measured and 1 data symbol(s) after each consecutive OD-SSB symbols to be measured within SMTC window duration outside Fast Measurement window duration.

The following scheduling restriction applies to SS-RSRQ measurement on an FR2 intra-frequency cell

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on OD-SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol(s) before each consecutive OD-SSB to be measured/RSSI symbols and 1 data symbol(s) after each consecutive OD-SSB to be measured/RSSI symbols within Fast Measurement window duration.

- The UE is not expected to transmit PUCCH/PUSCH/SRS or receive PDCCH/PDSCH/TRS/CSI-RS for CQI on OD-SSB symbols to be measured, RSSI measurement symbols, and on 1 data symbol(s) before each consecutive OD-SSB to be measured/RSSI symbols and 1 data symbol(s) after each consecutive OD-SSB to be measured/RSSI symbols within SMTC window duration outside Fast Measurement window duration.

where

- If the high layer signalling of *smtc2* is configured in TS 38.331 [2], the SMTC periodicity follows *smtc2*; Otherwise the SMTC periodicity follows *smtc1*.

- The signaling *deriveSSB-IndexFromCell* is always enabled.

When intra-band carrier aggregation in FR2 is performed, the scheduling restrictions due to a given serving cell also apply to all other serving cells in the same band on the symbols that fully or partially overlap with aforementioned restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to SS-RSRP, SS-RSRQ or SS-SINR measurement on an FR2 intra-frequency cell in different bands, provided that UE is capable of independent beam management on this FR2 band pair. Additionally, there is no scheduling restriction if the UE is configured with different numerology between SSB on one FR2 band and data on the other FR2 band provided the UE is configured for IBM operation for the band pair.

NOTE: When inter-band carrier aggregation in FR2 is performed, the scheduling restrictions as defined in clause 9.2.5.17.1 due to a given serving cell also apply to another serving cell in a different FR2 band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this FR2 band pair.

If following conditions are met:

- The UE has been notified about system information update through paging,

- The gap between the UE's reception of PDCCH that UE monitors in the Type 2-PDCCH CSS set that notifies system information update, and the PDCCH that UE monitors in the Type0-PDCCH CSS set, is greater than 2 slots

#### 9.17.5.5.4 Scheduling availability of UE performing measurements on FR1 or FR2 in case of FR1-FR2 inter-band CA

There are no scheduling restrictions on FR1 serving cell(s) due to measurements performed on FR2 serving cell frequency layer. However, the scheduling restrictions as defined in clause 9.2.5.17.1 due to a given serving cell in FR2 also apply to another serving cell in an FR1 band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this FR1-FR2 band pair.

There are no scheduling restrictions on FR2 serving cell(s) due to measurements performed on FR1 serving cell frequency layer. However, the scheduling restrictions as defined in clause 9.2.5.17.1 due to a given serving cell in FR1 also apply to another serving cell in an FR2 band on the symbols that fully or partially overlap with the aforementioned restricted symbols, if UE does not have the capability of supporting *simultaneousRxTxInterBandCA* for this FR1-FR2 band pair.

## 9.18 L1 Cross Link Interference measurements

### 9.18.1 Introduction

The UE capable of performing L1 CLI measurements shall be able to measure L1-SRS-RSRP and L1-CLI-RSSI which are defined in TS 38.215 [4] within the active DL BWP. The measurements requirements in this clause apply for TDD mode only.

The L1 CLI measurement requirements specified in this clause are applicable only for RRC_CONNECTED intra-frequency:

- when L1-SRS-RSRP measurement resource is configured within active DL BWP
- when L1-CLI-RSSI measurement resource is configured within active DL BWP

The measurements shall be performed for a serving cell, including PCell, PSCell, or SCell, on the resources configured for L1-SRS-RSRP and L1-CLI-RSSI measurements within the active BWP.

For performing CLI measurements in FR2, UE can optionally be configured with CLI measurement resources containing an explicit indication of a TCI state providing a TypeD QCL source [26, TS 38.214]. If the TCI state is not configured, UE can assume the configured CLI measurement resources are QCL-ed with TypeD to one of the latest received PDSCH and the latest monitored CORESET.

The UE does not expect to be configured with L1-CLI-RSSI measurement resources and L1-SRS-RSRP measurement resources on the same symbol.

The measurement reporting delay can be longer for the measurement reporting requirements in this clause when IDC autonomous denial is configured.

## 9.18.2 L1-SRS-RSRP measurements

### 9.18.2.1 Introduction

When configured by the network, the UE shall be able to perform L1-SRS-RSRP measurements on the *SRS-RSRP-MeasurementResourceSet* configured in a *CSI-ResourceConfig*.

The requirements apply when the subcarrier spacing for SRS-RSRP measurement resource configuration is the same as the subcarrier spacing of the active DL BWP of serving cell. The UE is not required to measure SRS using different SCS compared to the downlink active BWP SCS of the same carrier.

When the UE measures L1-SRS-RSRP, a constant offset relative to the downlink reference timing in the serving cell shall be applied. The constant offset value is derived by UE implementation and shall be at least $Tc*N_{TA_offset}$.

### 9.18.2.2 Requirements applicability

The requirements in clause 9.18.2 apply, provided:

- SRS resources configured for L1-SRS-RSRP measurements are measurable.

An SRS resource configured for L1-SRS-RSRP shall be considered measurable when for each relevant SRS the following conditions are met:

- L1-SRS-RSRP related side conditions given in clauses 10.1.22.1 for FR1 and FR2 for a corresponding band,
- SRS_RP and SRS Ês/Iot according to Annex B.2.7 for a corresponding band.

### 9.18.2.3 Measurement Reporting Requirements

The UE shall send L1-SRS-RSRP reports only for report configurations configured for aperiodic report when *cli-SRS-RSRP* is configured.

The UE shall report the L1-SRS-RSRP value as a 7-bit value in the range [-140, -44] dBm with 1 dB step size according to clause 10, if *nrofReportedCLImeasResources* is configured to one. If *nrofReportedCLImeasResources* is configured to be larger than one, the UE shall use differential L1-SRS-RSRP based reporting as defined in clause 10. The differential L1-SRS-RSRP is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-SRS-RSRP value and the measured quantity is described in clause 10.

#### 9.18.2.3.1 Aperiodic Reporting

Reported L1-SRS-RSRP measurements contained in aperiodic triggered L1-SRS-RSRP reports shall meet the requirements in clauses 10 for FR1 and 10 for FR2, respectively.

The UE shall only send aperiodic L1-SRS-RSRP measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-SRS-RSRP reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

### 9.18.2.4 Measurement capability

The UE shall be capable of performing L1-SRS-RSRP measurements on the SRS resources configured for measurement, provided that the total number of L1-SRS-RSRP measurement resources for the UE does not exceed the numbers indicated in *l1-SRS-RSRP-MeasAndAperiodicReporting-r19*.

### 9.18.2.5 L1-SRS-RSRP measurement period

The UE shall be capable of performing L1-SRS-RSRP measurement based on the configured SRS resource. For periodic and semi-persistent SRS resource, the UE shall be capable of reporting L1-SRS-RSRP measured over measurement period of $T_{L1_SRS_RSRP_measurement_period}$ for FR1 and FR2.

For the value of L1,

1> If UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network

2> L1 is not applicable

1> else if UE supports *sbfd-Aware-r19* and SBFD is configured by the network

2> if UE is configured to report L1-SRS-RSRP for SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the L1-SRS-RSRP resource that are overlapping with non-SBFD symbols during $T_{L1\text{-}SRS\text{-}RSRP_measurement_period}$

3> When DRX is configured, L1 is the number of DRX cycles in which all occasions of the L1-SRS-RSRP resource are overlapping with non-SBFD symbols during $T_{L1\text{-}SRS\text{-}RSRP_measurement_period}$

2> if UE is configured to report L1-SRS-RSRP for non-SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the L1-SRS-RSRP resource that are overlapping with SBFD symbols, during $T_{L1\text{-}SRS\text{-}RSRP_measurement_period}$

3> When DRX is configured, L1 is the number of DRX cycles in which all occasions of the L1-SRS-RSRP resource are overlapping with SBFD symbols, during $T_{L1\text{-}SRS\text{-}RSRP_measurement_period}$

**Table 9.18.2.5-1 Measurement period $T_{L1_SRS_RSRP_measurement_period}$**

| Configuration | $T_{L1_SRS_measurement_period}$ (ms) |
|---|---|
| No DRX | $Max(T_{Report}, (M+L1) \times T_{SRS})$ |
| DRX cycle ≤ 320 ms | $Max(T_{Report}, Ceil(1.5 \times (M+L1)) \times max(T_{SRS}, T_{DRX}))$ |
| DRX cycle > 320 ms | $(M+L1) \times T_{DRX}$ |
| NOTE 1: $T_{SRS}$ is SRS measurement periodicity configured *SRS-PeriodicityAndOffset*, and $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting.<br>NOTE 2: M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise. | |

If the SRS resources configured for measurement are partially or fully overlapping with SMTC window, SSB or CSI-RS configured for RLM, BFD, CBD or L1-RSRP measurement or measurement gaps, requirements are not specified for $T_{L1_SRS_RSRP_measurement_period}$.

### 9.18.2.6 Scheduling availability of UE during L1-CLI measurements

Scheduling availability restrictions when the UE is performing L1-SRS-RSRP measurement are described in the following clause.

#### 9.18.2.6.1 Scheduling availability of UE performing L1-SRS-RSRP measurement on FR1

The following scheduling restriction applies due to L1-SRS-RSRP measurements.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs L1-SRS-RSRP measurements, and on 1 data symbol before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 15 kHz and 30 kHz subcarrier spacing.

- For the UE which does not support *fdm-Reception-r19* in *l1-SRS-RSRP-MeasAndAperiodicReporting-r19*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbol(s) on which the UE performs L1-SRS-RSRP measurements, and on 1 data symbol before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 15 kHz and 30 kHz subcarrier spacing.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs L1-SRS-RSRP measurement, and on 2 data symbols before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 60 kHz subcarrier spacing.

- For the UE which does not support *fdm-Reception-r19* in *l1-SRS-RSRP-MeasAndAperiodicReporting-r19*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs L1-SRS-RSRP measurement, and on 2 data symbols before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 60 kHz subcarrier spacing.

When TDD intra-band carrier aggregation is configured, the scheduling restrictions on serving cell where CLI measurements are performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions on serving cell where CLI measurements are performed apply to all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-SRS-RSRP measurement is performed is configured.

#### 9.18.2.6.2 Scheduling availability of UE performing L1-SRS-RSRP measurement on FR2

The following scheduling restriction applies due to L1-SRS-RSRP measurements.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs L1-SRS-RSRP measurements, and on 1 data symbol before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 60 kHz subcarrier spacing.

- For the UE which does not support *fdm-Reception-r19* in *l1-SRS-RSRP-MeasAndAperiodicReporting-r19*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the OFDM symbols on which the UE performs L1-SRS-RSRP measurements, and on 1 data symbol before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 60 kHz subcarrier spacing.

- For the UE which supports *fdm-Reception-r19* in *l1-SRS-RSRP-MeasAndAperiodicReporting-r19* but the SRS resources are not TypeD QCL-ed with PDCCH/PDSCH, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs L1-SRS-RSRP measurements, and on 1 data symbol before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 60 kHz subcarrier spacing.

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs L1-SRS-RSRP measurements, and on 2 data symbols before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 120 kHz subcarrier spacing.

- For the UE which does not support *fdm-Reception-r19* in *l1-SRS-RSRP-MeasAndAperiodicReporting-r19*, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the OFDM symbol(s) on which the UE performs L1-SRS-RSRP measurements, and on 2 data symbols before the OFDM symbol(s) used for L1-SRS-RSRP measurements for 120 kHz subcarrier spacing.

- For the UE which supports *fdm-Reception-r19* in *l1-SRS-RSRP-MeasAndAperiodicReporting-r19* but the SRS resources are not TypeD QCL-ed with PDCCH/PDSCH, the UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on the OFDM symbols on which the UE performs L1-SRS-RSRP measurements, and on 2 data symbols before the OFDM symbol(s) used for SRS-RSRP measurements for 120 kHz subcarrier spacing.

When TDD intra-band carrier aggregation is configured, the scheduling restrictions on serving cell where L1-SRS-RSRP measurements are performed apply on all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to L1-SRS-RSRP measurement performed on FR2 serving cell(s) in different band(s), provided that UE is capable of independent beam management on this FR2 band pair.

## 9.18.3 L1-CLI-RSSI measurements

### 9.18.3.1 Introduction

When configured by the network, the UE shall be able to perform L1-CLI-RSSI measurement of configured *CLI-RSSI-MeasurementResourceSet*, and:

- UE measures L1-CLI-RSSI within one DL subband if one L1-CLI-RSSI measurement resource is configured within a DL subband or UE measures L1-CLI-RSSI within two DL subbands if one L1-CLI-RSSI measurement resource is configured across two DL subbands,

- UE measures L1-CLI-RSSI within UL subband if one L1-CLI-RSSI measurement resource is configured within a UL subband.

When the UE measures L1-CLI-RSSI, the downlink reference timing in the serving cell shall be applied.

### 9.18.3.2 Requirements applicability

The requirements in clause 9.18.3 apply, provided:

- The measurement resources configured for L1-CLI-RSSI measurements are measurable.

A measurement resource configured for L1-CLI-RSSI shall be considered measurable when for each relevant L1-CLI-RSSI resource the following conditions are met:

- L1-CLI-RSSI related side conditions given in clauses 10 for FR1 and FR2 for a corresponding band.

### 9.18.3.3 Measurement Reporting Requirements

The UE shall send L1-CLI-RSSI reports only for report configurations for periodical and aperiodic report when *cli-RSSI* is configured.

The UE shall report the L1-CLI-RSSI value as a 7-bit value in the range [-100, -25] dBm with 1 dB step size according to clause 10 if *nrofReportedCLIMeasResources* is configured to one. If *nrofReportedCLIMeasResources* is configured to be larger than one, the UE shall use differential L1-CLI-RSSI based reporting as defined in clause 10. The differential L1-CLI-RSSI is quantized to a 4-bit value with 2 dB step size. The mapping between the reported L1-CLI-RSSI value and the measured quantity is described in clause 10.

#### 9.18.3.3.1 Periodic Reporting

Reported L1-CLI-RSSI measurements contained in periodically triggered measurement reports shall meet the requirements in clause 10.

The UE shall transmit the periodic L1-CLI-RSSI reporting on PUCCH over the air interface according to the periodicity defined in clause 5.2.1.4 in TS 38.214 [26].

#### 9.18.3.3.2 Aperiodic Reporting

Reported L1-CLI-RSSI measurements contained in aperiodically triggered L1-CLI-RSSI measurement reports shall meet the requirements in clauses 10.

The UE shall only send aperiodic L1-CLI-RSSI measurement reports, if a DCI trigger has been received.

After the UE receives CSI request in DCI, the UE shall transmit the aperiodic L1-CLI-RSSI reporting on PUSCH over the air interface at the time specified according to clause 6.1.2.1 in TS 38.214 [26].

### 9.18.3.4 Measurement capability

The UE shall be capable of performing L1-CLI-RSSI measurement based on the configured resource, provided that the maximum number of L1-CLI-RSSI measurement resources for the UE does not exceed the numbers indicated in *l1-CLI-RSSI-MeasAndAperiodicReporting-r19*.

### 9.18.3.5 L1-CLI-RSSI measurement period

The UE capable of *supportL1-CLI-RSSI-Measurement* shall perform L1-CLI-RSSI measurement based on the configured L1-CLI-RSSI measurement resource. For periodic and semi-persistent L1-CLI-RSSI resource, the UE shall be capable of reporting L1-CLI-RSSI measured over measurement period of $T_{L1\text{-}CLI_RSSI_measurement_period}$ for FR1 and FR2.

For the value of L1,

1> If UE does not support *sbfd-Aware-r19* or SBFD is not configured by the network

2> L1 is not applicable

1> else if UE supports *sbfd-Aware-r19* and SBFD is configured by the network

2> if UE is configured to report L1- CLI-RSSI for SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the L1- CLI-RSSI resource that are overlapping with non-SBFD symbols during $T_{L1\text{-}CLI_RSSI_measurement_period}$

3> When DRX is configured, L1 is the number of DRX cycles in which all occasions of the L1- CLI-RSSI resource are overlapping with non-SBFD symbols during $T_{L1\text{-}CLI_RSSI_measurement_period}$

2> if UE is configured to report L1- CLI-RSSI for non-SBFD symbols

3> When DRX is not configured, L1 is the number of occasions of the L1- CLI-RSSI resource that are overlapping with SBFD symbols, during $T_{L1\text{-}CLI_RSSI_measurement_period}$

3> When DRX is configured, L1 is the number of DRX cycles in which all occasions of the L1- CLI-RSSI resource are overlapping with SBFD symbols, during $T_{L1\text{-}CLI_RSSI_measurement_period}$

**Table 9.18.3.5-1 Measurement period $T_{L1\text{-}CLI_RSSI_measurement_period}$**

| Configuration | $T_{L1\text{-}CLI_RSSI\ measurement_period}$ (ms) |
|---|---|
| No DRX | $Max(T_{Report}, (M+L1)\ X\ T_{CLI\text{-}RSSI})$ |
| DRX cycle ≤ 320ms | $Max(T_{Report}, Ceil(1.5\ X\ (M+L1))\ X\ max(T_{CLI\text{-}RSSI}, T_{DRX}))$ |
| DRX cycle > 320ms | $(M+L1)\ X\ T_{DRX}$ |
| NOTE 1: $T_{CLI\text{-}RSSI}$ is L1-CLI-RSSI measurement periodicity configured *RSSI-PeriodicityAndOffset*, and $T_{DRX}$ is the DRX cycle length. $T_{Report}$ is configured periodicity for reporting.<br>NOTE 2: M=1 if higher layer parameter *timeRestrictionForChannelMeasurement* is configured, and M=3 otherwise. | |

If the configured L1-CLI-RSSI measurement resources are partially or fully overlapping with SMTC window, SSB or CSI-RS configured for RLM, BFD, CBD or L1-RSRP measurement or measurement gaps, requirements are not specified for $T_{L1\text{-}CLI_RSSI_measurement_period}$.

### 9.18.3.6 Scheduling availability of UE during L1-CLI-RSSI measurements

Scheduling availability restrictions when the UE is performing L1-CLI-RSSI measurement are described in the following clause.

#### 9.18.3.6.1 Scheduling availability of UE performing L1-CLI-RSSI measurement on FR1

The following scheduling restriction applies due to the L1-CLI-RSSI measurement:

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs L1-CLI-RSSI measurements.

When TDD intra-band carrier aggregation is configured, the scheduling restrictions on serving cell where CLI measurements are performed apply on all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When intra-band non-contiguous carrier aggregation is configured for a UE indicating *intraBandNR-CA-non-collocated-r18* and if *nonCollocatedTypeNR-CA-r18* is not provided, there are no scheduling restrictions on FR1 serving cell(s) to be measured and configured on the non-contiguous CC(s) in the same band. Otherwise, the scheduling restrictions on serving cell where CLI measurements are performed apply on all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols if *nonCollocatedTypeNR-CA-r18* is provided.

When inter-band carrier aggregation within FR1 is configured, there are no scheduling restrictions on FR1 serving cell(s) configured in other bands than the bands in which the serving cell where L1-CLI-RSSI measurement is performed is configured.

#### 9.18.3.6.2 Scheduling availability of UE performing L1-CLI-RSSI measurement on FR2

The following scheduling restriction applies due to the L1-CLI-RSSI measurement:

- The UE is not expected to transmit PUCCH/PUSCH/SRS on OFDM symbols on which the UE performs L1-CLI-RSSI measurements.

- The UE is not expected to receive PDCCH/PDSCH/CSI-RS for tracking/CSI-RS for CQI on OFDM symbols on which the UE performs L1-CLI-RSSI measurements when RSSI resources are not TypeD QCL-ed with PDCCH/PDSCH/CSI-RS.

When TDD intra-band carrier aggregation is configured, the scheduling restrictions on serving cell where CLI measurements are performed apply on all serving cells in the same band on the symbols that fully or partially overlap with restricted symbols.

When inter-band carrier aggregation in FR2 is performed, there are no scheduling restrictions on FR2 serving cells in the bands due to L1-CLI-RSSI measurement performed on FR2 serving cell(s) in different band(s).

# 10 Measurement Performance requirements

## 10.1 NR measurements

### 10.1.1 Introduction

The requirements in clause 10.1 apply as follows:

- intra-frequency requirements apply for PCell measurements in SA, NR-DC, or NE-DC operation mode,
- intra-frequency requirements apply for PSCell measurements in NR-DC or EN-DC operation mode,
- intra-frequency requirements apply for SCell measurements in SA operation mode with NR CA or any MR-DC operation mode with NR CA,
- inter-frequency requirements apply for non-serving cell measurements on NR carrier frequencies.
- inter-frequency requirements apply for measurements from one cell on a frequency compared to the measurement from another cell on a different frequency.

In the requirements of clause 10.1, the exceptions for side conditions apply as follows:

- for the UE capable of CA but not configured with any SCell, the applicable exceptions for side conditions are specified in annex B, clause B.3.2.1 for UE supporting CA in FR1, and clause B.3.2.3 for UE supporting CA in FR2, respectively;
- for the UE capable of CA and configured with at least one SCell, the applicable exceptions for side conditions are specified in Annex B, clause B.3.2.2 for UE configured with CA in FR1, and clause B.3.2.4 for UE supporting CA in FR2, respectively;
- for the UE capable of SUL but not configured with SUL, the applicable exceptions for side conditions are specified in annex B, clause B.3.4.1 for UE supporting SUL in FR1;
- for the UE capable of SUL and configured with at least one SUL, the applicable exceptions for side conditions are specified in annex B, clause B.3.4.2 for UE configured with SUL in FR1.

### 10.1.2 Intra-frequency RSRP accuracy requirements for FR1

#### 10.1.2.1 Intra-frequency SS-RSRP accuracy requirements

##### 10.1.2.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the accuracy requirements for absolute SS-RSRP in this clause apply to a cell on the same frequency as that of the serving cell in FR1. The accuracy requirements in this clause are also applicable when *highSpeedMeasFlag-r16* or *highSpeedMeasCA-Scell-r17* is configured.

The accuracy requirements in table 10.1.2.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each relevant SSB.

**Table 10.1.2.1.1-1: SS-RSRP Intra-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | |
| | | | NR operating band groups [Note 2] | Minimum Io | Maximum Io |

| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
|---|---|---|---|---|---|---|---|
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4.5 | ±9 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -70 |
| ±8 | ±11 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | |

### 10.1.2.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy is defined as the SS-RSRP measured from one cell compared to the SS-RSRP measured from another cell on the same frequency, or between any two SS-RSRP levels measured on the same cell in FR1. The accuracy requirements in this clause are also applicable when *highSpeedMeasFlag-r16* or *highSpeedMeasCA-Scell-r17* is configured.

The accuracy requirements in table 10.1.2.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each relevant SSB.

**Table 10.1.2.1.2-1: SS-RSRP Intra-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB $\hat{E}s/Iot$ Note 2 | Io Note 1 range | | |
| | | | NR operating band groups Note 4 | Minimum Io | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ / $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |

| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
|---|---|---|---|---|---|---|---|
| ±2 | ±3 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| ±3 | ±3 | ≥-6 | Note 3 | Note 3 | Note 3 | N/A | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

## 10.1.2.2 Void

## 10.1.2.3 Intra-frequency CSI-RSRP accuracy requirements

### 10.1.2.3.1 Absolute CSI-RSRP Accuracy

Unless otherwise specified, the requirements for absolute CSI-RSRP accuracy in this clause apply to a cell where the CSI-RS resources to be measured have the same center frequency as the CSI-RS resources indicated for measurement in the serving cell in FR1.

The accuracy requirements in table 10.1.2.3.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each associated SSB.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.12 for a corresponding Band for each relevant CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.2.3.1-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for intra-frequency measurement is serving cell timing.

**Table 10.1.2.3.1-1: CSI-RSRP Intra-frequency absolute accuracy in FR1**

| **Accuracy** | | **Conditions** | | | |
|---|---|---|---|---|---|
| | | | **Io [Note 1] range** | | |
| **Normal condition** | **Extreme condition** | **CSI-RS Ês/Iot** | **NR operating band groups [Note 2]** | **Minimum Io** | **Maximum Io** |

| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
|---|---|---|---|---|---|---|---|---|
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±4.5 | ±9 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -70 |
| ±8 | ±11 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | | |

### 10.1.2.3.2 Relative CSI-RSRP Accuracy

The relative CSI-RSRP accuracy is defined as the CSI-RSRP measured from one cell compared to the CSI-RSRP measured from another cell on the same center frequency, or between any two CSI-RSRP levels measured on the same cell in FR1.

The accuracy requirements in table 10.1.2.3.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each associated SSB.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.12 for a corresponding Band for each relevant CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.2.3.2-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for intra-frequency measurement is serving cell timing.

**Table 10.1.2.3.2-1: CSI-RSRP Intra-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot Note 2 | Io Note 1 range | | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±2 | ±3 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |
| ±3 | ±3 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | N/A | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

# 10.1.2B Intra-frequency RSRP accuracy requirements for FR1 for CA/DC Idle Mode Measurements

## 10.1.2B.1 Intra-frequency SS-RSRP accuracy requirements

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute SS-RSRP accuracy.

### 10.1.2B.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to the serving cell in FR1.

The accuracy requirements in table 10.1.2B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.1.2 for a corresponding Band for each relevant SSB.

**Table 10.1.2B.1.1-1: SS-RSRP Intra-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±6 | ±10.5 | ≥-4 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -70 |

| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -70 |
| ±9.5 | ±12.5 | ≥-4 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.

# 10.1.2C Intra-frequency RSRP accuracy requirements for FR1 SAN

## 10.1.2C.1 Intra-frequency SS-RSRP accuracy requirements

### 10.1.2C.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in table 10.1.2C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for a corresponding Band for each relevant SSB.

- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.2C.1.1-1: SS-RSRP Intra-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4.5 | ±9 | ≥-6 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -70 |
| ±8 | ±11 | ≥-6 | NR_FDD_SAB_FR1_A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

### 10.1.2C.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy is defined as the SS-RSRP measured from one cell compared to the SS-RSRP measured from another cell on the same frequency, or between any two SS-RSRP levels measured on the same cell in FR1.

The accuracy requirements in table 10.1.2C.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.2C.1.2-1: SS-RSRP Intra-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 4] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±2 | ±3 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±3 | ±3 | ≥-6 | Note 3 | Note 3 | Note 3 | N/A | Note 3 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

## 10.1.2D Intra-frequency RSRP accuracy requirements for RedCap UE with Satellite Access in FR1

### 10.1.2D.1 Intra-frequency SS-RSRP accuracy requirements

#### 10.1.2D.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in clause 10.1.2C.1.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the absolute accuracy requirements in table 10.1.2D.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.2D.1.1-1: SS-RSRP Intra-frequency absolute accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | | | |
| | | | NR operating band groups Note 2 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±5.5 | ±10 | ≥-6 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -70 |
| ±9 | ±12 | ≥-6 | NR_FDD_SAB_FR1_A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

## 10.1.2D.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy is defined as the SS-RSRP measured from one cell compared to the SS-RSRP measured from another cell on the same frequency, or between any two SS-RSRP levels measured on the same cell in FR1.

The accuracy requirements in clause 10.1.2C.1.2 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the relative accuracy requirements in table 10.1.2D.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.2D.1.2-1: SS-RSRP Intra-frequency relative accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±4 | ±4 | ≥-6 | Note 3 | Note 3 | Note 3 | N/A | Note 3 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

# 10.1.3 Intra-frequency RSRP accuracy requirements for FR2

## 10.1.3.1 Intra-frequency SS-RSRP accuracy requirements

### 10.1.3.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR2.

The accuracy requirements in table 10.1.3.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.3.1.1-1: SS-RSRP Intra-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | | |
| ±6 | ±9 | ≥-6 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | N/A | -70 |
| ±8 | ±11 | | N/A | -70 | -50 |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.3.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy is defined as the SS-RSRP measured from one cell compared to the SS-RSRP measured from another cell on the same frequency, or between any two SS-RSRP levels measured on the same cell in FR2.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.3.1.2-1: SS-RSRP Intra-frequency relative accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±6 | ±9 | ≥-6 | Same value as SSB_RP in Table B.2.2-2, according to UE Power | -50 |

| | | | | |
|---|---|---|---|---|
| | | | class, operating band and angle of arrival | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.

## 10.1.3.2 Void

## 10.1.3.3 Intra-frequency CSI-RSRP accuracy requirements

### 10.1.3.3.1 Absolute CSI-RSRP Accuracy

Unless otherwise specified, the requirements for absolute CSI-RSRP accuracy in this clause apply to a cell where the CSI-RS resources to be measured have the same center frequency as the CSI-RS resources indicated for measurement in the serving cell in FR2.

The accuracy requirements in table 10.1.3.3.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each associated SSB(s).
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.12 for a corresponding Band for each relevant CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.3.3.1-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for intra-frequency measurement is serving cell timing.

- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.3.3.1-1: CSI-RSRP Intra-frequency absolute accuracy in FR2**

| **Accuracy** | | **Conditions** | | | |
|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **CSI-RS Ês/Iot** | **Io [Note 2] range** | | |
| | | | **Minimum Io** | | **Maximum Io** |
| | | | **dBm / $SCS_{CSI-RS}$ [Note 1]** | | |
| **dB** | **dB** | **dB** | **$SCS_{CSI-RS}$ = 60 kHz** | **$SCS_{CSI-RS}$ = 120 kHz** | **dBm/$BW_{Channel}$** | **dBm/$BW_{Channel}$** |
| ±6 | ±9 | ≥-6 | Same value as CSI-RS_RP in Table B.2.8-2, according to UE Power class, operating band and angle of arrival | | N/A | -70 |
| ±8 | ±11 | | N/A | | -70 | -50 |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

#### 10.1.3.3.2 Relative CSI-RSRP Accuracy

The relative CSI-RSRP accuracy is defined as the CSI-RSRP measured from one cell compared to the CSI-RSRP measured from another cell on the same center frequency, or between any two CSI-RSRP levels measured on the same cell in FR2.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each associated SSB(s).
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.12 for a corresponding Band for each CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.3.3.2-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for intra-frequency measurement is serving cell timing.

- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.3.3.2-1: CSI-RSRP Intra-frequency relative accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / SCS CSI-RS Note 1 | | dBm/BW Channel |
| | | | SCS CSI-RS = 60 kHz | SCS CSI-RS = 120 kHz | |
| ±6 | ±9 | ≥-6 | Same value as CSI-RS_RP in Table B.2.8-2, according to UE Power class, operating band and angle of arrival | | -50 |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of cells to which the requirement applies.

## 10.1.3B Intra-frequency RSRP accuracy requirements for FR2 for CA/DC Idle Mode Measurements

### 10.1.3B.1 Intra-frequency SS-RSRP accuracy requirements

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute SS-RSRP accuracy.

### 10.1.3B.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to the serving cell in FR2.

The accuracy requirements in table 10.1.3B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.1.2 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.3B.1.1-1: SS-RSRP Intra-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | |
| ±7.5 | ±10.5 | ≥-4 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | N/A | -70 |
| ±9.5 | ±12.5 | | N/A | -70 | -50 |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.3C Intra-frequency RSRP accuracy requirements for FR2-NTN

### 10.1.3C.1 Intra-frequency SS-RSRP accuracy requirements

### 10.1.3C.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR2-NTN.

The accuracy requirements in table 10.1.3C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.3C.1.1-1: SS-RSRP Intra-frequency absolute accuracy in FR2-NTN**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | |

| | | | | | |
|---|---|---|---|---|---|
| ±7 | ±10 | ≥-6 | Same value as SSB_RP derived from annex B.2.17, according to UE VSAT type | N/A | -70 |
| ±9 | ±12 | | N/A | -70 | -50 |
| NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.<br>NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | | |

### 10.1.3C.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy is defined as the SS-RSRP measured from one cell compared to the SS-RSRP measured from another cell on the same frequency, or between any two SS-RSRP levels measured on the same cell in FR2-NTN.

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.3C.1.2-1: SS-RSRP Intra-frequency relative accuracy in FR2-NTN**

| **Accuracy** | | **Conditions** | | | |
|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB Ês/Iot** | **Io [Note 2] range** | | |
| | | | **Minimum Io** | | **Maximum Io** |
| **dB** | **dB** | **dB** | **dBm / $SCS_{SSB}$ [Note 1]** | | **dBm/$BW_{Channel}$** |
| | | | **$SCS_{SSB}$ = 120 kHz** | **$SCS_{SSB}$ = 240 kHz** | |
| ±3 | ±6 | ≥-6 | Same value as SSB_RP derived from annex B.2.17, according to UE VSAT type | | -50 |
| NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.<br>NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.<br>NOTE 4: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies. | | | | | |

## 10.1.4 Inter-frequency RSRP accuracy requirements for FR1

### 10.1.4.1 Inter-frequency SS-RSRP accuracy requirements

#### 10.1.4.1.1 Absolute SS-RSRP Accuracy in FR1

The requirements for absolute SS-RSRP accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell. The accuracy requirements in this clause are also applicable when *highSpeedMeasInterFreq-r17* is configured.

The accuracy requirements in table 10.1.4.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.

**Table 10.1.4.1.1-1: SS-RSRP Inter-frequency Absolute accuracy in FR1**

| **Accuracy** | **Conditions** |
|---|---|

| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
|---|---|---|---|---|---|---|---|
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4.5 | ±9 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -70 |
| ±8 | ±11 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: Void
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.4.1.2 Relative SS-RSRP Accuracy in FR1

The relative SS-RSRP accuracy in inter-frequency case is defined as the RSRP measured from one cell on a frequency in FR1compared to the RSRP measured from another cell on a different frequency in FR1. The accuracy requirements in this clause are also applicable when *highSpeedMeasInterFreq-r17* is configured.

The accuracy requirements in Table 10.1.4.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] Clause 7.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB

**Table 10.1.4.1.2-1: SS-RSRP Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |

## 10.1.4.2 Void

## 10.1.4.3 Inter-frequency CSI-RSRP accuracy requirements

### 10.1.4.3.1 Absolute CSI-RSRP Accuracy in FR1

The requirements for absolute CSI-RSRP accuracy in this clause apply to a cell where the CSI-RS resources to be measured have the different center frequency as the CSI-RS resources indicated for measurement in the serving cell in FR1.

The accuracy requirements in table 10.1.4.3.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band for each relevant CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.4.3.1-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.

**Table 10.1.4.3.1-1: CSI-RSRP Inter-frequency Absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS ÊS/Iot | Io [Note 1] range | | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±4.5 | ±9 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B, | -120.5 | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -70 |
| ±8 | ±11 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | N/A | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.4.3.2 Relative CSI-RSRP Accuracy in FR1

The relative CSI-RSRP accuracy in inter-frequency case is defined as the CSI-RSRP measured from one cell on a frequency in FR1compared to the CSI-RSRP measured from another cell on a different frequency in FR1.

The accuracy requirements in table 10.1.4.3.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] clause 7.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band for each relevant CSI-RS to be measured.

- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.4.3.2-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.
  - NOTE: The reference measurement timing for one layer for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.
- $|CSI_RP1_{dBm} - CSI_RP2_{dBm}| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB

**Table 10.1.4.3.2-1: CSI-RSRP Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot Note 2 | Io Note 1 range | | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±4.5 | ±6 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: Void
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

# 10.1.4B Inter-frequency RSRP accuracy requirements for FR1 for CA/DC Idle Mode Measurements

## 10.1.4B.1 Inter-frequency SS-RSRP accuracy requirements

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute SS-RSRP accuracy.

### 10.1.4B.1.1 Absolute SS-RSRP Accuracy in FR1

The requirements for absolute SS-RSRP accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.4B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.1.3 for a corresponding Band for each relevant SSB.

**Table 10.1.4B.1.1-1: SS-RSRP Inter-frequency Absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±6 | ±10.5 | ≥-4 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -70 |
| ±9.5 | ±12.5 | ≥-4 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: Void
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.

# 10.1.4C Inter-frequency RSRP accuracy requirements for FR1 SAN

## 10.1.4C.1 Inter-frequency SS-RSRP accuracy requirements

### 10.1.4C.1.1 Absolute SS-RSRP Accuracy in FR1

The requirements for absolute SS-RSRP accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.4C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.4C.1.1-1: SS-RSRP Inter-frequency Absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB $\hat{E}s/Iot$ Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4.5 | ±9 | ≥-6 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -70 |
| ±8 | ±11 | ≥-6 | NR_FDD_SAB_FR1_A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: Void<br>NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

### 10.1.4C.1.2 Relative SS-RSRP Accuracy in FR1

The relative SS-RSRP accuracy in inter-frequency case is defined as the RSRP measured from one cell on a frequency in FR1compared to the RSRP measured from another cell on a different frequency in FR1.

The accuracy requirements in Table 10.1.4C.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] Clause 7.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.18 for a corresponding Band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB

**Table 10.1.4C.1.2-1: SS-RSRP Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB $\hat{E}s/Iot$ Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| ±4.5 | ±6 | ≥-6 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2A | | | | | | | |

# 10.1.4D Inter-frequency RSRP accuracy requirements for RedCap UE with Satellite Access in FR1

## 10.1.4D.1 Inter-frequency SS-RSRP accuracy requirements

### 10.1.4D.1.1 Absolute SS-RSRP Accuracy in FR1

The requirements for absolute SS-RSRP accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in clause 10.1.4C.1.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the absolute accuracy requirements in table 10.1.4D.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.4D.1.1-1: SS-RSRP Inter-frequency Absolute accuracy for 1Rx RedCap UE in FR1**

| **Accuracy** | | **Conditions** | | | | | |
|---|---|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB Ês/Iot** Note 2 | **Io** Note 1 **range** | | | | |
| | | | **NR operating band groups** Note 3 | **Minimum Io** | | | **Maximum Io** |
| **dB** | **dB** | **dB** | | **dBm / $SCS_{SSB}$** | | **dBm/$BW_{Channel}$** | **dBm/$BW_{Channel}$** |
| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
| ±5.5 | ±10 | ≥-6 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -70 |
| ±9 | ±12 | ≥-6 | NR_FDD_SAB_FR1_A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: Void<br>NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

### 10.1.4D.1.2 Relative SS-RSRP Accuracy in FR1

The relative SS-RSRP accuracy in inter-frequency case is defined as the RSRP measured from one cell on a frequency in FR1compared to the RSRP measured from another cell on a different frequency in FR1.

The accuracy requirements in clause 10.1.4C.1.2 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the relative accuracy requirements in table 10.1.4D.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] Clause 7.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.18 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB

**Table 10.1.4D.1.2-1: SS-RSRP Inter-frequency relative accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±5.5 | ±7 | ≥-6 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2A | | | | | | | |

## 10.1.5 Inter-frequency RSRP accuracy requirements for FR2

### 10.1.5.1 Inter-frequency SS-RSRP accuracy requirements

#### 10.1.5.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to a cell on a frequency in FR2 that is on a different frequency than the serving cell.

The accuracy requirements in table 10.1.5.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.5.1.1-1: SS-RSRP Inter-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | | |
| ±6 | ±9 | ≥-4 | Same value as SSB_RP in Table B.2.3-2, according to UE Power class, operating band and angle of arrival | N/A | -70 |
| ±8 | ±11 | | N/A | -70 | -50 |
| NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | | |

#### 10.1.5.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy is defined as the SS-RSRP measured from one cell on a frequency in FR2 compared to the SS-RSRP measured from another cell on another frequency in FR2.

