4. The SS verifies that the compression bit in EGPRS PACKET DOWNLINK ACK/NACK should be '1' and the RB in EGPRS PACKET DOWNLINK ACK/NACK shall contain compressed bitmap for BSN=1 till BSN=WS-2.
5. The SS sends all the missed RLC data blocks to MS.

Maximum Duration of Test

30 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode EGPRS Window Size: WS=Maximum value according to the number of Timeslots assigned for the TBF.
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	The BSN sequence of RLC data block is 1, 2, 3, ... 100, WS-1, In the last sent RLC data block ES/P='01'B, RRBp='00'B
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	The Compression Bit of EGPRS PACKET DOWNLINK ACK/NACK is '1'B Verify that the RB contains a compressed bitmap representing the status of BSN=1 till BSN=WS-2 Note: MS may send uncompressed bitmap along with compressed bitmap to achieve the best compression gain.

53.1.2.15 Acknowledged Mode/ Downlink TBF/ Received Bitmap/ Uncompressed

53.1.2.15.1 Conformance requirements

1. A Full Received Bitmap (FRB) is built from the receive state array V(N) by extracting the part between V(Q) and V(R) similar to the GPRS case.
2. From the FRB, a reported bitmap (RB) shall then be generated. The FRB shall be recalculated before each RB is generated. For downlink TBFs, the network may order the MS to transmit a certain RB size through use of the S/P field. The RB may be compressed or uncompressed.
3. If the compressed reported bitmap does not cover more blocks than the uncompressed reported bitmap, the receiver shall send the uncompressed reported bitmap.
4. The Compression bit in the reported bitmap shall be set to the value '1' if a compressed bitmap is sent, otherwise it shall be set to the value '0'.
5. As an exception, if the FRB length or the range of indices from SSN to the end of FRB is less than or equal to RB size, the receiver may send the uncompressed reported bitmap without attempting compression.

References

3GPP TS 04.60, subclause 9.1.8.2.3.

53.1.2.15.2 Test purpose

1. To verify the Compression Bit is set to '0' when uncompressed RB is sent.
2. To verify that if the compressed reported bitmap does not covers more blocks than the uncompressed reported bitmap, the receiver shall send the uncompressed reported bitmap.

53.1.2.15.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

- EGPRS Multislotclass (TSPC_Type_EGPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

-

Test Procedure

The SS establishes an acknowledge mode downlink EGPRS TBF with the MS:

1. Set the window size to the maximum value according to the number of timeslots assigned to TBF.
2. Make the compressed RB bitmap cover less blocks than uncompressed bitmap, and the FRB length is larger than the possible RB size, set the BSN sequence for transmit like 1,3,5,7,.....(max value of windows size -1), all with odd value.
3. The SS sends those RLC data blocks with the expected BSNs and polls the MS in the last sent RLC data block.
4. The SS verifies that the compression bit in EGPRS PACKET DOWNLINK ACK/NACK should be '0' and the RB in EGPRS PACKET DOWNLINK ACK/NACK should be an uncompressed bitmap.

Maximum Duration of Test

30 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode EGPRS Window Size: WS=Maximum value according to the number of Timeslots assigned for the TBF.
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	The BSN sequence of RLC data block is 1, 3, 5, 7, ... WS-1, all have odd number In the last sent RLC data block ES/P='01'B, RRBp='00'B
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	The Compression Bit of EGPRS PACKET DOWNLINK ACK/NACK is '0'B The RB is an uncompressed RB

53.1.2.16 Acknowledged Mode/ Downlink TBF/ Received Block Bitmap/ Compressed Bitmap Starting Colour Code

53.1.2.16.1 Conformance requirements

1. In RB compression, no special code words are used either at the beginning of the bitmap or the end of a bitmap. A one bit indicator (i.e., Compressed Bitmap Starting Colour Code) is used to indicate whether the compressed bitmap starts with a run length of zeros or a run length of ones.

References

3GPP TS 04.60, subclause 9.1.10.

53.1.2.16.2 Test purpose

1. To verify the correct coding of Compressed Bitmap Starting Colour Code bit field in Packet Downlink ACK/NACK.

53.1.2.16.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS initiates the establishment of a downlink EGPRS TBF, setting window size value to WS in the IMMEDIATE ASSIGNMENT message. WS should be greater than the available space for RB. SS sends a sequence of RLC data blocks with BSN=0, 1, 2, 4, 5, WS-1 and polls for acknowledgement. MS shall send a Packet Downlink Ack/Nack message with COMPRESSED_BITMAP_STARTING_COLOR_CODE = 1. SS sends one RLC data block with BSN=3 and polls for acknowledgement. MS shall send a Packet Downlink Ack/Nack message with COMPRESSED_BITMAP_STARTING_COLOR_CODE=0.

Maximum Duration of Test

30 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode EGPRS Window Size = 192.
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent a sequences of blocks on the assigned PDTCH, with BSN = 0, 1, 2, 4, 5, WS-1. In the last block of BSN = WS-1, ES/P = '01'B, RRBP = '00'B.
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on PACCH of the assigned PDTCH. COMPRESSED_BITMAP_STARTING_COLOR_CODE = 1
4	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH, BSN = 3, ES/P = '01'B, RRBP = '00'B.
5	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on PACCH of the assigned PDTCH. COMPRESSED_BITMAP_STARTING_COLOR_CODE = 0

53.1.2.17 Acknowledged Mode/ Downlink TBF/ Received Block Bitmap/ Terminating Code and Make-up Code

53.1.2.17.1 Conformance requirements

1. The T.4 procedure for encoding run lengths is as follows. Runs of ones and zeros alternate, and the run lengths are represented by the code words listed in the tables below. The code words for run lengths of zeros and ones are as described in T.4 except for one minor modification: the terminating code words used for indicating run lengths of 1 zero and 3 zeros are interchanged.
2. Run lengths greater than 63 bits are encoded first by the make-up code word which is equal to or shorter than that required. This is then followed by the terminating code word representing the difference between the required run length and the run length represented by the make-up code.

References

3GPP TS 04.60, subclause 9.1.10.

53.1.2.17.2 Test purpose

1. To verify that run lengths in the range 0-63 bits are encoded with their appropriate terminating code word.
2. To verify the correct use of make-up code word for run lengths in the range 64 and above.

53.1.2.17.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF, setting window size to the largest value WS corresponding the number of timeslots assigned to TBF.

The SS sends EGPRS RLC data blocks one by one with BSN from WS-1 to 1 and polls for acknowledgement in each block. The MS shall send a Packet Downlink Ack/Nack message in responding to each block received, the terminating code word or make-up code word for run length of ones or zeros shall be correct.

Maximum Duration of Test

30 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode EGPRS Window Size = Maximum for the MS according to the number of timeslots assigned to TBF.
2	-		N = WS-1
3	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH, with BSN = N. ES/P = '01'B, RRB = '00'B
4	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on PACCH of the assigned PDTCH. Check if CRBB contains the correct makeup code word and/or terminating code word. Note: MS may send uncompressed bitmap along with compressed bitmap to achieve the best compression gain.
5	-		N = N - 1
6	-		Repeat step 3 to 5 until N = 1.

53.1.2.18 Acknowledged Mode/ Downlink TBF/ Retransmission/ Padding

53.1.2.18.1 Conformance requirements

According to the link quality, an initial Modulation and Coding Scheme (MCS) is selected for an RLC block (see note). For the retransmissions, the same or another MCS from the same family of MCSs may be selected. E.g. if MCS-7 is selected for the first transmission of an RLC block, any MCS of the family B may be used for the retransmissions. Further, RLC data blocks initially transmitted with MCS4, MCS-5, MCS-6, MCS-7, MCS-8 or MCS-9, may be retransmitted with MCS-1, MCS-2 or MCS-3 as appropriate, by sending the different parts of the RLC data block in different radio blocks. In this case, the split block field in the header shall be set to indicate that the RLC data block is split, and the order of the two parts. For blocks initially transmitted with MCS-8 which are retransmitted using MCS-6 or MCS-3, padding of the first six octets shall be applied before each RLC data block, and the CPS field shall be set to indicate that this has been done (see an informative example in annex J).

References

3GPP TS 04.60, subclause 9.3.2.1

53.1.2.18.2 Test purpose

1. To verify that the MS correctly decodes the CPS field of Downlink Egprs RLC Data Block header.
2. To verify that the MS correctly decodes a retransmitted data block which contains first six octets of padding.

53.1.2.18.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

- EGPRS Multislotclass (TSPC_Type_EGPRS_Multislot_ClassX where X = 1..45)

PIXIT Statements

-

Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF, setting window size to the largest value WS corresponding the number of timeslots assigned to TBF.

The SS sends two EGPRS RLC radio blocks with BSN=0 BSN=1 and BSN=4 BSN=5 using MCS-8. In the last block FBI is set to 1 and the MS is polled for Acknowledgement.

The MS shall send a Egprs Packet Downlink Ack/Nack message acknowledging BSNs 0,1,4 and 5 and negatively acknowledging BSN=2 and BSN=3. SS verifies that FAI is set to 0.

The SS sends EGPRS RLC data block with BSN=2 using MCS-6, setting first 6 octets of the data block to padding, and setting CPS field to indicate the same and polls the MS for acknowledgement.

The MS shall send Egprs Packet Downlink Ack/Nack message acknowledging BSNs 0,1,2,4 and 5 and negatively acknowledging BSN=3. SS verifies that FAI is set to 0.

The SS sends first part of BSN=3 using MCS-3 with first six octets of the data block set to padding and polls the MS for acknowledgement. CPS is set correctly in the data block header to indicate that the block is first part of split block and that the data block is padded.

The MS shall send Egprs Packet Downlink Ack/Nack message acknowledging BSNs 0,1,2,4 and 5 and negatively acknowledging BSN=3. SS verifies that FAI is set to 0.

The SS sends second part of BSN=3 using MCS-3 and polls the MS for acknowledgement. CPS is set correctly in the data block header to indicate that the block is second part of split block and that the data block is not padded.

The MS shall send Egprs Packet Downlink Ack/Nack message acknowledging BSNs 0 to 5. SS verifies that FAI is set to 1.

Maximum Duration of Test

30 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode EGPRS Window Size = Maximum for the MS according to the number of timeslots assigned to TBF.

10	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on PACCH of the assigned PDTCH. SS verifies that BSN 0, 1, 2, 3, 4 and 5 are acknowledged and FAI=1

53.1.2.19 Acknowledged Mode/ Downlink TBF/ TBF Reallocation/Window Size

53.1.2.19.1 Conformance requirements

For EGPRS the window size (WS) shall be set by the network according to the number of timeslots allocated in the direction of the TBF (uplink or downlink). The allowed window sizes are given in Table 9.1.9.2.1.

MS shall support the maximum window size corresponding to its multislot capability. The selected WS shall be indicated within PACKET UL/DL ASSIGNMENT and PACKET TIMESLOT RECONFIGURE using the coding defined in Table 9.1.9.2.1.

Once a window size is selected for a given MS, it may be changed to a larger size but not to a smaller size, in order to prevent dropping data blocks from the window.

NOTE: If a TBF is reallocated so that the number of allocated timeslots is reduced, the RLC window size may become larger than the maximum window size for the new resources.

References

3GPP TS 04.60, subclause 9.1.9.2

53.1.2.19.2 Test purpose

To verify that if a downlink TBF is reallocated reducing the number of timeslots so that the RLC window size becomes larger than the maximum window size for the new resources, the MS retains the old window size.

53.1.2.19.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

SS establishes a downlink TBF allocating two timeslots. Downlink EGPRS Window Size is commanded to be 256 (the maximum according to the number of timeslots allocated to the TBF).

SS sends EGPRS RLC data block with BSN=1 on one assigned timeslot and BSN=191 in the other assigned timeslot to the MS, polling the MS for acknowledgement in the last block.

SS verifies that MS sends EGPRS PACKET DOWNLINK ACK/NACK message, positively acknowledging BSN=1 and BSN=191 and negatively acknowledging BSN=0 and all other data blocks from BSN=2 till BSN=190.

SS sends a PACKET DOWNLINK ASSIGNMENT message addressing the MS, changing the number of allocated downlink timeslots to 1.

SS sends an EGPRS RLC data block with BSN=255 on the new assigned PDCH, polling the MS for acknowledgement

SS verifies that MS sends EGPRS PACKET DOWNLINK ACK/NACK message in the assigned block period and that the received bitmap positively acknowledges blocks with BSN=1, BSN=191 and BSN=255 and negatively acknowledges BSN=0 and all blocks from BSN=2 till BSN=190 and BSN=192 till BSN=254.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1a	SS -> MS	IMMEDIATE ASSIGNMENT	For downlink TBF. Sent on PCH.
1b	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Acknowledged Mode. Sent on PACCH. See specific message contents
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Using MCS-1. Sent at least 3 block periods after Step 1 Sent on the assigned PDTCH TN3, with BSN = 1
3	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Using MCS-1 Sent on the assigned PDTCH TN4, with BSN = 191 ES/P = '01'B, RRBp = '00'B
4	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on PACCH of the assigned PDTCH in TN4. SS verifies that the received bitmap positively acknowledges BSN =1 and BSN=191 and negatively acknowledges BSN=0 and BSN=2 till BSN=190.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Acknowledged Mode. Sent on PACCH of the assigned PDTCH in TN4. See specific message contents
6	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Using MCS-1. Sent at least 3 block periods after Step 5 Sent on the PDTCH in TN3 assigned in Step 5, with BSN = 255 ES/P = '01'B, RRBp = '00'B
7	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on PACCH of the PDTCH assigned in Step 5. SS verifies that the received bitmap positively acknowledges BSN =1, BSN=191 and BSN=255 and negatively acknowledges BSN=0, BSN=2 till BSN=190, and BSN=192 till BSN=254.

Specific Message Contents

PACKET DOWNLINK ASSIGNMENT message in step 1b:

MAC_MODE	00 Dynamic Allocation
RLC_MODE	0 Acknowledged mode
TIMESLOT_ALLOCATION	00011000 (TN3 and TN4)
- EGPRS Window Size	00110 (256)

PACKET DOWNLINK ASSIGNMENT message in step 5:

MAC_MODE	00 Dynamic Allocation
RLC_MODE	0 Acknowledged mode
TIMESLOT_ALLOCATION	00010000 (TN3)
- EGPRS Window Size	00110 (256)

53.2 Unacknowledged Mode

53.2.1 Unacknowledged Mode/ Uplink TBF

53.2.1.1 Unacknowledged Mode/ Uplink TBF/ Stall Indicator

53.2.1.1.1 Conformance requirements

The transfer of RLC data blocks in the RLC unacknowledged mode does not include any retransmissions, except during the release of an uplink TBF where the last transmitted uplink block may be retransmitted (see sub-clause 9.3.3.3).

The network shall send PACKET UPLINK ACK/NACK messages when needed.

The mobile station shall set the Stall indicator (SI) bit to '0' in all RLC data blocks.

References

3GPP TS 04.60, subclause 9.3.3, 9.3.3.2

53.2.1.1.2 Test purpose

To verify that the MS sets SI to '0' in all RLC data blocks

53.2.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

An uplink TBF in unacknowledged RLC mode is established. Uplink EGPRS Window Size is commanded to be 192. SS assigns resources to the MS to transmit WS data blocks in the uplink. SS verifies that MS transmits data blocks sequentially and that SI is not set in the data blocks.

SS assigns resource to the MS to transmit in uplink.

SS verifies that the MS transmits new data block with BSN=WS after BSN=WS-1 is transmitted and that SI is not set in the data block with BSN=WS.

SS allows the MS to complete the data transfer.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 4400 octets USF GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1 EGPRS Window Size: 192
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN of the received data block is 0, and SI is not set.
4	-		Repeat Steps 2 and 3 until BSN=191 is received
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
6	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN of the received data block is 192, and SI is not set.
7	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledging BSN=192
8		{Completion of uplink RLC data block transfer}	

53.2.1.2 Unacknowledged Mode/ Uplink TBF/ RBB and SSN

53.2.1.2.1 Conformance requirements

The transfer of RLC data blocks in the RLC unacknowledged mode does not include any retransmissions, except during the release of an uplink TBF where the last transmitted uplink block may be retransmitted (see sub-clause 9.3.3.3).

The SSN and RB are transmitted in both RLC acknowledged and RLC unacknowledged mode (note the SSN is calculated differently in EGPRS (refer to table 8.1.1.1) and GPRS (refer to 9.1.8.1)). The SSN and RB shall be ignored by the RLC receiver in unacknowledged mode.

References

3GPP TS 04.60, subclause 9.1.8.2, 9.3.3, 9.3.3.2

53.2.1.2.2 Test purpose

To verify that the MS ignores SSN and RB included in Packet Uplink Ack/Nack message when in RLC unacknowledged mode.

53.2.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

53.3.2.1 Macro for uplink dynamic allocation two phase access

Step	Direction	Message	Comments
		{Uplink dynamic allocation two phase access}	Macro parameters: N: the number of data octets to be transferred, USF_GRANULARITY: 1 or 4 blocks, RLC_DATA_BLOCKS_GRANTED: 9-261 (close-end) or absent (open-end), EGPRS Channel Coding Command: MCS-1, -2, -3, -4, -5, -6, -7, -8, -9 or MCS-5-7, MCS6-9, Resegment IE: incremental redundancy on/off in uplink direction, EGPRS Window Size: according to number of allocated timeslots, TLLI_BLOCK_CHANNEL_CODING : MCS-1 or as data block, TBF Starting Time:
0	MS		Trigger the MS to initiate uplink transfer of N octets of data according to the activated test PDP context.
1	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH.
2	SS -> MS	IMMEDIATE ASSIGNMENT	Multi block assignment allocating two blocks using Multiblock Allocation Struct, to order the MS to follow the two-phase access procedure. Sent on AGCH.
3	MS -> SS	PACKET RESOURCE REQUEST	Two phase access procedure. Received on the multi block assigned in step 2. EGPRS capability indicated in the MS Radio Access Capability IE. Check that the PEAK_THROUGHPUT, RADIO_PRIORITY and RLC_MODE are compliant with the PDP context used.
3a (conditional)	MS -> SS	ADDITIONAL MS RADIO ACCESS CAPABILITIES	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 3) indicates 1, then step 3a is performed.
3b (optional)	MS -> SS	uplink control block (e.g. PACKET MEASUREMENT REPORT, PACKET UPLINK DUMMY CONTROL BLOCK)	If <ADDITIONAL MS RAC INFORMATION AVAILABLE> field in the received PACKET RESOURCE REQUEST message (step 3) indicates 0, then step 3b is optionally performed.
4	SS -> MS	PACKET UPLINK ASSIGNMENT	Uplink dynamic allocation, no starting time (as default, otherwise use TBF Starting Time), sent on PACCH of the same PDCH assigned in step 2.

53.3.2.2 Macro for downlink TBF establishment (PBCCH not present)

Step	Direction	Message	Comments
		{Downlink TBF establishment}	Macro parameters: TBF_STARTING_TIME
1	SS -> MS	PAGING REQUEST	Page info contains P-TMSI of the MS. Sent on PCH.
2	MS -> SS	CHANNEL REQUEST	ACCESS TYPE = "One phase packet access". Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Random Reference = pertaining to the message received in step 2. Dynamic allocation for RLC data blocks, Sent on AGCH.
4	MS -> SS	GPRS UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDCH assigned in step 3.
5	SS -> MS	PACKET UPLINK ACK/NACK	Acknowledge the received RLC data block. Sent on uplink PACCH.
6	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Acknowledge the RLC control message. Received on uplink PACCH.
7	SS -> MS	IMMEDIATE ASSIGNMENT	Downlink Assignment, TLLI value as received. Sent on PCH. Macro parameter as assigned in the test case.

53.3.2.3 Macro for downlink TBF establishment using ACCESS TYPE = "signalling" (PBCCH not present)

The following table describes a signalling sequence performing a downlink TBF establishment procedure.

The macros in the test cases refer to the table below starting at the step required for the particular sequence.

These steps are only applicable to mobiles that support EGPRS Packet Channel Request with Establishment Cause 'signalling' on RACH in a cell supporting EGPRS Packet Channel Request.

Related PICS Statement: TSPC_EGPRS_ENHANC

Step	Direction	Message	Comments
		{Downlink TBF establishment}	Macro parameters: TBF_STARTING_TIME
1	SS -> MS	PAGING REQUEST	Page info contains P-TMSI of the MS. Sent on PCH.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	ACCESS TYPE = "signalling". Received on RACH.
3	SS -> MS	IMMEDIATE ASSIGNMENT	Random Reference = pertaining to the message received in step 2. Assigning an EGPRS TBF. Dynamic allocation for RLC data blocks, Sent on AGCH.
4	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	LLC PDU implicitly indicating paging response, containing TLLI in the RLC/MAC header. Received on uplink PDTCH assigned in step 3.
5	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	Acknowledge the received RLC data block. Sent on uplink PACCH.
6	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Acknowledge the RLC control message. Received on uplink PACCH.
7	SS -> MS	IMMEDIATE ASSIGNMENT	Downlink Assignment, TLLI value as received. Assigning an EGPRS TBF. Sent on PCH. Macro parameter as assigned in the test case.

54 to 56 Void

57 EGPRS Dual Transfer Mode

57.1 Reallocation of CS resources

57.1.1 Void

57.1.2 Void

57.1.3 Intra frequency reallocation of CS resources / DTM Assignment Command

57.1.3.1 Conformance requirements

In dual transfer mode an intracell change of channel can be requested by upper layers for changing the channel type, or decided by the RR sub layer, e.g. for an internal handover or for the reallocation of all the resources of the mobile station. The purpose is to modify completely the physical channel configuration of the mobile station without frequency redefinition or change in synchronization while staying in the same cell.

Upon receipt of the DTM ASSIGNMENT COMMAND message, the mobile station initiates a local end release of link layer connections, disconnects the physical channels, commands the switching to the assigned channel and initiates the establishment of lower layer connection (this includes the activation of the channel, their connection and the establishment of the main signalling link).

NOTE: This conformance requirement was taken from Rel-5 specifications, but it is also a requirement on R99 and Rel-4 MS.

References

3GPP TS 44.018, sub-clause 3.4.23.2

57.1.3.2 Test purpose

To verify that the MS can reallocate both the CS connection and PS resources to different timeslot(s) within the same frequency band, having received the DTM ASSIGNMENT COMMAND message.

57.1.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is in GMM Ready state with a P-TMSI allocated and the PDP context 1 activated.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

Once the MS is in DTM, the SS attempts to modify the resources of the MS. The SS allocates the MS a different timeslot configuration, in the same frequency band, on the current cell. The re-allocation of the MS resources is realised by the MS receiving a DTM ASSIGNMENT COMMAND from the SS. On receipt of the DTM ASSIGNMENT COMMAND message, the MS initiates a local end release of link layer connections, disconnects the physical channels. After the MS has switched to the assigned channel, the MS initiates the establishment of lower layer connection, the activation of the channel and the establishment of the main signalling link. The MS returns an ASSIGNMENT COMPLETE message on the new signalling link.

MS supporting DTM/EGPRS shall complete testing for k=1, and indicating support of single slot DTM/EGPRS shall complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

Step	Direction	Message	Comments
1	SS		MS in state U10, on Timeslot N (chosen arbitrarily), utilising a default TCH of cell and either: k=1, Channel Type = TCH/F; or k=2, Channel Type = TCH/H.
2	SS->MS	PACKET ASSIGNMENT	Assigning downlink resources on Timeslot N+1.
3	SS<->MS	{ Downlink data transfer }	Macro – Transmitting 2.000 octet of Data
4	SS->MS	DTM ASSIGNMENT COMMAND	This message is sent after approximately 1.000 octets have been successfully transmitted. See specific message contents.
5	MS->SS	ASSIGNMENT COMPLETE	
6	SS<->MS	{ Downlink data transfer }	Macro – Completion of the 2.000 octet transmission.
7	SS		Verify that the CS connection is still through connected on the new Timeslot.

57.1.4.2 Test purpose

To verify that the MS, can reallocate both the CS connection and PS resources to a different frequency band, having received the DTM ASSIGNMENT COMMAND message while in DTM.

57.1.4.3 Method of test

Initial Conditions

System Simulator:

1 cell, Cell A, with both TCH of cell activated and DTM supported. TCH2 allocated in a different frequency band and added to the Cell Channel Description in SI1.

Mobile Station:

The MS is in the active state (U10) of a call, on cell A, with a TMSI and P-TMSI allocated and the PDP context 1 activated but no allocated TBFs.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

Once the MS is in DTM, the SS attempts to modify the resources of the MS. The MS is allocated a new timeslot, in a different frequency band. The re-allocation of the MS resources is realised by the MS receiving a DTM ASSIGNMENT

COMMAND from the SS. On receipt of the DTM ASSIGNMENT COMMAND message, the MS initiates a local end release of link layer connections and disconnects the physical channels. After the MS has switched to the assigned channel, the MS initiates the establishment of lower layer connection, the activation of the channel and the establishment of the main signalling link. The MS returns an ASSIGNMENT COMPLETE message on the new signalling link and continues transmitting on the uplink TBF.

MS supporting DTM/EGPRS shall complete testing for k=1 MSs indicating support of single slot DTM/EGPRS shall complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for k = 1,2.

Step	Direction	Message	Comments
1	SS		MS in state U10, on Timeslot N (chosen arbitrarily), utilising either: k=1, Channel Type = TCH/F; or k=2, Channel Type = TCH/H.

57.2 Release of CS resources

57.2.1 Network originating CS release

57.2.1.1 Conformance requirements

When the MS is operating in DTM and RR connection release is requested by the network, the radio resources allocated on a PDCH are released, the MS returns to the PCCCH or CCCH configuration, packet idle mode. The MS shall abort the RR connection by initiating a normal release of the main signalling link, perform a local end release of all other signalling links, disconnecting all traffic channels and abort all the packet resources.

References

3GPP TS 04.18/44.018, sub-clauses 3.4.13.1, 3.4.13.3

57.2.1.2 Test purpose

To verify that after the network releases the CS connection, the PS resources are correctly re-established

57.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, DTM supported.

Mobile Station:

The MS is in the active state (U10) of a call.

The MS is GPRS attached with a P-TMSI allocated and the PDP context 1 activated.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

An MS, in dedicated mode, is triggered to initiate uplink data transfer. The MS sends a DTM REQUEST message to the SS requesting uplink resources. The SS assigns the required resources and waits until approximately half the uplink data has been passed to the SS before instructing the MS to release the CS resources. The SS initiates the signalling required to release the channel by sending a DISCONNECT message to the MS. The MS responds to the DISCONNECT message with a RELEASE message, to which the SS responds with a RELEASE COMPLETE and then a CHANNEL RELEASE message. Once the resources have been cleared the MS requests the establishment of an uplink TBF and completes the data transmission.

MS supporting DTM/EGPRS shall complete testing for k=1 and MSs indicating support of single slot DTM/EGPRS shall additionally complete testing for k=2.

Maximum Duration of Test

5 minutes

Expected Sequence

58 Void

58a Latency reductions

Default Initial conditions:

All default conditions, message contents and macros are defined in section 40 and section 50. If a mobile station indicates support of Reduced Latency, then an additional default initial condition used for Latred testcases in this clause is as follows. This condition is not necessary for a mobile station that does not support Reduced Latency but supports FANR only.

- Unless otherwise stated in the test case, the REDUCED_LATENCY_ACCESS bit in GPRS Cell Options is set to 1 to indicate latency reduction support by the simulator.

58a.1 FANR Fast Ack/Nack reporting

58a.1.1 Uplink TBF, SSN based PAN Format

58a.1.1.1 Conformance Requirements

1. If a mobile station indicates support of Reduced Latency (see 3GPP TS 24.008), it may be assigned TBFs with FANR activated (see sub-clause 9.1.14), either in BTTI configuration or in RTTI configuration. If a mobile station indicates support of FANR (see 3GPP TS 24.008) and it does not indicate support of Reduced Latency, it may be assigned TBFs with FANR activated (see sub-clause 9.1.14) in BTTI configuration only.
2. The Fast Ack/Nack reporting procedure (FANR) allows to piggy-back, within EGPRS RLC/MAC blocks for data transfer sent in one direction, the acknowledgement status of data blocks relative to a TBF in the opposite direction.
3. If an uplink TBF is established or reconfigured with FANR activated (see sub-clauses 11.2.29, 11.2.29a, 11.2.31, and 11.2.31a), the mobile station shall monitor for the presence of a PAN field for this TBF on all downlink PDCHs on which it shall monitor the USF for this TBF... The network may encode the PAN field according to the SSN-based encoding defined in subclause 9.1.8 or the time-based encoding defined in subclause 9.1.15. The specific encoding selected by the network is notified to the mobile station at TBF establishment/reconfiguration.

4. When the SSN-based encoding is used (see sub-clause 9.1.14.1), the Piggy-backed Ack/Nack (PAN) field consists of a beginning of window (BOW), a short starting sequence number (ShortSSN), a reported bitmap (RB) and a temporary flow identifier (TFI) fields. In the downlink direction, the TFI field shall always include a valid value.
5. If included in a PAN field, the TFI identifies the Temporary Block Flow (TBF) being acknowledged.

References

- 3GPP TS 44.060, subclause 5.2.1.
- 3GPP TS 44.060, subclause 9.1.14.1.
- 3GPP TS 44.060, subclause 10.3a.5
- 3GPP TS 44.060, subclause 10.4.10.

58a.1.1.2 Test Purposes

1. To verify that the mobile station can establish an uplink TBF with FANR activated using the SSN based format.
2. To verify that the mobile station correctly interprets the contents of PAN fields received in downlink data blocks on downlink PDCHs which it is monitoring for USF for the uplink TBF.
3. To verify that the mobile station only interprets the PAN fields addressed to it via TFI.

58a.1.1.3 Method of Test

Initial Conditions

System Simulator:

- 1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer 440 octets of user data. An uplink TBF is established. During the uplink TBF the SS negatively acknowledges one of the MS's uplink RLC data blocks using a PAN field which addresses the MS via its TFI included in the header of a downlink data block sent on the assigned PDTCH. It is checked that the MS re-transmits the negatively acknowledged uplink RLC data block. The re-transmitted uplink RLC data block is then positively acknowledged by the SS. During the uplink TBF the SS includes a PAN field in a downlink data block sent on the assigned PDTCH which would otherwise negatively acknowledge one of the MS's uplink RLC data blocks were it not for the fact that the TFI in the PAN field addresses another MS. It is checked that the MS does not re-transmit the uplink RLC data block. The uplink RLC data block is then positively acknowledged by the SS. The uplink TBF is completed during which it is checked that the MS does not repeat any of the previously positively acknowledged uplink RLC data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for k =1 (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for k =2 (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

58a.1.2 Uplink TBF, SSN based PAN Format, with Concurrent Downlink TBF

58a.1.2.1 Conformance Requirements

1. If a mobile station indicates support of Reduced Latency (see 3GPP TS 24.008), it may be assigned TBFs with FANR activated (see sub-clause 9.1.14), either in BTTI configuration or in RTTI configuration. If a mobile station indicates support of FANR (see 3GPP TS 24.008) and it does not indicate support of Reduced Latency, it may be assigned TBFs with FANR activated (see sub-clause 9.1.14) in BTTI configuration only. The network shall ensure that, if a mobile station is assigned a TBF with FANR activated, FANR shall be activated for all concurrent TBFs assigned to that mobile station.
2. If an uplink TBF is established or reconfigured with FANR activated (see sub-clauses 11.2.29, 11.2.29a, 11.2.31, and 11.2.31a), the mobile station shall monitor for the presence of a PAN field for this TBF on all downlink PDCHs on which it shall monitor the USF for this TBF... If the presence of a PAN field is indicated in the header of an EGPRS RLC/MAC block for data transfer received on these PDCHs, the mobile station shall decode the PAN field also in the blocks addressed to other mobile stations. The network may encode the PAN field according to the SSN-based encoding defined in subclause 9.1.8 or the time-based encoding defined in subclause 9.1.15. The specific encoding selected by the network is notified to the mobile station at TBF establishment/reconfiguration.

3. When the SSN-based encoding is used (see sub-clause 9.1.14.1), the Piggy-backed Ack/Nack (PAN) field consists of a beginning of window (BOW), a short starting sequence number (ShortSSN), a reported bitmap (RB) and a temporary flow identifier (TFI) fields. In the downlink direction, the TFI field shall always include a valid value.
4. If included in a PAN field, the TFI identifies the Temporary Block Flow (TBF) being acknowledged.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer 440 octets of user data. An uplink TBF is established. A concurrent downlink TBF is established. During the concurrent uplink and downlink TBFs, the SS negatively acknowledges one of the MS's uplink RLC data blocks using a PAN field which addresses the MS via its TFI included in the header of a downlink data block addressed to another MS sent on the assigned PDTCH. It is checked that the MS re-transmits the negatively acknowledged uplink RLC data block. The re-transmitted uplink RLC data block is then positively acknowledged by the SS. During the concurrent uplink and downlink TBFs, the SS includes a PAN field in a downlink data block addressed to the MS sent on the assigned PDTCH which would otherwise negatively acknowledge one of the MS's uplink RLC data blocks were it not for the fact that the TFI in the PAN field addresses another MS. It is checked that the MS does not re-transmit the uplink RLC data block. The uplink RLC data block is then positively acknowledged by the SS. The downlink TBF is completed. The uplink TBF is completed during which it is checked that the MS does not repeat any of the previously positively acknowledged uplink RLC data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for k =1 (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for k =2 (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

58a.1.3 Uplink TBF, Time based PAN Format

58a.1.3.1 Conformance Requirements

1. If a mobile station indicates support of Reduced Latency (see 3GPP TS 24.008), it may be assigned TBFs with FANR activated (see sub-clause 9.1.14), either in BTTI configuration or in RTTI configuration. If a mobile station indicates support of FANR (see 3GPP TS 24.008) and it does not indicate support of Reduced Latency, it may be assigned TBFs with FANR activated (see sub-clause 9.1.14) in BTTI configuration only.
2. The Fast Ack/Nack reporting procedure (FANR) allows to piggy-back, within EGPRS RLC/MAC blocks for data transfer sent in one direction, the acknowledgement status of data blocks relative to a TBF in the opposite direction.
3. If an uplink TBF is established or reconfigured with FANR activated (see sub-clauses 11.2.29, 11.2.29a, 11.2.31, and 11.2.31a), the mobile station shall monitor for the presence of a PAN field for this TBF on all downlink PDCHs on which it shall monitor the USF for this TBF... The network may encode the PAN field according to the SSN-based encoding defined in subclause 9.1.8 or the time-based encoding defined in subclause 9.1.15. The specific encoding selected by the network is notified to the mobile station at TBF establishment/reconfiguration.
4. When the Time-based encoding is used (see sub-clause 9.1.14.1), the Piggy-backed Ack/Nack (PAN) field consists of a 20 bits reported bitmap, as described in sub-clause 9.1.15, plus 5 bits set to '0'.

58a.1.3.2 Test Purposes

1. To verify that the mobile station can establish an uplink TBF with FANR activated using the time based format.
2. To verify that the mobile station correctly interprets the contents of PAN fields received in downlink data blocks on downlink PDCHs which it is monitoring for USF for the uplink TBF.

58a.1.3.3 Method of Test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer 1000 octets of user data. An uplink TBF is established using an EGPRS coding scheme that requires the transmission of two RLC data blocks per EGPRS uplink radio block. During the uplink TBF the SS negatively acknowledges both RLC data blocks contained within one uplink EGPRS data block sent by the MS using a PAN field in the time based format included in a downlink data block sent on the assigned PDTCH. It is checked that the MS re-transmits both negatively acknowledged RLC data blocks. The re-transmitted RLC data blocks are then positively acknowledged by the SS. During the uplink TBF the SS negatively acknowledges the first of two RLC data blocks contained within one uplink EGPRS data block sent by the MS using a PAN field in the time based format included in a downlink data block sent on the assigned PDTCH. It is checked that the MS re-transmits the negatively acknowledged RLC data block. The re-transmitted RLC data block is then positively acknowledged by the SS. During the uplink TBF the SS negatively acknowledges the second of two RLC data blocks contained within one uplink EGPRS data block sent by the MS using a PAN field in the time based format included in a downlink data block sent on the assigned PDTCH. It is checked that the MS re-transmits the negatively acknowledged RLC data block. The re-transmitted RLC data block is then positively acknowledged by the SS. The uplink TBF is completed during which it is checked that the MS does not repeat any of the previously positively acknowledged uplink RLC data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for $k=1$ (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for $k=2$ (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

58a.1.4 Uplink TBF, Time based PAN Format, with Concurrent Downlink TBF

58a.1.4.1 Conformance Requirements

1. If a mobile station indicates support of Reduced Latency (see 3GPP TS 24.008), it may be assigned TBFs with FANR activated (see sub-clause 9.1.14), either in BTTI configuration or in RTTI configuration. If a mobile station indicates support of FANR (see 3GPP TS 24.008), it may be assigned TBFs with FANR activated (see sub-clause 9.1.14) in BTTI configuration only. The network shall ensure that, if a mobile station is assigned a TBF with FANR activated, FANR shall be activated for all concurrent TBFs assigned to that mobile station.
2. If an uplink TBF is established or reconfigured with FANR activated (see sub-clauses 11.2.29, 11.2.29a, 11.2.31, and 11.2.31a), the mobile station shall monitor for the presence of a PAN field for this TBF on all downlink PDCHs on which it shall monitor the USF for this TBF... If the presence of a PAN field is indicated in the header of an EGPRS RLC/MAC block for data transfer received on these PDCHs, the mobile station shall decode the PAN field also in the blocks addressed to other mobile stations. The network may encode the PAN field according to the SSN-based encoding defined in subclause 9.1.8 or the time-based encoding defined in subclause 9.1.15. The specific encoding selected by the network is notified to the mobile station at TBF establishment/reconfiguration.
3. When the Time-based encoding is used (see sub-clause 9.1.14.1), the Piggy-backed Ack/Nack (PAN) field consists of a 20 bits reported bitmap, as described in sub-clause 9.1.15, plus 5 bits set to '0'.

58a.1.5 Concurrent Uplink and Downlink TBFs, Discrimination of PAN Information from Different PDCH or PDCH Pairs

58a.1.5.1 Conformance Requirements

1. If an uplink TBF is established or reconfigured with FANR activated (see sub-clauses 11.2.29, 11.2.29a, 11.2.31, and 11.2.31a), the mobile station shall monitor for the presence of a PAN field for this TBF on all downlink PDCHs on which it shall monitor the USF for this TBF. The mobile station shall only attempt to decode a PAN field in a downlink EGPRS RLC/MAC block for data transfer if it is already required to check for a USF within that RLC/MAC block.

References

3GPP TS 44.060, subclause 9.1.14.1.

58a.1.5.2 Test Purposes

1. To verify that the mobile station only interprets PAN information received on a PDCH (BTTI configuration) or PDCH pairs (RTTI configuration) which it is required to monitor for USF for uplink TBF and ignores PAN information received on other downlink PDCH or PDCH pairs it may simultaneously be monitoring for downlink TBF.

58a.1.5.3 Method of Test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer 440 octets of user data. An uplink TBF in RTTI mode on a single PDCH pair is established if the MS indicates support of Reduced Latency. If the MS indicates support of FANR then an uplink TBF in BTTI mode on a single PDCH is established. A concurrent downlink TBF using two PDCH (BTTI mode) or two PDCH pairs (RTTI mode), one being the same as the slot or pair used for the uplink TBF, is established. During the concurrent uplink and downlink TBFs, the SS inserts a PAN field in the SSN based format into a downlink data block transmitted on the PDCH or PDCH pair not associated with the uplink TBF but which is associated with the downlink

TBF. The PAN field would otherwise negatively acknowledge one of the MS's uplink RLC data blocks and has the TFI set to the same value as assigned to the MS for its uplink TBF. It is checked that the MS does not re-transmit the otherwise negatively acknowledged uplink RLC data block. The uplink RLC data block is then positively acknowledged by the SS using a PAN field in the SSN based format which addresses the MS via its assigned uplink TFI sent on the PDCH or PDCH pair associated with the uplink TBF. The downlink TBF is completed. The uplink TBF is completed during which it is checked that the MS does not repeat any previously positively acknowledged uplink RLC data block.

Maximum Duration of Test

10 minutes.

Expected Sequence

58a.1.6 Concurrent Uplink and Downlink TBFs, Mobile Coding and Puncturing Schemes

58a.1.6.1 Conformance requirements

1. The presence of the PAN field, is signalled by the PAN indicator bit in the RLC/MAC header. When this bit is set the receiver shall use the corresponding Puncturing Scheme variant of the CPS indicated in the RLC/MAC header to decode the RLC data field.
2. For an EGPRS TBF with FANR activated, a Radio Block for data transfer consists of one RLC/MAC header, one or two RLC data block(s) and, optionally, one PAN field. It is always carried by four normal bursts. The interleaving depends on the MCS used.
3. For a TBF with FANR activated, the network may poll the mobile station to trigger the FANR procedure. In case the mobile station has at least one concurrent TBF in the uplink, the mobile station transmits, in a reserved radio block which is allocated together with polling, a radio block for data transfer including a PAN field with ack/nack information.
4. If a mobile station indicates support of Reduced Latency (see 3GPP TS 24.008), it may be assigned TBFs with FANR activated, either in BTTI configuration or in RTTI configuration. If a mobile station indicates support of FANR (see 3GPP TS 24.008), it may be assigned TBFs with FANR activated (see sub-clause 9.1.14) in BTTI configuration only. The network shall ensure that, if a mobile station is assigned a TBF with FANR activated, FANR shall be activated for all concurrent TBFs assigned to that mobile station.
5. For a TBF with FANR activated, if the commanded MCS is MCS-9 (respectively MCS-4), the initial transmission of the RLC data block(s) shall be done with MCS-8 (respectively MCS-3) if a PAN field is included in the radio block.

References

3GPP TS 43.064, subclause 3.3.5.1, 6.5.4.3, 6.6.4.8.2

3GPP TS 44.060, subclause 5.2.1, 8.1.1

58a.1.6.2 Test purpose

1. To verify that mobile station uses the received PAN field correctly for different mobile coding and puncturing schemes.
2. To verify that the MS includes the PAN field in uplink data blocks coded using different commanded MCS when polled for PAN by the network.
3. To verify that initial transmission of RLC data block(s) by MS, when PAN field is included in the radio block, shall be done with MCS-8 (respectively MCS-3) when commanded MCS is MCS-9 (respectively MCS-4).

58a.1.6.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

- EGPRS capable of 8PSK in Uplink, of all Multislot classes (TSPC_Type_EGPRS_8PSK_uplink)

PIXIT Statements

-

Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF, with FANR activated in the PACKET DOWNLINK ASSIGNMENT message. The MS is then triggered to transfer 5300 octets of user data, MCS-1 is used both for uplink and downlink.

After 3 uplink data blocks SS includes PAN field in the downlink data block. One uplink data block from MS is negatively acknowledged and two data blocks are positively acknowledged. MS re-transmits the negatively acknowledged data block. SS includes PAN field in the downlink data block and acknowledges the re-transmitted data block.

SS skips sending of two downlink data blocks and polls MS for acknowledgement of downlink data blocks sent. MS includes PAN field in the uplink data block and it is checked that the correct data blocks have been acknowledged.

SS re-transmits negatively acknowledged downlink data blocks and polls MS for acknowledgement of downlink data blocks sent. MS includes PAN field in the uplink data block and it is checked that the correct data blocks have been acknowledged.

Test procedure is repeated for all supported mobile coding schemes.

Maximum Duration of Test

15 minutes.

Expected Sequence

The test case is repeated for $k=1$ (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for $k=2$ (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode, FANR activated. SS Commands MS to use mobile coding scheme MCS-1.
2	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. CES/P = 001
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on uplink PACCH of the assigned PDTCH. Received in reserved block allocated by CES/P at Step 2.
4	MS		The MS is triggered to send 5300 octets of user data.
5	SS <-> MS		Steps 2 and 3 are repeated until the reception of an EGPRS PACKET DOWNLINK ACK/NACK with Channel request Description IE included at Step 3.
6	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. The uplink TBF is assigned. MCS-1 commanded as used mobile coding scheme. See Specific Message Contents below.
7	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. USF assigned to the MS.
8	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. BSN = BSN(n) For MCS-7 to MCS-9: BSN=BSN(n), BSN(n+1) The SS checks that the PAN field is not included in the uplink data block header.
9	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. USF assigned to the MS.
10	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. BSN = BSN(n+1) For MCS-7 to MCS-9: BSN=BSN(n+2), BSN(n+3) SS checks that the PAN field is not included in the uplink data.
11	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. PAN field included. UPLINK DATA BLOCK BSN=BSN(n) in negatively acknowledged. USF assigned to the MS.
12	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. BSN = BSN(n) For MCS-7 to MCS-9: BSN=BSN(n), BSN(n+4) SS checks that PAN field is not included in the uplink data.
13	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. PAN field included. UPLINK DATA BLOCK BSN=BSN(n) in positively acknowledged. BSN = BSN (n). For MCS-7 to MCS-9: BSN=BSN(n), BSN(n+1) USF assigned to the MS.
14	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. SS checks that the PAN field is not included in the uplink data.
15	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN=BSN (n+2). For MCS-7 to MCS-9: BSN=BSN(n+2), BSN(n+3) USF assigned to the MS.
16	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. SS checks that the PAN field is not included in the uplink data block header.
17	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN=BSN (n+4) For MCS-7 to MCS-9: BSN=BSN(n+4), BSN(n+5) CES/P is set to 011. Polling the MS for PAN.

18	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. Contains the PAN field. The PAN field negatively acknowledges downlink data blocks with BSN = BSN(n+1) and (n+3) and positively acknowledges downlink data blocks with BSN = BSN(n), (n+2) and (n+4). Note: If MCS-9 (respectively MCS-4) is used for the uplink data transfer this data block is sent using MCS-8 (respectively MCS-3).
19	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN=BSN (n+1). For MCS-7 to MCS-9: BSN=BSN(n+1), BSN(n+3) USF assigned to the MS.
20	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH.
21	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN=BSN (n+3). For MCS-7 to MCS-9: BSN=BSN(n+5), BSN(n+6) CES/P is set to 011. Polling the MS for PAN.
22	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. The PAN field positively acknowledges downlink data blocks with BSN = BSN(n+1) and BSN(n+3) For MCS-7 to MCS-9: The PAN field positively acknowledges downlink data blocks with BSN = BSN(n+1), BSN(n+3), BSN(n+5) and BSN(n+6) Note: If MCS-9 (respectively MCS-4) is used for the uplink data transfer this data block is sent using MCS-8 (respectively MCS-3).
23	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. SS Commands MS to use mobile coding scheme MCS-2. See Specific Message Contents below.
24	SS<>MS		Steps 7 to 22 are repeated using MCS-2 for downlink data blocks.
25	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. SS Commands MS to use mobile coding scheme MCS-3. See Specific Message Contents below.
26	SS<>MS		Steps 7 to 22 are repeated using MCS-3 for downlink data blocks.
27	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. SS Commands MS to use mobile coding scheme MCS-4. See Specific Message Contents below.
28	SS<>MS		Steps 7 to 22 are repeated using MCS-4 for downlink data blocks.
			Steps 29 to 38 are performed only for MSs supporting 8PSK in uplink (see PICS).
29	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. SS Commands MS to use mobile coding scheme MCS-5. See Specific Message Contents below.
30	SS<>MS		Steps 7 to 22 are repeated using MCS-5 for downlink data blocks.
31	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. SS Commands MS to use mobile coding scheme MCS-6. See Specific Message Contents below.
32	SS<>MS		Steps 7 to 22 are repeated using MCS-6 for downlink data blocks.
33	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. SS Commands MS to use mobile coding scheme MCS-7. See Specific Message Contents below.
34	SS<>MS		Steps 7 to 22 are repeated using MCS-7 for downlink data blocks.
35	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. SS Commands MS to use mobile coding scheme MCS-8. See Specific Message Contents below.
36	SS<>MS		Steps 7 to 22 are repeated using MCS-8 for downlink data blocks.

37	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. SS Commands MS to use mobile coding scheme MCS-9. See Specific Message Contents below.
38	SS<>MS		Steps 7 to 22 are repeated using MCS-9 for downlink data blocks.
39	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on assigned PDTCH. CES/P = 001 FBI = 1
40	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on uplink PACCH. Received in reserved block allocated by CES/P at Step 39. FAI = 1
41	SS	{Completion of uplink RLC data block transfer}

58a.1.7 Concurrent Uplink and Downlink TBFs, Choice of MCS for Uplink Data Block Re-Transmission with PAN Field Present

58a.1.7.1 Conformance Requirements

1. For a TBF with FANR activated, if these rules require a retransmission in MCS-9 and a PAN field is included in an EGPRS RLC/MAC block for data transfer, the mobile station shall use MCS-6. If these rules require a retransmission in MCS-4, a PAN field is to be included in an EGPRS RLC/MAC block for data transfer and re-segmentation is allowed, the mobile station shall use MCS-1. If these rules require a retransmission in MCS-4 and re-segmentation is not allowed, the mobile station shall use MCS-4 and shall not include a PAN field in this retransmission.

References

3GPP TS 44.060, subclause 8.1.1.

58a.1.7.2 Test Purposes

1. To verify that the mobile station re-transmits a negatively acknowledged uplink data block using MCS-6 when the rules would otherwise require re-transmission using MCS-9, but a PAN field is to be included.
2. To verify that the mobile station re-transmits a negatively acknowledged uplink data block using MCS-1 when re-segmentation is allowed and the rules would otherwise require re-transmission using MCS-4, but a PAN field is to be included.
3. To verify that the mobile station re-transmits a negatively acknowledged uplink data block using MCS-4 without including the requested PAN field where the rules require re-transmission using MCS-4 and re-segmentation is not allowed.

58a.1.7.3 Method of Test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer 1000 octets of user data. An uplink TBF using MCS-9 on an RTTI configuration is established, if the MS indicates support of Reduced Latency. If the MS indicates support of FANR then an uplink TBF using MCS-9 on an BTTI configuration is established. A concurrent downlink TBF is established. During the concurrent uplink and downlink TBFs, the SS negatively acknowledges one of the MS's uplink RLC data blocks using a PAN field included in the header of a downlink data block. It is checked that the MS re-transmits the negatively acknowledged uplink RLC data block using MCS-6 and includes the requested PAN field in the uplink data block. The re-transmitted uplink RLC data block is then positively acknowledged by the SS. The commanded MCS is changed to MCS-4. During the concurrent uplink and downlink TBFs, the SS negatively acknowledges one of the MS's uplink RLC data blocks using a PAN field included in the header of a downlink data block. It is checked that the MS re-transmits the negatively acknowledged uplink RLC data block using MCS-1 and includes the requested PAN field in the case where re-segmentation is allowed or alternatively using MCS-4 without including the requested PAN field in the case where re-segmentation is not allowed. The re-transmitted uplink RLC data block is then positively acknowledged by the SS. The downlink TBF is completed. The uplink TBF is completed during which it is checked that the MS does not repeat any of the previously positively acknowledged uplink RLC data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for k =1 (re-segmentation allowed), 2 (re-segmentation not allowed) for all MSs.

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 1000 octets USF_GRANULRITY = 1 block Acknowledged Mode. See Specific Message Contents below.
2	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on downlink PACCH. A downlink TBF is assigned. See Specific Message Contents below.

58a.1.8 Uplink TBF, Handling of Erroneous PAN Fields,SSN Based Format

58a.1.8.1 Conformance Requirements

In the case of a PAN field, the bitmap shall be interpreted in the same way as for the case of PACKET UPLINK ACK/NACK, EGPRS PACKET DOWNLINK ACK/NACK or EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message with the following exceptions:

- if the processing of a PAN would cause an element of V(B) to be changed from ACKED or TENTATIVE_ACK to NACKED, the entire PAN field shall be ignored;
-
- if a PAN positively acknowledges a block which has not yet been transmitted (i.e. whose BSN is higher than or equal to V(S)) the entire PAN field shall be ignored;

References

3GPP TS 44.060, subclause 9.1.8.2.4.

58a.1.8.2 Test Purposes

1. To verify that the mobile station ignores the entire PAN field if a previously positively acknowledged data block is subsequently negatively acknowledged.
2. To verify that the mobile station ignores the entire PAN field if the PAN field positively acknowledges a data block which has yet to be transmitted.