The accuracy requirements in table 10.1.5.1.2-1 are valid under the following conditions:

- Conditions defined in TS 38.101-2 [19] clause 7.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.
- -- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27dB$
- $|Channel\ 1_Io - Channel\ 2_Io| \leq 20$ dB
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.5.1.2-1: SS-RSRP Inter-frequency relative accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB Ês/Iot** | **Io [Note 2] range** | |
| | | | **Minimum Io** | **Maximum Io** |
| **dB** | **dB** | **dB** | **dBm / $SCS_{SSB}$ [Note 1]** | **dBm/$BW_{Channel}$** |
| | | | **$SCS_{SSB}$ = 120 kHz** \| **$SCS_{SSB}$ = 240 kHz** | |
| ±6 | ±9 | ≥-4 | Same value as SSB_RP in Table B.2.3-2, according to UE Power class, operating band and angle of arrival | -50 |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.

## 10.1.5.2 Void

## 10.1.5.3 Inter-frequency CSI-RSRP accuracy requirements

### 10.1.5.3.1 Absolute CSI-RSRP Accuracy

Unless otherwise specified, the requirements for absolute CSI-RSRP accuracy in this clause apply to a cell on a frequency in FR2 where the CSI-RS resources to be measured have the different center frequency as the CSI-RS resources indicated for measurement in the serving cell.

The accuracy requirements in table 10.1.5.3.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant associated SSB.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band for each relevant CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.5.3.1-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.

- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.5.3.1-1: CSI-RSRP Inter-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 1 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz / $SCS_{CSI-RS}$ = 120 kHz | | |
| ±6 | ±9 | ≥-4 | Same value as CSI_RP in Table B.2.9-2, according to UE Power class, operating band and angle of arrival | N/A | -70 |
| ±8 | ±11 | | N/A | -70 | -50 |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.5.3.2 Relative CSI-RSRP Accuracy

The relative CSI-RSRP accuracy in inter-frequency case is defined as the CSI-RSRP measured from one cell on a frequency in FR2 compared to the CSI-RSRP measured from another cell on another frequency in FR2.

The accuracy requirements in table 10.1.5.3.2-1 are valid under the following conditions:

- Conditions defined in TS 38.101-2 [19] clause 7.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant associated SSB.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band for each relevant CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.5.3.2-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.

- $|CSI_RP1_{dBm} - CSI_RP2_{dBm}| \leq 27dB$
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.5.3.2-1: CSI-RSRP Inter-frequency relative accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 1 | | dBm/$BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | |
| ±6 | ±9 | ≥-4 | Same value as CSI_RP in Table B.2.9-2, according to UE Power class, operating band and angle of arrival | | -50 |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.

NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of cells to which the requirement applies.

## 10.1.5B Inter-frequency RSRP accuracy requirements for FR2 for CA/DC Idle Mode Measurements

### 10.1.5B.1 Inter-frequency SS-RSRP accuracy requirements

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute SS-RSRP accuracy.

#### 10.1.5B.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to a cell on a frequency in FR2 that is on a different frequency than the serving cell.

The accuracy requirements in table 10.1.5B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.1.3 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.5B.1.1-1: SS-RSRP Inter-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | | |
| ±7.5 | ±10.5 | ≥-4 | Same value as SSB_RP in Table B.2.3-2, according to UE Power class, operating band and angle of arrival | N/A | -70 |
| ±9.5 | ±12.5 | | N/A | -70 | -50 |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

# 10.1.5C Inter-frequency RSRP accuracy requirements for FR2-NTN

## 10.1.5C.1 Inter-frequency SS-RSRP accuracy requirements

### 10.1.5C.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to a cell on a frequency in FR2-NTN that is on a different frequency than the serving cell.

The accuracy requirements in table 10.1.5C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.5C.1.1-1: SS-RSRP Inter-frequency absolute accuracy in FR2-NTN**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | |
| ±7 | ±10 | ≥-4 | Same value as SSB_RP derived from annex B.2.18, according to UE VSAT type | | N/A | -70 |
| ±9 | ±12 | | N/A | | -70 | -50 |

NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.5C.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy is defined as the SS-RSRP measured from one cell on a frequency in FR2-NTN compared to the SS-RSRP measured from another cell on another frequency in FR2-NTN.

The accuracy requirements in table 10.1.5C.1.2-1 are valid under the following conditions:

- Conditions defined in 38.101-5 [19] clause 10.3 for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27dB$
- $|Channel\ 1_Io - Channel\ 2_Io| \leq 20\ dB$
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.5C.1.2-1: SS-RSRP Inter-frequency relative accuracy in FR2-NTN**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | |

| | | | | |
|---|---|---|---|---|
| ±7 | ±10 | ≥-4 | Same value as SSB_RP derived from annex B.2.18, according to UE VSAT type | -50 |

NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.

## 10.1.6 RSRP Measurement Report Mapping

The reporting range of SS-RSRP and CSI-RSRP for L3 reporting is defined from -156 dBm to -31 dBm with 1 dB resolution. The reporting range of SS-RSRP and CSI-RSRP for L1 reporting is defined from -140 to -44 dBm with 1 dB resolution.

The mapping of measured quantity is defined in table 10.1.6.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

The reporting range of differential SS-RSRP and CSI-RSRP for L1 reporting is defined from 0 dB to -30 dB with 2 dB resolution.

The mapping of measured quantity is defined in table 10.1.6.1-2. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.6.1-1: SS-RSRP and CSI-RSRP measurement report mapping**

| Reported value | Measured quantity value (L3 SS-RSRP) and CSI-RSRP | Measured quantity value (L1 SS-RSRP and CSI-RSRP) | Unit |
|---|---|---|---|
| RSRP_0 | SS-RSRP<-156 | Not valid | dBm |
| RSRP_1 | -156≤ SS-RSRP<-155 | Not valid | dBm |
| RSRP_2 | -155≤ SS-RSRP<-154 | Not valid | dBm |
| RSRP_3 | -154≤ SS-RSRP<-153 | Not valid | dBm |
| RSRP_4 | -153≤ SS-RSRP<-152 | Not valid | dBm |

## 10.1.7 Intra-frequency RSRQ accuracy requirements for FR1

### 10.1.7.1 Intra-frequency SS-RSRQ accuracy requirements in FR1

#### 10.1.7.1.1 Absolute SS-RSRQ Accuracy in FR1

Unless otherwise specified, the requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1. The accuracy requirements in this clause are also applicable when *highSpeedMeasFlag-r16* or *highSpeedMeasCA-Scell-r17* is configured.

The accuracy requirements in table 10.1.7.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each relevant SSB.

**Table 10.1.7.1.1-1: SS-RSRQ Intra-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | |
| | | | NR operating band groups [Note 3] | Minimum Io | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| | | | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| ±2.5 | ±4 | ≥-3 | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | |

## 10.1.7.2 Intra-frequency CSI-RSRQ accuracy requirements

### 10.1.7.2.1 Absolute CSI-RSRQ Accuracy

Unless otherwise specified, the requirements for absolute CSI-RSRQ accuracy in this clause apply to the intra-frequency measurement defined in clause 9.10.2.1 in FR1.

The accuracy requirements in table 10.1.7.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for associated SSB.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.12 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.7.2.1-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for intra-frequency measurement is serving cell timing.

**Table 10.1.7.2.1-1: CSI-RSRQ Intra-frequency absolute accuracy in FR1**

| **Accuracy** | | **Conditions** | | | | | |
|---|---|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **CSI-RS $\hat{E}_s/I_{ot}$** | **Io [Note 1] range** | | | | |
| | | | **NR operating band groups [Note 3]** | **Minimum Io** | | | **Maximum Io** |
| **dB** | **dB** | **dB** | | **dBm / $SCS_{CSI-RS}$** | | | **$dBm/BW_{Channel}$** | **$dBm/BW_{Channel}$** |
| | | | | **$SCS_{CSI-RS}$ = 15 kHz** | **$SCS_{CSI-RS}$ = 30 kHz** | **$SCS_{CSI-RS}$ = 60 kHz** | | |

# 10.1.7B Intra-frequency RSRQ accuracy requirements for FR1 for CA/DC Idle Mode Measurements

## 10.1.7B.1 Intra-frequency SS-RSRQ accuracy requirements in FR1

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute SS-RSRQ accuracy.

### 10.1.7B.1.1 Absolute SS-RSRQ Accuracy in FR1

Unless otherwise specified, the requirements for absolute SS-RSRQ accuracy in this clause apply to the serving cell in FR1.

The accuracy requirements in table 10.1.7B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.1.2 for a corresponding Band for each relevant SSB.

**Table 10.1.7B.1.1-1: SS-RSRQ Intra-frequency absolute accuracy in FR1**

| **Accuracy** | | **Conditions** | | | | | |
|---|---|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB $\hat{E}_s/I_{ot}$** | **Io [Note 1] range** | | | | |
| | | | **NR operating band groups [Note 3]** | **Minimum Io** | | | **Maximum Io** |
| **dB** | **dB** | **dB** | | **dBm / $SCS_{SSB}$** | | **dBm/$BW_{Channel}$** | **dBm/$BW_{Channel}$** |
| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
| ±4 | ±5.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |

| | | | | | | | |

# 10.1.7C Intra-frequency RSRQ accuracy requirements for FR1 SAN

## 10.1.7C.1 Intra-frequency SS-RSRQ accuracy requirements in FR1

### 10.1.7C.1.1 Absolute SS-RSRQ Accuracy in FR1

Unless otherwise specified, the requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in table 10.1.7C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.7C.1.1-1: SS-RSRQ Intra-frequency absolute accuracy in FR1**

| **Accuracy** | | **Conditions** | | | | | |
|---|---|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB $\hat{E}_s/I_{ot}$** | **Io [Note 1] range** | | | | |
| | | | **NR operating band groups [Note 3]** | **Minimum Io** | | | **Maximum Io** |
| **dB** | **dB** | **dB** | | **dBm / $SCS_{SSB}$** | | **dBm/$BW_{Channel}$** | **dBm/$BW_{Channel}$** |
| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
| ±2.5 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2A | | | | | | | |

# 10.1.7D Intra-frequency RSRQ accuracy requirements for RedCap UE with Satellite Access in FR1

## 10.1.7D.1 Intra-frequency SS-RSRQ accuracy requirements in FR1

### 10.1.7D.1.1 Absolute SS-RSRQ Accuracy in FR1

Unless otherwise specified, the requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in clause 10.1.7C.1.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the absolute accuracy requirements in table 10.1.7D.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.7D.1.1-1: SS-RSRQ Intra-frequency absolute accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 3] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3.5 | ±5 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±4.5 | ±5 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2A

## 10.1.8 Intra-frequency RSRQ accuracy requirements for FR2

### 10.1.8.1 Intra-frequency SS-RSRQ accuracy requirements in FR2

#### 10.1.8.1.1 Absolute SS-RSRQ Accuracy in FR2

Unless otherwise specified, the requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR2.

The accuracy requirements in table 10.1.8.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.8.1.1-1: SS-RSRQ Intra-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±2.5 | ±4 | ≥-3 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±3.5 | ±4 | ≥-6 | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.8.2 Intra-frequency CSI-RSRQ accuracy requirements

#### 10.1.8.2.1 Absolute CSI-RSRQ Accuracy

Unless otherwise specified, the requirements for absolute CSI-RSRQ accuracy in this clause apply to the intra-frequency measurement defined in clause 9.10.2.1 in FR2.

The accuracy requirements in table 10.1.8.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each relevant SSB.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.12 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.8.2.1-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for intra-frequency measurement is serving cell timing.

- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.8.2.1-1: CSI-RSRQ Intra-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 1 | | dBm/$BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | |
| ±2.5 | ±4 | ≥-3 | Same value as CSI_RP in Table B.2.8-2, according to UE Power class, operating band and angle of arrival | | -50 |
| ±3.5 | ±4 | ≥-6 | | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.8B Intra-frequency RSRQ accuracy requirements for FR2 for CA/DC Idle Mode Measurements

### 10.1.8B.1 Intra-frequency SS-RSRQ accuracy requirements in FR2

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute SS-RSRQ accuracy.

### 10.1.8B.1.1 Absolute SS-RSRQ Accuracy in FR2

Unless otherwise specified, the requirements for absolute SS-RSRQ accuracy in this clause apply to the serving cell in FR2.

The accuracy requirements in table 10.1.8B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.1.2 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.8B.1.1-1: SS-RSRQ Intra-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±4 | ±5.5 | ≥-3 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±5 | ±5.5 | ≥-4 | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.8C Intra-frequency RSRQ accuracy requirements for FR2-NTN

### 10.1.8C.1 Intra-frequency SS-RSRQ accuracy requirements in FR2-NTN

### 10.1.8C.1.1 Absolute SS-RSRQ Accuracy in FR2-NTN

Unless otherwise specified, the requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR2-NTN.

The accuracy requirements in table 10.1.8C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.8C.1.1-1: SS-RSRQ Intra-frequency absolute accuracy in FR2-NTN**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±3.5 | ±5 | ≥-3 | Same value as SSB_RP derived from annex B.2.17, according to UE VSAT type | -50 |
| ±4.5 | ±5 | ≥-6 | | |

NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.9 Inter-frequency RSRQ accuracy requirements for FR1

### 10.1.9.1 Inter-frequency SS-RSRQ accuracy requirements in FR1

#### 10.1.9.1.1 Absolute SS-RSRQ Accuracy in FR1

The requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell. The accuracy requirements in this clause are also applicable when *highSpeedMeasInterFreq-r17* is configured.

The accuracy requirements in table 10.1.9.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.

**Table 10.1.9.1.1-1: SS-RSRQ Inter-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 3] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±2.5 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.

#### 10.1.9.1.2 Relative SS-RSRQ Accuracy in FR1

The relative SS-RSRQ accuracy in inter-frequency case is defined as the RSRQ measured from one cell on a frequency in FR1 compared to the RSRP measured from another cell on a different frequency in FR1. The accuracy requirements in this clause are also applicable when *highSpeedMeasInterFreq-r17* is configured.

The accuracy requirements in table 10.1.9.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB

**Table 10.1.9.1.2-1: SS-RSRQ Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| ±4 | ±4 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

## 10.1.9.2 Inter-frequency CSI-RSRQ accuracy requirements

### 10.1.9.2.1 Absolute CSI-RSRQ Accuracy

Unless otherwise specified, the requirements for absolute CSI-RSRQ accuracy in this clause apply to the inter-frequency measurement defined in clause 9.10.3.1 in FR1.

The accuracy requirements in table 10.1.9.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for associated SSB.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

- The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.9.2.1-1.

- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.

**Table 10.1.9.2.1-1: CSI-RSRQ Inter-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 1 range | | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±2.5 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.9.2.2 Relative CSI-RSRQ Accuracy

The relative CSI-RSRQ accuracy is defined as the CSI-RSRQ measured from one cell compared to the CSI-RSRQ measured from another cell with the same center frequency, or between any two CSI-RSRQ levels measured on the same cell in FR1.

The accuracy requirements in table 10.1.9.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for the associated SSB.

- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band for each relevant CSI-RS.

- $|CSI_RP1_{dBm} - CSI_RP2_{dBm}| \leq 27$ dB

- |Channel 1_Io - Channel 2_Io | ≤ 20 dB

- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

- The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.9.2.2-1.

- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.

**Table 10.1.9.2.2-1: CSI-RSRQ Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot Note 2 | Io Note 1 range | | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |
| ±4 | ±4 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

## 10.1.9B Inter-frequency RSRQ accuracy requirements for FR1 for CA/DC Idle Mode Measurements

### 10.1.9B.1 Inter-frequency SS-RSRQ accuracy requirements in FR1

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE

- that is synchronised to the cell that is measured.

The requirements are for absolute SS-RSRQ accuracy.

#### 10.1.9B.1.1 Absolute SS-RSRQ Accuracy in FR1

The requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.9B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.1.3 for a corresponding Band for each relevant SSB.

**Table 10.1.9B.1.1-1: SS-RSRQ Inter-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4 | ±5.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| ±5 | ±5.5 | ≥-4 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2A.

# 10.1.9C Inter-frequency RSRQ accuracy requirements for FR1 SAN

## 10.1.9C.1 Inter-frequency SS-RSRQ accuracy requirements in FR1

### 10.1.9C.1.1 Absolute SS-RSRQ Accuracy in FR1

The requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.9C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.9C.1.1-1: SS-RSRQ Inter-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | |
|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range |

| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
|---|---|---|---|---|---|---|---|
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±2.5 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | |

### 10.1.9C.1.2 Relative SS-RSRQ Accuracy in FR1

The relative SS-RSRQ accuracy in inter-frequency case is defined as the RSRQ measured from one cell on a frequency in FR1 compared to the RSRP measured from another cell on a different frequency in FR1.

The accuracy requirements in table 10.1.9C.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.9C.1.2-1: SS-RSRQ Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±4 | ±4 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

## 10.1.9D Inter-frequency RSRQ accuracy requirements for RedCap UE with Satellite Access in FR1

### 10.1.9D.1 Inter-frequency SS-RSRQ accuracy requirements in FR1

#### 10.1.9D.1.1 Absolute SS-RSRQ Accuracy in FR1

The requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in clause 10.1.9C.1.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the absolute accuracy requirements in table 10.1.9D.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.9D.1.1-1: SS-RSRQ Inter-frequency absolute accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3.5 | ±5 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±4.5 | ±5 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | |

## 10.1.9D.1.2 Relative SS-RSRQ Accuracy in FR1

The relative SS-RSRQ accuracy in inter-frequency case is defined as the RSRQ measured from one cell on a frequency in FR1 compared to the RSRP measured from another cell on a different frequency in FR1.

The accuracy requirements in clause 10.1.9C.1.2 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the relative accuracy requirements in table 10.1.9D.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- $|Channel\ 1_Io - Channel\ 2_Io| \leq 20$ dB
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.9D.1.2-1: SS-RSRQ Inter-frequency relative accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4 | ±5 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±5 | ±5 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement. | | | | | | | |

NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A.

## 10.1.10 Inter-frequency RSRQ accuracy requirements for FR2

### 10.1.10.1 Inter-frequency SS-RSRQ accuracy requirements in FR2

#### 10.1.10.1.1 Absolute SS-RSRQ Accuracy in FR2

The requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on a frequency in FR2 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.10.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.10.1.1-1: SS-RSRQ Inter-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±2.5 | ±4 | ≥-3 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±3.5 | ±4 | ≥-4 | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

#### 10.1.10.1.2 Relative SS-RSRQ Accuracy in FR2

The relative SS-RSRQ accuracy in inter-frequency case is defined as the RSRQ measured from one cell on a frequency in FR2 compared to the RSRP measured from another cell on a different frequency in FR2.

The accuracy requirements in table 10.1.10.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for each relevant SSB.
- $|SSB_RP1\ dB_m - SSB_RP2\ dB_m| \leq 27$ dB
- $|$ Channel 1_Io -Channel 2_Io $| \leq 20$ dB
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.10.1.2-1: SS-RSRQ Inter-frequency relative accuracy in FR2**

| Accuracy | Conditions |
|---|---|

| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | | |
|---|---|---|---|---|---|
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | |
| ±3 | ±4 | ≥-3 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | | -50 |
| ±4 | ±4 | ≥-4 | | | |
| NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 3: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 4: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | | |

## 10.1.10.2 Inter-frequency CSI-RSRQ accuracy requirements

### 10.1.10.2.1 Absolute CSI-RSRQ Accuracy

Unless otherwise specified, the requirements for absolute CSI-RSRQ accuracy in this clause apply the inter-frequency measurement defined in clause 9.10.3.1 in FR2.

The accuracy requirements in table 10.1.10.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for associated SSB.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.10.2.1-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.

**Table 10.1.10.2.1-1: CSI-RSRQ Inter-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io [Note 2] range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ [Note 1] | | $dBm/BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | |
| ±2.5 | ±4 | ≥-3 | Same value as CSI_RP in Table B.2.9-2, according to UE Power class, operating band and angle of arrival | | -50 |
| ±3.5 | ±4 | ≥-4 | | | |
| NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | | |

### 10.1.10.2.2 Relative CSI-RSRQ Accuracy

The relative CSI-RSRQ accuracy is defined as the CSI-RSRQ measured from one cell compared to the CSI-RSRQ measured from another cell with the same center frequency, or between any two CSI-RSRQ levels measured on the same cell in FR2.

The accuracy requirements in table 10.1.10.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band for the associated SSB.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.10.2.2-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.

**Table 10.1.10.2.2-1: CSI-RSRQ Inter-frequency relative accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 1 | | $dBm/BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | |
| ±3 | ±4 | ≥-3 | Same value as CSI_RP in Table B.2.9-2, according to UE Power class, operating band and angle of arrival | | -50 |
| ±4 | ±4 | ≥-4 | | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of cells to which the requirement applies.
NOTE 4: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.10B Inter-frequency RSRQ accuracy requirements for FR2 for CA/DC Idle Mode Measurements

### 10.1.10B.1 Inter-frequency SS-RSRQ accuracy requirements in FR2

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute SS-RSRQ accuracy.

### 10.1.10B.1.1 Absolute SS-RSRQ Accuracy in FR2

The requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on a frequency in FR2 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.10B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.1.3 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.10B.1.1-1: SS-RSRQ Inter-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±4 | ±5.5 | ≥-3 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±5 | ±5.5 | ≥-4 | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.10C Inter-frequency RSRQ accuracy requirements for FR2-NTN

### 10.1.10C.1 Inter-frequency SS-RSRQ accuracy requirements in FR2-NTN

#### 10.1.10C.1.1 Absolute SS-RSRQ Accuracy in FR2-NTN

The requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on a frequency in FR2-NTN that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.10C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.10C.1.1-1: SS-RSRQ Inter-frequency absolute accuracy in FR2-NTN**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±3.5 | ±5 | ≥-3 | Same value as SSB_RP derived from annex B.2.18, according to UE VSAT type | -50 |
| ±4.5 | ±5 | ≥-4 | | |

NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.10C.1.2 Relative SS-RSRQ Accuracy in FR2-NTN

The relative SS-RSRQ accuracy in inter-frequency case is defined as the RSRQ measured from one cell on a frequency in FR2-NTN compared to the RSRP measured from another cell on a different frequency in FR2-NTN.

The accuracy requirements in table 10.1.10C.1.2-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band for each relevant SSB.
- $|SSB_RP1\ dB_m - SSB_RP2\ dB_m| \leq 27$ dB
- $|$ Channel 1_Io -Channel 2_Io $| \leq 20$ dB
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.10C.1.2-1: SS-RSRQ Inter-frequency relative accuracy in FR2-NTN**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±4 | ±5 | ≥-3 | Same value as SSB_RP derived from annex B.2.18, according to UE VSAT type | -50 |
| ±5 | ±5 | ≥-4 | | |

NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 4: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.11 RSRQ report mapping

### 10.1.11.1 SS-RSRQ and CSI-RSRQ measurement report mapping

The reporting range of SS-RSRQ and CSI-RSRQ measurement is defined from -43 dB to 20 dB with 0.5 dB resolution. The mapping of measured quantity is defined in table 10.1.11.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.11.1-1: SS-RSRQ and CSI-RSRQ measurement report mapping**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| SS-RSRQ_0 | SS-RSRQ<-43 | dB |
| SS-RSRQ_1 | -43≤ SS-RSRQ<-42.5 | dB |
| SS-RSRQ_2 | -42.5≤ SS-RSRQ<-42 | dB |
| SS-RSRQ_3 | -42≤ SS-RSRQ<-41.5 | dB |
| SS-RSRQ_4 | -41.5≤ SS-RSRQ<-41 | dB |
| .. | .. | … |
| SS-RSRQ_122 | 17.5≤ SS-RSRQ<18 | dB |

| | | |
|---|---|---|
| SS-RSRQ_123 | 18≤ SS-RSRQ<18.5 | dB |
| SS-RSRQ_124 | 18.5≤ SS-RSRQ<19 | dB |
| SS-RSRQ_125 | 19≤ SS-RSRQ<19.5 | dB |
| SS-RSRQ_126 | 19.5≤ SS-RSRQ<20 | dB |
| SS-RSRQ_127 | 20 ≤ SS-RSRQ | dB |

## 10.1.12 Intra-frequency SINR accuracy requirements for FR1

### 10.1.12.1 Intra-frequency SS-SINR accuracy requirements in FR1

#### 10.1.12.1.1 Absolute SS-SINR Accuracy in FR1

Unless otherwise specified, the requirements for absolute SS-SINR accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in table 10.1.12.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band.

**Table 10.1.12.1.1-1: SS-SINR Intra-frequency absolute accuracy in FR1**

| **Accuracy** | | **Conditions** | | | | | |
|---|---|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB Ês/Iot** Note 3 | **Io** Note 1 **range** | | | | |
| | | | **NR operating band groups** Note 4 | **Minimum Io** | | | **Maximum Io** |
| **dB** | **dB** | **dB** | | **dBm / $SCS_{SSB}$** | | **dBm/$BW_{Channel}$** | **dBm/$BW_{Channel}$** |
| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
| ±3.0 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The requirements apply for SSB Ês/Iot ≤ 25 dB under non-HST scenarios.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: The requirements apply for SSB Ês/Iot ≤5 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

## 10.1.12.2 Intra-frequency CSI-SINR accuracy requirements in FR1

### 10.1.12.2.1 Absolute CSI-SINR Accuracy in FR1

Unless otherwise specified, the requirements for absolute CSI-SINR accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in table 10.1.12.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to Annex B.2.12 for a corresponding Band.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.
  - NOTE: The reference measurement timing for intra-frequency measurement is serving cell timing.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.12.2.1-1.

**Table 10.1.12.2.1-1: CSI-SINR Intra-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | Io [Note 1] range | | | | | |
| Normal condition | Extreme condition | CSI-RS Ês/Iot | NR operating band groups | Minimum Io | | | | Maximum Io |
| | | | | dBm / SCS | | | dBm/BW Channel | dBm/BW Channel |
| | | | | SCS (kHz) | | | | |
| dB | dB | dB | | 15 | 30 | 60 | | |
| ±3 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -70 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | N/A | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 4: The requirements apply for CSI-RS Ês/Iot ≤XdB. X=15 if timing offset between the reference measurement timing and the target CSI-RS is no larger than 0.5*CP, and X=4 if timing offset between the reference measurement timing and the target CSI-RS is larger than 0.5*CP but no larger than CP.

# 10.1.12C Intra-frequency SINR accuracy requirements for FR1 SAN

## 10.1.12C.1 Intra-frequency SS-SINR accuracy requirements in FR1

### 10.1.12C.1.1 Absolute SS-SINR Accuracy in FR1

Unless otherwise specified, the requirements for absolute SS-SINR accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in table 10.1.12C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for a corresponding Band.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.12C.1.1-1: SS-SINR Intra-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 3 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The requirements apply for SSB Ês/Iot ≤ 25 dB under non-HST scenarios.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A.
NOTE 5: The requirements apply for SSB Ês/Iot ≤5 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

# 10.1.12D Intra-frequency SINR accuracy requirements for RedCap UE with Satellite Access in FR1

## 10.1.12D.1 Intra-frequency SS-SINR accuracy requirements in FR1

### 10.1.12D.1.1 Absolute SS-SINR Accuracy in FR1

Unless otherwise specified, the requirements for absolute SS-SINR accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR1.

The accuracy requirements in clause 10.1.12D.1.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the absolute accuracy requirements in table 10.1.12D.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for both 1Rx and 2Rx RedCap UE for a corresponding Band.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.12D.1.1-1: SS-SINR Intra-frequency absolute accuracy for 1Rx RedCap UE in FR1**

| Accuracy | Conditions |
|---|---|

| Normal condition | Extreme condition | SSB Ês/Iot Note 3 | Io Note 1 range | | | | |
|---|---|---|---|---|---|---|---|
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4.0 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±4.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The requirements apply for SSB Ês/Iot ≤ 25 dB under non-HST scenarios.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A.
NOTE 5: The requirements apply for SSB Ês/Iot ≤5 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

## 10.1.13 Intra-frequency SINR accuracy requirements for FR2

### 10.1.13.1 Intra-frequency SS-SINR accuracy requirements in FR2

#### 10.1.13.1.1 Absolute SS-SINR Accuracy in FR2

Unless otherwise specified, the requirements for absolute SS-SINR accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR2.

The accuracy requirements in table 10.1.13.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.13.1.1-1: SS-SINR Intra-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz \| $SCS_{SSB}$ = 240 kHz | |
| ±3 | ±4 | ≥-3 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±3.5 | ±4 | ≥-6 | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The requirements apply for SSB Ês/Iot ≤ 25 dB.

### 10.1.13.2 Intra-frequency CSI-SINR accuracy requirements in FR2

#### 10.1.13.2.1 Absolute CSI-SINR Accuracy in FR2

Unless otherwise specified, the requirements for absolute CSI-SINR accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR2.

The accuracy requirements in table 10.1.13.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.12 for a corresponding Band.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.
  - NOTE: The reference measurement timing for intra-frequency measurement is serving cell timing.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.13.2.1-1.

**Table 10.1.13.2.1-1: CSI-SINR Intra-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 1 | | $dBm/BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | |
| ±3 | ±4 | ≥-3 | Same value as CSI_RP in Table B.2.8-2, according to UE Power class, operating band and angle of arrival | | -50 |
| ±3.5 | ±4 | ≥-6 | | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The requirements apply for CSI-RS Ês/Iot ≤XdB. X=15 if timing offset between the reference measurement timing and the target CSI-RS is no larger than 0.5*CP, and X=4 if timing offset between the reference measurement timing and the target CSI-RS is larger than 0.5*CP but no larger than CP.

# 10.1.13C Intra-frequency SINR accuracy requirements for FR2-NTN

## 10.1.13C.1 Intra-frequency SS-SINR accuracy requirements in FR2-NTN

### 10.1.13C.1.1 Absolute SS-SINR Accuracy in FR2-NTN

Unless otherwise specified, the requirements for absolute SS-SINR accuracy in this clause apply to a cell on the same frequency as that of the serving cell in FR2-NTN.

The accuracy requirements in table 10.1.13C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.17 for a corresponding Band.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.13C.1.1-1: SS-SINR Intra-frequency absolute accuracy in FR2-NTN**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | |

| | | | | |
|---|---|---|---|---|
| ±4 | ±5 | ≥-3 | Same value as SSB_RP derived from annex B.2.17, according to UE VSAT type | -50 |
| ±4.5 | ±5 | ≥-6 | | |

NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The requirements apply for SSB Ês/Iot ≤ 25 dB

## 10.1.14 Inter-frequency SINR accuracy requirements for FR1

### 10.1.14.1 Inter-frequency SS-SINR accuracy requirements in FR1

#### 10.1.14.1.1 Absolute SS-SINR Accuracy in FR1

The requirements for absolute SS-SINR accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.14.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band.

**Table 10.1.14.1.1-1: SS-SINR Inter-frequency absolute accuracy in FR1**

| **Accuracy** | | **Conditions** | | | | | |
|---|---|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB Ês/Iot** Note 3 | **Io** Note 1 **range** | | | | |
| | | | **NR operating band groups** Note 4 | **Minimum Io** | | | **Maximum Io** |
| **dB** | **dB** | **dB** | | **dBm / $SCS_{SSB}$** | | **dBm/$BW_{Channel}$** | **dBm/$BW_{Channel}$** |
| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
| ±3.0 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The requirements apply for SSB Ês/Iot ≤ 25 dB.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: The requirements apply for SSB Ês/Iot ≤ 5 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

### 10.1.14.1.2 Relative SS-SINR Accuracy in FR1

The relative SS-SINR accuracy in inter-frequency case is defined as the SS-SINR measured from one cell on a frequency in FR1 compared to the SS-SINR measured from another cell on a different frequency in FR1.

The accuracy requirements in table 10.1.14.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- | Channel 1_Io -Channel 2_Io | ≤ 20 dB

**Table 10.1.14.1.2-1: SS-SINR Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2,4 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 5 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | | |
| ±3.5 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| ±4 | ±4 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: The requirements apply for SSB Ês/Iot ≤ 25 dB.
NOTE 5: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 6: The requirements apply for SSB Ês/Iot ≤ 5 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

## 10.1.14.2 Inter-frequency CSI-SINR accuracy requirements in FR1

### 10.1.14.2.1 Absolute CSI-SINR Accuracy in FR1

The requirements for absolute CSI-SINR accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.14.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for the associated SSB.

- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

  Note: The reference measurement timing for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.14.2.1-1.

**Table 10.1.14.2.1-1: CSI-SINR Inter-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 1 range | | | | | |
| | | | NR operating band groups | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / SCS | | | dBm/BW Channel | dBm/BW Channel |
| | | | | SCS (kHz) | | | | |
| | | | | 15 | 30 | 60 | | |
| ±3 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | N/A | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 4: The requirements apply for CSI-RS Ês/Iot ≤XdB. X=15 if timing offset between the reference measurement timing and the target CSI-RS is no larger than 0.5*CP, and X=4 if timing offset between the reference measurement timing and the target CSI-RS is larger than 0.5*CP but no larger than CP.

### 10.1.14.2.2 Relative CSI-SINR Accuracy in FR1

The relative CSI-SINR accuracy in inter-frequency case is defined as the CSI-SINR measured from one cell on a frequency in FR1 compared to the CSI-SINR measured from another cell on a different frequency in FR1.

The accuracy requirements in table 10.1.14.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.3 for a corresponding Band for the associated SSB.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band.
- $|CSI_RP1_{dBm} - CSI_RP2_{dBm}| \leq 27$ dB

- | Channel 1_Io -Channel 2_Io | ≤ 20 dB

- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.

- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.14.2.2-1.

**Table 10.1.14.2.2-1: CSI-SINR Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | Io Note 1 range | | | | | |
| Normal condition | Extreme condition | CSI-RS Ês/Iot Note 3 | NR operating band groups | Minimum Io | | | | Maximum Io |
| | | | | dBm / SCS | | | dBm/BW Channel | dBm/BW Channel |
| | | | | SCS (kHz) | | | | |
| dB | dB | dB | | 15 | 30 | 60 | | |
| ±3.5 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |
| ±4 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | N/A | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of cells to which the requirement applies.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: The requirements apply for CSI-RS Ês/Iot ≤ XdB. X=15 if timing offset between the reference measurement timing and the target CSI-RS is no larger than 0.5*CP, and X=4 if timing offset between the reference measurement timing and the target CSI-RS is larger than 0.5*CP but no larger than CP.

# 10.1.14C Inter-frequency SINR accuracy requirements for FR1 SAN

## 10.1.14C.1 Inter-frequency SS-SINR accuracy requirements in FR1

### 10.1.14C.1.1 Absolute SS-SINR Accuracy in FR1

The requirements for absolute SS-SINR accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.14C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.

- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band.

- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.14C.1.1-1: SS-SINR Inter-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 3 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The requirements apply for SSB Ês/Iot ≤ 25 dB.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A.

## 10.1.14C.1.2 Relative SS-SINR Accuracy in FR1

The relative SS-SINR accuracy in inter-frequency case is defined as the SS-SINR measured from one cell on a frequency in FR1 compared to the SS-SINR measured from another cell on a different frequency in FR1.

The accuracy requirements in table 10.1.14C.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- | Channel 1_Io -Channel 2_Io | ≤ 20 dB
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.14C.1.2-1: SS-SINR Inter-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2,4 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 5 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | | |
| ±3.5 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±4 | ±4 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: The requirements apply for SSB Ês/Iot ≤ [25] dB.
NOTE 5: NR operating band groups in FR1 are as defined in clause 3.5.2A.

# 10.1.14D Inter-frequency SINR accuracy requirements for RedCap UE with Satellite Access in FR1

## 10.1.14D.1 Inter-frequency SS-SINR accuracy requirements in FR1

### 10.1.14D.1.1 Absolute SS-SINR Accuracy in FR1

The requirements for absolute SS-SINR accuracy in this clause apply to a cell on a frequency in FR1 that has different carrier frequency from the serving cell.

The accuracy requirements in clause 10.1.14C.1.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the absolute accuracy requirements in table 10.1.14D.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for both 1Rx and 2Rx RedCap UE for a corresponding Band.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.14D.1.1-1: SS-SINR Inter-frequency absolute accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB $\hat{E}s/Iot$ Note 3 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |

| ±4.5 | ±5 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 3: The requirements apply for SSB $\hat{E}s/Iot \leq 25$ dB.<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

### 10.1.14D.1.2 Relative SS-SINR Accuracy in FR1

The relative SS-SINR accuracy in inter-frequency case is defined as the SS-SINR measured from one cell on a frequency in FR1 compared to the SS-SINR measured from another cell on a different frequency in FR1.

The accuracy requirements in clause 10.1.14C.1.2 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the relative accuracy requirements in table 10.1.14D.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for both 1Rx and 2Rx RedCap UE for a corresponding Band.
- $|SSB_RP1_{dBm} - SSB_RP2_{dBm}| \leq 27$ dB
- $|$ Channel 1_Io -Channel 2_Io $| \leq 20$ dB
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.14D.1.2-1: SS-SINR Inter-frequency relative accuracy for 1Rx RedCap UE in FR1**

| Accuracy | Conditions |
|---|---|

| Normal condition | Extreme condition | SSB Ês/Iot Note 2,4 | Io Note 1 range | | | | |
|---|---|---|---|---|---|---|---|
| | | | NR operating band groups Note 5 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | | |
| ±4.5 | ±5 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| ±5 | ±5 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: The requirements apply for SSB Ês/Iot ≤ [25] dB.
NOTE 5: NR operating band groups in FR1 are as defined in clause 3.5.2A.

## 10.1.15 Inter-frequency SINR accuracy requirements for FR2

### 10.1.15.1 Inter-frequency SS-SINR accuracy requirements in FR2

#### 10.1.15.1.1 Absolute SS-SINR Accuracy in FR2

The requirements for absolute SS-SINR accuracy in this clause apply to a cell on a frequency in FR2 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.15.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.15.1.1-1: SS-SINR Inter-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±3 | ±4 | ≥-3 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±3.5 | ±4 | ≥-4 | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The requirements apply for SSB Ês/Iot ≤ 25 dB.

#### 10.1.15.1.2 Relative SS-SINR Accuracy in FR2

The relative SS-SINR accuracy in inter-frequency case is defined as the SS-SINR measured from one cell on a frequency in FR2 compared to the SS-SINR measured from another cell on a different frequency in FR2.

The accuracy requirements in table 10.1.15.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

- Conditions for inter-frequency measurements are fulfilled according to annex B.2.3 for a corresponding Band.
- $|SSB_RP1\ dB_m - SSB_RP2\ dB_m| \leq 27$ dB
- $|$ Channel 1_Io -Channel 2_Io $| \leq 20$ dB
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.15.1.2-1: SS-SINR Inter-frequency relative accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 2 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 1 | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±3.5 | ±4 | ≥-3 | Same value as SSB_RP in Table B.2.2-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±4 | ±4 | ≥-6 | | |

NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 4: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 5: The requirements apply for SSB Ês/Iot ≤ 25 dB.

## 10.1.15.2 Inter-frequency CSI-SINR accuracy requirements in FR2

### 10.1.15.2.1 Absolute CSI-SINR Accuracy in FR2

The requirements for absolute CSI-SINR accuracy in this clause apply to a cell on a frequency in FR2 that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.15.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.
  - NOTE: The reference measurement timing for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.15.2.1-1.

**Table 10.1.15.2.1-1: CSI-SINR Inter-frequency absolute accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 2 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 1 | $dBm/BW_{Channel}$ |

| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | |
|---|---|---|---|---|---|
| ±3 | ±4 | ≥-3 | Same value as CSI_RP in Table B.2.9-2, according to UE Power class, operating band and angle of arrival | | -50 |
| 3.5 | ±4 | ≥-4 | | | |
| NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.<br>NOTE 4: The requirements apply for CSI-RS Ês/Iot ≤XdB. X=15 if timing offset between the reference measurement timing and the target CSI-RS is no larger than 0.5*CP, and X=4 if timing offset between the reference measurement timing and the target CSI-RS is larger than 0.5*CP but no larger than CP. | | | | | |

### 10.1.15.2.2 Relative CSI-SINR Accuracy in FR2

The relative CSI-SINR accuracy in inter-frequency case is defined as the CSI-SINR measured from one cell on a frequency in FR2 compared to the CSI-SINR measured from another cell on a different frequency in FR2.

The accuracy requirements in table 10.1.15.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to Annex B.2.13 for a corresponding Band.
- $|CSI_RP1\ dB_m - CSI_RP2\ dB_m| \leq 27$ dB
- $|$ Channel 1_Io -Channel 2_Io $| \leq 20$ dB
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

  Note: The reference measurement timing for inter-frequency measurement is up to UE implementation and shall be based on the timing of one of the target cells.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
  - The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.15.2.2-1.

**Table 10.1.15.2.2-1: CSI-SINR Inter-frequency relative accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io [Note 2] range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ [Note 1] | | $dBm/BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | |
| ±3.5 | ±4 | ≥-3 | Same value as CSI_RP in Table B.2.9-2, according to UE Power class, operating band and angle of arrival | | -50 |
| ±4 | ±4 | ≥-6 | | | |
| NOTE 1: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.<br>NOTE 4: The requirements apply for CSI-RS Ês/Iot ≤XdB. X=15 if timing offset between the reference measurement timing and the target CSI-RS is no larger than 0.5*CP, and X=4 if timing offset between the reference measurement timing and the target CSI-RS is larger than 0.5*CP but no larger than CP. | | | | | |

# 10.1.15C Inter-frequency SINR accuracy requirements for FR2-NTN

## 10.1.15C.1 Inter-frequency SS-SINR accuracy requirements in FR2-NTN

### 10.1.15C.1.1 Absolute SS-SINR Accuracy in FR2-NTN

The requirements for absolute SS-SINR accuracy in this clause apply to a cell on a frequency in FR2-NTN that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.15C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.15C.1.1-1: SS-SINR Inter-frequency absolute accuracy in FR2-NTN**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±4 | ±5 | ≥-3 | Same value as SSB_RP derived from annex B.2.18, according to UE VSAT type | -50 |
| ±4.5 | ±5 | ≥-4 | | |

NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The requirements apply for SSB Ês/Iot ≤ 25 dB.

### 10.1.15C.1.2 Relative SS-SINR Accuracy in FR2-NTN

The relative SS-SINR accuracy in inter-frequency case is defined as the SS-SINR measured from one cell on a frequency in FR2-NTN compared to the SS-SINR measured from another cell on a different frequency in FR2-NTN.

The accuracy requirements in table 10.1.15C.1.2-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.18 for a corresponding Band.
- $|SSB_RP1\ dB_m - SSB_RP2\ dB_m| \leq 27$ dB
- $|$ Channel 1_Io -Channel 2_Io $| \leq 20$ dB
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.15C.1.2-1: SS-SINR Inter-frequency relative accuracy in FR2-NTN**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 2] range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 1] | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |

| | | | | |
|---|---|---|---|---|
| ±4.5 | ±5 | ≥-3 | Same value as SSB_RP derived from annex B.2.18, according to UE VSAT type | -50 |
| ±5 | ±5 | ≥-6 | | |

NOTE 1: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 2: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 3: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 4: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE ba The requirements apply for SSB Ês/Iot ≤ 25 dB.seband is above the value defined in this table.
NOTE 5: The requirements apply for SSB Ês/Iot ≤ 25 dB.

## 10.1.16 SINR report mapping

### 10.1.16.1 SS-SINR and CSI-SINR measurement report mapping

The reporting range of SS-SINR and CSI-SINR for L3 reporting and L1 reporing is defined from -23 dB to 40 dB with 0.5 dB resolution. The mapping of measured quantity is defined in table 10.1.16.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

The reporting range of differential SS-SINR and CSI-SINR for L1 reporting is defined from -15 dB to 0 dB with 1 dB resolution.

The mapping of measured quantity is defined in table 10.1.16.1-2. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.16.1-1: SS-SINR and CSI-SINR measurement report mapping**

| Reported value | Measured quantity value (L3 SS-SINR and L3 CSI-SINR) | Measured quantity value (L1 SS-SINR and L1 CSI-SINR) | Unit |
|---|---|---|---|

# 10.1.17 Power Headroom

## 10.1.17.1 Power Headroom Report

### 10.1.17.1.1 Power Headroom Report Mapping

The power headroom reporting range is from -32 ...+38 dB. table 10.1.17.1-1 defines the report mapping.

**Table 10.1.17.1-1: Power headroom report mapping**

| Reported value | Measured quantity value (dB) |
|---|---|
| POWER_HEADROOM_0 | PH < -32 |
| POWER_HEADROOM_1 | -32 ≤ PH < -31 |
| POWER_HEADROOM_2 | -31 ≤ PH < -30 |
| POWER_HEADROOM_3 | -30 ≤ PH < -29 |
| … | … |
| POWER_HEADROOM_53 | 20 ≤ PH < 21 |
| POWER_HEADROOM_54 | 21 ≤ PH < 22 |
| POWER_HEADROOM_55 | 22 ≤ PH < 24 |
| POWER_HEADROOM_56 | 24 ≤ PH < 26 |
| POWER_HEADROOM_57 | 26 ≤ PH < 28 |
| POWER_HEADROOM_58 | 28 ≤ PH < 30 |
| POWER_HEADROOM_59 | 30 ≤ PH < 32 |
| POWER_HEADROOM_60 | 32 ≤ PH < 34 |
| POWER_HEADROOM_61 | 34 ≤ PH < 36 |
| POWER_HEADROOM_62 | 36 ≤ PH < 38 |
| POWER_HEADROOM_63 | PH ≥ 38 |

# 10.1.18 $P_{CMAX,c,f}$

The UE is required to report the UE configured maximum output power ($P_{CMAX,c,f}$) together with the power headroom. This clause defines the requirements for the $P_{CMAX,c,f}$ reporting.

## 10.1.18.1 Report Mapping

The $P_{CMAX,c,f}$ reporting range is defined from -29 dBm to 33 dBm with 1 dB resolution. table 10.1.18.1-1 defines the reporting mapping.

**Table 10.1.18.1-1 Mapping of $P_{CMAX,c,f}$**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| PCMAX_C_00 | $P_{CMAX,c,f}$ < -29 | dBm |
| PCMAX_C_01 | -29 ≤ $P_{CMAX,c,f}$ < -28 | dBm |
| PCMAX_C_02 | -28 ≤ $P_{CMAX,c,f}$ < -27 | dBm |
| … | … | … |
| PCMAX_C_61 | 31 ≤ $P_{CMAX,c,f}$ < 32 | dBm |
| PCMAX_C_62 | 32 ≤ $P_{CMAX,c,f}$ < 33 | dBm |
| PCMAX_C_63 | 33 ≤ $P_{CMAX,c,f}$ | dBm |

# 10.1.19 L1-RSRP accuracy requirements for FR1

## 10.1.19.1 SSB based L1-RSRP accuracy requirements

Unless otherwise specified, the requirements for absolute and relative SSB based L1-RSRP accuracy in this clause apply to all SSBs of the serving cell configured for L1-RSRP measurement and all SSBs of cell(s) with different PCI from serving cell configured for L1-RSRP measurement in FR1.

### 10.1.19.1.1 Absolute Accuracy

The accuracy requirements in table 10.1.19.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.

**Table 10.1.19.1.1-1: SSB based L1-RSRP absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±5.0 | ±9.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | |

### 10.1.19.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the cell (serving cell or cell with different PCI from serving cell) on which UE performs L1-RSRP measurements.

The accuracy requirements in table 10.1.19.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.

**Table 10.1.19.1.2-1: SSB based L1-RSRP relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of SSBs to which the requirement applies.
NOTE 3: Void
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

## 10.1.19.2 CSI-RS based L1-RSRP accuracy requirements

### 10.1.19.2.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute CSI-RS based L1-RSRP accuracy in this clause apply to all CSI-RS resources of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in table 10.1.19.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.19.2.1-1.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS, and
- The CSI-RS density is 3.

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.19.2.1-1 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.19.2.1-1 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.19.2.1-1: CSI-RS based L1-RSRP absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io [Note 1] range | | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±5.0 | ±9.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, | N/A | N/A | N/A | -70 | -50 |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | | | | | |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | | |

### 10.1.19.2.2 Relative Accuracy

The relative CSI-RS based L1-RSRP accuracy is defined as the L1-RSRP measured from one CSI-RS compared to the largest measured value of L1-RSRP among all CSI-RS resources of the serving cell.

The accuracy requirements in table 10.1.19.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.19.2.2-1.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS, and
- The CSI-RS density is 3.

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.19.2.2-1 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.19.2.2-1 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met

- The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.19.2.2-1: CSI-RS based L1-RSRP relative accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot Note 2 | Io Note 1 range | | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: Void
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

# 10.1.19C L1-RSRP accuracy requirements for FR1 SAN

## 10.1.19C.1 SSB based L1-RSRP accuracy requirements

### 10.1.19C.1.1 Absolute Accuracy

Unless otherwise specified, the accuracy requirements for absolute SSB based L1-RSRP in this clause apply to all SSBs of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in table 10.1.19C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.19.1 for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.19C.1.1-1: SSB based L1-RSRP absolute accuracy in FR1**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | |
| | | | NR operating band groups Note 2 | Minimum Io | Maximum Io |

| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
|---|---|---|---|---|---|---|---|
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±5 | ±9.5 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | NR_FDD_SAB_FR1_A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

### 10.1.19C.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the serving cell.

The accuracy requirements in table 10.1.19C.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.19.1 for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.19C.1.2-1: SSB based L1-RSRP relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of SSBs to which the requirement applies.<br>NOTE 3: Void<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

## 10.1.19C.2 CSI-RS based L1-RSRP accuracy requirements

### 10.1.19C.2.1 Absolute Accuracy

Unless otherwise specified, the accuracy requirements for absolute CSI-RS based L1-RSRP in this clause apply to all CSI-RS resources of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in table 10.1.19C.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.19.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- Valid information for the SAN serving the target cell has been provided.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.19C.2.1-1.

**Table 10.1.19C.2.1-1: CSI-RS based L1-RSRP absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | | |
| ±5 | ±9.5 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | NR_FDD_SAB_FR1_A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

### 10.1.19C.2.2 Relative Accuracy

The relative CSI-RS based L1-RSRP accuracy is defined as the L1-RSRP measured from one CSI-RS compared to the largest measured value of L1-RSRP among all CSI-RS resources of the serving cell.

The accuracy requirements in table 10.1.19C.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.19.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- Valid information for the SAN serving the target cell has been provided.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.19C.2.2-1.

**Table 10.1.19C.2.2-1: CSI-RS based L1-RSRP relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot Note 2 | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 4] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of CSI-RS resources to which the requirement applies.<br>NOTE 3: Void<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

## 10.1.19D LTM Intra-frequency L1-RSRP accuracy requirements for FR1

### 10.1.19D.1 SSB based intra-frequency L1-RSRP accuracy requirements

#### 10.1.19D.1.1 Absolute Accuracy

Unless otherwise specified, the accuracy requirements for SSB based intra-frequency L1-RSRP in this clause apply to all SSBs of candidate neighbour cell(s) on the same frequency as that of the serving cell in FR1.

The accuracy requirements in table 10.1.19D.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.

**Table 10.1.19D.1.1-1: SSB based L1-RSRP absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±5.0 | ±9.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.

## 10.1.19D.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured on one SSB configured in *LTM-CSI-ResourceConfig* compared to the L1-RSRP measured on another SSB configured in *LTM-CSI-ResourceConfig* for the cell(s) on the same frequency in FR1.The accuracy requirements in Table 10.1.19D.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.

**Table 10.1.19D.1.2-1: SSB based L1-RSRP relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of SSBs to which the requirement applies.<br>NOTE 3: Void<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | |

## 10.1.19D.2 CSI-RS based intra-frequency L1-RSRP accuracy requirements

### 10.1.19D.2.1 Absolute CSI-RSRP Accuracy

Unless otherwise specified, the requirements for absolute CSI-RSRP accuracy in this clause apply to a cell where the LTM candidate cell CSI-RS resources to be measured are within the same active BWP as the CSI-RS resources indicated for measurement in the serving cell in FR1.

The accuracy requirements in table 10.1.19D.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each associated SSB.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.8 for a corresponding Band for each relevant CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.19D.2.1-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for intra-frequency measurement is serving cell timing.

**Table 10.1.19D.2.1-1: CSI-RSRP Intra-frequency absolute accuracy in FR1**

| Accuracy | | Conditions | |
|---|---|---|---|
| | | | Io Note 1 range |

| Normal condition | Extreme condition | CSI-RS Ês/Iot | NR operating band groups Note 2 | Minimum Io | | | | Maximum Io |
|---|---|---|---|---|---|---|---|---|
| | | | | dBm / $SCS_{CSI-RS}$ | | | | |
| dB | dB | dB | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| ±4.5 | ±9 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -70 |
| ±8 | ±11 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | N/A | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.19D.2.2 Relative CSI-RSRP Accuracy

The relative CSI-RSRP accuracy is defined as the CSI-RSRP measured from one cell compared to the CSI-RSRP measured from another cell within the same active BWP, or between any two CSI-RSRP levels measured on the same cell in FR1.

The accuracy requirements in table 10.1.19D.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each associated SSB.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.8 for a corresponding Band for each relevant CSI-RS to be measured.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3. The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.19D.2.2-1.
- The timing offset between the reference measurement timing and the target CSI-RS in one layer is no larger than CP.

NOTE: The reference measurement timing for one layer for intra-frequency measurement is serving cell timing.

**Table 10.1.19D.2.2-1: CSI-RSRP Intra-frequency relative accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot Note 2 | Io Note 1 range | | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±2 | ±3 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |
| ±3 | ±3 | ≥-3 | Note 3 | Note 3 | Note 3 | Note 3 | N/A | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.

# 10.1.19ELTM Inter-frequency L1-RSRP accuracy requirements for FR1

## 10.1.19E.1 SSB based Inter-frequency L1-RSRP accuracy requirements

### 10.1.19E.1.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute SSB based L1-RSRP accuracy in this clause apply to all SSBs of candidate neighbour cell(s) on a frequency in FR1 that is on a different frequency than the serving cell.

The accuracy requirements in table 10.1.19E.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.

**Table 10.1.19E.1.1-1: Inter-frequency L1-RSRP absolute accuracy in FR1**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | | |
| | | | NR operating band groups Note 2 | Minimum Io | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |

| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
|---|---|---|---|---|---|---|---|
| ±5.0 | ±9.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1.19E.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured on one SSB configured in *LTM-CSI-ResourceConfig* from one cell on a frequency in FR1 compared to another SSB configured in *LTM-CSI-ResourceConfig* from any other cell on another frequency in FR1.

The accuracy requirements in table 10.1.19E.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.
- $|SSB_RP1\ dB_m - SSB_RP2\ dB_m| \leq 27$ dB
- $|Channel\ 1_Io - Channel\ 2_Io| \leq 20$ dB

**Table 10.1.19E.1.2-1: Inter-frequency L1-RSRP relative accuracy in FR1**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |

| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
|---|---|---|---|---|---|---|---|
| ±5.0 | ±9.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | |

# 10.1.19F L1-RSRP accuracy requirements for RedCap UE with Satellite Access in FR1

## 10.1.19F.1 SSB based L1-RSRP accuracy requirements

### 10.1.19F.1.1 Absolute Accuracy

Unless otherwise specified, the accuracy requirements for absolute SSB based L1-RSRP in this clause apply to all SSBs of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in clause 10.1.19C.1.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the absolute accuracy requirements in table 10.1.19F.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.19.1 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.19F.1.1-1: SSB based L1-RSRP absolute accuracy for 1Rx RedCap UE in FR1**

| **Accuracy** | | **Conditions** | | | | | |
|---|---|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB Ês/Iot** | **Io [Note 1] range** | | | | |
| | | | **NR operating band groups [Note 2]** | **Minimum Io** | | | **Maximum Io** |
| **dB** | **dB** | **dB** | | **dBm / $SCS_{SSB}$** | | **dBm/$BW_{Channel}$** | **dBm/$BW_{Channel}$** |
| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
| ±8.0 | ±12.5 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -70 |
| ±11.5 | ±14.5 | ≥-3 | NR_FDD_SAB_FR1_A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

### 10.1.19F.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the serving cell.

The accuracy requirements in clause 10.1.19C.1.2 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the relative accuracy requirements in table 10.1.19F.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [43] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.19.1 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant SSB.
- Valid information for the SAN serving the target cell has been provided.

**Table 10.1.19F.1.2-1: SSB based L1-RSRP relative accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±6 | ±7 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of SSBs to which the requirement applies.<br>NOTE 3: Void<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

## 10.1.19F.2 CSI-RS based L1-RSRP accuracy requirements

### 10.1.19F.2.1 Absolute Accuracy

Unless otherwise specified, the accuracy requirements for absolute CSI-RS based L1-RSRP in this clause apply to all CSI-RS resources of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in clause 10.1.19C.2.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the absolute accuracy requirements in table 10.1.19F.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.19.2 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- Valid information for the SAN serving the target cell has been provided.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.19C.2.1-1.

**Table 10.1.19F.2.1-1: CSI-RS based L1-RSRP absolute accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 1 range | | | |
| | | | NR operating band groups Note 2 | Minimum Io | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |

| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | | |
|---|---|---|---|---|---|---|---|
| ±8.0 | ±12.5 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -70 |
| ±11.5 | ±14.5 | ≥-3 | NR_FDD_SAB_FR1_A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

### 10.1.19F.2.2 Relative Accuracy

The relative CSI-RS based L1-RSRP accuracy is defined as the L1-RSRP measured from one CSI-RS compared to the largest measured value of L1-RSRP among all CSI-RS resources of the serving cell.

The accuracy requirements in clause 10.1.19F.2.2 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1Rx, the relative accuracy requirements in table 10.1.19F.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.19.2 for both 1Rx and 2Rx RedCap UE for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- Valid information for the SAN serving the target cell has been provided.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.19C.2.2-1.

**Table 10.1.19F.2.2-1: CSI-RS based L1-RSRP relative accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | | |
| ±6 | ±7 | ≥-3 | NR_FDD_SAB_FR1_A | -121 | -118 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of CSI-RS resources to which the requirement applies.<br>NOTE 3: Void<br>NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2A. | | | | | | | |

## 10.1.20 L1-RSRP accuracy requirements for FR2

### 10.1.20.1 SSB based L1-RSRP accuracy requirements

Unless otherwise specified, the accuracy requirements for absolute and relative SSB based L1-RSRP in this clause apply to all SSBs of the serving cell configured for L1-RSRP measurement, all the SSBs of the serving cell configured for L1-RSRP measurement when the UE is configured with *groupBasedBeamReporting-r17* set to 'enabled' and all SSBs of cell(s) with different PCI from serving cell configured for L1-RSRP measurement in FR2.

#### 10.1.20.1.1 Absolute Accuracy

The accuracy requirements in table 10.1.20.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.

- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.20.1.1-1: SSB based L1-RSRP absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 2 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | | |
| ±6.5 | ±9.5 | ≥-3 | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | N/A | -70 | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.20.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the cell (serving cell or cell with different PCI from serving cell) on which UE performs L1-RSRP measurements.

When the UE is configured with *groupBasedBeamReporting-r17* set to 'enabled', the relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the serving cell on which UE performs L1-RSRP measurements with different Rx beams, the all SSBs are in the same or different resource set (s) in one CSI resource setting.

The accuracy requirements in table 10.1.20.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.

- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.20.1.2-1: SSB based L1-RSRP relative accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 3 | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±6.5 | ±9.5 | ≥-3 | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of SSBs to which the requirement applies.
NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.20.2 CSI-RS based L1-RSRP accuracy requirements

### 10.1.20.2.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute CSI-RS based L1-RSRP accuracy in this clause apply to all CSI-RS resources of the serving cell configured for L1-RSRP measurement, and all the CSI-RSs of the serving cell configured for L1-RSRP measurement when the UE is configured with *groupBasedBeamReporting-r17* set to 'enabled'.

The accuracy requirements in table 10.1.20.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.20.2.1-1.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS, and
- The CSI-RS density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.20.2.1-1 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.20.2.1-1 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.20.2.1-1: CSI-RS based L1-RSRP absolute accuracy in FR2**

| Accuracy | Conditions |
|---|---|

| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io [Note 1] range | | |
|---|---|---|---|---|---|
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ [Note 2] | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz / $SCS_{CSI-RS}$ = 120 kHz | | |
| ±6.5 | ±9.5 | ≥-3 | Same value as CSI-RS_RP in Table B.2.4.2-2, according to UE Power class, operating band and angle of arrival | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | N/A | -70 | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.20.2.2 Relative Accuracy

The relative CSI-RS based L1-RSRP accuracy is defined as the L1-RSRP measured from one CSI-RS compared to the largest measured value of L1-RSRP among all CSI-RSs of the cell (serving cell or cell with different PCI from serving cell) on which UE performs L1-RSRP measurements.

For simultaneous reception from multiple directions, when the UE is configured with *groupBasedBeamReporting-r17* set to 'enabled', the relative CSI-RS based L1-RSRP accuracy is defined as the L1-RSRP measured from one CSI-RS compared to the largest measured value of L1-RSRP among all CSI-RSs of the serving cell on which UE performs L1-RSRP measurements with different Rx beams, the all CSI-RSs are in the same or different resource set (s) in one CSI resource setting. RSRP among all CSI-RS resources of the serving cell.

The accuracy requirements in table 10.1.20.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.20.2.2-1.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS, and
- The CSI-RS density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.20.2.2-1 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met

- The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
- The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.20.2.2-1 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.20.2.2-1: CSI-RS based L1-RSRP relative accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io [Note 1] range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ | | $dBm/BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | |
| ±6.5 | ±9.5 | ≥-3 | Same value as CSI-RS RP in Table B.2.4.2-2, according to UE Power class, operating band and angle of arrival | | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

# 10.1.20A LTM Intra-frequency L1-RSRP accuracy requirements for FR2

## 10.1.20A.1 SSB based intra-frequency L1-RSRP accuracy requirements

### 10.1.20A.1.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute accuracy of SSB based intra-frequency L1-RSRP in this clause apply to all SSBs of candidate neighbour cell(s) on the same frequency as that of the serving cell in FR2.

The accuracy requirements in table 10.1.20A.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.20A.1.1-1: SSB based L1-RSRP absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 2] | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |

| | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | | |
|---|---|---|---|---|---|---|
| ±6.5 | ±9.5 | ≥-3 | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | N/A | | -70 | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.20A.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured on one SSB configured in *LTM-CSI-ResourceConfig* compared to the L1-RSRP measured from another SSB configured in *LTM-CSI-ResourceConfig* from the cell(s) on the same frequency in FR2.

The accuracy requirements in table 10.1.20A.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.20A.1.2-1: SSB based L1-RSRP relative accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 3] | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±6.5 | ±9.5 | ≥-3 | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of SSBs to which the requirement applies.
NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.20A.2 CSI-RS based intra-frequency L1-RSRP accuracy requirements

### 10.1.20A.2.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute accuracy of CSI-RS based intra-frequency L1-RSRP in this clause apply to all intra-frequency CSI-RS resources of candidate neighbour cell(s) in FR2 as defined in clause 9.14a.

The accuracy requirements in table 10.1.20A.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.20A.2.1-1.

**Table 10.1.20A.2.1-1: CSI-RS based L1-RSRP absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 2 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 120 kHz / $SCS_{CSI-RS}$ = 240 kHz | | |
| ±6.5 | ±9.5 | ≥-3 | Same value as CSI-RS_RP in Table B.2.4.2-2, according to UE Power class, operating band and angle of arrival | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | N/A | -70 | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.20A.2.2 Relative Accuracy

The relative CSI-RS based L1-RSRP accuracy is defined as the L1-RSRP measured on one CSI-RS configured in *LTM-CSI-ResourceConfig* compared to the L1-RSRP measured from another intra-frequency CSI-RS configured in *LTM-CSI-ResourceConfig* from the cell(s) in FR2 as defined in clause 9.14a.

The accuracy requirements in table 10.1.20A.2.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1.20A.2.2-1.

**Table 10.1.20A.2.2-1: CSI-RS based L1-RSRP relative accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 3 | | dBm/$BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 120 kHz | $SCS_{CSI-RS}$ = 240 kHz | |
| ±6.5 | ±9.5 | ≥-3 | Same value as CSI-RS_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.

NOTE 4: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

# 10.1.20BLTM Inter-frequency L1-RSRP accuracy requirements for FR2

## 10.1.20B.1 SSB based inter-frequency L1-RSRP accuracy requirements

### 10.1.20B.1.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute SSB based L1-RSRP accuracy in this clause apply to all SSBs of candidate neighbour cell(s) on a frequency in FR2 that is on a different frequency than the serving cell.

The accuracy requirements in table 10.1.20B.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.20B.1.1-1: SSB based L1-RSRP absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 2] | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | | |
| ±6.5 | ±9.5 | ≥-3 | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | | N/A | -70 |
| ±8.5 | ±11.5 | ≥-3 | N/A | | -70 | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.20B.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured on one SSB configured in *LTM-CSI-ResourceConfig* on one cell on a frequency in FR2 compared to the value of L1-RSRP measured from another SSB configured in *LTM-CSI-ResourceConfig* from any other cell on another frequency in FR2.

The accuracy requirements in table 10.1.20B.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.1 for a corresponding Band for each relevant SSB.
- $|SSB_RP1\ dB_m - SSB_RP2\ dB_m| \leq 27$ dB
- $|Channel\ 1_Io - Channel\ 2_Io| \leq 20$ dB
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.20B.1.2-1: SSB based L1-RSRP relative accuracy in FR2**

| Accuracy | | Conditions | | |
|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | |
| | | | Minimum Io | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 3] | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | |
| ±6.5 | ±9.5 | ≥-3 | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50 |
| NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of SSBs to which the requirement applies.<br>NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 4: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | |

# 10.1.20C L1-RSRP accuracy requirements for FR2-NTN

## 10.1.20C.1 SSB based L1-RSRP accuracy requirements

Unless otherwise specified, the requirements for absolute accuracy and relative accuracy of SSB based L1-RSRP in this clause apply to all SSBs of the serving cell configured for L1-RSRP measurement in FR2-NTN.

### 10.1.20C.1.1 Absolute Accuracy

The accuracy requirements in Table 10.1.20C.1.1-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.19 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.20C.1.1-1: SSB based L1-RSRP absolute accuracy in FR2-NTN**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ [Note 2] | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120kHz / $SCS_{SSB}$ = 240kHz | | |
| ±7.5 | ±10.5 | ≥-3 | Same value as SSB_RP derived from annex B.2.17, according to UE VSAT type | N/A | -70 |
| ±9.5 | ±12.5 | ≥-3 | N/A | -70 | -50 |
| NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 2: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.<br>NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | | |

### 10.1.20C.1.2 Relative Accuracy

The relative accuracy of SSB based L1-RSRP is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the serving cell on which UE performs L1-RSRP measurements.

The accuracy requirements in Table 10.1.20C.1.2-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.19 for a corresponding Band for each relevant SSB.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.

**Table 10.1.20C.1.2-1: SSB based L1-RSRP relative accuracy in FR2-NTN**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 3 | | $dBm/BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120kHz | $SCS_{SSB}$ = 240kHz | |
| ±3.5 | ±6.5 | ≥-3 | Same value as SSB_RP derived from annex B.2.17, according to UE VSAT type | | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of SSBs to which the requirement applies.
NOTE 3: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.20C.2 CSI-RS based L1-RSRP accuracy requirements

### 10.1.20C.2.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute accuracy of CSI-RS based L1-RSRP in this clause apply to all CSI-RS resources of the serving cell configured for L1-RSRP measurement.

The accuracy requirements in Table 10.1.20C.2.1-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.19 for a corresponding Band for each relevant CSI-RS.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.20C.2.1-1.

**Table 10.1.20C.2.1-1: CSI-RS based L1-RSRP absolute accuracy in FR2-NTN**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS Ês/Iot | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 2 | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60kHz | $SCS_{CSI-RS}$ = 120kHz | | |
| ±7.5 | ±10.5 | ≥-3 | Same value as SSB_RP derived from annex | N/A | -70 |

| | | | | | |
|---|---|---|---|---|---|
| | | | B.2.17, according to UE VSAT type | | |
| ±9.5 | ±12.5 | ≥-3 | N/A | -70 | -50 |
| NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 2: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.<br>NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | | |

### 10.1.20C.2.2 Relative Accuracy

The relative accuracy of CSI-RS based L1-RSRP is defined as the L1-RSRP measured from one CSI-RS compared to the largest measured value of L1-RSRP among all CSI-RS resources of the serving cell.

The accuracy requirements in Table 10.1.20C.2.2-1 are valid under the following conditions:

- Conditions defined in clause 10.3 of TS 38.101-5 [42] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to Annex B.2.19 for a corresponding Band for each relevant CSI-RS.
- The measured signals are in the directions within the declared minimum elevation angle supported for receiving.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in Table 10.1.20C.2.2-1.

**Table 10.1.20C.2.2-1: CSI-RS based L1-RSRP relative accuracy in FR2-NTN**

| **Accuracy** | | **Conditions** | | |
|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **CSI-RS Ês/Iot** | **Io [Note 1] range** | |
| | | | **Minimum Io** | **Maximum Io** |
| **dB** | **dB** | **dB** | **dBm / $SCS_{CSI-RS}$** | **dBm/$BW_{Channel}$** |
| | | | **$SCS_{CSI-RS}$ = 60kHz** / **$SCS_{CSI-RS}$ = 120kHz** | |
| ±3.5 | ±6.5 | ≥-3 | Same value as SSB_RP derived from annex B.2.17, according to UE VSAT type | -50 |
| NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter CSI-RS Ês/Iot is the minimum CSI-RS Ês/Iot of the pair of CSI-RS resources to which the requirement applies.<br>NOTE 3: Values based on EIS as defined in clause 10.3 of TS 38.101-5 [42]. Applicable side condition selected depending on angle of arrival.<br>NOTE 4: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | |

## 10.1.21 SFTD accuracy requirements

### 10.1.21.1 SFTD acuracy requirements for NE-DC

The SFN and frame timing difference (SFTD) is measured between PCell and E-UTRAN PSCell under NE-DC.

The accuracy requirements in table 10.1.21.1-4 are appilicable under the following conditions:

For FR1 PCell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

- Io range defined in Table 10.1.21.1-1.

**Table 10.1.21.1-1: PCell Io range conditions in FR1**

| Parameter | Io [Note 1] range | | | |
|---|---|---|---|---|
| | NR operating band groups [Note 4, 5] | Minimum Io [Note 2, 3] | | Maximum Io |
| | | dBm/ $SCS_{SSB}$ | | dBm/$BW_{Channel}$ |
| | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | |
| Conditions | NR_FDD_FR1_A, NR_TDD_FR1_A | -121 | -118 | -50 |
| | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -50 |
| | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -50 |
| | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -50 |
| | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -50 |
| | NR_FDD_FR1_F | -118.5 | -115.5 | -50 |
| | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -50 |
| | NR_FDD_FR1_H | -117.5 | -114.5 | -50 |
| | NR_FDD_FR1_N | -114.5 | -111.5 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The condition level is increased by $\Delta R_{IB,c}$ as defined in clause 7.3B in TS 38.101-3 [20], depending on E-UTRA – NR band combination.
NOTE 3: The condition level is increased by MSD as defined in clause 7.3B in TS 38.101-3 [20], if applicable depending on E-UTRA – NR band combination.
NOTE 4: NR operating band groups are as defined in clause 3.5.
NOTE 5: Only NR bands within EN-DC band combinations as specified in clause 5.5B in TS 38.101-3 [20] are applicable.

For FR2 PCell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Io range defined in Table 10.1.21.1-2.

**Table 10.1.21.1-2: PCell Io range conditions in FR2**

| Parameter | Io [Note 1] range | | |
|---|---|---|---|
| | Minimum Io [Note 2, 3] | | Maximum Io |
| | dBm/ $SCS_{SSB}$ | | dBm/$BW_{Channel}$ |
| | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | |
| Conditions | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth and specified at the Reference point.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

For E-UTRA PSCell SFN and frame timing measurement:

- Cell specific reference signals are transmitted either from one, two or four antenna ports.
- Conditions defined in TS 36.101 [25] clause 7.3 for reference sensitivity are fulfilled.
- No changes to the uplink transmission timing are applied during the measurement period.
- $RSRP|_{dBm}$ according to annex B.3.5 in TS 36.101 [25] for a corresponding Band.
- Io range defined in Table 10.1.21.1-3.

**Table 10.1.21.1-3: E-UTRA PSCell Io range conditions**

| Parameter | Io [Note 1] range | | |
|---|---|---|---|
| | E-UTRA operating band groups [Note 3] | Minimum Io | Maximum Io |
| Conditions | | dBm/15 kHz [Note 2] | dBm/$BW_{Channel}$ |
| | FDD_A, TDD_A | -121 | -50 |
| | FDD_C, TDD_C | -120 | -50 |
| | FDD_D | -119.5 | -50 |
| | FDD_E, TDD_E | -119 | -50 |
| | FDD_F | -118.5 | -50 |
| | FDD_G | -118 | -50 |
| | FDD_H | -117.5 | -50 |
| | FDD_N | -114.5 | -50 |
| NOTE 1: When in dBm/15 kHz, the minimum Io condition is expressed as the average Io per RE over all REs in that symbol. Io may be different in different symbols within a subframe.<br>NOTE 2: The condition level is increased by $\Delta$>0, when applicable, as described in clauses B.4.2 and B.4.3 in TS 36.133 [15].<br>NOTE 3: E-UTRA operating band groups are as defined in clause 3.5 in TS 36.133 [15]. | | | |

**Table 10.1.21.1-4: SFTD measurement accuracy**

| Accuracy | Conditions | |
|---|---|---|
| | $\hat{E}s/Iot$ [Note 2] | Frequency range |
| Ts [Note 1] | dB | |
| 40*64*Tc | ≥-3 | FR1 |
| 40*64*Tc | | FR2 |
| NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].<br>NOTE 2: The parameter $\hat{E}s/Iot$ is the minimum $\hat{E}s/Iot$ of the pair of cells to which the requirement applies. | | |

## 10.1.21.2 SFTD acuracy requirements for NR-DC

The SFN and frame timing difference (SFTD) is measured between PCell in FR1 and PSCell in FR2 under NR dual connectivity.

The accuracy requirements in table 10.1.21.2-3 are appilicable under the following conditions:

For FR1 PCell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Io range defined in Table 10.1.21.2-1.

**Table 10.1.21.2-1: PCell Io range conditions in FR1**

| Parameter | Io [Note 1] range | | | |
|---|---|---|---|---|
| | NR operating band groups [Note 2] | Minimum Io | | Maximum Io |
| | | dBm/ $SCS_{SSB}$ | | dBm/$BW_{Channel}$ |
| | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | |
| Conditions | NR_FDD_FR1_A, NR_TDD_FR1_A | -121 | -118 | -50 |
| | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -50 |
| | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -50 |
| | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -50 |
| | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -50 |
| | NR_FDD_FR1_F | -118.5 | -115.5 | -50 |
| | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -50 |
| | NR_FDD_FR1_H | -117.5 | -114.5 | -50 |
| | NR_FDD_FR1_N | -114.5 | -111.5 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups are as defined in clause 3.5.2. | | | | |

For FR2 PSCell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Io range defined in Table 10.1.21.2-2.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.21.2-2: PSCell Io range conditions in FR2**

| Parameter | Io Note 1 range | | |
|---|---|---|---|
| | Minimum Io Note 2, 3 | | Maximum Io |
| | dBm/ $SCS_{SSB}$ | | dBm/$BW_{Channel}$ |
| | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | |
| Conditions | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth and specified at the Reference point.<br>NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | |

**Table 10.1.21.2-3: SFTD measurement accuracy**

| Accuracy | Conditions | |
|---|---|---|
| | Ês/Iot Note 2 | Frequency range |
| Ts Note 1 | dB | |
| 40*64*Tc | ≥ -3 | Between FR1 and FR2 |
| NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].<br>NOTE 2: The parameter Ês/Iot is the minimum Ês/Iot of the pair of cells to which the requirement applies. | | |

## 10.1.21.3 Inter-frequency SFTD acuracy requirements

The SFN and frame timing difference (SFTD) is measured between PCell and inter-frequency neighbour cell.

The accuracy requirements in table 10.1.21.3-3 are appilicable under the following conditions:

For FR1 PCell, inter-frequency neighbour cell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Io range defined in Table 10.1.21.3-1.

**Table 10.1.21.3-1: PCell, inter-frequency neighbour cell Io range conditions in FR1**

| Parameter | Io Note 1 range | | | |
|---|---|---|---|---|
| | NR operating band groups Note 2 | Minimum Io | | Maximum Io |
| | | dBm/ $SCS_{SSB}$ | | dBm/$BW_{Channel}$ |
| | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | |
| **Conditions** | NR_FDD_FR1_A, NR_TDD_FR1_A | -121 | -118 | -50 |
| | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -50 |
| | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -50 |
| | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -50 |
| | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -50 |
| | NR_FDD_FR1_F | -118.5 | -115.5 | -50 |
| | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -50 |
| | NR_FDD_FR1_H | -117.5 | -114.5 | -50 |

| | | | | |
|---|---|---|---|---|
| | NR_FDD_FR1_N | -114.5 | -111.5 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups are as defined in clause 3.5.2. | | | | |

For FR2 PCell, inter-frequency neighbour cell SFN and frame timing measurement:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Io range defined in Table 10.1.21.3-2.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].

**Table 10.1.21.3-2: PCell, inter-frequency neighbour cell Io range conditions in FR2**

| **Parameter** | **Io [Note 1] range** | | |
|---|---|---|---|
| | **Minimum Io [Note 2, 3]** | | **Maximum Io** |
| | **dBm/ $SCS_{SSB}$** | | **dBm/$BW_{Channel}$** |
| | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | |
| **Conditions** | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | Same value as SSB_RP in Table B.2.4.1-2, according to UE Power class, operating band and angle of arrival | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth and specified at the Reference point.<br>NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | |

**Table 10.1.21.3-3: Inter-frequency SFTD measurement accuracy**

| **Accuracy** | **Conditions** | |
|---|---|---|
| | **Ês/Iot [Note 2]** | **Frequency range** |
| **Ts [Note 1]** | **dB** | |
| 40*64*Tc | ≥ -3 | FR1, FR2 |
| NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].<br>NOTE 2: The parameter Ês/Iot is the minimum Ês/Iot of the pair of cells to which the requirement applies. | | |

# 10.1.22 CLI measurement accuracy requirements

## 10.1.22.1 SRS-RSRP

### 10.1.22.1.1 SRS-RSRP Accuracy

The SRS-RSRP measurement reported by the UE shall fulfil the accuracy requirements defined in table 10.1.22.1.1-1 for FR1 and table 10.1.22.1.1-2 for FR2, provided that the following conditions are met. The accuracy requirements in this clause are derived based on AWGN radio propagation conditions.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for SRS-RSRP measurements are fulfilled according to annex B.2.7 for a corresponding Band for each relevant SRS resource configured for measurement.
- The time difference between UE's DL reference timing in the serving cell and SRS arrival time is no larger than $T_{error_SRS_RSRP}$, where
  - $T_{error_SRS_RSRP} = T_C \times N_{TA_offset}$ + 4.67μs for FR1
  - $T_{error_SRS_RSRP} = T_C \times N_{TA_offset}$ + 3.67μs for FR2

- $N_{TA_offset}$ is defined in table 7.1.2-2
- $T_C$ is 0.509 ns

- The number of SRS ports in the SRS resource configured for measurement is 1,
- The number of symbols in the SRS resource configured for measurement is 1,
- The number of repetitions in the SRS resource configured for measurement is 1,
- Frequency hopping, sequence group hopping or sequence hopping is disabled in the SRS resource configured for measurement,
- The bandwidth of the SRS resource is 48 PRBs.
- One of the following conditions is met
  - There is no other SRS resource with the same root sequence and on the same symbol and with same comb as the relevant SRS resource.
  - If multiple SRS resources are on the same symbol and with same comb, the distance between cyclic shifts of any two resources is no less than 6 if transmissionComb = n4, and no less than 4 if transmissionComb = n2.