58a.1.8.3 Method of Test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer 1000 octets of user data. An uplink TBF is established. During the uplink TBF, the SS negatively acknowledges one of the MS's uplink RLC data blocks that it has previously positively acknowledged using a PAN field included in the header of a downlink data block. It is checked that the MS does not re-transmit the erroneously negatively acknowledged uplink RLC data block. During the uplink TBF, the SS positively acknowledges an uplink RLC data block that has not yet been transmitted at the same time as negatively acknowledging a transmitted uplink data block which has not previously been positively or negatively acknowledged using a PAN field included in the header of a downlink data block. It is checked that the MS does not re-transmit the negatively acknowledged uplink RLC data block. The uplink TBF is completed during which it is checked that the MS does not repeat any of the previously positively acknowledged uplink RLC data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for $k=1$ (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for $k=2$ (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

58a.1.9 Uplink TBF, Handling of Erroneous PAN Fields, Time Based Format

58a.1.9.1 Conformance Requirements

1. In the case of a PAN field, the bitmap shall be interpreted in the same way as for the case of PACKET UPLINK ACK/NACK, EGPRS PACKET DOWNLINK ACK/NACK or EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message with the following exceptions:

- if the processing of a PAN would cause an element of V(B) to be changed from ACKED or TENTATIVE_ACK to NACKED, the entire PAN field shall be ignored;
- if a PAN positively acknowledges a block which has not yet been transmitted (i.e. whose BSN is higher than or equal to V(S)) the entire PAN field shall be ignored;
- if a time-based PAN indicates a reserved value the entire PAN field shall be ignored

References

3GPP TS 44.060, subclause 9.1.8.2.4.

3GPP TS 44.060, subclause 9.1.15.2.

58a.1.9.2 Test Purposes

1. To verify that the mobile station ignores the entire PAN field if a previously positively acknowledged data block is subsequently negatively acknowledged.
2. To verify that the mobile station ignores the entire PAN field if the PAN field positively acknowledges a data block which has yet to be transmitted.
3. To verify that the mobile station ignores the entire PAN field if the time based PAN field indicates a reserved value.

58a.1.9.3 Method of Test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer 1000 octets of user data. An uplink TBF is established. During the uplink TBF, the SS negatively acknowledges one of the MS's uplink RLC data blocks that it has previously positively acknowledged using a PAN field included in the header of a downlink data block. It is checked that the MS does not re-transmit the erroneously negatively acknowledged uplink RLC data block. During the uplink TBF, the SS positively acknowledges an uplink RLC data block that has not yet been transmitted at the same time as negatively acknowledging a transmitted uplink data block which has not previously been positively or negatively acknowledged using a PAN field included in the header of a downlink data block. It is checked that the MS does not re-transmit the negatively acknowledged uplink RLC data block. During the uplink TBF, the SS negatively acknowledges one of the MS's uplink data blocks but also includes a reserved value later in the same PAN field. It is checked that the MS does not re-transmit the negatively acknowledged uplink RLC data block. The uplink TBF is completed during which it is checked that the MS does not repeat any of the previously positively acknowledged uplink RLC data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for k =1 (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for k =2 (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

58a.1.10 Downlink TBF, with Concurrent Uplink TBF, Polled FANR

58a.1.10.1 Conformance Requirements

1. If the RLC endpoint transmitter is the network and the mobile station has at least one concurrent TBF in the uplink direction, the network may poll the mobile station to trigger the FANR procedure. In this case the mobile station shall answer in a reserved radio block period which is allocated with the polling as described in sub-clause 8.1.2.2.

References

3GPP TS 44.060, subclause 9.1.14.2

58a.1.10.2 Test purpose

1. To verify that the mobile station shall respond to polling for PAN by including a PAN field in a radio block belonging to a concurrent uplink TBF when a concurrent uplink TBF is established and uplink data is due to be sent.

58a.1.10.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF with FANR activated in the PACKET DOWNLINK ASSIGNMENT message. The MS is then triggered to transfer 440 octets of user data. The SS assigns an uplink TBF by sending a PACKET UPLINK ASSIGNMENT message. The SS sends a downlink data block addressed to the MS the header of which polls the MS for PAN but which has a BSN that is out of sequence by two BSNs with the last downlink data block addressing the MS. The SS verifies that the MS inserts a PAN field in the subsequently received uplink data block that indicates non-receipt of the downlink data blocks implied by the out of sequence BSNs. The downlink and the uplink data transfer is completed.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for k =1 (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for k =2 (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

PACKET DOWNLINK ASSIGNMENT in Step 1

{ 0 1 -- '1' indicates Fast Ack/Nack Reporting is activated < EVENT_BASED_FANR: bit (0) > }	1
	0

58a.1.11 Downlink TBF, with Concurrent Uplink TBF, Event Based FANR, Out of Sequence Condition

58a.1.11.1 Conformance requirements

1. The Fast Ack/Nack reporting procedure (FANR) refers to the possibility to include, in a radio block for data transfer sent in one direction, piggy-backed ack/nack information relative to a TBF with FANR activated in the other direction.

2. For a TBF with FANR activated, the network may poll the mobile station to trigger the FANR procedure. In case the mobile station has at least one concurrent TBF in the uplink, the mobile station transmits, in a reserved radio block which is allocated together with polling, a radio block for data transfer including a PAN field with ack/nack information. Additionally, if enabled at TBF establishment/reconfiguration, the mobile station may initiate the FANR procedure in an event-based manner. Whenever an out-of-sequence condition is detected, or the RLC/MAC header of a radio block for data transfer is correctly received but the RLC data part is corrupted, the mobile station piggy-backs a PAN field with ack/nack information in a radio block for data transfer sent in (one of) the mobile station's concurrent TBF(s) with FANR activated in the uplink.

58a.1.13 Downlink TBF, with Concurrent Uplink TBF, Event Based and Polled FANR Combined

58a.1.13.1 Conformance requirements

Event-based FANR may be used together with Polled FANR (see sub-clause 9.1.14.2).

If the RLC endpoint receiver is the mobile station, event-based FANR is enabled for this TBF and the mobile station has at least one assigned TBF in the uplink direction, the mobile station shall insert one PAN field in an EGPRS RLC/MAC block for data transfer transmitted during a given radio block period for that uplink TBF if the state of any element in the receive state array V(N) is UNREPORTED. The mobile station may continue to insert PAN fields in subsequent EGPRS RLC/MAC data blocks sent in the same radio block period as long as there exists one or more elements in the receive state array V(N) whose state is UNREPORTED.

If event-based FANR is enabled and the network polls the mobile station, the mobile station shall transmit, in the reserved radio block period which is allocated with the polling, one of the messages as described in sub-clause 8.1.2.2.

References

3GPP TS 44.060, subclause 9.1.14.3

58a.1.13.2 Test purpose

1. To verify that the mobile station establishes a downlink TBF with event-based FANR enabled.
2. To verify that the mobile station inserts a correctly encoded PAN field in response to the out of sequence condition into the header of an uplink data block belonging to it's concurrent uplink TBF.
3. To verify that the mobile station shall respond to polling for PAN by including a PAN field in a radio block belonging to a concurrent uplink TBF when a concurrent uplink TBF is established.

58a.1.13.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF with EVENT_BASED_FANR specified in the PACKET DOWNLINK ASSIGNMENT message. The MS is then triggered to transfer 440 octets of user data. The SS assigns an uplink TBF by sending a PACKET UPLINK ASSIGNMENT message. The SS sends a downlink data block which has a

BSN that is out of sequence by two BSNs with the last downlink data block addressing the MS. The SS verifies that the MS inserts a PAN field in the subsequently received uplink data block that indicates non-receipt of the downlink data blocks implied by the out of sequence BSNs. The SS transmits the previously negatively acknowledged downlink data blocks and polls the MS for PAN. The SS checks that the MS acknowledges all of the transmitted data blocks. Downlink and uplink data transfer is completed.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for $k=1$ (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for $k=2$ (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode, EVENT_BASED_FANR activated

58a.1.14 Downlink TBF, with and without Concurrent Uplink TBF, CES/P Polling Response

58a.1.14.1 Conformance requirements

For EGPRS when FANR is activated or for EGPRS2, the Combined EGPRS Supplementary/Polling field describes the feedback request and specifies a single uplink block in which the mobile station shall transmit a PACKET CONTROL ACKNOWLEDGEMENT message, a PACCH block or (applicable only if FANR is activated) a radio block containing a PAN field to the network, see table 9.1.8.2.1.3. The single uplink block is defined by a delay relative to the first TDMA frame (N) of the downlink block containing the CES/P value. If ordered to send a EGPRS PACKET DOWNLINK ACK/NACK message or EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message, a mobile station with one or more downlink TBFs using EGPRS2 shall send the EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message. Otherwise, the mobile station shall send the EGPRS PACKET DOWNLINK ACK/NACK message.

The CES/P field is used to indicate what fields the next uplink radio block reserved by this field shall contain (see further clause 9). The single uplink block is defined by a delay relative to the first TDMA frame (N) of the downlink block containing the CES/P value. The procedures defined for transmission of a PACCH block to the network as described in sub-clause 10.4.5 shall apply.

Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF with FANR activated in the PACKET DOWNLINK ASSIGNMENT message. The MS is then triggered to transfer 1000 octets of user data. The SS assigns an uplink TBF by sending a PACKET UPLINK ASSIGNMENT message. While the uplink TBF is ongoing, the SS polls the MS using the CES/P field in the header of the downlink data blocks for each of the CES/P values 001 to 111. It is checked that the MS sends the correct response (according to the table in 44.060 Section 10.4.4b) to the polling in the indicated reserved block.

Following completion of the uplink TBF, the SS polls the MS using the CES/P field in the header of the downlink data blocks for each of the CES/P values 011 and 100. It is checked that the MS sends the correct response (according to the table in 44.060 Section 10.4.4b) to the polling in the indicated reserved block. Downlink data transfer is completed.

Maximum Duration of Test

20 minutes.

Expected Sequence

The test case is repeated for $k=1$ (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for $k=2$ (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF with FANR activated in the PACKET DOWNLINK ASSIGNMENT message. The MS is then triggered to transfer 1000 octets of user data, MCS-1 is used. The SS assigns an uplink TBF by sending a PACKET UPLINK ASSIGNMENT message. The SS sends a downlink data block addressed to the MS the header of which polls the MS for PAN but which has a BSN that is out of sequence by two BSNs with the last downlink data block addressing the MS. The SS verifies that the MS inserts a PAN field in the subsequently received uplink data block that indicates non-receipt of the downlink data blocks implied by the out of sequence BSNs. The user is made to initiate the establishment of a mobile originated circuit switched call. The SS sends a downlink data block addressed to the MS the header of which polls the MS for PAN but which has a BSN that is out of sequence by two BSNs with the last downlink data block addressing the MS. The SS verifies that the MS sends PACKET CS REQUEST in the subsequently received uplink data block. The SS waits for 0.75 seconds. In the next subsequent downlink data block the MS is polled for PAN once again. The SS verifies that the MS inserts a PAN field in the subsequently received uplink data block that indicates non-receipt of the downlink data blocks implied by the out of sequence BSNs. In the next subsequent downlink data block the MS is polled once again for PAN. The SS verifies that the MS sends PACKET CS REQUEST in the subsequently received uplink data block. The SS responds with IMMEDIATE ASSIGNMENT REJECT encapsulated in the PACKET CS COMMAND. The downlink and the uplink data transfer is completed.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for k =1 (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for k =2 (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

58a.1.16 Downlink TBF, with Concurrent Uplink TBF, Transmission of Other Messages in Response to Polling for PAN, PACKET CELL CHANGE NOTIFICATION

58a.1.16.1 Conformance Requirements

Whenever the mobile station receives an RLC data block addressed to one of its TBFs and with a valid RRBp field or with a valid CES/P field in the RLC data block header (i.e. is polled), the mobile station shall transmit one of the following replies in the uplink radio block specified by the RRBp field or CES/P field, whatever the BSN value of the received RLC data block, according to the subsequent decreasing order of priority:

- 1) a (EGPRS) PACKET DOWNLINK ACK/NACK message or EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message containing a Final Ack Indicator;
- 2) a PACKET CS REQUEST message, if such a message is waiting to be transmitted;
- 3) a PACKET CELL CHANGE NOTIFICATION message, if such a message is waiting to be transmitted;

The SS initiates the establishment of a downlink EGPRS TBF with FANR activated in the PACKET DOWNLINK ASSIGNMENT message. The MS is then triggered to transfer 1000 octets of user data, MCS-1 is used. The SS assigns an uplink TBF by sending a PACKET UPLINK ASSIGNMENT message. The SS sends a downlink data block addressed to the MS the header of which polls the MS for PAN but which has a BSN that is out of sequence by two BSNs with the last downlink data block addressing the MS. The SS verifies that the MS inserts a PAN field in the subsequently received uplink data block that indicates non-receipt of the downlink data blocks implied by the out of sequence BSNs. The SS sends the data blocks that were negatively acknowledged. The RF level of the current serving CellA is lowered until the MS prefers cellB. The SS sends a downlink data block addressed to the MS the header of which polls the MS for PAN but which has a BSN that is out of sequence by two BSNs with the last downlink data block addressing the MS. The SS verifies that the MS sends PACKET CELL CHANGE NOTIFICATION in the subsequently received uplink data block. The SS waits for 0.3 seconds. In the next subsequent downlink data block the MS is polled for PAN once again. The SS verifies that the MS inserts a PAN field in the subsequently received uplink data block that indicates non-receipt of the downlink data blocks implied by the out of sequence BSNs. SS resends those data blocks that were negatively acknowledged in the previous poll results. In the next subsequent downlink data block the MS is polled once again for PAN. The SS verifies that the MS sends PACKET CELL CHANGE NOTIFICATION in the subsequently received uplink data block. The SS responds with PACKET CELL CHANGE ORDER message for CellB. Now MS send CHANNEL REQUEST in the CellB. SS responds with Immediate Assignment Reject. The MS sends PACKET CELL CHANGE FAILURE in the old CellA and completes the downlink and uplink data transfer.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for k =1 (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for k =2 (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode. FANR Activated
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH. CES/P = 001.
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on uplink PACCH. Received in reserved block allocated by CES/P at Step 2.
4	MS		The MS is triggered to send 1000 octets of user data.
5	MS<->SS		Steps 2 and 3 are repeated until reception of EGPRS PACKET DOWNLINK ACK/NACK with Channel request Description IE included at Step 3.
6	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. An uplink TBF is assigned. USF_GRANULARITY = 1 block, TLLI_BLOCK_CHANNEL_CODING: arbitrarily chosen CHANNEL_CODING_COMMAND: MCS-1.
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN (n). USF assigned to the MS.
8	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on assigned PDTCH. The SS checks that the PAN field is not included in the uplink data block.
9	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN (n+3) CES/P = 011
10	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on assigned PDTCH. Received in reserved block allocated by CES/P at Step 9. The SS checks that the PAN field is included in the uplink data block and indicates non-receipt of the downlink data blocks with BSN = BSN(n+1) and BSN(n+2) and the receipt of data block BSN = BSN (n+3).
11	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+1)
12	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+2)
13			The RF level of the current serving CellA is lowered until the MS prefers cellB.
14	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN (n+6) CES/P = 011
15	MS -> SS	EGPRS UPLINK RLC DATA BLOCK OR PACKET CELL CHANGE NOTIFICATION	Received on assigned PDTCH. Received in reserved block allocated by CES/P at Step14 The SS checks that the PAN field is included in the uplink data block and indicates non-receipt of the downlink data blocks with BSN = BSN(n+4) and BSN(n+5) and the receipt of the most recently sent downlink data block. Or Packet Cell Change Notification sent in the block indicated as reserved by the CES/P polling request.
16	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH. CES/P = 011
17	MS<->SS		Steps 15 and 16 are repeated until reception of PACKET CELL CHANGE NOTIFICATION at Step 15. BSN of downlink data blocks is incremented by one for each repetition. BSN of the last transmitted downlink data block is BSN = BSN (n+m).
18	SS		SS waits for 0.3 seconds.
19	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN (n+m+1) CES/P = 011

Step	Direction	Message	Comments
20	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on assigned PDTCH. Received in reserved block allocated by CES/P at Step 19. 58a.1.17 Downlink TBF, with and without Concurrent Uplink TBF, PAN Reaction Time, Polled PANR Polled Fast Ack/Nack reporting

58a.1.17.1 Conformance Requirements

1. The Fast Ack/Nack reporting procedure (FANR) refers to the possibility to include, in a radio block for data transfer sent in one direction, piggy-backed ack/nack information relative to a TBF with FANR activated in the other direction.
12. If the RLC endpoint transmitter is the network and the mobile station has at least one concurrent TBF in the uplink direction, the network may poll the mobile station to trigger the FANR procedure. In this case the mobile station shall answer in a reserved radio block period which is allocated with the polling as described in sub-clause 8.1.2.2.
23. In the case where the network polls (for a PAN) and the mobile station does not have any EGPRS RLC/MAC blocks for data transfer in the uplink direction or it does not have any TBF assigned in the uplink direction, the mobile station shall transmit a EGPRS PACKET DOWNLINK ACK/NACK, EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message containing NPB, see sub-clause 10.4.4b.
3. A mobile station that detects a missing/erroneous RLC data block for a downlink TBF with FANR activated (see 3GPP TS 44.060) shall be ready to send an uplink RLC/MAC block for data transfer with a PAN or an EGPRS PACKET DOWNLINK ACK/NACK or EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message (in the case that there is no uplink RLC data ready for transmission) reflecting the missing/erroneous block in the TDMA frame indicated in Table 6.11.5.2 where N = the last TDMA frame of the downlink block in which the MS detected the problem.

3GPP TS 44.060, subclause 9.1.14.2.

3GPP TS 45.010, subclause 6.11.5.

58a.1.17.2 Test purpose

1. To verify that the mobile station shall respond to polling (for a PAN) from the network by including a PAN field in a radio block belonging to a concurrent uplink TBF when a concurrent uplink TBF is established and uplink data is due to be sent.

2. To verify that the mobile station shall respond to polling for PAN by sending an EGPRS PACKET DOWNLINK ACK/NACK message containing NPB when no concurrent uplink TBF is established.
3. To verify that when responding to polling for PAN the MS adheres to the PAN reaction time requirement when a missing or erroneous data block has been detected.

58a.1.17.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 2 activated.

Test Procedure

The SS initiates the establishment of a downlink EGPRS TBF, with FANR activated in the PACKET DOWNLINK ASSIGNMENT message. The MS is then triggered to transfer 440 octets of user data. The SS assigns an uplink TBF by sending a PACKET UPLINK ASSIGNMENT message. The SS sends a downlink data block addressed to the MS the header of which polls the MS for PAN but which has a BSN that is out of sequence by two BSNs with the last downlink data block addressing the MS. SS skips two DOWNLINK Data blocks. Then network Polls (for a PAN) the MS with CES/P in the EGPRS downlink data block. The SS verifies that the MS inserts a PAN field in the header of the subsequently received uplink data block that indicates non-receipt of the downlink data blocks implied by the out of sequence BSNs. The SS checks that the uplink data block is received within the specified PAN reaction time UPLINK RLC DATA BLOCK correctly. The Uplink data transfer is completed. SS skips one more DOWNLINK DATA BLOCKS. The network polls(for a PAN) and the MS respond in the EGPRS PACKET DOWNLINK ACK/NACK message with valid NPB. The SS sends a downlink data block addressed to the MS the header of which is correctly encoded and which polls the MS for PAN but which has a corrupted RLC data part. The SS verifies that the MS sends an EGPRS PACKET DOWNLINK ACK/NACK message that indicates non-receipt of the corrupted downlink data block. The SS checks that the EGPRS PACKET DOWNLINK ACK/NACK message is received within the specified PAN reaction time. The SS transmits the previously negatively acknowledged downlink data blocks. The SS transmits a final downlink data block addressing the MS which polls the MS for PAN. The SS checks that the MS acknowledges all of the transmitted data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

The test case is repeated for k =1 (RTTI, single UL/DL pair), 2 (BTTI plus FANR, single UL/DL slot) for all MSs indicating support of Reduced Latency.

The test case is repeated for k =2 (BTTI plus FANR, single UL/DL slot) only for all MSs indicating support of FANR.

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode. FANR Activated
2	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH., with CES/P = 011.
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on uplink PACCH. of the assigned PDTCH Received in reserved block allocated by CES/P at Step 2.
4	MS		The MS is triggered to send 440 octets of user data.
5	MS <-> SS		Steps 2 and 3 are repeated until reception of EGPRS PACKET DOWNLINK ACK/NACK with Channel request Description IE included at Step 3.
6	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. An The uplink TBF is assigned.
7	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n) USF assigned to the MS.
8	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. The SS checks that the PAN field is not included in the uplink data block header.
9	SS		SS skips DOWNLINK DATA BLOCKS BSN (n+1) , BSN(n+2)
10	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+3) CES/P =is set to 011.Polling the MS for PAN.
11	MS -> SS	EGPRS UPLINK DATA BLOCK	The EGPRS Uplink RLC/MAC header should be checked for the PAN field with the correct bit map for missing DOWNLINK BLOCKS BSN(n+1), BSN(n+2). Received on assigned PDTCH. Received in reserved block allocated by CES/P at Step 10 (equivalent to the PAN reaction time). The SS checks that the PAN field is included in the uplink data block header and indicates non-receipt of the downlink data blocks with BSN = BSN(n+1) and BSN(n+2).
12		{Completion of uplink RLC data block transfer}	
13	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+4) CES/P =is set to 011.Polling the MS for PAN. The RLC/MAC header is correctly encoded but the RLC data part is corrupted.
14	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on uplink PACCH. Received in reserved block allocated by CES/P at Step 13 (equivalent to the PAN reaction time). Contains NPB which indicates non-receipt of the downlink data block with BSN = BSN(n+4). With valid NPB (Next Partial Bitmap), negatively acknowledging the blocks missed by the SS in step 13.
15	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+1) Retransmitting all the negatively acknowledged blocks and finally sending one data block with FBI=1, with CES/P = 011
16	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+2)
17	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+4)

58a.1.18 Downlink TBF, with Concurrent Uplink TBF, PAN Reaction Time, Event Based FANR

58a.1.18.1 Conformance Requirements

1. If the RLC endpoint receiver is the mobile station, event-based FANR is enabled for this TBF and the mobile station has at least one assigned TBF in the uplink direction, the mobile station shall insert one PAN field in an EGPRS RLC/MAC block for data transfer transmitted during a given radio block period for that uplink TBF if the state of any element in the receive state array V(N) is UNREPORTED. The mobile station may continue to insert PAN fields in subsequent EGPRS RLC/MAC data blocks sent in the same radio block period as long as there exists one or more elements in the receive state array V(N) whose state is UNREPORTED.
2. A mobile station that detects a missing/erroneous RLC data block for a downlink TBF with FANR activated (see 3GPP TS 44.060) shall be ready to send an uplink RLC/MAC block for data transfer with a PAN or an EGPRS PACKET DOWNLINK ACK/NACK or EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message (in the case that there is no uplink RLC data ready for transmission) reflecting the missing/erroneous block in the TDMA frame indicated in Table 6.11.5.2 where N = the last TDMA frame of the downlink block in which the MS detected the problem.

3GPP TS 44.060, subclause 9.1.14.1.

58a.1.19.2 Test Purposes

1. To verify that the mobile station operates concurrent uplink and downlink TBFs with FANR enabled in RLC unacknowledged mode.

58a.1.19.3 Method of Test

Initial Conditions

System Simulator:

- 1 cell with EGPRS support, default setting.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context 3 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer 1000 octets of user data. An uplink TBF with FANR on an RTTI configuration is established, if MS indicates support of Reduced Latency. If the MS indicates support of FANR, then an uplink TBF with FANR on an BTTI configuration is established. A concurrent downlink TBF with event based FANR is established. During the concurrent uplink and downlink TBFs, the SS includes the PAN field in a downlink data block which negatively acknowledges uplink data blocks sent by the MS. It is checked that the MS does not re-transmit the negatively acknowledged data blocks. All subsequent uplink data blocks are positively acknowledged by the SS by inserting PAN fields into downlink data blocks as appropriate. During the concurrent uplink and downlink TBFs, the SS omits transmission of selected downlink data blocks. Allowing for the PAN reaction time, it is checked that the MS does not include the PAN field requesting re-transmission of the missing data blocks in its subsequent uplink data blocks. During the concurrent uplink and downlink TBFs, the SS transmits downlink data blocks which have correctly encoded RLC/MAC headers but which have a corrupted RLC data part. Allowing for the PAN reaction time, it is checked that the MS does not include the PAN field requesting re-transmission of the corrupted data blocks in subsequent uplink data blocks. The downlink TBF is completed. The uplink TBF is completed.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 1000 octets USF_GRANULRITY = 1 block Un-acknowledged Mode. MCS chosen arbitrarily from MCS-1..4.
2	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on downlink PACCH. A downlink TBF is assigned. See Specific Message Contents below.
3	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on assigned PDTCH. IF MS supported Reduced Latency Capability THEN Sent three RTTI blocks after Step 2. ELSE IF MS supported FANR Capability THEN Sent three BTTI blocks after Step 2. Does not contain PAN field. USF assigned to the MS.
4	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. Does not contain PAN field. Contains RLC data block with :- BSN = BSN(n)u
5	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. USF not assigned to the MS. Contains the PAN field which negatively acknowledges the data block received at Step 4.
6	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. Does not contain PAN field. USF assigned to the MS. IF MS supported Reduced Latency Capability THEN Send two RTTI blocks after Step 5. ELSE IF MS supported FANR Capability THEN Sent two BTTI blocks after Step 5.
7	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. Does not contain PAN field. Contains RLC data block with :- BSN = BSN(n + 1)u
8	SS		The SS checks that all subsequent uplink data blocks have BSN > BSN(n+1)u
9	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n)d USF not assigned to the MS. Contains the PAN field which positively acknowledges the data block received at Step 7.
10	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+3)d USF not assigned to the MS.
11	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+4)d USF assigned to the MS. IF MS supported Reduced Latency Capability THEN Sent two RTTI blocks after Step 10 ELSE IF MS supported FANR Capability THEN Sent two BTTI blocks after Step 10.
12	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. Does not contain PAN field.
13	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+5)d USF not assigned to the MS. The RLC/MAC header is correctly encoded but the RLC data part is corrupted.

14	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+6)d USF assigned to the MS. Contains the PAN field which positively acknowledges the data block received at Step 12. IF MS supported Reduced Latency Capability THEN Sent two RTTI blocks after Step 13 ELSE IF MS supported FANR Capability THEN Sent two BTTI blocks after Step 13.
15	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. Does not contain PAN field.
16	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on the assigned PDTCH. BSN = BSN(n+7)d FBI = 1 CES/P = 001 USF not assigned to the MS. Contains the PAN field which positively acknowledges the data block received at Step 15.
17	MS -> SS	PACKET CONTROL ACK	Received on uplink PACCH. Received in reserved block allocated by CES/P at Step 16.
18		{Completion of uplink RLC data block transfer}

58a.2 EGPRS test cases for RTTI Configuration

58a.2.1 Uplink RTTI TBF/ Default PDCH pair configuration/ Dynamic Allocation / BTTI USF Mode

58a.2.1.1 Conformance Requirements

- Whenever the mobile station detects an assigned USF value on a monitored downlink PDCH or PDCH-pair, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH or corresponding PDCH-pair for that TBF except if that TBF is running in extended uplink TBF mode, in which case the mobile station may transmit RLC/MAC block(s) for other TBFs assigned on the same PDCH or corresponding PDCH-pair (see sub-clause 9.3.1b.2). The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 45.002. The number of RLC/MAC blocks to transmit is controlled by the USF_GRANULARITY parameter characterising the uplink TBF.
- For an uplink TBF in RTTI configuration that receives the USFs in BTTI USF mode:
 - An assigned USF received on the first PDCH of a monitored downlink PDCH-pair allocates resources for one or four uplink RTTI radio blocks in the first two TDMA frames of the following basic radio block period(s) on the corresponding uplink PDCH-pair, depending on the value of USF_GRANULARITY.
 - An assigned USF received on the second PDCH of a monitored downlink PDCH-pair allocates resources for one or four uplink RTTI radio blocks in the second two TDMA frames of the following basic radio block period(s) on the corresponding uplink PDCH-pair, depending on the value of USF_GRANULARITY.

References

3GPP TS 44.060, subclause 8.1.1.1.

58a.2.1.2 Test Purposes

To verify:

1. The MS is able to operate in RTTI configuration when receiving the USF in BTTI USF mode.
2. When the mobile station receives an assigned USF on the first PDCH of the downlink PDCH-pair, it transmits uplink radio blocks in the first two TDMA frames of the following radio block period on the corresponding PDCH-pair.
3. When the mobile station receives an assigned USF on the second PDCH of the downlink PDCH-pair, it transmits uplink radio blocks in the last two TDMA frames of the following radio block period on the corresponding PDCH-pair.

58a.2.1.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP context3 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

The SS orders the MS to have two-phase access. In PACKET UPLINK ASSIGNMENT an RTTI TBF comprising corresponding uplink and downlink PDCH-pairs is assigned to the MS. (USF_GRANULARITY is set to 1 block.) The SS sends the assigned USF on one of the PDCH of the corresponding downlink PDCH-pair assigned to the MS and checks that one RLC/MAC data block is sent in the appropriate two TDMA frames of the next radio block period. The SS assigns the USF assigned to the MS again. The check is repeated. The procedure continues until the MS completes the packet data transfer.

Maximum Duration of Test

4 minutes

58a.2.2 Uplink RTTI TBF/ default PDCH pair configuration/Dynamic Allocation/ RTTI USF Mode

58a.2.2.1 Conformance Requirement

Whenever the mobile station detects an assigned USF value on a monitored downlink PDCH or PDCH-pair, the mobile station shall transmit either a single RLC/MAC block or a sequence of four RLC/MAC blocks on the same PDCH or corresponding PDCH-pair for that TBF except if that TBF is running in extended uplink TBF mode, in which case the mobile station may transmit RLC/MAC block(s) for other TBFs assigned on the same PDCH or corresponding PDCH-pair (see sub-clause 9.3.1b.2). The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 45.002. The number of RLC/MAC blocks to transmit is controlled by the USF_GRANULARITY parameter characterising the uplink TBF.

For an uplink TBF in RTTI configuration that receives the USFs in RTTI USF mode:

- An assigned USF received on a monitored downlink PDCH-pair in the first reduced radio block period of a given basic radio block period allocates resources for one or four uplink RTTI radio blocks in the second reduced radio block period starting in the same basic radio block period and continuing with the second reduced radio block period in the following basic radio block periods on the corresponding uplink PDCH-pair, depending on the value of USF_GRANULARITY.
- An assigned USF received on a monitored downlink PDCH-pair in the second reduced radio block period of a given basic radio block period allocates resources for one or four uplink RTTI radio blocks in the first

reduced radio block period starting in the next basic radio block period and continuing with the first reduced radio block period in the following basic radio block periods on the corresponding uplink PDCH-pair, depending on the value of USF_GRANULARITY.

On a downlink PDCH-pair assigned to a TBF in RTTI configuration with RTTI USF mode, downlink RLC/MAC control blocks shall always be encoded using either coding scheme CS-1 or coding scheme MCS-0; an MS can differentiate CS-1 blocks from MCS-0 blocks by examining the stealing bits.

Test Procedure

The MS is triggered to perform uplink packet transfer. In the PACKET UPLINK ASSIGNMENT message sent during the subsequent two phase access procedure, an RTTI mode TBF (using a single PDCH pair) using RTTI USF mode with USF GRANULARITY set to 1 block is allocated. The SS grants the MS the assigned USF in a reduced radio block period using a downlink control block encoded using CS-1 occurring in the first two TDMA frames of a given basic radio block period. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS grants the MS the assigned USF in a reduced radio block period using a downlink control block encoded using CS-1 occurring in the last two TDMA frames of a given basic radio block period. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS grants the MS the assigned USF in a reduced radio block period using a downlink control block encoded using MCS-0 occurring in the first two TDMA frames of a given basic radio block period. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS grants the MS the assigned USF in a reduced radio block

period using a downlink control block encoded using MCS-0 occurring in the last two TDMA frames of a given basic radio block period. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. Using a PACKET UPLINK ASSIGNMENT message, the SS re-assigns the MS the same PDTCH pair as before but changes the USF GRANULARITY to 4 blocks. The SS grants the MS the assigned USF in a reduced radio block period using a downlink control block encoded using CS-1 occurring in the first two TDMA frames of a given basic radio block period. The SS checks that the MS sends four uplink data blocks in the corresponding reduced uplink data blocks. The SS acknowledges the received data blocks. The SS grants the MS the assigned USF in a reduced radio block period using a downlink control block encoded using CS-1 occurring in the last two TDMA frames of a given basic radio block period. The SS checks that the MS sends four uplink data blocks in the corresponding reduced uplink data blocks. The SS acknowledges the received data blocks. The SS grants the MS the assigned USF in a reduced radio block period using a downlink control block encoded using MCS-0 occurring in the first two TDMA frames of a given basic radio block period. The SS checks that the MS sends four uplink data blocks in the corresponding reduced uplink data blocks. The SS acknowledges the received data blocks. The SS grants the MS the assigned USF in a reduced radio block period using a downlink control block encoded using MCS-0 occurring in the last two TDMA frames of a given basic radio block period. The SS checks that the MS sends four uplink data blocks in the corresponding reduced uplink data blocks. The SS acknowledges the received data blocks. The uplink data transfer is completed.

Maximum Duration of Test

58a.2.3 Uplink RTTI TBF/default PDCH pair configuration/Extended Dynamic Allocation /BTTI USF

58a.2.3.1 Conformance Requirements

The PACKET UPLINK ASSIGNMENT and MULTIPLE TBF UPLINK ASSIGNMENT messages assign to the mobile station a subset of 1 to N uplink PDCHs (when the uplink TBF operates in BTTI configuration) or uplink PDCH-pairs (when the uplink TBF operates in RTTI configuration), where N depends on the mobile station multislot class.

The following applies for an uplink TBF in RTTI configuration that receives USFs in BTTI USF mode:

- An assigned USF received on the first PDCH of a monitored downlink PDCH-pair allocates resources for one or four uplink RTTI radio blocks in the first two TDMA frames of the following basic radio block period(s) on the corresponding uplink PDCH-pair and all assigned uplink PDCH-pairs with higher numbered timeslots.
- An assigned USF received on the second PDCH of a monitored downlink PDCH-pair allocates resources for one or four uplink RTTI radio blocks in the second two TDMA frames of the following basic radio block period(s) on the corresponding uplink PDCH-pair and all assigned uplink PDCH-pairs with higher numbered timeslots.

Test Procedure

The SS orders the MS to have two-phase access. In PACKET UPLINK ASSIGNMENT an RTTI TBF with EXTENDED DYNAMIC ALLOCATION comprising 2 uplink pairs is assigned to the MS. (USF_GRANULARITY is set to 1 block.)

The SS sends the assigned USF on the lowest PACCH it transmits on the following radio block in uplink the PDCH-pair and all PDCH-pairs with higher numbered timeslots assigned to the MS and checks that one RLC/MAC data block

The SS acknowledge the received data and USF not addressing MS, SS checks that no RLC data blocks received.

The SS sends the assigned USF on the highest PACCH for PDCH-pair2 it transmits on the following radio block in uplink the PDCH-pair and it is checked that the MS sends RLC/MAC data blocks in the next radio block period only on the highest assigned PDCH-pair.

Maximum Duration of Test

4 minutes

3GPP TS 44.060, subclause 8.1.1.2.1

58a.2.4.2 Test Purposes

To verify:

1. When the mobile station receives an assigned USF on a monitored downlink PDCH-pair in the first reduced radio block of a given basic radio block period, it transmits uplink PDCH-pair and all assigned PDCH-pairs with higher numbered timeslots in the second reduced radio block period starting in the same basic radio block period and continuing with the second reduced radio block period in the following basic radio block period on the corresponding PDCH-pair depending on the value of USF_GRANULARITY.
2. When the mobile station receives an assigned USF on a monitored downlink PDCH-pair in the second reduced radio block period of a given basic radio block period it transmits uplink PDCH-pair and all assigned PDCH-pairs with higher numbered timeslots in the first reduced radio block period starting in the next basic radio block period and continuing with the first reduced radio block period in the following basic radio block periods on the corresponding uplink PDCH-pair, depending on the value of USF_GRANULARITY.

58a.2.4.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, Extended dynamic allocation supported, PBCCH not present.

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated and the test PDP context 2 activated.

Test Procedure

The MS is triggered to perform uplink packet transfer. In the PACKET UPLINK ASSIGNMENT message sent during the subsequent two phase access procedure, an RTTI mode TBF (using 2 uplink PDCH pairs) using RTTI USF mode with EXTENDED DYNAMIC ALLOCATION.

The SS sends the assigned USF on the lowest PACCH for the assigned PDCH-pairs. It is checked that the MS sends RLC/MAC data in correct reduced radio block on all assigned PDCH-pairs with USF GRANULARITY set to 1 block

The SS sends the assigned USF on the highest PACCH for the assigned PDCH-pairs. It is checked that the MS sends RLC/MAC data in correct reduced radio block only on the highest assigned PDCH-pair with USF GRANULARITY set to 1 block

Above procedures is repeated with USF GRANULARITY set to 4 blocks.

Maximum Duration of Test

6 minutes

58a.2.5 Uplink RTTI TBF/Default PDCH pair configuration/Dynamic Allocation/USF Mode reconfiguration

58a.2.5.1 Conformance Requirement

The network may, at any time during uplink packet transfer, change the TTI configuration or USF mode (BTTI USF mode or RTTI USF mode) as well as the corresponding downlink PDCH-pairs of an already established uplink TBF by sending on the downlink PACCH, an uplink TBF assignment message (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION). The mobile station shall begin using the new parameters within the reaction time defined in 3GPP TS 45.010.

References

3GPP TS 44.060, subclause 8.1.1.

58a.2.5.2 Test Purposes

To verify:

1. When using BTTI USF mode, if the MS is granted the allocated USF in basic radio block period $B(n)$ on the first of the two downlink timeslots corresponding to an uplink PDCH pair, the MS shall transmit an uplink radio block in reduced radio block period $B(n+1)a$ occurring in the first two TDMA frames of basic radio block period $B(n+1)$ on the uplink PDTCH pair
2. When using BTTI USF mode, if the MS is granted the allocated USF in basic radio block period $B(n)$ on the second of the two downlink timeslots corresponding to an uplink PDCH pair, the MS shall transmit an uplink radio block in reduced radio block period $B(n+1)b$ occurring in the last two TDMA frames of basic radio block period $B(n+1)$ on the uplink PDTCH pair.
3. When using RTTI USF mode, if the MS is granted the allocated USF in reduced radio block period $B(n)a$ occurring in the first two TDMA frames of basic radio block $B(n)$ on the downlink timeslots corresponding to an uplink PDCH pair, the MS shall transmit an uplink radio block in reduced radio block period $B(n)b$ occurring in the last two TDMA frames of basic radio block period $B(n)$ on the uplink PDTCH pair.
4. When using RTTI USF mode, if the MS is granted the allocated USF in reduced radio block period $B(n)b$ occurring in the last two TDMA frames of basic radio block $B(n)$ on the downlink timeslots corresponding to an uplink PDCH pair, the MS shall transmit an uplink radio block in reduced radio block period $B(n+1)a$ occurring in the first two TDMA frames of basic radio block period $B(n+1)$ on the uplink PDTCH pair.
5. The MS is able to perform USF mode reconfiguration (from BTTI USF mode to RTTI USF mode and vice versa) during an ongoing uplink packet transfer and shall respond to the new parameters within the reaction time defined in 3GPP TS 45.010

58a.2.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, default setting.

Mobile Station:

The MS is GPRS attached with a P-TMSI allocated and the test PDP Context 3 activated.

Test Procedure

The MS is triggered to perform uplink packet transfer. In the PACKET UPLINK ASSIGNMENT message sent during the subsequent two phase access procedure, an RTTI mode TBF (using a single PDCH pair) using BTTI USF mode (USF GRANULARITY set to 1 block) is allocated. The SS sends the assigned USF on the first of the two corresponding downlink PDCHs. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS sends the assigned USF on the second of the two corresponding downlink PDCHs. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS checks on each timeslot that the MS does not respond to USF grants using the USF allocated to the other timeslot. Using a PACKET UPLINK ASSIGNMENT message, the SS changes the USF mode (from BTTI mode to RTTI USF mode). The SS grants the MS the assigned USF in a reduced radio block period occurring in the first two TDMA frames of a given basic radio block period. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS grants the MS the assigned USF in a reduced radio block period occurring in the last two TDMA frames of a given basic radio block period. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS checks that the MS no longer responds to the USFs previously allocated in BTTI USF mode. Using a PACKET TIMESLOT RECONFIGURE message, the SS changes the USF mode (from RTTI mode to BTTI USF mode). The SS sends the assigned USF on the first of the two corresponding downlink PDCHs. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS sends the assigned USF on the second of the two corresponding downlink PDCHs. The SS checks that the MS sends one uplink data block in the corresponding reduced uplink data block. The SS acknowledges the received data block. The SS checks that the MS does not respond to USF grants using the USF previously allocated in RTTI USF mode. The uplink data transfer is completed.

Maximum Duration of Test

6 minutes

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access until the last PACKET UPLINK ASSIGNMENT message}	n=1500 octets Assigns a single PDTCH pair on TSm and TSm+1 with default corresponding downlink pair. First burst containing the control block Sent 5/6 frames (dependant on the occurrence of idle or PTCCH frames) after the last TDMA frame containing the assignment message at Step 11. Note : Either CS-1 or MCS-0 may be used on downlink pairs supporting RTTI USF mode.
13	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on uplink PDTCH pair. Received on reduced radio block B(n)b. MCS as specified in Step 2.
14	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on downlink PDTCH pair. Contains the PAN field which acknowledges the radio block received in Step 13. USF = USF1.
15	SS		Check that no radio block is transmitted by the MS in response to the USF grant in Step 14.

16	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on downlink PACCH of PDCH pair. Sent on reduced radio block B(n)b. Control block format MCS-0. USF = USF3. Note : Either CS-1 or MCS-0 may be used on downlink pairs supporting RTTI USF mode.
17	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on uplink PDTCH pair. Received on reduced radio block B(n+1)a. MCS as specified in Step 2.
18	SS -> MS	EGRS DOWNLINK DATA BLOCK	Sent on downlink PDTCH pair. Contains the PAN field which acknowledges the radio block received in Step 17. USF = USF2.
19	SS		Check that no radio block is transmitted by the MS in response to the USF grant in Step 18.
20	SS -> MS	PACKET TIMESLOT RECONFIGURE	Assigns a single PDTCH pair on TSm and TSm+1 with default corresponding downlink pair. USF Mode = BTTI USF Mode. Assigns USF4 (on TSm) and USF5 (on TSm+1). USF Granularity = 1 block
21	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	One control block sent in BTTI mode on downlink PACCH of TSm with USF set to USF4. Sent in basic control block B(n). Control block format MCS-0. First burst containing the control block Sent 5/6 frames (dependant on the occurrence of idle or PTCCH frames) after the last TDMA frame containing the assignment message at Step 20.
22	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on uplink PDTCH pair. Received on reduced radio block B(n+1)a. MCS as specified in Step 2.
23	SS -> MS	EGPRS DOWNLINK DATA BLOCKS	Two blocks sent on downlink PDTCH pair in RTTI mode. The first block contains the PAN field which acknowledges the radio block received in Step 22. USF on TSm = USF not assigned to the MS. USF on TSm+1 = USF3.
24	SS		Check that no radio block is transmitted by the MS in response to the USF grant in Step 23.
25	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCKS	Two control blocks sent in RTTI mode on the downlink PACCH of the PDCH pair in reduced radio blocks B(n)a and B(n)b such that the USF on TSm+1 in B(n) is set to USF5. Control block format MCS-0.
26	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on uplink PDTCH pair. Received on reduced radio block B(n+1)b. MCS as specified in Step 2.
27	SS -> MS	EGPRS DOWNLINK DATA BLOCKS	Two blocks sent on downlink PDTCH pair in RTTI mode. The first block contains the PAN field which acknowledges the radio block received in Step 26. USF on TSm = USF3. USF on TSm+1 = USF not assigned to the MS.
28	SS		Check that no radio block is transmitted by the MS in response to the USF grant in Step 27.
29		{Completion of uplink RLC data block transfer}	

58a.2.6 Uplink RTTI TBF / One Phase Access Request by Reduced Latency MS / CCCH Case / Contention Resolution

58a.2.6.1 Conformance requirements

EGPRS TBF mode capable mobile stations shall monitor the GPRS Cell Options IE on the BCCH (SI13) for the cell's EGPRS capability and, if the mobile station is also Reduced Latency capable, the cell's Reduced Latency Access capability. In the GPRS Cell Options IE it is also indicated if the EGPRS PACKET CHANNEL REQUEST message is supported in the cell and if Reduced Latency Access is supported in the cell. The following table specifies which

message and which establishment cause shall be used by an EGPRS mobile station when accessing an EGPRS capable cell depending on the purpose of the packet access procedure, and mobile station's and cell's capabilities; this table covers the case where PBCCH is not present in the cell (see 3GPP TS 44.060 for the case where PBCCH is present in the cell).

Table 3.5.2.1.2.1 [abridged]: EGPRS Packet Access Procedure

Purpose of the packet access procedure	EGPRS PACKET CHANNEL REQUEST supported in the cell	EGPRS PACKET CHANNEL REQUEST not supported in the cell
User data transfer – requested RLC mode = acknowledged (Reduced Latency supported by MS)	EGPRS PACKET CHANNEL REQUEST with access type = 'One Phase Access Request by Reduced Latency MS' (NOTE 2)	CHANNEL REQUEST with establishment cause = 'Single block packet access' for initiation of a two-phase access
NOTE 2: The One phase Access Request by Reduced Latency MS shall be used by the mobile station supporting reduced latency if Reduced Latency Access is supported by the network.		

In the case of an uplink EGPRS TBF assignment in RTTI configuration where an IMMEDIATE ASSIGNMENT message is sent in response to a one phase access with access type indicating "One Phase Access Request by Reduced Latency MS" as defined in 3GPP TS 44.060, the assigned timeslots of the uplink PDCH pair(s) and the corresponding downlink PDCH pair (as defined in 3GPP TS 44.060) associated with each assigned uplink PDCH pair are indicated by a combination of the TN given by the *Packet Channel Description* information element and information in the EGPRS Packet Uplink Assignment construction of the IA Rest Octets information element as described in sub-clause 10.5.2.16.

The contention resolution is successfully completed on the mobile station side when the mobile station receives a PACKET UPLINK ACK/NACK message addressing the mobile station with the TFI value associated with the uplink TBF and including the same TLLI value that the mobile station has included in the RLC header of the first RLC data blocks, or alternatively, in EGPRS TBF mode, a PACKET UPLINK ASSIGNMENT message addressing the mobile station with the TFI value associated with the uplink TBF and including the same TLLI value that the mobile station included in the RLC header of the first RLC data blocks. The mobile shall then stop timer T3166 and counter N3104.

Upon contention resolution during one phase access, the mobile station shall start transmitting RLC data blocks without the TLLI field as follows:

- For a TBF operating in RTTI configuration, no later than the next occurrence of block $B((x+2) \bmod 12)_b$ where block Bx_a is the radio block containing the contention resolution message or no later than the next occurrence of block $B((x+3) \bmod 12)_a$ where block Bx_b is the radio block containing the contention resolution message (see 3GPP TS 45.002 [10] for an explanation of RTTI radio block indexing applicable to the RTTI configuration).

3GPP TS 44.018 subclauses 3.5.2.1.2, 3.5.2.1.3.2

3GPP TS 44.060 subclause 7.1.2.3

3GPP TS 45.010 subclause 6.11.3

58a.2.6.2 Test purpose

- To verify that the MS uses the Access Type "One Phase Access Request by Reduced Latency MS" when appropriate.
- To verify that the MS is able to utilise a PDCH pair assigned via the IMMEDIATE ASSIGNMENT message.
- To verify that the MS completes the one phase access contention resolution procedure upon receipt of a PACKET UPLINK ASSIGNMENT message containing its TLLI.
- To verify that the MS meets the contention resolution reaction time requirements for one phase access for a TBF operating in RTTI configuration.

58a.2.6.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated, with a P-TMSI allocated, SPLIT_PG_CYCLE negotiated and test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate uplink data transfer. Following reception of the EGPRS PACKET CHANNEL REQUEST message, the SS assigns an uplink TBF in RTTI mode on a single PDTCH pair using an IMMEDIATE ASSIGNMENT message. The SS checks that the MS includes the TLLI in the initial uplink data blocks received on the assigned resources. The SS sends a PACKET UPLINK ASSIGNMENT message allocating the same uplink resources as in the previous IMMEDIATE ASSIGNMENT message, but including the contention resolution TLLI. The SS checks that the MS ceases to include the TLLI in the header of the subsequent uplink data blocks within the reaction time defined. The uplink TBF is completed.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to transfer 200 octets of user data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH. Access Type = "One phase Access Request by Reduced Latency MS".
3	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on AGCH. Assigns RTTI mode uplink TBF on a single PDTCH pair. MCS arbitrarily chosen from MCS-1..MCS-4.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on PACCH. USF assigned to the MS.
5	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH pair. Contains TLLI. MCS as assigned at Step 3.

6	SS<>MS		Steps 4 and 5 are repeated three times.
7	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on PACCH. Sent on next occurrence of RTTI block B0a following Step 6. Includes the contention resolution TLLI as received in Step 5. Assigns the same PDTCH pair as in Step 3.
8	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on PACCH. Sent on next occurrence of RTTI block B2a following Step 7. USF assigned to the MS.
9	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH pair. Does not contain TLLI. MCS as assigned at Step 3.
10	SS<>MS		Steps 8 and 9 are repeated three times.
11	SS->MS	EGPRS DOWNLINK DATA BLOCK	Sent on corresponding downlink PDTCH pair. Contains the PAN field. PAN field acknowledges receipt of uplink data blocks received in Steps 5 and 9.
12		{Uplink TBF completion}	

Specific Message Contents

None.

58a.2.7 Concurrent RTTI TBF / Channel Quality Reporting

58a.2.7.1 Conformance requirements

In case of EGPRS the MS shall report the overall MEAN_BEP and CV_BEP for the modulations, GMSK and/or 8-PSK (i.e. GMSK_MEAN_BEP, GMSK_CV_BEP; and/or 8PSK_MEAN_BEP, 8PSK_CV_BEP respectively) for which it has received blocks on at least one allocated channel (timeslot or timeslot pair) since it last sent a measurement report to the network.

Additionally, in case of EGPRS, the MS shall report MEAN_BEP_TNx on a per timeslot basis in BTTI configuration, or on a per timeslot pair basis in RTTI configuration where TNx is the lower numbered timeslot of the timeslot pair according to what the network has ordered (see 3GPP TS 44.060).

In RTTI configuration, the mean bit error probability value calculated on per timeslot pair shall be reported on **MODULATION_1_MEAN_BEP_TNx / MODULATION_2_MEAN_BEP_TNx** where TNx is the lower numbered timeslot of each reported timeslot pair.

Reference

3GPP TS 45.008 subclauses 10.2.3.2

3GPP TS 44.060 subclauses 12.5a.3.2

58a.2.7.2 Test purpose

To verify that the MS is able to report the Channel Quality Report of the downlink RTTI Channels when operating in a RTTI configuration. The mean bit error probability value measured per RTTI channel basis shall be reported on GMSK_MEAN_BEP_TNx/8PSK_MEAN_BEP_TNx or MODULATION_1_MEAN_BEP_TNx/ MODULATION_1_MEAN_BEP_TNx where TNx is the lower numbered timeslot of each timeslot pair.

58a.2.7.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated, with a P-TMSI allocated, SPLIT_PG_CYCLE negotiated and test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to perform uplink packet transfer. An RTTI mode uplink TBF using RTTI USF mode on a single PDCH pair having contiguous timeslots is assigned. It is checked that the MS responds to USF grant on the corresponding downlink PDCH pair. A downlink RTTI mode TBF using a single PDCH pair having the same timeslots as the corresponding downlink PDCH pair of the uplink PDCH pair is assigned. It is checked that the MS responds to polling for PAN on the assigned downlink PDCH pair.

The assigned downlink resources are reassigned so that the downlink TBF uses a single PDCH pair on contiguous timeslots different to those used by the corresponding downlink PDCH pair of the uplink TBF. The assigned uplink resources (uplink PDCH pair and corresponding downlink PDCH pair) remain unchanged. The MS includes a Channel Quality Report IE in EGPRS PACKET DOWNLINK ACK/NACK message. It is checked that the MS responds to polling for downlink ack/nack on the new downlink PDCH pair. It is checked that the MS responds to USF grant on the downlink PDCH pair corresponding to the uplink PDCH pair. It is checked that the MS reports on the correct _TNx.