**Table 10.1.22.1.1-1: SRS-RSRP absolute accuracy in FR1**

| Accuracy | | | | | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| Normal condition | | | Extreme condition | | | SRS Ês/Iot | Io [Note 1] range | | | | |

| ±6.5 | ±7 | ±8.5 | ±9.5 | ±10 | ±11.5 | ≥1 | NR_TDD_FR1_A, NR_TDD_FR1_C, NR_TDD_FR1_D, NR_TDD_FR1_E | N/A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2. | | | | | | | | | | | | |

**Table 10.1.22.1.1-2: SRS-RSRP absolute accuracy in FR2**

| Accuracy | | | | Conditions | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | | Extreme condition | | SRS Ês/Iot | Io [Note 1] range | | | |
| | | | | | Minimum Io | | | Maximum Io |
| dB | | | | dB | dBm / $SCS_{SRS}$ [Note 2] | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| $SCS_{SRS}$ (kHz) | | $SCS_{SRS}$ (kHz) | | | $SCS_{SRS}$ = 60 kHz | $SCS_{SRS}$ = 120 kHz | | |
| 60 | 120 | 60 | 120 | | | | | |
| ±6 | ±8.5 | ±9 | ±11.5 | ≥1 | Same value as SRS_RP in Table B.2.7-2, according to UE Power class, operating band and angle of arrival | | N/A | -70 |
| ±9 | ±11.5 | ±11 | ±13.5 | ≥1 | N/A | | -70 | -50 |
| NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth. | | | | | | | | |

NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

#### 10.1.22.1.2 SRS-RSRP report mapping

The reporting range of SRS-RSRP is defined from -140 dBm to -44 dBm with 1 dB resolution. The mapping of measured quantity is defined in table 10.1.22.1.2-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.22.1.2-1: SRS-RSRP measurement report mapping**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| SRS-RSRP_0 | SRS-RSRP<-140 | dBm |
| SRS-RSRP_1 | -140≤ SRS-RSRP<-139 | dBm |
| SRS-RSRP_2 | -139≤ SRS-RSRP<-138 | dBm |
| SRS-RSRP_3 | -138≤ SRS-RSRP<-137 | dBm |
| SRS-RSRP_4 | -137≤ SRS-RSRP<-136 | dBm |
| .. | .. | … |
| SRS-RSRP_95 | -46≤ SRS-RSRP<-45 | dBm |
| SRS-RSRP_96 | -45≤ SRS-RSRP<-44 | dBm |
| SRS-RSRP_97 | -44≤ SRS-RSRP | dBm |
| SRS-RSRP_98 | Infinity | |
| NOTE: 'Infinity' means that UE cannot detect SRS due to too strong signal to measure. | | |

### 10.1.22.2 CLI-RSSI

#### 10.1.22.2.1 CLI-RSSI Accuracy

The CLI-RSSI measurement reported by the UE shall fulfil the accuracy requirements defined in table 10.1.22.2.1-1 for FR1 and table 10.1.22.2.1-2 for FR2, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

**Table 10.1.22.2.1-1: CLI-RSSI absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | Io [Note 1] range | | | | | |
| | | NR operating band groups [Note 2] | Minimum Io | | | | Maximum Io |
| dB | dB | | dBm / $SCS_{SRS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | $SCS_{SRS}$ = 15 kHz | $SCS_{SRS}$ = 30 kHz | $SCS_{SRS}$ = 60 kHz | | |
| ±3.5 | ±6.5 | NR_TDD_FR1_A, | -120 | -117 | -114 | N/A | -70 |
| | | NR_TDD_FR1_C | -119 | -116 | -113 | N/A | -70 |
| | | NR_TDD_FR1_D | -118.5 | -115.5 | -112.5 | N/A | -70 |
| | | NR_TDD_FR1_E | -118 | -115 | -112 | N/A | -70 |
| ±5.5 | ±8.5 | Note 3 | Note 3 | Note 3 | Note 3 | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.

**Table 10.1.22.2.1-2: CLI-RSSI absolute accuracy in FR2**

| Accuracy | Conditions |
|---|---|

| Normal condition | Extreme condition | Io Note 1 range | | | |
|---|---|---|---|---|---|
| | | Minimum Io | | | Maximum Io |
| dB | dB | dBm / $SCS_{SRS}$ Note 2 | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | $SCS_{SRS}$ = 60 kHz | $SCS_{SRS}$ = 120 kHz | | |
| ±5 | ±8 | Same value as SRS_RP in Table B.2.7-2, according to UE Power class, operating band and angle of arrival | | N/A | -70 |
| ±7 | ±10 | Note 4 | | -70 | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.

#### 10.1.22.2.2 CLI-RSSI report mapping

The reporting range of CLI-RSSI is defined from -100 dBm to -25 dBm with 1 dB resolution. The mapping of measured quantity is defined in table 10.1.22.2.2-1. The range in the signalling may be larger than the guaranteed accuracy range. UE shall scale the measured CLI-RSSI to report a nominal RSSI equivalent to 6RB measurement with 15 kHz SCS.

**Table 10.1.22.2.2-1: CLI-RSSI measurement report mapping**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| CLI-RSSI_00 | CLI-RSSI < -100 | dBm |
| CLI-RSSI_01 | -100 ≤ CLI-RSSI < -99 | dBm |
| CLI-RSSI_02 | -99 ≤ CLI-RSSI < -98 | dBm |
| … | … | … |
| CLI-RSSI_74 | -27 ≤ CLI-RSSI < -26 | dBm |
| CLI-RSSI_75 | -26 ≤ CLI-RSSI < -25 | dBm |
| CLI-RSSI_76 | -25 ≤ CLI-RSSI | dBm |

## 10.1.23 RSTD Measurements

### 10.1.23.1 Introduction

The requirements in clause 10.1.23 shall apply, provided the UE has received *nr-DL-TDOA-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to report one or more DL RSTD measurements defined in TS 38.215 [4]. The requirements in clause 10.1.23 shall apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG or without MG,
- when UE is in RRC_INACTIVE state.
- when UE is in RRC_IDLE state.

### 10.1.23.2 Measurement Accuracy Requirements

The accuracy requirements for RSTD measurement shall be within $\pm(X+Y+Z+\Delta)\ T_c$.

X is defined in table 10.1.23.2-1 for AWGN channel and table 10.1.23.2-3 for fading channel for FR1, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.

- UE does not perform positioning measurement with reduced number of samples.

X is defined in table 10.1.23.2-2 for AWGN channel and table 10.1.23.2-4 for fading channel for FR2, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE does not perform positioning measurement with reduced number of samples.

X is defined in table 10.1.23.2-7 for AWGN channel in FR1 provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

X is defined in table 10.1.23.2-8 for AWGN channel in FR2 provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

NOTE: The requirements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5 Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2 respectively.

When UE measures RSTD on PRS resources belonging to different PFLs, then the RSTD accuracy is defined as the accuracy corresponding to the largest accuracy value among different PFLs.

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and Δ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbor cell, which are used for a single RSTD estimate, is no greater than 160 ms.
- When UE measures RSTD on PRS resources belonging different PFLs, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbor cell, which are used for a single RSTD estimate, is no greater than 1280 ms.
- Z is defined in table 10.1.23.2-5 for FR1 and table 10.1.23.2-6 for FR2, respectively.
- Δ is zero for single PFL, and is defined in table 10.1.23.2-5a for FR1 and table 10.1.23.2-6a for FR2, respectively, for dual PFL.

If the measurements of reference cell and neighbour cell belong to the same Rx TEG, i.e. associated and reported with a common Rx TEG ID, then the sum of Y+Z+Δ is equal to the timing error margin of the Rx TEG reported in *nr-UE-RxTEG-TimingErrorMargin*. The timing error margin reported via *nr-UE-RxTEG-TimingErrorMargin* cannot be larger than the value of (Y+Z+Δ) defined when the UE does not associate the measurements with the same Rx TEG.

**Table 10.1.23.2-1: RSTD absolute accuracy in FR1 for AWGN channel**

### 10.1.23.3 Report mapping

#### 10.1.23.3.1 Absolute DL RSTD Measurement Reporting

The reporting range for the DL RSTD measurement is defined from $-985024 \times T_c$ to $985024 \times T_c$ with the resolution step of $2^k \times T_c$, where

$T_c$ is defined in TS 38.211 [6],

$k_{min} \leq k \leq k_{max}$,

$k_{min} = -6$ and $k_{max} = 5$,

$k \geq$ *timingReportingGranularityFactor* [34] configured by LMF via LPP for the RSTD measurement.

The measurement report mapping for different *k* values are specified in tables 10.1.23.3.1-1 – 10.1.23.3.1-12.

**Table 10.1.23.3.1-1: Report mapping for *k*=0**

| Reported Quantity Value, RSTD_i | Measured Quantity Value, RSTD | Unit |
|---|---|---|
| RSTD_0000000 | RSTD < -985024 | $T_c$ |
| RSTD_0000001 | -985024 ≤ RSTD < -985023 | $T_c$ |

### 10.1.23.3.2 Differential Reporting for DL RSTD Measurement

A first DL RSTD measurement is reported by means of differential reporting, i.e. as ΔRSTD, relative to a second DL RSTD measurement (RSTD2), provided that:

- the absolute measured quantity value of the second DL RSTD measurement (RSTD2) is not larger than the absolute measured quantity value of the first DL RSTD measurement (RSTD1), i.e., ΔRSTD=RSTD1-RSTD2≥0, and
- the absolute value of the second DL RSTD measurement (RSTD2) is reported together with ΔRSTD for the first DL RSTD measurement.

The reporting range for differential reporting ΔRSTD of the first DL RSTD measurement is defined from 0 up to $8191 \times T_c$ with the resolution step of $2^k \times T_c$, where

$T_c$ is defined in TS 38.211 [6],

$k_{min} \leq k \leq k_{max}$,

$k_{min}$ = -6 and $k_{max}$ = 5,

$k \geq$ *timingReportingGranularityFactor* [34] configured by LMF via LPP for the RSTD measurement.

The measurement report mapping for different *k* values are specified in tables 10.1.23.3.2-1 – 10.1.23.3.2-12.

**Table 10.1.23.3.2-1: Report mapping for *k*=0**

| Reported Quantity Value, DIFFRSTD_i | ΔRSTD = RSTD1 – RSTD2 | Unit |
|---|---|---|
| DIFFRSTD_0000 | 0 ≤ ΔRSTD < 1 | $T_c$ |
| DIFFRSTD_0001 | 1 ≤ ΔRSTD < 2 | $T_c$ |
| DIFFRSTD_0002 | 2 ≤ ΔRSTD < 3 | $T_c$ |

### 10.1.23.3.3 Additional Path Report Mapping for DL RSTD

The reporting range for the additional path reporting for an RSTD measurement is defined up to the range from -8175×$T_c$ to 8175×$T_c$ with the resolution step of $2^k$×$T_c$, where

$T_c$ is defined in TS 38.211 [6],

$k_{min} \leq k \leq k_{max}$,

$k_{min}$ = -6 and $k_{max}$ = 5,

$k \geq$ *timingReportingGranularityFactor* [34] configured by LMF via LPP for the RSTD measurement.

The UE can report the timing of up to two additional paths with respect to the path timing determining the RSTD measurement.

A UE capable of *additionalPathsExtSupport-r17* can report the timing for a number additional paths, up to its capability, with respect to the path timing determining the RSTD measurement.

The report mappings for different *k* values are specified in tables 10.1.23.3.3-1 – 10.1.23.3.3-12.

**Table 10.1.23.3.3-1: Report mapping for *k*=0**

# 10.1.23ARSTD Measurements Based on PRS Aggregation

## 10.1.23A.1 Introduction

The requirements in clause 10.1.23A shall apply, provided the UE has received *nr-DL-TDOA-RequestLocationInformation* message with *nr-DL-PRS-JointMeasurementRequestedPFL-List* from LMF via LPP TS 37.355 [34] requesting the UE to report one or more DL RSTD measurements defined in TS 38.215 [4] with aggregated measurement. The requirements in clause 10.1.23A shall apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG or without MG,
- when UE is in RRC_INACTIVE state,
- when UE is in RRC_IDLE state.

## 10.1.23A.2 Measurement Accuracy Requirements

When UE measures RSTD on PRS resources belonging to different PFLs or different PFL combinations, then the RSTD accuracy is defined as the accuracy corresponding to the largest accuracy value among different PFLs or different PFL combinations.

The requirements in this clause for 3-PFL and 2-PFL apply provided that:

- PRS resources linked for aggregation saftisfy all the conditions specified in TS 38.214 [26] clause 5.1.6.5.3.

- The spacing between the center frequencies of adjacent PFLs containing PRS resources linked for aggregation does not exceed the nominal channel spacing for intra-band contiguous CA defined in TS 38.101-1 [18], clause 5.4A.1 for FR1, and in TS 38.101-2, [19] clause 5.4A.1 for FR2-1.

The accuracy requirements for RSTD measurement based on PRS Aggregation shall be within $\pm(X+Y+Z+\Delta)\ T_c$.

X is defined in table 10.1.23A.2-1 for AWGN channel and table 10.1.23A.2-3 for fading channel for FR1, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE does not perform positioning measurement with reduced number of samples.

X is defined in table 10.1.23A.2-2 for AWGN channel and table 10.1.23A.2-4 for fading channel for FR2, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE does not perform positioning measurement with reduced number of samples.

X is defined in table 10.1.23A.2-5 for AWGN channel in FR1, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

X is defined in table 10.1.23A.2-6 for AWGN channel in FR2, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for RSTD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- UE supports positioning measurement with reduced number of sample and is indicated by LMF to perform positioning measurement with reduced number of samples.

NOTE: The requriements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2 respectively.

If the UE doesn't support Rx TEG reporting for RSTD measurement or when the measurements of reference cell and neighbour cell belong to different Rx TEGs, Y, Z and $\Delta$ are defined as follows:

- When UE measures RSTD on PRS resources belonging to same PFL or same PFL combination, Y=32 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbor cell, which are used for a single RSTD estimate, is no greater than 160 ms.
- When UE measures RSTD on PRS resources belonging different PFLs or different PFL combinations, Y=256 Tc, provided that the time offset between the two PRS resource instances from the reference cell and the neighbor cell, which are used for a single RSTD estimate, is no greater than 1280 ms.
- Z is defined in table 10.1.23A.2-7 for FR1 and table 10.1.23A.2-9 for FR2, respectively, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.
- $\Delta$ is zero when UE measures RSTD on PRS resources belonging to same PFL or same PFL combination and is defined in table 10.1.23A.2-8 for FR1 and table 10.1.23A.2-10 for FR2, respectively, when UE measures RSTD on PRS resources belonging different PFLs or different PFL combinations, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.

If the measurements of reference cell and neighbour cell belong to the same Rx TEG, i.e. associated and reported with a common Rx TEG ID, then the sum of Y+Z+Δ is equal to the timing error margin of the Rx TEG reported in *nr-UE-RxTEG-TimingErrorMargin*. The timing error margin reported via *nr-UE-RxTEG-TimingErrorMargin* cannot be larger than the value of (Y+Z+Δ) defined when the UE does not associate the measurements with the same Rx TEG.

**Table 10.1.23A.2-1: RSTD absolute accuracy in FR1 for AWGN channel**

| Accuracy for 2 PFLs | Accuracy for 3 PFLs | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | PRS ÊS/IOT | PRS SCS | PRS bandwidth per PFL Note 1 | PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) Note 2 | Io Note 3 range | | |

### 10.1.23A.3 Report Mapping

#### 10.1.23A.3.1 Absolute DL RSTD Measurement Reporting

The report mapping as defined in clause 10.1.23.3.1 shall apply.

#### 10.1.23A.3.2 Differential Reporting for DL RSTD Measurement

The report mapping as defined in clause 10.1.23.3.2 shall apply.

#### 10.1.23A.3.3 Additional Path Report Mapping for DL RSTD

The report mapping as defined in clause 10.1.23.3.3 shall apply.

## 10.1.24 PRS-RSRP Measurements

### 10.1.24.1 Introduction

The requirements in clause 10.1.24 shall apply, provided the UE has received *nr-DL-TDOA-RequestLocationInformation* or *nr-Multi-RTT-RequestLocationInformation* or *nr-DL-AoD-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to report one or more DL PRS-RSRP measurements defined in TS 38.215 [4].

The requirements in clause 10.1.24 apply for UE in RRC_CONNECTED, including PRS-RSRP measurement with MG and outside MG, as well as for UE in RRC_INACTIVE and RRC_IDLE state. For PRS-RSRP measurement in FR2, the requirements apply with and without reduced Rx beam sweeping factor.

### 10.1.24.2 Measurement Accuracy Requirements

#### 10.1.24.2.1 Absolute PRS-RSRP accuracy

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in table 10.1.24.2.1-1 are valid under the following conditions:

- Conditions defined in 38.101-1 clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

The absolute accuracy requirements for PRS-RSRP measurement for FR2 defined in table 10.1.24.2.1-2 are valid under the following conditions:

- Conditions defined in 38.101-2 [19] clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

**Table 10.1.24.2.1-1: PRS-RSRP absolute accuracy for FR1**

| Accuracy | | Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Io Note 7 range | | | | |
| Normal condition | Extreme condition | PRS Ês/Iot | PRS BW | Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) | NR operating band groups Note 8 | Minimum Io Note 1 dBm / $SCS_{PRS}$ | | | Maximum Io |
| | | | | | | dBm / $SCS_{PRS}$ | | | |

| | | | | | NR_FDD_FR1_H | -123.5 | -120.5 | -117.5 | -50 |
| | | | | | NR_FDD_FR1_N | -120.5 | -117.5 | -114.5 | -50 |
| | | | | | Note 4 | | | | |
| | | | | | Note 4 | | | | |
| ±8.5 | ±13 | ≥-13 dB | 24 ≤ BW ≤ 52 | All | Note 4 | | | | |
| ±6 | ±10.5 | | 52< BW≤ 104 | All | Note 4 | | | | |
| ±4.5 | ±9 | | BW >104 | All | Note 4 | | | | |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by $\Delta>0$, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

**Table 10.1.24.2.1-2: PRS-RSRP absolute accuracy for FR2**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| | | | | | Io Note 7 range | |

| | | | | | dBm / $SCS_{PRS}$ | |
| dB | dB | dB | PRB | - | dBm/120 kHz Note 6 / dBm/60 kHz Note 6 | $dBm/BW_{Channel}$ |
| ±5 | ±8 | ≥-3 dB | ≥24 | All | Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival | -50 |
| | | | | | Note 4 | |
| | | | | | Note 4 | |
| ±8.5 | ±11.5 | ≥-13 dB | 24 ≤ BW ≤ 64 | All | Note 4 | |
| ±6 | ±9 | | BW >64 | All | Note 4 | |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by $\Delta$>0, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in table 10.1.24.2.1-3 are valid under the following conditions:

- Conditions defined in 38.101-1 clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE supports positioning measurements with reduced number of samples, and LMF indicates UE to perform positioning measurements with reduced number of samples
- AWGN channel

The absolute accuracy requirements for PRS-RSRP measurement for FR2 defined in table 10.1.24.2.1-4 are valid under the following conditions:

- Conditions defined in 38.101-2 [19] clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE supports positioning measurements with reduced number of samples, and LMF indicates UE to perform positioning measurements with reduced number of samples
- AWGN channel

**Table 10.1.24.2.1-3: PRS-RSRP absolute accuracy for FR1 with reduced sample number**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| | | | | | Io Note 6 range | | |

| ±6 | ±9 | | BW >64 | All | Note 3 | |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 PRB.
NOTE 4: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 5: The condition level is increased by Δ>0, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 7: NR operating band groups are as defined in clause 3.5.2.

### 10.1.24.2.2 Relative PRS RSRP accuracy

The relative PRS-RSRP accuracy is defined as accuracy of the difference between two PRS-RSRP measurements.

The relative PRS-RSRP accuracy requirements apply for the cases when PRS-RSRP is measured from PRS resources in the same PRS resource set in FR1 or FR2, and measured with same Rx beam in case of FR2.

The accuracy requirements for PRS-RSRP measurement for FR1 defined in table 10.1.24.2.2-1 are valid under the following conditions:

- Conditions defined in 38.101-1 clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

The accuracy requirements for PRS-RSRP measurement for FR2 defined in table 10.1.24.2.2-2 are valid under the following conditions:

- Conditions defined in 38.101-2 clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE does not support positioning measurements with reduced number of samples, or LMF does not indicate UE to perform positioning measurements with reduced number of samples

**Table 10.1.24.2.2-1: PRS-RSRP relative accuracy for FR1**

| Accuracy | | Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Io Note 7 range | | | | |

| | | | | | Note 4 | | |
| | | | | | Note 4 | | |
| ±10 | ±13 | ≥-13 dB | 24 ≤ BW ≤ 64 | All | Note 4 | | |
| ±7.5 | ±10.5 | | BW >64 | All | Note 4 | | |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the OTDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

The absolute accuracy requirements for PRS-RSRP measurement for FR1 defined in table 10.1.24.2.2-3 are valid under the following conditions:

- Conditions defined in 38.101-1 clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE supports positioning measurements with reduced number of samples, and LMF indicates UE to perform positioning measurements with reduced number of samples
- AWGN channel

The absolute accuracy requirements for PRS-RSRP measurement for FR2 defined in table 10.1.24.2.2-4 are valid under the following conditions:

- Conditions defined in 38.101-2 [19] clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band
- UE supports positioning measurements with reduced number of samples, and LMF indicates UE to perform positioning measurements with reduced number of samples
- AWGN channel

NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

## 10.1.24.3 Report mapping

### 10.1.24.3.1 Absolute PRS-RSRP Measurement Report Mapping

The reporting range of absolute PRS-RSRP measurement is defined from -156 dBm to -31 dBm with 1 dB resolution.

The mapping of measured quantity is defined in table 10.1.24.3.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.24.3.1-1: Measurement report mapping for PRS-RSRP**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| PRS_RSRP_0 | PRS-RSRP<-156 | dBm |
| PRS_RSRP_1 | -156≤PRS-RSRP<-155 | dBm |
| PRS_RSRP_2 | -155≤PRS-RSRP<-154 | dBm |
| PRS_RSRP_3 | -154≤PRS-RSRP<-153 | dBm |
| PRS_RSRP_4 | -153≤PRS-RSRP<-152 | dBm |

| PRS_RSRP_126 | -31≤PRS-RSRP | dBm |

### 10.1.24.3.2 Differential Report Mapping for PRS-RSRP Measurement

The reporting range of differential PRS-RSRP is defined from -30 dB to 0 dB with 1 dB resolution when *nr-DL-AoD-RequestLocationInformation* message is received.

The mapping of measured quantity is defined in table 10.1.24.3.2-1. The range in the signalling may be larger than the guaranteed accuracy range.

The reporting range of differential PRS-RSRP is defined from -30 dB to 30 dB with 1 dB resolution when *nr-DL-TDOA-RequestLocationInformation* or *nr-Multi-RTT-RequestLocationInformation* is received.

The mapping of measured quantity is defined in Table 10.1.24.3.2-2. The range in the signalling may be larger than the guaranteed accuracy range or the range supported by the UE receiver for differential RSRP measured on different PRS resources in frequency domain at the same time.

**Table 10.1.24.3.2-1: Measurement report mapping for differential PRS-RSRP**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| DIFFRSRP_0 | -30≥ΔRSRP | dB |
| DIFFRSRP_1 | -29≥ΔRSRP>-30 | dB |

# 10.1.24APRS-RSRP Measurements Based on PRS Aggregation

## 10.1.24A.1 Introduction

The requirements in clause 10.1.24A shall apply, provided that the UE has received *nr-DL-TDOA-RequestLocationInformation* or *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP TS 37.355 [34] requesting the UE to report one or more DL PRS-RSRP measurements defined in TS 38.215 [4] performed by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequested* TS 37.355 [34].

The requirements in clause 10.1.24A shall apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG,
- when UE is in RRC_INACTIVE state,
- when UE is in RRC_IDLE state.

## 10.1.24A.2 Measurement Accuracy Requirements

### 10.1.24A.2.1 Absolute PRS RSRP Accuracy Requirement

The accuracy requirements in clause 10.1.24.2.1 corresponding to the total aggregated PRS bandwidth shall apply.

### 10.1.24A.2.2 Relative PRS RSRP Accuracy Requirement

The accuracy requirements in clause 10.1.24.2.2 corresponding to the total aggregated PRS bandwidth shall apply.

### 10.1.24A.3 Report Mapping

#### 10.1.24A.3.1 Absolute PRS-RSRP Measurement Report Mapping

The absolute report mapping for PRS-RSRP measurement in clause 10.1.24.3.1 shall apply.

#### 10.1.24A.3.2 Differential Report Mapping for PRS-RSRP Measurement

The differential report mapping for PRS-RSRP measurement in clause 10.1.24.3.2 shall apply.

## 10.1.25 UE Rx-Tx Time Difference Measurements

### 10.1.25.1 Introduction

The requirements in clause 10.1.25 shall apply, provided the UE has received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP [31] requesting the UE to report one or more UE Rx-Tx time difference measurements defined in TS 38.215 [4]. The requirements in clause 10.1.25 shall apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG or without MG,
- when UE is in RRC_INACTIVE state.

### 10.1.25.2 Measurement Accuracy Requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

$N_{TA_offset}$ defined in table 7.1.2-2 changes during the UE Rx-Tx measurement period or

if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1.1) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.
- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in clause 7.1.1) for SRS transmission, if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The relative UE Rx-Tx measurement accuracy in this clause is defined as accuracy of the difference between two UE Rx-Tx measurements.

The accuracy requirements in table 10.1.25.2-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.

AWGN propagation condition.

**Table 10.1.25.2-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN**

| Accuracy | Conditions | | | | | | |

| ± (8+δ) | | ≥ 132 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in clause 3.5.
NOTE 3: $T_{rep}^{PRS}$, $L_{PRS}$, $K_{comb}^{PRS}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25.2-5.

The accuracy requirements in table 10.1.25.2-1a for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.

Number of measurement samples is less than 4

AWGN propagation condition.

**Table 10.1.25.2-1a: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN with reduced measurement samples**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in clause 3.5.
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, $L_{\text{PRS}}$, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25.2-5.

The accuracy requirements in table 10.1.25.2-3 for FR2 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.

AWGN propagation condition.

## 10.1.25.3 Report mapping

Absolute UE Rx-Tx measurement reporting in clause 10.1.25.3.1, differential reporting for UE Rx-Tx measurement in clause 10.1.25.3.2, and additional path report mapping for UE Rx-Tx measurement in clause 10.1.25.3.3 applies, regardless of number of samples used to measure PRS, to report:

- TEG based measurement corresponding to UE reported Rx TEG in *nr-UE-Rx-TEG-ID-r17* [34],
- gap-based UE Rx-Tx measurement,
- gapless UE Rx-Tx measurement,
- UE Rx-Tx in RRC_INACTIVE state.

### 10.1.25.3.1 Absolute UE Rx-Tx Measurement Report Mapping

The reporting range for the absolute UE Rx-Tx time difference measurement ($T_{UE\ Rx\text{-}Tx}$) is defined from $-985024 \times T_c$ to $985024 \times T_c$ with the resolution step of $2^k \times T_c$, where:

$T_c$ is defined in TS 38.211 [6],

$k_{min} \leq k \leq k_{max}$,

$k_{min} = -6$ and $k_{max} = 5$,

$k \geq$ *timingReportingGranularityFactor* TS 34.355 [34] configured by LMF via LPP for the UE Rx-Tx time difference measurement.

The $T_{UE\ Rx\text{-}Tx}$ report mapping for $k = \{0, 1, 2, 3, 4, 5, -1, -2, -3, -4, -5, -6\}$ are specified in tables 10.1.25.3.1-1, 10.1.25.3.1-2, 10.1.25.3.1-3, 10.1.25.3.1-4, 10.1.25.3.1-5, 10.1.25.3.1-6, 10.1.25.3.1-7, 10.1.25.3.1-8, 10.1.25.3.1-9, 10.1.25.3.1-10, 10.1.25.3.1-11, and 10.1.25.3.1-12, respectively.

**Table 10.1.25.3.1-1: Absolute UE Rx-Tx time difference measurement report mapping for *k*=0**

| Reported Quantity Value | Measured Quantity Value | Unit |

### 10.1.25.3.2 Differential UE Rx-Tx Measurement Report Mapping

The reporting range for differential UE Rx-Tx time difference measurement ($\Delta T_{UE\ Rx-Tx}$) is defined from 0 up to $8191 \times T_c$ where:

$\Delta T_{UE\ Rx-Tx} = T_{UE\ Rx-Tx1} - T_{UE\ Rx-Tx2;}$ where:

$T_{UE\ Rx-Tx1} > T_{UE\ Rx-Tx2}$,

$T_{UE\ Rx-Tx1}$ is the first absolute UE Rx-Tx time difference measurement,

$T_{UE\ Rx-Tx1}$ is the second absolute UE Rx-Tx time difference measurement,

$T_c$ is defined in TS 38.211 [6],

$k_{min} \leq k \leq k_{max}$,

$k_{min}$ = -6 and $k_{max}$ = 5,

$k \geq$ *timingReportingGranularityFactor* [34] configured by LMF via LPP for the UE Rx-Tx time difference measurement.

The $\Delta T_{UE\ Rx-Tx}$ report mapping for $k$ = {0, 1, 2, 3, 4, 5, -1, -2, -3, -4, -5, -6} are specified in tables 10.1.25.3.2-1, 10.1.25.3.2-2, 10.1.25.3.2-3, 10.1.25.3.2-4, 10.1.25.3.2-5, 10.1.25.3.2-6, 10.1.25.3.2-7, 10.1.25.3.2-8, 10.1.25.3.2-9, 10.1.25.3.2-10, 10.1.25.3.2-11, and 10.1.25.3.2-12, respectively.

### 10.1.25.3.3 Additional Path Report Mapping for UE Rx-Tx Time Difference

The reporting range for the additional path reporting for an UE Rx-Tx time difference measurement is defined up to the range from $-8175 \times T_c$ to $8175 \times T_c$ with the resolution step of $2^k \times T_c$, where

$T_c$ is defined in TS 38.211 [6],

$k_{min} \le k \le k_{max}$,

$k_{min} = -6$ and $k_{max} = 5$,

$k \ge$ *timingReportingGranularityFactor* [34] configured by LMF via LPP for the UE Rx-Tx time difference measurement.

The UE can report the timing of up to two additional paths with respect to the path timing determining the UE Rx-Tx time difference measurement.

The UE capable of *additionalPathsExtSupport-r17* can report the timing of up to its supported number of additional paths with respect to the path timing determining the UE Rx-Tx measurement.

The report mappings for different *k* values are specified in tables 10.1.25.3.3-1 – 10.1.25.3.3-12.

**Table 10.1.25.3.3-1: Report mapping for *k*=0**

# 10.1.25AUE Rx-Tx Time Difference Measurement Based on PRS Aggregation

## 10.1.25A.1 Introduction

The requirements in clause 10.1.25A apply provided the UE has received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP TS 37.355 [34] requesting the UE to report one or more UE Rx-Tx time difference measurements, defined in TS 38.215 [4], performed by aggregating PRS resources on multiple PFLs. The requirements in clause 10.1.25A apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG,
- when UE is in RRC_INACTIVE state.

## 10.1.25A.2 Measurement Accuracy Requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

$N_{TA_offset}$ defined in table 7.1.2-2 changes during the UE Rx-Tx measurement period or

if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.
- PRS resources linked for aggregation saftisfy all the conditions specified in TS 38.214 [26] clause 5.1.6.5.3.
- the spacing between the center frequencies of adjacent PFLs containing PRS resources linked for aggregation does not exceed the nominal channel spacing for intra-band contiguous CA defined in TS 38.101-1 [18], clause 5.4A.1 for FR1 and in TS 38.101-2 [19], clause 5.4A.1 for FR2-1.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1.1) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.
- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in clause 7.1.1) for SRS transmission, if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The accuracy requirements in table 10.1.25A.2-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.

AWGN propagation condition.

| ±(4+δ) | ±(3+δ) | | ≥ 132 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{\mathrm{rep}}^{\mathrm{PRS}}$, $L_{\mathrm{PRS}}$, $K_{\mathrm{comb}}^{\mathrm{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from table 10.1.25A.2-5, where the PRS BW refers to the sum of the PRS PRB numbers across the aggregated PFLs.

The accuracy requirements in table 10.1.25A.2-1a for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.

Number of measurement samples is less than 4.

AWGN propagation condition.

**Table 10.1.25A.2-1a: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN with reduced measurement samples**

| NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].<br>NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies. | | | |

**Table 10.1.25A.2-6: Margin for UE Rx-Tx time difference measurement accuracy in FR2**

| Min(PRS BW, SRS BW) (PRB) | | Margin (Tc [Note 1]) |
|---|---|---|
| SCS = 60 kHz | SCS = 120 kHz | |
| ≥ 64 | N/A | 32 |
| ≥ 132 | ≥ 64 | 24 |
| N/A | ≥ 128 | 20 |
| NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].<br>NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies. | | |

The relative accuracy of UE Rx-Tx measurement in this clause is defined as accuracy of the difference between two UE Rx-Tx measurements.

The relative accuracy requirements in table 10.1.25A.2-7 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.

AWGN propagation condition.

The two UE Rx-Tx time difference measurements are associated with the same RxTx TEG.

**Table 10.1.25A.2-7: UE Rx-Tx time difference relative measurement accuracy in FR1 in AWGN with TEG reporting**

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of resource j and resource i.
NOTE 2: Minimum number of PRS resource repetitions among resource j and resource i. $T_{\mathrm{rep}}^{\mathrm{PRS}}$, $L_{\mathrm{PRS}}$, $K_{\mathrm{comb}}^{\mathrm{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: Δ is the value of the timing error margin for the RxTx TEG, reported via *nr-UE-RxTxTEG-TimingErrorMargin*. Δ cannot be larger than the sum of the margins in table 10.1.25A.2-5 (dependent on PRS/SRS BW) for any pair of individual UE Rx-Tx time difference measurements associated with the RxTx TEG.

The relative accuracy requirements in table 10.1.25A.2-8 for FR2 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

$PRP|_{\mathrm{dBm}}$ according to annex B.2.14 for a corresponding Band.

AWGN propagation condition.

the two UE Rx-Tx time difference measurements are associated with the same RxTx TEG.

**Table 10.1.25A.2-8: UE Rx-Tx time difference relative measurement accuracy in FR2 in AWGN with TEG reporting**

| Accuracy for 2 PFLs | Accuracy for 3 PFLs | Conditions | | | | | |
|---|---|---|---|---|---|---|---|

### 10.1.25A.3 Report mapping

Applicable measurement report mappings are defined in clause 10.1.25.3.

## 10.1.25C UE Rx-Tx Time Difference Measurements in Satellite Accesss

### 10.1.25C.1 Introduction

The requirements in clause 10.1.25C shall apply, provided the UE has received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP [31] requesting the UE to report one or more UE Rx-Tx time difference measurements defined in TS 38.215 [4]. The requirements in clause 10.1.25C shall apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG or without MG.

### 10.1.25C.2 Measurement Accuracy Requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

- $N_{TA_offset}$ defined in table 7.1.2-2 changes during the UE Rx-Tx measurement period or

- if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within -160, 160 msec of at least one DL PRS resource of each of the TRPs corresponding to the serving cell in the assistance data.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1C.2 then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1C.1) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

The accuracy requirements in table 10.1.25C.2-1 for FR1-NTN are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-5 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.

**Table 10.1.25C.2-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN with reduced measurement samples**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth | PRS SCS | PRS resource repetition ($T_{rep}^{PRS} * L_{PRS}/K_{comb}^{PRS}$ Note 3 | NR operating band groups Note 2 | Io Note 4 range | |
| | | | | | | Minimum Io Note 1 | Maximum Io |
| Tc Note 5 | dB | PRB | kHz | | | dBm / $SCS_{PRS}$ | dBm/BW |
| ± 59+δ | 0 | ≥52 | 15 | ≥1 | NR_FDD_SAB_FR1_A | -121 | -50 |
| ± 30+δ | | >104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ± 30+δ | | ≥48 | 30 | ≥1 | NR_FDD_SAB_FR1_A | -118 | -50 |
| ± 15+δ | | ≥132 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ± 15+δ | | ≥64 | 60 | ≥1 | NR_FDD_SAB_FR1_A | -115 | -50 |
| ± 7+δ | | ≥132 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ± 75+δ | -6 | ≥52 | 15 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ± 37+δ | | >104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ± 39+δ | | ≥48 | 30 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ± 16+δ | | ≥132 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ± 16+δ | | ≥64 | 60 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ± 8+δ | | ≥132 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in clause 3.5.
NOTE 3: $T_{rep}^{PRS}$, $L_{PRS}$, $K_{comb}^{PRS}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25C.2-2.

**Table 10.1.25C.2-2: Margin for UE Rx-Tx time difference measurement accuracy in FR1-NTN**

| Min(PRS BW, SRS BW) (PRB) | | | Margin (Tc Note 1) |
|---|---|---|---|
| SCS = 15 kHz | SCS = 30 kHz | SCS = 60 kHz | |
| ≥ 24 | N/A | N/A | 160 |
| ≥ 52 | ≥ 24 | N/A | 80 |
| ≥ 104 | ≥ 48 | ≥ 24 | 56 |
| N/A | ≥ 132 | ≥ 64 | 24 |
| N/A | N/A | ≥ 132 | 24 |

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

## 10.1.25C.3 Report mapping

The report mapping provided in clause 10.1.25.3 is applicable for NTN.

# 10.1.25D UE Rx-Tx Time Difference Measurements RedCap UE with Satellite Access in FR1

## 10.1.25D.1 Introduction

The requirements in clause 10.1.25D shall apply, provided the UE has received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP [31] requesting the UE to report one or more UE Rx-Tx time difference measurements defined in TS 38.215 [4]. The requirements in clause 10.1.25D shall apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG or without MG.

## 10.1.25D.2 Measurement Accuracy Requirements

### 10.1.25D.2.1 UE Rx-Tx Accuracy Requirement for 2Rx RedCap UE without FH

For UE Rx-Tx time difference measurement performed by 2Rx RedCap UE without RX FH, the accuracy requirements corresponding to the PRS bandwidth supported by the RedCap UE for PRS measurement without RX FH in clause 10.1.25C.2 shall apply.

### 10.1.25D.2.2 UE Rx-Tx Accuracy Requirement for 1Rx RedCap UE without FH

For UE Rx-Tx time difference measurement performed by 1Rx RedCap UE without Rx FH, the accuracy requirements corresponding to the PRS bandwidth supported by the RedCap UE for PRS measurement without RX FH in clause 10.1.25C.2 shall apply, except those defined in Table 10.1.25D.2.2-1 and Table 10.1.25D.2.2-2.