The assigned downlink resources are reassigned so that the downlink TBF uses a single PDCH pair on non-contiguous timeslots different to those used by the corresponding downlink PDCH pair of the uplink TBF. The assigned uplink resources (uplink PDCH pair and corresponding downlink PDCH pair) remain unchanged. The MS includes a Channel Quality Report IE in EGPRS PACKET DOWNLINK ACK/NACK message. It is checked that the MS responds to polling for downlink ack/nack on the new downlink PDCH pair. It is checked that the MS responds to USF grant on the downlink PDCH pair corresponding to the uplink PDCH pair. It is checked that the MS reports on the correct _TNx.

The uplink TBF is completed.

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n=1500 octets Macro performed up to but not including the final PACKET UPLINK ASSIGNMENT message.
2	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. Assigns a single uplink PDTCH pair on contiguous timeslots. The corresponding downlink PDTCH pair uses the same timeslots as the assigned uplink pair. USF Mode = RTTI USF Mode. USF Granularity = 1 block EGPRS Channel coding command arbitrarily chosen between MCS 1 and MCS 4.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on downlink PACCH of the corresponding downlink PDCH pair of the uplink PDCH pair assigned at Step 2. Sent three RTTI blocks after Step 2. USF assigned to the MS.
4	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on uplink PDTCH pair assigned in Step 2. MCS as specified in Step 2.
5	SS->MS	PACKET DOWNLINK ASSIGNMENT	Sent on downlink PACCH of the corresponding downlink PDCH pair of the uplink Ink PDCH assigned at Step 2. Assigns a downlink TBF. Assigns a single downlink PDTCH pair on the same timeslots as in Step 2. The corresponding uplink PDTCH pair uses the same timeslots as the uplink pair assigned at Step 2.
6	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on downlink PDTCH pair assigned in Step 5. Sent three RTTI blocks after Step 5. Contains the PAN field which acknowledges the radio block received in Step 4. CES/P = 011
7	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on uplink PDTCH pair assigned at Step 2. Received in reserved block allocated by CES/P at Step 6. MCS as specified in Step 2.
8	SS-> MS	PACKET TIMESLOT RECONFIGURE	Sent on downlink PACCH of the corresponding downlink PDCH pair of the uplink PDCH pair assigned at Step 2. Assigns the same uplink PDCH pair and corresponding downlink pair as in Step 2. Assigns a downlink PDCH pair on contiguous timeslots which are not the same as the assigned uplink PDCH pair.
9	SS-> MS	EGPRS DOWNLINK DATA BLOCK	Sent on downlink PDTCH pair assigned in Step 8. Sent three RTTI blocks after Step 8. CES/P = 001 Contains the PAN field which acknowledges the radio block received in Step 7.
10	MS-> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the uplink PDCH pair corresponding to the downlink PDTCH pair assigned at Step 8. Acknowledges receipt of the downlink data block sent at Step 9. Includes a Channel Quality Report IE
11	SS-> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on corresponding downlink PDCH pair of the uplink PDCH pair assigned at Step 8. USF assigned to the MS
12	MS-> SS	EGPRS UPLINK DATA BLOCK	Received on the uplink PDTCH pair assigned in Step 8.
13	SS-> MS	PACKET TIMESLOT RECONFIGURE	Sent on downlink PACCH of the corresponding downlink PDCH pair of the uplink PDCH pair assigned at Step 8. Assigns the same uplink PDCH pair and corresponding downlink pair as in Step 8. Assigns a downlink PDCH pair on non-contiguous timeslots which are not the same as the assigned uplink PDCH pair.

14	SS-> MS	EGPRS DOWNLINK DATA BLOCK	Sent on downlink PDTCH pair assigned in Step 13. Sent three RTTI blocks after Step 13. CES/P = 001 Contains the PAN field which acknowledges the radio block received in Step 12.
15	MS-> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the uplink PDCH pair corresponding to the downlink PDTCH pair assigned at Step 13. Acknowledges receipt of the downlink data block sent at Step 14. Includes a Channel Quality Report IE
16	SS-> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on corresponding downlink PDCH pair of the uplink PDCH pair assigned at Step 13. USF assigned to the MS
17	MS-> SS	EGPRS UPLINK DATA BLOCK	Received on the uplink PDTCH pair assigned in Step 13.
18		{Completion of uplink RLC data block transfer}

58a.2.8 Downlink RTTI TBF / default PDCH pair configuration/CCCH case

58a.2.8.1 Conformance requirements

The network initiates the packet downlink assignment procedure by sending an IMMEDIATE ASSIGNMENT message in unacknowledged mode on the CCCH timeslot corresponding to CCCH group the mobile station belongs to.

On receipt of an IMMEDIATE ASSIGNMENT message or, in case of a two-message assignment, a matching pair of IMMEDIATE ASSIGNMENT messages, the mobile station stops monitoring downlink CCCH and switches to the assigned PDCH and starts listening for downlink RLC/MAC blocks identified by the assigned TFI; it starts timer T3190.

In case RTTI configuration is supported by the network and the mobile station and a downlink TBF operating in RTTI configuration is assigned, the following parameters shall be provided by the network in the assignment message (e.g. PACKET DOWNLINK ASSIGNMENT, MULTIPLE TBF DOWNLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION).

- a Temporary Flow Identity (TFI). The TFI applies to all radio blocks transferred in regards to the downlink Temporary Block Flow (TBF);
- one or more downlink PDCH-pairs to be used for the downlink transfer;

None.

58a.2.9 Concurrent RTTI TBFs / Explicit PDCH Pair Configuration

58a.2.9.1 Conformance Requirement

If the default single carrier PDCH pair configuration is indicated, then the assignment is for resources on a subset of the PDCH pairs comprising timeslots 0 and 1, 2 and 3, 4 and 5, and 6 and 7 in both the uplink and on the downlink. If the default dual carrier PDCH pair configuration is indicated, then the assignment is for resources on a subset of the PDCH pairs comprising timeslots 0 and 1, 2 and 3, 4 and 5, and 6 and 7 on both carriers in both the uplink and on the downlink. Otherwise, the assignment is for resources on a subset of the PDCH pairs as specified in the Downlink_PDCH_Pairs_C1, Downlink_PDCH_Pairs_C2, Uplink_PDCH_Pairs_C1 and Uplink_PDCH_Pairs_C2 bitmaps.

If the mobile station is currently in packet transfer mode with one or more RTTI TBFs ongoing, then the network may indicate in the assignment message that the PDCH pair configuration is 'Unchanged'. In this case, the PDCH pair configuration described in the most recently received assignment message (for this mobile station) previous to this message applies.

For an uplink PDCH pair using timeslots *i* and *j*, where $j > i$, the corresponding downlink PDCH pair is:

- the one using timeslots *i* and *j*; else, if no such PDCH pair is specified
- the one using timeslots *i*-1 and *i*; else, if no such PDCH pair is specified
- the one using timeslots *i*-2 and *i*; else, if no such PDCH pair is specified

- the one using timeslots i-3 and i if such a PDCH pair exists.

In case the uplink TBF operates in RTTI configuration then the network shall transmit all PACCH messages on the corresponding downlink PDCH-pair associated with the lowest numbered assigned uplink PDCH-pair. Additionally, for the concurrent TBF case, the network may transmit PACCH messages on any of the PDCH-pairs assigned that are common to the downlink and uplink PDCH-pair assignments.

58a.2.9.2 Test Purposes

To verify that the MS can operate concurrent uplink and downlink TBFs where the PDCH pairs have been explicitly assigned using the Downlink_PDCH_Pairs_C1 and Uplink_PDCH_Pairs_C1 fields for the following PDCH pair configurations :-

1. The assigned downlink PDCH pair uses the same timeslots as the corresponding downlink pair of the uplink PDCH pair.
2. The assigned downlink PDCH pair uses different timeslots to those of the corresponding downlink pair of the uplink PDCH pair.
3. The assigned downlink PDCH pair uses different timeslots to those of the corresponding downlink pair of the uplink PDCH pair and the downlink PDCH pair timeslots are non-contiguous.
4. The assigned downlink PDCH pair uses different timeslots to those of the corresponding downlink pair of the uplink PDCH pair and the uplink PDCH pair timeslots are non-contiguous.

58a.2.10 Concurrent RTTI TBF / Change in TTI configuration

58a.2.10.1 Conformance requirements

The network may, at any time during uplink packet transfer, change the TTI configuration or USF mode (BT TI USF mode or RTTI USF mode) as well as the corresponding downlink PDCH-pairs of an already established uplink TBF by sending on the downlink PACCH, an uplink TBF assignment message (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION). The mobile station shall begin using the new parameters within the reaction time defined in 3GPP TS 45.010.

The network may, at any time during downlink packet transfer, change the TTI configuration of an already established downlink TBF by sending on the downlink PACCH a downlink TBF assignment message (e.g. PACKET DOWNLINK ASSIGNMENT, MULTIPLE TBF DOWNLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION). In case of a TTI configuration change the mobile station shall begin using the new TTI configuration within the reaction time defined in 3GPP TS 45.010.

An MS shall be ready to transmit and receive using a new assignment 9 frame periods after the last radio block containing the assignment message. A mobile station that receives an assignment message for a new or ongoing TBF

with FANR activated (see 3GPP TS 44.060) shall be ready to transmit and receive using the new assignment in the TDMA frame indicated in Table 6.11.1.1 where N = the last TDMA frame of the downlink block containing the assignment message.

Table 6.11.1.1: Assignment Reaction Time for a TBF with FANR activated

Assignment message block format	Full-rate PDCH uplink block with TDMA frame number
BTTI	$(N+5 \text{ or } N+6) \bmod 2715648$
RTTI	$(N+5 \text{ or } N+6) \bmod 2715648$

58a.2.10.2 Test purpose

To verify:

1. The MS is able operate in the new TTI configuration when the TTI configuration (BTTI to RTTI and vice-versa) of an ongoing RTTI or BTTI TBF is changed.
2. The MS is able to perform TTI mode reconfiguration during an ongoing uplink packet transfer and shall respond to the new parameters within the reaction time defined in 3GPP TS 45.010.

58a.2.10.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present.

Mobile Station:

The MS is EGPRS updated, with a P-TMSI allocated, SPLIT_PG_CYCLE negotiated and test PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The MS is triggered to perform uplink packet transfer. A BTTI uplink TBF is established and in progress. After the MS sends an uplink data block the SS assigns a downlink TBF on the same timeslot as the uplink TBF. The SS sends a downlink data block with polling for acknowledgement and the assigned USF assigned to the MS for the MS, and indicates FBI=1 for the final data block. The MS sends an uplink data block and acknowledges the received downlink data block on the correct frame.

An RTTI mode uplink TBF using RTTI USF mode on a single PDCH pair having contiguous timeslots is assigned by a PACKET UPLINK ASSIGNMENT message (to change TTI configuration from BTTI to RTTI). It is checked that the MS responds to USF grant on the corresponding downlink PDCH pair. A downlink RTTI mode TBF using a single PDCH pair having the same timeslots as the corresponding downlink PDCH pair of the uplink PDCH pair is assigned. It is checked that the MS responds to polling for PAN on the assigned downlink PDCH pair.

The SS sends PACKET TIMESLOT RECONFIGURE (to change TTI configuration from RTTI to BTTI) assigning a new downlink PDCH replacing the previous PDCH-pair assignment. A downlink data block is sent, the assigned USF assigned to the MS and the MS is polled for acknowledgement. The MS sends an uplink data block and acknowledges the last received downlink data block on the correct frame.

The SS sends PACKET TIMESLOT RECONFIGURE (to change TTI configuration from BTTI to RTTI) assigning a new downlink PDCH-pair replacing the previous PDCH assignment. An RTTI mode uplink TBF using RTTI USF mode on a single PDCH pair having contiguous timeslots is assigned. A downlink RTTI mode TBF using a single PDCH pair having the same timeslots as the corresponding downlink PDCH pair of the uplink PDCH pair is assigned. It is checked that the MS responds to polling for downlink ack/nack on the newly assigned downlink PDCH pair corresponding to the new uplink PDCH pair. The uplink TBF is completed.

Maximum Duration of Test

5 minutes

58a.2.11 Concurrent RTTI TBF / Downlink Dual Carrier configuration

58a.2.11.1 Conformance requirements

If the default dual carrier PDCH pair configuration is indicated, then the assignment is for resources on a subset of the PDCH pairs comprising timeslots 0 and 1, 2 and 3, 4 and 5, and 6 and 7 on both carriers in both the uplink and on the downlink. Otherwise, the assignment is for resources on a subset of the PDCH pairs as specified in the Downlink_PDCH_Pairs_C1, Downlink_PDCH_Pairs_C2, Uplink_PDCH_Pairs_C1 and Uplink_PDCH_Pairs_C2 bitmaps.

For the purposes of interpreting the RTTI_DOWNLINK_PDCH_PAIR_ASSIGNMENT_SC and RTTI_DOWNLINK_PDCH_PAIR_ASSIGNMENT_DC bitmaps and the repeated USF structures in the Dynamic Allocation 2 struct and Uplink TBF Assignment 2 struct, PDCH pairs are ordered starting with the PDCH pair on

carrier 1 using the lowest numbered timeslots, followed by the PDCH pair on carrier 1 using the next lowest numbered timeslots and so on, followed by the PDCH pair on carrier 2 using the lowest numbered timeslots (if present), etc.

For an uplink PDCH pair using timeslots i and j , where $j > i$, the corresponding downlink PDCH pair is:

- the one using timeslots i and j ; else, if no such PDCH pair is specified
- the one using timeslots $i-1$ and j ; else, if no such PDCH pair is specified
- the one using timeslots $i-2$ and j ; else, if no such PDCH pair is specified
- the one using timeslots $i-3$ and j if such a PDCH pair exists.

When a mobile station has resources assigned on only one carrier then, for the purposes of subsequent assignment messages, that carrier shall be considered carrier 1. A subsequent assignment message may assign resources on a second carrier, thereby establishing a Downlink Dual Carrier configuration; in this case, the assignment message shall provide frequency parameters for a second carrier (carrier 2) for use in a Downlink Dual Carrier configuration.

Downlink Dual Carrier enables downlink TBFs and uplink TBFs to use allocated resources on one or more assigned PDCHs on two different radio frequency channels. Uplink RLC/MAC blocks shall not be scheduled on both carriers of a downlink dual carrier configuration in the same radio block period. Downlink RLC/MAC blocks may be scheduled on both carriers of a downlink dual carrier configuration in the same radio block period.

The network may, at any time during uplink packet transfer, change the TTI configuration or USF mode (BTTI USF mode or RTTI USF mode) as well as the corresponding downlink PDCH-pairs of an already established uplink TBF by sending on the downlink PACCH, an uplink TBF assignment message (e.g. PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION). The mobile station shall begin using the new parameters within the reaction time defined in 3GPP TS 45.010.

Reference

3GPP TS 44.060, subclause 7.1.3.6, 5.5.1.7, 5.9 and 8.1.1.

58a.2.11.2 Test purpose

To verify that:

- the MS is able to operate a RTTI TBF in Downlink Dual Carrier configuration
- the MS is able to change from concurrent RTTI in DLDC mode to Single Carrier BTTI mode and back to concurrent RTTI in DLDC mode
- PDCH pairs on each of the downlink are different from each other
- the PDCH pair Timeslots are non-contiguous.

58a.2.11.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, Downlink Dual Carrier configuration, PBCCH not present.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is EGPRS updated, with a P-TMSI allocated, SPLIT_PG_CYCLE negotiated

Specific PICS Statements

-TSPC Type GPRS Multislot ClassX (where X = 1..45)

-TSPC Type Multislot Capability Reduction for Downlink Dual Carrier of 0 or 1 Timeslots

- TSPC Type Multislot Capability Reduction for Downlink Dual Carrier of 2 or more Timeslots

PIXIT Statements

-

Test Procedure

The MS is triggered to initiate uplink data transfer. Following reception of the EGPRS PACKET CHANNEL REQUEST message, the SS assigns an uplink TBF in RTTI mode on a single PDTCH pair using an IMMEDIATE ASSIGNMENT message. The MS is then made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. SS sends a PACKET DOWNLINK ASSIGNMENT message on its PACCH, instructing the MS for a Dual Carrier Downlink configuration. The SS sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by SS. This is to setup Concurrent Downlink Dual Carrier TBF. The SS sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. The MS receives PACKET UPLINK ASSIGNMENT messages to establish one uplink TBFs with resources on both carrier 1 and carrier 2. MS when polled acknowledges all data blocks send by SS. The MS receives PACKET TIMESLOT RECONFIGURE message on its PACCH to establish single carrier in both downlink and uplink and change the configuration from RTTI to BTTI mode. Also the assigned downlink PDCH pairs are non-contiguous. The SS sends MS a PACKET DOWNLINK DUMMY CONTROL BLOCK in BTTI mode and assigns the USF. The MS sends an EGPRS UPLINK RLC DATA BLOCK to the SS.

The MS receives another PACKET TIMESLOT RECONFIGURE message to change the configuration back to Dual Carrier in BTTI mode. Repeat step 21 to step 28 until the completion of data transfer.

If the MS is of EGPRS multislot class 30-39, steps 30-31 should be executed after step 29.

Maximum Duration of Test

10 minutes

Expected Sequence

Step	Direction	Message	Comments
1	MS		The MS is triggered to transfer 10000 octets of user data.
2	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH. Access Type = "One phase Access Request by Reduced Latency MS".
3	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on AGCH. Assigns RTTI mode uplink TBF on a single PDTCH pair. MCS arbitrarily chosen from MCS-1..MCS-4.
4	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on PACCH. USF assigned to the MS.
5	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on uplink PDTCH pair assigned in Step 3. SS verifies that the BSN starts from 0, and the correct MCS is used. MCS as specified in Step 3.
6	SS->MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 3. Addressing the MS using the UL TFI assigned in Step 3. Two Carriers Assigned. USF Mode = RTTI USF Mode. Downlink TBF established.
7	SS		Wait for at least 3 block periods
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (Start with BSN 0). USF Assigned
9	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on carrier 1. CES/P=011
10	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the corresponding PACCH. Received on reserved block by CES/P in step 9 the MS acknowledges RLC data blocks are received.
11	SS -> MS	PACKET UPLINK ASSIGNMENT	Addressed to the MS. Two Carriers Assigned. New PDTCH assigned for carrier2 and carrier 1 will use assigned PDTCH in step3 USF Mode = RTTI USF Mode.
12	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on downlink PACCH of the corresponding downlink PDCH pair of the uplink PDCH pair. USF assigned to the MS
13	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 1 SS verifies that the correct BSN is received and the correct MCS is used.
14	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on downlink PACCH of the corresponding downlink PDCH pair of the uplink PDCH pair. USF assigned to the MS
15	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 2 SS verifies that the correct BSN is received and the correct MCS is used.
16	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	Received on the corresponding PACCH.
17	SS->MS	PACKET TIMESLOT RECONFIGURE	Change to single carrier in uplink and downlink. Change configuration to BTTI mode.
18	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	One control block sent in BTTI mode on downlink PACCH with USF.
19	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the correct BSN is received and the correct MCS is used.
20	SS->MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDCH assigned. Two Carriers Assigned, Assigns BTTI mode. The assigned downlink PDCH pairs are non-contiguous
21	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (Start with BSN 0). USF Assigned
22	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on carrier 1. MS was polled for valid RRBP field.
23	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the corresponding PACCH. The SS verifies that the MS acknowledges all the received RLC data blocks.
24	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on downlink PACCH of the corresponding downlink PDCH pair of the uplink Ink PDCH . USF assigned to the MS

25	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
26	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on downlink PACCH of the corresponding downlink PDCH pair of the uplink Ink PDCH . USF assigned to the MS
27	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
28	SS -> MS	EGPRS PACKET UPLINK ACK/NACK	Received on the corresponding PACCH.
29	SS		Repeat Steps 21-29 until end of data transfer
30	SS->MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 17. Reconfigure the timeslots if the MS is of the EGPRS multislot class 30-39. The assigned downlink PDCH pairs are non-contiguous This step is optional and shall only be executed if the MS is of EGPRS multislot class 30-39 with 4 downlink and 2 uplink timeslot configuration
31	SS		Repeat step 21 to step 28 until the completion of data transfer. This step is optional and shall only be executed if the MS is of EGPRS multislot class 30-39
		{Completion of uplink RLC data block transfer}	

Specific Message Contents

None.

58a.2.12 Concurrent RTTI TBF / Dual Transfer Mode

58a.2.12.1 Conformance requirements

The RR connection establishment procedure is initiated by the RR entity of the mobile station. Initiation is triggered by request from the MM sublayer to enter dual transfer mode. The request from the MM sublayer to establish the RR connection specifies an establishment cause.

While in dedicated mode, the establishment of an uplink packet resource may be initiated by the RR entity of the mobile station using the packet request procedure.

The mobile station initiates the establishment the packet resource by sending a DTM REQUEST message on the main DCCH.

On receipt of a DTM REQUEST message the network may allocate an uplink packet resource. The packet uplink resource is assigned to the mobile station in one of the DTM assignment messages:

- DTM ASSIGNMENT COMMAND; or
- PACKET ASSIGNMENT.

These messages are sent in acknowledged mode. The DTM ASSIGNMENT COMMAND message may be sent on the SDCCH and on the FACCH. The PACKET ASSIGNMENT message shall be sent only on FACCH.

When sending the DTM ASSIGNMENT COMMAND message on the network side, and when receiving it on the mobile station side, all transmission of signalling layer messages except for those RR messages needed for this procedure and for abnormal cases is suspended until resumption is indicated.

The PACKET ASSIGNMENT message is only used when the packet resource is a PDCH and no reallocation of the RR connection is needed.

The mobile station remains in dual transfer mode until the RR connection or all the packet resources are released.

Reference

3GPP TS 44.060 v9.0.0, subclause 8.9

3GPP TS 44.018, subclause 3.4.22, 3.4.23

All of the above requirements shall be met while maintaining Concurrent RTTI TBF.

58a.2.12.2 Test purpose

To verify that the MS is able to operate a RTTI TBF in Dual Transfer Mode with DTM Command message. The following parts are verified:

MS is in active state of a call and MS initiates the data.

MS is in active state of a call and the network initiates the data.

MS is in a packet transfer mode and user is made to initiate the establishment of a mobile originated circuit switched call.

58a.2.12.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, DTM supported, default setting, PBCCH not present.

Mobile Station:

The MS is in the active state (U10) of a call.

Support for Dual Transfer Mode indicated in MS Radio Access Capabilities IE.

The MS is EGPRS updated, with a P-TMSI allocated, SPLIT_PG_CYCLE negotiated and test PDP Context 1 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

This part tests the DTM ASSIGNMENT COMMAND message. Reallocation of the RR connection is needed while assigning the packet resources.

Once the MS is in state U10 utilising the default TCH of the cell, the MS is triggered to transfer 10000 octets of user data. MS send DTM REQUEST message indicating the supports for Reduced Latency Capability. SS send a DTM ASSIGNMENT COMMAND to the MS to change the channel configuration to a configuration with CS and packet connections when no timing adjustment is needed and reallocation of the CS timeslot is required. MS replies back with ASSIGNMENT COMPLETE message.

The MS starts to send RLC DATA BLOCKS to the SS on the assigned PDTCH. The network also starts to send RLC data blocks to the MS. The test procedure is complete when the SS successfully verifies both uplink and downlink transmission are working in parallel. Finally the CS connection is released.

Steps 12-20 tests the PACKET ASSIGNMENT COMMAND message. The packet resource is a PDCH and no reallocation of the RR connection is needed.

Steps 1-11 are repeated except that in this case the SS send a PACKET ASSIGNMENT to the MS upon receipt of the DTM request message from the MS. There is no ASSIGNMENT COMPLETE message sent back to the SS.

Next the MS is in a dedicated mode and the network initiates data transfer. Steps 21-28 tests the DTM ASSIGNMENT COMMAND message. Reallocation of the RR connection is needed while assigning the packet resources. In step 21 the MS in the active state (U10) of a call on Timeslot N. in step 22 the network initiates transfer of 10000 octets of data by sending a DTM ASSIGNMENT COMMAND message. The MS replies back with an ASSIGNMENT COMPLETE message. Concurrent TBF's is established and the data is transferred in both uplink and downlink. The SS verifies that

both uplink and downlink data transmission is functioning correctly. The SS also verifies that the CS connection is still through connected. Finally the SS releases the CS connection.

In step 29 the MS is again triggered to transfer 10000 octets of user data. Steps 29-35 tests the PACKET ASSIGNMENT COMMAND message. The packet resource is a PDCH and no reallocation of the RR connection is needed.

Steps 36-57 correspond to the concurrent RTTI TBF establishment in the enhanced DTM CS establishment procedure.

The MS is brought into packet transfer mode for uplink TBF. The user is made to initiate the establishment of a mobile originated circuit switched call. The MS sends the PACKET CS REQUEST message on PACCH. The NW responds by sending an encapsulated DTM ASSIGNMENT COMMAND on the PACCH. Upon receipt of the PACKET CS COMMAND, the MS initiates the establishment of the CS connection. It is checked that the MS maintains the uplink TBF throughout the enhanced DTM CS establishment procedure.

Maximum Duration of Test

10 minutes

Expected Sequence

The test sequence is repeated for $k = 1, 2$

Step	Direction	Message	Comments
1	SS		MS in state U10, on Timeslot N (chosen arbitrarily), utilising a default TCH of cell and either: k=1, Channel Type = TCH/F; or k=2, Channel Type = TCH/H.
2	MS		The MS is triggered to transfer 10000 octets of user data.
3	MS->SS	DTM REQUEST	See Specific Message Contents, Reduced Latency Capability is indicated.
4	SS->MS	DTM ASSIGNMENT COMMAND	This message to be sent before the termination of the macro. RTTI mode is defined in the RR PACKET DOWNLINK ASSIGNMENT TYPE 2 value part of the DTM ASSIGNMENT COMMAND. See specific message contents.
5	SS<->MS	{Uplink data transfer}	Macro – Transmitting 2000 octets of data
6	MS->SS	ASSIGNMENT COMPLETE	
7	SS<->MS	{ Downlink data transfer }	Macro.
8	SS<->MS	{ Uplink data transfer }	Macro.
9	SS		Verify both uplink and downlink data transmission is functioning correctly. Completion of 10000 octets of data upload
10	SS		Verify that the CS connection is still through connected on the new time slot.
11	SS->MS	CHANNEL RELEASE	CS Release
12	SS		MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H.
13	MS		Trigger the MS to initiate an uplink packet transfer containing 10000 octets.
14	MS->SS	DTM REQUEST	See Specific Message Contents, Reduced Latency Capability is indicated.
15	SS->MS	PACKET ASSIGNMENT	Sent on the FACH. Includes information on the Radio resources provided to the MS. RTTI mode is defined in the RR PACKET DOWNLINK ASSIGNMENT TYPE 2 value part of the PACKET ASSIGNMENT
16	SS<->MS	{ Downlink data transfer }	Macro
17	SS<->MS	{ Uplink data transfer }	Macro
18	SS		Verify both uplink and downlink data transmission is functioning correctly. Completion of 10000 octets of data upload.
19	SS		Verify that the CS connection is still through connected on the new time slot.
20	SS->MS	CHANNEL RELEASE	CS Release
21	SS		MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H.
22	SS	DTM ASSIGNMENT COMMAND	Network initiates transfer of 10000 octets of data. See specific message contents.
23	MS->SS	ASSIGNMENT COMPLETE	
24	SS<->MS	{ Downlink data transfer }	Macro
25	SS<->MS	{ Uplink data transfer }	Macro
26	SS		Verify both uplink and downlink data transmission is functioning correctly. Completion of 10000 octets of data upload.
27	SS		Verify that the CS connection is still through connected on the new time slot.
28	SS	CHANNEL RELEASE	CS Release.
29	SS		MS in the active state (U10) of a call on Timeslot N. When: k=1, Channel Type=TCH/F; k=2, Channel Type=TCH/H.

58b Downlink Dual Carrier

58b.1 Downlink Dual Carrier Reconfiguration

58b.1.1 Single Carrier Uplink TBF with no Downlink TBF/ DLDC TBF established / No change in Uplink TBF

58b.1.1.1 Conformance requirement

If the network and mobile station both support Downlink Dual Carrier, the network may send a packet assignment message to a mobile station specifying packet resources for one or more TBFs on two carriers (referred to as carrier 1 and carrier 2) and thereby establish a Downlink Dual Carrier configuration. If this message is sent to a mobile station in packet idle mode, the assignment message shall include frequency parameters for both carriers.

When a mobile station has resources assigned on only one carrier then, for the purposes of subsequent assignment messages, that carrier shall be considered carrier 1. A subsequent assignment message may assign resources on a second carrier, thereby establishing a Downlink Dual Carrier configuration; in this case, the assignment message shall provide frequency parameters for a second carrier (carrier 2) for use in a Downlink Dual Carrier configuration.

In a Downlink Dual Carrier configuration, one or more PDCHs are assigned to a single mobile station on each of two different radio frequency channels. A mobile station with a Downlink Dual Carrier configuration shall not be allocated radio blocks on both radio frequency channels during any given radio block period.

3GPP TS 44.060; subclause 5.5.1.7, 8.1.1.1

58b.1.1.2 Test purpose

To verify that the MS:

- decodes correctly the Packet downlink Assignment that assigns dual downlink carrier
- is able to correctly receive data simultaneously on both the carriers assigned

58b.1.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. Then MS receives a PACKET DOWNLINK ASSIGNMENT message on its PACCH, instructing a Dual Carrier Downlink configuration. The SS sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by SS.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 1000 octets USF_GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
4	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 1. Addressing the MS using the UL TFI assigned in Step 1. Two Carriers Assigned. See specific message contents
6	SS		Wait for at least 3 block periods
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (Start with BSN 0). USF Assigned. MCS-1
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1. MCS-1
9	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
10			Repeat Steps 7 to 9 10 Times
11	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With next in sequence BSN. FBI bit set to '1' and valid RRBp field, sent on Carrier 1. MCS-1
12	MS -> SS	EGPRS DOWNLINK PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field. Final Ack Indicator bit set to '1'.
13		{Completion of uplink RLC data block transfer}

58b.1.2 Single Carrier concurrent TBF to DLDC TBF/ Uplink DLDC TBF (on both carrier 1 and carrier 2)/ Reconfigured back to single Carrier Concurrent TBF

58b.1.2.1 Conformance requirement

When a mobile station has resources assigned on only one carrier then, for the purposes of subsequent assignment messages, that carrier shall be considered carrier 1. A subsequent assignment message may assign resources on a second carrier, thereby establishing a Downlink Dual Carrier configuration; in this case, the assignment message shall provide frequency parameters for a second carrier (carrier 2) for use in a Downlink Dual Carrier configuration.

Downlink Dual Carrier enables downlink TBFs and uplink TBFs to use allocated resources on one or more assigned PDCHs on two different radio frequency channels. Uplink RLC/MAC blocks shall not be scheduled on both carriers of a downlink dual carrier configuration in the same radio block period. Downlink RLC/MAC blocks may be scheduled on both carriers of a downlink dual carrier configuration in the same radio block period.

If the network initially assigns a mobile station radio resources on only one carrier, it can extend this assignment to a downlink dual carrier configuration by sending a new single carrier assignment to the mobile station including assigned radio resources for the second carrier, without changing the resources already assigned for the initial carrier. Alternatively the network can include radio resources for two carriers in an initial or subsequent assignment message.

If the network and mobile station both support Downlink Dual Carrier, the network may send a downlink assignment message (e.g. PACKET DOWNLINK ASSIGNMENT, MULTIPLE TBF DOWNLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION) to a mobile station assigning one or more TBFs with packet resources on two carriers (referred to as carrier 1 and carrier 2) and thereby establish a Downlink Dual Carrier configuration.

If the assignment message contains the *Assignment Info* IE indicating an assignment type other than 'Dual Carrier assignment', then the packet resources specified in this message replace any existing assignment for the addressed TBFs on the carrier identified by the Carrier ID field. In this case, if the assignment message addresses TBFs that currently have packet resources assigned on the other carrier (i.e. the carrier not identified by the Carrier ID field) then these packet resources shall be treated as follows:

- these resources are implicitly released, if the ASSIGNMENT TYPE field (carried in the *Assignment Info* IE) indicates that the assignment is an 'Assignment on single carrier only';
- these resources are unchanged, if the ASSIGNMENT TYPE field indicates that the assignment is a 'Modification of existing assignment'.

If the assignment message contains the *Assignment Info* IE indicating an assignment type of 'Dual Carrier assignment', then the packet resources specified in this message replace any existing assignment for the addressed TBFs.

In the case of a mobile station with a Downlink Dual Carrier configuration where the continuous timing advance procedure is used there is no explicit indication of the carrier on which the PTCCH is allocated, and the mobile station shall consider the PTCCH allocation to be on carrier 1 (see sub-clause 5.5.1.7). If a mobile station with a Downlink Dual Carrier configuration receives an assignment message which results in the mobile station no longer being in a Downlink Dual Carrier configuration (but still in packet transfer mode), the mobile station shall consider the PTCCH allocation to be on the carrier on which packet resources are assigned.

When the MS receives the updated value of TA from the BTS on the downlink PTCCH, it shall always use the last received TA value for the uplink transmission.

Within the packet resource assignments (see 3GPP TS 04.08 / 3GPP TS 24.008 and 3GPP TS 04.60) for uplink or downlink messages the MS gets the Timing Advance Index (TAI). The MS shall send access bursts on the subchannel defined by the TAI on the PTCCH using TA=0.

References

3GPP TS 44.060; subclause 5.5.1.7, 7.1.2.5, 5.9 and 8.1.1.1.3

3GPP TS 45.10, subclause 6.5.2.

58b.1.2.2 Test purpose

To verify that:

- the MS is able to change from single carrier concurrent TBF to dual carrier configuration and operate downlink dual carrier downlink and uplink TBF.
- the MS is able to change from single carrier concurrent TBF to dual carrier configuration and operate downlink dual carrier downlink and uplink TBF.
- in Downlink Dual Carrier configuration where the continuous timing advance procedure is used there is no explicit indication of the carrier on which the PTCCH is allocated, and the mobile station shall consider the PTCCH allocation to be on carrier 1. To verify that the mobile station uses the continuous update timing advance mechanism and sends access bursts on the PTCCH slots as determined by the Timing Advance Index sent in the PACKET UPLINK ASSIGNMENT message.
- the MS is able to change from dual carrier to a single carrier assignment and continue to use the same Timing advance parameters if the values are not changed.

58b.1.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

Multislot Capability Reduction for Downlink Dual Carrier of 0 or 1 Timeslots
(TSPC_Type_Multislot_Capability_Reduction_for_Downlink_Dual_Carrier_of_0_or_1_Timeslots)

Multislot Capability Reduction for Downlink Dual Carrier of 2 or more Timeslots

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The timing advance value is included in the PACKET UPLINK ASSIGNMENT. The MS receives a PACKET DOWNLINK ASSIGNMENT message on its PACCH with assignment type set to dual carrier assignment. This configures the MS in Dual Carrier Downlink configuration. The SS sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. The MS receives a PACKET UPLINK ASSIGNMENT with assignment type set to dual carrier assignment. The timing advance parameter values are assigned. Timing advanced Index is set to 2. Frequency parameters are specified separately. The SS sends PACKET UPLINK ACK/NACK on both carriers assigning USF. During uplink transfer the SS continues monitoring the access burst on PTCCH on carrier 1 such that $(FN \bmod (8*52)) = 64$ (TAI =2).

$(8*52)) = 64$ (TAI =2).

The SS sends a PACKET TIMESLOT RECONFIGURE message assigning a single carrier assignment on carrier C1. The timing advance parameters are unchanged. The MS is polled to see if MS responds on C2. The uplink and downlink data transfer is initiated on both directions simultaneously. During uplink transfer the SS continues monitoring the access burst on PTCCH on carrier 1 such that $(FN \bmod (8*52)) = 64$ (TAI =2) same as before.

The SS sends a PACKET DOWNLINK ASSIGNMENT and a PACKET UPLINK ASSIGNMENT to re establish the concurrent dual carrier TBF. The SS sends a PACKET TIMESLOT RECONFIGURE message assigning a single carrier assignment on carrier C2. The timing advance parameters are unchanged. The MS is polled to see if MS responds on C1. The uplink and downlink data transfer is initiated on both directions simultaneously. During uplink transfer the SS continues monitoring the access burst on PTCCH on carrier 2 such that $(FN \bmod (8*52)) = 64$ (TAI =2) same as before as the timing advance parameter is unchanged.

The MS is configured back to dual carrier configuration mode as it has been done previously.(PACKET UPLINK and DOWNLINK ASSIGNMENT). The SS sends a PACKET TIMESLOT RECONFIGURE message assigning a single carrier assignment on carrier C1. The timing advance parameters are changed to an arbitrarily chosen value. The MS is polled to see if MS responds on C2. The uplink and downlink data transfer is initiated on both directions simultaneously. The SS monitors the access burst on PTCCH on carrier 1SS shall verify that the access burst are sent in the correct idle slots as specified in 3GPP TS 05.02 table 6.

MS is reconfigured in dual carrier configuration mode. The SS sends PACKET TIMESLOT RECONFIGURE message assigning a single carrier assignment on carrier C1. New frequency and timeslot values are assigned and new timeslot allocations are assigned. The timing advance index is set to 0. The MS completes the uplink and downlink data transfer. During the uplink data transfer the SS monitors the access burst on PTCCH which are located on slots with numbers

FN, such that $(FN \bmod (8 \cdot 52)) = 12$ for Timing Advance Index = 0 (3GPP TS 03.64 subclause 6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be MESSAGE_TYPE = 011111 and CTRL_ACK = 11.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 10000 octets USF GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1 Timing advance values included.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
4	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 1. Addressing the MS using the UL TFI assigned in Step 1. Two Carriers Assigned. See specific message contents of sub-clause 58b.1.2. Timing advance values included. Including Timing Advance Index = 2 Assignment Type = Dual carrier Assignment
6	SS		Wait for at least 3 block periods
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (Start with BSN 0). USF not Assigned to MS.
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1 with MCS-1 with valid RRBp field. USF not Assigned to MS.
9	MS -> SS	PACKET DOWNLINK ACK/NACK	Sent on PACCH of the PDTCH assigned in Step 5. Addressing the MS using the UL TFI assigned in Step 1 MS acknowledges the previously received RLC data Blocks. Sent on PACCH on the valid RRBp specified in step 10.
12	SS -> MS	PACKET UPLINK ASSIGNMENT	Two Carriers Assigned. New PDTCH assigned for carrier2 and carrier 1 will use assigned PDTCH in step1. See specific message contents 58b.1.2. Timing advance values included. Including Timing Advance Index = 2 Assignment Type = Dual carrier Assignment
11	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
12	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
13	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN and MCS-1. USF assigned to the MS.
14	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
15	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, SS acknowledges all received RLC data Block
16			Repeat steps 11-15 10 times. During uplink transfer in the SS continues monitoring the access burst on PTCCH such that $(FN \bmod (8 \cdot 52)) = 64$ (TAI = 2). SS checks that timing advance from PTCCH allocation on carrier1 used for both carriers.
17	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 10. Addressing the MS using the UL TFI assigned in Step 1.: Assignment type = Single Carrier (C1) Assigned. See specific message contents section of this test case
18	SS		Wait for at least 3 block periods
19	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence. USF not Assigned to MS
20	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN with MCS-1 with valid RRBp field. USF not Assigned to MS

21	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data Blocks. Sent on PACCH on the valid RRBp specified in step 20
22	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, USF not assigned to the MS and with a valid RRBp field
23	SS		SS monitors that no EGPRS PACKET DOWNLINK ACK/NACK is sent on C2 from MS
24	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
25	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
26	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, USF assigned to the MS.
27	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
28	SS		Repeat steps 19 – 27 10 times. During uplink transfer in steps the SS continues monitoring the access burst on PTCH such that $(FN \bmod (8*52)) = 64$ (TAI =2). SS checks the timing advance from PTCH allocation is on carrier1.
29	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 17. Addressing the MS using the UL TFI assigned in Step 1 .Two Carriers Assigned. See specific message contents of sub-clause 58b.1.2. Timing advance values included. Including Timing Advance Index = 2: Assignment Type = Dual carrier Assignment
30	SS		Wait for at least 3 block periods
31	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN. USF not Assigned to MS.
32	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1 with MCS-1 with valid RRBp field. USF not Assigned to MS.
33	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data Blocks. Sent on PACCH on the valid RRBp specified in step 32.
34	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 29. Addressing the MS using the UL TFI assigned in Step 1 Two Carriers Assigned. New PDTCH assigned for carrier2 and carrier 1 will use assigned PDTCH in step29 See specific message contents 58b.1.2 Timing advance values included. Including Timing Advance Index = 2 Assignment Type = Dual carrier Assignment
35	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, USF assigned to the MS.
36	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
37	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, USF assigned to the MS.
38	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
39	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH,
40	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 34. Addressing the MS using the UL TFI assigned. Assignment type = Single Carrier (C2) Assigned. See specific message contents section of this test
41	SS		Wait for at least 3 block periods
42	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN. USF not Assigned with MCS-1

43	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN with MCS-1 with valid RRBp field. USF not Assigned to the MS.
44	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data Blocks. Sent on PACCH on the valid RRBp specified in step 43.
45	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF not assigned to the MS with a valid RRBp field
46	SS		SS monitors that no EGPRS PACKET DOWNLINK ACK/NACK is sent on C1 from MS
47	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to the MS.
48	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
49	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, USF assigned to the MS.
50	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
51	SS		Repeat steps 42 – 50 10 times. During uplink transfer the SS continues monitoring the access burst on PTCCH such that $(FN \bmod (8*52)) = 64$ (TAI =2). SS checks the timing advance from PTCCH allocation is on carrier2. The SS makes sure that PTCCH slot and TA values from Carrier1 are still applied on Carrier2.
52	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 40. Addressing the MS using the UL TFI assigned. Two Carriers Assigned. See specific message contents of sub-clause 58b.1.2. Timing advance values included. Including Timing Advance Index = 2 Assignment Type = Dual carrier Assignment
53	SS		Wait for at least 3 block periods
54	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN. USF not Assigned to the MS.
55	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1 with MCS-1 with valid RRBp field USF not assigned to the MS.
56	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data Blocks. Sent on PACCH on the valid RRBp specified in step 57.
57	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 52. Addressing the MS using the UL TFI assigned in Step 1. Two Carriers Assigned. New PDTCH assigned for carrier2 and carrier 1 will use assigned PDTCH in step 52 See specific message contents 58b.1.2 Timing advance values included. Including Timing Advance Index = 2 Assignment Type = Dual carrier Assignment
58	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
59	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
60	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, USF assigned to the MS.
61	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
62	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH,

63	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 57. Addressing the MS using the UL TFI assigned in step 1. Assignment type = Single Carrier (C1) Assigned. See specific message contents section of this test
64	SS		Wait for at least 3 block periods
65	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN with MCS-1 with valid RRBp field. USF not Assigned to the MS.
66	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN with MCS-1 with valid RRBp field. USF not Assigned to the MS.
67	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data. Blocks. Sent on PACCH on the valid RRBp specified in step 66.
68	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF not assigned to the MS with a valid RRBp field
69	SS		SS monitors that no EGPRS PACKET DOWNLINK ACK/NACK is sent on C2 from MS
70	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
71	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
72	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, USF assigned to the MS.
73	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
74	SS		Repeat steps 66 - 73 10 times. During uplink transfer the SS continues monitoring the access burst on PTCCH and SS shall verify that the access burst are sent in the correct idle slots as specified in 3GPP TS 05.02 table 6. SS checks the timing advance from PTCCH allocation is on carrier1.
75	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 64 .Addressing the MS using the UL TFI. Two Carriers Assigned. See specific message contents of sub-clause 58b.1.2. Timing advance values included. Including Timing Advance Index = 2 Assignment Type = Dual carrier Assignment
76	SS		Wait for at least 3 block periods
77	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN. USF not assigned to the MS.
78	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1 with MCS-1 with valid RRBp field
79	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data Blocks. Sent on PACCH on the valid RRBp specified in step 78.
80	SS -> MS	PACKET UPLINK ASSIGNMENT	Addressed to the MS. Two Carriers Assigned. New PDTCH assigned for carrier2 and carrier 1 will use assigned PDTCH in step 1. See specific message contents 58b.1.2. Timing advance values included. Including Timing Advance Index = 2. Assignment Type = Dual carrier Assignment
81	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
82	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
83	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, USF assigned to the MS.
84	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.

85	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH,
86	SS -> MS	PACKET TIMESLOT RECONFIGURE	Legacy Rel 6 PDU. Sent on PACCH of the PDTCH assigned in Step 80. Addressing the MS using the UL TFI Timing Advance Index = 0. Assignment type = Single Carrier (C1) Assigned. New frequency parameters, New timeslots and new USF parameters specified. See specific message contents section of this test
87	SS		Wait for at least 3 block periods
88	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN. USF not Assigned.
89	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN with MCS-1 with valid RRBp field
90	MS -> SS	PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data. Blocks. Sent on PACCH on the valid RRBp specified in step 89.
91	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF not assigned to the MS with a valid RRBp field.
92	SS		SS monitors that no EGPRS PACKET DOWNLINK ACK/NACK is sent on C2 from MS
93	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
94	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
95	SS -> MS	PACKET UPLINK ACK/NACK	Sent on the PACCH, USF assigned to the MS.
96	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
97		{Completion of Uplink and downlink data transfer}{ C98 completion of downlink and downlink data transfer }	
	SS		During the uplink data transfer (steps 96 to 99) the SS monitors the access burst on PTCH which are located on slots with numbers FN, such that $(FN \bmod (8 \cdot 52)) = 12$ for Timing Advance Index = 0 (3GPP TS 03.64 subclause 6.5.7.2 and 3GPP TS 05.02 table 6). The access burst contents shall be MESSAGE_TYPE = 011111 and CTRL_ACK = 11.

58b.1.3 Single Carrier Concurrent TBF/Downlink TBF reconfigured to DLDC configuration / Uplink single carrier TBF reallocated to Carrier 2/Uplink modified to Dual Carrier

58b.1.3.1 Conformance requirement

If the network and mobile station both support Downlink Dual Carrier, the network may send a packet assignment message to a mobile station specifying packet resources for one or more TBFs on two carriers (referred to as carrier 1 and carrier 2) and thereby establish a Downlink Dual Carrier configuration. If this message is sent to a mobile station in packet idle mode, the assignment message shall include frequency parameters for both carriers.

When a mobile station has resources assigned on only one carrier then, for the purposes of subsequent assignment messages, that carrier shall be considered carrier 1. A subsequent assignment message may assign resources on a second carrier, thereby establishing a Downlink Dual Carrier configuration; in this case, the assignment message shall provide frequency parameters for a second carrier (carrier 2) for use in a Downlink Dual Carrier configuration.

If the assignment message contains the *Assignment Info* IE indicating an assignment type other than 'Dual Carrier assignment', then the packet resources specified in this message replace any existing assignment for the addressed TBFs on the carrier identified by the Carrier ID field. In this case, if the assignment message addresses TBFs that currently have packet resources assigned on the other carrier (i.e. the carrier not identified by the Carrier ID field) then these packet resources shall be treated as follows:

- these resources are implicitly released, if the ASSIGNMENT TYPE field (carried in the *Assignment Info IE*) indicates that the assignment is an 'Assignment on single carrier only';
- these resources are unchanged, if the ASSIGNMENT TYPE field indicates that the assignment is a 'Modification of existing assignment'.

If the assignment message contains the *Assignment Info* IE indicating an assignment type of 'Dual Carrier assignment', then the packet resources specified in this message replace any existing assignment for the addressed TBFs.

Subsequent assignment messages may be sent to a mobile station operating in a Downlink Dual Carrier configuration as described in sub-clause 8.1.1.1.3.

3GPP TS 44.060; subclause 5.5.1.7, 8.1.1.1.3 and 7.1.2.5

58b.1.3.2 Test purpose

To verify that:

- the MS can change from single carrier concurrent TBF to a DLDC TBF with the uplink reallocated to carrier 2.
- re-assignment with different Assignment type for downlink and uplink.

58b.1.3.3. Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks. MS receives a PACKET DOWNLINK ASSIGNMENT message on its PACCH. MS receives another PACKET DOWNLINK ASSIGNMENT message on its PACCH with dual carrier assignment type. SS transmits downlink RLC data blocks for on both carriers. MS sends uplink data block on carrier 1. SS sends packet downlink assignment message (assignment type single carrier) to establish single carrier configuration on the downlink side on carrier 1. SS sends downlink blocks on carrier 1 and MS sends acknowledgment. MS receives a PACKET DOWNLINK ASSIGNMENT message on its PACCH with dual carrier assignment type. Frequency parameters for both carriers are specified. Carrier 1 is specified for all other parameters and this applies to both carriers. SS sends another PACKET DOWNLINK ASSIGNMENT message. All the parameters for carrier 1 and 2 are specified separately. SS sends a PACKET UPLINK ASSIGNMENT (assignment of single carrier only) message. Uplink TBF is reallocated to carrier 2. SS sends another PACKET UPLINK ASSIGNMENT (modification of existing assignment) message. Uplink TBF is reallocated to carrier 1. MS receives another PACKET UPLINK ASSIGNMENT (dual carrier assignment) message. Both carriers are assigned on uplink side. MS completes uplink data transfer.

After each assignment SS checks:

- that the MS is sending uplink data block only on the uplink assigned carrier
- that the MS answers to the polled downlink data block only on the downlink assigned carrier

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 500 octets USF_GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
4	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 1. Addressing the MS using the UL TFI assigned in Step 1.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH addressing the MS assigned in step 1. Assignment type "Modification of existing assignment" Carrier 2 assigned.
6	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (start with BSN 0) USF assigned to the MS. MCS-1. A valid RRBP is indicated.
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN MCS-1. A valid RRBP is indicated.
9	MS->SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBP field.

11	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN USF assigned to the MS. MCS-1. A valid RRBP is indicated.
12	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
13	MS->SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBP field.
14	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH addressing the MS assigned in step 1. Assignment type "Dual Carrier assignment" Both Carriers assigned.
15	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN Send with MCS-1, USF assigned to MS in step 13.
16	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on carrier 1 with MCS-1. A valid RRBP is indicated.
17	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on carrier 1.
18	MS->SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBP field.
19	SS -> MS	PACKET UPLINK ASSIGNMENT	Addressed to the MS. Assignment type "Assignment of single carrier only" Carrier 2 assigned.
20	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to the MS.
21	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 2. SS verifies that the correct BSN is received and the correct MCS is used.
22	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS
23			SS checks that the MS does not answer
24	SS -> MS	PACKET UPLINK ASSIGNMENT	Addressed to the MS. Assignment type "Assignment of single carrier only" Carrier 1 is assigned.

25	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1,
26	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 1. SS verifies that the correct BSN is received and the correct MCS is used.
27	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to the MS.
28			SS checks that the MS does not answer
29	SS -> MS	PACKET UPLINK ASSIGNMENT	Addressed to the MS. Assignment type "Dual Carrier assignment " Both Carriers are assigned.
30	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN Send with MCS-1. USF assigned to the MS. With next in sequence BSN. FBI bit set to '1' and valid RRBp field
31	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on carrier 1.
32	MS -> SS	EGPRS DOWNLINK PACKET DOWNLINK ACK/NACK	On carrier 1, in the uplink block specified by the RRBp field. Final Ack Indicator bit set to '1' .
33	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to the MS.
34	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 2. SS verifies that the correct BSN is received and the correct MCS is used.
35	SS-> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received.
36		{Completion of uplink RLC data block transfer}	

Specific Message Contents

None.

58b.1.4 Single Carrier Uplink TBF with no Downlink TBF / DLDC TBF established / Uplink DLDC TBF (on both carrier 1 and carrier 2)/ Uplink TBF Reconfigured to Single Carrier TBF

58b.1.4.1 Conformance requirement

If the network and mobile station both support Downlink Dual Carrier, the network may send a packet assignment message to a mobile station specifying packet resources for one or more TBFs on two carriers (referred to as carrier 1 and carrier 2) and thereby establish a Downlink Dual Carrier configuration. If this message is sent to a mobile station in packet idle mode, the assignment message shall include frequency parameters for both carriers. If this message is sent to a mobile station which is in packet transfer mode (and is not in a Downlink Dual Carrier configuration) the assignment message shall either:

- provide new frequency parameters for both carriers, or
- provide frequency parameters for only one carrier (carrier 2) in which case the frequency parameters for carrier 1 remain unchanged.

When a mobile station has resources assigned on only one carrier then, for the purposes of subsequent assignment messages, that carrier shall be considered carrier 1. A subsequent assignment message may assign resources on a second carrier, thereby establishing a Downlink Dual Carrier configuration; in this case, the assignment message shall provide frequency parameters for a second carrier (carrier 2) for use in a Downlink Dual Carrier configuration.

When assigning resources on one carrier to a mobile station which is currently in a Downlink Dual Carrier configuration using a format of the message which does not include the Carrier ID field, the network shall always include frequency parameters;

If the assignment message contains the *Assignment Info* IE indicating an assignment type other than 'Dual Carrier assignment', then the packet resources specified in this message replace any existing assignment for the addressed TBFs on the carrier identified by the Carrier ID field. In this case, if the assignment message addresses TBFs that currently have packet resources assigned on the other carrier (i.e. the carrier not identified by the Carrier ID field) then these packet resources shall be treated as follows:

- these resources are implicitly released, if the ASSIGNMENT TYPE field (carried in the *Assignment Info IE*) indicates that the assignment is an 'Assignment on single carrier only';
- these resources are unchanged, if the ASSIGNMENT TYPE field indicates that the assignment is a 'Modification of existing assignment'.

If the assignment message contains the *Assignment Info IE* indicating an assignment type of 'Dual Carrier assignment', then the packet resources specified in this message replace any existing assignment for the addressed TBFs.

3GPP TS 44.060; subclause 5.5.1.7 and 8.1.1.1.3

58b.1.4.2 Test purpose

To verify that the MS:

- the MS can change from single carrier uplink TBF to (with no downlink TBF) to downlink dual carrier TBF with additional resources on new frequency and resources for uplink TBF being allocated on both carriers.
- the MS is able to change from dual carrier configuration in uplink and downlink direction and operate a single carrier TBF in uplink.

58b.1.4.3. Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. MS receives a PACKET TIMESLOT RECONFIGURE (Assignment type "Dual Carrier assignment") message on its PACCH, instructing a Dual Carrier configuration for both uplink and downlink. SS sends downlink data block simultaneously on both carriers and MS sends uplink data block.

SS sends another PACKET TIMESLOT RECONFIGURE (Assignment type "Dual Carrier assignment") to change the USF and timeslot assignment on both carriers in both uplink and downlink direction. MS sends PACKET DOWNLINK DUMMY CONTROL BLOCK on USF not assigned to MS to verify MS does not response to old USF assignment. MS sends uplink data blocks on both carriers on newly assigned USF. The SS sends downlink RLC data blocks on carrier 1 and carrier 2 under new assignment.

MS then receives a PACKET UPLINK ASSIGNMENT message (with assignment type single carrier assignment) to establish single carrier operation on uplink side (carrier 1). MS should not send any data on carrier 2.

SS sends PACKET UPLINK ASSIGNMENT message (Assignment type "Dual Carrier assignment") to change uplink side from single carrier to dual carrier. MS then receives a PACKET UPLINK ASSIGNMENT message (with assignment type single carrier assignment) to establish single carrier operation on uplink side (carrier 1). This is a legacy Rel-6 message. MS finishes uplink data transfer.

Maximum Duration of Test

8 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 4000 octets USF_GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
4	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received.
5	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 1. Assignment type "Dual Carrier assignment" Addressing the MS using the UL TFI assigned in Step 1. Two Carriers Assigned for both uplink and downlink. See specific message contents.
6	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (start with BSN 0) USF assigned to the MS. MCS-1. A valid RRBp is indicated.
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as data block sent on carrier 1. USF assigned to the MS. MCS-1.
8	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 1 SS verifies that the correct BSN is received and the correct MCS is used.
9	MS->SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field.
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1 containing USF assigned to the MS.
11	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
12	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to the MS.
13	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
14	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 1. Assignment type "Dual Carrier assignment" New assignment of timeslot and usf for both uplink and downlink. See specific message contents.
15	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1 containing USF assigned to the MS in step 5.
16	SS		SS should check MS does not send any data on carrier 1.
17	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, USF assigned to the MS.
18	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
19	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to MS in step 5.
20	SS		SS should check MS does not send any data on carrier 2.
21	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, USF assigned to the MS.
22	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier2 SS verifies that the correct BSN is received and the correct MCS is used.
23	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received.
24	SS-> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN MCS-1. A valid RRBp is indicated.
25	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as data block sent on carrier 1. MCS-1
26	MS->SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field.

27	SS -> MS	PACKET UPLINK ASSIGNMENT	Addressed to the MS. Assignment type "Assignment of single carrier only" Carrier 1 assigned.
28	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
29	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
31	SS		SS should check no data is send on USF on carrier 2 from MS
32	SS -> MS	PACKET UPLINK ASSIGNMENT	Addressed to the MS. Assignment type "Dual Carrier assignment" Both carrier 1 and 2 assigned.
33	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
34	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
35	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to the MS.
36	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 2 SS verifies that the correct BSN is received and the correct MCS is used.
37	SS -> MS	PACKET UPLINK ASSIGNMENT	Addressed to the MS. Assignment type "Assignment of single carrier only" Carrier 1 assigned. Legacy Rel 6 message. See specific message contents.
38	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
39	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
40	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN. A valid RRBp is indicated.
41	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as data block sent on carrier 1. MCS-1
42	MS->SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field.
43	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
44	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
45	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1 with next in sequence BSN. FBI bit set to '1' and valid RRBp field, sent on Carrier 1. MCS-1
46	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the assigned PDTCH on carrier1 In the uplink block specified by the RRBp field. Final Ack Indicator bit set to '1' .
47	SS-> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received.
48		{Completion of uplink RLC data block transfer}

58b.1.5 Single Carrier Downlink TBF with No Uplink TBF/ Downlink reconfigured to DLDC TBF/ Uplink TBF established

58b.1.5.1 Conformance requirement

If the network and mobile station both support Downlink Dual Carrier, the network may send a packet assignment message to a mobile station specifying packet resources for one or more TBFs on two carriers (referred to as carrier 1 and carrier 2) and thereby establish a Downlink Dual Carrier configuration. If this message is sent to a mobile station in packet idle mode, the assignment message shall include frequency parameters for both carriers. If this message is sent to a mobile station which is in packet transfer mode (and is not in a Downlink Dual Carrier configuration) the assignment message shall either:

- provide new frequency parameters for both carriers, or
- provide frequency parameters for only one carrier (carrier 2) in which case the frequency parameters for carrier 1 remain unchanged.

In a Downlink Dual Carrier configuration, one or more PDCHs are assigned to a single mobile station on each of two different radio frequency channels. A mobile station with a Downlink Dual Carrier configuration shall not be allocated radio blocks on both radio frequency channels during any given radio block period.

3GPP TS 44.060; subclause 5.5.1.7 and 8.1.1.1

58b.1.5.2 Test purpose

To verify:

The MS is able to change from Single Carrier downlink TBF (no uplink TBF in process) to operate a DLDC TBF

- - new (additional resources) frequency parameters can be allocated to both carriers
- - when frequency parameters are allocated for only one carrier the other carrier remain unchanged.

58b.1.5.3. Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Test Procedure

MS receives an IMMEDIATE ASSIGNMENT message on its PCH allocating resources for carrier 1. SS transmits downlink RLC data blocks. MS responds by sending a PACKET DOWNLINK ACK/NACK. An uplink data transfer is triggered, the MS insert the Channel Request Description in a PDAN and the SS sends a PACKET TIMESLOT RECONFIGURE message to the MS instructing a Dual Carrier Downlink configuration and single carrier on the uplink side (carrier 1). SS starts to send downlink data and MS sends uplink data blocks. SS sends ACK/NACK message to the MS. MS receives a PACKET DOWNLINK ASSIGNMENT message instructing a single carrier assignment for downlink side and brings back it to the initial state (step 1).

SS sends another PACKET TIMESLOT RECONFIGURE message to the MS instructing a dual carrier configuration on downlink side and single carrier on the uplink side (carrier 2). SS starts to send downlink data and MS sends uplink data blocks. SS sends ACK/NACK message to the MS. MS receives a PACKET DOWNLINK ASSIGNMENT message instructing a single carrier assignment for downlink side and brings back it to the initial state (step 1).

SS sends a PACKET TIMESLOT RECONFIGURE message to the MS instructing a dual carrier configuration on both downlink and uplink side. SS starts to send downlink data and MS sends uplink data blocks. SS completes sending downlink data blocks and the MS completes sending uplink data blocks..

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on PCH triggers the MS to assigned PDTCH. Carrier C1 is assigned.
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on assigned PDCH with MCS-1 assigned to the MS. A valid RRBp is indicated.
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field, MS acknowledges the previously received RLC data blocks.
4	MS		MS trigger an uplink data transfer of 1000 octets. Step 2 to 3 are repeated until the Channel Request Description is included into the PACKET DOWNLINK ACK/NACK
5	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH addressing the MS assigned in step 1. Assignment type "Dual Carrier assignment" Two carriers assigned for downlink and carrier 1 is assigned in uplink side. See specific message contents.
6	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence. USF Assigned with MCS-1. A valid RRBp is indicated.
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1 with MCS-1.
8	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 1. SS verifies that the correct BSN is received and the correct MCS is used.
9	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field, MS acknowledges receiving all the data blocks on carrier 1.
10	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to MS.
11			SS should check MS does not send any data on carrier 2
12	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received on carrier 2..
13	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH addressing the MS assigned in step 1. Assignment type "Assignment of single carrier only" Carrier 1 is assigned in downlink side.
14	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on assigned PDCH with MCS-1 assigned to the MS. A valid RRBp is indicated.
15	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	MS acknowledges the previously received RLC data blocks.
16	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH addressing the MS assigned in step 1. Assignment type "Dual Carrier assignment" Two carriers assigned for downlink and carrier 2 is assigned in uplink side.
17	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN. USF Assigned with MCS-1.
18	SS		SS should check MS does not send any data on carrier 1.
19	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN with MCS-1. A valid RRBp is indicated. USF Assigned with MCS-1.
20	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 2. SS verifies that the correct BSN is received and the correct MCS is used.
21	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field, MS acknowledges receiving all the data blocks on carrier 2.
22	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received on carrier 2..
23	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH addressing the MS assigned in step 1. Assignment type "Assignment of single carrier only" Carrier 1 is assigned in downlink side.
24	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on assigned PDCH with MCS-1 assigned to the MS on carrier 1. A valid RRBp is indicated.
25	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field, MS acknowledges the previously received RLC data blocks in carrier 1.

26	SS -> MS	PACKET TIMESLOT RECONFIGURE	Assignment type "Dual Carrier assignment" Reconfigure downlink TBF from single carrier to DLDC configuration. Establish uplink TBF on carrier 1 and carrier 2. USF specified for both carriers.
27	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN with MCS-1. USF assigned to MS. A valid RRBp is indicated.
28	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 1. SS verifies that the correct BSN is received and the correct MCS is used.
29	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field, MS acknowledges receiving all the data blocks on carrier 1 in step 27.
30	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN USF assigned to MS.
31	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 2. SS verifies that the correct BSN is received and the correct MCS is used.
32	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received on carrier 1.
33	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN with MCS-1. USF assigned to MS. A valid RRBp is indicated.
34	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 2. SS verifies that the correct BSN is received and the correct MCS is used.
35	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN USF assigned to MS. FBI bit set to '1' and valid RRBp field
36	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 1. SS verifies that the correct BSN is received and the correct MCS is used.
37	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field, MS acknowledges receiving all the data blocks on carrier 2. Acknowledges receipt of the downlink data block sent on step 31. In the uplink block specified by the RRBp field. Final Ack Indicator bit set to '1'.
38	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received on carrier 2.
39		{Completion of uplink }

58b.2 Concurrent Downlink Dual Carrier TBF

58b.2.1 Concurrent Downlink Dual Carrier TBF/ Reconfigure Frequency Parameters

58b.2.1.1 Conformance requirement

Frequency parameters may be included in the packet assignment messages (i.e., PACKET DOWNLINK ASSIGNMENT, MULTIPLE TBF DOWNLINK ASSIGNMENT, PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION messages) and define the radio frequency channels or set of radio frequency channels the mobile station is to use during the assigned TBF(s). The first assignment message, sent to the mobile station when it enters packet transfer mode or MAC-Shared state, shall include the frequency parameters. Subsequent assignment messages, sent to the mobile station during packet transfer mode or MAC-Shared state, may omit the frequency parameters. If a mobile station receives a subsequent assignment message, during packet transfer mode or MAC-Shared state, without the frequency parameters, the mobile station shall continue to use the previously assigned frequency parameters.

If the network and mobile station both support Downlink Dual Carrier, the network may send a packet assignment message to a mobile station specifying packet resources for one or more TBFs on two carriers (referred to as carrier 1 and carrier 2) and thereby establish a Downlink Dual Carrier configuration. If this message is sent to a mobile station in packet idle mode, the assignment message shall include frequency parameters for both carriers. If this message is sent to a mobile station which is in packet transfer mode (and is not in a Downlink Dual Carrier configuration) the assignment message shall either:

- provide new frequency parameters for both carriers, or

- provide frequency parameters for only one carrier (carrier 2) in which case the frequency parameters for carrier 1 remain unchanged.

Subsequent assignment messages sent to a mobile station in a Downlink Dual Carrier configuration may:

- include frequency parameters which correspond to the frequency parameters already in use for one or both carriers; or
- provide no new frequency parameters, in which case the existing parameters continue to apply; or
- provide new frequency parameters for both carriers; or
- provide new frequency parameters for only one carrier, in which case the frequency parameters for the other carrier remain unchanged.

When a mobile station has resources assigned on only one carrier then, for the purposes of subsequent assignment messages, that carrier shall be considered carrier 1. A subsequent assignment message may assign resources on a second carrier, thereby establishing a Downlink Dual Carrier configuration; in this case, the assignment message shall provide frequency parameters for a second carrier (carrier 2) for use in a Downlink Dual Carrier configuration.

An assignment message sent to a mobile station in packet transfer mode may specify frequency parameters for one or (in the case of a mobile station with a downlink dual carrier configuration) both carriers which are different from those currently in effect for that mobile station only in the following cases:

- a) the assignment message is a PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE message.
- b) the assignment message is a PACKET DOWNLINK ASSIGNMENT message (respectively PACKET UPLINK ASSIGNMENT message) being sent to a mobile station which has no ongoing uplink (respectively downlink) TBF(s).
- c) the assignment message is a MULTIPLE TBF DOWNLINK ASSIGNMENT message (respectively MULTIPLE TBF UPLINK ASSIGNMENT message) being sent to a mobile station which is or, after this assignment, will be in a downlink dual carrier configuration and has no ongoing uplink (respectively downlink) TBF(s); in this case, the ongoing downlink (respectively uplink) TBFs are implicitly reassigned on the new frequency parameters with all other parameters for those TBFs unchanged.
- d) the assignment message is a PACKET DOWNLINK ASSIGNMENT message (respectively PACKET UPLINK ASSIGNMENT message) sent to a mobile station with a downlink dual carrier configuration, where the frequency parameters for only one carrier are changed, and where no ongoing uplink (respectively downlink) TBF(s) had resources assigned on that carrier.

In cases c) and d) above, a format of the message which includes the Carrier ID field shall be used.

When assigning resources on one carrier to a mobile station which is currently in a Downlink Dual Carrier configuration using a format of the message which does not include the Carrier ID field, the network shall always include frequency parameters; if one or more TBFs which are ongoing are not explicitly addressed in the assignment message and will remain ongoing after the new assignment, the included frequency parameters shall be those in use for either carrier 1 or carrier 2.

The Frequency Parameters information element is defined in sub-clause 12.8 and the Dual Carrier Frequency Parameters information element is defined in sub-clause 12.8.2. The frequency parameters may use an ARFCN defining a non-hopping radio frequency channel, or use the indirect encoding, direct encoding 1 or direct encoding 2 defining a hopping radio frequency channel.

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. Then MS receives a PACKET DOWNLINK ASSIGNMENT message on its PACCH, instructing a Dual Carrier Downlink configuration. The SS sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by SS and sends uplink data block when it receives USF on Carrier 1. This is to setup Concurrent Downlink Dual Carrier TBF.

Then the SS sends a PACKET TIMESLOT RECONFIGURE message on the PACCH, instructing a modification of existing assignment for Carrier 1. A new frequency parameter is specified for Carrier 1. The SS then sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by the SS and sends uplink data block when it receives USF on Carrier 1.

Next the SS sends a PACKET TIMESLOT RECONFIGURE message on the PACCH, instructing a modification of existing assignment for Carrier 2. A new frequency parameter is specified for Carrier 2. The SS then sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by the SS and sends uplink data block when it receives USF on Carrier 1.

Next the SS sends a PACKET TIMESLOT RECONFIGURE message on the PACCH, instructing a Dual Carrier Assignment for both Carrier 1 and Carrier 2 using legacy IEs. New frequency parameters are specified for Carrier 1 and Carrier 2. The SS then sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by the SS and sends uplink data block when it receives USF on Carrier 1.

Then the SS sends a PACKET TIMESLOT RECONFIGURE message on the PACCH, instructing a Dual Carrier Assignment for both Carrier 1 and Carrier 2 using dual carrier frequency parameters. New frequency parameters are specified for Carrier 1 and Carrier 2. The SS then sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by the SS and sends uplink data block when it receives USF on Carrier 1.

Finally the SS sends a PACKET TIMESLOT RECONFIGURE message on the PACCH, instructing a Dual Carrier Assignment for both Carrier 1 only using legacy IEs. New frequency parameters are specified for Carrier 1. The SS then sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by the SS and sends uplink data block when it receives USF on Carrier 1.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 1000 octets USF GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
4	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 1. Addressing the MS using the UL TFI assigned in Step 1. Two Carriers Assigned. See specific message contents
6	SS		Wait for at least 3 block periods
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (Start with BSN 0). USF Assigned. MCS-1.
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1. MCS-1.Valid RRBp field
9	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
10	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on Carrier 2 In the uplink block specified by the RRBp field .Concurrent TBF established.
11	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 1. New Frequency Parameters specified for carrier1. See specific message contents
12	SS		Wait for at least 3 block periods
13			Repeat step 7 to 10
14	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 1. New Frequency Parameters specified for carrier2. See specific message contents
15	SS		Wait for at least 3 block periods
16			Repeat step 7 to 10
17	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 1. New Frequency Parameters specified for carrier1 and carrier2 using legacy IEs. See specific message contents
18	SS		Wait for at least 3 block periods
19			Repeat step 7 to 10
20	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 1. New Frequency Parameters specified for carrier1 and carrier2 using dual carrier assignment IEs. See specific message contents
21	SS		Wait for at least 3 block periods
22			Repeat step 7 to 10
23	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 1. New Frequency Parameters specified for carrier1 only using legacy IEs. See specific message contents
24	SS		Wait for at least 3 block periods
25	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (Start with BSN 0). USF Assigned. MCS-1.
26	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1. MCS-1.Valid RRBp field. FBI=1
27	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
28	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on Carrier 2 In the uplink block specified by the RRBp field FBI is set to 1.
29		{ Completion of uplink RLC data block transfer}

58b.2.2 Concurrent Downlink Dual Carrier TBF/ Change in Modulation and Coding Schemes

58b.2.2.1 Conformance requirement

In the case of a Downlink Dual Carrier configuration the commanded MCS shall apply to both of the carriers.

References

3GPP TS 44.060; subclause 8.1.1

58b.2.2.2 Test purpose

To verify that the MS is able to operate in different modulation and coding schemes while operating in a downlink dual carrier configuration on different carrier.

58b.2.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

The downlink blocks on C1 will be cycled through all valid MCS combinations. The SS asks for an acknowledgement from the MS. The MS shall correctly acknowledge all the received data blocks.

The downlink blocks on C2 will be cycled through all valid MCS combinations. The SS asks for an acknowledgement from the MS. The MS shall correctly acknowledge all the received data blocks.

The downlink blocks on both carriers will be cycled through all valid MCS combinations. The SS asks for an acknowledgement from the MS. The MS shall correctly acknowledge all the received data blocks.

The MS will be ordered to cycle through different MCS in the UL direction. The SS verifies the correct MCS is used. The SS shall correctly acknowledge all the received data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 1000 octets USF_GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
4	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 1. Addressing the MS using the UL TFI assigned in Step 1. Two Carriers Assigned. Downlink TBF established. See specific message content.
6	SS		Wait for at least 3 block periods
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With MCS-1 on carrier 1 with next in sequence BSN (Start with BSN 0).
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With MCS-1 on carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on carrier 1. For the last repetition a valid RRBp field is sent.
9			Repeat step 7 and 8 using MCS-2 till MCS 9 on carrier 1 only in each iteration.
10	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the corresponding PACCH. The SS verifies that the MS acknowledges all the received RLC data blocks.
11			Repeat step 7 and 8 using MCS-2 till MCS-9 on carrier 2 only in each iteration
12	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the corresponding PACCH. The SS verifies that the MS acknowledges all the received RLC data blocks.
13			Repeat step 7 and 8 using MCS-1 till MCS-9 on both carrier 1 and carrier 2 in each iteration.
14	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the corresponding PACCH. The SS verifies that the MS acknowledges all the received RLC data blocks.
15	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on the PACCH of the PDCH assigned. See specific message content.
16	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 1, containing USF assigned to the MS.
17	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	SS verifies that the correct BSN is received and the correct MCS is used.
18	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned on carrier 2, containing USF assigned to the MS.
19	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	SS verifies that the correct BSN is received and the correct MCS is used.
20	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges RLC data block received. MCS changed. See specific message content.
21			Repeat step 16 to 20 by using MCS-2 till MCS-9 on uplink carrier in each iteration
22		{Completion of uplink RLC data block transfer}

58b.2.3 Concurrent Downlink Dual Carrier TBF/ Frequency Hopping

58b.2.3.1 Conformance requirement

The Frequency Parameters information element is defined in sub-clause 12.8 and the Dual Carrier Frequency Parameters information element is defined in sub-clause 12.8.2. The frequency parameters may use an ARFCN defining a non-hopping radio frequency channel, or use the indirect encoding, direct encoding 1 or direct encoding 2 defining a hopping radio frequency channel.

The indirect encoding defines the assigned set of radio frequency channels by referencing information stored within the mobile station. Such information may be received on BCCH or BCCH (see sub-clauses 5.5.2.1, 11.2.19, 12.8 and 12.10a and 3GPP TS 44.160), or be received in a previous assignment message using one of the direct encoding options. An MA_NUMBER identifies which of up to eight stored sets of frequency parameters is to be used. The MA_NUMBER shall use the following coding:

- | | |
|------------------|--|
| MA_NUMBER = 0-13 | shall be used to reference a GPRS mobile allocation received in a PSI2 message; |
| MA_NUMBER = 14 | shall be used to reference a GPRS mobile allocation received in a SI13 or PSI13 message; |
| MA_NUMBER = 15 | shall be used to reference a GPRS mobile allocation received in a previous assignment message using the direct encoding. |

The direct encoding defines the assigned set of radio frequency channels by using information contained within the assignment message. The direct encoding 1 references the cell allocation or reference frequency lists received on BCCH for the decoding of this information. The direct encoding 2 is self contained. When the direct encoding 1 or 2 is used, the mobile station shall store the received GPRS mobile allocation for possible later reference in an assignment message using the indirect encoding. Such reference shall be made using the MA_NUMBER = 15.

NOTE: If there is a GPRS mobile allocation associated with MA_NUMBER = 15, the association shall be kept unchanged if the mobile station receives a packet assignment using the indirect encoding (referencing any value of the MA_NUMBER), the frequency parameters are not included in the packet assignment (i.e., in packet transfer mode, dual transfer mode, MAC-Shared state or MAC-DTM state) or the mobile station establishes an RR connection (for A/Gb mode) or is allocated a DBPSCH (for Iu mode).

For the decoding of frequency parameters, the mobile station shall be able to store the following frequency information (see sub-clauses 11.2.19, 12.8 and 12.10a):

- four Reference Frequency Lists received in the PSI2 information and the corresponding RFL_NUMBERS for identification, each RFL having a contents length of up to 18 octets;
- a Cell Allocation received in the PSI2 information referencing up to four RFLs;
- seven GPRS Mobile Allocations received in the PSI2 or the SI13/PSI13 information and the corresponding MA_NUMBERS for identification, each GPRS Mobile Allocation information element having a length of up to 12 octets (96 bits); and
- one GPRS mobile allocation received in an assignment message using direct encoding 1 or 2, consisting of either a GPRS Mobile Allocation information element having a length of up to 12 octets (96 bits) or a MA Frequency List having a contents length of up to 18 octets.

References

3GPP TS 44.060; subclause 5.5.1.7

58b.2.3.2 Test purpose

To verify that the MS is able to operate a downlink dual carrier TBF with frequency hopping enabled on one or both carriers.

58b.2.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported,

- For GSM 900, CA in SI1 includes the frequencies:
(8, 10, 15, 37, 39, 40, 45, 50)
- For DCS 1800 and PCS 1900, CA in SI1 includes the frequency:
(518, 520, 525, 530, 535, 540, 545, 550)
- For GSM 700, T-GSM810, CA in SI1 includes the frequency:
(455, 457, 465, 467, 475, 477, 485, 487)
- For GSM 850, CA in SI1 includes the frequencies:
(145, 159, 160, 161, 162, 163, 164, 165)

System information 13 indicates MA Number with frequency hopping

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Test Procedure

SI1, and SI13 message sent to MS to indicate frequency hopping parameters.

The SS send PACKET TIMESLOT RECONFIGURE message indicating Indirect Encoding in frequency parameters on Carrier 1 and 2. The SS shall start to transmit the downlink data to the MS on both carrier. To verify that the MS use the new assigned PDTCH parameter, the downlink data block on carrier 1 has the USF assigned to the MS and the downlink data block on carrier 2 is polled to MS to maintain the uplink TBF. This procedure is repeated on both Carrier 1 and Carrier 2.

The SS send PACKET DOWNLINK ASSIGNMENT message indicating Direct Encoding 1 in frequency parameters on Carrier 1 only using legacy Frequency Parameters IE. The SS shall start to transmit the downlink data to the MS. The MS and SS complete the downlink data transfer. The SS verifies that the MS use the last CA information received on BCCH to decode the Mobile Allocation. The SS assigns an USF The SS checks that the MS sent an uplink data block on carrier 1 and a packet downlink ack/nack with correct SS value in response to the polled.

The SS send PACKET TIMESLOT RECONFIGURE message indicating Direct Encoding 2 in frequency parameters on Carrier 1 only using legacy Frequency Parameters IE and no hopping on Carrier 2. The SS shall start to transmit the downlink data to the MS on both carriers. To verify that the MS use the new assigned PDTCH parameter, the downlink data block on carrier 1 has the USF assigned to the MS and the downlink data block on carrier 2 is polled. The SS checks that the MS sent an uplink data block on carrier 1 and a packet downlink ack/nack with correct SS value in response to the polled

The SS send PACKET TIMESLOT RECONFIGURE message indicating Direct Encoding 2 in frequency parameters on Carrier 1 and Carrier 2. The SS shall start to transmit the downlink data to the MS on both carrier . To verify that the MS use the new assigned PDTCH parameter, the downlink data block on carrier 1 has the USF assigned to the MS and the downlink data block on carrier 2 is polled. The SS checks that the MS sent an uplink data block on carrier 1 and a packet downlink ack/nack with correct SS value in response to the polled

The SS send PACKET TIMESLOT RECONFIGURE message indicating Indirect Encoding in frequency parameters on both Carrier 1 and Carrier 2 using Optimized Dual Carrier Frequency parameters. The SS shall start to transmit the downlink data to the MS on both carrier . To verify that the MS use the last CA information received on BCCH to decode the Mobile Allocation, the downlink data block on carrier 1 has the USF assigned to the MS and the downlink data block on carrier 2 is polled. The SS checks that the MS sent an uplink data block on carrier 1 and a packet downlink ack/nack with correct SS value in response to the polled

The SS send PACKET TIMESLOT RECONFIGURE message indicating Direct Encoding 1 in frequency parameters on both Carrier 1 and Carrier 2 using Optimized Dual Carrier Frequency parameters. The SS shall start to transmit the downlink data to the MS on both carrier . To verify that the MS use the new assigned PDTCH parameter, the downlink data block on carrier 1 has the USF assigned to the MS and the downlink data block on carrier 2 is polled. The SS checks that the MS sent an uplink data block on carrier 1 and a packet downlink ack/nack with correct SS value in response to the polled

The SS send PACKET TIMESLOT RECONFIGURE message indicating Direct Encoding 2 in frequency parameters on both Carrier 1 and Carrier 2 using Optimized Dual Carrier Frequency parameters. The SS shall start to transmit the downlink data to the MS on both carrier . To verify that the MS use the new assigned PDTCH parameter, the downlink data block on carrier 1 has the USF assigned to the MS and the downlink data block on carrier 2 is polled. The SS checks that the MS sent an uplink data block on carrier 1 and a packet downlink ack/nack with correct SS value in response to the polled

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS		Change SI1, and SI13 message contents . See specific message contents.
2		{Uplink dynamic allocation two phase access}	N = 1000 octets USF GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
4	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
5	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Two carriers assigned with no frequency hopping. Including the polling bit set and a valid RRBp field. See specific message contents
6	SS		Wait for at least 3 block periods
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (Start with BSN 0). MCS-1. USF assigned to the MS
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on Carrier 1. MCS-1.
9	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier 1. SS verifies that the correct BSN is received and the correct MCS is used.
10	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the corresponding PACCH. The SS verifies that the MS acknowledges all the received RLC data blocks. Initial conditions reached. Concurrent TBF established.
11	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using legacy Frequency Parameters IE, Carrier 1 assigned with frequency hopping using Indirect Encoding. Carrier 2 with no frequency hopping. See specific message contents
12			Repeat step 6-10
13	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using legacy Frequency Parameters IE, two carriers assigned with frequency hopping using Indirect Encoding. See specific message contents
14			Repeat step 6-10
15	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using legacy Frequency Parameters IE, Carrier 1 assigned with frequency hopping using Direct Encoding 1. Carrier 2 with no frequency hopping. See specific message contents
16			Repeat step 6-10
17	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using legacy Frequency Parameters IE, two carriers assigned with frequency hopping using Direct Encoding 1. See specific message contents
18			Repeat step 6-10
19	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using legacy Frequency Parameters IE, Carrier 1 assigned with frequency hopping using Direct Encoding 2. Carrier 2 with no frequency hopping. See specific message contents
20			Repeat step 6-10

21	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using legacy Frequency Parameters IE, two carriers assigned with frequency hopping using Direct Encoding 2. See specific message contents
22			Repeat step 6-10
23	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using Dual Carrier Frequency Parameters IE, two carriers assigned with frequency hopping using Indirect Encoding. See specific message contents
24			Repeat step 6-10
25	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using Dual Carrier Frequency Parameters IE, two carriers assigned with frequency hopping using Direct Encoding 1. See specific message contents
26			Repeat step 6-10
27	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 2. Addressing the MS using the UL TFI assigned in Step 2. Using Dual Carrier Frequency Parameters IE, two carriers assigned with frequency hopping using Direct Encoding 2. See specific message contents
28			Repeat step 6-10
29		{Completion of uplink RLC data block transfer}	

Specific Message Contents

As default messages contents, except:

SYSTEM INFORMATION Type 1 in step 1

- Cell Allocation ARFCN	For GSM 900: Channel Numbers (8, 10, 15, 37, 39, 40, 45, 50). For DCS1800 and PCS 1900: Channel Numbers (518, 520, 525, 530, 535, 540, 545, 550) For GSM 700, T-GSM 810: Channel Numbers (455, 457, 465, 467, 475, 477, 485, 487) For GSM 850: Channel Numbers (145, 159, 160, 161, 162, 163, 164, 165)

58b.2.4 Concurrent Downlink Dual Carrier TBF/ Downlink Dual Carrier Configuration / Channel Quality Reporting

58b.2.4.1 Conformance requirement

In a downlink dual carrier configuration, channel quality measurements shall be performed for each radio frequency channel independently. Depending on the amount of information requested by the network (e.g. whether or not per-timeslot information is required) the MS may not be able to include channel quality measurements for both radio frequency channels within the EGPRS PACKET DOWNLINK ACK/NACK message. In this case, the MS shall include channel quality measurements for the radio frequency channel on which the poll was received.

In a downlink dual carrier configuration the MS shall send channel quality reports for both carriers, if there is room in the message. If there is room for only one channel quality report, the MS shall include channel quality measurements for the radio frequency channel on which the poll was received.

PIXIT Statements

-

Test Procedure

The SS initiates the establishment of concurrent downlink dual carrier in BTTI mode. The MS is then triggered to transfer 500 octets of user data. The SS assigns an uplink TBF by sending a PACKET UPLINK ASSIGNMENT message.

While the uplink TBF is ongoing, a PACKET DOWNLINK ASSIGNMENT is sent to the MS to establish a concurrent downlink dual carrier TBF. The SS sends a RLC data blocks on downlink dual carriers that will correspond to a small RB size and poll for the First Partial Bitmap from the MS. The SS polls the MS using the ES/P field in the header of the last downlink data blocks for ES/P value = '11' (EGPRS PACKET DOWNLINK ACK/NACK message containing Channel Quality Report and if there is enough room left in RLC/MAC block, NPB(s)). The SS checks if the EGPRS PACKET DOWNLINK ACK/NACK from MS includes a Channel Quality Report IE for Carrier 1 and Carrier 2.

Next the SS sends RLC data blocks on downlink dual carriers in odd BSN sequence number (bad blocks).and poll for the First Partial Bitmap from the MS pm Carrier 1. The SS polls the MS using the ES/P field in the header of the downlink data blocks for ES/P value = '01' (EGPRS PACKET DOWNLINK ACK/NACK message containing FPB (First Partial Bitmap), and if there is enough room left in RLC/MAC block, channel quality report(s)). The SS checks if the EGPRS PACKET DOWNLINK ACK/NACK from MS includes a Channel Quality Report IE for Carrier 1 only.

Finally, the SS sends RLC data blocks on downlink dual carriers in odd BSN sequence number (bad blocks).and poll for the First Partial Bitmap from the MS pm Carrier 2. The SS polls the MS using the ES/P field in the header of the downlink data blocks for ES/P value = '10' (EGPRS PACKET DOWNLINK ACK/NACK message containing NPB (Next Partial Bitmap), and if there is enough room left in RLC/MAC block, channel quality report(s)). The SS checks if the EGPRS PACKET DOWNLINK ACK/NACK from MS includes a Channel Quality Report IE for Carrier 2 only.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 500 octets USF_GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1 EGPRS Window Size: Maximum value according to the number of Timeslots assigned for the TBF.
2	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on the PACCH of the PDCH assigned. See specific message content.

58b.2.5 Concurrent Downlink Dual Carrier TBF / Downlink Dual Carrier Configuration in Dual Transfer Mode

58b.2.5.1 Conformance requirement

A mobile station in dual transfer mode in a Downlink Dual Carrier configuration shall respond in the uplink radio block on the timeslot or on the PDCH pair indicated by the RRBp field or by the CES/P field, on the uplink radio frequency channel where the dedicated resource is assigned regardless of which downlink radio frequency channel the poll was received on. The network shall not poll the mobile station in a manner which would require the mobile station to respond on the same timeslot as that on which the dedicated resource is assigned.

A mobile station in dual transfer mode in a Downlink Dual Carrier configuration shall respond in the uplink radio block on the timeslot or the PDCH pair indicated by the RRBp field (see sub-clause 10.4.5) on the uplink radio frequency channel where the dedicated resource is assigned regardless of which downlink radio frequency channel the poll was received on, unless this would prevent the transmission or reception of a TCH radio block on a dedicated resource.

References

3GPP TS 44.060; subclause 8.1.2.2 and 8.6

58b.2.5.2 Test purpose

To verify that:

The MS receives downlink data blocks on the time slots assigned on the two carriers in the DLDC configuration.

58b.2.5.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported and DTM supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

Support for Downlink Dual carrier for DTM capability in MS Radio Access Capabilities IE.

Support of DTM is indicated in SI6 in dedicated mode and in SI13 in idle mode.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

Once the MS is in DTM, the SS assigns uplink resources in the Packet Uplink assignment IE and downlink resources in the Packet downlink Assignment IE of the DTM Assignment Command message. SS assigns time slots on two carriers C1 and C2 and brings MS in DLDC configuration. The SS sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by SS. SS makes sure that MS sends all the data blocks on the assigned timeslot.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1			MS in state U10, on Timeslot N (chosen arbitrarily), utilising either: k=1, Channel Type = TCH/F; or k=2, Channel Type = TCH/H.
2	MS		Trigger the MS to initiate an uplink packet transfer Containing 2kB of data.
3	MS->SS	DTM REQUEST	
4	SS->MS	DTM ASSIGNMENT COMMAND	NW sets Packet Downlink Assignment Type to 2 and Allocates 2 carriers with TIMESLOT_ALLOCATION_C1 and TIMESLOT_ALLOCATION_C2 arbitrarily chosen (default timeslot 4). Packet Uplink Assignment IE set to EGPRS_MCS_MODE : MCS -9 EGPRS Window Size : 192 TIMESLOT_ALLOCATION : 5
5	MS->SS	ASSIGNMENT COMPLETE	
6	SS -> MS	RLC DATA BLOCK	On carrier 1 with next in sequence BSN (Start with BSN 0). USF Assigned
7	SS -> MS	RLC DATA BLOCK	On carrier 2 with next in sequence BSN Sent on same Radio Block as Data Block send on Carrier 1. Valid RRBP field
8	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH on carrier1 SS verifies that the correct BSN is received and the correct MCS is used.
9	SS -> MS	EGPRS PACKET DOWNLINK ACK/NACK	Received on carrier 2 in the allocated uplink block.
10			Repeat Steps 6 to 9 to verify that both uplink and downlink data transmission is functioning correctly.

58b.2.6 Concurrent Downlink Dual Carrier TBF/ Extended Dynamic Allocation

58b.2.6.1 Conformance requirement

If a mobile station supports Downlink Dual Carrier, the PACKET UPLINK ASSIGNMENT or MULTIPLE TBF UPLINK ASSIGNMENT message may assign PDCHs (corresponding to any given uplink TBF) on more than one carrier frequency. If this occurs, the Extended Dynamic Allocation procedures shall operate independently on each of the two carriers.

Reference

3GPP TS 44.060; subclause 8.1.1.2.1

58b.2.6.2 Test purpose

To verify that:

The Extended Dynamic allocation procedures work independently on each of the two carriers for a MS configured in DLDC.

58b.2.6.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported, Extended Dynamic allocation supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. MS receives a PACKET DOWNLINK ASSIGNMENT message on its PACCH, instructing a Dual Carrier Downlink configuration. MS receives an uplink assignment with assignment type set to Dual Carrier assignment and EXTENDED_DYNAMIC_ALLOCATION set to 1. MS is allocated USF on carrier 1. When the MS receives the assigned USF of the lowest assigned PDCH, it transmits RLC/MAC data block on the same and all higher PDCHs in the next TDMA frame. It is checked at the SS that the MS sends RLC/MAC data blocks in the next radio block period on all assigned PDCH and that each data block contains the correct TFI without TLLI on Carrier 1. The MS is allocated USF on carrier 2. The MS transmits RLC/MAC blocks on the TS on the same and all higher PDCHs in the next TDMA frame. The test is repeated till completion of data transfer to make sure that extended dynamic allocation works independently on each carrier.

Maximum Duration of Test

5 minutes.

58b.2.7 Concurrent Downlink Dual Carrier TBF / Downlink Dual Carrier Configuration/ Extended RLC/MAC control message segmentation

58b.2.7.1 Conformance requirement

A mobile station supporting Downlink Dual Carrier shall also support the extended RLC/MAC control message segmentation as defined in sub-clause 9.1.12a.

In the case of a Downlink Dual Carrier configuration, all segments belonging to each RLC/MAC control message shall be sent on PACCH blocks belonging to the same carrier.

The network may segment RLC/MAC control messages into one, two or up to nine RLC/MAC control blocks depending on the length of the RLC/MAC control message. Segmentation of an RLC/MAC control message into more than two RLC/MAC control blocks is referred to as extended RLC/MAC control message segmentation. Extended RLC/MAC control message segmentation shall not be used for an RLC/MAC control message that can be sent using one or two RLC/MAC control blocks. Unless explicitly stated otherwise, extended RLC/MAC control message segmentation shall not be used. If the contents of a control message do not fit an integer number of control blocks, filler

octets shall be used to fill the remainder of the RLC/MAC control block. Only the last RLC/MAC control block containing elements of the control message shall contain filler octets.

Reference

3GPP TS 44.060; sub clause 5.9, 8.1.1.1.1 and 9.1.12a

58b.2.7.2 Test purpose

To verify that:

This MS is able to operate in a DLDC TBF with Extended RLC/MAC control message segmentation.

58b.2.7.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported, Extended RLC/MAC control message segmentation supported.

For GSM 900, CA in SI1 includes the frequencies:

(10, 30, 50, 60, 70, 80, 90, 100, 110, 120)

For DCS 1800 and PCS 1900, CA in SI1 includes the frequency:

(520, 530, 540, 550, 560, 570, 580, 590, 600, 610)

For GSM 850, CA in SI1 includes the frequencies:

(130, 140, 150, 160, 170, 180, 190, 200, 230, 240)

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. Then MS receives a PACKET DOWNLINK ASSIGNMENT message on its PACCH, segmented in 3 blocks, instructing a Dual Carrier Downlink configuration. The MS must do a re assembly of the received block and switch to the assigned PDCH. The SS sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously. MS when polled acknowledges all data blocks send by SS.

While the MS has a concurrent TBF established, the SS sends a PACKET DOWNLINK ASSIGNMENT that assigned a new TFI value. The PACKET DOWNLINK ASSIGNMENT is segmented in 3 RLC control block but the final segment with FSe bit and RBSNe set to 1. The SS sends RLC data blocks on Carrier 1 and Carrier 2 simultaneously with the new assigned TFI; the tester checks that the MS does not answer with an EGPRS PACKET DOWNLINK ACK/NACK.

The SS sends RLC data blocks on Carrier 1 and 2 with TFI assigned in step 5. MS when polled acknowledges all data blocks send by SS and complete the uplink data transfer.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = 500 octets USF_GRANULARITY = 1 block EGPRS Channel Coding Command: MCS-1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
4	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Segmented into 3 Extended segment control blocks. The segments are sent on the same PDCH with same RTI values. Assignment type = Dual carrier Assignment. The final segment contains RBSNe = 1 and FSe = 1.
5	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (start with BSN 0) USF assigned to the MS. MCS-1. A valid RRBp is indicated. USF assigned to the MS
6	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on carrier 2 with MCS-1. A valid RRBp is indicated.
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on carrier 1.
8	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on carrier 2. In the uplink block specified by the RRBp field.
9	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Segmented into 3 Extended segment control blocks. Only two segments are sent from SS, the RBSNe = 0 and FSe = 0. The segments are sent on the same PDCH with same RTI values. Assignment type = Dual carrier Assignment. Valid RRBp specified in each segment TFI value is different than in step 5
10	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN. TFI value assigned in step 10
11	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on carrier 2 with MCS-1. A valid RRBp is indicated. TFI value assigned in step 10
12	SS		SS checks that the MS did not answer to the polled DOWNLINK RLC DATA BLOCK.
13	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 1 with next in sequence BSN (start with BSN 0) USF assigned to the MS. MCS-1. A valid RRBp is indicated. USF assigned to the MS TFI value assigned in step 5
14	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	On carrier 2 with next in sequence BSN Send on same Radio Block as Data Block Send on carrier 2 with MCS-1. A valid RRBp is indicated. TFI value assigned in step 5 FBI set to 1.
15	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on carrier 1.
16	MS -> SS	PACKET DOWNLINK ACK/NACK	Received on carrier 2. In the uplink block specified by the RRBp field. MS set the Final Ack Indicator to 1.
17		{Completion of uplink RLC data block transfer}

58b.2.8 Concurrent Downlink Dual Carrier TBF/ Dual Carrier Uplink TBF/ USF granularity 4

58b.2.8.1 Conformance requirement

In a Downlink Dual Carrier configuration, one or more PDCHs are assigned to a single mobile station on each of two different radio frequency channels. A mobile station with a Downlink Dual Carrier configuration shall not be allocated radio blocks on both radio frequency channels during any given radio block period.

The time relation between an uplink block, which the mobile station shall use for transmission, and the occurrence of the USF value is defined in 3GPP TS 45.002. The number of RLC/MAC blocks to transmit is controlled by the USF_GRANULARITY parameter characterising the uplink TBF.

3GPP TS 44.060; subclause 8.1.1.1

58b.2.8.2 Test purpose

To verify that the MS:

When USF_GRANULARITY is set to four blocks allocation, MS sends uplink data blocks as per the USF_GRANULARITY parameter.

58b.2.8.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

58b.3 DLDC Configuration / Abnormal Case

58b.3.1 DLDC Configuration / Abnormal Case / DLDC Assignment Multislot Class Violations

58b.3.1.1 Conformance requirement

During uplink transfer, the network may initiate the establishment of one or more downlink TBFs by sending a downlink assignment message (e.g. PACKET DOWNLINK ASSIGNMENT, MULTIPLE TBF DOWNLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE, PACKET CS RELEASE INDICATION) to the mobile station on the PACCH.

If the information in the PACKET TIMESLOT RECONFIGURE or MULTIPLE TBF TIMESLOT RECONFIGURE message does not properly specify an uplink and downlink PDCH or violates the mobile station's multislot capabilities, the mobile station shall perform an abnormal release with access retry (see sub-clause 8.7.2 and 3GPP TS 44.160);

References

3GPP TS 44.060, subclause 8.1.1.1.3, and 8.1.1.1.3.1.

58b.3.1.2 Test purpose

To verify that the MS, in downlink TBF establishment during uplink transfer, performs an abnormal release with random access, when the information in the PACKET TIMESLOT RECONFIGURE message violates the mobile station's multislot capabilities with respect to the multislot class and the Multislot Capability Reduction for Downlink Dual Carrier field signalled by the mobile station, as defined in Table B.2 of Annex B.4 in 3GPP TS 45.002.

58b.3.1.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 3 activated.

Specific PICS Statements

The GPRS multislot class supported (TSPC_Type_GPRS_Multislot_ClassX, where X = 1..45)

PIXIT Statements

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC unacknowledged mode. The SS sends a PACKET TIMESLOT RECONFIGURE message, instructing a Downlink Dual Carrier configuration, but the TIMESLOT_ALLOCATION_C1 and TIMESLOT_ALLOCATION_C2 violate the mobile station's multislot capabilities. To verify that the MS did not consider the downlink dual carrier assignment, a polled downlink rlc data block is sent on carrier 1 and the SS checks that the MS does not acknowledge it. The procedure is repeated on Carrier 2. The MS starts a random access for uplink establishment and the MS complete the uplink data transfer. The test procedure is repeated 2 times. The message contents of PACKET TIMESLOT RECONFIGURE are varied as defined below.

1st execution, TIMESLOT_ALLOCATION_C1 and TIMESLOT_ALLOCATION_C2 violate the MS maximum number of downlink timeslots and violate the transmission and reception timing constraints.

2nd execution, TIMESLOT_ALLOCATION_C1 and TIMESLOT_ALLOCATION_C2 don't violate the MS maximum number of downlink timeslots but violate the transmission and reception timing constraints.

Maximum Duration of Test

5 minutes.

Expected Sequence

The sequence is repeated 2 times.

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: MCS1 EGPRS CHANNEL CODING COMMAND: MCS1
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the BSN starts from 0, and the correct MCS is used.
4	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 1. Addressing the MS using the UL TFI assigned in Step 1. Two Carriers Assigned.
5	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCKS	On carrier 1 with next in sequence BSN (Start with BSN 0). MCS-1Valid RRBp field.

58b.3.2 DLDC Configuration / Abnormal Case/ Frequencies not within same band/ Access Retry

58b.3.2.1 Conformance requirement

If a mobile which supports Downlink Dual Carrier receives a PACKET DOWNLINK ASSIGNMENT message, PACKET TIMESLOT RECONFIGURE message, MULTIPLE TBF DOWNLINK ASSIGNMENT message or a MULTIPLE TBF TIMESLOT RECONFIGURE message that assigns resources on two carriers and those two carriers are not within the same frequency band, the mobile station shall perform an abnormal release with access retry (see sub-clause 8.7.2 and 3GPP TS 44.160);

References

3GPP TS 44.060, subclause 8.1.1.1.3.1.

58b.3.2.2 Test purpose

Verify that a MS with ongoing uplink transfer performs an abnormal release with random access when it receives a PACKET DOWNLINK ASSIGNMENT message with a Dual Downlink Carrier configuration that has carrier 1 and carrier 2 assigned on two different bands.

58b.3.2.3 Method of test

Initial Conditions

System Simulator:

1 cell, EGPRS supported, Downlink Dual Carrier supported.

Mobile Station:

Support for Downlink Dual Carrier indicated in MS Radio Access Capabilities IE.

The MS is in the state "idle, GMM-registered" with a P-TMSI allocated, SPLIT PG CYCLE negotiated, and PDP context 2 activated.

Specific PICS Statements

PIXIT Statements

-

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. Transfer is allowed to continue such that BSN is greater than 0.

The SS sends a PACKET DOWNLINK ASSIGNMENT message with Dual Carrier Frequency Parameters defining non-hopping frequency parameters for both carriers. Carrier 1 is assigned the same TSC and ARFCN as used on the uplink TBF while Carrier 2 is assigned an ARFCN that lies in a different frequency band. Verify that the MS aborts the uplink TBF and starts a random access for uplink establishment.

The SS assigns a new uplink PDCH to the MS with the same TFI as used in the preceding uplink TBF. Verify that the MS sends RLC data blocks with BSN starting at 0.

The SS sends a PACKET TIMESLOT RECONFIGURE message with Dual Carrier Frequency Parameters defining non-hopping frequency parameters for both carriers. Carrier 1 is assigned the same TSC and ARFCN as used on the uplink TBF while Carrier 2 is assigned an ARFCN that lies in a different frequency band. Verify that the MS aborts the uplink TBF and starts a random access for uplink establishment.

The SS assigns a new uplink PDCH to the MS with the same TFI as used in the preceding uplink TBF. Verify that the MS sends RLC data blocks with BSN starting at 0.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: MCS1 EGPRS CHANNEL CODING COMMAND: MCS1.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. SS verifies that the BSN starts from 0, and the correct MCS is used. Steps 2-3 are repeated 5 times. SS verifies that the BSN is incremented successfully.
4	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of the PDTCH assigned in Step 1 addressing the MS using the UL TFI assigned in Step 1. Two carriers are assigned. ARFCN2 in Frequency Parameters_C2 is in a different band (arbitrarily chosen).
5	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCKS	On carrier 1 with next in sequence BSN (Start with BSN 0). MCS-1Valid RRBp field.
6	SS		Verify MS does not transmit on the PDCH allocated by the RRBp field.
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCKS	On carrier 2 with next in sequence BSN MCS-1Valid RRBp field.
8	SS		Verify MS does not transmit on the PDCH allocated by the RRBp field.
9	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH. MS can send it during steps 5 to 8.
10	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on AGCH. Single block assignment, to force the MS to make a two phase access procedure
11	MS -> SS	PACKET RESOURCE REQUEST	Received on the single block assigned in step 6. Two phase access procedure.
12	SS -> MS	PACKET UPLINK ASSIGNMENT	USF_GRANULARITY = 1 block, RLC_DATA_BLOCKS_GRANTED = open-end TLLI_BLOCK_CHANNEL_CODING: MCS1 EGPRS CHANNEL CODING COMMAND: MCS1.
13	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS in step 12.
14	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. SS verifies that the BSN starts from 0. Steps 9-10 are repeated 5 times. SS verifies that the BSN is incremented successfully.
15	SS -> MS	PACKET TIMESLOT RECONFIGURE	Sent on PACCH of the PDTCH assigned in Step 8 addressing the MS using the UL TFI assigned in Step 8. Two carriers are assigned. ARFCN2 in Frequency Parameters_C2 is in a different band (arbitrarily chosen).
16	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCKS	On carrier 1 with next in sequence BSN (Start with BSN 0). MCS-1Valid RRBp field.
17	SS		Verify MS does not transmit on the PDCH allocated by the RRBp field.
18	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCKS	On carrier 2 with next in sequence BSN MCS-1Valid RRBp field.
19	SS		Verify MS does not transmit on the PDCH allocated by the RRBp field.
29	MS -> SS	EGPRS PACKET CHANNEL REQUEST	Received on RACH. MS can send it during steps 16 to 19.
21	SS -> MS	IMMEDIATE ASSIGNMENT	Sent on AGCH. Single block assignment, to force the MS to make a two phase access procedure.
24	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS in step 23.
25	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. SS verifies that the BSN starts from 0.
26		{Completion of uplink RLC data block transfer}

58b.3.3 DLDC Configuration / Abnormal case/ DLDC Configuration Supported / UL Single Carrier TBF / Frequency violations

58b.3.3.1 Conformance requirement

If the mobile station does not support Downlink Dual Carrier but receives a PACKET DOWNLINK ASSIGNMENT or MULTIPLE TBF DOWNLINK ASSIGNMENT message specifying containing different frequency parameters than are those currently in effect for the uplink TBF (see sub-clause 5.5.1.7), the mobile station shall ignore the PACKET DOWNLINK ASSIGNMENT/ MULTIPLE TBF DOWNLINK ASSIGNMENT message and continue normal operation of the uplink TBF

If a failure in the PACKET DOWNLINK ASSIGNMENT, MULTIPLE TBF DOWNLINK ASSIGNMENT or PACKET CS RELEASE INDICATION message is due to any other reason (including the presence of frequency parameters which do not comply with the requirements specified in sub-clause 5.5.1.7), the mobile station shall abort the procedure and continue the normal operation of the ongoing uplink TBFs and ongoing downlink TBFs.