**Table 10.1.25D.2.2-1: UE Rx-Tx time difference measurement accuracy for 1Rx RedCap UE in FR1 in AWGN with reduced measurement samples**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth | PRS SCS | PRS resource repetition ($T_{\text{rep}}^{\text{PRS}} * L_{\text{PRS}}/K_{\text{comb}}^{\text{PRS}}$ Note 3 | NR operating band groups Note 2 | Io Note 4 range | |
| | | | | | | Minimum Io Note 1 | Maximum Io |
| Tc Note 5 | dB | PRB | kHz | | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±65+δ | 0 | ≥52 | 15 | ≥1 | NR_FDD_SAB_FR1_A | -121 | -50 |
| ±36+δ | | >104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±35+δ | | ≥48 | 30 | ≥1 | NR_FDD_SAB_FR1_A | -118 | -50 |
| ±73+δ | -6 | ≥52 | 15 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±40+δ | | >104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±39+δ | | ≥48 | 30 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in clause 3.5.
NOTE 3: $T_{\text{rep}}^{\text{PRS}}$, $L_{\text{PRS}}$, $K_{\text{comb}}^{\text{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols and dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from Table 10.1.25C.2-2.

**Table 10.1.25D.2.2-2: Margin for UE Rx-Tx time difference measurement accuracy in FR1-NTN**

| Min(PRS BW, SRS BW) (PRB) | | | Margin (Tc Note 1) |
|---|---|---|---|
| SCS = 15 kHz | SCS = 30 kHz | SCS = 60 kHz | |
| ≥ 24 | N/A | N/A | 160 |
| ≥ 52 | ≥ 24 | N/A | 80 |
| ≥ 104 | ≥ 48 | ≥ 24 | 56 |

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

### 10.1.25D.3 Report mapping

The report mapping provided in clause 10.1.25.3 is applicable for RedCap with NTN.

## 10.1.26 FR2 P-MPR report

The FR2 P-MPR report mapping is defined by this clause.

### 10.1.26.1 Report mapping

table 10.1.26.1-1 defines the FR2 P-MPR report mapping.

**Table 10.1.26.1-1 Mapping of FR2 P-MPR**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| P-MPR_00 | 3 ≤ P-MP < 6 | dB |
| P-MPR_01 | 6 ≤ P-MP < 9 | dB |
| P-MPR_02 | 9 ≤ P-MP < 12 | dB |
| P-MPR_03 | P-MP ≥ 12 | dB |

## 10.1.27 L1-SINR accuracy requirements for FR1

### 10.1.27.1 L1-SINR accuracy requirements with CSI-RS based CMR and no dedicated IMR configured

#### 10.1.27.1.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute CSI-RS based L1-SINR accuracy in this clause apply to all CSI-RS resources configured as CMR and no dedicated resource configured as IMR of the serving cell configured for L1-SINR measurement.

The accuracy requirements in table 10.1.27.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.1 for a corresponding Band for each relevant CSI-RS based CMR.
- The bandwidth of CSI-RS as CMR is 48 PRBs and the density is 3.
- AWGN radio propagation conditions.

The performance with larger bandwidth of CSI-RS as CMR is equal to or better than the accuracy requirements in table 10.1.27.1.1-1.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS based CMR, and
- The CSI-RS density is 3.
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.27.2.1-1 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.27.2.1-1 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.27.1.1-1: L1-SINR absolute accuracy for CSI-RS based CMR only in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR Ês/Iot | Io [Note 1] range | | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±5.5 | ±6.5 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.<br>NOTE 3: The requirements apply for CSI-RS CMR Ês/Iot ≤ 6 dB with SCS 15kHz or 30kHz under NR high speed scenarios. | | | | | | | | |

## 10.1.27.1.2 Relative Accuracy

The relative CSI-RS based L1-SINR accuracy is defined as the L1-SINR measured from one CSI-RS compared to the largest measured value of L1-SINR among all CSI-RS resources of the serving cell.

The accuracy requirements in table 10.1.27.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.1 for a corresponding Band for each relevant CSI-RS based CMR.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.
- AWGN radio propagation conditions.

The performance with larger bandwidth of CSI-RS as CMR is equal to or better than the accuracy requirements in table 10.1.27.1.2-1.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS based CMR, and
- The CSI-RS density is 3.
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.27.1.2-1 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.27.1.2-1 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.27.1.2-1: L1-SINR relative accuracy for CSI-RS based CMR only in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR Ês/Iot Note 2 | Io Note 1 range | | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| | | | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |

| | | | | | | | | |
|---|---|---|---|---|---|---|---|---|
| ±[4.5] | ±[5.5] | ≥-3 | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS CMR Ês/Iot is the minimum CMR Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 4: The requirements apply for CSI-RS CMR Ês/Iot ≤ 6 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

## 10.1.27.2 L1-SINR accuracy requirements with SSB based CMR and dedicated IMR configured

### 10.1.27.2.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute SSB based L1-SINR accuracy in this clause apply to all SSBs configured as CMR and dedicated resources configured as IMR of the serving cell configured for L1-SINR measurement.

The accuracy requirements are defined in table 10.1.27.2.1-1 for SSB based CMR and NZP-IMR and in table 10.1.27.2.1-2 for SSB based CMR and ZP-IMR.

The accuracy requirements in tables 10.1.27.2.1-1 and 10.1.27.2.1-2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.2 for a corresponding Band for each relevant SSB based CMR and IMR.
- The bandwidth of NZP-IMR and ZP-IMR is 48 PRBs and the density is 3.
- AWGN radio propagation conditions.

The performance with larger bandwidth of NZP-IMR and ZP-IMR is equal to or better than the accuracy requirements in tables 10.1.27.2.1-1 and 10.1.27.2.1-2.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.2 for a corresponding Band for each relevant SSB based CMR and IMR.
- The CSI-RS density is 3.
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS as NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.27.2.1-1 and 10.1.27.2.1-2 apply.

- For the case when one DL subband is configured

- The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband

- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS as NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.27.2.1-1 and 10.1.27.2.1-2 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband

- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

### 10.1.27.2.2 Relative Accuracy

The relative SSB based L1-SINR accuracy is defined as the L1-SINR measured from one SSB configured as CMR and one IMR configured as IMR compared to the largest measured value of L1-SINR among all SSBs and IMRs of the serving cell.

The accuracy requirements are defined in table 10.1.27.2.2-1 for SSB based CMR and NZP-IMR and in table 10.1.27.2.2-2 for SSB based CMR and ZP-IMR.

The accuracy requirements in tables 10.1.27.2.2-1 and 10.1.27.2.2-2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.2 for a corresponding Band for each relevant SSB based CMR and IMR.
- The bandwidth of NZP-IMR and ZP-IMR is 48 PRBs and the density is 3.
- AWGN radio propagation conditions.

The performance with larger bandwidth of NZP-IMR and ZP-IMR is equal to or better than the accuracy requirements in tables 10.1.27.2.2-1 and 10.1.27.2.2-2.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.2 for a corresponding Band for each relevant SSB based CMR and IMR.
- The CSI-RS density is 3.
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS as NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.27.2.2-1 and 10.1.27.2.2-2 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband

- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS as NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.27.2.2-1 and 10.1.27.2.2-2 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.27.2.2-1: L1-SINR relative accuracy for SSB based CMR and NZP-IMR in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB-CMR Ês/Iot Note 2 | NZP-IMR Ês/Iot | Io Note 1 range | | | | |
| | | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3.0 | ±4.0 | ≥0 | ≥0 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |

NOTE 2: The parameter SSB CMR Ês/Iot is the minimum SSB CMR Ês/Iot of the pair of SSBs to which the requirement applies.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 4: he requirements apply for SSB Ês/Iot ≤ 6 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

## 10.1.27.3 L1-SINR accuracy requirements with CSI-RS based CMR and dedicated IMR configured

### 10.1.27.3.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute CSI-RS based L1-SINR accuracy in this clause apply to all CSI-RS resources configured as CMR and dedicated resources configured as IMR of the serving cell configured for L1-SINR measurement.

The accuracy requirements are defined in table 10.1.27.3.1-1 for CSI-RS based CMR and NZP-IMR and in table 10.1.27.3.1-2 for CSI-RS based CMR and ZP-IMR.

The accuracy requirements in tables 10.1.27.3.1-1 and 10.1.27.3.1-2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.3 for a corresponding Band for each relevant CSI-RS based CMR and IMR.
- The bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR is 48 PRBs and the density is 3.
- AWGN radio propagation conditions.

The performance with larger bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR is equal to or better than the accuracy requirements in tables 10.1.27.3.1-1 and 10.1.27.3.1-2.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS based CMR and IMR, and
- The CSI-RS density is 3.
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.27.3.1-1 and 10.1.27.3.1-2 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.27.3.1-1 and 10.1.27.3.1-2 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.27.3.1-1: L1-SINR absolute accuracy for CSI-RS based CMR and NZP-IMR in FR1**

| Accuracy | | Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR Ês/Iot | NZP-IMR Ês/Iot | Io [Note 1] range | | | | | |
| | | | | NR operating band groups [Note 2] | Minimum Io | | | | Maximum Io |
| dB | dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±4.0 | ±5.0 | ≥0 | ≥0 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 3: The requirements apply for CSI-RS CMR Ês/Iot ≤ 6 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

### 10.1.27.3.2 Relative Accuracy

The relative CSI-RS based L1-SINR accuracy is defined as the L1-SINR measured from one CSI-RS configured as CMR and one IMR configured as IMR compared to the largest measured value of L1-SINR among all CSI-RS and IMR resources of the serving cell.

The accuracy requirements are defined in table 10.1.27.3.2-1 for CSI-RS based CMR and NZP-IMR and in table 10.1.27.3.2-2 for CSI-RS based CMR and ZP-IMR.

The accuracy requirements in tables 10.1.27.3.2-1 and 10.1.27.3.2-2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.3 for a corresponding Band for each relevant CSI-RS based CMR and IMR.
- The bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR is 48 PRBs and the density is 3.
- AWGN radio propagation conditions.

The performance with larger bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR is equal to or better than the accuracy requirements in tables 10.1.27.3.2-1 and 10.1.27.3.2-2.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and

- Conditions for L1-SINR measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS based CMR and IMR, and
- The CSI-RS density is 3.
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.27.3.2-1 and 10.1.27.3.2-2 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.27.3.2-1 and 10.1.27.3.2-2 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.27.3.2-1: L1-SINR relative accuracy for CSI-RS based CMR and NZP-IMR in FR1**

| Accuracy | | Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR $\hat{E}s/Iot$ Note 2 | NZP-IMR $\hat{E}s/Iot$ | Io Note 1 range | | | | | |
| | | | | NR operating band groups Note 3 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS CMR Ês/Iot is the minimum CMR Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 4: The requirements apply for CSI-RS CMR Ês/Iot ≤ 6 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

**Table 10.1.27.3.2-2: L1-SINR relative accuracy for CSI-RS based CMR and ZP-IMR in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR Ês/Iot Note 2 | Io Note 1 range | | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{CSI-RS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 15 kHz | $SCS_{CSI-RS}$ = 30 kHz | $SCS_{CSI-RS}$ = 60 kHz | | |
| ±[3.5] | ±[4.5] | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | -115 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | -114 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | -113.5 | N/A | -50 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | -113 | N/A | -50 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | -112.5 | N/A | -50 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | -112 | N/A | -50 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | -111.5 | N/A | -50 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | -108.5 | N/A | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS CMR Ês/Iot is the minimum CMR Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 4: The requirements apply for CSI-RS CMR Ês/Iot ≤ 6 dB with SCS 15kHz or 30kHz under NR high speed scenarios.

# 10.1.28 L1-SINR accuracy requirements for FR2

## 10.1.28.1 L1-SINR accuracy requirements with CSI-RS based CMR and no dedicated IMR configured

### 10.1.28.1.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute CSI-RS based L1-SINR accuracy in this clause apply to all CSI-RS resources configured as CMR and no dedicated resource configured as IMR of the serving cell configured for L1-SINR measurement.

The accuracy requirements in table 10.1.28.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.1 for a corresponding Band for each relevant CSI-RS based CMR.
- The bandwidth of CSI-RS as CMR is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.

The performance with larger bandwidth of CSI-RS as CMR is equal to or better than the accuracy requirements in table 10.1.28.1.1-1.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS based CMR, and
- The CSI-RS density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.28.1.1-1 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.28.1.1-1 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.28.1.1-1: L1-SINR absolute accuracy for CSI-RS based CMR only in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR $\hat{E}s/Iot$ Note 3 | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 2 | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | | |
| ±5.5 | ±6.5 | ≥-3 | Same value as CSI-RS_RP in clause B.2.8.1, according to UE Power class, operating band and angle of arrival | | N/A | -50 |
| NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth. | | | | | | |

| | |
|---|---|
| NOTE 2: | Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival. |
| NOTE 3: | In the test cases, the CSI-RS CMR Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. |

#### 10.1.28.1.2 Relative Accuracy

The relative CSI-RS based L1-SINR accuracy is defined as the L1-SINR measured from one CSI-RS compared to the largest measured value of L1-SINR among all CSI-RS resources of the serving cell.

The accuracy requirements in table 10.1.28.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.1 for a corresponding Band for each relevant CSI-RS based CMR.
- The bandwidth of CSI-RS as CMR is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.

The performance with larger bandwidth of CSI-RS as CMR is equal to or better than the accuracy requirements in table 10.1.28.1.2-1.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS based CMR, and
- The CSI-RS density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.28.1.2-1 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS meets the following condition the requirements in table 10.1.28.1.2-1 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.28.1.2-1: L1-SINR relative accuracy for CSI-RS based CMR only in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR Ês/Iot Note 2, Note 4 | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 3 | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | | |
| ±4.5 | ±5.5 | ≥-3 | Same value as CSI-RS_RP in clause B.2.8.1, according to UE Power class, operating band and angle of arrival | | N/A | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS CMR Ês/Iot is the minimum CSI-RS CMR Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: Values based on Refsens and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the te Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.st cases, the CSI-RS CMR Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.28.2 L1-SINR accuracy requirements with SSB based CMR and dedicated IMR configured

### 10.1.28.2.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute SSB based L1-SINR accuracy in this clause apply to all SSBs configured as CMR and dedicated resources configured as IMR of the serving cell configured for L1-SINR measurement.

The accuracy requirements are defined in table 10.1.28.2.1-1 for SSB based CMR and NZP-IMR and in table 10.1.28.2.1-2 for SSB based CMR and ZP-IMR.

The accuracy requirements in tables 10.1.28.2.1-1 and 10.1.28.2.1-2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.2 for a corresponding Band for each relevant SSB based CMR and IMR.
- The bandwidth of NZP-IMR and ZP-IMR is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.
- SSB based CMR and IMR in the test come from the same direction.

The performance with larger bandwidth of NZP-IMR and ZP-IMR is equal to or better than the accuracy requirements in tables 10.1.28.2.1-1 and 10.1.28.2.1-2.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.2 for a corresponding Band for each relevant SSB based CMR and IMR.
- The CSI-RS density is 3.

- AWGN radio propagation conditions.

If the bandwidth of CSI-RS as NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.28.2.1-1 and 10.1.28.2.1-2 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS as NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.28.2.1-1 and 10.1.28.2.1-2 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.28.2.1-1: L1-SINR absolute accuracy for SSB based CMR and NZP-IMR in FR2**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB CMR Ês/Iot Note 3 | NZP-IMR Ês/Iot Note 3 | Io Note 1 range | | |
| | | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dB | dBm / $SCS_{SSB}$ Note 2 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | | |
| ±4.0 | ±5.0 | ≥0 | ≥0 | Same value as SSB_RP in clause B.2.8.2, according to UE Power class, operating band and angle of arrival | N/A | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the SSB Ês/Iot, NZP-IMR Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

**Table 10.1.28.2.1-2: L1-SINR absolute accuracy for SSB based CMR and ZP-IMR in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB CMR Ês/Iot Note 3 | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 2 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | | |
| ±4.5 | ±5.5 | ≥-3 | Same value as SSB_RP in clause B.2.8.2, according to UE Power class, operating band and angle of arrival | N/A | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.

NOTE 3: In the test cases, the SSB CMR Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

### 10.1.28.2.2 Relative Accuracy

The relative SSB based L1-SINR accuracy is defined as the L1-SINR measured from one SSB configured as CMR and one IMR configured as IMR compared to the largest measured value of L1-SINR among all SSB based CMRs and IMRs of the serving cell.

The accuracy requirements are defined in table 10.1.28.2.2-1 for SSB based CMR and NZP-IMR and in table 10.1.28.2.2-2 for SSB based CMR and ZP-IMR.

The accuracy requirements in tables 10.1.28.2.2-1 and 10.1.28.2.2-2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.2 for a corresponding Band for each relevant SSB based CMR and IMR.
- The bandwidth of NZP-IMR and ZP-IMR is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.
- SSB based CMR and IMR in the test come from the same direction.

The performance with larger bandwidth of NZP-IMR and ZP-IMR is equal to or better than the accuracy requirements in tables 10.1.28.2.2-1 and 10.1.28.2.2-2.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.2 for a corresponding Band for each relevant SSB based CMR and IMR.
- The CSI-RS density is 3.
- AWGN radio propagation conditions.

If the bandwidth of CSI-RS as NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.28.2.2-1 and 10.1.28.2.2-2 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS as NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.28.2.2-1 and 10.1.28.2.2-2 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met

- The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.28.2.2-1: L1-SINR relative accuracy for SSB based CMR and NZP-IMR in FR2**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB CMR Ês/Iot Note 2, Note 4 | NZP-IMR Ês/Iot Note 4 | Io Note 1 range | | |
| | | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dB | dBm / $SCS_{SSB}$ Note 3 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | | |
| ±3.0 | ±4.0 | ≥0 | ≥0 | Same value as SSB_RP in clause B.2.8.2, according to UE Power class, operating band and angle of arrival | N/A | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB CMR Ês/Iot is the minimum SSB CMR Ês/Iot of the pair of SSBs to which the requirement applies.
NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the test cases, the SSB CMR Ês/Iot, NZP-IMR Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

**Table 10.1.28.2.2-2: L1-SINR relative accuracy for SSB based CMR and ZP-IMR in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB CMR Ês/Iot Note 2, Note 4 | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{SSB}$ Note 3 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 120 kHz / $SCS_{SSB}$ = 240 kHz | | |
| ±3.5 | ±4.5 | ≥-3 | Same value as SSB_RP in clause B.2.8.2, according to UE Power class, operating band and angle of arrival | N/A | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB CMR Ês/Iot is the minimum SSB CMR Ês/Iot of the pair of SSBs to which the requirement applies.
NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the test cases, the SSB CMR Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

## 10.1.28.3 L1-SINR accuracy requirements with CSI-RS based CMR and dedicated IMR configured

### 10.1.28.3.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute CSI-RS based L1-SINR accuracy in this clause apply to all CSI-RS resources as CMR and dedicated resources configured as IMR of the serving cell configured for L1-SINR measurement.

The accuracy requirements are defined in table 10.1.28.3.1-1 for CSI-RS based CMR and NZP-IMR and in table 10.1.28.3.1-2 for CSI-RS based CMR and ZP-IMR.

The accuracy requirements in tables 10.1.28.3.1-1 and 10.1.28.3.1-2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.3 for a corresponding Band for each relevant CSI-RS based CMR and IMR.
- The bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.
- CSI-RS based CMR and IMR in the test come from the same direction.

The performance with larger bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR is equal to or better than the accuracy requirements in tables 10.1.28.3.1-1 and 10.1.28.3.1-2.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS based CMR and IMR, and
- The CSI-RS density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.
- CSI-RS based CMR and IMR in the test come from the same direction

If the bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.28.3.1-1 and 10.1.28.3.1-2 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.28.3.1-1 and 10.1.28.3.1-2 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.28.3.1-1: L1-SINR absolute accuracy for CSI-RS based CMR and NZP-IMR in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR Ês/Iot Note 3 | NZP-IMR Ês/Iot Note 3 | Io Note 1 range | |
| | | | | Minimum Io | Maximum Io |

| dB | dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 2 | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
|---|---|---|---|---|---|---|---|
| | | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | | |

Applicable side condition selected depending on angle of arrival.<br>NOTE 3: In the test cases, the CSI-RS Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | | | |

### 10.1.28.3.2 Relative Accuracy

The relative CSI-RS based L1-SINR accuracy is defined as the L1-SINR measured from one CSI-RS configured as CMR and one IMR configured as IMR compared to the largest measured value of L1-SINR among all CSI-RS based CMRs and IMRs of the serving cell.

The accuracy requirements are defined in table 10.1.28.3.2-1 for CSI-RS based CMR and NZP-IMR and in table 10.1.28.3.2-2 for CSI-RS based CMR and ZP-IMR.

The accuracy requirements in tables 10.1.28.3.2-1 and 10.1.28.3.2-2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.8.3 for a corresponding Band for each relevant CSI-RS based CMR and IMR.
- The bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR is 48 PRBs and the density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.
- CSI-RS based CMR and IMR in the test come from the same direction.

The performance with larger bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR is equal to or better than the accuracy requirements in tables 10.1.28.3.2-1 and 10.1.28.3.2-2.

If UE supports *sbfd-Aware-r19* and SBFD is configured by the network, for CSI-RS measurement in SBFD symbols the accuracy requirements apply under the following conditions and depending on the bandwith of CSI-RS.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled, and
- Conditions for L1-SINR measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS based CMR and IMR, and
- The CSI-RS density is 3.
- The measured signals are in the directions covered by the percentile EIS spherical coverage of the UE, defined in clause 7.3.4 of TS 38.101-2 [19].
- AWGN radio propagation conditions.
- CSI-RS based CMR and IMR in the test come from the same direction

If the bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.28.3.2-1 and 10.1.28.3.2-2 apply.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 48 PRBs in at least one DL subband
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is no less than 72 PRBs across two DL subbands

If the bandwidth of CSI-RS as CMR, NZP-IMR and ZP-IMR meets the following condition the requirements in table 10.1.28.3.2-1 and 10.1.28.3.2-2 apply with additional 0.5dB margin.

- For the case when one DL subband is configured
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in the DL subband
- For the case when two DL subbands are configured, when one of the following conditions is met
  - The bandwidth of CSI-RS is no less than 24 PRBs but less than 48 PRBs in each DL subband, and the total bandwidth of CSI-RS is less than 72 PRBs across two DL subbands

**Table 10.1.28.3.2-1: L1-SINR relative accuracy for CSI-RS based CMR and NZP-IMR in FR2**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR Ês/Iot Note 2, Note 4 | NZP-IMR Ês/Iot Note 4 | Io Note 1 range | | |
| | | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 3 | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{CSI-RS}$ = 60 kHz / $SCS_{CSI-RS}$ = 120 kHz | | |
| ±3.0 | ±4.0 | ≥0 | ≥0 | Same value as CSI-RS_RP in clause B.2.8.3, according to UE Power class, operating band and angle of arrival | N/A | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS CMR Ês/Iot is the minimum CSI-RS CMR Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the test cases, the CSI-RS CMR Ês/Iot, NZP-IMR Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

**Table 10.1.28.3.2-2: L1-SINR relative accuracy for CSI-RS based CMR and ZP-IMR in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | CSI-RS CMR Ês/Iot Note 2, Note 4 | Io Note 1 range | | |
| | | | Minimum Io | | Maximum Io |
| dB | dB | dB | dBm / $SCS_{CSI-RS}$ Note 3 | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{CSI-RS}$ = 60 kHz | $SCS_{CSI-RS}$ = 120 kHz | | |
| ±3.5 | ±4.5 | ≥-3 | Same value as CSI-RS_RP in clause B.2.8.3, according to UE Power class, operating band and angle of arrival | | N/A | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter CSI-RS CMR Ês/Iot is the minimum CSI-RS CMR Ês/Iot of the pair of CSI-RS resources to which the requirement applies.
NOTE 3: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 4: In the test cases, the CSI-RS CMR Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.

# 10.1.29 Intra-frequency RSRQ accuracy requirements under CCA

## 10.1.29.1 Intra-frequency SS-RSRQ accuracy requirements in FR1

### 10.1.29.1.1 Absolute SS-RSRQ Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on the same frequency as that of the serving cell under CCA.

The accuracy requirements in table 10.1.29.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.9 for a corresponding Band for each relevant SSB.

**Table 10.1.29.1.1-1: SS-RSRQ intra-frequency absolute accuracy under CCA**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±2.5 | ±4 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: NR operating band groups are as defined in clause 3.5.2.

# 10.1.30 Inter-frequency RSRQ accuracy requirements under CCA

## 10.1.30.1 Inter-frequency SS-RSRQ accuracy requirements in FR1

### 10.1.30.1.1 Absolute SS-RSRQ Accuracy

The requirements for absolute SS-RSRQ accuracy in this clause apply to a cell on a frequency under CCA that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.30.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.10 for a corresponding Band for each relevant SSB.

**Table 10.1.30.1.1-1: SS-RSRQ inter-frequency absolute accuracy under CCA**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 3] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±2.5 | ±4 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 3: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

### 10.1.30.1.2 Relative SS-RSRQ Accuracy

The relative SS-RSRQ accuracy in inter-frequency case is defined as the RSRQ measured from one cell on a frequency compared to the RSRP measured from another cell on a different frequency, with at least one of the two frequencies being under CCA.

The accuracy requirements in table 10.1.30.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.10 for a corresponding Band for each relevant SSB.
- $|SSB_RP1\ dB_m - SSB_RP2\ dB_m| \leq 27$ dB
- $|Channel\ 1_Io - Channel\ 2_Io| \leq 20$ dB

**Table 10.1.30.1.2-1: SS-RSRQ inter-frequency relative accuracy under CCA**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot [Note 2] | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 4] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| ±4 | ±4 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 4: NR operating band groups are as defined in clause 3.5.2.

# 10.1.31 Intra-frequency SINR accuracy requirements under CCA

## 10.1.31.1 Intra-frequency SS-SINR accuracy requirements in FR1

### 10.1.31.1.1 Absolute SS-SINR Accuracy

Unless otherwise specified, the requirements for absolute SS-SINR accuracy in this clause apply to a cell on the same frequency as that of the serving cell under CCA.

The accuracy requirements in table 10.1.31.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.9 for a corresponding Band.

**Table 10.1.31.1.1-1: SS-SINR intra-frequency absolute accuracy under CCA**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 3 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3.0 | ±4 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.
NOTE 3: The requirements apply for SSB Ês/Iot ≤ 25 dB.
NOTE 4: NR operating band groups are as defined in clause 3.5.2.

# 10.1.32 Inter-frequency SINR accuracy requirements under CCA

## 10.1.32.1 Inter-frequency SS-SINR accuracy requirements in FR1

### 10.1.32.1.1 Absolute SS-SINR Accuracy

The requirements for absolute SS-SINR accuracy in this clause apply to a cell on a frequency under CCA that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.32.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.10 for a corresponding Band.

**Table 10.1.32.1.1-1: SS-SINR inter-frequency absolute accuracy under CCA**

| Accuracy | Conditions |
|---|---|

| Normal condition | Extreme condition | SSB Ês/Iot Note 3 | Io Note 1 range | | | | |
|---|---|---|---|---|---|---|---|
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3.0 | ±4 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | 116.5 | -113.5 | | |
| ±3.5 | ±4 | ≥-6 | Note 2 | Note 2 | Note 2 | Note 2 | Note 2 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 3: The requirements apply for SSB Ês/Iot ≤ 25 dB.<br>NOTE 4: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

### 10.1.32.1.2 Relative SS-SINR Accuracy

The relative SS-SINR accuracy in inter-frequency case is defined as the SS-SINR measured from one cell on a frequency compared to the SS-SINR measured from another cell on a different frequency, with at least one of the two frequencies being under CCA.

The accuracy requirements in table 10.1.32.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.10 for a corresponding Band.
- SSB_RP1 $dB_m$ - SSB_RP2 $dB_m| \leq 27$ dB
- |Channel 1_Io -Channel 2_Io | ≤ 20 dB

**Table 10.1.32.1.2-1: SS-SINR inter-frequency relative accuracy under CCA**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2,4 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 5 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 120 kHz | $SCS_{SSB}$ = 240 kHz | | |
| ±3.5 | ±4 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| ±4 | ±4 | ≥-6 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: The requirements apply for SSB Ês/Iot ≤ 25 dB.<br>NOTE 5: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

## 10.1.33 L1-RSRP accuracy requirements under CCA

### 10.1.33.1 SSB based L1-RSRP accuracy requirements in FR1

#### 10.1.33.1.1 Absolute Accuracy

Unless otherwise specified, the requirements for absolute SSB based L1-RSRP accuracy in this clause apply to all SSBs of the serving cell configured for L1-RSRP measurement under CCA.

The accuracy requirements in table 10.1.33.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.10.1 for a corresponding Band for each relevant SSB.

**Table 10.1.33.1.1-1: SSB based L1-RSRP absolute accuracy under CCA**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB $\hat{E}_s/I_{ot}$ | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±5.0 | ±9.5 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -70 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| ±8.5 | ±11.5 | ≥-3 | NR_CCA_FR1_I | N/A | N/A | -70 | -50 |
| | | | NR_CCA_FR1_J | | | | |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

### 10.1.33.1.2 Relative Accuracy

The relative SSB based L1-RSRP accuracy is defined as the L1-RSRP measured from one SSB compared to the largest measured value of L1-RSRP among all SSBs of the serving cell under CCA.

The accuracy requirements in table 10.1.33.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.10.1 for a corresponding Band for each relevant SSB.

**Table 10.1.33.1.2-1: SSB based L1-RSRP relative accuracy under CCA**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB $\hat{E}_s/I_{ot}$ [Note 2] | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 3] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB $\hat{E}_s/I_{ot}$ is the minimum SSB $\hat{E}_s/I_{ot}$ of the pair of SSBs to which the requirement applies.<br>NOTE 3: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

## 10.1.34 RSSI measurements under CCA

### 10.1.34.1 Intra-frequency absolute RSSI measurement accuracy requirements in FR1

The accuracy requirements for intra-frequency RSSI measurements on a carrier frequency under CCA are specified in table 10.1.34.1-1. The requirements apply for any configured RSSI *measDuration* [2], provided that:

- All symbols during each RSSI measurement duration are available for RSSI sampling within the same reporting interval.

The intra-frequency RSSI measurement bandwidth is the channel bandwidth defined in clause 4 of TS 37.213 [33], where the channel has the center frequency configured by *ARFCN-valueNR*.

**Table 10.1.34.1-1: Intra-frequency RSSI accuracy under CCA**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | Io [Note 1] range | | | | |
| | | NR operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| [±3.5] | [±6.5] | NR_CCA_FR1_I | -117 | -114 | N/A | -70 |
| | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| [±5.5] | [±8.5] | NR_CCA_FR1_I | N/A | N/A | -70 | -50 |
| | | NR_CCA_FR1_J | | | | |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups are as defined in clause 3.5.2. | | | | | | |

### 10.1.34.2 Inter-frequency absolute RSSI measurement accuracy requirements in FR1

The accuracy requirements for inter-frequency RSSI measurements on a carrier frequency under CCA are the same as specified in clause 10.1.34.1.

The inter-frequency RSSI measurement bandwidth is the channel bandwidth defined in clause 4 of TS 37.213 [33], where the channel has the center frequency configured by *ARFCN-valueNR*.

### 10.1.34.3 RSSI measurement report mapping

The reporting range of RSSI measurement is defined from -100 dBm to -25 dBm with 1 dBm resolution.

The mapping of the measured quantity is defined in table 10.1.34.3-1. The range in the signalling may be larger than the guaranteed accuracy range, provided that the following condition is met:

the RSSI measurement bandwidth is the channel bandwidth defined in clause 4 of TS 37.213 [33], where the channel has the center frequency configured by *ARFCN-valueNR*.

**Table 10.1.34.3-1: RSSI measurement report mapping**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| RSSI_00 | RSSI < -100 | dBm |
| RSSI_01 | -100 ≤ RSSI < -99 | dBm |
| RSSI_02 | -99 ≤ RSSI < -98 | dBm |
| … | … | … |
| RSSI_74 | -27 ≤ RSSI < -26 | dBm |
| RSSI_75 | -26 ≤ RSSI < -25 | dBm |
| RSSI_76 | -25 ≤ RSSI | dBm |

## 10.1.35 Channel occupancy measurements under CCA

### 10.1.35.1 Intra-frequency channel occupancy measurement accuracy requirements in FR1

The UE shall be able to correctly evaluate the intra-frequency channel occupancy configured according to TS 38.331 [2], provided that the following conditions are met:

- All symbols during each RSSI measurement duration are available for RSSI sampling within the same reporting interval,

- RSSI at the UE receiver meets the following condition with respect to the configured *channelOccupancyThreshold* [2]:
  - RSSI at the UE receiver is below *channelOccupancyThreshold*- $\Delta_{RSSI}$, or
  - RSSI at the UE receiver is above *channelOccupancyThreshold*+ $\Delta_{RSSI}$,
- where $\Delta_{RSSI}$ is the applicable RSSI measurement accuracy value from the RSSI measurement accuracy requirements specified in clause 10.1.34.1.

The channel occupancy measurement bandwidth is the same as the RSSI measurement bandwidth in clause 10.1.34.1.

### 10.1.35.2 Inter-frequency channel occupancy measurement accuracy requirements in FR1

The UE shall be able to correctly evaluate the inter-frequency channel occupancy configured according to TS 38.331 [2], provided that the following conditions are met:

- All symbols during each RSSI measurement duration are available for RSSI sampling within the same reporting interval,
- RSSI at the UE receiver meets the following condition with respect to the configured *channelOccupancyThreshold* [2]:
  - RSSI at the UE receiver is below *channelOccupancyThreshold*- $\Delta_{RSSI}$, or
  - RSSI at the UE receiver is above *channelOccupancyThreshold*+ $\Delta_{RSSI}$,
- where $\Delta_{RSSI}$ is the applicable RSSI measurement accuracy value from the RSSI measurement accuracy requirements specified in clause 10.1.34.2.

The channel occupancy measurement bandwidth is the same as the RSSI measurement bandwidth in clause 10.1.34.2.

## 10.1.36 Intra-frequency RSRP accuracy requirements under CCA

### 10.1.36.1 Intra-frequency SS-RSRP accuracy requirements in FR1

#### 10.1.36.1.1 Absolute SS-RSRP Accuracy

Unless otherwise specified, the requirements for absolute SS-RSRP accuracy in this clause apply to a cell on the same frequency as that of the serving cell under CCA.

The accuracy requirements in table 10.1.36.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.8 for a corresponding Band for each relevant SSB.

**Table 10.1.36.1.1-1: SS-RSRP intra-frequency absolute accuracy**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |

| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
|---|---|---|---|---|---|---|---|
| ±4.5 | ±9 | ≥-6 | NR_CCA_FR1_I | -117 | -114 | N/A | -70 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| ±8 | ±11 | ≥-6 | NR_CCA_FR1_I | N/A | N/A | -70 | -50 |
| | | | NR_CCA_FR1_J | | | | |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

### 10.1.36.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy is defined as the SS-RSRP measured from one cell compared to the SS-RSRP measured from another cell on the same frequency, or between any two SS-RSRP levels measured on the same cell under CCA.

The accuracy requirements in table 10.1.36.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.8 for a corresponding Band for each relevant SSB.

**Table 10.1.36.1.2-1: SS-RSRP intra-frequency relative accuracy under CCA**

| **Accuracy** | | **Conditions** | | | | | |
|---|---|---|---|---|---|---|---|
| **Normal condition** | **Extreme condition** | **SSB Ês/Iot** Note 2 | **Io** Note 1 **range** | | | | |
| | | | **NR operating band groups** Note 4 | **Minimum Io** | | | **Maximum Io** |
| **dB** | **dB** | **dB** | | **dBm / $SCS_{SSB}$** | | **dBm/$BW_{Channel}$** | **dBm/$BW_{Channel}$** |
| | | | | **$SCS_{SSB}$ = 15 kHz** | **$SCS_{SSB}$ = 30 kHz** | | |
| ±2 | ±3 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| ±3 | ±3 | ≥-6 | Note 3 | Note 3 | Note 3 | N/A | Note 3 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.<br>NOTE 4: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

## 10.1.37 Inter-frequency RSRP accuracy requirements under CCA

### 10.1.37.1 Inter-frequency SS-RSRP accuracy requirements in FR1

#### 10.1.37.1.1 Absolute SS-RSRP

The requirements for absolute SS-RSRP in this clause apply to a cell on a frequency under CCA that has different carrier frequency from the serving cell.

The accuracy requirements in table 10.1.37.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.9 for a corresponding Band for each relevant SSB.

**Table 10.1.37.1.1-1: SS-RSRP inter-frequency absolute accuracy under CCA**

| **Accuracy** | **Conditions** |
|---|---|

| Normal condition | Extreme condition | SSB Ês/Iot | Io Note 1 range | | | | |
|---|---|---|---|---|---|---|---|
| | | | NR operating band groups Note 2 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4.5 | ±9 | ≥-6 | NR_CCA_FR1_I | -117 | -114 | N/A | -70 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| ±8 | ±11 | ≥-6 | NR_CCA_FR1_I | N/A | N/A | -70 | -50 |
| | | | NR_CCA_FR1_J | | | | |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

### 10.1.37.1.2 Relative SS-RSRP Accuracy

The relative SS-RSRP accuracy in inter-frequency case is defined as the RSRP measured from one cell on a frequency compared to the RSRP measured from another cell on a different frequency, with at least one of the two frequencies being under CCA.

The accuracy requirements in table 10.1.37.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for inter-frequency measurements are fulfilled according to annex B.2.9 for a corresponding Band for each relevant SSB.
- $|SSB_RP1\ dB_m - SSB_RP2\ dB_m| \leq 27$ dB
- $|Channel\ 1_Io - Channel\ 2_Io| \leq 20$ dB

**Table 10.1.37.1.2-1: SS-RSRP inter-frequency relative accuracy under CCA**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 3 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±4.5 | ±6 | ≥-6 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | | |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: The parameter SSB Ês/Iot is the minimum SSB Ês/Iot of the pair of cells to which the requirement applies.<br>NOTE 3: NR operating band groups are as defined in clause 3.5.2. | | | | | | | |

## 10.1.38 PRS-RSRPP Measurements

### 10.1.38.1 Introduction

The requirements in clause 10.1.38.2 shall apply, provided the UE has received *nr-DL-AoD-RequestLocationInformation* message from LMF via LPP [34] requesting the UE to report one or more DL PRS-RSRPP measurements defined in TS 38.215 [4]. The requirements in clause 10.1.38 shall apply:

- when UE is in RRC_CONNECTED state,
- when UE is in RRC_INACTIVE state,
- when UE is in RRC_IDLE state.

The requirements in clause 10.1.38.2 apply for the first path PRS-RSRP measurement.

## 10.1.38.2 Measurement Accuracy Requirements

### 10.1.38.2.1 Absolute PRS RSRPP accuracy

The absolute accuracy requirements for PRS-RSRPP measurement for FR1 defined in table 10.1.38.2.1-1 and table 10.1.38.2.1-3 are valid under the following conditions:

- Conditions defined in 38.101-1 clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band

The absolute accuracy requirements for PRS-RSRPP measurement for FR2 defined in table 10.1.38.2.1-2 and table 10.1.38.2.1-4 are valid under the following conditions:

- Conditions defined in 38.101-2 [19] clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{dBm}$ according to annex B.2.14 for a corresponding Band

The absolute accuracy requirements for PRS-RSRPP measurement defined in table 10.1.38.2.1-1 and table 10.1.38.2.1-2 apply for the UE not supporting *supportedDL-PRS-ProcessingSamples* [34] or LMF does not indicate UE to perform positioning measurements with reduced number of samples.