References

3GPP TS 44.060, subclause 8.1.1.1.3.1, 8.1.1.2.1.

58b.3.3.2 Test purpose

Verify that the MS, in downlink TBF establishment during uplink transfer, when frequency parameters for carrier 1 in that message are different from those used in the current uplink TBF, ignores the PACKET DOWNLINK ASSIGNMENT/ MULTIPLE TBF DOWNLINK ASSIGNMENT message and continues normal operation of the uplink TBF.

Verify that the MS, in downlink TBF establishment during uplink transfer, when frequency parameters for carrier 2 in that message are absent or invalid, ignores the PACKET DOWNLINK ASSIGNMENT/ MULTIPLE TBF DOWNLINK ASSIGNMENT message and continues normal operation of the uplink TBF.

58b.3.3.3 Method of test

Initial Conditions

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode.

The SS sends a PACKET DOWNLINK ASSIGNMENT message, instructing a Downlink Dual Carrier configuration, but the Frequency Parameters C1 field contains a different TSC than that used for the current uplink TBF. After 5 radio blocks, on the new downlink PDCH for carrier 1, SS sends a few RLC data blocks addressing the MS, with the last data block containing a valid RRBp field. Verify MS does not send Packet Downlink Ack/Nack. SS sends Packet Downlink Dummy Control Block with the assigned USF on the uplink PDCH. Verify MS sends one RLC data block with the correct BSN value.

The SS sends another PACKET DOWNLINK ASSIGNMENT message, instructing a Downlink Dual Carrier configuration, but the Frequency Parameters C1 field contains a different ARFCN than that used for the current uplink TBF. After 5 radio blocks, on the new downlink PDCH for carrier 1, SS sends a few RLC data blocks addressing the

MS, with the last data block containing a valid RRBP field. Verify MS does not send Packet Downlink Ack/Nack. SS sends Packet Downlink Dummy Control Block with the assigned USF on the uplink PDCH. Verify MS sends one RLC data block with the correct BSN value.

The SS sends another PACKET DOWNLINK ASSIGNMENT message, instructing a Downlink Dual Carrier configuration, but the Frequency Parameters C2 field doesn't exist. After 5 radio blocks, on the new downlink PDCH for carrier 1, SS sends a few RLC data blocks addressing the MS, with the last data block containing a valid RRBP field. Verify MS does not send Packet Downlink Ack/Nack. SS sends Packet Downlink Dummy Control Block with the assigned USF on the uplink PDCH. Verify MS sends one RLC data block with the correct BSN value.

The SS sends another PACKET DOWNLINK ASSIGNMENT message, instructing a Downlink Dual Carrier configuration, but the Frequency Parameters C1 field contains an unknown MA_NUMBER. After 5 radio blocks, on the new downlink PDCH for carrier 1, SS sends a few RLC data blocks addressing the MS, with the last data block containing a valid RRBP field. Verify MS does not send Packet Downlink Ack/Nack. SS sends Packet Downlink Dummy Control Block with the assigned USF on the uplink PDCH. Verify MS sends one RLC data block with the correct BSN value.

The SS sends another PACKET DOWNLINK ASSIGNMENT message, instructing a Downlink Dual Carrier configuration with all valid parameters. After 3 radio blocks, on the new downlink PDCH for carrier 1, SS sends a few RLC data blocks addressing the MS, with the last data block containing a valid RRBP field. Verify MS acknowledges the previously received RLC data blocks.

Complete the uplink data transfer.

Maximum Duration of Test

5 minutes.

58c EGPRS2

58c.1 Concurrent EGPRS2 TBF

58c.1.1a Concurrent EGPRS2A TBF using RTTI Latency reduction

58c.1.1a.1 Conformance Requirement

If a mobile station is assigned concurrent TBFs, these shall be in the same TBF mode.

A TBF in EGPRS mode operates using one of four groups of modulation and coding schemes:

- EGPRS-GMSK only (applicable to uplink TBFs only); this comprises MCS-1 to MCS-4
- EGPRS: this comprises MCS-1 to MCS-9
- EGPRS2-A: for uplink TBFs, this comprises MCS-1 to MCS-6 and UAS-7 to UAS-11; for downlink TBFs, this comprises MCS-1 to MCS-4, MCS-6 (only for retransmissions of blocks originally transmitted using EGPRS), MCS-7, MCS-8 and DAS-5 to DAS-12
- EGPRS2-B: for uplink TBFs, this comprises MCS-1 to MCS-4 and UBS-5 to UBS-12; for downlink TBFs, this comprises MCS-1 to MCS-4, MCS-6 to MCS-9, DAS-5, DAS-6, DAS-8, DAS-9, DAS-11 and DBS-5 to DBS-12.

The group of modulation and coding schemes to be used on a PDTCH associated with a TBF is indicated in the assignment message.

The use of the EGPRS2-A group for uplink or downlink is only supported by MSs which are capable of EGPRS2-A or EGPRS2-B in that direction.

If a mobile station indicates support of Reduced Latency (see 3GPP TS 24.008), it may be assigned TBFs with FANR activated (see sub-clause 9.1.14), either in BTTI configuration or in RTTI configuration. The network shall ensure that, if a mobile station is assigned a TBF with FANR activated, FANR shall be activated for all concurrent TBFs assigned to that mobile station.

References

3GPP TS 44.060, subclauses 5.2.1

GPRS, EGPRS and EGPRS2 capable mobile stations can be multiplexed dynamically on the same PDCH.

- For a mobile station supporting EGPRS2-A in the downlink, the network may use either GMSK, 8-PSK, 16-QAM or 32-QAM modulation with normal symbol rate, i.e. CS-1 to CS-4, MCS-0, MCS-1 to MCS-9 or DAS-5 to DAS-12 in those blocks.

Test Procedure

An EGPRS2A MS receives a PACKET DOWNLINK ASSIGNMENT message on its PACCH allocating resources for carrier 1. SS transmits downlink RLC data blocks. MS responds by sending a PACKET DOWNLINK ACK/NACK. MS then triggered to perform uplink data transfer in EGPRS2A to establish a concurrent uplink TBF. MS sends uplink data blocks and SS acknowledges. SS then send a PACKET TIMSLOT RECONFIGURE message to MS and to change the TTI configuration to RTTI in RTTI USF mode. A new EGPRS2A channel coding scheme is chosen for downlink. MS sends and receives data in new RTTI configuration. The uplink data transfer is completed.

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH triggers the MS to assigned PDTCH.
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on assigned PDCH with DAS-5 assigned to the MS. A valid RRBp is indicated.
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	In the uplink block specified by the RRBp field, MS acknowledges the previously received RLC data blocks.
4		{Uplink dynamic allocation two phase access}	n = 2000 octets, USF GRANULARITY = 1 block EGPRS2 Channel Coding Command: UAS-11

58c.2.1a Acknowledged Mode/ Uplink TBF/ Countdown Value, in EGPRS2A

58c.2.1a.1 Conformance requirements

1. The mobile station shall send the Countdown Value (CV) in each uplink RLC data block to indicate to the network the absolute BSN (BSN') of the last RLC data block that will be sent in the uplink TBF.
2. When a radio block for EGPRS2-A data transfer consists of two RLC data blocks, the CV value of the RLC/MAC header refers to the second RLC data block.

References

3GPP TS 44.060, subclause 9.3.1.

58.2.1a.2 Test purpose

1. To verify that when a radio block for EGPRS2-A data transfer consists of two RLC data blocks, the CV value is calculated based on BSN of the second RLC data block.

58.2.1a.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS2-A support, default setting, PBCCH not present, BS_CV_MAX = 15.

Mobile Station:

The MS is EGPRS2-A updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Test Procedure

The MS is made to transmit uplink RLC data blocks in an acknowledged mode uplink EGPRS2-A TBF to transmit N octets to calculate TBC value. Uplink RLC data block transfer is completed.

The MS is made to transmit uplink RLC data blocks in an acknowledged mode uplink EGPRS2-A TBF to transmit TBC uplink RLC data blocks. EGPRS2-A Channel Coding Scheme is UAS-7. N is less than Window Size.

The SS assigns resources for the mobile station to transmit data blocks. Each time one radio block is assigned.

The SS observes the CV value in the uplink blocks. $BSN' = \text{Absolute BSN of the second RLC data block}$ is calculated upon each radio block is received.

The SS verifies that when $x = \text{round}((TBC - BSN' - 1) / NTS * 2)$ is greater than BS_CV_MAX, CV equals to 15, otherwise, CV=x.

UAS-8, UAS9, UAS10 and UAS-11 shall be applied.

Maximum Duration of Test

50 minutes.

58c.2.2a Acknowledged Mode/ Uplink TBF/ Retransmission/ Split RLC Data Block, in EGPRS2-A

58c.2.2a.1 Conformance requirements

1. In RLC acknowledged mode, each RLC endpoint transmitter shall have an associated acknowledge state array (V(B)).
2. The transmitter shall transmit the oldest RLC data block whose corresponding element in V(B) indexed relative to V(A) has the value NACKED. As each RLC data block is transmitted the corresponding element in V(B) is set to the value PENDING_ACK.
3. In EGPRS2-A uplink, depending on the modulation and coding one to three RLC data blocks are contained in one RLC/MAC block as follows:
 - One RLC data block per RLC/MAC block: MCS-1, MCS-2, MCS-3, MCS-4, MCS-5 and MCS-6.
 - Two RLC data blocks per RLC/MAC block: UAS-7, UAS-8 and UAS-9.
 - Three RLC data blocks per RLC/MAC block: UAS-10 and UAS-11.
4. A re-segment bit is included within each PACKET UPLINK ACK/NACK, PACKET UPLINK ASSIGNMENT and PACKET TIMESLOT RECONFIGURE message. For initial transmissions of new RLC blocks the channel coding commanded is applied. The re-segment bit is used to set the ARQ mode to type I or type II (incremental redundancy) for uplink TBFs.

5. For retransmissions, setting the re-segment bit to 1 (type I ARQ) requires the mobile station to use an MCS within the same family as the initial transmission and the payload may be split.
6. If the RLC data block to be transmitted is split over two radio blocks, both radio blocks shall be transmitted
7. RLC data blocks initially transmitted with MCS4, MCS-5, MCS-6, UAS-7, UAS-8, UAS-9, UAS-10 or UAS-11, can optionally be retransmitted with MCS-1, MCS-2 and MCS-3 respectively, using two radio blocks. In this case, the split block field in the header shall be set to indicate that the RLC data block is split, and the order of the two parts.

Test Procedure

The EGPRS2-A capable MS is made to transmit uplink RLC data blocks in EGPRS2-A TBF RLC acknowledged mode. The EGPRS2-A Channel Coding Command IE indicates UAS-7 in the Packet Uplink Assignment message.

After BS_CV_MAX block periods the SS sends a Packet Uplink Ack/Nack message to negatively acknowledge some RLC data blocks. In the message EGPRS2-A Channel Coding Command IE is set to MCS-1 and Re-segment IE should be set to '1'B.

The MS shall retransmit the NACKED RLC data blocks using MCS-1 in splitted radio blocks. Observe the uplink RLC data block header. Both of split blocks shall be received, the first one shall contain a SPB field equals to '10'B while the second shall be '11'B.

Maximum Duration of Test

8 minutes

Expected Sequence

11	MS -> SS	EGPRS2-A UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. BSN = 8, SPB = '11'B. SS verifies that the NACKED RLC data blocks are received and that the correct MCS is used.
12		{Completion of uplink RLC data block transfer}	

58c.2 Uplink EGPRS2 TBF

58c.2.1 to 58c.2.4 Void

58c.2.4a Acknowledged Mode/ Uplink TBF/ Verification of new coding schemes for EGPRS2A

58c.2.4a.1 Conformance requirements

A TBF in EGPRS mode operates using one of four groups of modulation and coding schemes:

- EGPRS-GMSK only (applicable to uplink TBFs only): this comprises MCS-1 to MCS-4
- EGPRS: this comprises MCS-1 to MCS-9
- EGPRS2-A: for uplink TBFs, this comprises MCS-1 to MCS-6 and UAS-7 to UAS-11; for downlink TBFs, this comprises MCS-1 to MCS-4, MCS-6 (only for retransmissions of blocks originally transmitted using EGPRS), MCS-7, MCS-8 and DAS-5 to DAS-12
- EGPRS2-B: for uplink TBFs, this comprises MCS-1 to MCS-4 and UBS-5 to UBS-12; for downlink TBFs, this comprises MCS-1 to MCS-4, MCS-6 to MCS-9, DAS-5, DAS-6, DAS-8, DAS-9, DAS-11 and DBS-5 to DBS-12.

A RESEGMENT bit is included within each PACKET UPLINK ACK/NACK, PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION messages. For initial transmissions of new RLC blocks the channel coding commanded is applied. The RESEGMENT bit is used to set the ARQ mode to type I or type II (incremental redundancy) for uplink TBFs. For retransmissions, setting the RESEGMENT bit to '1' (type I ARQ) requires the mobile station to use an MCS within the same family as the initial transmission and the payload may be split (refer to table 8.1.1.1). For retransmissions, setting the RESEGMENT bit to '0' (type II ARQ) requires the mobile station to use an MCS within the same family as the initial transmission without splitting the payload even if the network has commanded it to use MCS-1, MCS-2 or MCS-3 for subsequent RLC blocks (refer to table 8.1.1.2), see note. In RLC unacknowledged mode, RESEGMENT bit shall be ignored and default value 0 should be used.

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE is commanded in the Packet Uplink Assignment message. The resegment IE is set to 1.

The SS checks that the Uplink RLC Data Blocks are transmitted by the mobile using the channel coding scheme commanded by the SS.

The SS negatively acknowledges the received data blocks. The Coding scheme to be used by the mobile is commanded in the EGPRS Channel Coding Command IE.

The SS checks that the Uplink RLC data blocks are retransmitted using the channel coding scheme commanded by the SS.

Maximum Duration of Test

5 minutes.

Expected Sequence

MS supporting 'EGPRS capable of 8PSK and 16 QAM in Uplink, of all Multislot classes' should run the test for $k=0$, $k=1$, $k=2$, $k=3$, $k=4$.

58c.2.5a Acknowledged Mode/ Uplink TBF/ Recalculation of CV on MCS change for EGPRS2A

58c.2.5a.1 Conformance requirements

1. The mobile station shall send the Countdown Value (CV) in each uplink RLC data block to indicate the current number of remaining RLC data blocks for the uplink TBF. The CV shall be calculated as follows:

$$\text{Let integer } x = \text{round}\left(\frac{TBC - BSN' - 1}{NTS \times K}\right).$$

$$\text{then, } CV = \begin{cases} x, & \text{if } x \leq BS_CV_MAX, \\ 15, & \text{otherwise.} \end{cases}$$

where:

TBC = total number of RLC data blocks currently to be transmitted in the TBF.

BSN' = absolute block sequence number of the RLC data block, with range from 0 to (TBC - 1).

NTS = number of timeslots assigned to the uplink TBF in the assignment message, with range 1 to 8 when operating in BTTI configuration. In RTTI configuration this parameter shall be equal to the number of assigned uplink PDCH pairs, with the range 1 to 4.

K = 2 when commanded MCS is MCS-7, MCS-8, MCS-9, UAS-7, UAS-8, UAS-9, UBS-7 or UBS-8

3 when commanded UAS-10, UAS-11, UBS-9 or UBS-10

4 when commanded UBS-11 or UBS-12 otherwise K=1

the function round() rounds upwards to the nearest integer.

BS_CV_MAX is a parameter broadcast in the system information,

the division operation is non-integer and results in zero only for (TBC - BSN' - 1) = 0.

The countdown procedure starts when RLC data blocks include CV values different from '15'. When the mobile station transmits the last RLC data block currently in the send buffer for the TBF (i.e. the RLC data block with BSN' = TBC - 1), the RLC data block shall have CV set to the value '0'.

When an EGPRS or EGPRS2 RLC/MAC block for data transfer consists of two or more RLC data blocks, a CV value is calculated for each block and the CV of the RLC/MAC header refers to the last RLC data block.

2. If the mobile station receives a change in the Channel Coding Command in a PACKET UPLINK ACK/NACK message during the countdown procedure, the mobile station shall act upon the new Channel Coding Command. The mobile station shall then recalculate the CV for any untransmitted RLC data block using the new RLC data block size.

In EGPRS TBF mode, a MS may choose an alternate MCS than the one commanded, for the initial transmission of the last RLC data blocks of the TBF under the following conditions:

- the alternate MCS is more robust than the commanded MCS;
- the alternate MCS has already been commanded by the network during the TBF or was available for selection by the MS during the TBF according to the MCS selection rules for retransmissions; and
- the TBF requires no more radio blocks for initial transmission of the RLC data blocks using the alternate MCS than would be required when using the commanded MCS.

References

3GPP TS 44.060, subclause 8.1.1, 9.3.1 and clause F.3.

58c.2.5a.2 Test purpose

To verify that the mobile station correctly recalculates the CV values when the MCS is changed during countdown procedure.

58c.2.5a.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting, PBCCH not present, BS_CV_MAX = 15.

Test Procedure

The EGPRS capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. UAS-10 is commanded. Total number of Data Blocks is taken to be a minimum of 20 blocks.

SS acknowledges all the Data Blocks upon reception.

SS monitors the CV of the data blocks sent.

SS sends a PACKET UL ACK/NACK message acknowledging the RLC data block with CV =14 or CV =13 and ordering a change of MCS to MCS-5.

The Mobile might send a new Data Block with UAS-10 which could have been stored in the Transmit buffer.

SS notes the BSN of the last RLC data block, received with UAS-10 as BSN2. SS verifies that $CV=15$ till $BSN=BSN2+3*CV1-15$, $BSN2+3*CV1-16$ or $BSN=BSN2+3*CV1-17$ (MS can select alternate MCS)

where $CV1 = CV$ in the last radio block received with UAS-10

SS verifies that CV decreases progressively in further blocks.

Maximum Duration of Test

5 minutes.

58c.2.7a EGPRS Acknowledged mode / Uplink TBF / Retransmission/ UAS or MCS Selection with Re-segmentation, in EGPRS2A

58c.2.7a.1 Conformance requirements

In EGPRS TBF mode, RLC data blocks that are transmitted for the first time shall be transmitted with the commanded MCS, except if the commanded mode is MCS-5-7, in which case the data block shall be transmitted with MCS-5, or if the commanded mode is MCS-6-9, in which case the data block shall be transmitted with MCS-6. In the case of a Downlink Dual Carrier configuration the commanded MCS shall apply to both of the carriers. In EGPRS TBF mode, a MS may choose an alternate MCS than the one commanded, for the initial transmission of the last RLC data blocks of the TBF under the following conditions:

- the alternate MCS is more robust than the commanded MCS;
- the alternate MCS has already been commanded by the network during the TBF or was available for selection by the MS during the TBF according to the MCS selection rules for retransmissions; and
- the TBF requires no more radio blocks for initial transmission of the RLC data blocks using the alternate MCS than would be required when using the commanded MCS.

For a TBF with FANR activated, if the commanded MCS is MCS-9 (respectively MCS-4), the initial transmission of the RLC data block(s) shall be done with MCS-8 (respectively MCS-3) if a PAN field is included in the radio block.

When EMST is used, the commanded MCS shall apply to the RLC entity on the TBF identified by the TFI included in the header of the RLC/MAC block.

A RESEGMENT bit is included within each PACKET UPLINK ACK/NACK, PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION messages. For initial transmissions of new RLC blocks the channel coding commanded is applied. The RESEGMENT bit is used to set the ARQ mode to type I or type II (incremental redundancy) for uplink TBFs. For retransmissions, setting the RESEGMENT bit to '1' (type I ARQ) requires the mobile station to use an MCS within the same family as the initial transmission and the payload may be split (refer to table 8.1.1.1). For retransmissions, setting the RESEGMENT bit to '0' (type II ARQ) requires the mobile station to use an MCS within the same family as the initial transmission without splitting the payload even if the network has commanded it to use MCS-1, MCS-2 or MCS-3 for subsequent RLC blocks (refer to table 8.1.1.2), see note. In RLC unacknowledged mode, RESEGMENT bit shall be ignored and default value 0 should be used.

NOTE: This bit is particularly useful for networks with uplink IR capability since it allows combining on retransmissions.

Table 8.1.1.3: Choice of modulation and coding scheme for retransmissions with re-segmentation (EGPRS2-A)

Scheme used for Initial transmission	Scheme to use for retransmissions after switching to a different modulation and coding scheme (MCS or UAS)										
	UAS-11 Commanded	UAS-10 Commanded	UAS-9 Commanded	UAS-8 Commanded	UAS-7 Commanded	MCS-6 Commanded	MCS-5 Commanded	MCS-4 Commanded	MCS-3 Commanded	MCS-2 Commanded	MCS-1 Commanded
UAS-11	UAS-11	UAS-8	UAS-8	UAS-8	MCS-6 (pad)	MCS-6 (pad)	MCS-3 (pad)	MCS-3 (pad)	MCS-3 (pad)	MCS-3 (pad)	MCS-3 (pad)
UAS-10	UAS-10	UAS-10	UAS-7	UAS-7	UAS-7	MCS-5	MCS-5	MCS-2	MCS-2	MCS-2	MCS-2
UAS-9	UAS-9	UAS-9	UAS-9	MCS-6	MCS-6	MCS-6	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3
UAS-8	UAS-11	UAS-8	UAS-8	UAS-8	MCS-6 (pad)	MCS-6 (pad)	MCS-3 (pad)	MCS-3 (pad)	MCS-3 (pad)	MCS-3 (pad)	MCS-3 (pad)
UAS-7	UAS-10	UAS-10	UAS-7	UAS-7	UAS-7	MCS-5	MCS-5	MCS-2	MCS-2	MCS-2	MCS-2
MCS-6	UAS-9	UAS-9	UAS-9	MCS-6	MCS-6	MCS-6	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3
MCS-5	UAS-10	UAS-10	UAS-7	UAS-7	UAS-7	MCS-5	MCS-5	MCS-2	MCS-2	MCS-2	MCS-2
MCS-4	MCS-4	MCS-4	MCS-4	MCS-4	MCS-4	MCS-4	MCS-4	MCS-4	MCS-1	MCS-1	MCS-1
MCS-3	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3	MCS-3
MCS-2	MCS-2	MCS-2	MCS-2	MCS-2	MCS-2	MCS-2	MCS-2	MCS-2	MCS-2	MCS-2	MCS-2
MCS-1	MCS-1	MCS-1	MCS-1	MCS-1	MCS-1	MCS-1	MCS-1	MCS-1	MCS-1	MCS-1	MCS-1

In EGPRS2, if these rules require a transmission (either original transmission or retransmission) in a modulation and coding scheme where there are fewer than the maximum number of RLC blocks that can be transmitted, the mobile station shall use the modulation and coding scheme specified in tables 8.1.1.7 and 8.1.1.8.

Table 8.1.1.7: Retransmissions with fewer RLC blocks (EGPRS2-A)

Modulation and Coding Scheme specified	Modulation/Coding scheme to be used (only 1 block can be transmitted)	Modulation/Coding scheme to be used (only 2 blocks can be transmitted)
UAS-7	MCS-5	n/a
UAS-8	MCS-6 (with padding)	n/a
UAS-9	MCS-6	n/a
UAS-10	MCS-5	UAS-7
UAS-11	MCS-6 (with padding)	UAS-8

Test Procedure

The EGPRS2A capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE in the Packet Uplink Assignment message is set according to the execution counter K described as below.

After BS_CV_MAX block periods the SS sends a Packet Uplink Ack/Nack message to negatively acknowledge some RLC data blocks. In the message EGPRS Channel Coding Command IE is set to a different UAS or MCS and Resegment IE should be set to '0'.

The MS shall then retransmit the negatively acknowledged RLC data blocks using the UAS or MCS specified in table 8.1.1.3, 3GPP TS 44.060.

Test procedure is repeated for K = 1 to 7 with:

K = 1: UAS-11 to be used at step 1,

K = 2: UAS-10 to be used at step 1,

K = 3: UAS-9 to be used at step 1,

K = 4: UAS-8 to be used at step 1,

K = 5: UAS-7 to be used at step 1,

K = 6: MCS-6 to be used at step 1,

K = 7: MCS-5 to be used at step 1,

Maximum Duration of Test

30 minutes.

58c.2.9 Void

58c.2.9a Acknowledged Mode/ Uplink TBF/ Retransmission/ MCS or UAS Selection without Re-segmentation, in EGPRS2A

58c.2.9a.1 Conformance requirements

In EGPRS TBF mode, RLC data blocks that are transmitted for the first time shall be transmitted with the commanded MCS, except if the commanded mode is MCS-5-7, in which case the data block shall be transmitted with MCS-5, or if the commanded mode is MCS-6-9, in which case the data block shall be transmitted with MCS-6. In the case of a Downlink Dual Carrier configuration the commanded MCS shall apply to both of the carriers. In EGPRS TBF mode, a MS may choose an alternate MCS than the one commanded, for the initial transmission of the last RLC data blocks of the TBF under the following conditions:

- the alternate MCS is more robust than the commanded MCS;
- the alternate MCS has already been commanded by the network during the TBF or was available for selection by the MS during the TBF according to the MCS selection rules for retransmissions; and
- the TBF requires no more radio blocks for initial transmission of the RLC data blocks using the alternate MCS than would be required when using the commanded MCS.

For a TBF with FANR activated, if the commanded MCS is MCS-9 (respectively MCS-4), the initial transmission of the RLC data block(s) shall be done with MCS-8 (respectively MCS-3) if a PAN field is included in the radio block.

When EMST is used, the commanded MCS shall apply to the RLC entity on the TBF identified by the TFI included in the header of the RLC/MAC block.

A RESEGMENT bit is included within each PACKET UPLINK ACK/NACK, PACKET UPLINK ASSIGNMENT, MULTIPLE TBF UPLINK ASSIGNMENT, PACKET TIMESLOT RECONFIGURE, MULTIPLE TBF TIMESLOT RECONFIGURE or PACKET CS RELEASE INDICATION messages. For initial transmissions of new RLC blocks the channel coding commanded is applied. The RESEGMENT bit is used to set the ARQ mode to type I or type II (incremental redundancy) for uplink TBFs. For retransmissions, setting the RESEGMENT bit to '1' (type I ARQ) requires the mobile station to use an MCS within the same family as the initial transmission and the payload may be split (refer to table 8.1.1.1). For retransmissions, setting the RESEGMENT bit to '0' (type II ARQ) requires the mobile station to use an MCS within the same family as the initial transmission without splitting the payload even if the network has commanded it to use MCS-1, MCS-2 or MCS-3 for subsequent RLC blocks (refer to table 8.1.1.2), see note. In RLC unacknowledged mode, RESEGMENT bit shall be ignored and default value 0 should be used.

NOTE: This bit is particularly useful for networks with uplink IR capability since it allows combining on retransmissions.

Test Procedure

The EGPRS2A capable MS is made to transmit uplink RLC data blocks in EGPRS TBF RLC acknowledged mode. The EGPRS Channel Coding Command IE in the Packet Uplink Assignment message is set according to the execution counter K described as below.

After BS_CV_MAX block periods the SS sends a Packet Uplink Ack/Nack message to negatively acknowledge some RLC data blocks. In the message EGPRS Channel Coding Command IE is set to a different MCS or UAS and Resegment IE should be set to '0'.

The MS shall then retransmit the negatively acknowledged RLC data blocks using the MCS or UAS specified in table 8.1.1.4, 3GPP TS 44.060.

Test procedure is repeated for K = 1 to 7 with:

K = 1: UAS-11 to be used at step 1,

K = 2: UAS-10 to be used at step 1,

K = 3: UAS-9 to be used at step 1,

K = 4: UAS-8 to be used at step 1,

K = 5: UAS-7 to be used at step 1,

K = 6: MCS-6 to be used at step 1,

K = 7: MCS-5 to be used at step 1,

Maximum Duration of Test

30 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	N = for K = 1: 4600 octets. (K = 2: 4250, K = 3: 3500, K = 4: 3000, K = 5: 2500, K = 6: 3500, K = 7: 2500.) USF_GRANULARITY = 1 block. EGPRS Channel Coding Command is set according to execution counter K (e.g., K=1: UAS-11).
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS2A UPLINK RLC DATA BLOCK	Received on the assigned PDTCH. The SS verifies that the BSN starts from 0, and verifies the correct MCS or UAS is used.
4	-		Repeat steps 2 and 3 until RLC data block BSN = 31.
5	-		Wait for BS_CV_MAX block periods relative to the last received RLC data block.
6	SS -> MS	PACKET UPLINK ACK/NACK	The SS acknowledges RLC data blocks from BSN 10 to 31 with RBB set to 1 and negatively acknowledges RLC data blocks from BSN 1 to 9 with RBB set to 0, SSN = 1 (Note: This is NACK for BSN = 0). USF not assigned to the MS. EGPRS Channel Coding Command is set to UAS-11. Resegment IE is set to '0'.
7	-		Wait for 6 blocks with no USF.

-

Test Procedure

The MS is made to transmit uplink RLC data blocks in an acknowledged mode uplink EGPRS TBF. EGPRS Coding Command is set to indicate UAS-11.

The SS sends a PACKET UPLINK ACK/NACK message and NACK all blocks received. UAS-7 is commanded in the message.

The SS checks that the retransmitted blocks are received in MCS-6, PS1.

Repeat the above steps with different allowed MCS and PS combinations.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 2000 octets, USF GRANULARITY = 1 block EGPRS Channel Coding Command: UAS-11
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
3	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that the correct Puncturing Scheme is received.
4	SS	-	Repeat steps 2-3 until RLC data block with BSN=5 is received.
5	SS -> MS	PACKET UPLINK ACK/NACK	Wait for BS_CV_MAX block periods before sending this message. SS negatively acknowledges all RLC data blocks. MCS Command is UAS-7, USF not assigned to the MS. Wait for 6 blocks with no USF
6	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
A7 (optional step)	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	MS may transmit new data block if it has already been scheduled while Packet Uplink Ack/Nack is being processed.
B7 (optional step)	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
7	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that modulation and coding scheme is MCS-6 (pad) and Puncturing Scheme is PS1 is received. BSN=0
8	SS		Repeat steps 9-10 until RLC data block with BSN=5 is received.
9	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Sent on the PACCH of the PDCH assigned, containing USF assigned to the MS.
10	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on the assigned PDTCH SS verifies that modulation and coding scheme is MCS-6 and Puncturing Scheme is PS1 is received.
11		{Completion of uplink RLC data block transfer}	
12	-		The above steps 1-11 are repeated for different MCS and PS combinations as per table 8.1.1.3, 8.1.1.4 of Subclause 8.1.1, table 9.3.2.1.1 of Subclause 9.3, 3GPP TS 44.060, i.e. UAS-10 switching to UAS-8, SS verifies MCS is UAS-7 in step 7 and step 10 UAS-9 switching to UAS-8, SS verifies MCS is MCS-6 in step 7 and step 10 UAS-7 switching to UAS-11, SS verifies MCS is UAS-10 in step 7 and step 10

58c.3 Downlink EGPRS2 TBF

58c.3.1 Void

58c.3.2 Void

58c.3.2a Acknowledged Mode/ Downlink TBF/ Split RLC Data Block, in EGPRS2A

58.3.2a.1 Conformance requirements

1. Each RLC endpoint receiver shall have an associated receive state array $V(N)$. $V(N)$ is an array of SNS elements indicating the receive status of WS RLC data blocks that are supposed to follow the block $BSN=V(Q)-1$. The array is indexed relative to the receive window state variable $V(Q)$ modulo SNS. When an RLC data block is received with BSN within the receive window, the corresponding element in $V(N)$ is set to the value RECEIVE
2. If the RLC data block is split over two radio blocks, the element shall be set to the value RECEIVED if and only if both radio blocks have been received.
3. The elements in $V(N)$ shall be set to the value INVALID at the beginning of each TBF. During the TBF, an element in $V(N)$ that falls outside the receive window, shall be set to the value INVALID.

References

3GPP TS 44.060, subclause 9.1.7

58.3.2a.2 Test purpose

To verify that in case an RLC data block is split over two radio blocks:

1. When an RLC data block is received with BSN within the active window i.e. such that $[V(Q) \leq BSN < V(Q) + WS]$ modulo SNS, the corresponding element in $V(N)$ is set to the value RECEIVED (the RLC data block has passed FCS).
2. The corresponding $V(N)$ element shall not be marked as RECEIVED if any of the two radio blocks is not received.
3. The corresponding $V(N)$ element shall be marked as RECEIVED if both of the radio blocks are received.

58.3.2a.3 Method of test

Initial Conditions

Test Procedure

The SS establishes a downlink EGPRS TBF.

The SS sends a RLC data block $n > N$, $n < WS$ using DAS-10. The SS sends the first part of a spitted RLC data block using DAS-7, with $BSN=N$ ($N < \text{window size}$), $SPB='10'B$, and polls for the EGPRS PACKET DOWNLINK ACK/NACK message from the MS. The MS shall respond with an EGPRS PACKET DOWNLINK ACK/NACK message indicating the block $BSN=N$ is not received.

The SS then sends the second part of the spitted RLC block with the same $BSN=N$ ($N < WS$), $SPB='11'$ using DAS-7, and polls for the EGPRS PACKET DOWNLINK ACK/NACK message from the MS. The MS shall respond with an EGPRS PACKET DOWNLINK ACK/NACK message with the $BSN=N$ acknowledged.

Maximum Duration of Test

30 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode EGPRS2 Window Size: arbitrarily chosen
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With DAS-10, $BSN=6$, $RRBP = '00'B$
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	The SS verifies that RBB is set to 0 for RLC data blocks with $BSN = 0, 1, 2, 3, 4$ and 5 and RBB is set to 1 for $BSN=6$.
4	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With DAS-7, BSN starts from 0 $ES/P = '00'B$, $SPB='10'B$
5			Repeat step 4 until $BSN = 3$
6	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With DAS-7 $BSN = 5$, $ES/P = '01'B$, $RRBP = '00'B$, $SPB='11'B$
7	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	The SS verifies that the bits in RBB for $BSN=0, 1, 2, 3, 4, 5$ are set to '0'B.
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With DAS-7 $BSN = 4$, $SPB = '10'B$, $ES/P = '01'B$, $RRBP = '00'B$
9	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	The SS verifies that the bit for $BSN=4$ in RBB is set to '0'B.
10	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With DAS-7 $BSN = 4$, $SPB = '11'B$, $ES/P = '01'B$, $RRBP = '00'B$
11	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	The SS verifies that the bit for $BSN=4$ in RBB is set to '1'B.
			{Completion of downlink data transfer}

58c.3.3a Acknowledged Mode / Downlink TBF / Decoding of Coding Schemes, in EGPRS2-A

58c.3.3a.1 Conformance requirements

1. In EGPRS TBF mode, the transfer of RLC Data Blocks in the acknowledged RLC/MAC mode can be controlled by a selective type I ARQ mechanism, or by type II hybrid ARQ (Incremental Redundancy: IR) mechanism, coupled with the numbering of the RLC Data Blocks within one Temporary Block Flow.
2. According to the link quality, an initial Modulation and Coding Scheme (MCS) is selected for an RLC block (see note). For the retransmissions, the same or another MCS from the same family of MCSs can be selected.
3. The selection of MCS is controlled by the network.
4. In EGPRS header, the Coding and Puncturing Scheme indicator field is used to indicate the kind of channel coding and puncturing used for data blocks.(see 3GPP TS 05.03)

Test Procedure

The SS establishes a downlink EGPRS2-A TBF setting EGPRS window size to 256, FANR disabled and in BTTI mode.

The SS establishes a Downlink EGPRS TBF.

The send SS sends a few RLC data blocks in different coding schemes and asks for an acknowledgement from the MS.

The MS shall correctly acknowledge all the received data blocks.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode EGPRS Window Size: 256. BTTI configuration Mode, FANR disabled, EGPRS Level set to EGPRS2-A, EGPRS Window Size: arbitrarily chosen
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With DAS-5, BSN=0, CES/P = '000'B
3			Repeat step 2 using DAS-6 till DAS-7. The BSNs of the data blocks shall be sequential. Repeat step 2 using DAS-8 till DAS-10. The BSNs of the data blocks shall be sequential. Repeat step 2 using DAS-11 till DAS-12. The BSNs of the data blocks shall be sequential. The last block transmitted should be DAS-12 with BSN=12, 13, and 14 for the last block transmitted. CES/P = '001'B and RRBp='00'B is set in the header of last RLC Data Block sent with BSN=12, 13, and 14.
4	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the corresponding PACCH. The SS verifies that the MS acknowledges all the received RLC data blocks. SSN shall be equal to 16

Specific message contents

None.

58c.3.4a Acknowledged Mode / Downlink TBF / Retransmission / Padding in EGPRS2-A

58c.3.4a.1 Conformance requirements

According to the link quality, an initial Modulation and Coding Scheme (MCS) is selected for an RLC block (see note). For the retransmissions, the same or another MCS from the same family of MCSs may be selected. E.g. if MCS-7 is selected for the first transmission of an RLC block, any MCS of the family B may be used for the retransmissions. Further, RLC data blocks initially transmitted with MCS-4, MCS-5, MCS-6, MCS-7, MCS-8 or MCS-9, may be retransmitted with MCS-1, MCS-2 or MCS-3 as appropriate, by sending the different parts of the RLC data block in different radio blocks. In this case, the split block field in the header shall be set to indicate that the RLC data block is split, and the order of the two parts. For blocks initially transmitted with MCS-8 which are retransmitted using MCS-6 or MCS-3, padding of the first six octets shall be applied before each RLC data block, and the CPS field shall be set to indicate that this has been done (see an informative example in annex J).

References

3GPP TS 44.060, subclause 9.3.2.1

58c.3.4a.2 Test purpose

To verify that the MS correctly decodes the CPS field of EGPRS Downlink RLC Data Block header.

To verify that the MS correctly decodes a retransmitted data block this contains first six octets of padding.

58c.3.4a.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting,

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP context2 activated.

Specific PICS Statements

- EGPRS Multislotclass (TSPC_Type_EGPRS_Multislot_ClassX where X = 1...45)

PIXIT Statements

Test Procedure

The SS initiates the establishment of a downlink EGPRS2-A TBF, setting window size to the largest value WS corresponding the number of timeslots assigned to TBF.

The SS sends two EGPRS2-A RLC radio blocks with BSN=0 BSN=1 and BSN=4 BSN=5 using DAS-9. In the last block FBI is set to 1 and the MS is polled for Acknowledgement.

The MS shall send a EGPRS Packet Downlink Ack/Nack type 2 message acknowledging BSNs 0,1,4 and 5 and negatively acknowledging BSN=2 and BSN=3. SS verifies that FAI is set to 0.

The SS sends EGPRS RLC data block with BSN=2 using DAS-6, setting first 6 octets of the data block to padding, and setting CPS field to indicate the same and polls the MS for acknowledgement.

The MS shall send EGPRS Packet Downlink Ack/Nack type 2 message acknowledging BSNs 0,1,2,4 and 5 and negatively acknowledging BSN=3. SS verifies that FAI is set to 0.

The SS sends first part of BSN=3 using MCS-3 with first six octets of the data block set to padding and polls the MS for acknowledgement. CPS is set correctly in the data block header to indicate that the block is first part of split block and that the data block is padded.

The MS shall send EGPRS Packet Downlink Ack/Nack message acknowledging BSNs 0,1,2,4 and 5 and negatively acknowledging BSN=3. SS verifies that FAI is set to 0.

The SS sends second part of BSN=3 using MCS-3 and polls the MS for acknowledgement. CPS is set correctly in the data block header to indicate that the block is second part of split block and that the data block is not padded.

The MS shall send EGPRS Packet Downlink Ack/Nack Type 2 message acknowledging BSNs 0 to 5. SS verifies that FAI is set to 1.

Maximum Duration of Test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode, EGPRS level = 01 EGPRS Window Size = Maximum for the MS according to the number of timeslots assigned to TBF.

None.

58c.3.5a Acknowledged Mode / Downlink TBF / First Partial Bitmap and Next Partial Bitmap in EGPRS2-A

58c.3.5a.1 Conformance requirements

1. In EGPRS downlink TBFs, an additional poll bit is added to the S/P field in every downlink RLC block so that the network can request the following:

- First Partial Bitmap (FPB) segment with $SSN = (V(Q) + 1) \bmod 2048$ where SSN denotes the Starting Sequence Number.
 - Next Partial Bitmap (NPB) segment with $SSN = (PBSN + 1) \bmod 2048$ where PBSN denotes a Partial Bitmap Sequence Number variable stored at the receiver.
2. SSN is determined by the receiver as a function of ES/P, V(Q) and PBSN. The FPB and NPB are specific instances of the *EGPRS Ack/Nack Description Information Element* within the EGPRS PACKET DOWNLINK ACK/NACK message, EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message. The mobile station shall respond to ES/P field according to table 9.1.8.2.1.1 (non-MBMS). For a mobile station with one or more downlink TBFs using EGPRS2, the mobile station shall send the EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message. Otherwise, the mobile station shall send the EGPRS PACKET DOWNLINK ACK/NACK message.
3. Based on PBSN, V(Q) and the ES/P field set by the network, SSN and PBSN shall be determined according to table 9.1.8.2.2.1. For EGPRS2, SSN and PBSN shall be determined based on PBSN, V(Q) and CES/P fields according to table 9.1.8.2.2.2. For EGPRS2 the Combined EGPRS Supplementary/Polling field describes the feedback request and specifies a single uplink block in which the mobile station shall transmit a PACKET CONTROL ACKNOWLEDGEMENT message, a PACCH block see table 9.1.8.2.1.3. The single uplink block is defined by a delay relative to the first TDMA frame (N) of the downlink block containing the CES/P value. If ordered to send a EGPRS PACKET DOWNLINK ACK/NACK message or EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message, a mobile station with one or more downlink TBFs using EGPRS2 shall send the EGPRS PACKET DOWNLINK ACK/NACK TYPE 2 message. Otherwise, the mobile station shall send the EGPRS PACKET DOWNLINK ACK/NACK message.

58c.3.5a.2 Test purpose

To verify the correct generation of SSN and RB in the First Partial Bitmap.

To verify the correct generation of SSN and RB in the Next Partial Bitmap.

58c.3.5a.3 Method of test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting,

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, SPLIT PG CYCLE negotiated and the test PDP Context2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

The SS establishes a downlink EGPRS2-A TBF setting EGPRS window size to 256, FANR disabled and in BTTI mode.

The SS sends a series of RLC data blocks with BSN=0, 1...5, CES/P = '000'B using DAS-7 coding scheme.

The SS sends a RLC data block with BSN=21, CES/P = '001'B and using DAS7. MS responds back with EGPRS PACKET DOWNLINK ACK/NACK TYPE2 message with CQR and FPB within radio period (N+8 or N+9) mode 2715648.

The SS sends a RLC data block with BSN=32, CES/P = '010'B and using DAS-5. MS responds back with EGPRS PACKET DOWNLINK ACK/NACK TYPE2 message with CQR and FPB within radio period (N+13) mode 2715648.

The SS sends a RLC data block with BSN=22, CES/P = '011'B and using DAS-6. MS doesn't responds back with EGPRS PACKET DOWNLINK ACK/NACK TYPE2 message.

The SS sends a RLC data block with BSN=24, CES/P = '100'B and using DAS-5. MS doesn't responds back with EGPRS PACKET DOWNLINK ACK/NACK TYPE2 message.

The SS sends a RLC data block with BSN=26, CES/P = '101'B and using DAS-7. MS responds back with EGPRS PACKET DOWNLINK ACK/NACK TYPE2 message with CQR and NPB within radio period (N+8 or N+9) mode 2715648.

The SS sends a RLC data block with BSN=29, CES/P = '110'B and using DAS-5. MS responds back with EGPRS PACKET DOWNLINK ACK/NACK TYPE2 message with CQR and NPB within radio period (N+13) mode 2715648.

The SS sends a RLC data block with BSN=31, CES/P = '111'B and using DAS-5. MS responds back with EGPRS PACKET DOWNLINK ACK/NACK TYPE2 message with CQR and NPB within radio period (N+8 or N+9) mode 2715648.

The SS sends RLC data blocks with BSN=256, 116,241. CES/P = '000'B using DAS-5 coding scheme

The SS sends a RLC data block with BSN=237, CES/P = '111'B and using DAS-5. MS responds back with EGPRS PACKET DOWNLINK ACK/NACK TYPE2 message with no channel quality report and NPB within radio period (N+8 or N+9) mode 2715648.

Maximum Duration of Test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1		{Downlink TBF establishment}	Acknowledged Mode EGPRS Window Size: 256. BTTI configuration Mode, FANR disabled, EGPRS Level set to EGPRS2-A,
2	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	With DAS-7,BSN = N, CES/P = '000'B

58d EFTA

58d.1 Concurrent EFTA TBF

58d.1.1 EFTA / Extended Dynamic Allocation/Concurrent TBF

58d.1.1.1 Conformance Requirement

For a mobile station with an uplink TBF for which EFTA is used transmissions shall be performed on the uplink PDCHs or PDCH-pairs allocated by the USF as specified in Annex N. In case the mobile station also has one or more concurrent downlink TBF(s), but does not have enough RLC/MAC blocks ready for transmission to fully utilize the total number of allocated resources for uplink radio block transmission during the corresponding radio block period(s), then it shall immediately begin monitoring its assigned downlink PDCHs or PDCH-pairs after transmitting its last available RLC/MAC block taking into account the switching requirements of its multislot class (see 3GPP TS 45.002).

References

3GPP TS 44.060, subclause 8.1.1.2.1

A mobile station with an uplink TBF operating in BTTI configuration for which EFTA is used shall perform transmissions on a subset of the uplink PDCHs allocated by the USF. If the mobile station has P RLC/MAC blocks ready for transmission, then this subset is defined as the first P number of the allocated uplink PDCHs arranged according to the specific timeslot numbers order as specified in Table N.1 below. T_{ra} or T_{rb} , whichever is applicable, is the switching time from transmission to reception (see 3GPP TS 45.002).

Table N.1: Uplink timeslots transmission order for EFTA

Lowest Numbered Downlink Timeslot the MS Needs to Monitor	T_{ra} or T_{rb} , whichever is applicable		
	0	1	2
TN0	4,3,2,1,0,5,6,7	3,2,1,0,4,5,6,7	2,1,0,3,4,5,6,7
TN1	5,4,3,2,1,0,6,7	4,3,2,1,0,5,6,7	3,2,1,0,4,5,6,7
TN2	6,5,4,3,2,1,0,7	5,4,3,2,1,0,6,7	4,3,2,1,0,5,6,7
TN3	7,6,5,4,3,2,1,0	6,5,4,3,2,1,0,7	5,4,3,2,1,0,6,7
TN4	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	6,5,4,3,2,1,0,7
TN5	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0
TN6	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0
TN7	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0

A mobile station with an uplink TBF operating in RTTI configuration for which EFTA is used shall perform transmissions on a subset of the uplink PDCH-pairs allocated by the USF in the same manner as specified above. For

this case the specific timeslot number order shall be seen as indicating the lowest numbered timeslot of the uplink PDCH-pair.

NOTE: The above described rule determine the subset of the allocated uplink PDCHs or PDCH-pairs on which uplink transmissions shall be performed when EFTA is used. This procedure however, does not define which uplink PDCHs or PDCH-pairs that shall be allocated by the USF. Nor does the procedure define the individual ordering of any transmitted RLC/MAC blocks on these resources, which shall remain the same as for the case when EFTA is not used.

A mobile station with an uplink TBF for which EFTA is used shall perform the transmission of any uplink PACCH message allocated via the polling mechanism (see sub-clauses 10.4.4b and 10.4.5) on the first of the assigned uplink PDCHs or PDCH-pairs arranged according to the specific timeslot number order as described by Table N.1 above, regardless of which resources are allocated by the USF. The switching time T_{ra} or T_{rb} shall be interpreted according to its value at the time the poll was received.

References

3GPP TS 45.002, Annex B.1 and B.5

3GPP TS 45.002 Table 6.4.2.2.1

58d.1.1.2 Test Purposes

The test purpose is to verify that the EFTA capable MS indicating support for an Alternative EFTA Multislot Class supports as many downlink timeslots per TDMA frame as indicated with the multislot classes. Especially it's verified that the Sum parameter is not used in the conditions where Sum is not applicable according to TS 45.002 Annex B.5.

1. T_{tb} , the minimum number of slots allowed between the end of the previous transmit or receive TS and the next transmit TS when measurement is to be performed for type 1 MS.
2. T_{ra} , the minimum number of slots allowed between the previous transmit or receive TS and the next receive TS when measurement is to be performed for type 1 MS.
3. The maximum number of Rx and Tx supported.
4. Check that MS transmit according to 44.060 Table N.1.
5. MS shall if uplink data is ongoing then for these overlapping instances prioritize uplink radio block transmission over attempting to read downlink radio blocks.

58d.1.1.3 Method of Test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting,

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

Establish a concurrent uplink downlink TBF using max number of Tx and Rx timeslot according to multislot class and alternative EFTA multislot class, EDA used, USF_GRANULARITY=4 blocks, MCS-5.

Transmit on all downlink timeslots and check that all data is Ack'd correctly.

Transmit on all uplink timeslots while downlink transmission on all timeslot also is ongoing, check that the uplink always gets transmitted correctly and that only overlapping downlink data is Nacked.

Send 2 RLC blocks on uplink assign USF on lowest TN, while downlink transmission on all timeslots also is ongoing, check that uplink is transmitted according to 44.060 Table N.1.

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	{Downlink TBF establishment}	Acknowledged Mode. SS Commands MS to use mobile coding scheme MCS-5. Max number of timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1) and Alternative EFTA multislot class (TS 45.002 Annex B.5): - TN_1 to TN_x .
2	SS -> MS	30 RLC data blocks	SS sends data, last block is polling.
3	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Sent on PACCH. Check all blocks Aacked ok.
4	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. The uplink TBF is assigned. MCS-5, EDA used, USF_GRANULARITY=4. Max number of timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1) and Alternative EFTA multislot class (TS 45.002 Annex B.5): - TN_1 to TN_x .
5	SS -> MS	30 RLC data blocks	SS sends data, last block is polling.
6	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Sent on PACCH. SS checks that all data blocks are Aacked.
7	SS <-> MS	{Downlink data transfer},{Uplink data transfer}	2000 octets of data in downlink and SS checks that Aacked/Nack is according to EFTA requirements: - Downlink packets are Nacked if simultaneous as uplink. - Downlink packets are Nacked related to T_{tb} and T_{ra} . 1000 octets of data in uplink and SS checks that all data blocks are Aacked. Downlink and uplink data transfers are simultaneous.
8	SS -> MS	30 RLC data blocks	SS sends data, last block is polling.
9	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF on PACCH on lowest TN.
10	MS -> SS	2 RLC data blocks	Trigger 2 UL data blocks while SS sends data on all assigned downlink timeslots in step 9. SS checks that MS send the data according to TS 44.060 Table N.1.
11	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Sent on PACCH.
12	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges receiving all RLC data blocks. Final Ack Indicator = '1' containing valid RRBp. Sent on the PACCH of the assigned PDCH.
13	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBp on PACCH of the assigned PDCH.

Specific Message Contents

None.

58d.1.2 EFTA / Acknowledge mode/ Concurrent TBF/ pre-emptive retransmission

58d.1.2.1 Conformance Requirement

When Enhanced Flexible Timeslot Assignment, EFTA, is used, and the applicable conditions for pre-emptive retransmission are true, the mobile station shall not prioritize uplink radio block transmission over attempting to read downlink radio blocks.

References

3GPP TS 44.060 subclause 9.1.3.2.1

For a mobile station with an uplink TBF for which EFTA is used transmissions shall be performed on the uplink PDCHs or PDCH-pairs allocated by the USF as specified in Annex N. In case the mobile station also has one or more concurrent downlink TBF(s), but does not have enough RLC/MAC blocks ready for transmission to fully utilize the total number of allocated resources for uplink radio block transmission during the corresponding radio block period(s), then it shall immediately begin monitoring its assigned downlink PDCHs or PDCH-pairs after transmitting its last available RLC/MAC block taking into account the switching requirements of its multislot class (see 3GPP TS 45.002).

Test Procedure

Establish a concurrent uplink downlink TBF using max number of Tx and Rx allowed timeslots according to multislot class and alternative EFTA multislot class for K=1 (DL with minimum 6 TS) and for K=2 (5 DL TS should be used), EDA used, USF_GRANULARITY=1 blocks, MCS-5.

Transmit on all downlink timeslots.

Send 30 RLC block on uplink while downlink transmission on all timeslot also is ongoing. 15 RLC blocks neither acked nor nacked by SS.

Check if K=1 that MS not tries to resend RLC blocks while downlink ongoing.

Check if K=2 that MS resend RLC blocks while downlink ongoing.

Maximum Duration of Test

5 minutes

Expected Sequence

The test sequence is repeated for K = 1: DL using max number of TS allowed, minimum 6 TS, K=2: DL using 5 TS.

Step	Direction	Message	Comments
1	SS -> MS	{Downlink TBF establishment}	Acknowledged Mode. SS Commands MS to use mobile coding scheme MCS-5. timeslots are assigned for K=1: according to MS multislot class (TS 45.002 Annex B.1) and Alternative EFTA multislot class (TS 45.002 Annex B.5) for K=2: 5 TS is assigned: - TN_1 to TN_x
2	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. The uplink TBF is assigned. MCS-5, EDA used, USF_GRANULARITY=1 Max number of timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1) and Alternative EFTA multislot class (TS 45.002 Annex B.5) : - TN_1 to TN_x
3	SS -> MS	{Downlink data transfer}	2000 octets of data in downlink. Downlink data transfer are simultaneous with steps 4 to step 6
4	MS -> SS	30 RLC data blocks	Trigger 30 UL data blocks while SS sends data on all assigned downlink timeslots in step 3. .
5	SS -> MS	PACKET UPLINK ACK/NACK	SS acknowledges 15 RLC data blocks, the other 15 RLC data blocks SS neither Ack nor Nack. PRE_EMPTIVE_TRANSMISSION bit in PUAN message set to '1'.
6a	SS		For K=1: SS checks that MS does not try to resend RLC blocks while downlink data transfer ongoing. Downlink transfer ends
6b	MS -> SS	15 RLC data blocks	For K=2 SS checks that MS resends outstanding Pending Ack blocks while downlink data transfer ongoing. Downlink transfer ends
7	SS -> MS	PACKET UPLINK ACK/NACK	SS sets Final Ack Indicator = '1' containing valid RRBp. Sent on the PACCH of the assigned PDCH.
8	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBp on PACCH of the assigned PDCH.

58d.1.3 EFTA / Concurrent TBF / PAN Polling

58d.1.3.1 Conformance Requirement

In case EFTA is used at the time the CES/P field is received, the mobile station shall transmit the uplink radio block according to the uplink radio block transmission order as described in Annex N regardless of the timeslot or PDCH pair where the block containing the CES/P field was received

References

3GPP TS 44.060, subclause 10.4.4b

A mobile station with an uplink TBF operating in BTTI configuration for which EFTA is used shall perform transmissions on a subset of the uplink PDCHs allocated by the USF. If the mobile station has P RLC/MAC blocks ready for transmission, then this subset is defined as the first P number of the allocated uplink PDCHs arranged according to the specific timeslot numbers order as specified in Table N.1 below. T_{ra} or T_{rb} , whichever is applicable, is the switching time from transmission to reception (see 3GPP TS 45.002).

Table N.1: Uplink timeslots transmission order for EFTA

Lowest Numbered Downlink Timeslot the MS Needs to Monitor	T_{ra} or T_{rb} , whichever is applicable		
	0	1	2
TN0	4,3,2,1,0,5,6,7	3,2,1,0,4,5,6,7	2,1,0,3,4,5,6,7
TN1	5,4,3,2,1,0,6,7	4,3,2,1,0,5,6,7	3,2,1,0,4,5,6,7
TN2	6,5,4,3,2,1,0,7	5,4,3,2,1,0,6,7	4,3,2,1,0,5,6,7
TN3	7,6,5,4,3,2,1,0	6,5,4,3,2,1,0,7	5,4,3,2,1,0,6,7
TN4	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	6,5,4,3,2,1,0,7
TN5	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0
TN6	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0
TN7	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0

A mobile station with an uplink TBF operating in RTTI configuration for which EFTA is used shall perform transmissions on a subset of the uplink PDCH-pairs allocated by the USF in the same manner as specified above. For this case the specific timeslot number order shall be seen as indicating the lowest numbered timeslot of the uplink PDCH-pair.

NOTE: The above described rule determine the subset of the allocated uplink PDCHs or PDCH-pairs on which uplink transmissions shall be performed when EFTA is used. This procedure however, does not define which uplink PDCHs or PDCH-pairs that shall be allocated by the USF. Nor does the procedure define the individual ordering of any transmitted RLC/MAC blocks on these resources, which shall remain the same as for the case when EFTA is not used.

A mobile station with an uplink TBF for which EFTA is used shall perform the transmission of any uplink PACCH message allocated via the polling mechanism (see sub-clauses 10.4.4b and 10.4.5) on the first of the assigned uplink PDCHs or PDCH-pairs arranged according to the specific timeslot number order as described by Table N.1 above, regardless of which resources are allocated by the USF. The switching time T_{ra} or T_{rb} shall be interpreted according to its value at the time the poll was received.

References

3GPP TS 44.060, Annex N

For a mobile station with an uplink TBF for which EFTA is used transmissions shall be performed on the uplink PDCHs or PDCH-pairs allocated by the USF as specified in Annex N. In case the mobile station also has one or more concurrent downlink TBF(s), but does not have enough RLC/MAC blocks ready for transmission to fully utilize the total number of allocated resources for uplink radio block transmission during the corresponding radio block period(s), then it shall immediately begin monitoring its assigned downlink PDCHs or PDCH-pairs after transmitting its last available RLC/MAC block taking into account the switching requirements of its multislot class (see 3GPP TS 45.002).

3GPP TS 45.002 Table 6.4.2.2.1

58d.1.3.2 Test Purposes

The test purpose is to verify that the EFTA capable MS indicating support for an Alternative EFTA Multislot Class supports as many uplink and downlink timeslots per TDMA frame as indicated with the multislot classes. Especially it's verified that the Sum parameter is not used in the conditions where Sum is not applicable according to TS 45.002 Annex B.5.

1. The maximum number of Rx and Tx supported.
2. MS is polled for a Piggy-back Ack/Nack with CES/P field. Check that MS transmit response according to 44.060 Table N.1.

58d.1.3.3 Method of Test

Initial Conditions

System Simulator:

1 cell with EGPRS support, default setting,

Mobile Station:

The MS is EGPRS updated with a P-TMSI allocated, PDP Context 2 activated.

Specific PICS Statements

-

PIXIT Statements

-

Test Procedure

Establish a concurrent uplink downlink TBF using max number of Tx and Rx timeslot according to multislot class and alternative EFTA multislot class, EDA used, USF_GRANULARITY=4 blocks, MCS-5, RTTI and FANR configuration used.

Transmit on all uplink timeslots while downlink transmission on all timeslot also is ongoing, check that the uplink always gets transmitted correctly and that only overlapping downlink data is Nacked.

MS is polled for a Piggy-back Ack/nack on lowest TN, while downlink transmission on all timeslot also is ongoing, check that uplink response is transmitted according to 44.060 Table N.1.

Maximum Duration of Test

5 minutes

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	{Downlink TBF establishment}	Acknowledged Mode. SS Commands MS to use mobile coding scheme MCS-5. Max number of timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1) and Alternative EFTA multislot class (TS 45.002 Annex B.5): - TN_1 to TN_x : RTTI and FANR activated.
2	SS -> MS	PACKET UPLINK ASSIGNMENT	Sent on downlink PACCH. The uplink TBF is assigned. MCS-5, EDA used, USF_GRANULARITY=1 Max number of timeslots are assigned according to MS multislot class (TS 45.002 Annex B.1) and Alternative EFTA multislot class (TS 45.002 Annex B.5) : - TN_1 to TN_x RTTI and FANR activated. BTTI USF.
3	SS <-> MS	{Downlink data transfer},{Uplink data transfer}	2000 octets of data in downlink and SS checks that Aced/Nack is according to EFTA requirements: - Downlink packets are Nacked if simultaneous as uplink. - Downlink packets are Nacked related to T_{fb} and T_{ra} . 1000 octets of data in uplink and SS checks that all data blocks are Aced. Downlink and uplink data transfers are simultaneous and also simultaneous with steps 4 to step 7.
4	SS -> MS	EGPRS DOWNLINK DATA BLOCK	Sent on assigned PDTCH on lowest TN. TFI assigned to the MS. CES/P = 011 Does not contain PAN field.
5	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Assigned USF on PACCH on lowest TN.
6	MS -> SS	EGPRS UPLINK DATA BLOCK	Received on assigned PDTCH. Received in reserved block allocated by CES/P at Step 4. Contains PAN field
7	SS		SS checks MS sends the block including the PAN response according to TS 44.060 Table N.1. Downlink and uplink transfer ends
8	SS -> MS	PACKET UPLINK ACK/NACK	SS sets Final Ack Indicator = '1' containing valid RRBp. Sent on the PACCH of the assigned PDCH.
9	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBp on PACCH of the assigned PDCH.

Specific Message Contents

None.

58d.1.4 EFTA / Concurrent TBF / Polling

58d.1.4.1 Conformance Requirement

In case of a BTTI or an RTTI configuration when EFTA is used at the time the RRBp field is received, the mobile station shall transmit the uplink radio block according to the uplink radio block transmission order as described in Annex N regardless of the timeslot or PDCH-pair where the block containing the RRBp was received.

References

3GPP TS 44.060, subclause 10.4.5

A mobile station with an uplink TBF operating in BTTI configuration for which EFTA is used shall perform transmissions on a subset of the uplink PDCHs allocated by the USF. If the mobile station has P RLC/MAC blocks ready for transmission, then this subset is defined as the first P number of the allocated uplink PDCHs arranged according to the specific timeslot numbers order as specified in Table N.1 below. T_{ra} or T_{fb} , whichever is applicable, is the switching time from transmission to reception (see 3GPP TS 45.002).

Table N.1: Uplink timeslots transmission order for EFTA

Lowest Numbered Downlink Timeslot the MS Needs to Monitor	T_{ra} or T_{rb} , whichever is applicable		
	0	1	2
TN0	4,3,2,1,0,5,6,7	3,2,1,0,4,5,6,7	2,1,0,3,4,5,6,7
TN1	5,4,3,2,1,0,6,7	4,3,2,1,0,5,6,7	3,2,1,0,4,5,6,7
TN2	6,5,4,3,2,1,0,7	5,4,3,2,1,0,6,7	4,3,2,1,0,5,6,7
TN3	7,6,5,4,3,2,1,0	6,5,4,3,2,1,0,7	5,4,3,2,1,0,6,7
TN4	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	6,5,4,3,2,1,0,7
TN5	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0
TN6	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0
TN7	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0	7,6,5,4,3,2,1,0

A mobile station with an uplink TBF operating in RTTI configuration for which EFTA is used shall perform transmissions on a subset of the uplink PDCH-pairs allocated by the USF in the same manner as specified above. For this case the specific timeslot number order shall be seen as indicating the lowest numbered timeslot of the uplink PDCH-pair.

NOTE: The above described rule determine the subset of the allocated uplink PDCHs or PDCH-pairs on which uplink transmissions shall be performed when EFTA is used. This procedure however, does not define which uplink PDCHs or PDCH-pairs that shall be allocated by the USF. Nor does the procedure define the individual ordering of any transmitted RLC/MAC blocks on these resources, which shall remain the same as for the case when EFTA is not used.

A mobile station with an uplink TBF for which EFTA is used shall perform the transmission of any uplink PACCH message allocated via the polling mechanism (see sub-clauses 10.4.4b and 10.4.5) on the first of the assigned uplink PDCHs or PDCH-pairs arranged according to the specific timeslot number order as described by Table N.1 above, regardless of which resources are allocated by the USF. The switching time T_{ra} or T_{rb} shall be interpreted according to its value at the time the poll was received.

58e DTR

58e.1 DTR with Uplink TBF / PACKET UPLINK ACK/NACK message with DTR information / Resumption to normal operation

58e.1.1 Conformance requirements

[3GPP TS 44.060, 8.1.8.2]

During an uplink TBF, the network may transmit the DTR information within a PACKET UPLINK ACK/NACK message. If DTR information is received in a PACKET UPLINK ACK/NACK message and an RLC data block in the same block period, the mobile station shall ignore the DTR information received in the RLC data block.

A mobile station not already in DTR mode shall enter DTR mode and start monitoring only the indicated PDCH or PDCH-pair (and if applicable, carrier) within the reaction time specified in 3GPP TS 45.010, when:

- DTR information was included in whichever of the following was the most recently received:
 - i) any PACKET UPLINK ACK/NACK message (applicable if the mobile station has an ongoing uplink TBF) and

[3GPP TS 44.060, 8.1.8.3]

The mobile station shall exit DTR mode within the reaction time specified in 3GPP TS 45.010:

- when an RLC data block with BSN equal to V(S) is transmitted and the medium access mode is Dynamic Allocation;

References

3GPP TS 44.060, subclause 8.1.8

58e.1.2 Test purpose

1. To verify that MS enters DTR mode when PACKET UPLINK ACK/NACK message with DTR information is received during an uplink TBF.
2. To verify that MS resumes the RLC data block transfer on all the timeslots configured when a new LLC PDU is received from upper layers, after exiting the DTR mode.

58e.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, EXT_UTBF_NODATA = 1, BS_CV_MAX = 15

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

- DTR Supported (TSPC_DTR)

PIXIT Statements

-

Test Procedure

The MS is triggered to transfer user data. A TBF of dynamic allocation in acknowledged mode is assigned. SS assigns an USF to MS until MS has sent CV = 0. SS acknowledges all received data with Final Ack Indicator bit set to '0'. SS continues to assign USF to MS. As the EXT_UTBF_NODATA = 1, MS refrains from transmitting the Packet Uplink Dummy Control Blocks. SS transmits PACKET UPLINK ACK/NACK message with DTR information. SS transmits PACKET POLLING REQUEST on PACCH on TN2. Verify that MS does not respond with PACKET CONTROL ACK, as the MS is in DTR mode and it shall not monitor TN2. Then MS is triggered to send more data. Verify that MS shall send data blocks with a recalculated CV on both TN1 and TN2. Then the uplink TBF is continued and completed.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 400 octets, without starting time, USF_GRANULARITY = 1 block, EGPRS channel coding command: MCS 1, RLC acknowledged mode (PDP context2), Two slots, USF1 on TN1 and USF2 on TN2 are assigned.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF1 assigned to the MS. Sent in TN1 on PACCH of PDCH assigned in step 1.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF2 assigned to the MS. Sent in TN2 on PACCH of PDCH assigned in step 1.
4	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₁ on the PDTCH assigned in step 1.
5	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₂ on the PDTCH assigned in step 1.
6			Repeat step 2 and 3 until CV=0
7	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indication = 0. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received.
8	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	Received on TN ₁ on the PDTCH assigned in step 1.
9	SS		Verify that MS does not transmit any data as EXT_UTBF_NODATA = 1
10	SS -> MS	PACKET UPLINK ACK/NACK	Sent on TN1 of the uplink PDTCH, with DTR information.
11	SS -> MS	PACKET POLLING REQUEST	Sent on TN2 of the uplink PDTCH, with a valid RRBp=N+13
12	SS		Verify that there is no PACKET CONTROL ACKNOWLEDGEMENT received, as the DTR is active for TN2.
13	MS		Trigger the MS to send 400 octets of data. Verify that UPLINK RLC DATA BLOCK is transmitted by the MS on both TN0 and TN1 and has recalculated the CV.
14	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF1 assigned to the MS. Sent in TN1 on PACCH of PDCH assigned in step 1.
15	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF2 assigned to the MS. Sent in TN2 on PACCH of PDCH assigned in step 1.
16	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₁ on the PDTCH assigned in step 1.
17	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₂ on the PDTCH assigned in step 1.
18			Repeat step 12 and 13 until CV=0
19	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indication = 1 containing valid RRBp. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received.
20	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBp on PACCH of the assigned PDCH.

58e.3 DTR with Concurrent TBF / RLC data block with DTR information / Resumption to normal operation

58e.3.1 Conformance requirements

[3GPP TS 44.060, 8.1.8.2]

During a downlink TBF, the network may transmit the DTR information within downlink RLC data blocks of the TBF (see sub-clause 10.3a.1). During an uplink TBF, the network may transmit the DTR information within a PACKET UPLINK ACK/NACK message. If DTR information is received in a PACKET UPLINK ACK/NACK message and an RLC data block in the same block period, the mobile station shall ignore the DTR information received in the RLC data block.

A mobile station not already in DTR mode shall enter DTR mode and start monitoring only the indicated PDCH or PDCH-pair (and if applicable, carrier) within the reaction time specified in 3GPP TS 45.010, when:

- DTR information was included in whichever of the following was the most recently received:
 - ii) the RLC data block with BSN equal to $V(Q) - 1$ modulo SNS (applicable if the mobile station has an ongoing downlink TBF) and
- $V(R) = V(Q)$, if the mobile station has an ongoing downlink TBF, and
- if the mobile station has an ongoing uplink TBF, the RLC data block with BSN = $V(S)$ is not available and either:
 - $V(A) = V(S)$, or
 - $V(A) < V(S) \bmod \text{SNS}$, the most recently received pre-emptive transmission bit is set to '0', and no element of $V(B)$ has the value NACKED (for RLC acknowledged mode).

[3GPP TS 44.060, 8.1.8.3]

The mobile station shall exit DTR mode within the reaction time specified in 3GPP TS 45.010:

- when an RLC data block with BSN equal to $V(S)$ is transmitted and the medium access mode is Dynamic Allocation;

References

3GPP TS 44.060, subclause 8.1.8

58e.3.2 Test purpose

1. To verify that MS enters DTR mode when RLC data block with LLC UI dummy command is received during a concurrent TBF.
2. To verify that MS resumes the RLC data block transfer on all the timeslots configured when a new LLC PDU is received from upper layers, after exiting the DTR mode.

58e.3.3 Method of test

Initial Conditions

System Simulator:

1 cell, NW_EXT_UTBF = 1, EXT_UTBF_NODATA = 1, BS_CV_MAX = 15

Mobile Station:

MS is in Packet Idle mode, GPRS attached with support of GERAN Feature Package 1 indicated in MS Radio Access Capabilities, and PDP context 2 established.

Specific PICS Statements

- DTR Supported (TSPC_DTR)

PIXIT Statements

-

Test Procedure

An uplink TBF is established and in progress. After the MS sends an uplink data block the SS assigns a downlink TBF on the same timeslot as the uplink TBF. Uplink and downlink data transfer are in progress until CV = 0. SS transmits a RLC data block with LLC UI dummy command with DTR information. SS transmits PACKET POLLING REQUEST on PACCH on TN2. Verify that MS does not respond with PACKET CONTROL ACK, as DTR is active for TN2. Then MS is triggered to send more data. Verify that MS shall send data blocks with a recalculated CV on both TN1 and TN2. Then the uplink TBF is continued and completed.

Expected Sequence

Step	Direction	Message	Comments
1		{Uplink dynamic allocation two phase access}	n = 440 octets, without starting time, USF_GRANULARITY = 1 block, TLLI_BLOCK_CHANNEL_CODING: MCS1 EGPRS CHANNEL CODING COMMAND: MCS1 Two uplink timeslots TN1 and TN2 assigned.
2	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF ₁ assigned to the MS. Sent in TN ₁ on PACCH of PDCH assigned in step 1.
3	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF ₂ assigned to the MS. Sent in TN ₂ on the same radio block as step 2, on PACCH of PDCH assigned in step 1.
4	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₁ on the PDTCH assigned in step 1.
5	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₂ , on the same radio block as step 4, on PDTCH assigned in step 1.
6	SS -> MS	PACKET DOWNLINK ASSIGNMENT	Sent on PACCH of PDCH assigned in step 1. Assign a downlink TBF, MAC mode = dynamic allocation, RLC mode = acknowledged mode, TFI _d , no starting time, assigning the timeslots TN ₁ and TN ₂ .
7	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on TN ₁ of the downlink PDTCH, RRB invalid, the assigned USF ₁ addressing the MS.
8	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on TN ₂ of the downlink PDTCH, RRB invalid, the assigned USF ₂ addressing the MS.
9	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₁ on the next radio block from step 7.
10	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₂ on the next radio block from step 8.
11	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on TN ₁ of the downlink PDTCH, RRB invalid, the assigned USF ₁ addressing the MS.
12	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	Sent on TN ₂ of the downlink PDTCH, with FBI= 0, ES/P set to 01 and a valid RRB. Sent on downlink PDTCH.
13	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₁ .
14	MS -> SS	EGPRS PACKET DOWNLINK ACK/NACK	Received on the specified RRB of the downlink PACCH.
15			Repeat step 7 to 14, until CV=0 in step 9, 10 or 13.
16	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indication = 0. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received.
17	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	USF assigned to the MS
18	SS		Verify that MS does not transmit any data as EXT_UTBF_NODATA = 1
19	SS -> MS	EGPRS DOWNLINK RLC DATA BLOCK	LLC UI dummy command, with DTR information
20	SS -> MS	PACKET POLLING REQUEST	Sent on TN2 of the uplink PDTCH, with a valid RRB=N+13
21	SS		Verify that there is no PACKET CONTROL ACKNOWLEDGEMENT received, as the DTR is active for TN2.
23	MS		The MS is triggered to send 440 octets of user data. Verify that UPLINK RLC DATA BLOCK is transmitted by the MS on both TN1 and TN2 and has recalculated the CV.
24	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent in TN1 on PACCH of PDCH assigned in step 1.
25	SS -> MS	PACKET DOWNLINK DUMMY CONTROL BLOCK	The USF assigned to the MS. Sent in TN2 on PACCH of PDCH assigned in step 1.(NOTE 1)
26	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₁ .
27	MS -> SS	EGPRS UPLINK RLC DATA BLOCK	Received on TN ₂ .
28			Repeat step 24 to 27 until CV=0
29	SS -> MS	PACKET UPLINK ACK/NACK	Final Ack Indication = 1 containing valid RRB. Sent on PACCH of the assigned PDCH. Acknowledge all data blocks received.

Step	Direction	Message	Comments
30	MS -> SS	PACKET CONTROL ACKNOWLEDGEMENT	Received on the block specified by RRBP on PACCH of the assigned PDCH.

NOTE 1: The mobile stations shall be ready to receive on TN2 in step 25 in TDMA frame (N+9) mod 2715648 where N is the last TDMA frame of block sent in step 24 (3GPP TS 45.010).

60 Inter-system hard handover from GSM to UTRAN

Clause 60 contains test procedures to be used for executing Inter-system Handover from GSM to UTRAN tests. Table 60-1 contains a summary of the different combinations of parameters being tested, together with a reference to the appropriate generic test procedure. If a test uses a parameter which the MS under test does not support, the test shall be skipped. Test cases in this clause are applicable only to the MS supporting both UTRAN and GSM. The test USIM shall support service 27 to carry out these test cases.

Table 60-1

60.1 Inter system handover to UTRAN/From GSM/Speech/Success

60.1.1 Definition

60.1.2 Conformance requirement

The MS shall be able to receive a INTERSYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.1.3 Test purpose

To test that MS supporting both GSM and UTRAN hands over to the indicated channel in the UTRAN target cell when it is in the speech call active state in the GSM serving cell and receives a INTERSYSTEM TO UTRAN HANDOVER COMMAND. It is also verified that the MS performs measurements on the target UTRAN cell before the handover.

60.1.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GPRS, Cell 2 is UTRAN (cell selection conditions in favour of the GPRS cell).

The present document subclause 40 shall be referenced for the default parameters of cell 1, and subclause 26.6.5.1 shall be referenced for cell allocation.

3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell 2.

MS:

"idle, updated", channel released mode with TMSI allocated.

For MS supporting GPRS:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

Specific PICS statements

- MS supports GSM FR (TSPC_AddInfo_Full_rate_version_1).
- MS supports GSM AMR (TSPC_AddInfo_Full_rate_version_3).
- MS supports GSM EFR (TSPC_AddInfo_Full_rate_version_2).
- MS supports GSM HR (TSPC_AddInfo_Half_rate_version_1).
- Support of UTRAN FDD (TSPC_Type_UTRAN FDD)
- Support of UTRAN TDD (TSPC_Type_UTRAN TDD)

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

Test Procedure

The SS brings the MS into the call active state (CC state U10) according to settings for execution counter M (with FR speech call for execution counter M = 1). The SS configures the UTRAN dedicated channel corresponding to the UTRAN FDD/TDD mode to default configuration 3. The SS sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell. The SS verifies that the MS includes the UTRAN cell in the MEASUREMENT REPORT and then sends INTERSYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

Depending on the PIXIT parameters, the above procedure is executed each time for different initial conditions:

For MS following procedures are executed:

- if the MS supports GSM FR, the procedure is executed for execution counter M = 1 (UTRAN_FDD);
- if the MS supports GSM EFR, the procedure is executed for execution counter M = 2 (UTRAN_FDD);
- if the MS supports GSM AMR, the procedure is executed for execution counter M = 3 (UTRAN_FDD);
- if the MS supports GSM HR, the procedure is executed for execution counter M = 4 (UTRAN_FDD);
- if the MS supports GSM FR, the procedure is executed for execution counter M = 5 (UTRAN_TDD);
- if the MS supports GSM EFR, the procedure is executed for execution counter M = 6 (UTRAN_TDD);
- if the MS supports GSM AMR, the procedure is executed for execution counter M = 7 (UTRAN_TDD);
- if the MS supports GSM HR, the procedure is executed for execution counter M = 8 (UTRAN_TDD).

Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2, 3, 4, 5, 6, 7, 8 depending on the PIXIT parameters.

Step	Direction		Message	Comments
	MS	SS		
1	MS			The SS bring the MS into GSM U10 state in cell 1 and for M = 1 and 5: the MS is in GSM FR speech call; for M = 2 and 6: the MS is in GSM EFR speech call; for M = 3 and 7: the MS is in GSM AMR speech call; for M = 4 and 8: the MS is in GSM HR speech call. on a hopping traffic channel
2	SS			The SS configures the dedicated channel with the configuration: conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs in UTRAN cell.
3	←		MEASUREMENT INFORMATION	
4	→		MEASUREMENT REPORT	Including Measurement Results on the UTRAN cell in Step 4
5	←		INTERSYSTEM TO UTRAN HANDOVER COMMAND	Send on cell 1 (GSM cell)
6	MS			The MS accepts the handover command and configures its lower layers using the parameters contained in the INTERSYSTEM TO UTRAN HANDOVER COMMAND
7	SS			The SS waits for uplink physical channel in synchronization
8	→		HANDOVER TO UTRAN COMPLETE	The SS receives this message on DCCH of cell 2 (UTRAN cell). It implies that the down link physical channel has synchronised with UTRAN.

60.1.5 Test requirement

At step 4 the MEASUREMENT REPORT should include details of the UTRAN cell. At step 8 a HANDOVER TO UTRAN COMPLETE command should be received on DCCH of the UTRAN cell.

60.1a Inter system handover to UTRAN/From GSM/Speech/Success with A5/3 and UEA2/UIA2 ciphering

60.1a.1 Definition

The A5/3 ciphering algorithm is applied in the GERAN cell. UEA2/UIA2 algorithms are applied in the UTRAN cell.

60.1a.2 Conformance requirement

Identical to 60.1.2

60.1a.3 Test purpose

Identical to 60.1.3 but the ciphering /integrity algorithms are defined in 60.1.1.

60.1a.4 Method of test

Identical to 60.1.4

Specific message contents

Similar to the specific message contents in 60.1 except the Rel-7 IE are used and the MS/UE capability to support A5/3 and UEA2/UIA2 is checked, instead.

60.1a.5 Test requirement

Identical to 60.1.5

60.1b Inter system handover to UTRAN/From GSM/Speech/Success with A5/4 and UEA2/UIA2 ciphering

60.1b.1 Definition

The A5/4 ciphering algorithm is applied in the GERAN cell. UEA2/UIA2 algorithms are applied in the UTRAN cell.

60.1b.2 Conformance requirement

Identical to 60.1.2

60.1b.3 Test purpose

Identical to 60.1.3 but the ciphering /integrity algorithms are defined in table 60-1.

60.1b.4 Method of test

Identical to 60.1.4

Specific message contents

Similar to the specific message contents in 60.1 except the Rel-9 IE are used and the MS/UE capability to support A5/4 and UEA2/UIA2 is checked, instead.

60.1b.5 Test requirement

Identical to 60.1.5

60.2a Inter system handover to UTRAN/From GSM/Data/Same data rate/Success

60.2a.1 Definition

60.2a.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.2a.3 Test purpose

To test that the MS hands over to the indicated UTRAN target cell and the data rate of the target channel is the same as the old channel when it is in the data call active state in the GSM serving cell and receives a INTER SYSTEM TO UTRAN HANDOVER COMMAND. It is also verified that the MS performs measurements on the target UTRAN cell before the handover.

60.2a.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GPRS, Cell 2 is UTRAN (cell selection conditions in favour of the GPRS cell).

The present document subclause 40 shall be referenced for the default parameters of Cell 1, and subclause 26.6.5.1 shall be referenced for cell allocation.

3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell 2.

MS:

"idle, updated", channel released mode with TMSI allocated.

For MS supporting GPRS:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

Specific PICS statements

- Support of UTRAN FDD (TSPC_Type_UTRAN FDD)

- Support of UTRAN TDD (TSPC_Type_UTRAN TDD)

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

Test Procedure

The SS brings the MS into the call active state (CC state U10) with a 14.4 kbps CS data call. The SS configures a dedicated channel corresponding to the UTRAN FDD/TDD mode (default configuration 7 - streaming/unknown/UL:14.4 DL:14.4 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBS) in the UTRAN cell. The SS sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell. The SS verifies that the MS include the UTRAN cell in the MEASUREMENT REPORT and then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of the UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

For MS following procedures are executed:

- if the MS supports UTRAN_FDD the procedure is executed for execution counter M = 1;
- if the MS supports UTRAN_TDD the procedure is executed for execution counter M = 2.

Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2 depending on the PIXIT parameters.

Step	Direction		Message	Comments
	MS	SS		
1	MS			The SS bring the MS into GSM U10 state in cell 1 - GSM 14.4 kbps CS data call on a hopping traffic channel.
2		SS		The SS configures a dedicated channel in the UTRAN cell with the configuration: streaming/unknown/UL:14.4 DL:14.4 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs.
3		←	MEASUREMENT INFORMATION	
4		→	MEASUREMENT REPORT	Including Measurement Results on the UTRAN cell in Step 4.
5		←	INTER SYSTEM TO UTRAN HANDOVER COMMAND	Send on cell 1 (GSM cell)
6	MS			The MS accepts the handover command and configures its lower layers using the parameters contained in the INTER SYSTEM TO UTRAN HANDOVER COMMAND
7		SS		The SS waits for uplink physical channel in synchronization
8		→	HANDOVER TO UTRAN COMPLETE	The SS receives this message on DCCH of cell 2 (UTRAN cell). It implies that the down link physical channel has synchronised with UTRAN.

60.2b Inter system handover to UTRAN/From GSM/Data/Same data rate/Extended Rates/Success

60.2b.1 Definition

60.2b.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.2b.3 Test purpose

To test that the MS hands over to the indicated UTRAN target cell and the data rate of the target channel is the same as the old channel when it is in the data call active state in the GSM serving cell and receives a INTER SYSTEM TO UTRAN HANDOVER COMMAND. It is also verified that the MS performs measurements on the target UTRAN cell before the handover.

60.2b.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN (cell selection conditions in favour of the GSM cell).

The present document subclause 26.6.5.1 or subclause 26.13.1.3 (for HSCSD) shall be referenced for the default parameters of Cell 1.

3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell 2.

MS:

"idle, updated", channel released mode with TMSI allocated.

Specific PICS statements

- MS supports UTRAN Streaming/unknown/UL:14.4 DL:14,4 kbps/CS RAB + UL:3.4 DL:3,4 kbps SRBs.
- MS supports UTRAN Streaming/unknown/UL:28.8 DL:28,8 kbps/CS RAB + UL:3.4 DL:3,4 kbps SRBs.
- MS supports UTRAN Streaming/unknown/UL:57.6 DL:57,6 kbps/CS RAB + UL:3.4 DL:3,4 kbps SRBs.

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

Test Procedure

The SS brings the MS into the call active state (CC state U10) with a CS data call (14.4 kbps HSCSD for execution counter M = 1). The SS configures an appropriate dedicated channel(default configuration 7 - streaming/unknown/UL:14.4 DL:14.4 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBS for M = 1) in the UTRAN cell. The SS sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell. The SS verifies that the MS include the UTRAN cell in the MEASUREMENT REPORT and then sends INTER SYSTEM

TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of the UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

Depending on the PIXIT parameters, the above procedure is executed maximum three times, each time for different initial conditions:

- if the MS supports GSM 14.4 kbps HSCSD and UTRAN streaming/unknown/UL:14.4 DL:14.4 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 1, using Default configuration 7;
- if the MS supports GSM 28.8 kbps CS data and UTRAN streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 2, using Default configuration 8;
- if the MS supports GSM 57.6 kbps CS data and UTRAN streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 3, using Default configuration 9.

Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2, 3, depending on the PIXIT parameters.

Step	Direction		Message	Comments
	MS	SS		
1	MS			The SS bring the MS into GSM U10 state in cell 1 and for M = 1: the MS is in GSM 14.4 kbps HSCSD call; for M = 2: the MS is in GSM 28.8 kbps CS data call; for M = 3: the MS is in GSM 57.6 kbps CS data call;
2		SS		The SS configures a dedicated channel in the UTRAN cell with the configuration: For M = 1: (streaming/unknown/UL:14.4 DL:14.4 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs); For M = 2: (streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs); For M = 3: (streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs)
3		←	MEASUREMENT INFORMATION

- Spreading factor	16
- Downlink information per radio link	Same content as in 60.1 except for:
- Downlink information for each radio link	
- Downlink DPCH info for each RL	
- CHOICE Spreading factor	32

60.2b.5 Test requirement

At step 5 the MEASUREMENT REPORT should include details of the UTRAN cell. At step 9 a HANDOVER TO UTRAN COMPLETE command should be received on DCCH of the UTRAN cell.

60.3a Inter system handover to UTRAN/From GSM/Data/Data rate upgrading/Success

60.3a.1 Definition

60.3a.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.3a.3 Test purpose

To test that the MS being in the data call active state hands over from the GSM serving cell to the indicated channel of a higher data rate in the UTRAN target cell after it receives a INTER SYSTEM TO UTRAN HANDOVER COMMAND. It is also verified that the MS performs measurements on the target UTRAN cell before the handover.

60.3a.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GPRS, Cell 2 is UTRAN (cell selection conditions in favour of the GPRS cell).

The present document subclause 40 shall be referenced for the default parameters of cell 1, and subclause 26.6.5.1 shall be referenced for cell allocation.

3GPP TS 34.108 subclause 6.1 shall be referenced for default parameters of Cell 2.

MS:

"idle, updated", channel released mode with TMSI allocated.

For MS supporting GPRS:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

Specific PICS statements

- MS supports UTRAN Streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBs.
- MS supports UTRAN Streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBs.

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

Test Procedure

Then the SS brings the MS into the call active state (CC state U10) with a 14.4 kbps CS data call . The SS configures an appropriate dedicated channel in the UTRAN cell (default configuration 8 streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBS for M = 1). The SS sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell. The SS verifies that the MS include the UTRAN cell in the MEASUREMENT REPORTs and then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the new channel of the UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

Depending on the PIXIT parameters, the above procedure is executed maximum two times, each time for different conditions:

- if the MS supports GSM 14.4 kbps CS data and UTRAN streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBs, the procedure is executed for execution counter M = 1, using Default configuration 8;
- if the MS supports GSM 14.4 kbps CS data and UTRAN streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBs, the procedure is executed for execution counter M = 2, using Default configuration 9;

Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2 depending on the PIXIT parameters.

Step	Direction		Message	Comments
	MS	SS		
1	MS			The SS bring the MS into GSM U10 state in cell 1 and the MS is in GSM 14.4 kbps CS data call on a hopping traffic channel
2	SS			The SS configures a dedicated channel in the UTRAN cell with the configuration: For M = 1: (streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs); For M = 2: (streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs);
3		←	MEASUREMENT INFORMATION	
4		→	MEASUREMENT REPORT	Including Measurement Results on the UTRAN cell in Step 4
5		←	INTER SYSTEM TO UTRAN HANDOVER COMMAND	Send on cell 1 (GSM cell)
6	MS			The MS accepts the handover command and configures its lower layers using the parameters contained in the INTER SYSTEM TO UTRAN HANDOVER COMMAND
7	SS			The SS waits for uplink physical channel in synchronization
8		→	HANDOVER TO UTRAN COMPLETE	The SS receives this message on DCCH of cell 2 (UTRAN cell). It implies that the down link physical channel has synchronised with UTRAN.

Specific message contents

For execution1 (M = 1):

Same as the default message contents in subclause 60.2b for M = 2.

For execution2 (M = 2):

Same as the default message contents in subclause 60.2b for M = 3.

60.3a.5 Test requirement

At step 4 the MEASUREMENT REPORT should include details of the UTRAN cell. At step 8 a HANDOVER TO UTRAN COMPLETE command should be received on DCCH of the UTRAN cell.

60.3b Inter system handover to UTRAN/From GSM/Data/Data rate upgrading/Extended Rates/Success

60.3b.1 Definition

60.3b.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.3b.3 Test purpose

To test that the MS being in the data call active state hands over from the GSM serving cell to the indicated channel of a higher data rate in the UTRAN target cell after it receives a INTER SYSTEM TO UTRAN HANDOVER COMMAND. It is also verified that the MS performs measurements on the target UTRAN cell before the handover.

60.3b.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN (cell selection conditions in favour of the GSM cell).

The present document subclause 26.6.5.1 or subclause 26.13.1.3 (for HSCSD) shall be referenced for the default parameters of cell 1.

3GPP TS 34.108 subclause 6.1 shall be referenced for default parameters of Cell 2.

MS:

"idle, updated", channel released mode with TMSI allocated.

Specific PICS statements

- MS supports UTRAN Streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBs.
- MS supports UTRAN Streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL:3.4 kbps SRBs.

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

Test Procedure

Then the SS brings the MS into the call active state (CC state U10) with a CS data call (14.4 kbps HSCSD for execution counter M = 1). The SS configures an appropriate dedicated channel in the UTRAN cell (default configuration 4 streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBS for M = 1). The SS sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell. The SS verifies that the MS include the UTRAN cell in the MEASUREMENT REPORTs and then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the new channel of the UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

Depending on the PIXIT parameters, the above procedure is executed maximum three times, each time for different conditions:

- if the MS supports GSM 14.4 kbps HSCSD and UTRAN streaming/unknown/UL:28.8 DL:28.8 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 1, using Default configuration 8;
- if the MS supports GSM 14.4 kbps HSCSD and UTRAN streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 2, using Default configuration 9;
- if the MS supports GSM 28.8 kbps CS data and UTRAN streaming/unknown/UL:57.6 DL:57.6 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs, the procedure is executed for execution counter M = 3, using Default configuration 9.

Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2, 3, depending on the PIXIT parameters.

Step	Direction		Message	Comments
	MS	SS		
1	MS			The SS bring the MS into GSM U10 state in cell 1 and for M = 1: the MS is in GSM 14.4 kbps HSCSD call; for M = 2: the MS is in GSM 14.4 kbps HSCSD call; for M = 3: the MS is in GSM 28.8 kbps CS data call;

Specific message contents

For execution1 (M = 1):

Same as the default message contents in subclause 60.2b for M = 2.

For execution2 (M = 2):

Same as the default message contents in subclause 60.2b for M = 3.

For execution3 (M = 3):

Same as the default message contents in subclause 60.2b for M = 3.

60.3b.5 Test requirement

At step 5 the MEASUREMENT REPORT should include details of the UTRAN cell. At step 9 a HANDOVER TO UTRAN COMPLETE command should be received on DCCH of the UTRAN cell.

60.4 Inter system handover to UTRAN/From GSM/SDCCH/CC Establishment/Success

60.4.1 Definition

60.4.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.4.3 Test purpose

To test that the MS supporting both GSM and UTRAN handovers from the GSM serving cell to the indicated channel in UTRAN target cell when the MS is on SDCCH during call establishment phase and receives an INTER SYSTEM TO UTRAN HANDOVER COMMAND. It is also verified that the MS performs measurements on the target UTRAN cell before the handover.

60.4.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GPRS, Cell 2 is UTRAN (cell selection conditions in favour of the GPRS cell).

The present document subclause 40 shall be referenced for the default parameters of cell 1. Except for SI3 indicating SI2quater on BCCH norm, and SI2quater is broadcasted on BCCH of Cell 1, and subclause 26.6.5.1 shall be referenced for cell allocation..

3GPP TS 34.108, subclause 6.2 shall be referred to default parameters of Cell 2.

MS:

"idle, updated", channel released mode with TMSI allocated.

For MS supporting GPRS:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

Specific PICS statements

- Support of UTRAN FDD (TSPC_Type_UTRAN FDD)
- Support of UTRAN TDD (TSPC_Type_UTRAN TDD)

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U1 on cell 2.

Test Procedure

The UTRAN cell is set up corresponding to the UTRAN FDD/TDD mode. The MS reads SI2quater indicating presence of the UTRAN cell. The MS is triggered to make an MO speech call. After the SS received SETUP message it configures a dedicated channel corresponding to the default configuration 1 (UL:13.6 DL13.6 kbps SRBs) corresponding to the UTRAN FDD/TDD mode and then the SS sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel to the MS through the GSM serving cell. After the MS receives the command and it shall configure itself accordingly and switch to the new channel of UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

For MS following procedures are executed:

- if the MS supports UTRAN_FDD the procedure is executed for execution counter M = 1;
- if the MS supports UTRAN_TDD the procedure is executed for execution counter M = 2.

Expected sequence

This sequence is performed for a maximum execution counter M = 1, 2 depending on the PIXIT parameters.

Step	Direction		Message	Comments
	MS	SS		
1		SS		The MS reads SI2quater indicating presence of the UTRAN cell.
3	→		SETUP	The SS brings the MS to GSM U1 state in Cell 1
4		SS		The SS configures a dedicated channel with the default configuration 1: UL:13.6 DL13.6 kbps SRBs in UTRAN cell.
5	→		MEASUREMENT REPORT	
6				Step 5 is repeated until the MEASUREMENT REPORT contains the measurement result on the UTRAN cell
7	←		INTER SYSTEM TO UTRAN HANDOVER COMMAND	Send on cell 1 (GSM cell)
8		MS		The MS accepts the handover command and configures its lower layers using the parameters contained in the INTER SYSTEM TO UTRAN HANDOVER COMMAND
9		SS		The SS waits for uplink physical channel in synchronization
10	→		HANDOVER TO UTRAN COMPLETE	The SS receives this message on DCCH of cell 2 (UTRAN cell). It implies that the down link physical channel has synchronised with UTRAN.

INTER SYSTEM TO UTRAN HANDOVER COMMAND

For M = 1:

Same as the default message contents in subclause 60.1 for M = 1 with the following exceptions:

Information Element	Value/remark
CHOICE specification mode	Preconfiguration
CHOICE preconfiguration mode	Default configuration
- Default configuration identity	1 (13.6 kbps signalling)
RAB information list	Not Present

For M = 2:

Same as the default message contents in subclause 60.2a for M = 2 using the configuration defined in TS 34.108 [149] clause 6.10.2.4.1.2:

60.4.5 Test requirement

At step 5 the MEASUREMENT REPORT should include details of the UTRAN cell. At step 10 a HANDOVER TO UTRAN COMPLETE command should be received on DCCH of the UTRAN cell.

60.5 Inter system handover to UTRAN/From GSM/Speech/Blind HO/Success

60.5.1 Definition

60.5.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

If the MS succeeds to establish the connection to UTRAN, it shall transmit a HANDOVER TO UTRAN COMPLETE message on the uplink DCCH.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.5.3 Test purpose

To test that the MS handovers from the GSM serving cell to the indicated channel of UTRAN target cell when it is in the speech call active state without any knowledge of the target system (blind handover) and receives an INTER SYSTEM TO UTRAN HANDOVER COMMAND.

60.5.4 Method of test

Initial conditions

2 cells - Cell 1 is GPRS, Cell 2 is UTRAN (cell conditions favour the GPRS cell).

The present document subclause 40 shall be referenced for the default parameters of cell 1, and subclause 26.6.5.1 shall be referenced for cell allocation.

3GPP TS 34.108 subclause 6.1 shall be referred to for default parameters of Cell 2.

MS:

"idle, updated", channel released mode with TMSI allocated.

For MS supporting GPRS:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

Specific PICS statements

-

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

Test Procedure

No SYSTEM INFORMATION TYPE 2quarter or MEASUREMENT INFORMATION indicating presence of the UTRAN cell are broadcasted in the GSM cell. The SS brings the MS into the call active state (CC state U10) with FR speech. The SS configures a dedicated channel (conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBS), then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. After the MS receives the command it shall configure itself accordingly and switch to the dedicated channel of UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell.

Expected sequence

Step	Direction		Message	Comments
	MS	SS		
1	MS			The SS bring the MS into GSM U10 state in cell 1, on a hopping traffic channel, and the MS has no pre-configuration information stored or received any information of presence of the UTRAN cell.
2	SS			The SS configures dedicated channel with the configuration: conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs in UTRAN cell.
3	←		INTER SYSTEM TO UTRAN HANDOVER COMMAND	Send on cell 1 (GSM cell)
4	MS			The MS accepts the handover command and configures its lower layers using the parameters contained in the INTER SYSTEM TO UTRAN HANDOVER COMMAND
5	SS			The SS waits for uplink physical channel in synchronization
6	→		HANDOVER TO UTRAN COMPLETE	The SS receives this message on DCCH of cell 2 (UTRAN cell). It implies that the down link physical channel has synchronised with UTRAN.

Specific message contents

INTER SYSTEM TO UTRAN HANDOVER COMMAND

Same as the specific message contents in subclause 60.1 for M = 1.

60.5.5 Test requirement

At step 6 the HANDOVER TO UTRAN COMPLETE shall be received on UTRAN cell.

60.6 Inter system handover to UTRAN/From GSM/Speech/Failure

60.6.1 Definition

60.6.2 Conformance requirement

The MS shall be able to receive a INTER SYSTEM TO UTRAN HANDOVER COMMAND message from GSM and perform an inter-system handover.

If the MS can not establish the connection to UTRAN, it shall reactivate the old channel and transmit a HANDOVER FAILURE message on the old channel.

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.6.3 Test purpose

To test that the MS reactivates the old channel and transmits HANDOVER FAILURE message to the network on the old channel in the GSM cell when it received INTER SYSTEM TO UTRAN HANDOVER COMMAND towards a non-existing UTRAN cell.

60.6.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GPRS, Cell 2 is UTRAN (cell selection conditions in favour of the GPRS cell).

The present document subclause 40 shall be referenced for the default parameters of cell 1, and subclause 26.6.5.1 shall be referenced for cell allocation.

3GPP TS 34.108, subclause 6.1 will be referenced for the default parameters of Cell 2.

MS:

"idle, updated", channel released mode with TMSI allocated.

For MS supporting GPRS:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

Specific PICS statements

-

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 1.

Test Procedure

The SS brings the MS into the call active state (CC state U10) with FR speech call. The SS does not configure a dedicated channel corresponding to the default configuration 3. The SS sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell. The SS verifies that the MS include the UTRAN cell in the MEASUREMENT REPORT and, then sends INTER SYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell. The MS will not be able to establish the connection to UTRAN dedicated channel. The SS checks that the handover is failed by checking that the MS returns to the old channel and transmits HANDOVER FAILURE to the SS through the old channel.

Expected sequence

Step	Direction		Message	Comments
	MS	SS		
1	MS			The SS brings the MS into GSM U10 state in cell 1 on a hopping traffic channel
2	SS			The SS configures the Physical channel of the UTRAN cell but here is no dedicated channel with the configuration: conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs in UTRAN cell.
3	←		MEASUREMENT INFORMATION	Including Measurement Results on the UTRAN cell in Step 4
4	→		MEASUREMENT REPORT	
5	←		INTER SYSTEM TO UTRAN HANDOVER COMMAND	Send on cell 1 (GSM cell)
6	MS			The MS accepts the handover command and configures its lower layers using the parameters contained in the INTER SYSTEM TO UTRAN HANDOVER COMMAND
7	MS			The MS fails to configure to the indicated RAB in Step 6 and fails to establish a connection to UTRAN cell
8	→		HANDOVER FAILURE	The SS receives this message on DCCH of cell 1 (old channel in GSM cell)

Specific message contents

Same as the specific message contents in subclause 60.1 for M = 1.

60.6.5 Test requirement

At step 8 the HANDOVER FAILURE shall be received on GSM cell.

60.7 Inter system handover to UTRAN/From GSM/Failure/Cause: Frequency not implemented

60.7.1 Definition

60.7.2 Conformance requirement

The MS shall be able to receive a HANDOVER TO UTRAN COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency.

The HANDOVER TO UTRAN COMMAND message instructs the mobile station to use frequency that it is not capable of, and then the MS shall return a HANDOVER FAILURE message with cause "frequency not implemented" (Reference 3GPP TS 04.18 subclause 3.4.4a.3).

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.7.3 Test purpose

To test that the MS reactivates the old channel and transmits HANDOVER FAILURE message to the network on the old channel in the GSM cell when it received HANDOVER TO UTRAN COMMAND and the handover to UTRAN failed because of frequency not implemented.

60.7.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. TS 51.010-1 subclause 26.6.5.1 shall be referenced for the default parameters of Cell 1.

MS:

CC State U10 in cell 1.

Specific PICS statements

-

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 1.

Test Procedure:

The SS starts the GSM cell and UTRAN cell with the cell selection condition in favour of GSM cell. The MS selects the GSM cell.

SS brings the MS into the call active state (CC state U10) with FR speech call. The SS configures the dedicated channel corresponding to the default configuration (conversational/speech/uplink: 12.2 DL: 12.2 kbps/CS RAB + uplink: 3.4 DL3.4 kbps SRBS), then sends HANDOVER TO UTRAN COMMAND the MS through the GSM serving cell. The HANDOVER TO UTRAN COMMAND message instructs the mobile station to use frequency that it is not capable of, and then the MS shall return a HANDOVER FAILURE message with cause "frequency not implemented" (Reference 3GPP TS 04.18 subclause 3.4.4a.3) and continue the voice call on the old channel.

Expected sequence

Step	Direction		Message	Comments
	MS	SS		
1		SS		The SS starts GSM and UTRAN cells; the UTRAN cell broadcasts SIB16 containing pre-configuration information. MS camps on GSM cell and received SIB 16 from UTRAN cell.
2	MS			The SS brings the MS into GSM U10 state in cell 1.
3		SS		The SS configures dedicated channel with the configuration: conversational/speech/uplink:12.2 DL:12.2 kbps/CS RAB + uplink:3.4 DL3.4 kbps SRBs in UTRAN cell.
4		←	HANDOVER TO UTRAN COMMAND	Handover message is sent on cell 1 (GSM cell) with unsupported frequency.
5	MS			The MS fails to establish a connection to UTRAN cell
6		→	HANDOVER FAILURE	The SS receives this message on DCCH of cell 1 (old channel in GSM cell) with RR Cause "frequency not implemented".