The absolute accuracy requirements for PRS-RSRPP measurement defined in table 10.1.38.2.1-3 and table 10.1.38.2.1-4 apply for the UE supporting *supportedDL-PRS-ProcessingSamples* [34].

NOTE: The requirements in this clause are derived based on two-tap channel defined in TS 38.101-4 [21] annex B.2.4 (a = 1, $\tau_d$=0.45 μs and $f_D$=5 Hz).

NOTE: The requirements in this clause are derived based on the difference between the estimated PRS-RSRPP compared to the ideal PRS-RSRPP defined as

$$\mathrm{RSRPP}_p \propto \left| \sum_k H_k \exp\left( j 2\pi D_p \frac{k}{N_{\mathrm{IFFT}}} \right) \right|^2$$

Where:

$H_k$ is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

$D_p$ is the exact delay of the p-th path in the channel model.

**Table 10.1.38.2.1-1: PRS-RSRPP absolute accuracy for FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | Io Note 7 range | | | |
| Normal condition | Extreme condition | PRS $\hat{E}_s/I_{ot}$ | PRS BW | Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) | NR operating band groups Note 8 | Minimum Io Note 1 dBm / $SCS_{PRS}$ | | Maximum Io |
| | | | | | | dBm / $SCS_{PRS}$ | | |
| dB | dB | dB | PRB | - | | dBm/15 kHz Note 6 | dBm/30 kHz Note 6 | dBm/60 kHz Note 6 | $dBm/BW_{Channel}$ |
| ±4.1 | ±8.6 | ≥-3 | ≥24 | All | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -127 | -124 | -121 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -126.5 | -123.5 | -120.5 | -50 |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -126 | -123 | -120 | -50 |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -125.5 | -122.5 | -119.5 | -50 |

| | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -125 | -122 | -119 | -50 |
| | | | | | NR_FDD_FR1_F | -124.5 | -121.5 | -118.5 | -50 |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -124 | -121 | -118 | -50 |
| | | | | | NR_FDD_FR1_H | -123.5 | -120.5 | -117.5 | -50 |
| | | | | | NR_FDD_FR1_N | -120.5 | -117.5 | -114.5 | -50 |
| | | | | | Note 4 | | | | |
| | | | | | Note 4 | | | | |
| ±5.8 | ±10.3 | ≥-13 | 24 ≤ BW ≤ 52 | All | Note 4 | | | | |
| ±4.9 | ±9.4 | | BW > 52 | All | Note 4 | | | | |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the DL-TDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by Δ>0, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

**Table 10.1.38.2.1-2: PRS-RSRPP absolute accuracy for FR2**

| **Accuracy** | | **Conditions** | | | | |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: Void.
NOTE 3: PRS bandwidth is as indicated in *prs-Bandwidth* in the DL-TDOA or DL-AoD assistance data defined in [34].
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 PRB.

NOTE 5: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 6: The condition level is increased by $\Delta$>0, when applicable, as described in clauses B.3.2 and B.3.3.
NOTE 7: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 8: NR operating band groups are as defined in clause 3.5.2.

## 10.1.38.3 Report mapping

### 10.1.38.3.1 Absolute PRS-RSRPP Measurement Report Mapping

The reporting range of absolute PRS-RSRPP measurement is defined from -156 dBm to -31 dBm with 1 dB resolution.

The mapping of measured quantity is defined in table 10.1.38.3.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

The UE capable of *additionalPathsExtSupport-r17* can report the PRS-RSRPP measurement of up to its supported number of additional paths.

**Table 10.1.38.3.1-1: Measurement report mapping for PRS-RSRPP**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| PRS_RSRPP_0 | PRS-RSRPP<-156 | dBm |
| PRS_RSRPP_1 | -156≤PRS-RSRPP<-155 | dBm |
| PRS_RSRPP_2 | -155≤PRS-RSRPP<-154 | dBm |
| PRS_RSRPP_3 | -154≤PRS-RSRPP<-153 | dBm |
| PRS_RSRPP_4 | -153≤PRS-RSRPP<-152 | dBm |
| PRS_RSRPP_5 | -152≤PRS-RSRPP<-151 | dBm |
| PRS_RSRPP_6 | -151≤PRS-RSRPP<-150 | dBm |
| PRS_RSRPP_7 | -150≤PRS-RSRPP<-149 | dBm |
| PRS_RSRPP_8 | -149≤PRS-RSRPP<-148 | dBm |
| PRS_RSRPP_9 | -148≤PRS-RSRPP<-147 | dBm |
| PRS_RSRPP_10 | -147≤PRS-RSRPP<-146 | dBm |
| PRS_RSRPP_11 | -146≤PRS-RSRPP<-145 | dBm |

| PRS_RSRPP_13 | -144≤PRS-RSRPP<-143 | dBm |
| PRS_RSRPP_14 | -143≤PRS-RSRPP<-142 | dBm |
| PRS_RSRPP_15 | -142≤PRS-RSRPP<-141 | dBm |
| PRS_RSRPP_16 | -141≤PRS-RSRPP<-140 | dBm |
| PRS_RSRPP_17 | -140≤PRS-RSRPP<-139 | dBm |
| PRS_RSRPP_18 | -139≤PRS-RSRPP<-138 | dBm |
| … | … | … |
| PRS_RSRPP_111 | -46≤PRS-RSRPP<-45 | dBm |
| PRS_RSRPP_112 | -45≤PRS-RSRPP<-44 | dBm |
| PRS_RSRPP_113 | -44≤PRS-RSRPP<-43 | dBm |
| PRS_RSRPP_114 | -43≤PRS-RSRPP<-42 | dBm |
| PRS_RSRPP_115 | -42≤PRS-RSRPP<-41 | dBm |
| PRS_RSRPP_116 | -41≤PRS-RSRPP<-40 | dBm |
| PRS_RSRPP_117 | -40≤PRS-RSRPP<-39 | dBm |
| PRS_RSRPP_118 | -39≤PRS-RSRPP<-38 | dBm |
| PRS_RSRPP_119 | -38≤PRS-RSRPP<-37 | dBm |
| PRS_RSRPP_120 | -37≤PRS-RSRPP<-36 | dBm |
| PRS_RSRPP_121 | -36≤PRS-RSRPP<-35 | dBm |
| PRS_RSRPP_122 | -35≤PRS-RSRPP<-34 | dBm |
| PRS_RSRPP_123 | -34≤PRS-RSRPP<-33 | dBm |
| PRS_RSRPP_124 | -33≤PRS-RSRPP<-32 | dBm |
| PRS_RSRPP_125 | -32≤PRS-RSRPP<-31 | dBm |
| PRS_RSRPP_126 | -31≤PRS-RSRPP | dBm |

### 10.1.38.3.2 Differential Report Mapping for PRS-RSRPP Measurement

The reporting range of differential PRS-RSRPP is defined from -30 dB to 30 dB with 1 dB resolution.

The mapping of measured quantity is defined in table 10.1.38.3.2-1. The range in the signalling may be larger than the guaranteed accuracy range.

For differential reporting, PRS-RSRPP is reported as the difference in dB with respect to the first reported PRS-RSRPP.

**Table 10.1.38.3.2-1: Measurement report mapping for differential PRS-RSRPP**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| DIFFRSRPP_0 | -30≥ΔRSRPP | dB |
| DIFFRSRPP_1 | -29≥ΔRSRPP>-30 | dB |
| DIFFRSRPP_2 | -28≥ΔRSRPP>-29 | dB |
| DIFFRSRPP_3 | -27≥ΔRSRPP>-28 | dB |
| DIFFRSRPP_4 | -26≥ΔRSRPP>-27 | dB |
| DIFFRSRPP_5 | -25≥ΔRSRPP>-26 | dB |
| DIFFRSRPP_6 | -24≥ΔRSRPP>-25 | dB |
| DIFFRSRPP_7 | -23≥ΔRSRPP>-24 | dB |

## 10.1.38APRS-RSRPP Measurements Based on PRS Aggregation

### 10.1. 38A.1 Introduction

The requirements in clause 10.1.38A.2 shall apply, provided the UE has received *nr-DL-TDOA-RequestLocationInformation* or *nr-Multi-RTT-RequestLocationInformation* or *nr-DL-AoD-RequestLocationInformation*

message from LMF via LPP TS 37.355 [34] with a request to perform measurement by aggregating PRS resources from multiple PFLs via *nr-DL-PRS-JointMeasurementRequested* for UE to report one or more DL PRS-RSRPP measurements defined in TS 38.215 [4]. The requirements in clause 10.1.38A.2 shall apply:

- when UE is in RRC_CONNECTED state, and the measurement is performed with MG,
- when UE is in RRC_INACTIVE state.
- when UE is in RRC_IDLE state.

The requirements in clause 10.1.38A.2 apply for the first path PRS-RSRP measurement.

### 10.1.38A.2 Measurement Accuracy Requirements

#### 10.1.38A.2.1 Absolute PRS RSRPP accuracy

The accuracy requirements in clause 10.1.38.2.1 corresponding to the total aggregated PRS bandwidth shall apply.

### 10.1.38A.3 Report mapping

#### 10.1.38A.3.1 Absolute PRS-RSRPP Measurement Report Mapping

The absolute report mapping for PRS-RSRPP measurement in clause 10.1.38.3.1 shall apply.

#### 10.1.38A.3.2 Differential Report Mapping for PRS-RSRPP Measurement

The differential report mapping for PRS-RSRPP measurement in clause 10.1.38.3.2 shall apply.

## 10.1.39 UE Rx-Tx time difference measurements for RTT-based PDC

### 10.1.39.1 *Void*

### 10.1.39.2 Measurement Accuracy Requirements for PRS

The error in the reported value of UE Rx-Tx time difference measurement, including both the measurement error and the reporting quantization error, shall be within the accuracy requirements specified in this clause.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

- $N_{TA_offset}$ defined in table 7.1.2-2 changes during the UE Rx-Tx measurement period or
- if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within -160, 160 msec of at least one PDC DL PRS resource from the serving cell (PCell).

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The accuracy requirements in table 10.1.39.2-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to Annex B.2.14 for a corresponding Band.

AWGN propagation condition.

**Table 10.1.39.2-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN**

| Accuracy | Conditions | | | | | | |

## 10.1.39.3 Measurement Accuracy Requirements for TRS

The error in the reported value of UE Rx-Tx time difference measurement, including both the measurement error and the reporting quantization error, shall be within the accuracy requirements specified in this clause.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

- $N_{TA_offset}$ defined in table 7.1.2-2 changes during the UE Rx-Tx measurement period or
- if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within -160, 160 msec of at least one PDC TRS resource from the serving cell (PCell).

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The accuracy requirements in table 10.1.39.3-1 for FR1 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.13 for a corresponding Band.

AWGN propagation condition.

**Table 10.1.39.3-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN**

| Accuracy | Conditions | | | | | |

| | | | | NR_FDD_FR1_H | -111.5 | |
| | | | | NR_FDD_FR1_N | -108.5 | |
| [14+δ+ε] | | ≥[64] | | NOTE 5 | NOTE 5 | NOTE 5 |
| [7+δ+ε] | | ≥[132] | | NOTE 5 | NOTE 5 | NOTE 5 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in clause 3.5.
NOTE 3: The Io is defined in TRS slots. The same Io range applies to TRS and non-TRS symbols. Io levels are different in TRS and non-TRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the TRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: δ is the margin determined from Table 10.1.39.3-3.
NOTE 7: ε is the margin for reporting quantization error and $\varepsilon = 16\,Tc$.

The accuracy requirements in table 10.1.39.3-2 for FR2 are valid under the following conditions:

Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

$PRP|_{dBm}$ according to annex B.2.13 for a corresponding Band.

AWGN propagation condition.

**Table 10.1.39.3-2: UE Rx-Tx time difference measurement accuracy in FR2 in AWGN**

| Accuracy | Conditions | | | | |
|---|---|---|---|---|---|
| | TRS Ês/Iot | Minimum TRS bandwidth | TRS SCS | Io[Note 3] range | |
| | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 4] | dB | PRB | kHz | dBm / $SCS_{TRS}$ | dBm/$BW_{Channel}$ |
| [29+δ+ε] | -3 | ≥[24] | 60 | Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival | -50 |
| [14+δ+ε] | | ≥[64] | | NOTE 5 | NOTE 5 |
| [7+δ+ε] | | ≥[132] | | NOTE 5 | NOTE 5 |
| [15+δ+ε] | | ≥[32] | 120 | Same value as PRP in Table B.2.14-2, according to UE Power class, operating band and angle of arrival | -50 |
| [7+δ+ε] | | ≥[64] | | NOTE 5 | NOTE 5 |
| [4+δ+ε] | | ≥[128] | | NOTE 5 | NOTE 5 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in clause 3.5.
NOTE 3: The Io is defined in TRS slots. The same Io range applies to TRS and non-TRS symbols. Io levels are different in TRS and non-TRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the TRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: δ is the margin determined from Table 10.1.39.3-4.
NOTE 7: ε is the margin for reporting quantization error and ε=16 Tc.

**Table 10.1.39.3-3: Margin for UE Rx-Tx time difference measurement accuracy in FR1**

| Min(TRS BW, SRS BW) (RB) | | | Margin (Tc [Note 1]) |
|---|---|---|---|
| SCS = 15 kHz | SCS = 30 kHz | SCS = 60 kHz | |
| ≥ 24 | N/A | N/A | 160 |
| ≥ 52 | ≥ 24 | N/A | 80 |
| ≥ 104 | ≥ 48 | ≥ 24 | 56 |
| N/A | ≥ 132 | ≥ 64 | 24 |
| N/A | N/A | ≥ 132 | 24 |

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and TRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

**Table 10.1.39.3-4: Margin for UE Rx-Tx time difference measurement accuracy in FR2**

| Min(TRS BW, SRS BW) (MHz) | | Margin (Tc [Note 1]) |
|---|---|---|
| SCS = 60 kHz | SCS = 120 kHz | |
| ≥ 24 | N/A | 76 |
| ≥ 64 | ≥ 32 | 32 |
| ≥ 132 | ≥ 64 | 24 |
| N/A | ≥ 128 | 20 |

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and TRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

## 10.1.40 Void

## 10.1.41 FR1 DPC report

The FR1 DPC report mapping is defined in this clause.

### 10.1.41.1 Report mapping

table 10.1.41.1-1 defines the FR1 DPC report mapping.

**Table 10.1.41.1-1 Mapping of FR1 DPC**

| Reported value | Reported quantity value | Unit |
|---|---|---|
| DPC_00 | 0 | dB |
| DPC_03 | 3 | dB |
| DPC_06 | 6 | dB |

## 10.1.42 TDCP Measurement Report Mapping

The reporting range of TDCP amplitude is defined from 0 to 1. The reporting range of TDCP phase is 0 to 2π. The mapping of measured quantity is defined in tables 10.1.42-1, 10.1.42-2. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.42-1: TDCP amplitude measurement report mapping**

| Reported value | Measured quantity value |
|---|---|
| TDCP_0 | $1 - \frac{1}{128\sqrt{2}} < \text{TDCP} \leq 1$ |
| TDCP_1 | $1 - \frac{1}{128} < \text{TDCP} \leq 1 - \frac{1}{128\sqrt{2}}$ |
| TDCP_2 | $1 - \frac{1}{64\sqrt{2}} < \text{TDCP} \leq 1 - \frac{1}{128}$ |

## 10.1.43 DL-RSCPD Measurements

### 10.1.43.1 Introduction

The requirements in clause 10.1.43 shall apply, provided the UE has received *NR-DL-TDOA-RequestLocationInformation* message with *dl-PRS-RSCPD-Request-r18* from LMF via LPP TS 37.355 [34] requesting the UE to measure and report DL RSCPD measurement together with DL RSTD measurements defined in TS 38.215 [4]. The requirements in clause 10.1.43 shall apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG,
- when UE is in RRC_IDLE or RRC_INACTIVE state.

### 10.1.43.2.1 Measurement Accuracy Requirements

The accuracy requirements for DL RSCPD measurement are based on single measurement sample in single PFL and shall be within ±(X+Y) degree, provided that the following conditions are met:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled for FR1.
- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled for FR2.
- Conditions for DL RSCPD measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- The measurements to derive DL RSCPD are performed on PRS resources within same set of symbols.
- DL RSCPD measurements are based on PRS resources with comb size other than 12.

The requirements in this clause are derived based on AWGN channel and on two-tap channel defined in 38.101-4 [21] annex B.2.4 (a = 1, $\tau_d$=0.45 μs and $f_D$=5 Hz).

X is defined in table 10.1.43.2-1 for AWGN channel and table 10.1.43.2-2 for two-tap channel for FR1 and is derived assuming no carrier frequency offset at TRP.

X is defined in table 10.1.43.2-3 for AWGN channel and table 10.1.43.2-4 for two-tap channel for FR2 and is derived assuming no carrier frequency offset at TRP.

Y is 14 degrees for FR1 and 28 degrees for FR2.

**Table 10.1.43.2-1: DL RSCPD absolute accuracy in FR1 for AWGN channel**

| Accuracy ($\hat{E}s/Iot)_{ref}$ ≥ -6dB<br>($\hat{E}s/Iot)_i$ ≥ -13dB | Accuracy ($\hat{E}s/Iot)_{ref}$ ≥ -3dB<br>($\hat{E}s/Iot)_i$ ≥ -6dB | Conditions | | | | | |

## 10.1.43.3 Report Mapping

### 10.1.43.3.1 Absolute DL RSCPD Measurement Reporting

The reporting range of DL RSCPD, as defined in clause 5.1.43 of TS 38.215 [4], is defined from -180 degree to +180 degree. The reporting resolution is 0.1 degree.

The mapping of DL RSCPD measured quantity is defined in table 10.1.43.3.1-1.

**Table 10.1.43.3.1-1: DL RSCPD measurement report mapping**

| Reported value | Measured quantity value (DL RSCPD) | Unit |
|---|---|---|
| DL_RSCPD_0000 | -180 ≤ DL RSCPD < -179.9 | degree |

| | | |
|---|---|---|
| DL_RSCPD_0001 | -179.9 ≤ DL RSCPD < -179.8 | degree |
| DL_RSCPD_0002 | -179.8 ≤ DL RSCPD < -179.7 | degree |
| … | … | … |
| DL_RSCPD_1798 | -0.2 ≤ DL RSCPD < -0.1 | degree |
| DL_RSCPD_1799 | -0.1 ≤ DL RSCPD < 0 | degree |
| DL_RSCPD_1800 | 0 ≤ DL RSCPD < 0.1 | degree |
| DL_RSCPD_1801 | 0.1 ≤ DL RSCPD < 0.2 | degree |
| DL_RSCPD_1802 | 0.2 ≤ DL RSCPD < 0.3 | degree |
| … | … | … |
| DL_RSCPD_3598 | 179.8 ≤ DL RSCPD < 179.9 | degree |
| DL_RSCPD_3599 | 179.9 ≤ DL RSCPD < 180 | degree |

## 10.1.44 DL-RSCP Measurements

### 10.1.44.1 Introduction

The requirements in clause 10.1.44 shall apply, provided the UE has received *NR-Multi-RTT-RequestLocationInformation* message with *dl-PRS-RSCP-Request-r18* from LMF via LPP TS 37.355 [34] requesting the UE to measure and report DL RSCP measurement together with UE Rx-Tx time difference measurements defined in TS 38.215 [4].

The requirements in clause 10.1.44 shall apply:

- when UE is in RRC_CONNECTED state and the measurement is performed with MG,
- when UE is in RRC_INACTIVE state.

### 10.1.44.2 Measurement Accuracy Requirements

The relative accuracy of DL RSCP measurement in this clause is defined as accuracy of the difference between two DL RSCP measurements, each based on single measurement sample in single PFL.

The requirements in this clause are derived based on AWGN channel and based on two-tap channel defined in 38.101-4 [21] annex B.2.4 (a = 1, $\tau_d$=0.45 μs and $f_D$=5 Hz).

The DL RSCP relative measurement accuracy requirements in this clause shall not apply, if:

- $N_{TA_offset}$ defined in table 7.1.2-2 changes during the DL RSCP with UE Rx-Tx measurement period, or
- if the uplink transmission timing changes during the DL RSCP with UE Rx-Tx measurement period due to the network-configured Timing Advance.

The DL RSCP relative measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the DL RSCP with UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1.2 then:

- DL RSCP and UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in section 7.1.1) for SRS transmission.
- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in section 7.1.1) for SRS transmission.

When a serving cell change occurs during the DL RSCP with UE Rx-Tx measurement period, UE Rx-Tx measurement accuracy requirements and DL RSCP measurement requirements do not apply.

The relative DL RSCP accuracy requirements defined in clause 10.1.44 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled for FR1.
- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled for FR2.
- Conditions for DL RSCP measurements are fulfilled according to annex B.2.14 for a corresponding Band for each relevant PRS resource configured for measurement.
- DL RSCP measurements to derive the relative accuracy are performed on PRS resources within the same set of symbols.
- DL RSCPD measurements are based on PRS resources with comb size other than 12.

The accuracy requirement for relative DL-RSCP shall be within ±(X+Y) degree.

The values of X for accuracy requirements for relative DL-RSCP measurement in FR1 are defined in table 10.1.44.2-1 for AWGN channel and in table 10.1.44.2-2 for two-tap channel and is derived assuming no carrier frequency offset at TRP.

The values of X for accuracy requirements for relative DL-RSCP measurement in FR2 are defined in table 10.1.44.2-3 for AWGN channel and in table 10.1.44.2-4 for two-tap channel and is derived assuming no carrier frequency offset at TRP.

Y is 14 degrees for FR1 and 28 degrees for FR2.

**Table 10.1.44.2-1: DL RSCP relative accuracy in FR1 for AWGN channel**

| Accuracy $(PRS \hat{E}s/Iot)_{ref} \geq -3dB$ $(PRS \hat{E}s/Iot)_i \geq -13dB$ | Accuracy $(PRS \hat{E}s/Iot)_{ref} \geq 0dB$ $(PRS \hat{E}s/Iot)_i \geq -6dB$ | Conditions | | | | | |

## 10.1.44.3 Report Mapping

Relative DL RSCP measurement reporting in clause 10.1.44.3.1 applies to report:

- gap-based DL RSCP measurement, and
- DL RSCP in RRC_INACTIVE state.

### 10.1.44.3.1 Relative DL RSCP Measurement Reporting

The reporting range of relative DL RSCP, as defined in clause 5.1.42 of TS 38.215 [4], is defined from 0 degree to 360 degree. The reporting resolution is 0.1 degree.

The mapping of DL RSCP measured quantity is defined in table 10.1.44.3.1-1.

**Table 10.1.44.3.1-1: DL RSCP measurement report mapping**

| Reported value | Measured quantity value (DL RSCP) | Unit |
|---|---|---|
| DL_RSCP_0000 | 0 ≤ DL RSCP < 0.1 | degree |
| DL_RSCP_0001 | 0.1 ≤ DL RSCP < 0.2 | degree |
| DL_RSCP_0002 | 0.2 ≤ DL RSCP < 0.3 | degree |
| … | … | … |
| DL_RSCP_1798 | 179.8 ≤ DL RSCP < 179.9 | degree |
| DL_RSCP_1799 | 179.9 ≤ DL RSCP < 180 | degree |
| DL_RSCP_1800 | 180 ≤ DL RSCP < 180.1 | degree |
| DL_RSCP_1801 | 180.1 ≤ DL RSCP < 180.2 | degree |
| DL_RSCP_1802 | 180.2 ≤ DL RSCP < 180.3 | degree |
| … | … | … |
| DL_RSCP_3598 | 359.8 ≤ DL RSCP < 359.9 | degree |
| DL_RSCP_3599 | 359.9 ≤ DL RSCP < 360 | degree |

# 10.1.45 CJT calibration measurements

## 10.1.45.1 Introduction

The accuracy requirements in table 10.1.2.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.2 for a corresponding Band for each relevant SSB.
- The bandwidth of CSI-RS is 48 PRBs.

## 10.1.45.2 CJTC calibration delay offset report

# 10.1.46 CJT Calibration Report Mapping

## 10.1.46.1 CJT Calibration Delay Offset Measurement Report Mapping

The reporting range of delay offset is defined from 0 to $A_D$, where $A_D \in \{0.5CP, CP\}$. The number of levels is defined by $M_D$, where $M_D \in \{32, 64, 128, 256\}$. The mapping of measured quantity is defined in tables 10.1.y.1-1. The range in the signaling may be larger than the guaranteed accuracy range.

**Table 10.1.46.1-1: Mapping of cjtc-Dd**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| CJTC_D_00 | 0 ≤ CJTC-Dd < $\frac{A_D}{M_D-1}$ | ns |
| CJTC_D _01 | $\frac{A_D}{M_D-1}$ ≤ CJTC-Dd < $\frac{2*A_D}{M_D-1}$ | ns |
| CJTC_D _02 | $\frac{2*A_D}{M_D-1}$ ≤ CJTC-Dd < $\frac{3*A_D}{M_D-1}$ | ns |
| … | … | … |
| CJTC_D _$M_D$-2 | $\frac{(M_D-2)*A_D}{M_D-1}$ ≤ CJTC-Dd < $A_D$ | ns |
| CJTC_D _$M_D$-1 | $A_D$ ≤ CJTC-Dd | ns |

## 10.1.46.2 CJT Calibration Frequency Offset Measurement Report Mapping

The reporting range of frequency offset is defined from 0 to $A_{FO}$, where $A_{FO} \in \{0.1ppm, 0.2ppm\}$. The number of levels is defined by $M_{FO}$, where $M_{FO} \in \{16, 32, 256\}$. The mapping of measured quantity is defined in tables 10.1.46.2-1. The range in the signaling may be larger than the guaranteed accuracy range.10.1.46

**Table 10.1.46.2-1: Mapping of cjtc-F**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| CJTC_F_00 | 0 ≤ CJTC-F < $\frac{A_{FO}}{M_{FO}-1}$ | Hz |
| CJTC_F _01 | $\frac{A_{FO}}{M_{FO}-1}$ ≤ CJTC-F < $\frac{2*A_{FO}}{M_{FO}-1}$ | Hz |
| CJTC_F _02 | $\frac{2*A_{FO}}{M_{FO}-1}$ ≤ CJTC-F < $\frac{3*A_{FO}}{M_{FO}-1}$ | Hz |
| … | … | … |
| CJTC_F _$M_{FO}$-2 | $\frac{(M_{FO}-2)*A_{FO}}{M_{FO}-1}$ ≤ CJTC-F < $A_{FO}$ | Hz |
| CJTC_F _$M_{FO}$-1 | 'Invalid' | N/A |

## 10.1.46.3 CJT Calibration Phase Offset Measurement Report Mapping

The reporting range of phase offset is defined from 0 to 2π. The number of levels is defined by $M_\Phi$, where $M_\Phi \in \{16, 32\}$. The mapping of measured quantity is defined in tables 10.1.46.3-1. The range in the signaling may be larger than the guaranteed accuracy range.

**Table 10.1.46.3-1: Mapping of cjtc-P**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| CJTC_P_00 | 0 ≤ CJTC-P < $\frac{2\pi}{M_\Phi-1}$ | rad |
| CJTC_P _01 | $\frac{2\pi}{M_\Phi-1}$ ≤ CJTC-P < $\frac{2*2\pi}{M_\Phi-1}$ | rad |
| CJTC_P _02 | $\frac{2*2\pi}{M_\Phi-1}$ ≤ CJTC-P < $\frac{3*2\pi}{M_\Phi-1}$ | rad |
| … | … | … |
| CJTC_P _ $M_\Phi$ -2 | $\frac{(M_\Phi-2)*2\pi}{M_\Phi-1}$ ≤ CJTC-P ≤ $2\pi$ | rad |
| CJTC_P _ $M_\Phi$ -1 | 'Invalid' | N/A |

# 10.1.47 L1 CLI measurement accuracy requirements

## 10.1.47.1 L1-SRS-RSRP

### 10.1.47.1.1 L1-SRS-RSRP Accuracy

The L1-SRS-RSRP measurement reported by the UE shall fulfil the accuracy requirements defined in table 10.1.47.1.1-1 for FR1 and table 10.1.47.1.1-2 for FR2-1, provided that the following conditions are met. The accuracy requirements in this clause are derived based on AWGN radio propagation conditions.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-SRS-RSRP measurements are fulfilled according to annex B.2.7 for a corresponding Band for each relevant SRS resource configured for measurement.
- The time difference between UE's DL reference timing in the serving cell and SRS arrival time is no larger than $T_{error_SRS_RSRP}$, where
  - $T_{error_SRS_RSRP} = T_C \times N_{TA_offset}$ + 4.67μs for 15 kHz SCS and 30 kHz SCS for FR1
  - $T_{error_SRS_RSRP} = T_C \times N_{TA_offset}$ + 1.67 μs for 60 kHz SCS for FR1.
  - $T_{error_SRS_RSRP} = T_C \times N_{TA_offset}$ + 0.67μs for FR2
  - $N_{TA_offset}$ is defined in table 7.1.2-2
  - $T_C$ is 0.509 ns
- The number of SRS ports in the SRS resource configured for measurement is 1,
- The number of symbols in the SRS resource configured for measurement is 1,
- The number of repetitions in the SRS resource configured for measurement is 1,
- Frequency hopping, sequence group hopping or sequence hopping is disabled in the SRS resource configured for measurement,
- The bandwidth of the SRS resource is 24 PRBs.
- One of the following conditions is met
  - There is no other SRS resource with the same root sequence and on the same symbol and with same comb as the relevant SRS resource.
  - If multiple SRS resources are on the same symbol and with same comb, the distance between cyclic shifts of any two resources is no less than 6 if transmissionComb = n4, and no less than 4 if transmissionComb = n2.

**Table 10.1.47.1.1-1: L1-SRS-RSRP absolute accuracy in FR1**

| Accuracy | | | | | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Normal condition | | | Extreme condition | | | SRS $\hat{E}s/Iot$ | Io [Note 1] range | | | | | |

| NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.<br>NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.<br>NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table. | | | | | | | | |

### 10.1.47.1.2 L1-SRS-RSRP report mapping

The reporting range of L1-SRS-RSRP is defined from -140 dBm to -44 dBm with 1 dB resolution. The mapping of measured quantity is defined in table 10.1.47.1.2-1. The range in the signalling may be larger than the guaranteed accuracy range.

The reporting range of differential SRS-RSRP for L1 reporting is defined from 0 dB to -30 dB with 2 dB resolution. The mapping of measured quantity is defined in table 10.1.47.1.2-2. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.47.1.2-1: L1-SRS-RSRP measurement report mapping**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| L1-SRS-RSRP_0 | L1-SRS-RSRP<-140 | dBm |
| L1-SRS-RSRP_1 | -140≤ L1-SRS-RSRP<-139 | dBm |
| L1-SRS-RSRP_2 | -139≤ L1-SRS-RSRP<-138 | dBm |
| L1-SRS-RSRP_3 | -138≤ L1-SRS-RSRP<-137 | dBm |
| L1-SRS-RSRP_4 | -137≤ L1-SRS-RSRP<-136 | dBm |
| .. | .. | … |
| L1-SRS-RSRP_95 | -46≤ L1-SRS-RSRP<-45 | dBm |
| L1-SRS-RSRP_96 | -45≤ L1-SRS-RSRP<-44 | dBm |
| L1-SRS-RSRP_97 | -44≤ L1-SRS-RSRP | dBm |
| L1-SRS-RSRP_98 | Infinity | |
| NOTE: 'Infinity' means that UE cannot detect SRS due to too strong signal to measure. | | |

**Table 10.1.47.1.2-2: Differential SRS-RSRP measurement (for L1 reporting) report mapping**

| Reported value | Measured quantity value (difference in measured RSRP from strongest RSRP) | Unit |
|---|---|---|
| DIFF_SRS-RSRP_0 | 0≥ Δ RSRP>-2 | dB |
| DIFF_SRS-RSRP_1 | -2≥ Δ RSRP>-4 | dB |
| DIFF_SRS-RSRP_2 | -4≥ Δ RSRP>-6 | dB |
| DIFF_SRS-RSRP_3 | -6≥ Δ RSRP>-8 | dB |
| DIFF_SRS-RSRP_4 | -8≥ Δ RSRP>-10 | dB |
| DIFF_SRS-RSRP_5 | -10≥ Δ RSRP>-12 | dB |

| | | |
|---|---|---|
| DIFF_SRS-RSRP_6 | -12≥ Δ RSRP>-14 | dB |
| DIFF_SRS-RSRP_7 | -14≥ Δ RSRP>-16 | dB |
| DIFF_SRS-RSRP_8 | -16≥ Δ RSRP>-18 | dB |
| DIFF_SRS-RSRP_9 | -18≥ Δ RSRP>-20 | dB |
| DIFF_SRS-RSRP_10 | -20≥ Δ RSRP>-22 | dB |
| DIFF_SRS-RSRP_11 | -22≥ Δ RSRP>-24 | dB |
| DIFF_SRS-RSRP_12 | -24≥ Δ RSRP>-26 | dB |
| DIFF_SRS-RSRP_13 | -26≥ Δ RSRP>-28 | dB |
| DIFF_SRS-RSRP_14 | -28≥ Δ RSRP>-30 | dB |
| DIFF_SRS-RSRP_15 | -30≥ Δ RSRP | dB |

## 10.1.47.2 L1-CLI-RSSI

### 10.1.47.2.1 L1-CLI-RSSI Accuracy

The L1-CLI-RSSI measurement reported by the UE shall fulfil the accuracy requirements defined in table 10.1.47.2.1-1 for FR1 and table 10.1.47.2.1-2 for FR2, provided that the following conditions are met.

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.

**Table 10.1.47.2.1-1: L1-CLI-RSSI absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | Io [Note 1] range | | | | | |
| | | NR operating band groups [Note 2] | Minimum Io | | | | Maximum Io |
| dB | dB | | dBm / $SCS_{SRS}$ | | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | | $SCS_{SRS}$ = 15 kHz | $SCS_{SRS}$ = 30 kHz | $SCS_{SRS}$ = 60 kHz | | |
| ±3.5 | ±6.5 | NR_TDD_FR1_A, | -120 | -117 | -114 | N/A | -70 |
| | | NR_TDD_FR1_C | -119 | -116 | -113 | N/A | -70 |
| | | NR_TDD_FR1_D | -118.5 | -115.5 | -112.5 | N/A | -70 |
| | | NR_TDD_FR1_E | -118 | -115 | -112 | N/A | -70 |
| ±5.5 | ±8.5 | Note 3 | Note 3 | Note 3 | Note 3 | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.

**Table 10.1.47.2.1-2: L1-CLI-RSSI absolute accuracy in FR2**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| Normal condition | Extreme condition | Io [Note 1] range | | | |
| | | Minimum Io | | | Maximum Io |
| dB | dB | dBm / $SCS_{SRS}$ [Note 2] | | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| | | $SCS_{SRS}$ = 60 kHz | $SCS_{SRS}$ = 120 kHz | | |
| ±5 | ±8 | Same value as SRS_RP in Table B.2.7-2, according to UE Power class, operating band and angle of arrival | | N/A | -70 |
| ±7 | ±10 | Note 4 | | -70 | -50 |

NOTE 1: Io specified at the Reference point, and assumed to have constant EPRE across the bandwidth.
NOTE 2: Values based on REFSENS and EIS spherical coverage as defined in clauses 7.3.2 and 7.3.4 of TS 38.101-2 [19]. Applicable side condition selected depending on angle of arrival.
NOTE 3: In the test cases, the SSB Ês/Iot and related parameters may need to be adjusted to ensure Ês/Iot at UE baseband is above the value defined in this table.
NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.

#### 10.1.47.2.2 L1-CLI-RSSI report mapping

The reporting range of L1-CLI-RSSI is defined from -100 dBm to -25 dBm with 1 dB resolution. The mapping of measured quantity is defined in table 10.1.47.2.2-1. The range in the signalling may be larger than the guaranteed accuracy range. UE shall scale the measured L1-CLI-RSSI to report a nominal RSSI equivalent to 6RB measurement with 15 kHz SCS.

The reporting range of differential L1-CLI-RSSI reporting is defined from 0 dB to -30 dB with 2 dB resolution. The mapping of measured quantity is defined in table 10.1.47.2.2-2. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.1.47.2.2-1: L1-CLI-RSSI measurement report mapping**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| L1-CLI-RSSI_00 | L1-CLI-RSSI < -100 | dBm |
| L1-CLI-RSSI_01 | -100 ≤ L1-CLI-RSSI < -99 | dBm |
| L1-CLI-RSSI_02 | -99 ≤ L1-CLI-RSSI < -98 | dBm |
| … | … | … |
| L1-CLI-RSSI_74 | -27 ≤ L1-CLI-RSSI < -26 | dBm |
| L1-CLI-RSSI_75 | -26 ≤ L1-CLI-RSSI < -25 | dBm |
| L1-CLI-RSSI_76 | -25 ≤ L1-CLI-RSSI | dBm |

**Table 10.1.47.2.2-2: Differential CLI-RSSI measurement (for L1 reporting) report mapping**

| Reported value | Measured quantity value (difference in measured RSSI from strongest RSSI) | Unit |
|---|---|---|
| DIFF_CLI-RSSI_0 | 0≥ Δ CLI-RSSI>-2 | dB |
| DIFF_CLI-RSSI_1 | -2≥ Δ CLI-RSSI>-4 | dB |

# 10.1A NR measurements for RedCap

## 10.1A.1 Introduction

The requirements in this clause are applicable for RedCap UE as follows:

- intra-frequency requirements apply for PCell measurements in SA,
- inter-frequency requirements apply for non-serving cell measurements on NR carrier frequencies.
- inter-frequency requirements apply for measurements from one cell on a frequency compared to the measurement from another cell on a different frequency.

The accuracy requirements in this clause are applicable for AWGN radio propagation conditions. The accuracy requirements of RSRP, RSRQ and SINR are applicable provided that reference SSB is not changed during measurement period.

# 10.1A.2 Intra-frequency RSRP accuracy requirements for FR1

## 10.1A.2.1 Intra-frequency SS-RSRP accuracy requirements

### 10.1A.2.1.1 Absolute SS-RSRP Accuracy

The accuracy requirements in clause 10.1.2.1.1 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1RX, the absolute accuracy requirements in table 10.1A.2.1.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3I of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.15 for a corresponding Band for each relevant SSB.

**Table 10.1A.2.1.1-1: SS-RSRP Intra-frequency absolute accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB Ês/Iot | Io [Note 1] range | | | | |
| | | | NR operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±5.5 | ±10 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -70 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -70 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -70 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -70 |
| | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | -116 | N/A | -70 |
| | | | NR_FDD_FR1_F | -118.5 | -115.5 | N/A | -70 |
| | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | -115 | N/A | -70 |
| | | | NR_FDD_FR1_H | -117.5 | -114.5 | N/A | -70 |
| | | | NR_FDD_FR1_N | -114.5 | -111.5 | N/A | -70 |
| ±9 | ±12 | ≥-6 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A, NR_FDD_FR1_B, NR_TDD_FR1_B, NR_FDD_FR1_C, NR_TDD_FR1_C, NR_FDD_FR1_D, NR_TDD_FR1_D, NR_FDD_FR1_E, NR_TDD_FR1_E, NR_FDD_FR1_F, NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G, NR_FDD_FR1_H, NR_FDD_FR1_N | N/A | N/A | -70 | -50 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR operating band groups in FR1 are as defined in clause 3.5.2.

### 10.1A.2.1.2 Relative SS-RSRP Accuracy

The accuracy requirements in clause 10.1.2.1.2 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1RX, the absolute accuracy requirements in table 10.1A.2.1.2-1 are valid under the following conditions:

- Conditions defined in clause 7.3I of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for intra-frequency measurements are fulfilled according to annex B.2.15 for a corresponding Band for each relevant SSB.

**Table 10.1A.2.1.2-1: SS-RSRP Intra-frequency relative accuracy for 1Rx RedCap UE in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | SSB $\hat{E}_s/I_{ot}$ Note 2 | Io Note 1 range | | | | |
| | | | NR operating band groups Note 4 | Minimum Io | | | Maximum Io |
| dB | dB | dB | | dBm / $SCS_{SSB}$ | | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| | | | | $SCS_{SSB}$ = 15 kHz | $SCS_{SSB}$ = 30 kHz | | |
| ±3 | ±4 | ≥-3 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -118 | N/A | -50 |
| | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | -117.5 | N/A | -50 |
| | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | -117 | N/A | -50 |
| | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | -116.5 | N/A | -50 |

## 10.1A.14.2 CSI-RS based L1-RSRP accuracy requirements

### 10.1A.14.2.1 Absolute Accuracy

The accuracy requirements in clause 10.1.19.2.2 shall apply when RedCap UE is capable of 2Rx. When UE is only required to support 1RX, the absolute accuracy requirements in table 10.1A.14.2.1-1 are valid under the following conditions:

- Conditions defined in clause 7.3I of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for L1-RSRP measurements are fulfilled according to annex B.2.4.2 for a corresponding Band for each relevant CSI-RS.
- The bandwidth of CSI-RS is 48 PRBs and the density is 3.

The performance with larger bandwidth of CSI-RS is equal to or better than the accuracy requirements in table 10.1A.19.2.1-1.

**Table 10.1A.14.2.1-1: CSI-RS based L1-RSRP absolute accuracy for 1Rx RedCap UE in FR1**

| **Accuracy** | | **Conditions** | | | | | | |

### 10.1A.15.2.2 Relative Accuracy

The accuracy requirements in clause 10.1.20.1.1 shall apply.

# 10.1A.16RSTD Measurements for RedCap Positioning

## 10.1A.16.1 Introduction

The requirements in clause 10.1A.16 shall apply, provided the UE has received *nr-DL-TDOA-RequestLocationInformation* message from LMF via LPP TS 37.355 [34] requesting the UE to report one or more DL RSTD measurements defined in TS 38.215 [4].

The requirements in clause 10.1A.16 shall apply,

- When the RedCap UE is in RRC_CONNECTED state and the RSTD measurement is performed with and without RX FH within measurement gap.
- When RedCap UE is in RRC_CONNECTED state and the RSTD measurement is performed without RX FH outside of the measurement gap.
- When RedCap UE is in RRC_CONNECTED state and the RSTD measurement is performed without RX FH when both PPW and measurement gap is configured.
- When RedCap UE is in RRC_INACTIVE state and the RSTD measurement is performed with and without RX FH.
- When RedCap UE is in RRC_IDLE state and the RSTD measurement is performed with and without RX FH.

The requirements defined in clause 10.1A.16 are valid under the conditions defined in clause 10.1.23.

## 10.1A.16.2 Measurement Accuracy Requirements

The accuracy requirements for RSTD measurement shall be within $\pm(X+Y+Z+\Delta)$ $T_c$. The values of Y, Z and $\Delta$ and Rx TEG based requirement are as defined in clause 10.1.23.2. For Rx FH, PRS BW in tables 10.1.23.2-5, 10.1.23.2-5a, 10.1.23.2-6, and 10.1.23.2-6a refer to per hop BW. The requirements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) and TDL-C (60 ns delay spread, 300 Hz) channel models for FR1 and FR2, respectively.

### 10.1A.16.2.1 Accuracy requirement for RSTD measurement without RX FH

For 4 sample RSTD measurement performed by 2Rx RedCap UE without RX FH, the values of X, corresponding to the PRS bandwidth supported by the RedCap UE for PRS measurement without RX FH, in tables 10.1.23.2-1 in FR1 for

AWGN, 10.1.23.2-2 in FR2 for AWGN, 10.1.23.2-3 in FR1 for fading channel, and 10.1.23.2-4 in FR2 for fading channel apply.

For reduced sample RSTD measurement performed by 2Rx RedCap UE without RX FH, the values of X, corresponding to the PRS bandwidth supported by the RedCap UE for PRS measurement without RX FH, in tables 10.1.23.2-7 in FR1 for AWGN, and 10.1.23.2-8 in FR2 for AWGN apply.

The value of X for 4 sample RSTD measurement performed by 1Rx RedCap UE without RX FH is defined in table 10.1A.16.2.1-1 in FR1 for AWGN, and in table 10.1A.16.2.1-2 in FR1 for fading channel.

The value of X for reduced sample RSTD measurement performed by 1Rx RedCap UE without RX FH is defined in table 10.1A.16.2.1-3 in FR1 for AWGN.

**Table 10.1A.16.2.1-1: RSTD absolute accuracy for 1Rx RedCap UE in FR1 for AWGN channel (without RX FH)**

NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.

### 10.1A.16.2.2 Accuracy requirement for RSTD measurement with RX FH

The value of X for 4 sample RSTD measurement performed by 2Rx RedCap UE with RX FH is defined in tables 10.1A.16.2.2-1 in FR1 for AWGN, 10.1A.16.2.2-2 in FR2 for AWGN, 10.1A.16.2.2-3 in FR1 for fading channel, and 10.1.23.2-4 in FR2 for fading channel, respectively.

The value of X for reduced sample RSTD measurement performed by 2Rx RedCap UE with RX FH is defined in tables 10.1A.16.2.2-5 in FR1 for AWGN, and 10.1A.16.2.2-6 in FR2 for AWGN, respectively.

The value of for 4 sample RSTD measurement performed by 1Rx RedCap UE with RX FH is defined in tables 10.1A.16.2.2-7 in FR1 for AWGN, and 10.1A.16.2.2-8 in FR1 for fading channel, respectively.

The value of for reduced sample RSTD measurement performed by 1Rx RedCap UE with RX FH is defined in table 10.1A.16.2.2-9 in FR1 for AWGN.

**Table 10.1A.16.2.2-1: RSTD absolute accuracy for 2Rx RedCap UE in FR1 for AWGN channel (with RX FH)**

### 10.1A.16.3 Report Mapping

#### 10.1A.16.3.1 Absolute DL RSTD Measurement Reporting

Measurement reporting range and report mapping tables defined in clause 10.1.23.3.1 apply to DL RSTD measurement reporting for both 1Rx and 2Rx RedCap UEs and DL RSTD measurement performed with and without RX FH.

#### 10.1A.16.3.2 Differential Reporting for DL RSTD Measurement

Measurement reporting range and report mapping tables defined in clause 10.1.23.3.2 apply to DL RSTD measurement reporting for both 1Rx and 2Rx RedCap UEs and DL RSTD measurement performed with and without RX FH.

#### 10.1A.16.3.3 Additional Path Report Mapping for DL RSTD

Measurement reporting range and report mapping tables defined in clause 10.1.23.3.3 apply to DL RSTD measurement reporting for both 1Rx and 2Rx RedCap UEs and DL RSTD measurement performed with and without RX FH.

## 10.1A.17PRS-RSRP Measurements for RedCap positioning

### 10.1A.17.1 Introduction

The requirements in clause 10.1A.17 shall apply, provided the UE has received *nr-DL-TDOA-RequestLocationInformation* or *nr-Multi-RTT-RequestLocationInformation* or *nr-DL-AoD-RequestLocationInformation* message from LMF via LPP TS 37.355 [34] requesting the UE to report one or more DL PRS-RSRP measurements defined in TS 38.215 [4].

The requirements in clause 10.1A.17 shall apply,

- When the RedCap UE is in RRC_CONNECTED state and the PRS-RSRP measurement is performed with and without RX FH within measurement gap.
- When RedCap UE is in RRC_CONNECTED state and the PRS-RSRP measurement is performed without RX FH outside of the measurement gap.
- When RedCap UE is in RRC_CONNECTED state and the PRS-RSRP measurement is performed without RX FH when both PPW and measurement gap is configured.
- When RedCap UE is in RRC_INACTIVE state and the PRS-RSRP measurement is performed with and without RX FH.
- When RedCap UE is in RRC_IDLE state and the PRS-RSRP measurement is performed with and without RX FH.

The requirements defined in clause 10.1A.17 are valid under the conditions defined in clause 10.1.24.1.

### 10.1A.17.2 Measurement Accuracy Requirements

#### 10.1A.17.2.1 Absolute PRS RSRP Accuracy Requirement

Accuracy requirement, corresponding to the PRS bandwidth supported by the RedCap UE for measurement without RX FH, defined in clause 10.1.24.2.1 apply to the PRS-RSRP measurement performed by 2Rx RedCap UE without RX FH.

Accuracy requirement in clause 10.1.24.2.1 apply to the PRS-RSRP measurement performed by 2Rx RedCap UE with RX FH, where the PRS bandwidth in clause 10.1.24.2.1 correspond to the PRS bandwidth measured by the RedCap UE per hop.

Accuracy requirement in table 10.1A.17.2.1-1 applies to the 4-sample PRS-RSRP measurement performed by 1Rx RedCap UE without RX FH.

Accuracy requirement in table 10.1A.17.2.1-2 applies to reduced sample PRS-RSRP measurement performed by 1Rx RedCap UE without RX FH

Accuracy requirement in table 10.1A.17.2.1-1 and table 10.1A.17.2.1-2 apply to the PRS-RSRP measurement performed by 1Rx RedCap UE with RX FH, where the PRS bandwidth in table 10.1A.17.2.1-1 and table 10.1A.17.2.1-2 correspond to the PRS bandwidth measured by the RedCap UE per hop.

**Table 10.1A.17.2.1-1: PRS-RSRP absolute accuracy for 1Rx RedCap UE in FR1 (without RX FH)**

| Accuracy | | Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Io Note 5 range | | | | |
| Normal condition | Extreme condition | PRS Ês/Iot | PRS BW Note 2 | Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) | NR operating band groups Note 6 | Minimum Io Note 1 dBm / $SCS_{PRS}$ | | | Maximum Io |
| | | | | | | dBm / $SCS_{PRS}$ | | | dBm/$BW_{Channel}$ |
| dB | dB | dB | PRB | | | dBm/15kHz Note 4 | dBm/30kHz Note 4 | dBm/60kHz Note 4 | |
| ±7 | ±11.5 | ≥-3dB | ≥24 | All | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -127 | -124 | -121 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -126.5 | -123.5 | -120.5 | -50 |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -126 | -123 | -120 | -50 |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -125.5 | -122.5 | -119.5 | -50 |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -125 | -122 | -119 | -50 |
| | | | | | NR_FDD_FR1_F | -124.5 | -121.5 | -118.5 | -50 |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -124 | -121 | -118 | -50 |
| | | | | | NR_FDD_FR1_H | -123.5 | -120.5 | -117.5 | -50 |
| | | | | | NR_FDD_FR1_N | -120.5 | -117.5 | -114.5 | -50 |
| ±7.5 | ±12 | ≥-10dB | 24 ≤ BW ≤ 52 | All | Note 3 | | | | |
| ±6 | ±10.5 | | 52< BW≤ 104 | All | Note 3 | | | | |
| ±5.5 | ±9.5 | | BW >104 | All | Note 3 | | | | |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *dl-PRS-ResourceBandwidth* in the DL-TDOA or DL-AoD or multi-RTT assistance data defined in TS 37.355 34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 4: The condition level is increased by Δ>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 5: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.

| Accuracy | | Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Io Note 5 range | | | | |
| Normal condition | Extreme condition | PRS Ês/Iot | PRS BW Note 2 | Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) | NR operating band groups Note 6 | Minimum Io Note 1 dBm / $SCS_{PRS}$ | | | Maximum Io |

### 10.1A.17.2.2 Relative PRS RSRP Accuracy Requirement

Relative accuracy requirement, corresponding to the PRS bandwidth supported by the RedCap UE for measurement without RX FH, defined in clause 10.1.24.2.2 apply to the PRS-RSRP measurement performed by 2Rx RedCap UE without RX FH.

Relative accuracy requirement in clause 10.1.24.2.2 apply to the PRS-RSRP measurement performed by 2Rx RedCap UE with RX FH, where the PRS bandwidth in clause 10.1.24.2.2 correspond to the PRS bandwidth measured by the RedCap UE per hop.

### 10.1A.17.3 Report Mapping

#### 10.1A.17.3.1 Absolute PRS-RSRP Measurement Report Mapping

Measurement reporting range and report mapping tables defined in clause 10.1.24.3.1 apply to PRS-RSRP measurement reporting for both 1Rx and 2Rx RedCap UEs and PRS-RSRP measurement performed with and without RX FH.

#### 10.1A.17.3.2 Differential Report Mapping for PRS-RSRP Measurement

Measurement reporting range and report mapping tables defined in clause 10.1.24.3.2 apply to PRS-RSRP measurement reporting for both 1Rx and 2Rx RedCap UEs and PRS-RSRP measurement performed with and without RX FH.

## 10.1A.18 UE Rx-Tx Time Difference Measurements for RedCap Positioning

### 10.1A.18.1 Introduction

The requirements in clause 10.1A.18 shall apply, provided the RedCap UE has received *nr-Multi-RTT-RequestLocationInformation* message from LMF via LPP TS 37.355 [34] requesting the UE to report one or more UE Rx-Tx time difference measurements defined in TS 38.215 [4]. The requirements in clause 10.1A.18 shall apply:

- When the RedCap UE is in RRC_CONNECTED state and the UE Rx-Tx time difference measurement is performed with and without RX FH within measurement gap.
- When RedCap UE is in RRC_CONNECTED state and the UE Rx-Tx time difference measurement is performed without RX FH outside of the measurement gap.
- When RedCap UE is in RRC_CONNECTED state and the UE Rx-Tx time difference measurement is performed without RX FH when both PPW and measurement gap is configured.
- When RedCap UE is in RRC_INACTIVE state and the UE Rx-Tx time difference measurement is performed with and without RX FH.

### 10.1A.18.2 Measurement Accuracy Requirements

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall not apply, if:

- $N_{TA_offset}$ defined in table 7.1A.2-2 changes during the UE Rx-Tx measurement period or
- if the uplink transmission timing changes during the UE Rx-Tx measurement period due to the network-configured Timing Advance.

The UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that:

- The UE transmits SRS within the range from -160 ms to 160 ms of at least one DL PRS resource of each of the TRPs in the assistance data.

If the uplink transmission timing changes during the UE Rx-Tx measurement period due to the autonomous timing adjustment defined in clause 7.1A.2 then:

- UE Rx-Tx measurement accuracy requirements shall apply for a cell, which is also the downlink reference cell (defined in clause 7.1A.1) for SRS transmission even if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.
- UE Rx-Tx measurement accuracy requirements shall not apply for a cell, which is not the downlink reference cell (defined in clause 7.1A.1) for SRS transmission, if the uplink transmission timing changes during the UE Rx-Tx measurement period due to autonomous adjustment.

When a serving cell change occurs during the UE Rx-Tx measurement period, the UE Rx-Tx time difference measurement accuracy requirements in this clause shall apply provided that the serving cell change does not impact SRS configuration for the UE Rx-Tx measurement.

The relative accuracy of UE Rx-Tx measurement in this clause is defined as accuracy of the difference between two UE Rx-Tx measurements.

### 10.1A.18.2.1 UE Rx-Tx Accuracy Requirement for 2RX RedCap UE without FH

For UE Rx-Tx time difference measurement performed by 2RX RedCap UE without RX FH, the accuracy requirements corresponding to the PRS bandwidth supported by the RedCap UE for PRS measurement without RX FH in clause 10.1.25.2 shall apply.

### 10.1A.18.2.2 UE Rx-Tx Accuracy Requirement for 1RX RedCap UE without FH

The accuracy requirements in table 10.1A.18.2.2-1 for FR1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.

**Table 10.1A.18.2.2-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth | PRS SCS | PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$ Note 3 | NR operating band groups Note 2 | Io Note 4 range | |
| | | | | | | Minimum Io Note 1 | Maximum Io |
| Tc Note 5 | dB | PRB | kHz | | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±(89+δ) | -3 | ≥24 | 15 | ≥4 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -127 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -126.5 | |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -126 | |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -125.5 | |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -125 | |
| | | | | | NR_FDD_FR1_F | -124.5 | |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -124 | |
| | | | | | NR_FDD_FR1_H | -123.5 | |
| | | | | | NR_FDD_FR1_N | -120.5 | |
| ±(51+δ) | | ≥52 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(25+δ) | | 104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(49+δ) | | ≥24 | 30 | ≥4 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -124 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -123.5 | |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -123 | |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -122.5 | |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -122 | |
| | | | | | NR_FDD_FR1_F | -121.5 | |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -121 | |
| | | | | | NR_FDD_FR1_H | -120.5 | |
| | | | | | NR_FDD_FR1_N | -117.5 | |

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth | PRS SCS | PRS resource repetition ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$ Note 3 | NR operating band groups Note 2 | Io Note 4 range | |
| | | | | | | Minimum Io Note 1 | Maximum Io |
| Tc Note 5 | dB | PRB | kHz | | | dBm / $SCS_{PRS}$ | dBm/BW |

| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | |
| | | | | | NR_FDD_FR1_H | -117.5 | |
| | | | | | NR_FDD_FR1_N | -114.5 | |
| ±(98+δ) | -13 | ≥24 | 15 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(61+δ) | | ≥52 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(32+δ) | | 104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(55+δ) | | ≥24 | 30 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(34+δ) | | 48 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(31+δ) | | 24 | 60 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{rep}^{PRS}$, $L_{PRS}$ , $K_{comb}^{PRS}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols* and *dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 7: δ is the margin determined from table 10.1A.18.2.2-3.

The accuracy requirements in table 10.1A.18.2.2-1a for FR1 for are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- Number of measurement samples is less than 4.
- AWGN propagation condition.

**Table 10.1A.18.2.2-1a: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN with reduced measurement samples**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth | PRS SCS | PRS resource repetition ($T_{rep}^{PRS} * L_{PRS}/K_{comb}^{PRS}$ Note 3 | NR operating band groups Note 2 | Io Note 4 range | |
| | | | | | | Minimum Io Note 1 | Maximum Io |
| Tc Note 5 | dB | PRB | kHz | | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±(65+δ) | 0 | ≥52 | 15 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(36+δ) | | 104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| ±(35+δ) | | 48 | 30 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(73+δ) | -6 | ≥52 | 15 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(40+δ) | | 104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(39+δ) | | 48 | 30 | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{\mathrm{rep}}^{\mathrm{PRS}}$, $L_{\mathrm{PRS}}$, $K_{\mathrm{comb}}^{\mathrm{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols,* and *dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS as defined in table 10.1A.18.2.2-1.
NOTE 7: δ is the margin determined from table 10.1A.18.2.2-3.

The relative accuracy requirements in table 10.1A.18.2.2-1b for FR1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $\mathrm{PRP}|_{\mathrm{dBm}}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.
- the two UE Rx-Tx time difference measurements are associated with the same RxTx TEG.

**Table 10.1A.18.2.2-1b: UE Rx-Tx time difference relative measurement accuracy in FR1 in AWGN with TEG reporting**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | | | | | Io Note 3 range | | |
| | PRS Ês/Iot | PRS SCS | PRS bandwidth Note 1 | PRS resource repetition ($T_{\mathrm{rep}}^{\mathrm{PRS}} * L_{\mathrm{PRS}} / K_{\mathrm{comb}}^{\mathrm{PRS}}$) Note 2 | NR operating band groups Note 4 | Minimum Io | Maximum Io |
| Tc Note 5 | dB | kHz | PRB | | | dBm/SCS | dBm/BW$_{\mathrm{Channel}}$ |
| 137 + Δ | (PRS Ês/Iot)$_j$ ≥ -6dB | 15 | ≥ 24 | ≥ 4 | Note 6 | Note 6 | Note 6 |
| 79 + Δ | | | ≥ 52 | ≥ 1 | Note 6 | Note 6 | Note 6 |
| 45 + Δ | | | 104 | ≥ 1 | Note 6 | Note 6 | Note 6 |
| 81 + Δ | (PRS Ês/Iot)$_j$ ≥ -13dB | 30 | ≥ 24 | ≥ 4 | Note 6 | Note 6 | Note 6 |
| 46 + Δ | | | 48 | ≥ 1 | Note 6 | Note 6 | Note 6 |
| 52 + Δ | | 60 | 24 | ≥ 4 | Note 6 | Note 6 | Note 6 |

NOTE 1: Minimum PRS bandwidth, which is minimum of the PRS bandwidths of resource j and resource i.
NOTE 2: Minimum number of PRS resource repetitions among resource j and resource i. $T_{\mathrm{rep}}^{\mathrm{PRS}}$, $L_{\mathrm{PRS}}$, $K_{\mathrm{comb}}^{\mathrm{PRS}}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols,* and *dl-PRS-CombSizeN* defined in TS 37.355 [34], respectively.
NOTE 3: Io is assumed to have constant EPRE across the bandwidth.
NOTE 4: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS as defined in table 10.1A.18.2.2-1.
NOTE 7: Δ is the value of the timing error margin for the RxTx TEG, reported via *nr-UE-RxTxTEG-TimingErrorMargin*. Δ cannot be larger than the sum of the margins in table 10.1A.18.2.2-3 (dependent on PRS/SRS BW) for any pair of individual UE Rx-Tx time difference measurements associated with the RxTx TEG.

The accuracy requirements in table 10.1A.18.2.2-2 for FR1 for are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $\mathrm{PRP}|_{\mathrm{dBm}}$ according to annex B.2.14 for a corresponding Band.

- Fading propagation condition.

**Table 10.1A.18.2.2-2: UE Rx-Tx time difference measurement accuracy in FR1 in fading**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth | PRS SCS | PRS resource repetition ($T_{rep}^{PRS} * L_{PRS}/K_{comb}^{PRS}$ Note 3 | NR operating band groups Note 2 | Io Note 4 range | |
| | | | | | | Minimum Io Note 1 | Maximum Io |
| Tc Note 5 | dB | PRB | kHz | | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±(202+δ) | -3 | ≥24 | 15 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(158+δ) | | ≥52 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(114+δ) | | 104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(153+δ) | | ≥24 | 30 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(120+δ) | | 48 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(72+δ) | | 24 | 60 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(179+δ) | -10 | ≥24 | 15 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(169+δ) | | ≥52 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(126+δ) | | 104 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(152+δ) | | ≥24 | 30 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(133+δ) | | 48 | | ≥1 | NOTE 6 | NOTE 6 | NOTE 6 |
| ±(72+δ) | | 24 | 60 | ≥4 | NOTE 6 | NOTE 6 | NOTE 6 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: $T_{rep}^{PRS}$, $L_{PRS}$ , $K_{comb}^{PRS}$ are configured by higher layer parameter *dl-PRS-ResourceRepetitionFactor, dl-PRS-NumSymbols*, and *dl-PRS-CombSizeN* defined in TS 37.355 [34].
NOTE 4: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 5: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 6: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS as defined in table 10.1A.18.2.2-1.
NOTE 7: δ is the margin determined from table 10.1A.18.2.2-3.

**Table 10.1A.18.2.2-3: Margin for UE Rx-Tx time difference measurement accuracy in FR1**

| Min(PRS BW, SRS BW) (PRB) | | | Margin (Tc Note 1) |
|---|---|---|---|
| SCS = 15 kHz | SCS = 30 kHz | SCS = 60 kHz | |
| ≥ 24 | N/A | N/A | 160 |
| ≥ 52 | ≥ 24 | N/A | 80 |
| 104 | 48 | 24 | 56 |

NOTE 1: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 2: If SRS and PRS have different SCS, the margin corresponding to the smallest RS BW in MHz applies.

### 10.1A.18.2.3 UE Rx-Tx Accuracy Requirement for 2RX RedCap UE with FH

The accuracy requirements in table 10.1A.18.2.3-1 for FR1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.
- The $BW_{total}$ as defined in clause 9.9A.4.8 for RRC_CONNECTED and in clause 5.6A.6.6 for RRC_INACTIVE is no less than the “Total PRS bandwidth after FH”.

**Table 10.1A.18.2.3-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | NR operating band groups[Note 2] | Io[Note 3] range | |
| | | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 4] | dB | PRB | kHz | PRB | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±(23+δ) | -3 | ≥52 | 15 | 268 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -127 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -126.5 | |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -126 | |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -125.5 | |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -125 | |
| | | | | | NR_FDD_FR1_F | -124.5 | |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -124 | |
| | | | | | NR_FDD_FR1_H | -123.5 | |
| | | | | | NR_FDD_FR1_N | -120.5 | |
| ±(17+δ) | | 48 | 30 | 272 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -124 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -123.5 | |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -123 | |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -122.5 | |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -122 | |
| | | | | | NR_FDD_FR1_F | -121.5 | |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -121 | |
| | | | | | NR_FDD_FR1_H | -120.5 | |
| | | | | | NR_FDD_FR1_N | -117.5 | |
| ±(21+δ) | | 24 | 60 | 132 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | |
| | | | | | NR_FDD_FR1_F | -118.5 | |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | |
| | | | | | NR_FDD_FR1_H | -117.5 | |
| | | | | | NR_FDD_FR1_N | -114.5 | |
| ±(54+δ) | -13 | ≥52 | 15 | 268 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(38+δ) | | 48 | 30 | 272 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(40+δ) | | 24 | 60 | 132 | NOTE 5 | NOTE 5 | NOTE 5 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | NR operating band groups[Note 2] | Io[Note 3] range | |
| | | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 4] | dB | PRB | kHz | PRB | | dBm / $SCS_{PRS}$ | dBm/BW |
| NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot. | | | | | | | |
| NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6]. | | | | | | | |
| NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS. | | | | | | | |
| NOTE 6: δ is the margin determined from table 10.1A.18.2.3-5. | | | | | | | |

The accuracy requirements in table 10.1A.18.2.3-1a for FR1 for are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- Number of measurement samples is less than 4.
- AWGN propagation condition.
- The $BW_{total}$ as defined in clause 9.9A.4.8 for RRC_CONNECTED and in clause 5.6A.6.6 for RRC_INACTIVE is no less than the “Total PRS bandwidth after FH”.

**Table 10.1A.18.2.3-1a: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN with reduced measurement samples**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | NR operating band groups[Note 2] | Io[Note 3] range | |
| | | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 4] | dB | PRB | kHz | PRB | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±(17+δ) | 0 | ≥52 | 15 | 268 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(11+δ) | | 48 | 30 | 272 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(18+δ) | | 24 | 60 | 132 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(32+δ) | -6 | ≥52 | 15 | 268 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(20+δ) | | 48 | 30 | 272 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(31+δ) | | 24 | 60 | 132 | NOTE 5 | NOTE 5 | NOTE 5 |
| NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol. | | | | | | | |
| NOTE 2: NR operating band groups are as defined in Section 3.5. | | | | | | | |
| NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot. | | | | | | | |
| NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6]. | | | | | | | |
| NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS as defined in table 10.1A.18.2.3-1. | | | | | | | |
| NOTE 6: δ is the margin determined from table 10.1A.18.2.3-5. | | | | | | | |

The accuracy requirements in table 10.1A.18.2.3-2 for FR1 for are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- Fading propagation condition.
- The $BW_{total}$ as defined in clause 9.9A.4.8 for RRC_CONNECTED and in clause 5.6A.6.6 for RRC_INACTIVE is no less than the “Total PRS bandwidth after FH”.

**Table 10.1A.18.2.3-2: UE Rx-Tx time difference measurement accuracy in FR1 in fading**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | NR operating band groups[Note 2] | Io[Note 3] range | |
| | | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 4] | dB | PRB | kHz | PRB | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±(94+δ) | -3 | ≥52 | 15 | 268 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(52+δ) | | 48 | 30 | 272 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(52+δ) | | 24 | 60 | 132 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(99+δ) | -13 | ≥52 | 15 | 268 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(53+δ) | | 48 | 30 | 272 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(63+δ) | | 24 | 60 | 132 | NOTE 5 | NOTE 5 | NOTE 5 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS as defined in table 10.1A.18.2.3-1.
NOTE 6: δ is the margin determined from table 10.1A.18.2.3-5.

The accuracy requirements in table 10.1A.18.2.3-3 for FR2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.
- The $BW_{total}$ as defined in clause 9.9A.4.8 for RRC_CONNECTED and in clause 5.6A.6.6 for RRC_INACTIVE is no less than the "Total PRS bandwidth after FH".

**Table 10.1A.18.2.3-3: UE Rx-Tx time difference measurement accuracy in FR2 in AWGN**

| Accuracy | Conditions | | | | | |
|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | Io[Note 4] range | |
| | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 5] | dB | PRB | kHz | PRB | dBm / $SCS_{PRS}$ | $dBm/BW_{Channel}$ |
| ±(11+δ) | -3 | ≥64 | 60 | 264 | Same value as PRP in table B.2.14-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±(7+δ) | | 64 | 120 | 264 | Same value as PRP in table B.2.14-2, according to UE Power class, operating band and angle of arrival | -50 |
| ±(33+δ) | -13 | ≥64 | 60 | 264 | NOTE 5 | NOTE 5 |
| ±(27+δ) | | 64 | 120 | 264 | NOTE 5 | NOTE 5 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: δ is the margin determined from table 10.1A.18.2.3-6.

The accuracy requirements in table 10.1A.18.2.3.3-3a for FR2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.

- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- Number of measurement samples is less than 4.
- AWGN propagation condition.
- The $BW_{total}$ as defined in clause 9.9A.4.8 for RRC_CONNECTED and in clause 5.6A.6.6 for RRC_INACTIVE is no less than the "Total PRS bandwidth after FH".

**Table 10.1A.18.2.3-3a: UE Rx-Tx time difference measurement accuracy in FR2 in AWGN with reduced measurement samples**

| Accuracy | Conditions | | | | | |
|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | Io[Note 4] range | |
| | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 5] | dB | PRB | kHz | PRB | dBm / $SCS_{PRS}$ | dBm/$BW_{Channel}$ |
| ±(11+δ) | 0 | ≥64 | 60 | 264 | NOTE 5 | NOTE 5 |
| ±(5+δ) | | 64 | 120 | 264 | NOTE 5 | NOTE 5 |
| ±(17+δ) | -6 | ≥64 | 60 | 264 | NOTE 5 | NOTE 5 |
| ±(14+δ) | | 64 | 120 | 264 | NOTE 5 | NOTE 5 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS as defined in table 10.1A.18.2.3-3.
NOTE 6: δ is the margin determined from table 10.1A.18.2.3-6.

The accuracy requirements in table 10.1A.18.2.3-4 for FR2 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-2 [19] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- Fading propagation condition.
- The $BW_{total}$ as defined in clause 9.9A.4.8 for RRC_CONNECTED and in clause 5.6A.6.6 for RRC_INACTIVE is no less than the "Total PRS bandwidth after FH".

**Table 10.1A.18.2.3-4: UE Rx-Tx time difference measurement accuracy in FR2 in fading**

| Accuracy | Conditions | | | | | |
|---|---|---|---|---|---|---|
| | PRS Ês/Iot | Minimum PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | Io[Note 4] range | |
| | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 5] | dB | PRB | kHz | | dBm / $SCS_{PRS}$ | dBm/$BW_{Channel}$ |
| ±(27+δ) | -3 | ≥64 | 60 | 264 | NOTE 5 | NOTE 5 |
| ±(17+δ) | | 64 | 120 | 264 | NOTE 5 | NOTE 5 |

### 10.1A.18.2.4 UE Rx-Tx Accuracy Requirement for 1RX RedCap UE with FH

The accuracy requirements in table 10.1A.18.2.4-1 for FR1 are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- AWGN propagation condition.

**Table 10.1A.18.2.4-1: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | NR operating band groups[Note 2] | Io[Note 3] range | |
| | | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 4] | dB | PRB | kHz | PRB | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±(23+δ) | -3 | ≥52 | 15 | 268 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -127 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -126.5 | |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -126 | |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -125.5 | |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -125 | |
| | | | | | NR_FDD_FR1_F | -124.5 | |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -124 | |
| | | | | | NR_FDD_FR1_H | -123.5 | |

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | NR operating band groups[Note 2] | Io[Note 3] range | |
| | | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 4] | dB | PRB | kHz | PRB | | dBm / $SCS_{PRS}$ | dBm/BW |
| | | | | | NR_FDD_FR1_N | -120.5 | |
| ±(14+δ) | | 48 | 30 | 272 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -124 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -123.5 | |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -123 | |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -122.5 | |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -122 | |
| | | | | | NR_FDD_FR1_F | -121.5 | |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -121 | |
| | | | | | NR_FDD_FR1_H | -120.5 | |
| | | | | | NR_FDD_FR1_N | -117.5 | |
| ±(22+δ) | | 24 | 60 | 132 | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -121 | -50 |
| | | | | | NR_FDD_FR1_B, NR_TDD_FR1_B | -120.5 | |
| | | | | | NR_FDD_FR1_C, NR_TDD_FR1_C | -120 | |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -119.5 | |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -119 | |
| | | | | | NR_FDD_FR1_F | -118.5 | |
| | | | | | NR_FDD_FR1_G, NR_TDD_FR1_G, NR_SDL_FR1_G | -118 | |
| | | | | | NR_FDD_FR1_H | -117.5 | |
| | | | | | NR_FDD_FR1_N | -114.5 | |
| ±(60+δ) | -13 | ≥52 | 15 | 268 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(42+δ) | | 48 | 30 | 272 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(45+δ) | | 24 | 60 | 132 | NOTE 5 | NOTE 5 | NOTE 5 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS.
NOTE 6: δ is the margin determined from table 10.1A.18.2.3-5.

The accuracy requirements in table 10.1A.18.2.4-1a for FR1 for are valid under the following conditions:

- Conditions defined in clause 7.3 of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- $PRP|_{dBm}$ according to annex B.2.14 for a corresponding Band.
- Number of measurement samples is less than 4.
- AWGN propagation condition.

**Table 10.1A.18.2.4-1a: UE Rx-Tx time difference measurement accuracy in FR1 in AWGN with reduced measurement samples**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | PRS Ês/Iot | PRS bandwidth per hop | PRS SCS | Total PRS bandwidth after FH | NR operating band groups[Note 2] | Io[Note 3] range | |
| | | | | | | Minimum Io[Note 1] | Maximum Io |
| Tc[Note 4] | dB | PRB | kHz | PRB | | dBm / $SCS_{PRS}$ | dBm/BW |
| ±(16+δ) | 0 | ≥52 | 15 | 268 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(9+δ) | | 48 | 30 | 272 | NOTE 5 | NOTE 5 | NOTE 5 |
| ±(10+δ) | | 24 | 60 | 132 | NOTE 5 | NOTE 5 | NOTE 5 |

| ±(55+δ) | | 24 | 60 | 132 | NOTE 5 | NOTE 5 | NOTE 5 |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: NR operating band groups are as defined in Section 3.5.
NOTE 3: The Io is defined in PRS slots. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same slot.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth of the smallest PRB number for the corresponding SCS as defined in table 10.1A.18.2.4-1.
NOTE 6: δ is the margin determined from table 10.1A.18.2.3-5.

## 10.1A.18.3 Report mapping

### 10.1A.18.3.1 Absolute UE Rx-Tx Measurement Report Mapping

The report mapping as defined in clause 10.1.25.3.1 shall apply.

#### 10.1A.18.3.2 Differential UE Rx-Tx Measurement Report Mapping

The report mapping as defined in clause 10.1.25.3.2 shall apply.

#### 10.1A.18.3.3 Additional Path Report Mapping for UE Rx-Tx Time Difference

The report mapping as defined in clause 10.1.25.3.3 shall apply.

## 10.1A.19PRS-RSRPP Measurements for RedCap Positioning

### 10.1A.19.1 Introduction

The requirements in clause 10.1A.19.2 shall apply, provided the RedCap UE has received *nr-DL-AoD-RequestLocationInformation* message from LMF via LPP 37.355 [34] requesting the RedCap UE to report one or more DL PRS-RSRPP measurements defined in TS 38.215 [4]. The requirements in clause 10.1A.19 shall apply:

- when RedCap UE is in RRC_CONNECTED state,
- when RedCap UE is in RRC_INACTIVE state,
- when RedCap UE is in RRC_IDLE state.

The requirements in clause 10.1A.19.2 apply for the first path PRS-RSRP measurement.

### 10.1A.19.2 Measurement Accuracy Requirements

#### 10.1A.19.2.1 Absolute PRS RSRPP accuracy

The absolute accuracy requirements for PRS-RSRPP measurements for 1Rx RedCap UE for FR1 defined in table 10.1A.19.2.1-1 and table 10.1A.19.2.1-2 are valid under the following conditions:

- Conditions defined in TS 38.101-1 [18] clause 7.3 for reference sensitivity are fulfilled.
- PRP $1,2|_{\text{dBm}}$ according to annex B.2.14 for a corresponding Band.

The absolute accuracy requirements for PRS-RSRPP measurements defined in clause 10.1.38.2.1 are reused for 2Rx RedCap UE.

The absolute accuracy requirements for PRS-RSRPP measurement defined in table 10.1A.19.2.1-1 apply for the RedCap UE not supporting *supportedDL-PRS-ProcessingSamples* TS 37.355 [34] or LMF does not indicate RedCap UE to perform positioning measurements with reduced number of samples.

The absolute accuracy requirements for PRS-RSRPP measurement defined in table 10.1A.19.2.1-2 apply for the RedCap UE supporting *supportedDL-PRS-ProcessingSamples* TS 37.355 [34].

The absolute accuracy requirements for PRS-RSRPP measurement defined in this clause apply to the measurements with and without frequency hopping. For the measurements with frequency hopping, the accuracy requirements apply for the corresponding PRS bandwidth per hop.

NOTE 1: The requriements in this clause are derived based on two-tap channel defined in TS 38.101-4 [21] annex B.2.4 (a = 1, $\tau_d$=0.45 μs and $f_D$=5 Hz).

NOTE 2: The requirements in this clause are derived based on the difference between the estimated PRS-RSRPP compared to the ideal PRS-RSRPP defined as

$$\text{RSRPP}_p \propto \left| \sum_k H_k \exp\left( j 2\pi D_p \frac{k}{N_{\text{IFFT}}} \right) \right|^2$$

Where:

$H_k$ is the effective channel frequency response (over REs occupied by PRS) measured without receiver noise.

$D_p$ is the exact delay of the p-th path in the channel model.

**Table 10.1A.19.2.1-1: PRS-RSRPP absolute accuracy for 1Rx RedCap UE for FR1**

| Accuracy | | Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | Io Note 6 range | | | | |
| Normal condition | Extreme condition | PRS Ês/Iot | PRS BW | Repetition factor ($T_{rep}^{PRS} * L_{PRS} / K_{comb}^{PRS}$) | NR operating band groups Note 7 | Minimum Io Note 1 dBm / $SCS_{PRS}$ | | | Maximum Io |
| | | | | | | dBm / $SCS_{PRS}$ | | | dBm/$BW_{Channel}$ |
| dB | dB | dB | PRB | - | | dBm/15kHz Note 5 | dBm/30kHz Note 5 | dBm/60kHz Note 5 | |
| ±3.5 | ±8 | ≥-3 | ≥24 | All | NR_FDD_FR1_A, NR_TDD_FR1_A, NR_SDL_FR1_A | -127 | -124 | -121 | -50 |
| | | | | | NR_FDD_FR1_B | -126.5 | -123.5 | -120.5 | -50 |
| | | | | | NR_TDD_FR1_C | -126 | -123 | -120 | -50 |
| | | | | | NR_FDD_FR1_D, NR_TDD_FR1_D | -125.5 | -122.5 | -119.5 | -50 |
| | | | | | NR_FDD_FR1_E, NR_TDD_FR1_E | -125 | -122 | -119 | -50 |
| | | | | | NR_FDD_FR1_F | -124.5 | -121.5 | -118.5 | -50 |
| | | | | | NR_FDD_FR1_G | -124 | -121 | -118 | -50 |
| | | | | | NR_FDD_FR1_H | -123.5 | -120.5 | -117.5 | -50 |
| | | | | | NR_FDD_FR1_N | -120.5 | -117.5 | -114.5 | -50 |
| | | | | | Note 3 | | | | |
| | | | | | Note 3 | | | | |
| ±4.5 | ±9 | ≥-10 | 24 ≤ BW ≤ 52 | All | Note 3 | | | | |
| ±4 | ±8.5 | | BW > 52 | All | Note 3 | | | | |

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *prs-Bandwidth* in the DL-TDOA or DL-AoD assistance data defined in TS 37.355 [34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 24 PRB.
NOTE 4: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 5: The condition level is increased by $\Delta$>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 7: NR operating band groups are as defined in Section 3.5.2.