Specific message contents

Same as the specific message contents in subclause 60.1 for M = 1 except that the INTER SYSTEM TO UTRAN HANDOVER COMMAND indicates a frequency not supported by the MS.

60.7.5 Test requirement

At step 7 the HANDOVER FAILURE shall be received on GSM cell.

60.8 Inter system handover to UTRAN/From GSM/Failure/Cause: UTRAN configuration unknown

60.8.1 Definition

60.8.2 Conformance requirement

The MS shall be able to receive a HANDOVER TO UTRAN COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency. The HANDOVER TO UTRAN COMMAND message instructs the mobile station to use preconfiguration that the mobile station has not read or instruct to use default reconfiguration not implemented by MS, then the MS shall return a HANDOVER FAILURE message with cause "UTRAN configuration unknown" (3GPP TS 04.18 subclause 3.4.4a.3).

Reference(s)

3GPP TS 25.331 subclause 8.3.6.

3GPP TS 04.18 subclause 3.4.4a.

60.8.3 Test purpose

To test that the MS reactivates the old channel and transmits HANDOVER FAILURE message to the network on the old channel in the GSM cell when it receives HANDOVER TO UTRAN COMMAND and the handover to UTRAN failed because of UTRAN configuration unknown.

60.8.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. TS 51.010-1 section 26.6.5.1 shall be referenced for the default parameters of cell 1.

MS:

CC State U10 in cell.

Specific PICS statements

-

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 1.

Test Procedure

The SS starts the GSM cell and UTRAN cell with the cell selection condition in favour of GSM cell, SIB16 is not broadcast in UTRAN cell and MS has no predefined configuration stored.

The MS selects the GSM cell. SS brings the MS into the call active state (CC state U10) with FR speech call. The SS configures a dedicated channel (conversational/speech/uplink: 12.2 DL: 12.2 kbps/CS RAB + uplink: 3.4 DL 3.4 kbps

SRBS). The SS sends a HANDOVER TO UTRAN COMMAND message through the GSM cell that instructs the MS to use a preconfiguration that the mobile station has not read or instructed to use default configuration not implemented by MS. The MS shall return a HANDOVER FAILURE message with cause "UTRAN preconfiguration unknown" and continue the voice call on the old cell.

Expected sequence

Step	Direction		Message	Comments
	MS	SS		
1		SS		The SS starts GSM and UTRAN cells; SIB16 is not broadcast in the UTRAN cell.
2	MS			The SS brings the MS into GSM U10 state in cell 1 and MS has not any pre-configuration stored.
3		SS		The SS configures dedicated channel with the configuration: conversational/speech/uplink:12.2 DL:12.2 kbps/CS RAB + uplink:3.4 DL3.4 kbps SRBs in UTRAN cell.
4		←	HANDOVER TO UTRAN COMMAND	Handover message is sent on cell 1 (GSM cell) with unknown preconfiguration.
5	MS			The MS fails to establish a connection to UTRAN cell
6		→	HANDOVER FAILURE	The SS receives this message on DCCH of cell 1 (old channel in GSM cell) with RR Cause "UTRAN configuration unknown".

RR Cause	RR Cause (Refer : table 10.5.2.31.1/3GPP TS 04.18: RR Cause information element)

60.8.5 Test requirement

At step 7 the HANDOVER FAILURE shall be received on GSM cell.

60.9 Inter system handover to UTRAN/From GSM/Failure/Cause: Protocol Error

60.9.1 Definition

60.9.2 Conformance requirement

The MS shall be able to receive a HANDOVER TO UTRAN COMMAND message from GSM and perform an inter-system handover, even if no prior MS measurements have been performed on the target UTRAN cell and/or frequency. The HANDOVER TO UTRAN COMMAND message, which contains a protocol error causing the variable PROTOCOL_ERROR_REJECT to be set TRUE according to subclause 9 of 3GPP TS 25.331.

3GPP TS 04.18 subclause 8.5

When on receipt of a message,

- an "imperative message part" error; or
- a "missing mandatory IE" error

is diagnosed or when a message containing:

- a syntactically incorrect mandatory IE; or
- an IE unknown in the message, but encoded as "comprehension required" (see clause 3GPP TS 24.007); or
- an out of sequence IE encoded as "comprehension required" (see clause 3GPP TS 24.007)

is received,

- the mobile station shall proceed as follows:

If the message is not one of the messages listed in clauses 8.5.1, 8.5.2, 8.5.3 the mobile station shall ignore the message except for the fact that, if an RR connection exists, it shall return a status message (RR STATUS) with cause # 96 "Invalid mandatory information".

Reference(s)

3GPP TS 25.331 subclause 8.3.6 and 9.

3GPP TS 04.18 subclause 3.4.4a and 8.5.

60.9.3 Test purpose

To test that the MS reactivates the old channel and transmits RR Status message to the network on the old channel in the GSM cell when it receives HANDOVER TO UTRAN COMMAND and the handover to UTRAN failed because of protocol error.

60.9.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN. TS 51.010-1 section 26.6.5.1 shall be referenced for the default parameters of cell 1.

MS:

CC State U10 in cell 1.

Specific PICS statements

-

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 1.

Test Procedure

The SS starts the GSM cell and UTRAN cell with the cell selection condition in favour of GSM cell. The MS selects the GSM cell. SS brings the MS into the call active state (CC state U10) with FR speech call. The SS configures the dedicated channel corresponding to the default configuration 3 (conversational/speech/uplink: 12.2 DL: 12.2 kbps/CS RAB + uplink: 3.4 DL3.4 kbps SRBS), then sends HANDOVER TO UTRAN COMMAND indicating the dedicated channel of the target cell to the MS through the GSM serving cell.

The SS sends a HANDOVER TO UTRAN COMMAND message, that contains a protocol error causing the variable `PROTOCOL_ERROR_REJECT` to be set TRUE according to 3GPP TS 25.331 subclause 9. Then the MS shall return an RR STATUS message on DCCH of cell 1 (old channel in GSM cell) with RR cause #96 "Invalid mandatory information".

Expected sequence

Step	Direction		Message	Comments
	MS	SS		
1		SS		The SS starts GSM and UTRAN cells; The MS camps on GSM cell
2	MS			The SS brings the MS into GSM U10 state in cell 1
3		SS		The SS configures dedicated channel with the configuration: conversational/speech/uplink:12.2 DL:12.2 kbps/CS RAB + uplink:3.4 DL3.4 kbps SRBs in UTRAN cell.
4		←	HANDOVER TO UTRAN COMMAND	Handover message is sent on cell 1 (GSM cell) with missing mandatory IE.
5	→		RR STATUS	The SS receives this message on DCCH of cell 1 (old channel in GSM cell) with RR cause #96 "Invalid mandatory information".

Specific message contents

Same as the specific message contents in subclause 60.1 for M = 1 except that in the INTER SYSTEM TO UTRAN HANDOVER COMMAND a mandatory IE is missing causing a protocol error.

60.9.5 Test requirement

At step 5 the RR STATUS shall be received on GSM cell.

60.10 Inter system handover to UTRAN/From GSM/Integrity Protection Activation

60.10.1 Definition

60.10.2 Conformance requirement

The MS shall include the Security START values in INTER RAT HANDOVER INFO in the RR message UTRAN CLASSMARK CHANGE -definition and in the RRC message HANDOVER TO UTRAN COMPLETE.

If the MS succeeds to establish the connection to UTRAN after reception of an INTERSYSTEM TO UTRAN HANDOVER COMMAND, the NW may start Integrity protection using the previously received CS START value by sending a SECURITY MODE COMMAND message to the MS.

Reference(s)

3GPP TS 25.331 subclause 8.1.12 and 8.3.6.

3GPP TS 04.18 subclause 3.4.4a and 3.4.11.

60.10.3 Test purpose

To test that MS supporting both GSM and UTRAN applies the correct CS Security START value after a successful handover from GSM to UTRAN when Integrity protection is activated by the NW.

60.10.4 Method of test

Initial conditions

System Simulator:

2 cells - Cell 1 is GSM, Cell 2 is UTRAN.

The present document subclause 40 shall be referenced for the default parameters of cell 1, and subclause 26.6.5.1 shall be referenced for cell allocation.

3GPP TS 34.108, subclause 6.1 shall be referenced for default parameters of Cell 2.

Mobile Station:

"idle, updated", channel released mode with TMSI allocated.

For MS supporting GPRS:

The MS is GPRS attached with a P-TMSI allocated, SPLIT PG CYCLE negotiated.

Specific PICS statements

-

PIXIT statements

-

Foreseen final state of the MS

The MS is in CC state U10 on cell 2.

Test Procedure

The SS brings the MS into the call active state (CC state U10) with FR speech call.

The SS starts the UTRAN cell, configures the UTRAN dedicated channel corresponding to default handover configuration 3 and sends a MEASUREMENT INFORMATION to trigger the MS to perform measurements on the UTRAN cell.

The SS verifies that the MS includes the UTRAN cell in the MEASUREMENT REPORT. The SS then sends a CLASSMARK ENQUIRY requesting an UTRAN CLASSMARK CHANGE from the MS. The MS responds with a UTRAN CLASSMARK CHANGE and the SS verifies that the INTER RAT HANDOVER INFO includes a START value for the CS domain.

The SS sends an INTERSYSTEM TO UTRAN HANDOVER COMMAND indicating the dedicated channel of the target cell to the MS. After the MS receives the command, it shall switch to the dedicated channel of the UTRAN cell. The SS checks whether the handover is performed by checking that the MS transmits HANDOVER TO UTRAN COMPLETE to the SS through DCCH of the UTRAN cell. It is also verified that the START value for the CS domain in the HANDOVER TO UTRAN COMPLETE message is the same as the START value received in the INTER RAT HANDOVER INFO.

The SS attempts to activate Integrity protection by sending an Integrity protected SECURITY MODE COMMAND on the DCCH with an incorrect IE "Integrity check info". It is verified that the MS does not respond with a SECURITY MODE COMPLETE message.

The SS retransmits the SECURITY MODE COMMAND on the DCCH with a correct IE Integrity Check Info and the MS responds with an Integrity protected SECURITY MODE COMPLETE. Both SS and MS shall use the START value for the CS domain for Integrity protection that the MS has indicated in UTRAN CLASSMARK CHANGE and HANDOVER TO UTRAN COMPLETE.

Expected sequence

Step	Direction		Message	Comments
	MS	SS		
1	MS – SS			The SS brings the MS into GSM U10 state in cell 1 on a hopping traffic channel
2	SS			The SS configures the UTRAN cell with a dedicated channel configuration: conversational/speech/UL:12.2 DL:12.2 kbps/CS RAB + UL:3.4 DL3.4 kbps SRBs in UTRAN cell (default handover configuration 3).
				The following messages are sent and received on the GSM cell
3	←		MEASUREMENT INFORMATION	
4	→		MEASUREMENT REPORT	Including Measurement Results on the UTRAN cell in Step 4.
5	←		CLASSMARK ENQUIRY	
6	→		UTRAN CLASSMARK CHANGE	Verify that the ue-SecurityInformation is present.
7	←		INTERSYSTEM TO UTRAN HANDOVER COMMAND	
8	MS			The MS accepts the handover command and configures its lower layers using the parameters contained in the INTERSYSTEM TO UTRAN HANDOVER COMMAND
9	SS			The SS waits for uplink physical channel in synchronization
				The following messages are sent and received on the UTRAN cell.
10	→		HANDOVER TO UTRAN COMPLETE	Received on DCCH of the UTRAN cell. Verify that the same CS-domain START-Value is indicated as in step 6.
11	←		SECURITY MODE COMMAND	Integrity protected with a different CS-domain START value than the indicated in step 6 is applied.
12	SS			Verify that no SECURITY MODE COMPLETE is sent by the MS for 5 sec.
13	←		SECURITY MODE COMMAND	Integrity protected with the CS-domain START value indicated in step 6 is applied.
14	→		SECURITY MODE COMPLETE	Verify that Integrity protection is applied using the CS-domain START value indicated in step 6.

SECURITY MODE COMMAND message AM, in step 11

Information Element	Value/remark
Message Type	
RRC transaction identifier	Arbitrarily selects an integer between 0 and 3
Integrity check info	
- Message authentication code	Set to MAC-I value computed by the SS using a different START value for the CS domain from the indicated in the INTER RAT HANDOVER INFO. The first/ leftmost bit of the bit string contains the most significant bit of the MAC-I.
UE system specific security capability	
- Inter-RAT UE security capability	
- CHOICE system	GSM
- GSM security capability	The indicated algorithms must be the same as the algorithms supported by the UE as indicated in the IE " Mobile station classmark 2 " in the LOCATION UPDATING REQUEST message.

SECURITY MODE COMMAND message AM, in step 13

Information Element	Value/remark
Message Type	
RRC transaction identifier	Arbitrarily selects an integer between 0 and 3
Integrity check info	
- Message authentication code	Set to MAC-I value computed by the SS using the indicated START value for the CS domain from the INTER RAT HANDOVER INFO. The first/ leftmost bit of the bit string contains the most significant bit of the MAC-I.
UE system specific security capability	
- Inter-RAT UE security capability	
- CHOICE <i>system</i>	GSM
- GSM security capability	The indicated algorithms must be the same as the algorithms supported by the UE as indicated in the IE " Mobile station classmark 2 " in the LOCATION UPDATING REQUEST message.

60.10.5 Test requirement

After step 14, the ongoing call shall continue on UTRAN cell with Integrity protection using the CS Security START value indicated in the UTRAN CLASSMARK CHANGE.

61-69 Void

70 Location Services

This sub clause contains test cases for Location Services (LCS).

70.1 Default conditions during LCS tests

During signalling tests in sub clause 70, default conditions from sub clause 26 shall apply, if not otherwise stated within the test descriptions, with the following exception.

SYSTEM INFORMATION TYPE 3:

as default except:

Information Element	value/remark
SI 3 rest octets - Early Classmark Sending Control	1 (perform early classmark sending)

70.1.1 Default conditions during EOTD tests

For EOTD testing the serving cell shall provide a BCCH for the duration of the test to enable the MS to make the required measurements.

70.1.2 Default conditions during A-GPS signalling tests

During A-GPS signalling tests defined in sub clause 70.7 to 70.9 the SS shall generate the six satellite signals and shall provide assistance data as defined in sub TS 51.010-7 subclasses 5.1.3 to 5.1.8. The levels of the simulated satellites shall all be at -125dBm +/- 6dB.

70.1.3 Default conditions during A-GNSS signalling tests

During A-GNSS signalling tests defined in sub clause 70.12 to 70.15 the SS shall generate all the MS supported GNSS satellite signals defined in TS 51.010-7 sub clause 6.1.2 and shall provide assistance data, dependent on the MS capabilities, defined in TS 51.010-7 sub clauses 6.1.3 and 6.1.4. The levels of the simulated satellites shall all be at -125dBm +/- 6dB.

70.2 EOTD Network Induced Location Request

The test cases in this sub clause focus on Network Induced Location requests. Although normally associated with Emergency Calls, it is possible for an MS to receive a NI-LR at any time during idle or dedicated mode by a PLMN operator LCS client.

70.2.1 LCS Network Induced Emergency Call on an SDCCH / idle, no IMSI for Mobiles supporting MS-Assisted EOTD

70.2.1.1 Conformance requirement

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 MS in the USA), or 08 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. After assignment of a dedicated channel the first layer message sent by the MS on the assigned dedicated channel shall be a CM SERVICE REQUEST message specifying the correct IMEI and a non-available CKSN, with CM Service Type "emergency call establishment". The ES_IND bit in the Mobile Station Classmark 2 information element shall be set to "Controlled Early Classmark Sending is implemented".
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.

4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. On receiving the RRLP MEASURE POSITION REQUEST message the MS will perform position measurements and respond with an RRLP MEASURE POSITION RESPONSE message. The RRLP Measure Position Response message shall contain either an EOTD Measurement Information element or a Location Information Error element.
6. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.

3GPP TS 04.31 Annex A sub clause 2.2.1.

70.2.1.2 Test Purpose

To verify when an emergency call is initiated by an MS which does not have a SIM fitted, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing E-OTD measurement values.

70.2.1.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: Default parameters.

Neighbor Cells: 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, no IMSI", no SIM inserted.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

An Emergency Call is initiated with the MS, with no SIM inserted in the MS.

Directly after sending EMERGENCY SETUP the MS receives a RR APPLICATION INFORMATION message containing an RRLP Measure Position Request.

The MS then performs positioning measurements and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The emergency call is then established as normal with late assignment. Having reached the active state, the call is cleared by the SS.

Maximum duration of the test

3 minutes.

Expected Test Sequence

Step	Direction	Message	Comments
1	MS		The appropriate "emergency called number" is entered.
2	MS -> SS	CHANNEL REQUEST	Establishment cause is emergency call establishment.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM. The CM service type IE indicates "emergency call establishment". The mobile identity IE specifies the IMEI of the MS. The cipher key sequence number IE indicates "no key is available".
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7 .
6	SS -> MS	CM SERVICE ACCEPT	
7	MS -> SS	EMERGENCY SETUP	
8	SS-> MS	RR APPLICATION INFORMATION	(RRLP Measure Position Request)
9	MS -> SS	RR APPLICATION INFORMATION	(RRLP Measure Position Response indicating either EOTD Measurement Information or a Location Information Error)
10	SS -> MS	CALL PROCEEDING	
11	SS -> MS	ALERTING	
12	SS -> MS	ASSIGNMENT COMMAND	
13	MS -> SS	ASSIGNMENT COMPLETE	
14	SS -> MS	CONNECT	
15	MS -> SS	CONNECT ACKNOWLEDGE	The MS indicates that the TCH is through connected in both directions.
16	SS -> MS	DISCONNECT	
17	MS -> SS	RELEASE	
18	SS -> MS	RELEASE COMPLETE	
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.2.2 Void

70.2.3 Network Induced Location Request Emergency Call on an SDCCH for MS-Assisted EOTD Mobiles

For Mobiles supporting speech, emergency call establishment will be initiated by the MS whether location updating has been successful or not and whether a SIM is inserted into the MS or not.

A Network Induced Location Request could occur at any point during emergency call setup (Ref 3GPP TS 03.71 sub clause 7.6.4.1). This could occur during an emergency setup before connection to a traffic channel.

70.2.3.1 Conformance requirements:

The following requirements apply for this test:

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM 900 and 1800 MS), or 911 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 MS in the USA), or 08 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. After assignment of a dedicated channel, the MS shall send a CM SERVICE REQUEST message specifying the correct CKSN and TMSI with CM Service Type "emergency call establishment". The ES_IND bit in the Mobile Station Classmark 2 information element shall be set to "Controlled Early Classmark Sending is implemented".
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. On receiving the RRLP Measure Position Request message the MS will perform position measurements and respond with an RRLP Measure Position Response message. The RRLP Measure Position Response message shall contain either an EOTD Measurement Information element or a Location Information Error element.
6. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.

70.2.3.3 Test Purpose

To verify when an emergency call is initiated by the MS, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing E-OTD measurement values.

Specific PICS statements

-

PIXIT statements

-

70.2.3.4 Method of Test

Initial Conditions:

System Simulator:

Serving cell: Default parameters

Neighbor Cells: 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

Test Procedure:

An Emergency Call is initiated with the MS. SIM card is included in the MS.

Directly after sending EMERGENCY SETUP the MS receives a RR APPLICATION INFORMATION message containing an RRLP Measure Position Request.

The MS then performs positioning measurements and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The emergency call is then established as normal with late assignment. Having reached the active state, the call is cleared by the SS.

Maximum duration of the test:

3 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		The appropriate "emergency call number" is entered.
2	MS -> SS	CHANNEL REQUEST	Establishment cause is emergency call establishment.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM. The CM service type IE indicates "emergency call establishment".
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7 .
6	SS -> MS	CM SERVICE ACCEPT	
7	MS -> SS	EMERGENCY SETUP	
8	SS-> MS	RR APPLICATION INFORMATION	(RRLP Measure Position Request)
9	MS -> SS	RR APPLICATION INFORMATION	(RRLP Measure Position Response indicating either EOTD Measurement Information or a Location Information Error)
10	SS -> MS	CALL PROCEEDING	
11	SS -> MS	ALERTING	
12	SS -> MS	ASSIGNMENT COMMAND	
13	MS -> SS	ASSIGNMENT COMPLETE	
14	SS -> MS	CONNECT	
15	MS -> SS	CONNECT ACKNOWLEDGE	The MS indicates that the TCH is through connected in both directions.
16	SS -> MS	DISCONNECT	
17	MS -> SS	RELEASE	
18	SS -> MS	RELEASE COMPLETE	
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.2.4 Emergency Call NI-LR while Voice is Through Connected for Mobiles supporting MS-Assisted EOTD

A Network Induced Location Request could occur at any point during emergency call setup (Ref 3GPP TS 03.71 sub clause 7.6.4.1). In this case the voice call is established before the MS receives the location request.

70.2.4.1 Conformance requirements:

The following requirements apply for this test:

1. With the MS in the "idle, updated" state, the user shall initiate an emergency call after the number 112 (GSM 900 and 1800 MSs), or 911 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 in the USA), or 08 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 in Mexico) has been entered by the user. The MS shall end a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. After assignment of a dedicated channel, the MS shall send a CM SERVICE REQUEST message specifying the correct CKSN and TMSI with CM Service Type "emergency call establishment". The ES_IND bit in the Mobile Station Classmark 2 information element shall be set to "Controlled Early Classmark Sending is implemented".
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call, the MS shall indicate that the TCH is through connected in both directions.
6. On receiving the RRLP Measure Position Request message the MS will perform position measurements and respond with an RRLP Measure Position Response message. The RRLP Measure Position Response message shall contain either an EOTD Measurement Information element or a Location Information Error element.

70.2.4.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: Default parameters.

Neighbor Cells: 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

Test Procedure:

An Emergency Call is initiated by the MS. SIM card is present in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on the FACCH.

The MS then performs positioning measurements and responds with a RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The call is then cleared by the SS.

Maximum duration of the test:

1 minute.

Expected Sequence

Step	Direction	Message	Comments
1	MS		The appropriate Emergency Called number is entered.
2	MS -> SS	CHANNEL REQUEST	Establishment cause is emergency call establishment.
3	SS -> MS	IMMEDIATE ASSIGNMENT

70.3 Mobile Originating Location Request

The test cases in this sub clause focus on Mobile Originating Location Request. A MO_LR could occur by a MS to request the network to start location procedure, which is used for either its own location, location assistance data or deciphering keys for broadcast assistance data message.

70.3.1 MO_LR Basic Self Location Request

Basic Self Location Request is only applicable for requesting its own location by using MS Assisted E-OTD positioning..

70.3.1.1 MO_LR Basic Self Location Request In Idle Mode (Normal Case)

70.3.1.1.1 Conformance requirements:

The MS sends a DTAP LCS MO-LR invoke to the VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component with MO_LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References

3GPP TS 03.71, sub clause 7.6.6.

3GPP TS 04.30 sub clause 5.1.1.

3GPP TS 04.80 sub clauses 2.4, 2.5 and 4.

70.3.1.1.2 Test Purpose

Verifies that a MS sends a correct LCS-MOLR Invoke message with the component MO_LR TYPE set to LocationEstimate and LCS_QoS value on the initiation of MOLR. On receipt of a RRLP Measure position request from SS to start the measurement, MS shall send back RRLP Measure Position Response to SS after finishing the measurement.

70.3.1.1.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

Neighbor Cells: at least 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to LCS-MOLR Invoke. The SS sends RRLP Request to start the measurement. Once the measurement is done, RRLP response is sent back to SS with the measurement data. The SS returns location estimate to MS through LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message.

Maximum duration of the test:

3 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (Basic Self Location Request)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "call independent supplementary Services".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the IMSI. "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7. This includes support of LCS VA Capability.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	SS -> MS	CM SERVICE ACCEPT	
11	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR MOLR-Type set to LocationEstimate
12	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST
13	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE
14	SS -> MS	FACILITY	LCS MO-LR RETURE RESULT (locationEstimate)
15	MS -> SS	RELEASE COMPLETE	Terminates the session
16	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

3GPP TS 04.30 sub clause 5.1.1

3GPP TS 04.80 sub clauses 2.4, 2.5 & 4

70.3.1.2.2 Test Purpose

Verifies that a MS sends a correct LCS-MOLR Invoke message on already established speech call related SACCH with the component MO_LR TYPE sets to LocationEstimate and LCS_QoS value on the initiation of MO_LR. On receipt of a RRLP Measure position request from SS to start the measurement, MS shall send back RRLP Measure Position Response to SS after finishing the measurement.

70.3.1.2.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: Default parameters.

Neighbor Cells: 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS has valid TMSI and CKSN.

The MS is brought into the state U10 by using table 26.8.1.2/3.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS on the existing SACCH channel. After received CM SERVICE ACCEPT message, MS sends a REGISTER message with Facility IE containing a component set to a LCS-MOLR Invoke. The SS sends RRLP Request to start the measurement. Once the measurement is done, RRLP Response is sent back to SS with the measurement data. The SS returns location estimate to MS through LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message.

Maximum duration of the test:

3 minutes.

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a LCS-MOLR Invoke. The SS sends RRLP Request to start the measurement. Once the measurement is done, RRLP response is sent back to SS with the measurement data. The SS may then transfer the location information to the internal or external LCS client.

Maximum duration of the test:

3 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (Transfer to 3 rd Party)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "call independent supplementary Services".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the IMSI. "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7. This includes support of LCS VA Capability.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	SS -> MS	CM SERVICE ACCEPT	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR MOLR-Type set to LocationEstimate LCSClntExternalID present RRLP MEASURE POSITION REQUEST
11	MS -> SS	REGISTER	
12	SS -> MS	RR APPLICATION INFORMATION	
13	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE
14	SS		SS may return the location estimate result to the LCS client as MAP subscriber location report
15	SS -> MS	RELEASE COMPLETE	Confirmation of successful transfer to 3 rd Party
16	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.3.3 MO_LR Autonomous Location

70.3.3.1 Conformance Requirement

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting location assistance data, the message specifies the type of assistance data and the positioning method for which the assistance data applies.

The MS invokes a MO_LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO_LR TYPE set to AssistanceData, Location-Method set to MS-AssistedEOTD, LCS QoS value and other optional field if it is needed.

The MS acknowledges the reception of each assistance data component to network with a RRLP ASSISTANCE DATA Ack before the next Assistance Data component is received.

3GPP TS 04.80 sub clauses 2.4, 2.5 and 4

70.3.3.2 Test Purpose

Verifies that a MS sends a correct LCS-MOLR Invoke message with the component MOLR Type set to Assistance Data, Location-Method sets to MS-Assisted EOTD, and LCS-QoS on the initiation of MO_LR. The MS shall acknowledge the reception of each assistance data component.

70.3.3.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

Mobile Station:

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

70.3.4.4 MO_LR Positioning Measurement / Multiple RRLP REQUEST with different Reference Number

70.3.4.4.1 Conformance requirement

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO_LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO_LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS aborts activity for the former RRLP MEASURE POSITION REQUEST component and starts to act according to the later RRLP MEASURE POSITION REQUEST component if the old and new RRLP MEASURE POSITION REQUEST components have different Reference Number.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 03.71 subclause 7.6.6

3GPP TS 04.31 sub clause 2.5.5

3GPP TS 04.80 sub clause 2.4, 2.5 & 4

70.3.4.4.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with a different REFERENCE NUMBER. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.3.4.4.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

Neighbor Cells: at least 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke. The SS determines the positioning method and instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST to start the measurement. Before the current positioning measurement finishes, the MS receives the second RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER as in the first one. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement. The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

3 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates " call independent supplementary Services".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the IMSI. "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7. This includes support of LCS VA Capability.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	SS -> MS	CM SERVICE ACCEPT	
11	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR
12	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1
13	MS		MS is performing the measurement
14	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 (with different reference number as in Request 1)
13	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE 2 (otd-measureInfo)
14	SS -> MS	FACILITY	Check reference number is 2 LCS MO-LR RETURE RESULT (locationEstimate)
15	MS -> SS	RELEASE COMPLETE	Terminates the session
16	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.3.4.5 MO_LR Positioning Measurement / RR Management Commands

70.3.4.5.1 Conformance requirement

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO_LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO_LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS aborts the measurement procedure and starts on the RR MANAGEMENT procedure if a RR MANAGEMENT command is received during the measurement procedure. The MS sends RR MANAGEMENT RESPONSE message upon completion.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

70.3.4.5.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if a RR MANAGEMENT command is received during the measurement procedure. The MS shall send a RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST and send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.3.4.5.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

Neighbor Cells: at least 2 neighbor cells are used with a minimum configuration of a BCCH. This is to allow the MS to perform the required timing measurements.

70.4 Mobile Terminated Location Request for Mobiles supporting MS-Assisted EOTD

The test cases in this sub clause focus on Mobile Terminated Location Request. A MT-LR occurs when an external LCS client requests the position of an MS by sending the SS REGISTER message. This may be sent to request verification for a particular MT-LR or simply to notify the user about an MT-LR that has already been authorized.

70.4.1 MT-LR Location Notification for MS-Assisted EOTD

Location notification takes place to inform the MS user that a particular LCS client is requesting their position without seeking the user's permission.

70.4.1.1 Conformance requirements:

The following requirements apply for this test:

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyLocationAllowed. The MS shall notify the MS user of the location request using the method defined in the manufacturers' specification.
2. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Test References

3GPP TS 03.71, sub clause 7.6.1,

3GPP TS 04.30, sub clause 4.1.1,

3GPP TS 04.80, sub clauses 2.4 and 2.5.

70.4.1.2 Test Purpose

Verifies that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyLocationAllowed, the MS displays information about the LCS client correctly (as defined by the individual manufacturer) and sends a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

70.4.1.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: Default parameters, in SYSTEM INFORMATION TYPE 3 (SI3 Rest Octet) the early classmark sending control is implemented in the SS.

Mobile Station:

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

Test Procedure:

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed as defined by the Manufacturer. The MS then responds with a RELEASE COMPLETE message containing a LocationNotification return to terminate the dialogue.

Maximum duration of the test:

1 minute.

Expected Sequence

Step	Direction	Message	Comments
1	SS -> MS	PAGING REQUEST TYPE 1	Sent on the correct paging subchannel Establishment cause indicates "answer to paging". Message is contained in SABM "Mobile identity" IE contains the IMSI. "mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7. This includes support of LCS VA Capability.
2	MS -> SS	CHANNEL REQUEST	
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	PAGING RESPONSE	
5	MS -> SS	CLASSMARK CHANGE	
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	SS		SS starts ciphering.
11	SS -> MS	REGISTER	Call Independent SS containing Facility IE Location Notification Invoke message set to notifyLocationAllowed
12	MS -> SS	RELEASE COMPLETE	Contains a LocationNotification return result to terminate the dialogue
13	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.4.2 MT-LR Privacy Options for Mobiles supporting MS-Assisted EOTD

Privacy options are used in conjunction with the MS subscription profile on the VLR. They give the MS user the option to grant or withhold permission for individual location requests as they occur.

70.4.2.1 MT-LR Privacy Options/ Verification – Location Allowed If No Response for mobiles supporting MS-Assisted EOTD

The case occurs when the target MS subscription profile on the VLR is set to location allowed if no response is sent. This is the default option if the VMSC does not receive verification from the target MS within a predetermined time.

70.4.2.1.1 Conformance requirements

The following requirements apply for this test:

1. On receipt of a REGISTER message containing the LCS Notification Invoke component with notificationType set to notifyAndVerify-LocationAllowedIfNoResponse. The MS a) notifies the user of the request and b) indicates the default is location allowed if no response is received within a predetermined period, while c) providing the opportunity to accept or deny the request by the method defined in the manufacturer's specification.

2.

Option 1:

The user accepts the location request using the method specified by the manufacturer.
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2:

The user denies the location request using the method defined by the manufacturer.
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3:

The user takes no action and the verification process times-out.
The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Test References

70.5 Void

70.6 E-OTD Timing Measurement Accuracy

Scope of Tests

This test procedure plan is intended verify the operation of Enhanced Observed Timing Difference (E-OTD) measurement functionality from an E-OTD capable GSM Mobile Station (MS).

The scope of this test plan is limited to verification of the MS physical layer against 3GPP TS 05.05, Release 1999, version 8.7.1, annex I. Specifically, this includes validation of MS observed timing measurement accuracy only.

The recommended measurement test environment is shown in the present document annex 6.

70.6.1 E-OTD Accuracy, Sensitivity Performance Tests using GMSK Signals

70.6.1.1 Definition

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

70.6.1.2 Conformance requirement

The RMS₉₀ measurement error of an E-OTD capable MS receiving a neighbor shall not exceed 100 nanoseconds and 300 nanoseconds at a minimum neighbor carrier signal strength relative to relative sensitivity levels of 12 dB and –8 dB respectively, as specified in 3GPP TS 05.05, annex I, sub clause I.2.1, table I.2.1

70.6.1.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. Nearby neighbor stations that provide a relatively high C/N to the MS receiver should result in greater measurement accuracy than those further away with a low C/N.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a GMSK neighbor. During this test, there shall be no co-, adjacent-, or alternate-channel interference.

70.6.1.5 Test procedure

- Configure serving base station simulator to transmit GMSK dummy bursts in time slots 1 through 7.
- Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dB.
- Disable the interfering signal generator.
- Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -90 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- The serving base station SS initiates a Measure Position Request RRLP message. Begin logging E-OTD Measure Position Response RRLP message from the MS under test. The Measure Position Request is repeated a minimum of 250 times at 5 s intervals and the response RRLP messages are logged.
- The SS calculates each trial's error relative to the known RTD, sort the data in ascending order, develop the 90 % subset M and calculate the RMS₉₀ error.
- Disable the interfering signal generator.
- Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -110 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.

- i) The serving base station SS initiates a Measure Position Request RRLP message. Begin logging E-OTD Measure Position Response RRLP message from the MS under test. The Measure Position Request is repeated a minimum of 250 times at 5 second intervals and the response RRLP messages are logged.
- j) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90 % subset M and calculate the RMS₉₀ error.

70.6.1.6 Test Requirements

Verify that the RMS₉₀ error calculated for each procedure in 70.6.1.5 is within the test conformance requirements listed in Table 70.6.1-3

Table 70.6.1-3, Test Conformance Requirements

Procedure	RMS ₉₀ error, 3GPP TS 05.05, Annex I, Minimum Performance Requirement	RMS ₉₀ error, 3GPP TS 51.010, 70.6.1, Test Conformance Requirement
Step f	≤ 100 nanoseconds	≤110 nanoseconds
Step j	≤ 300 nanoseconds	≤310 nanoseconds

70.6.2 E-OTD Accuracy, Interference Performance Tests

70.6.2.1 Definition

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

70.6.2.2 Conformance requirement

The RMS₉₀ measurement error of an E-OTD capable MS receiving a neighbor with a co-channel interference ratio of 0 dB shall not exceed 300 nanoseconds, 10dB not exceeding 100 nanoseconds, adjacent channel interference ratio of –18dB not exceeding 500 nanoseconds, –8 dB not exceeding 200 nanoseconds, as well as an adjacent channel (400 kHz) interference ratio of –41dB not exceeding 100 nanoseconds, as specified in 3GPP TS 05.05, Release 99, Annex I, Section I.2.1, Table I.2.2

70.6.2.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. As the C/I ratio due to neighbor cell co-channel interference is reduced, E-OTD measurement accuracy may be reduced as well.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a GMSK neighbor in the presence of a channel interference with a 0 dB, 10dB, -18dB, -8dB, and –41dB C/I.

Specific PICS statements

70.6.2.4 Method of Test

Initial Configuration

Neighbor Cells: at least two neighbor cells with a minimum configuration of a BCCH in order to allow the mobile to perform the required accuracy measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

70.6.2.5 Test procedure

Co-Channel test procedure at 0dB C/I:

- a) Configure serving base station simulator to transmit GMSK dummy bursts in time slots 1 through 7
- b) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- c) Enable the interfering signal generator on the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -80 dBm
- d) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- e) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- f) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90% subset M and calculate the RMS₉₀ error.

Co-Channel test procedure at 10dB C/I:

- g) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- h) Enable the interfering signal generator on the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -90 dBm
- i) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- j) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- k) Repeat Step f) and calculate the results.

Adjacent channel test procedure at -18dB C/I:

- l) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- m) Enable the interfering signal generator on either of the channels adjacent to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -62 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- n) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- o) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- p) Repeat Step f) and calculate the results.

Adjacent channel test procedure at - 8dB C/I:

- q) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- r) Enable the interfering signal generator on either of the channels adjacent to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -72 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- s) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- t) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- u) Repeat Step f) and calculate the results.

Adjacent channel (400kHz) test procedure at -41dB C/I:

- v) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- w) Enable the interfering signal generator on either of the channels alternate (400 kHz offset) to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -39 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- x) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting GMSK dummy bursts in time slots 1 through 7.
- y) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- z) Repeat Step f) and calculate the results.

70.6.2.6 Test Requirements

Verify that the RMS₉₀ error calculated for each procedure in 70.6.2.5 is within the test conformance requirements listed in Table 70.6.2-1.

Table 70.6.2-1, Test Conformance Requirements

Procedure	RMS ₉₀ error, 3GPP TS 05.05, Annex I, Minimum Performance Requirement	RMS ₉₀ error, 3GPP TS 51.010, 70.6.2, Test Conformance Requirement
Step f	≤ 300 nanoseconds	≤310 nanoseconds
Step k	≤ 100 nanoseconds	≤110 nanoseconds
Step p	≤ 500 nanoseconds	≤510 nanoseconds
Step u	≤ 200 nanoseconds	≤210 nanoseconds
Step z	≤ 100 nanoseconds	≤110 nanoseconds

70.6.3 E-OTD Accuracy, Multipath Performance Test using GMSK Modulated Signals.

70.6.3.1 Definition

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

70.6.3.2 Conformance requirement

The RMS₉₀ measurement error of an E-OTD capable MS receiving a TU3 Rayleigh-faded neighbor shall not exceed 1.5 microseconds, as specified in 3GPP TS 05.05, Release 99, Version 8.7.1, Annex I, Clause I.2.3, Table I.2.3

70.6.3.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. Rayleigh fading to the neighbor cell will reduce E-OTD measurement accuracy.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a TU3 Rayleigh fading GMSK distant neighbor. During this test, there shall be no co-, adjacent-, or alternate-channel interference.

70.6.3.5 Test procedure

- Configure serving base station simulator to transmit GMSK dummy bursts in time slots 1 through 7
- Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- Disable the interfering signal generator
- Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the EOTD MS under test) is -110 dBm with Rayleigh fading disabled. The neighbor shall be transmitting GMSK dummy bursts in time slots 1 through 7
- Configure the fading simulator for Rayleigh fading corresponding to a velocity of 3 kph, with a 12-tap delay and amplitude spread in accordance with 3GPP TS 05.05, Release 99, Rev. 8.7.1, Annex C, Section C.3.3.
- With the carrier from the serving base station simulator disabled, enable TU3 Rayleigh fading on the neighbor cell, and verify an average RSSI (at the antenna connection of the MS) of -110 dBm
- Re-enable the serving base station simulator carrier, verify an RSSI (at the antenna connection of the MS) of -80 dBm
- The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90% subset M and calculate the RMS₉₀ error.

70.6.3.6 Test Requirements

Verify that the RMS₉₀ error calculated in Step i) is < 1.5 microseconds

70.6.4 E-OTD Accuracy, Interference Performance Tests, 8PSK BCCH

70.6.4.1 Definition

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

70.6.2.2 Conformance requirement

The RMS_{90} measurement error of an E-OTD capable MS receiving an 8PSK neighbor with a co-channel interference ratio of 0 dB shall not exceed 300 nanoseconds, 10dB not exceeding 300 nanoseconds, adjacent channel interference ratio of -18dB not exceeding 500 nanoseconds, -8 dB not exceeding 200 nanoseconds, as well as an adjacent channel (400 kHz) interference ratio of -41dB not exceeding 100 nanoseconds, as specified in 3GPP TS 05.05, Release 99, Annex I, Section I.2.1, Table I.2.2

70.6.2.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. As the C/I ratio due to neighbor cell co-channel interference is reduced, E-OTD measurement accuracy may be reduced as well.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a neighbor modulated with 8PSK in time slots 1-7, in the presence of a channel interference with a 0 dB, 10dB, -18dB, -8dB, and -41dB C/I.

70.6.4.4 Method of Test

Initial Configuration

Neighbor Cells: at least one neighbor cell with a minimum configuration of a BCCH in order to allow the mobile to perform the required accuracy measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

70.6.4.5 Test procedure

Co-Channel 8PSK test procedure at 0dB C/I:

- a) Configure serving base station simulator to transmit in time slots 1 through 7
- b) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- c) Enable the interfering signal generator on the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -80 dBm
- d) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- e) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- f) After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90% subset M and calculate the RMS_{90} error.

Co-Channel 8PSK test procedure at 10dB C/I:

- g) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- h) Enable the interfering signal generator on the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -90 dBm
- i) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- j) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- k) Repeat Step f) and calculate the results.

Adjacent channel 8PSK test procedure at -18dB C/I:

- l) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- m) Enable the interfering signal generator on either of the channels adjacent to the frequency of the neighbor cell at a power (at the antenna connection of the EOTD-capable MS) of -62 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- n) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- o) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- p) Repeat Step f) and calculate the results.

Adjacent channel 8PSK test procedure at - 8dB C/I:

- q) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm

- r) Enable the interfering signal generator on either of the channels adjacent to the frequency of the neighbor cell at a power (at the antenna connection of the E-OTD-capable MS) of -72 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- s) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- t) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- u) Repeat Step f) and calculate the results.

Adjacent channel (400kHz) 8PSK test procedure at -41dB C/I:

- v) Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -70 dBm
- w) Enable the interfering signal generator on either of the channels alternate (400 kHz offset) to the frequency of the neighbor cell at a power (at the antenna connection of the E-OTD-capable MS) of -39 dBm. The RF channel used by the interfering signal generator during this test must not be the same as that used by the serving base station simulator.
- x) Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -80 dBm, and that it is transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7.
- y) The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- z) Repeat Step f) and calculate the results.

70.6.4.6 Test Requirements

Verify that the RMS₉₀ error calculated for each procedure in 70.6.4.5 is within the test conformance requirements listed in Table 70.6.4-1

Table 70.6.4-1, Test Conformance Requirements

Procedure	RMS ₉₀ error, 3GPP TS 05.05, Annex I, Minimum Performance Requirement	RMS ₉₀ error, 3GPP TS 51.010, 70.6.4, Test Conformance Requirement
Step f	≤ 300 nanoseconds	≤310 nanoseconds
Step k	≤ 100 nanoseconds	≤110 nanoseconds
Step p	≤ 500 nanoseconds	≤510 nanoseconds
Step u	≤ 200 nanoseconds	≤210 nanoseconds
Step z	≤ 100 nanoseconds	≤110 nanoseconds

70.6.5 E-OTD Accuracy, Multipath Performance Test, 8PSK BCCH

70.6.5.1 Definition

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

70.6.5.2 Conformance requirement

The RMS_{90} measurement error of an E-OTD capable MS receiving a TU3 Rayleigh-faded 8PSK-modulated neighbor shall not exceed 1.5 microseconds, as specified in 3GPP TS 05.05, Release 99, Annex I, Clause I.2.3, Table I.2.3

70.6.5.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. Rayleigh fading to the neighbor cell will reduce E-OTD measurement accuracy.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against a TU3 Rayleigh fading distant neighbor modulated with 8PSK in time slots 1-7. During this test, there shall be no co-, adjacent-, or alternate-channel interference.

Relative East	None	Not Applicable

70.6.5.5 Test procedure

- Configure serving base station simulator to transmit 8PSK bursts modulated with pseudo-random data in time slots 1 through 7
- Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm
- Disable the interfering signal generator
- Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the EOTD MS under test) is -110 dBm with Rayleigh fading disabled. The neighbor shall be transmitting 8PSK bursts modulated with pseudo-random data in time slots 1 through 7
- Configure the fading simulator for Rayleigh fading corresponding to a velocity of 3 kph, with a 12-tap delay and amplitude spread in accordance with 3GPP TS 05.05, Release 99, Rev. 8.7.1, Annex C, Section C.3.3.
- With the carrier from the serving base station simulator disabled, enable TU3 Rayleigh fading on the neighbor cell, and verify an average RSSI (at the antenna connection of the MS) of -110 dBm
- Re-enable the serving base station simulator carrier, verify an RSSI (at the antenna connection of the MS) of -80 dBm
- The SS initiates a Measure Position Request RRLP messages and begins logging E-OTD Response messages from the MS under test. The Measure Position Request message is repeated 250 times at 5-second intervals and the response RRLP messages are recorded.
- After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90% subset M and calculate the RMS₉₀ error.

70.6.5.6 Test Requirements

Verify that the RMS₉₀ error calculated in Step i) is < 1.5 microseconds

70.6.6 E-OTD Accuracy, Sensitivity Performance Tests for 8PSK Modulated signals

70.6.6.1 Definition

Enhanced Observed Timing Difference is a mechanism intended to provide location information from an MS within a GSM network. E-OTD measures the burst timing alignment between the serving cell for the MS and a minimum of two neighbor cells. The observed timing difference, along with the BSIC or Cell ID of each neighbor cell that can be received and measured by the MS, is reported to the network. Using this information, an E-OTD capable network can calculate the location of the MS using triangulation techniques.

Although an E-OTD capable MS must receive a minimum of two neighbors in order to provide the network with useable data for E-OTD positioning, only one neighbor is required for the timing measurement tests described in this procedure.

70.6.6.2 Conformance requirement

The RMS_{90} measurement error of an E-OTD capable MS receiving a neighbor shall not exceed 100 nanoseconds and 300 nanoseconds at a minimum neighbor carrier signal strength relative to relative sensitivity levels of 12 dB and –8 dB respectively, as specified in 3GPP TS 05.05, annex I, sub clause I.2.1, table I.2.1

70.6.6.3 Test purpose

E-OTD measurement accuracy is heavily influenced by the type of RF environment available to the MS at the time a Measure Position Request is received from the network. Nearby neighbor stations that provide a relatively high C/N to the MS receiver should result in greater measurement accuracy than those further away with a low C/N.

The purpose of this test case is to verify that an E-OTD capable MS can provide an observed timing difference (OTD) measurement of sufficient accuracy when measuring against an 8PSK neighbor. During this test, there shall be no co-, adjacent-, or alternate-channel interference.

70.6.6.4 Method of Test

Initial Configuration

Neighbor Cell: One-neighbor cells with a minimum configuration of a BCCH in order to allow the MS to perform the required measurements. The neighbor BCCH shall be included in the serving BCCH System Information Neighbor List.

Assistance Data: The assistance data listed in Table 70.6.6-1 and Table 70.6.6-2 shall be provided by the serving base station simulator. Without assistance data, successful validation of the MS physical layer may be impossible due to limitations imposed by the device's upper protocol layers.

Table 70.6.6-7: RRLP Measure Position Request Field Values, E-OTD Reference BTS for Assistance Data Element

Field Name	Value	Comments
BCCH Carrier	Range 0-1023	ARFCN of Serving BCCH
BSIC	Range 0 to 65	BSIC of Serving BCCH
Time Slot Scheme	Either 0 or 1, as applicable	0=All time slots 156.25 bits long 1=Time slots 0 and 4 are 157 bits long, all other time slots are 156 bits long.
BTS Position	None	Not applicable for timing accuracy measurements

**Table 70.6.6-2: RRLP Measure Position Request Field Values,
E-OTD Measurement Assistance Data for System Information List Element**

Field Name	Value	Comments
Number of Neighbors	1	
E-OTD Neighbor Present	1	
BSIC	Range 0 to 63	BSIC of neighbor BCCH
Multiframe Offset	Range 0-51	The value of this field is specific to the test configuration, and shall be calculated according to 3GPP TS 04.31, Annex A, Section A.2.2.3.
Time Slot Scheme	Either 0 or 1, as applicable	0=All time slots 156.25 bits long 1=Time slots 0 and 4 are 157 bits long, all other time slots are 156 bits long.
Rough RTD	Range 0-1250	Set to rough RTD value for the specific test configuration
Expected OTD	None	Not Applicable
Uncertainty of Expected OTD	None	Not Applicable
Fine RTD	None	Not Applicable
Relative North	None	Not Applicable
Relative East	None	Not Applicable

70.6.6.5 Test procedure

- Configure serving base station simulator to transmit 8PSK bursts in time slots 1 through 7.
- Establish RF connectivity between the E-OTD compatible MS and its serving base station simulator, verify RSSI of -80 dBm.
- Disable the interfering signal generator.
- Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -90 dBm, and that it is transmitting 8PSK bursts in time slots 1-7.
- The serving base station SS initiates a Measure Position Request RRLP message. Begin logging E-OTD Measure Position Response RRLP messages from the MS under test. The Measure Position Request is repeated a minimum of 250 times at 5-second intervals and the response RRLP messages are logged.
- The SS calculates each trial's error relative to the known RTD, sort the data in ascending order, develop the 90 % subset M and calculate the RMS_{90} error.
- Disable the interfering signal generator.
- Configure the neighbor base station simulator such that its power (as measured at the antenna terminal of the E-OTD MS under test) is -110 dBm, and that it is transmitting 8PSK bursts in time slots 1-7.
- The serving base station SS initiates a Measure Position Request RRLP message. Begin logging E-OTD Measure Position Response RRLP messages from the MS under test. The Measure Position Request is repeated a minimum of 250 times at 5 s intervals and the response RRLP messages are logged.
- After transmitting 250 Measure Position Request RRLP messages to the MS under test, calculate each trial's error relative to the known RTD, sort the data in ascending order, develop the 90 % subset M and calculate the RMS_{90} error.

70.6.6.6 Test Requirements

Verify that the RMS_{90} error calculated for each procedure in 70.6.6.5 is within the test conformance requirements listed in Table 70.6.6-3

Table 70.6.6-3, Test Conformance Requirements

Procedure	RMS ₉₀ error, 3GPP TS 05.05, Annex I, Minimum Performance Requirement	RMS ₉₀ error, 3GPP TS 51.010, 70.6.6, Test Conformance Requirement
Step f	≤ 100 nanoseconds	≤110 nanoseconds
Step j	≤ 300 nanoseconds	≤310 nanoseconds

70.7 Assisted GPS Network Induced Tests

70.7.1 Void

70.7.2 Void

70.7.3 Void

70.7.4 Network Induced Location Request Emergency Call on TCH Radio Channel

70.7.4.1 Network Induced Location Request Emergency Call on TCH Radio Channel for Mobiles Supporting MS-Based GPS

70.7.4.1.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM900 and 1800 MS), or 911 (for PCS 1900 MS in the USA), or 08 (for PCS 1900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
6. On receiving the MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements, and calculates its own position. It sends the results in the RRLP MEASURE POSITION RESPONSE message.

70.7.4.1.2 Test Purpose

To verify when a network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message, after a traffic channel has been established during an emergency call, the mobile responds with RRLP (Measure Position Response) containing MS location estimate.

70.7.4.1.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station (MS):

The MS is in MM-state “idle, updated” with valued TMSI and CKSN.

SIM:

Normal SIM

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure

An Emergency Call is initiated with the MS. SIM card is included in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on FACCH including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The call is cleared by the SS.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		The appropriate "emergency call number" is entered.
2	MS -> SS	CHANNEL REQUEST	Establishment cause is emergency call establishment.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM. The CM service type IE indicates "emergency call establishment". "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	CM SERVICE ACCEPT

70.7.4.2 Network Induced Location Request Emergency Call on TCH Radio Channel for mobiles supporting MS-Assisted GPS

70.7.4.2.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM900 and 1800 MS), or 911 (for PCS 1900 MS in the USA), or 08 (for PCS 1900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).

3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
6. On receiving the RRLP MEASURE POSITION REQUEST the MS tries to perform the requested location measurements. It sends the results in the MEASURE POSITION RESPONSE message.

70.7.4.3 Network Induced Location Request Emergency Call on TCH Radio Channel, no IMSI for Mobiles Supporting MS-Based GPS

70.7.4.3.1 Conformance requirements

1. With the MS (no SIM inserted) in the "idle, no IMSI" state, the user shall initiate an emergency call by dialling the number 112 (for GSM 900 and 1 800 MSs), or 911 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 MS in the USA 1 900 MS), or 08 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS MS in Mexico). The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
6. On receiving the RRLP MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements, and calculates its own position. It sends the results in the RRLP MEASURE POSITION RESPONSE message.