**Table 10.1A.19.2.1-2: PRS-RSRPP absolute accuracy for 1Rx RedCap UE for FR1 for reduced number of samples**

| Accuracy | | Conditions | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|

NOTE 1: This minimum Io condition is expressed as the average Io per RE over all REs in an OFDM symbol.
NOTE 2: PRS bandwidth is as indicated in *prs-Bandwidth* in the DL-TDOA or DL-AoD assistance data defined in TS 37.355 [34].
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the PRS bandwidth ≥ 48 PRB.
NOTE 4: The serving cell, the reference cell, and the measured neighbour cell i are on the same carrier frequency.
NOTE 5: The condition level is increased by $\Delta$>0, when applicable, as described in Sections B.3.2 and B.3.3.
NOTE 6: The Io is defined in PRS positioning subframes. The same Io range applies to PRS and non-PRS symbols. Io levels are different in PRS and non-PRS symbols within the same subframe.
NOTE 7: NR operating band groups are as defined in Section 3.5.2.

## 10.1A.19.3 Report mapping

### 10.1A.19.3.1 Absolute PRS-RSRPP Measurement Report Mapping

The absolute PRS-RSRPP measurement report mapping defined in clause 10.1.38.3.1 applies.

#### 10.1A.19.3.2 Differential Report Mapping for PRS-RSRPP Measurement

The differential report mapping for PRS-RSRPP measurement defined in clause 10.1.38.3.2 applies.

# 10.2 E-UTRAN measurements

## 10.2.1 Introduction

Accuracy requirements for measurements on E-UTRAN carrier frequencies are specified in clause 10.2 and apply for UE in SA or NR-DC or NE-DC operation mode, unless otherwise specified.

Unless otherwise specified, the requirements in clause 10.2 are applicable for a UE:

- in RRC_CONNECTED state
- performing measurements with appropriate measurement gaps according to clause 9.1.2.
- that is synchronised to the cell that is measured.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in TS 36.300 [24].

The accuracy requirements of E-UTRA measurements in this clause are valid for the reported measurement result after layer 1 filtering. The accuracy requirements are verified from the measurement report at point D in the measurement model having the layer 3 filtering disabled.

If the UE needs measurement gaps to perform the inter-RAT NR ─ E-UTRAN FDD and NR ─ E-UTRAN TDD measurements, the relevant measurement procedure and measurement gap patterns stated in clause 9.1.2 shall apply.

## 10.2.2 E-UTRAN RSRP measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RSRP in RRC_CONNECTED state is specified in clauses 9.4.2 and 9.4.3.

The accuracy requirements of E-UTRA RSRP measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRP Accuracy Requirements in clause 9.1.3 of TS 36.133 [15].

The reporting range and mapping specified for RSRP measurements in clause 9.1.4 of TS 36.133 [15] shall apply.

## 10.2.3 E-UTRAN RSRQ measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RSRQ in RRC_CONNECTED state is specified in clauses 9.4.2 and 9.4.3.

The accuracy requirements of E-UTRA RSRQ measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRQ Accuracy Requirements in clause 9.1.6 of TS 36.133 [15].

The requirements for E-UTRA RSRQ measurements accuracy in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRQ Accuracy Requirements in clause 9.1.6 of TS 36.133 [15].

The reporting range and mapping specified for RSRQ measurements in clause 9.1.7 of TS 36.133 [15] shall apply.

## 10.2.4 E-UTRAN RSTD measurements

The requirements in this clause are valid for UE supporting this capability.

The measurement period is specified in clauses 9.4.4.1 and 9.4.4.2 for inter-RAT NR ─ E-UTRAN FDD and inter-RAT NR ─ E-UTRAN TDD RSTD measurements, respectively.

The accuracy requirements and the corresponding side conditions shall be the same as the inter-frequency measurement accuracy requirements for RSTD measurements in RRC_CONNECTED in clauses 9.1.10.2 of TS 36.133 [15].

If the UE needs measurement gaps to perform the inter-RAT NR ─ E-UTRAN FDD and NR ─ E-UTRAN TDD RSTD measurements, the relevant measurement procedure and measurement gap patterns stated in clause 9.1.2 shall apply.

The reporting range and mapping for the inter-RAT NR ─ E-UTRAN FDD and NR ─ E-UTRAN TDD RSTD measurements is the same as specified for RSTD measurements in TS 36.133 [15, clauses 9.1.10.3 and 9.1.10.4].

## 10.2.5 E-UTRAN RS-SINR measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RS-SINR in RRC_CONNECTED state is specified in clauses 9.4.2 and 9.4.3.

The accuracy requirements of E-UTRA RS-SINR measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RS-SINR Accuracy Requirements in clause 9.1.17.3 of TS 36.133 [15].

The reporting range and mapping for E-UTRA RS-SINR measurements shall be the same as specified for RS-SINR measurements in clause 9.1.17.1 of TS 36.133 [15].

## 10.2.6 E-UTRAN RSRP measurements for CA/DC Idle Mode Measurements

NOTE: This measurement is for CA/DC Idle Mode measurements between NR and E-UTRAN.

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute E-UTRA RSRP accuracy.

The measurement period of E-UTRA RSRP in RRC_IDLE and RRC_INACTIVE states are specified in clause 4.4.2.

The accuracy requirements of E-UTRA RSRP measurements in RRC_IDLE and RRC_INACTIVE states and the corresponding side conditions shall be as the inter-frequency RSRP Accuracy Requirements in clause 9.1.3B.2 of TS 36.133 [15].

The reporting range and mapping specified for RSRP measurements in clause 9.1.4 of TS 36.133 [15] shall apply.

## 10.2.7 E-UTRAN RSRQ measurements for CA/DC Idle Mode Measurements

NOTE: This measurement is for CA/DC Idle Mode measurements between NR and E-UTRAN.

The requirements in this clause are applicable for a UE:

- in state RRC_IDLE or RRC_INACTIVE
- that is synchronised to the cell that is measured.

The requirements are for absolute E-UTRA RSRQ accuracy.

The measurement period of E-UTRA RSRQ in RRC_IDLE and RRC_INACTIVE states are specified in clause 4.4.2.

The accuracy requirements of E-UTRA RSRQ measurements in RRC_IDLE and RRC_INACTIVE states and the corresponding side conditions shall be as the inter-frequency RSRQ Accuracy Requirements in clause 9.1.6B.2 of TS 36.133 [15].

The reporting range and mapping specified for RSRQ measurements in clause 9.1.7 of TS 36.133 [15] shall apply.

# 10.2A E-UTRAN measurements for RedCap

## 10.2A.1 Introduction

Accuracy requirements for measurements on E-UTRAN carrier frequencies are specified in clause 10.2A and apply for RedCap UE in SA operation mode, unless otherwise specified.

Unless otherwise specified, the requirements in clause 10.2A are applicable for a UE:

- in RRC_CONNECTED state
- performing measurements with appropriate measurement gaps according to clause 9.1A.2.
- that is synchronised to the cell that is measured.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in TS 36.300 [24].

The accuracy requirements of E-UTRA measurements in this clause are valid for the reported measurement result after layer 1 filtering. The accuracy requirements are verified from the measurement report at point D in the measurement model having the layer 3 filtering disabled.

If the UE needs measurement gaps to perform the inter-RAT NR ─ E-UTRAN FDD and NR ─ E-UTRAN TDD measurements, the relevant measurement procedure and measurement gap patterns stated in clause 9.1A.2 shall apply.

## 10.2A.2 E-UTRAN RSRP measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RSRP in RRC_CONNECTED state is specified in clauses 9.4A.2 and 9.4A.3.

For 2Rx RedCap,

- The accuracy requirements of E-UTRA RSRP measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRP accuracy requirements for UE other than Cat.1bis in clause 9.1.3 of TS 36.133 [15].

For 1Rx RedCap,

- The accuracy requirements of E-UTRA RSRP measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRP accuracy requirements for UE Cat.1bis in clause 9.1.3 of TS 36.133 [15].

The reporting range and mapping specified for RSRP measurements in clause 9.1.4 of TS 36.133 [15] shall apply.

## 10.2A.3 E-UTRAN RSRQ measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RSRQ in RRC_CONNECTED state is specified in clauses 9.4A.2 and 9.4A.3.

For 2Rx RedCap,

- The accuracy requirements of E-UTRA RSRQ measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRQ accuracy requirements for UE other than Cat.1bis in clause 9.1.6 of TS 36.133 [15].

For 1Rx RedCap,

- The accuracy requirements of E-UTRA RSRQ measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRQ accuracy requirements for UE Cat.1bis in clause 9.1.6 of TS 36.133 [15].

The requirements for accuracy of E-UTRA RSRQ measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RSRQ Accuracy Requirements in clause 9.1.6 of TS 36.133 [15].

The reporting range and mapping specified for RSRQ measurements in clause 9.1.7 of TS 36.133 [15] shall apply.

### 10.2A.4 E-UTRAN RS-SINR measurements

NOTE: This measurement is for handover between NR and E-UTRAN.

The measurement period of E-UTRA RS-SINR in RRC_CONNECTED state is specified in clauses 9.4A.2 and 9.4A.3.

For 2Rx RedCap,

- The accuracy requirements of E-UTRA RS-SINR measurements in RRC_CONNECTED state and the corresponding side conditions shall be the same as the inter-frequency RS-SINR accuracy requirements in clause 9.1.17.3 of TS 36.133 [15].

The reporting range and mapping for E-UTRA RS-SINR measurements shall be the same as specified for RS-SINR measurements in clause 9.1.17.1 of TS 36.133 [15].

## 10.3 UTRAN FDD Measurements

The requirements in this clause are applicable for a UE:

- in state RRC_CONNECTED
- performing measurements according to clause 9.4.6 with appropriate measurement gaps
- that is synchronised to the cell that is measured.

The reported measurement result after layer 1 filtering shall be an estimate of the average value of the measured quantity over the measurement period. The reference point for the measurement result after layer 1 filtering is referred to as point B in the measurement model described in TS 25.302 [30].

The accuracy requirements in this clause are valid for the reported measurement result after layer 1 filtering. The accuracy requirements are verified from the measurement report at point D in the measurement model having the layer 3 filtering disabled.

### 10.3.1 UTRAN FDD CPICH RSCP

NOTE: This measurement is for handover between E-UTRAN and UTRAN FDD.

The requirements in this clause are valid for terminals supporting this capability.

The measurement period for RRC_CONNECTED state is specified in clause 9.4.6.

In RRC_CONNECTED state the accuracy requirements shall meet the absolute accuracy requirements in table 10.3.1-1, under the following conditions:

- CPICH Ec/Io condition for a detectable cell is as specified in clause 9.4.6;
- SCH_Ec/Io condition for a detectable cell is as specified in clause 9.4.6.

**Table 10.3.1-1: UTRAN FDD CPICH_RSCP absolute accuracy**

| Accuracy | | Conditions |
|---|---|---|
| **Normal condition** | **Extreme condition** | **Io range** |

| | | UTRA operating bands | Minimum Io | Maximum Io |
|---|---|---|---|---|
| **dB** | **dB** | | **dBm/3.84 MHz** | **dBm/3.84 MHz** |
| ±6 | ±9 | Band I, IV, VI, X XI, XIX and XXI | -94 | -70 |
| | | Band IX | -93 | -70 |
| | | Band II, V and VII | -92 | -70 |
| | | Band III, VIII, XII, XIII, XIV , XX and XXII | -91 | -70 |
| | | Band XXV, XXVI Note 1 | -90.5 | -70 |
| ±8 | ±11 | Note 2 | -70 | -50 |
| NOTE 1: For Band XXVI, the condition has the minimum Io of -92 dBm/3.84 MHz when the carrier frequency of the assigned UTRA channel is within 869-894 MHz for the UE which supports both Band V and Band XXVI operating frequencies. | | | | |
| NOTE 2: The same bands apply for this requirement as for the corresponding highest accuracy requirement. | | | | |

If the UE, in RRC_CONNECTED state, needs measurement gaps to perform UTRAN FDD measurements, the relevant UTRAN FDD measurement procedure and measurement gap pattern stated in clause 9.4.6 shall apply.

The reporting range and mapping specified for FDD CPICH RSCP in TS 25.133 [29] shall apply.

## 10.3.2 UTRAN FDD CPICH Ec/No

NOTE: This measurement is for handover between E-UTRAN and UTRAN FDD.

The requirements in this clause are valid for terminals supporting this capability.

The measurement period for RRC_CONNECTED state is specified in clause 9.4.6.

In RRC_CONNECTED state the accuracy requirements shall be the same as the inter-frequency measurement accuracy requirements for FDD CPICH Ec/No in TS 25.133 [29].

If the UE, in RRC_CONNECTED state, needs measurement gaps to perform UTRAN FDD measurements, the UTRAN FDD measurement procedure and measurement gap pattern stated in clause 9.4.6 shall apply.

The reporting range and mapping specified for FDD CPICH Ec/No in TS 25.133 [29] shall apply.

# 10.4 V2X measurements

## 10.4.1 Introduction

The requirements in this clause are applicable for a UE capable of V2X sidelink communication.

The accuracy requirements in this clause are:

- applicable for AWGN radio propagation conditions,
- assume independent interference (noise) at each receiver antenna port.

## 10.4.2 Intra-frequency PSBCH-RSRP accuracy requirements for FR1

### 10.4.2.1 PSBCH-RSRP Absolute Accuracy

The requirements for absolute PSBCH-RSRP accuracy in this clause apply to a V2X synchronization source on the same frequency as that of the own V2X UE performing the measurement in FR1.

The accuracy requirements in table 10.4.2.1-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in clause 7.3E of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for PSBCH-RSRP measurements are fulfilled according to annex B.4.2 for a corresponding Band for each relevant PSBCH-DMRS.

**Table 10.4.2.1-1: Intra-frequency PSBCH-RSRP absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | Ês/Iot Note 3 | Io Note 1 range | | | | | |
| | | | NR V2X operating band groups Note 2 | Minimum Io | | | | Maximum Io |
| | | | | dBm / $SCS_{SL}$ | | | | |
| dB | dB | dB | | $SCS_{SL}$ = 15 kHz | $SCS_{SL}$ = 30 kHz | $SCS_{SL}$ = 60 kHz | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| ±4.5 | ±9 | ≥-6 | NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -70 |
| | | | NR_TDD_FR1_J | -116.5 | -113.5 | -110.5 | N/A | -70 |
| ±8 | ±11 | ≥-6 | NR_TDD_FR1_B, NR_TDD_FR1_J | N/A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR V2X operating band groups in FR1 are as defined in clause 3.5.2.<br>NOTE 3: Ês/Iot for a SyncRef UE is the Ês/Iot of PSBCH-DMRS. | | | | | | | | |

### 10.4.2.2 PSBCH-RSRP Relative Accuracy

The relative PSBCH-RSRP accuracy is defined as the PSBCH-RSRP measured from one V2X synchronization source compared to the PSBCH-RSRP measured from another V2X synchronization source on the same frequency in FR1.

The accuracy requirements in table 10.4.2.2-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in clause 7.3E of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for PSBCH-RSRP accuracy measurements are fulfilled according to annex B.4.2 for a corresponding Band for each relevant PSBCH-DMRS.

**Table 10.4.2.2-1: Intra-frequency PSBCH-RSRP relative accuracy in FR1**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| Normal condition | Extreme condition | Ês/Iot Note 3 | Io Note 1 range | | | | | |
| | | | NR V2X operating band groups Note 2 | Minimum Io | | | | Maximum Io |
| | | | | dBm / $SCS_{SL}$ | | | | |
| dB | dB | dB | | $SCS_{SL}$ = 15 kHz | $SCS_{SL}$ = 30 kHz | $SCS_{SL}$ = 60 kHz | $dBm/BW_{Channel}$ | $dBm/BW_{Channel}$ |
| ±2 | ±3 | ≥-3 | NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -50 |
| | | | NR_TDD_FR1_J | -116.5 | -113.5 | -110.5 | N/A | -50 |
| ±3 | ±3 | ≥-6 | Note 4 | Note 4 | Note 4 | Note 4 | N/A | Note 4 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR V2X operating band groups in FR1 are as defined in clause 3.5.2.<br>NOTE 3: Ês/Iot for a SyncRef UE is the Ês/Iot of PSBCH-DMRS.<br>NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement. | | | | | | | | |

## 10.4.2A Intra-frequency PSBCH-RSRP accuracy requirements for FR1 under CCA

### 10.4.2A.1 PSBCH-RSRP Absolute Accuracy

The requirements for absolute PSBCH-RSRP accuracy in this clause apply to a sidelink synchronization source on the same frequency as that of the own sidelink UE performing the measurement in FR1 under CCA.

The accuracy requirements in table 10.4.2A.1-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in clause 7.3E of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for PSBCH-RSRP measurements are fulfilled according to annex B.4.2 for a corresponding Band for each relevant PSBCH-DMRS.

**Table 10.4.2A.1-1: Intra-frequency PSBCH-RSRP absolute accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| | | | Io Note 1 range | | | | |
| Normal condition | Extreme condition | Ês/Iot Note 3 | NR sidelink operating band groups Note 2 | Minimum Io | | | Maximum Io |
| | | | | dBm / $SCS_{SL}$ | | | |
| dB | dB | dB | | $SCS_{SL}$ = 15 kHz | $SCS_{SL}$ = 30 kHz | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| ±4.5 | ±9 | ≥-6 | NR_CCA_FR1_I | -117 | -114 | N/A | -70 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | N/A | -70 |
| ±8 | ±11 | ≥-6 | NR_CCA_FR1_I, NR_CCA_FR1_J | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR sidelink operating band groups in FR1 are as defined in clause 3.5.2.<br>NOTE 3: Ês/Iot for a SyncRef UE is the Ês/Iot of PSBCH-DMRS. | | | | | | | |

## 10.4.2A.2 PSBCH-RSRP Relative Accuracy

The relative PSBCH-RSRP accuracy is defined as the PSBCH-RSRP measured from one sidelink synchronization source compared to the PSBCH-RSRP measured from another sidelink synchronization source on the same frequency in FR1 under CCA.

The accuracy requirements in table 10.4.2A.2-1 are valid under the following conditions:

- Demodulation reference signals are transmitted from one port.
- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for PSBCH-RSRP accuracy measurements are fulfilled according to annex B.4.2 for a corresponding Band for each relevant PSBCH-DMRS.
- The same number of S-SSB repetitions on frequency domain is configured between two sidelink synchronization sources.

**Table 10.4.2A.2-1: Intra-frequency PSBCH-RSRP relative accuracy in FR1**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| | | | Io Note 1 range | | | | |
| Normal condition | Extreme condition | Ês/Iot Note 3 | NR sidelink operating band groups Note 2 | Minimum Io | | | Maximum Io |
| | | | | dBm / $SCS_{SL}$ | | | |
| dB | dB | dB | | $SCS_{SL}$ = 15 kHz | $SCS_{SL}$ = 30 kHz | dBm/$BW_{Channel}$ | dBm/$BW_{Channel}$ |
| ±2 | ±3 | ≥-3 | NR_CCA_FR1_I | -117 | -114 | N/A | -50 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | N/A | -50 |
| ±3 | ±3 | ≥-6 | Note 4 | Note 4 | Note 4 | N/A | Note 4 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR sidelink operating band groups in FR1 are as defined in clause 3.5.2.<br>NOTE 3: Ês/Iot for a SyncRef UE is the Ês/Iot of PSBCH-DMRS.<br>NOTE 4: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement. | | | | | | | |

## 10.4.3 Intra-Frequency SL-RSSI Measurement Accuracy Requirements for FR1

### 10.4.3.1 Absolute SL-RSSI Accuracy

The intra-frequency SL-RSSI requirements are specified in table 10.4.3.1-1. The requirements apply for measurement period of 1 slot and for any configured measurement bandwidth larger than 10 PRBs, provided that:

- All symbols duing each RSSI measurement duration are available for RSSI sampling within the same measurement interval.

**Table 10.4.3.1-1: Intra-frequency SL-RSSI absolute accuracy**

| Accuracy | | Conditions | | | | |
|---|---|---|---|---|---|---|
| | | Io [Note 1] range | | | | |
| Normal condition | Extreme condition | NR V2X operating band groups [Note 2] | Minimum Io | | | Maximum Io |
| | | | dBm/$SCS_{SL}$ | | | |
| dB | dB | | $SCS_{SL}$ = 15 kHz | $SCS_{SL}$ = 30 kHz | $SCS_{SL}$ = 60 kHz | $dBm/BW_{Channel}$ |
| ±2.5 | ±5.5 | NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | -50 |
| | | NR_TDD_FR1_J | -116.5 | -113.5 | -110.5 | -50 |
| ±4.5 | ±7.5 | Note 3 | Note 3 | Note 3 | Note 3 | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR V2X operating band groups are as defined in clause 3.5 for the corresponding NR operating bands.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.

## 10.4.3A Intra-Frequency SL-RSSI Measurement Accuracy Requirements for FR1 under CCA

### 10.4.3A.1 Absolute SL-RSSI Accuracy

The intra-frequency SL-RSSI requirements are specified in table 10.4.3A.1-1 under CCA. The requirements apply for measurement period of 1 slot and for any configured measurement bandwidth larger than 10 PRBs, provided that:

- All symbols during each RSSI measurement duration according to indication of first or second starting symbol within a slot are available for RSSI sampling within the same measurement interval.

**Table 10.4.3A.1-1: Intra-frequency SL-RSSI absolute accuracy**

| Accuracy | | Conditions | | | |
|---|---|---|---|---|---|
| | | Io [Note 1] range | | | |
| Normal condition | Extreme condition | NR sidelink operating band groups [Note 2] | Minimum Io | | Maximum Io |
| | | | dBm/$SCS_{SL}$ | | |
| dB | dB | | $SCS_{SL}$ = 15 kHz | $SCS_{SL}$ = 30 kHz | $dBm/BW_{Channel}$ |
| ±2.5 | ±5.5 | NR_CCA_FR1_I | -117 | -114 | -50 |
| | | NR_CCA_FR1_J | -116.5 | -113.5 | -50 |
| ±4.5 | ±7.5 | Note 3 | Note 3 | Note 3 | Note 3 |

NOTE 1: Io is assumed to have constant EPRE across the bandwidth.
NOTE 2: NR sidelink operating band groups are as defined in clause 3.5 for the corresponding NR operating bands.
NOTE 3: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding highest accuracy requirement.

## 10.4.4 Intra-Frequency L1 SL-RSRP Measurement Accuracy Requirements for FR1

### 10.4.4.1 Absolute L1 SL-RSRP Accuracy

The requirements for absolute L1 SL-RSRP accuracy in this clause apply to a UE performing PSCCH-RSRP and/or PSSCH-RSRP measurements on the same frequency as used by operating V2X sidelink communication.

The accuracy requirements in table 10.4.4.1-1 are valid under the following conditions:

- Demodulation reference signals for PSCCH and/or PSSCH are transmitted from one port.
- Conditions defined in clause 7.3E of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- PSCCH-RSRP|dBm and/or PSSCH-RSRP|dBm according to annex B.4.4 for a corresponding Band are fulfilled.

**Table 10.4.4.1-1: Intra-frequency L1 SL-RSRP absolute accuracy for UE capable of V2X sidelink communication**

| Accuracy | | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|---|
| | | | Io Note 1 range | | | | | |
| Normal condition | Extreme condition | Ês/Iot Note 3 | NR V2X operating band groups Note 2 | Minimum Io | | | | Maximum Io |
| | | | | dBm/SCS | | | dBm/BW$_{Channel}$ | dBm/BW$_{Channel}$ |
| dB | dB | dB | | SCS = 15 kHz | SCS = 30 kHz | SCS = 60 kHz | | |
| ± 4.5 | ± 9 | ≥0 dB | NR_TDD_FR1_B | -120.5 | -117.5 | -114.5 | N/A | -70 |
| | | | NR_TDD_FR1_J | -116.5 | -113.5 | -110.5 | N/A | -70 |
| ± 8 | ± 11 | ≥0 dB | NR_TDD_FR1_B<br>NR_TDD_FR1_J | N/A | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR V2X operating band groups are as defined in clause 3.5 for the corresponding NR operating bands.<br>NOTE 3: The parameter Ês/Iot is the Ês/Iot of PSCCH-DMRS and/or PSSCH-DMRS. | | | | | | | | |

## 10.4.4A Intra-Frequency L1 SL-RSRP Measurement Accuracy Requirements for FR1 under CCA

### 10.4.4A.1 Absolute L1 SL-RSRP Accuracy

The requirements for absolute L1 SL-RSRP accuracy in this clause apply to a UE performing PSCCH-RSRP and/or PSSCH-RSRP measurements on the same frequency as used by operating sidelink communication under CCA.

The accuracy requirements in table 10.4.4A.1-1 are valid under the following conditions:

- Demodulation reference signals for PSCCH and/or PSSCH are transmitted from one port.
- Conditions defined in clause 7.3F of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- PSCCH-RSRP|dBm and/or PSSCH-RSRP|dBm according to annex B.4.4 for a corresponding Band are fulfilled.

**Table 10.4.4A.1-1: Intra-frequency L1 SL-RSRP absolute accuracy for UE capable of sidelink communication**

| Accuracy | | Conditions | | | | | |
|---|---|---|---|---|---|---|---|
| | | | Io Note 1 range | | | | |
| Normal condition | Extreme condition | Ês/Iot Note 3 | NR sidelink operating band groups Note 2 | Minimum Io | | | Maximum Io |
| | | | | dBm/SCS | | dBm/BW$_{Channel}$ | dBm/BW$_{Channel}$ |
| dB | dB | dB | | SCS = 15 kHz | SCS = 30 kHz | | |

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| ± 4.5 | ± 9 | ≥0 dB | NR_CCA_FR1_I | -117 | -114 | N/A | -70 |
| | | | NR_CCA_FR1_J | -116.5 | -113.5 | N/A | -70 |
| ± 8 | ± 11 | ≥0 dB | NR_CCA_FR1_I<br>NR_CCA_FR1_J | N/A | N/A | -70 | -50 |
| NOTE 1: Io is assumed to have constant EPRE across the bandwidth.<br>NOTE 2: NR sidelink operating band groups are as defined in clause 3.5 for the corresponding NR operating bands.<br>NOTE 3: The parameter Ês/Iot is the Ês/Iot of PSCCH-DMRS and/or PSSCH-DMRS. | | | | | | | |

## 10.4.5 Intra-Frequency Discovery Signal Measurement Accuracy Requirements

The requirements in this clause are applicable for a remote sidelink UE in U2N relay scenario provided that the remote UE:

- is out of coverage on the frequency used for sidelink, and
- that is synchronised to the sidelink relay UE that is measured.

The requirements in this clause are applicable for a remote sidelink UE in multipath relay scenario provided that the remote UE:

- is synchronised to the sidelink relay UE that is measured and
- is in coverage on the frequency used for sidelink if both the direct path and the sidelink on the indirect path are on the same frequency
- is out of coverage on the frequency used for sidelink if the direct path and the sidelink on the indirect path are on different frequencies.

### 10.4.5.1 Absolute Discovery Signal Measurement Accuracy

The accuracy requirements for absolute discovery signal measurement in this clause apply to a sidelink UE performing SL-RSRP measurements for direct to indirect path switch or SL-RSRP measurements for indirect to direct path switch on the same frequency as used by the sidelink relay UE transmitting the relay Discovery message.

The accuracy requirements in table 10.4.5.1-1 are valid under the following conditions:

- Demodulation reference signals for PSCCH and/or PSSCH are transmitted from one port.
- Conditions defined in clause 7.3E of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- PSCCH-RSRP|dBm and/or PSSCH-RSRP|dBm according to annex B.4.4 for a corresponding Band are fulfilled.

**Table 10.4.5.1-1: Intra-frequency discovery signal measurement absolute accuracy for a remote sidelink UE [2] capable of sidelink Communication and sidelink Discovery and configured by upper layers for relay operation.**

| **Accuracy** | | **Conditions** | | | | | | |

# 10.4A NR Sidelink Measurements for Positioning

## 10.4A.1 Introduction

The SL measurements for positioning are performed based on SL-PRS. The SL-PRS reception procedure is as described in TS 38.321 [7]. The UE shall monitor PSCCH to receive the associated SL-PRS in the same slot TS 38.214 [26].

## 10.4A.2 SL RSTD measurements

### 10.4A.2.1 Measurement Report Mapping

#### 10.4A.2.1.1 Absolute SL RSTD Measurement Reporting

The reporting range for the SL RSTD measurement is defined from $-985024 \times T_c$ to $985024 \times T_c$ with the resolution step of $2^k \times T_c$, where

$T_c$ is defined in TS 38.211 [6],

$k_{min} \leq k \leq k_{max}$,

$k_{min}$=2 and $k_{max}$=5, when configured SL-PRS resources of both of the reference UE and the second anchor UE measured for the SL RSTD measurement are in FR1.

The measurement report mapping for different $k$ values are specified in tables 10.4A.2.1.1-1 – 10.4A.2.1.1-4.

**Table 10.4A.2.1.1-1: Report mapping for *k*=2**

| Reported Quantity Value, SL_RSTD_i | Measured Quantity Value, SL_RSTD | Unit |
|---|---|---|
| SL_RSTD_000000 | SL_RSTD < -985024 | $T_c$ |
| SL_RSTD_000001 | -985024 ≤ SL_RSTD < -985020 | $T_c$ |
| SL_RSTD_000002 | -985020 ≤ SL_RSTD < -985016 | $T_c$ |
| … | … | … |
| SL_RSTD_246256 | -4 ≤ SL_RSTD < 0 | $T_c$ |
| SL_RSTD_246257 | 0 ≤ SL_RSTD < 4 | $T_c$ |
| … | … | … |
| SL_RSTD_492511 | 985016 ≤ SL_RSTD < 985020 | $T_c$ |
| SL_RSTD_492512 | 985020 ≤ SL_RSTD < 985024 | $T_c$ |
| SL_RSTD_492513 | 985024 ≤ SL_RSTD | $T_c$ |

**Table 10.4A.2.1.1-2: Report mapping for *k*=3**

| Reported Quantity Value SL_RSTD_i | Measured Quantity Value, SL_RSTD | Unit |
|---|---|---|
| SL_RSTD_000000 | SL_RSTD < -985024 | $T_c$ |
| SL_RSTD_000001 | -985024 ≤ SL_RSTD < -985016 | $T_c$ |
| SL_RSTD_000002 | -985016 ≤ SL_RSTD < -985008 | $T_c$ |
| … | … | … |
| SL_RSTD_123128 | -8 ≤ SL_RSTD < 0 | $T_c$ |
| SL_RSTD_123129 | 0 ≤ SL_RSTD < 8 | $T_c$ |
| … | … | … |
| SL_RSTD_246255 | 985008 ≤ SL_RSTD < 985016 | $T_c$ |
| SL_RSTD_246256 | 985016 ≤ SL_RSTD < 985024 | $T_c$ |
| SL_RSTD_246257 | 985024 ≤ SL_RSTD | $T_c$ |

**Table 10.4A.2.1.1-3: Report mapping for *k*=4**

| … | … | … |
| SL_RSTD_30782 | -32 ≤ SL_RSTD < 0 | $T_c$ |
| SL_RSTD_30783 | 0 ≤ SL_RSTD < 32 | $T_c$ |
| … | … | … |
| SL_RSTD_61563 | 984960 ≤ SL_RSTD < 984992 | $T_c$ |
| SL_RSTD_61564 | 984992 ≤ SL_RSTD < 985024 | $T_c$ |
| SL_RSTD_61565 | 985024 ≤ SL_RSTD | $T_c$ |

## 10.4A.2.2 Measurement Accuracy Requirements

The accuracy requirements for SL RSTD measurement shall be within ±(X+Y+Z) $T_c$, where X, Y, and Z are defined as follows.

X is defined in table 10.4A.2.2-1 for AWGN propagation condition and table 10.4A.2.2-2 for fading propagation condition in FR1, provided that the following conditions are met:

- Conditions defined in clause 7.3E of TS 38.101-1 [18] for reference sensitivity are fulfilled.
- Conditions for SL RSTD measurements are fulfilled according to annex B.4A.1 for a corresponding Band for each relevant SL-PRS resource configured for measurement.
- Y=32 Tc, provided that the time offset between the two SL-PRS resource instances from the reference UE and the second anchor UE, which are used for a single SL RSTD estimate, is no greater than 160 ms.
- Z is defined in table 10.4A.2.2-3 for FR1.

NOTE: The requriements for fading channel in this clause are derived based on TDL-A (30 ns delay spread, 5Hz) channel models for FR1.

**Table 10.4A.2.2-1: SL RSTD absolute accuracy in FR1 for AWGN channel**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | SL-PRS $\hat{E}_s/I_{ot}$ | SL-PRS SCS | SL-PRS bandwidth Note 1 | Number of samples, S | Io Note 2 range | | |
| | | | | | NR operating band groups Note 3 | Minimum Io | Maximum Io |
| Tc Note 4 | dB | kHz | PRB | | | dBm/SCS | $dBm/BW_{Channel}$ |
| ±66 | $(\hat{E}_s/I_{ot})_{ref}$ ≥ 0 dB | 15 | 48 | ≥ 4 | NR_TDD_FR1_B | -123.5 | -50 |
| | | | | | NR_TDD_FR1_C | -123 | -50 |
| | | | | | NR_FDD_FR1_G | -121 | -50 |
| | | | | | NR_TDD_FR1_J | -119.5 | -50 |
| ±69 | | | >48 | ≥ 1 | Note 5 | Note 5 | Note 5 |

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | SL-PRS Ês/Iot | SL-PRS SCS | SL-PRS bandwidth Note 1 | Number of samples, S | Io Note 2 range | | |
| | | | | | NR operating band groups Note 3 | Minimum Io | Maximum Io |
| Tc Note 4 | dB | kHz | PRB | | | dBm/SCS | dBm/BW$_{Channel}$ |
| ±40 | (SL-PRS Ês/Iot)$_i$ ≥ -3 dB | | ≥ 96 | ≥ 1 | Note 5 | Note 5 | Note 5 |
| ±73 | | 30 | ≥ 24 | ≥ 4 | NR_TDD_FR1_B | -120.5 | -50 |
| | | | | | NR_TDD_FR1_C | -120 | -50 |
| | | | | | NR_FDD_FR1_G | -118 | -50 |
| | | | | | NR_TDD_FR1_J | -116.5 | -50 |
| ±39 | | >48 | ≥ 1 | Note 5 | Note 5 | Note 5 | |
| ±40 | | 60 | ≥ 24 | ≥ 4 | NR_TDD_FR1_B | -117.5 | -50 |
| | | | | | NR_TDD_FR1_C | -117 | -50 |
| | | | | | NR_FDD_FR1_G | -115 | -50 |
| | | | | | NR_TDD_FR1_J | -113.5 | -50 |

NOTE 1: Minimum SL-PRS bandwidth, which is the minimum of the SL-PRS bandwidths of the reference resource and the measured neighbour resource i.
NOTE 2: Io is assumed to have constant EPRE across the bandwidth.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the SL-PRS bandwidth of the smallest PRB number for the corresponding SCS.

**Table 10.4A.2.2-2: SL RSTD absolute accuracy in FR1 for fading channel**

| Accuracy | Conditions | | | | | | |
|---|---|---|---|---|---|---|---|
| | SL-PRS Ês/Iot | SL-PRS SCS | SL-PRS bandwidth Note 1 | Number of samples, S | Io Note 2 range | | |
| | | | | | NR operating band groups Note 3 | Minimum Io | Maximum Io |
| Tc Note 4 | dB | kHz | PRB | | | dBm/SCS | dBm/BW$_{Channel}$ |
| ±97 | (SL-PRS Ês/Iot)$_{ref}$ ≥ 0 dB<br>(SL-PRS Ês/Iot)$_i$ ≥ -3 dB | 15 | 48 | ≥ 4 | NR_TDD_FR1_B | -123.5 | -50 |
| | | | | | NR_TDD_FR1_C | -123 | -50 |
| | | | | | NR_FDD_FR1_G | -121 | -50 |
| | | | | | NR_TDD_FR1_J | -119.5 | -50 |
| ±133 | | | >48 | ≥ 1 | Note 5 | Note 5 | Note 5 |
| ±91 | | | ≥ 96 | ≥ 1 | Note 5 | Note 5 | Note 5 |
| ±138 | | 30 | ≥ 24 | ≥ 4 | NR_TDD_FR1_B | -120.5 | -50 |
| | | | | | NR_TDD_FR1_C | -120 | -50 |
| | | | | | NR_FDD_FR1_G | -118 | -50 |
| | | | | | NR_TDD_FR1_J | -116.5 | -50 |
| ±99 | | | >48 | ≥ 1 | Note 5 | Note 5 | Note 5 |
| ±83 | | 60 | ≥ 24 | ≥ 4 | NR_TDD_FR1_B | -117.5 | -50 |
| | | | | | NR_TDD_FR1_C | -117 | -50 |
| | | | | | NR_FDD_FR1_G | -115 | -50 |
| | | | | | NR_TDD_FR1_J | -113.5 | -50 |

NOTE 1: Minimum SL-PRS bandwidth, which is the minimum of the SL-PRS bandwidths of the reference resource and the measured neighbour resource i.
NOTE 2: Io is assumed to have constant EPRE across the bandwidth.
NOTE 3: NR operating band groups in FR1 are as defined in clause 3.5.2.
NOTE 4: Tc is the basic timing unit defined in TS 38.211 [6].
NOTE 5: The same bands and the same Io conditions for each band apply for this requirement as for the corresponding requirement with the SL-PRS bandwidth of the smallest PRB number for the corresponding SCS.

**Table 10.4A.2.2-3: Margin for SL RSTD measurement accuracy in FR1**

| PRS BW (PRB number) | | | Margin Z (Tc) |
|---|---|---|---|
| SCS=15kHz | SCS=30kHz | SCS=60kHz | |
| ≥ 48 | ≥ 24 | N/A | 72 |
| ≥ 96 | ≥ 48 | ≥ 24 | 36 |

# 10.4A.3 SL PRS-RSRP measurements

## 10.4A.3.1 Measurement Report Mapping

### 10.4A.3.1.1 Absolute SL PRS-RSRP Measurement Report Mapping

The reporting range of absolute SL PRS-RSRP measurement is defined from -156 dBm to -31 dBm with 1 dB resolution.

The mapping of measured quantity is defined in table 10.4A.3.1.1-1. The range in the signalling may be larger than the guaranteed accuracy range.

**Table 10.4A.3.1.1-1: Measurement report mapping for SL PRS-RSRP**

| Reported value | Measured quantity value | Unit |
|---|---|---|
| SL_PRS-RSRP_0 | SL_PRS-RSRP<-156 | dBm |
| SL_PRS-RSRP_1 | -156≤SL_PRS-RSRP<-155 | dBm |
| SL_PRS-RSRP_2 | -155≤SL_PRS-RSRP<-154 | dBm |
| SL_PRS-RSRP_3 | -154≤SL_PRS-RSRP<-153 | dBm |