70.7.4.3.2 Test Purpose

To verify when an emergency call is initiated by an MS that does not have a SIM fitted, the network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message and the mobile responds with RRLP (Measure Position Response) containing MS location.

70.7.4.3.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station (MS):

The MS is in MM-state "idle, no IMSI", no SIM inserted.

SIM:

No SIM.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure

An Emergency Call is initiated by the MS, with no SIM inserted in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on FACCH including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The call is cleared by the SS.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		The appropriate "emergency call number" is entered.
2	MS -> SS	CHANNEL REQUEST	Establishment cause is emergency call establishment.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM. The CM service type IE indicates "emergency call establishment". "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	CM SERVICE ACCEPT	
7	MS -> SS	EMERGENCY SETUP	
8	SS -> MS	CALL PROCEEDING	
9	SS -> MS	ALERTING	
10	SS -> MS	ASSIGNMENT COMMAND	
11	MS -> SS	ASSIGNMENT COMPLETE	
12	SS -> MS	CONNECT	
13	MS -> SS	CONNECT ACKNOWLEDGE	The MS indicates that the TCH is through connected in both directions.

70.7.4.4 Network Induced Location Request Emergency Call on TCH Radio Channel, no IMSI for mobiles supporting MS-Assisted GPS

70.7.4.4.1 Conformance requirements

1. With the MS (no SIM inserted) in the "idle, no IMSI" state, the user shall initiate an emergency call by dialling the number 112 (for GSM 900 and 1 800 MSs), or 911 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 MS in USA and Canada), or 08 (for GSM 710, GSM 750, T_GSM 810, GSM 850, PCS 1 900 MS in Mexico). The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the

“Controlled Early Classmark Sending” option. A mobile station which implements the “Controlled Early Classmark Sending” option shall indicate it in the classmark (ES IND bit).

3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
6. On receiving the RRLP MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements. It sends the results in the RRLP MEASURE POSITION RESPONSE message.

Test Procedure

An Emergency Call is initiated by the MS, with no SIM inserted in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on FACCH including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The call is cleared by the SS.

Maximum duration of the test

5 minutes.

Test Procedure

The MS invokes call independent supplementary service through a CM SERVICE REQUEST. The SS initiates authentication and ciphering. Then the MS invokes an MO-LR request.

The SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result. When MS receives FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test

5 minutes.

Expected Sequence

70.8.2 Basic Self Location in Dedicated Mode

70.8.2.1 Conformance requirements

The MS sends a DTAP LCS MO-LR invoke to the VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component with MO_LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

References

3GPP TS 04.80 / 3GPP TS 24.080, sub clauses 2.4, 2.5, 3.4 and 4.

70.8.2.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing the Facility IE LCS MO-LR on an already established speech call related main DCCH (FACCH). When the MS receives a FACILITY message containing a Facility IE MO-LR LCS result carrying the requested location estimate, it clears the transaction by sending a RELEASE COMPLETE message.

70.8.2.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellite signals: default conditions.

Mobile Station (MS):

The MS has valid TMSI and CSKN.

The MS is brought into the state U10 by using table 26.8.1.2/3.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure

The MS invokes call independent supplementary service on an existing FACCH channel. After receiving a CM SERVICE ACCEPT message, the MS invokes a self-location request by sending a REGISTER message containing the Facility IE LCS MO-LR.

The SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result. When the MS receives a FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate LCS MOLR Procedure (location estimation) on existing FACCH channel
2	MS -> SS	CM SERVICE REQUEST	The CM Service Type IE indicates "Supplementary service activation". "mobile station classmark 2" includes settings for ES_IND.
3	SS -> MS	CM SERVICE ACCEPT	
4	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request with MOLR-Type set to locationEstimate
5	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request
6	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: gps-MeasureInfo (Option 1) or locationError with gpsAssDataMissing (Option 2)
6a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 6 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
6b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 6a, the MS acknowledges the received assistance data.
6c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 6 that is available in the SS, this message may include further assistance data.
6d	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 6, this message contains gps-MeasureInfo.
7	SS -> MS	FACILITY	LCS MO-LR result message containing location estimate
8	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
9	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Test Procedure

The MS invokes call independent supplementary service for an LCS MO-LR. After receiving a CM SERVICE ACCEPT message, the MS invokes a transfer to 3rd party location request by sending a REGISTER message containing the Facility IE LCS MO-LR with LCSClientExternalID present.

The SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS sends location information of the MS to another LCS Client, and then it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate LCS MOLR Procedure (location estimation) with transfer to 3 rd party
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates, "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 3 is set to 1 (MS-Assisted GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request with MOLR-Type set to locationEstimate with LCSCientExternalID present
11	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: gps-MeasureInfo (Option 1) or locationError with gpsAssDataMissing (Option 2)
12a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 12 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
12b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 12a, the MS acknowledges the received assistance data.
12c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 12 that is available in the SS, this message may include further assistance data.
12d	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 12, this message contains gps-MeasureInfo.
13	SS		SS may return the location estimate result to the LCS Client as identified by the LCSCientExternalID provided in the REGISTER message

14	SS -> MS	FACILITY	LCS MO-LR Return Result message as confirmation that the position estimate was transferred to the requested LCS client.
15	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
16	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.8.4 MO-LR Positioning Measurement

70.8.4.1 MO-LR Positioning Measurement / Protocol Error

70.8.4.1.1 Conformance requirement:

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS sends a RRLP PROTOCOL ERROR message to network if there is a problem that prevents the MS to receive a complete and understandable RRLP MEASURE POSITION REQUEST component.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References

3GPP TS 03.71 sub clause 7.6.6

3GPP TS 04.30 sub clause 5.1.1

3GPP TS04.31 sub clause 2.2, 2.5

3GPP TS 04.80 / 3GPP TS 24.080 sub clause 2.4, 2.5, 3.4 & 4

70.8.4.1.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. The MS shall send a RRLP PROTOCOL ERROR message to SS with specific error code if RRLP MEASURE POSITION REQUEST is incomplete. On receipt of second RRLP MEASURE POSITION REQUEST from SS to start the measurement, MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.8.4.1.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

The SS determines the positioning method and instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST with missing information element. The MS shall send RRLP PROTOCOL ERROR as it fails to decode RRLP MEASURE POSITION REQUEST. The SS repeats RRLP MEASURE POSITION REQUEST with correct message contents including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.

70.8.4.2 MO-LR Positioning Measurement / Location Error

70.8.4.2.1 Location Error: Requested Method not Supported

70.8.4.2.1.1 Conformance requirement:

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS sends a RRLP MEASURE POSITION RESPONSE to network containing a Location Error component with an error indication if the measurement is not possible.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 03.71 sub clause 7.6.6

3GPP TS 04.30 sub clause 5.1.1

3GPP TS04.31 sub clause 2.2

3GPP TS 04.80 / 3GPP TS 24.080 sub clause 2.4, 2.5, 3.4 and 4

70.8.4.2.1.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall send back RRLP MEASURE POSITION RESPONSE message with Location Error component if the MS does not support the requested method. On receipt of second RRLP MEASURE POSITION REQUEST from SS to start the measurement, the MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.8.4.2.1.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke. The SS determines the positioning method and instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST with a method type not supported by the mobile. (Type not supported to be EOTD).

The MS sends RRLP MEASURE POSITION RESPONSE to SS containing a Location Error component (Request Method not Supported) as the requested method is not supported. The SS repeats RRLP MEASURE POSITION REQUEST with correct message contents including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS returns location estimate to MS through LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR request with MOLR-Type set to locationEstimate
11	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1 (Request method not supported)
12	MS->SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE 1 (location error)
13	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2
14	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response 2: gps-MeasureInfo (Option 1) or locationError with gpsAssDataMissing (Option 2)
14a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 14, this message contains gps-MeasureInfo.
15	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
16	MS -> SS	RELEASE COMPLETE	Terminates the session
17	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Test Procedure

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke. The SS determines the positioning method and instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the first one (this delay shall be cancelled in the event of option 2). The MS shall ignore the second RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the second one. The MS shall ignore the third RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT

70.8.4.4 MO-LR Positioning Measurement / Multiple RRLP Requests with Different Reference Number

70.8.4.4.1 Conformance requirement

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS aborts activity for the former RRLP MEASURE POSITION REQUEST component and starts to act according to the later RRLP MEASURE POSITION REQUEST component if the old and new RRLP MEASURE POSITION REQUEST components have different Reference Number.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

70.8.4.4.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with a different REFERENCE NUMBER. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.8.4.4.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke. The SS determines the positioning method and instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER from the first one (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER from the second one. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST,

including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1
12	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1) The SS continues to step 13. If the MS sends RRLP Measure Position Response: locationError with gpsAssDataMissing (Option 2) within 8 seconds, then the SS continues to step 12a.
12a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 12 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
12b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 12a, the MS acknowledges the received assistance data.
12c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2. If the MS requested additional assistance data in step 12 that is available in the SS, this message may include further assistance data.

Test Procedure

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP

LCS-MOLR Invoke. The SS determines the positioning method and instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends an RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends an RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends a RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends a RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS either sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST or requests more assistance data and then sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test

5 minutes.

Expected Sequence

70.8.5 MO_LR Basic Self Location Request for MS-Based AGPS

The test cases in this sub clause focus on Mobile Originating Location Request using MS-Based AGPS method. A MO-LR procedure could occur for requesting assistance data for mobile's own location.

70.8.5.1 MO_LR Basic Self Location Request in Idle Mode (Normal Case)

70.8.5.1.1 Conformance requirements:

The following requirements apply for this test:

1. The MS sends CM SERVICE REQUEST to network for call independent supplementary service.
2. The MS invokes self-location request by sending a REGISTER message containing a LCS-MOLR invoke component with MO_LR TYPE set to ASSISTANCE DATA, LOCATION_METHOD TYPE set ASSISTEDGPS, and GPS_ASSISTANCE_DATA TYPE set to the type of ASSISTANCE_DATA requested.
3. The MS sends RRLP ASSISTANCE DATA ACK. for each RRLP ASSISTANCE DATA component.
4. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References

3GPP TS 03.71, sub clause 7.6.6,

3GPP TS 04.30 sub clause 5.1.1,

3GPP TS 04.80 / 3GPP TS 24.080 sub clause 2.4, 2.5, 3.4 and 4

70.8.5.1.2 Test Purpose

To verify that a MS invokes a self-location request by sending the network a REGISTER message containing FACILITY IE LCS-MOLR REQ. On receipt of each of RRLP ASSISTANCE DATA from SS with the requested assistance data, MS shall send RRLP ASSISTANCE ACK for each component to SS. When the MS receives a FACILITY message containing a FACILITY IE LCS-MOLR return result for the acknowledgement of completing assistance data delivery, it clears the transaction by sending a RELEASE COMPLETE message.

Specific PICS statements

PIXIT statements

-

70.8.5.1.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke for Assistance Data. The SS sends a number of RRLP Assistance Data components and MS sends RRLP Assistance Data Ack for each component. SS sends DTAP LCS-MOLR Return Result for acknowledgement of completion of assistance data delivery. The MS performs the measurement and calculates the position fix using the assistance data delivered. The MS terminates the dialogue by sending RELEASE COMPLETE message.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate LCS MOLR Procedure (assistance data request)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Establishment cause indicates "Supplementary service activation". "mobile station classmark 2" includes settings for ES_IND.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES_IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7. Position method Capability is set to 1 and Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to assistanceData.
11n	SS -> MS	RR APPLICATION INFORMATION	RRLP ASSISTANCE DATA The number of instances of this message depends on the amount of assistance data requested in step 10
12n	MS -> SS	RR APPLICATION INFORMATION	RRLP ASSISTANCE DATA ACK Each instance of RRLP ASSISTANCE DATA message in step 11 is acknowledged
13	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT
14	MS -> SS	RELEASE COMPLETE	Terminates the session
15	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Specific Message Contents

CLASSMARK CHANGE

Information element	Value/remark
as default except: Mobile station Classmark 2 -ES_IND	"Controlled Early Classmark Sending" option is implemented in the MS.
CM3	The MS Supports options that are indicated in classmark 3 IE
Mobile station Classmark 3 MS Positioning Method Capability	See below This bit indicates that the MS supports Positioning Method for the provision of Location Services.
Positioning Method(s) support, 5 bit field	Support of certain positioning method (3GPP TS 24.008, table 10.5.1.7), Bit 2 set to 1.

70.8.5.2 MO_LR Basic Self Location Request in Dedicated Mode (Normal case)

70.8.5.2.1 Conformance Requirement:

The following requirements apply for this test:

1. The MS sends CM SERVICE REQUEST to network for call independent supplementary service.
2. The MS invokes self-location request by sending a REGISTER message containing a LCS-MOLR invoke component with MO_LR TYPE set to ASSISTANCE DATA, LOCATION_METHOD TYPE set ASSISTEDGPS, and GPS_ASSISTANCE_DATA TYPE set to the type of ASSISTANCE_DATA requested.
3. The MS sends RRLP ASSISTANCE DATA ACK. for each RRLP ASSISTANCE DATA component.
4. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 03.71 sub clause 7.6.6

3Gpp TS 24.30 sub clause 5

3GPP TS 24.80 sub clause 4

70.8.5.2.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing the FACILITY IE LCS-MOLR REQ on an already established speech call related main DCCH (FACCH). On receipt of a RRLP ASSISTANCE DATA from SS with the requested assistance data, MS shall send back RRLP ASSISTANCE ACK for each component to SS. When the MS receives a FACILITY message containing a FACILITY IE LCS-MOLR return result for the acknowledgment of completing assistance data delivery, it clears the transaction by sending a RELEASE COMPLETE message.

Specific PICS statements

PIXIT statements

-

70.8.5.2.3 Method of Test**Initial Conditions:****System Simulator:**

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS has valid TMSI and CSKN.

The MS is brought into the state U10 by using table 26.8.1.2/3

Test Procedure:

A MOLR procedure as call independent supplementary services is initiated from the MS on the existing FACCH channel. After received CM SERVICE ACCEPT message, MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke for Assistance Data. The SS sends a number of RRLP ASSISTANCE DATA components and MS sends acknowledgement of RRLP ASSISTANCE DATA ACK for each component. SS sends DTAP LCS-MOLR Return Result for acknowledgement of completion of assistance data delivery procedure. MS performs the measurement and calculates the location estimate using the assistance data delivered. The MS terminates the dialogue by sending RELEASE COMPLETE message.

Maximum duration of the test:

5 minutes.

Expected Sequence:

Step	Direction	Message	Comments
1	MS		Initiate LCS MOLR Procedure (assistance data request) on existing FACCH channel
2	MS -> SS	CM SERVICE REQUEST	"Mobile identity" IE contains the TMSI. Establishment cause indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
3	SS -> MS	CM SERVICE ACCEPT	
4	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to assistanceData.
5n	SS->MS	RR APPLICATION INFORMATION	RRLP ASSISTANCE DATA The number of instances of this message depends on the amount of assistance data requested in step 4

70.8.5.3 MO_LR Basic Self Location Request in Idle Mode (Alternative Case)

70.8.5.3.1 Conformance requirements:

The following requirements apply for this test:

1. If the MS is in idle mode, the MS requests an SDCCH and sends a DTAP CM service request indicating a request for call independent supplementary services to the BSC.
2. The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component. SS Version Indicator value 1 or above shall be used.
3. On receiving an RRLP MEASURE POSITION REQUEST message, the MS tries to perform the requested location measurements, and possibly calculates its own position. When the MS has location measurements, location estimate, or an error indication (measurements/location estimation not possible), it sends the results in the Measure Position Response component to the SMLC.

5. The network shall pass the result of the location procedure to the MS by sending a FACILITY message to the MS containing a LCS-MOLR return result component.
6. After the last location request operation the MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References

3GPP TS 04.31 sub clause 2.2

70.8.5.3.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing an MO-LR Request of type "locationEstimate". When the MS receives a FACILITY message containing a MO-LR return result carrying the requested location estimate, it clears the transaction by sending a RELEASE COMPLETE message.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

70.8.5.3.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure:

The MS invokes call independent supplementary service through a CM SERVICE REQUEST. The SS initiates authentication and ciphering. Then the MS invokes an MO-LR request of type "locationEstimate".

The SS orders an A-GPS positioning measurement by sending RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages followed by an RRLP Measure Position Request including further assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result. When the MS receives the FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimation)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	The CM Service Type IE indicates "Supplementary service activation".
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method support. In the position method support (5 bit field), bit 2 is set to 1 (MS-based GPS).
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	

8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering
11	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request and MO-LR Type set to "locationEstimate".
12	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
13	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
14	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
15	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
16	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request
17	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: locationInfo (Option 1) or locationError with gpsAssDataMissing and additionalAssistanceData (Option 2)
17a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 17 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
17b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 17a, the MS acknowledges the received assistance data.
17c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 17 that is available in the SS, this message may include further assistance data.
17d	MS-> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 17, this message contains locationInfo.
18	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT message containing location estimate
19	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
20	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.8.5.4 MO_LR Basic Self Location Request in Dedicated Mode (Alternative Case)

70.8.5.4.1 Conformance requirements:

The following requirements apply for this test:

1. The MS sends CM SERVICE REQUEST to network for call independent supplementary service.
2. The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component. SS Version Indicator value 1 or above shall be used.
3. On receiving an RRLP MEASURE POSITION REQUEST message, the MS tries to perform the requested location measurements, and possibly calculates its own position. When the MS has location measurements, location estimate, or an error indication (measurements/location estimation not possible), it sends the results in the Measure Position Response component to the SMLC.
5. The network shall pass the result of the location procedure to the MS by sending a FACILITY message to the MS containing a LCS-MOLR return result component.
6. After the last location request operation the MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

3GPP TS 04.31 sub clause 2.2

70.8.5.4.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing an MO-LR Request of type "locationEstimate" on an already established speech call related SACCH. When the MS receives a FACILITY message containing a MO-LR return result carrying the requested location estimate, it clears the transaction by sending a RELEASE COMPLETE message.

70.8.5.4.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS has valid TMSI and CKSN.

The MS is brought into state U10 by using table 26.8.1.2/3.

Test Procedure:

The MS invokes call independent supplementary service on an existing SACCH channel. After receiving a CM SERVICE ACCEPT message, the MS invokes a self location request by sending a REGISTER message containing an MO-LR request of type "locationEstimate".

The SS orders an A-GPS positioning measurement by sending RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages followed by an RRLP Measure Position Request including further assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result. When the MS receives the FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MO-LR procedure (location estimation) on existing SACCH channel
2	MS -> SS	CM SERVICE REQUEST	The CM Service Type IE indicates "Supplementary service activation".
3	SS -> MS	CM SERVICE ACCEPT	
4	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request and MO-LR Type set to "locationEstimate".
5	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
6	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
7	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
8	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
9	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request
10	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: locationInfo (Option 1) or locationError with gpsAssDataMissing and additionalAssistanceData (Option 2)
10a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 10 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
10b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 10a, the MS acknowledges the received assistance data.
10c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 10 that is available in the SS, this message may include further assistance data.
10d	MS-> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 10, this message contains locationInfo.
11	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT message containing location estimate
12	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
13	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.8.6 MO-LR Transfer to 3rd Party for MS-Based A-GPS

70.8.6.1 Conformance requirements

The following requirements apply for this test:

1. If the MS is in idle mode, the MS requests an SDCCH and sends a DTAP CM service request indicating a request for call independent supplementary services to the BSC.
2. The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component. SS Version Indicator value 1 or above shall be used.
3. If the MS is requesting that its location be sent to another LCS client, the message shall include the identity of the LCS client and may include the address of the GMLC through which the LCS client should be accessed.
4. On receiving an RRLP MEASURE POSITION REQUEST message, the MS tries to perform the requested location measurements, and possibly calculates its own position. When the MS has location measurements, location estimate, or an error indication (measurements/location estimation not possible), it sends the results in the Measure Position Response component to the SMLC.
5. The VMSC returns a DTAP LCS MO-LR Return Result to the MS carrying any location estimate requested by the MS, ciphering keys or a confirmation that a location estimate was successfully transferred to the GMLC serving an LCS client.
6. The network shall pass the result of the location procedure to the MS by sending a FACILITY message to the MS containing a LCS-MOLR return result component.
7. After the last location request operation the MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test Procedure

The MS invokes call independent supplementary service through a CM SERVICE REQUEST. The SS initiates authentication and ciphering. Then the MS invokes an MO-LR request of type "locationEstimate" with "LCSClientExternalID" present.

The SS orders an A-GPS positioning measurement by sending RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages followed by an RRLP Measure Position Request including further assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result to confirm that the location estimate has been transferred to the LCS client. When the MS receives the FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Transfer to 3 rd Party Procedure
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates, "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering
11	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request with MOLR-Type set to locationEstimate with LCSClntExternalID present
12	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
13	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
14	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
15	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
16	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request
17	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: locationInfo (Option 1) or locationError with gpsAssDataMissing and additionalAssistanceData (Option 2)
17a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 17 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
17b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 17a, the MS acknowledges the received assistance data.
17c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 17 that is available in the SS, this message may include further assistance data.
17d	MS-> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 17, this message contains locationInfo.

18	SS		SS may return the location estimate result to the LCS Client as identified by the LCSClientExternalID provided in the REGISTER message
19	SS -> MS	FACILITY	LCS MO-LR Return Result message as confirmation that the position estimate was transferred to the requested LCS client.
20	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
21	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.9.1.2 MT-LR Location Notification for Mobiles Supporting MS-Assisted GPS

70.9.1.2.1 Conformance requirements

1. The network invokes a location notification procedure by sending a REGISTER message containing a LCS-LocationNotification invoke component to the MS with notificationType set to notifyLocationAllowed. The MS shall notify the MS user of the location request.
2. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

70.9.1.2.2 Test Purpose

To verify that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to NotifyLocationAllowed, the MS displays information about the LCS client correctly and sends a RELEASE

COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

70.9.1.2.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Mobile Station (MS):

The MS is in MM-state “idle, updated” with valued TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The LCS Client Name contained in the USSD text string of the lcs-LocationNotification shall be displayed. The MS then responds with a RELEASE COMPLETE message containing a LocationNotification return to terminate the dialogue.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 3 is set to 1 (MS-Assisted GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.

Protocol Discriminator	Call Independent SS message (1011)
Transaction identifier Message type	RELEASE COMPLETE (0010 1010)

70.9.4 MT-LR / RRLP Error Handling for MS-Based A-GPS

70.9.4.1 RRLP Protocol Error

70.9.4.1.1 Conformance requirement:

The MS sends an RRLP PROTOCOL ERROR message to the network if there is a problem that prevents the MS to receive a complete and understandable RRLP MEASURE POSITION REQUEST component.

Test References

3GPP TS04.31 sub clause 2.2, 2.5

70.9.4.1.2 Test Purpose

To verify that the MS sends the correct positioning capability via controled early classmark sending. The MS shall send a RRLP PROTOCOL ERROR message to SS with specific error code if RRLP MEASURE POSITION REQUEST is incomplete. On receipt of second RRLP MEASURE POSITION REQUEST from SS to start the measurement, MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.9.4.1.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure:

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RRLP MEASURE POSITION REQUEST message with missing information element.

The MS shall send RRLP PROTOCOL ERROR as it fails to decode RRLP MEASURE POSITION REQUEST. The SS repeats RRLP MEASURE POSITION REQUEST with correct message contents.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
15	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 1 (with missing final octet)
16	MS -> SS	RR APPLICATION INFORMATION	RRLP PROTOCOL ERROR
17	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2
18	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: locationInfo (Option 1) or locationError with gpsAssDataMissing and additionalAssistanceData (Option 2)
18a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 18 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
18b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 18a, the MS acknowledges the received assistance data.
18c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 18 that is available in the SS, this message may include further assistance data.
18d	MS-> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 18, this message contains locationInfo.
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released

70.9.4.2 RRLP Location Error – Requested Method Not Supported

70.9.4.2.1 Conformance requirement:

The MS sends an RRLP MEASURE POSITION RESPONSE message to the network containing a Location Error component with an error indication if the measurement is not possible.

Test References

3GPP TS04.31 sub clause 2.2, A.3.2.6

70.9.4.2.2 Test Purpose

To verify that the MS sends the correct positioning capability via controlled early classmark sending. The MS shall send a RRLP MEASURE POSITION RESPONSE message with Location Error component if the MS does not support the requested method. On receipt of second RRLP MEASURE POSITION REQUEST from SS to start the measurement, the MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.9.4.2.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure:

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

The SS sends an RRLP MEASURE POSITION REQUEST message with a method type not supported by the mobile (type not supported to be E-OTD).

The MS sends RRLP MEASURE POSITION RESPONSE to SS containing a Location Error component (Requested Method not Supported) as the requested method is not supported.

The MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages followed by a new RRLP MEASURE POSITION REQUEST with correct message contents including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Maximum duration of the test:

5 minutes.

70.9.4.3 RRLP Location Error – GPS Assistance Data Missing

70.9.4.3.1 Conformance requirement

The MS sends an RRLP MEASURE POSITION RESPONSE message to the network containing a Location Error component with an error indication if the measurement is not possible.

Test References

3GPP TS04.31 sub clause 2.2, A.3.2.6

70.9.4.3.2 Test Purpose

To verify that the MS sends the correct positioning capability via controled early classmark sending. The MS shall send a RRLP MEASURE POSITION RESPONSE message with Location Error component if some GPS assistance data are missing. On receipt of second RRLP MEASURE POSITION REQUEST (with all necessary GPS assistance data to obtain a location estimate included) from SS to start the measurement, the MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.9.4.3.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure

The A-GPS assistance data stored in the MS is reset.

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS receives an RRLP MEASURE POSITION REQUEST message with Reference Time GPS assistance data.

The MS requests additional assistance data by sending an RRLP MEASURE POSITION RESPONSE message to SS containing a Location Error component with IE LocErrorReason set to gpsLocCalAssDataMissing or gpsAssDataMissing.

The SS provides the requested assistance data that is available in the SS in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data.

The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Maximum duration of the test

5 minutes.

ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	msrPositionRsp A valid response will contain LocationInfo otherwise LocationError will be returned
gps-MeasureInfo	SEQUENCE	Any value of the parameters is acceptable.
locationError	SEQUENCE	Any error value is acceptable.
extended-reference	SEQUENCE	Rel5 and later The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

70.9.4.4 Multiple RRLP Requests with same Reference Number

70.9.4.4.1 Conformance requirement:

When after reception of a Measure Position Request component, but before responding with a Measure Position Response or Protocol Error Component, the MS receives a new RRLP message with the Measure Position Request component, the MS ignores the latter component if the old and new RRLP Measure Position Request components have the same Reference Number.

The SMLC may use the same Reference Number or different Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS04.31 sub clause 2.5.5

3GPP TS04.31 sub clause 3.2

70.9.4.4.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall ignore the second RRLP MEASURE POSITION REQUEST if the second RRLP MEASURE POSITION REQUEST has the same REFERENCE NUMBER as in the previous one. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the current measurement.

70.9.4.4.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

Test Procedure:

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay to of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the first one (this delay shall be cancelled in the event of option 2). The MS shall ignore the second RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the second one. The MS shall ignore the third RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 1
16	MS (Option 1) or MS->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 17. If the MS sends RRLP Measure Position Response: locationError with gpsAssDataMissing (Option 2) within 8 seconds, then the SS continues to step 16a.
16a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS (Option 2)		MS is performing the measurement (Option 2)
17	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2 with same reference number as in Request 1 (Option 1) or RRLP Measure Position Request 3 with same reference number as in Request 2 (Option 2) Note: The satellite signals should be made available to MS after sending this message

18	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: locationInfo
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released

70.9.4.6 RR Management Commands

70.9.4.6.1 Conformance requirement

A target MS shall terminate any positioning procedure or the transfer of RRLP positioning assistance data without sending any response to the SMLC if any RR message is received from the BSC that starts some other RR management procedure, including a new positioning procedure. The new RR procedure shall then be executed by the MS.

Upon receiving the HO or other RR management command, the MS will stop the location procedure and start on handover or other RR management procedure, since this has higher priority than location. The MS will then send the HO complete or other RR management response message to BSC.

The SMLC may use the same Reference Number or different Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS 03.71 sub clause 7.11.5,

3GPP TS 03.71 sub clause 10.6

3GPP TS04.31 sub clause 3.2

70.9.4.6.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if an RR MANAGEMENT command is received during the measurement procedure. The MS shall send an RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST and send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.9.4.6.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

-

Test Procedure:

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds the SS sends an RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends an RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST (possibly by requesting additional assistance data first).

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends a RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends a RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a

new RRLP MEASURE POSITION REQUEST including assistance data and the MS either sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST or requests more assistance data and then sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 1
16	MS (Option 1) or MS->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 17. If the MS sends RRLP Measure Position Response: locationError with gpsAssDataMissing (Option 2) within 8 seconds, then the SS continues to step 17a.
16a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS (Option 2)		MS is performing the measurement (Option 2)
17	SS -> MS	RR MANAGEMENT COMMAND	
18	MS -> SS	RR MANAGEMENT COMPLETE	MS terminates the measurement procedure and act on the RR management command
19	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2 (Option 1) or RRLP Measure Position Request 3 (Option 2) Note: The satellite signals should be made

			available to MS after sending this message
20	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: locationInfo (Option 1 or 2a) or locationError with gpsAssDataMissing (Option 2b)
20a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 20 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
20b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 20a, the MS acknowledges the received assistance data.
20c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 20 that is available in the SS, this message may include further assistance data.
20d	MS-> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 20 this message contains locationInfo.
21	SS -> MS	CHANNEL RELEASE	The main signalling link is released

70.10 Conventional GPS Network Induced Tests

70.10.1 Void

70.10.2 Network Induced Location Request Emergency Call on TCH Radio Channel

70.10.2.1 Network Induced Location Request Emergency Call on TCH Radio Channel for Mobiles Supporting Conventional GPS

70.10.2.1.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM900 and 1800 MS), or 911 (for PCS 1900 MS in the USA), or 08 (for PCS 1900 MS in Mexico) has been entered by

the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").

2. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS.
4. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
5. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
6. On receiving the MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements, and calculates its own position. It sends the results in the RRLP MEASURE POSITION RESPONSE message.

70.10.2.1.2 References

3GPP TS 04.08/44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 04.08/24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9, 10.5.1.6, 10.5.1.7.

3GPP TS 02.30 sub clause 4.

3GPP TS 04.31 sub clause 2.2.

70.10.2.1.3 Test Purpose

To verify when a network instigates the LCS positioning procedure by sending RRLP (Measure Position Request) message, after a traffic channel has been established during an emergency call, the mobile responds with RRLP (Measure Position Response) containing MS location estimate.

70.10.2.1.4 Method of Test

70.10.2.1.5 Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valued TMSI and CKSN.

SIM:

Normal SIM

Specific PICS statements

- TSPC_MS_RRLP_RELEASE

PIXIT statements

-

70.10.2.1.6 Void

70.10.2.1.7 Test Procedure

An Emergency Call is initiated with the MS. SIM card is included in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on FACCH.

The MS then performs positioning measurements, and responds with a RR APPLICATION INFORMATION message containing a RRLP Measure Position Response.

The call is cleared by the SS.

70.10.2.1.8 Maximum duration of the test

5 minutes.

70.10.2.1.9 Expected Sequence

Step	Direction	Message	Comments
1	MS		The appropriate "emergency call number" is entered.
2	MS -> SS	CHANNEL REQUEST	Establishment cause is emergency call establishment.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM. The CM service type IE indicates "emergency call establishment". "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 1 is set to 1 (Conventional GPS) and Bit 2 is set to 0 (no support for MS-based GPS)
6	SS -> MS	CM SERVICE ACCEPT	
7	MS -> SS	EMERGENCY SETUP	
8	SS -> MS	CALL PROCEEDING	
9	SS -> MS	ALERTING	
10	SS -> MS	ASSIGNMENT COMMAND	
11	MS -> SS	ASSIGNMENT COMPLETE	
12	SS -> MS	CONNECT	
13	MS -> SS	CONNECT ACKNOWLEDGE	The MS indicates that the TCH is through connected in both directions.
14	SS-> MS	RR APPLICATION INFORMATION	(RRLP Measure Position Request)
15	MS -> SS	RR APPLICATION INFORMATION	(RRLP Measure Position Response)
16	SS -> MS	DISCONNECT	
17	MS -> SS	RELEASE	
18	SS -> MS	RELEASE COMPLETE	
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.11 A-GPS Minimum Performance tests

This sub clause specifies the measurement procedures for the conformance test of the minimum performance requirements for GSM user equipment (MS) where the only Assisted Global Navigation Satellite System (A-GNSS) supported is Assisted Global Positioning System (A-GPS) L1 C/A. The procedures for MSs that support other or additional A-GNSSs are specified in sub clause 70.16.

70.11.1 Abbreviations

A-GPS	Assisted - Global Positioning System
A-GNSS	Assisted Global Navigation Satellite System
C/A	Coarse/Acquisition
ECEF	Earth Centred, Earth Fixed
GPS	Global Positioning System
GSS	GPS System Simulator

HDOP	Horizontal Dilution Of Precision
LOS	Line Of Sight
WLS	Weighted Least Square

70.11.2 GPS test conditions

70.11.2.1 GPS signals

The GPS signal is defined at the A-GPS antenna connector of the MS. For MS with integral antenna only, a reference antenna with a gain of 0 dBi is assumed.

70.11.2.2 GPS frequency

The GPS signals shall be transmitted with a frequency accuracy of ± 0.025 PPM.

70.11.2.3 GPS static propagation conditions

The propagation for the static performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this propagation model.

70.11.2.4 GPS multi-path conditions

Doppler frequency difference between direct and reflected signal paths is applied to the carrier and code frequencies. The Carrier and Code Doppler frequencies of LOS and multi-path for GPS L1 signal are defined in table 70.11.2.1.

Table 70.11.2.1: Multi-path Conditions for GPS Signals

Initial relative Delay [GPS chip]	Carrier Doppler frequency of tap [Hz]	Code Doppler frequency of tap [Hz]	Relative mean Power [dB]
0	F_d	F_d / N	0
0.5	$F_d - 0.1$	$(F_d - 0.1) / N$	-6
NOTE: Discrete Doppler frequency is used for each tap.			

$N = f_{\text{GPSL1}} / f_{\text{chip}}$, where f_{GPSL1} is the nominal carrier frequency of the GPS L1 signal (1575.42 MHz) and f_{chip} is the GPS L1 C/A code chip rate (1.023 Mc/s).

The initial carrier phase difference between taps shall be randomly selected between 0 and 2π radians. The initial value shall have uniform random distribution.

70.11.3 GSM test conditions

70.11.3.1 GSM frequency band and frequency range

The tests in this sub clause are performed on one of the mid range ARFCNs of the GSM operating frequency band of the MS. The ARFCNs to be used for mid range are defined in Table 3.3

If the MS supports multiple frequency bands then the Sensitivity tests in sub clause 70.11.5 shall be repeated in each supported frequency band.

70.11.3.2 GSM frequency

For all tests the GSM frequency shall be offset with respect to the nominal frequency by an amount equal to the sum of +0.025 PPM and the offset in PPM of the actual transmitted GPS carrier frequency with respect to the nominal GPS frequency.

70.11.4 A-GPS test conditions

70.11.4.1 General

This sub clause defines the minimum performance requirements for both MS based and MS assisted A-GPS terminals. If a terminal supports both modes then it shall be tested in both modes.

70.11.4.2 Measurement parameters

70.11.4.2.1 MS based A-GPS measurement parameters

In case of MS-based A-GPS, the measurement parameters are contained in the RRLP LOCATION INFORMATION IE. The measurement parameter is the horizontal position estimate reported by the MS and expressed in latitude/longitude.

70.11.4.2.2 MS assisted A-GPS measurement parameters

In case of MS-assisted A-GPS, the measurement parameters are contained in the RRLP GPS MEASUREMENT INFORMATION IE. The measurement parameters are the MS GPS Code Phase measurements. The MS GPS Code Phase measurements are converted into a horizontal position estimate using the procedure detailed in sub clause 70.11.4.3.

70.11.4.2.3 2D position error

The 2D position error is defined by the horizontal difference in meters between the ellipsoid point reported or calculated from the MS Measurement Report and the actual simulated position of the MS in the test case considered.

70.11.4.2.4 Response time

Max Response Time is defined as the time starting from the moment that the MS has received the final RRLP MEASURE POSITION REQUEST sent before the MS sends the MEASURE POSITION RESPONSE containing the Location Information or the GPS Measurement Information, and ending when the MS starts sending the MEASURE POSITION RESPONSE containing the Location Information or the GPS Measurement Information on the Air interface. The response times specified for all test cases are Time-to-First-Fix (TTFF), i.e. the MS shall not re-use any information on GPS time, location or other aiding data that was previously acquired or calculated and stored internally in the MS. A dedicated test message 'RESET MS POSITIONING STORED INFORMATION' has been defined in TS 44.014 for the purpose of deleting this information.

70.11.4.3 Converting MS-assisted measurement reports into position estimates

To convert the MS measurement reports in case of MS-assisted mode of A-GPS into position errors, a transformation between the "measurement domain" (code-phases, etc.) into the "state" domain (position estimate) is necessary. Such a transformation procedure is outlined in the following sub clauses. The details can be found in [ICD-GPS 200], [P. Axelrad, R.G. Brown] and [S.K. Gupta]

70.11.4.3.1 MS measurement reports

In case of MS-assisted A-GPS, the measurement parameters are contained in the RRLP GPS MEASUREMENT INFORMATION ELEMENT (sub clause A.3.2.5 in 3GPP TS 44.031). The measurement parameters required for calculating the MS position are:

- 1) Reference Time: The MS has two choices for the Reference Time:
 - a) "Reference Frame";
 - b) "GPS TOW".
- 2) Measurement Parameters: 1 to <maxSat>:
 - a) "Satellite ID (SV PRN)";
 - b) "Whole GPS chips";
 - c) "Fractional GPS Chips";
 - d) "Pseudorange RMS Error".

Additional information required at the system simulator:

- 1) "Reference Location" (sub clause A.4.2.4 in 3GPP TS 44.031):
Used for initial approximate receiver coordinates.
- 2) "Navigation Model" (sub clause A.4.2.4 in 3GPP TS 44.031):
Contains the GPS ephemeris and clock correction parameters as specified in [ICD-GPS 200]; used for calculating the satellite positions and clock corrections.

3) "Ionospheric Model" (sub clause A.4.2.4 in 3GPP TS 44.031):

Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [ICD-GPS 200] for computation of the ionospheric delay.

70.11.4.3.2 WLS position solution

The WLS position solution problem is concerned with the task of solving for four unknowns; x_u, y_u, z_u the receiver coordinates in a suitable frame of reference (usually ECEF) and b_u the receiver clock bias. It typically requires the following steps:

Step 1: Formation of pseudo-ranges

The observation of code phase reported by the MS for each satellite SV_i is related to the pseudo-range/c modulo 1 ms (the length of the C/A code period). For the formation of pseudo-ranges, the integer number of milliseconds to be added to each code-phase measurement has to be determined first. Since 1 ms corresponds to a travelled distance of 300 km, the number of integer ms can be found with the help of reference location and satellite ephemeris. The distance between the reference location and each satellite SV_i is calculated and the integer number of milliseconds to be added to the MS code phase measurements is obtained.

Step 2: Formation of weighting matrix

The MS reported "Pseudorange RMS Error" values are used to calculate the weighting matrix for the WLS algorithm [P. Axelrad, R.G. Brown]. According to 3GPP TS 44.031, the encoding for this field is a 6 bit value that consists of a 3 bit mantissa, X_i and a 3 bit exponent, Y_i for each SV_i :

$$w_i = RMSError = 0.5 \times \left(1 + \frac{X_i}{8} \right) \times 2^{Y_i}$$

The weighting Matrix $\mathbf{W}$ is defined as a diagonal matrix containing the estimated variances calculated from the "Pseudorange RMS Error" values:

$$\mathbf{W} = \text{diag}\{1/w_1^2, 1/w_2^2, \dots, 1/w_n^2\}$$

Step 3: WLS position solution

The WLS position solution is described in reference [P. Axelrad, R.G. Brown] and usually requires the following steps:

- 1) Computation of satellite locations at time of transmission using the ephemeris parameters and user algorithms defined in [ICD-GPS 200], sub clause 20.3.3.4.3.
- 2) Computation of clock correction parameters using the parameters and algorithms as defined in [ICD-GPS 200], sub clause 20.3.3.3.1.
- 3) Computation of atmospheric delay corrections using the parameters and algorithms defined in [ICD-GPS 200], sub clause 20.3.3.5.2.5 for the ionospheric delay, and using the Gupta model in reference [S.K. Gupta], p. 121 equation (2) for the tropospheric delay.
- 4) The WLS position solution starts with an initial estimate of the user state (position and clock offset). The Reference Location is used as initial position estimate. The following steps are required:
 - a) Calculate geometric range (corrected for Earth rotation) between initial location estimate and each satellite included in the MS measurement report.
 - b) Predict pseudo-ranges for each measurement including clock and atmospheric biases as calculated in 1) to 3) above and defined in [ICD-GPS 200] and [P. Axelrad, R.G. Brown].
 - c) Calculate difference between predicted and measured pseudo-ranges Δp

d) Calculate the "Geometry Matrix" $\mathbf{G}$ as defined in [P. Axelrad, R.G. Brown]:

$$\mathbf{G} \equiv \begin{bmatrix} -\hat{\mathbf{1}}_1^T & 1 \\ -\hat{\mathbf{1}}_2^T & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}_n^T & 1 \end{bmatrix} \text{ with } \hat{\mathbf{1}}_i \equiv \frac{\mathbf{r}_{si} - \hat{\mathbf{r}}_u}{|\mathbf{r}_{si} - \hat{\mathbf{r}}_u|} \text{ where } \mathbf{r}_{si} \text{ is the Satellite position vector for SV}_i \text{ (calculated in 1)}$$

above), and $\hat{\mathbf{r}}_u$ is the estimate of the user location.

e) Calculate the WLS solution according to [P. Axelrad, R.G. Brown]:

$$\Delta \hat{\mathbf{x}} = (\mathbf{G}^T \mathbf{W} \mathbf{G})^{-1} \mathbf{G}^T \mathbf{W} \Delta \mathbf{p}$$

f) Adding the $\Delta \hat{\mathbf{x}}$ to the initial state estimate gives an improved estimate of the state vector:

$$\hat{\mathbf{x}} \rightarrow \hat{\mathbf{x}} + \Delta \hat{\mathbf{x}}.$$

5) This new state vector $\hat{\mathbf{x}}$ can be used as new initial estimate and the procedure is repeated until the change in $\hat{\mathbf{x}}$ is sufficiently small.

Step 4: Transformation from Cartesian coordinate system to Geodetic coordinate system

The state vector $\hat{\mathbf{x}}$ calculated in Step 3 contains the MS position in ECEF Cartesian coordinates together with the MS receiver clock bias. Only the user position is of further interest. It is usually desirable to convert from ECEF coordinates x_u, y_u, z_u to geodetic latitude φ , longitude λ and altitude h on the WGS84 reference ellipsoid.

Step 5: Calculation of "2-D Position Errors"

The latitude φ / longitude λ obtained after Step 4 is used to calculate the 2-D position error.

70.11.5 Sensitivity

70.11.5.1 Sensitivity Coarse Time Assistance

70.11.5.1.1 Definition

Sensitivity with coarse time assistance is the minimum level of GPS satellite signals required for the MS to make an A-GPS position estimate to a specific accuracy and within a specific response time when the network only provides coarse time assistance.

70.11.5.1.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.11.5.1.2 for the parameters specified in table 70.11.5.1.1.

Table 70.11.5.1.1: Test parameters for Sensitivity Coarse Time Assistance

Parameters	Unit	Value
Number of generated satellites	-	8
HDOP Range	-	1.1 to 1.6
Propagation conditions	-	AWGN
GPS Coarse Time assistance error range	seconds	± 2
GPS Signal for one satellite	dBm	-142
GPS Signal for remaining satellites	dBm	-147

Table 70.11.5.1.2: Conformance requirement for Sensitivity Coarse Time Assistance

Success rate	2-D position error	Max response time
95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, sub clause M.2.1.1.

70.11.5.1.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GPS satellite signal conditions that represent weak signal conditions and with only Coarse Time Assistance provided by the SS.

70.11.5.1.4 Method of test

Initial conditions

Test environment: normal; see sub clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GPS test parameters as specified in table 70.11.5.1.3 for GPS scenario #1. Select the first satellite PRN defined in the table in sub clause 5.2.1.2.5 in TS 51.010-7 for the one satellite with the higher level.
3. Switch on the MS.
4. Set up a voice call according to the generic call set up procedure in sub clause 10.1, or for a device not supporting a voice call set up a signalling connection according to the generic call set up procedure in sub clause 10.1a, on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GPS scenario #1 as specified in TS 51.010-7 sub clause 5.2.1.2 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in TS 51.010-7 sub clause 5.2.1.2.4.
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in TS 51.010-7 sub clauses 5.2.2 and 5.2.6 for MS based testing; or sub clauses 5.2.4 and 5.2.6 for MS assisted testing with the value of GPS TOW offset by a random value as specified in TS 51.010-7 sub clause 5.2.6.2; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.11.5.1.4 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.11.5.1.4 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in sub clause 70.11.4.2.3. Compare the 2D position error against the value in table 70.11.5.1.4 and record one Good Result or Bad Result as appropriate; or

For MS assisted testing convert the GPS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in sub clause 70.11.4.3 and then compare the result against the simulated position of the MS, used in step 1, and calculate the 2D position error as specified in sub clause 70.11.4.2.3. Compare the 2D position error against the value in table 70.11.5.1.4 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GPS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Select the first satellite PRN defined in the table in sub clause 5.2.1.2.5 in TS 51.010-7 for the one satellite with the higher level. Use new random values for the MS location and altitude in step 1 and for the GPS TOW offset in step 2.

6. Repeat steps 1 to 5 until the statistical requirements of sub clause 70.11.5.1.5 are met. Each time scenario #1 or #2 is used, the start time of the GPS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again. Each time scenario #1 or #2 is used select the next satellite PRN from the one used previously, defined in the table in sub clause 5.2.1.2.5 in TS 51.010-7, for the one satellite with the higher level.

7. Terminate the call.

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

GPS Coarse Time assistance error range	seconds	± 1.8
GPS Signal for one satellite	dBm	-141
GPS Signal for remaining satellites	dBm	-146

Table 70.11.5.1.4: Test requirements for Sensitivity Coarse Time Assistance

Success rate	2-D position error	Max response time
95 %	101.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in sub clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in sub clause A5.5.4.

70.11.5.2 Sensitivity Fine Time Assistance

70.11.5.2.1 Definition

Sensitivity with fine time assistance is the minimum level of GPS satellite signals required for the MS to make an A-GPS position estimate to a specific accuracy and within a specific response time when the network provides fine time assistance in addition to coarse time assistance.

70.11.5.2.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.11.5.2.2 for the parameters specified in table 70.11.5.2.1.

Table 70.11.5.2.1: Test parameters for Sensitivity Fine Time Assistance

Parameters	Unit	Value
Number of generated satellites	-	8
HDOP Range	-	1.1 to 1.6
Propagation conditions	-	AWGN

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in sub clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in sub clause A5.5.4.

70.11.6 Nominal Accuracy

70.11.6.1 Definition

Nominal accuracy is the accuracy of the MS's A-GPS position estimate under ideal GPS signal conditions.

70.11.6.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.11.6.2 for the parameters specified in table 70.11.6.1.

Table 70.11.6.1: Test parameters for Nominal Accuracy

Parameters	Unit	Value
Number of generated satellites	-	8
HDOP Range	-	1.1 to 1.6
Propagation conditions	-	AWGN
GPS Coarse Time assistance error range	seconds	± 2
GPS Signal for all satellites	dBm	-130

Procedure

1. Start GPS scenario #1 as specified in TS 51.010-7 sub clause 5.2.1.2 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in TS 51.010-7 sub clause 5.2.1.2.4.
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in TS 51.010-

7 sub clauses 5.2.2 and 5.2.6 for MS based testing; or sub clauses 5.2.4 and 5.2.6 for MS assisted testing with the value of GPS TOW offset by a random value as specified in TS 51.010-7 sub clause 5.2.6.2; as required to obtain a fix.

3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.11.6.4 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.11.6.4 or reports a MS positioning error in the Measure Position Response message then record one Good Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in sub clause 70.11.4.2.3. Compare the 2D position error against the value in table 70.11.6.4 and record one Good Result or Bad Result as appropriate; or

For MS assisted testing convert the GPS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in sub clause 70.11.4.3 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in sub clause 70.11.4.2.3. Compare the 2D position error against the value in table 70.11.6.4 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GPS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Use new random values for the MS location and altitude in step 1 and for the GPS TOW offset in step 2.
6. Repeat steps 1 to 5 until the statistical requirements of sub clause 70.11.6.5 are met. Each time scenario #1 or #2 is used, the start time of the GPS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again.
7. Terminate the call.

Success rate	2-D position error	Max response time
95 %	31.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in sub clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in sub clause A5.5.4.

70.11.7 Dynamic Range

70.11.7.1 Definition

Dynamic Range is the maximum difference in level of the GPS signals from a number of satellites that allows the MS to make an A-GPS position estimate with a specific accuracy and a specific response time.

70.11.7.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.11.7.2 for the parameters specified in table 70.11.7.1.

Table 70.11.7.1: Test parameters for Dynamic Range

Parameters	Unit	Value
Number of generated satellites	-	6
HDOP Range	-	1.4 to 2.1
GPS Coarse Time assistance error range	seconds	±2
Propagation conditions	-	AWGN
GPS Signal for 1 st satellite	dBm	-129
GPS Signal for 2 nd satellite	dBm	-135
GPS Signal for 3 rd satellite	dBm	-141
GPS Signal for 4 th satellite	dBm	-147
GPS Signal for 5 th satellite	dBm	-147

Success rate	2-D position error	Max response time
95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, sub clause M.2.3.

70.11.7.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GPS satellite signal conditions that have a wide dynamic range. Strong satellites are likely to degrade the acquisition of weaker satellites due to their cross-correlation products.

70.11.7.4 Method of test

Initial conditions

Test environment: normal; see sub clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GPS test parameters as specified in table 70.11.7.3 for GPS scenario #1. Select the first three satellite PRNs defined in the table in sub clause 5.2.1.2.5 in TS 51.010-7 for the three satellites with the higher levels.
3. Switch on the MS.
4. Set up a voice call according to the generic call set up procedure in sub clause 10.1, or for a device not supporting a voice call set up a signalling connection according to the generic call set up procedure in sub clause 10.1a, on a channel in the Mid ARFCN range.

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in sub clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in sub clause A5.5.4.

70.11.8 Multi-Path scenario

70.11.8.1 Definition

Multi-path performance measures the accuracy and response time of the MS's A-GPS position estimate in a specific GPS signal multi-path environment.

70.11.8.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.11.8.2 for the parameters specified in table 70.11.8.1.

Table 70.11.8.1: Test parameters for Multi-Path scenario

Parameters	Unit	Value
Number of generated satellites (see note)	-	5
GPS Coarse Time assistance error range	seconds	±2
HDOP Range	-	1.8 to 2.5
GPS signal for Satellite 1, 2 (see note)	dBm	-130
GPS signal for Satellite 3, 4, 5 (see note)	dBm	LOS signal of -130 dBm, multi-path signal of -136 dBm
NOTE: Satellites 1, 2 no multi-path. Satellites 3, 4, 5 multi-path defined in sub clause 70.11.2.4.		

Table 70.11.8.2: Conformance requirement for Multi-Path scenario

Success rate	2-D position error	Max response time
95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, sub clause M.2.4.

70.11.8.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GPS satellite signal conditions that represent simple multi-path conditions.

70.11.8.4 Method of test

Initial conditions

Test environment: normal; see sub clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GPS test parameters as specified in table 70.11.8.3 for GPS scenario #1. Select the first two satellite PRNs defined in the table in sub clause 5.2.1.2.5 in TS 51.010-7 for the two satellites with the higher levels.
3. Switch on the MS.
4. Set up a voice call according to the generic call set up procedure in sub clause 10.1, or for a device not supporting a voice call set up a signalling connection according to the generic call set up procedure in sub clause 10.1a, on a channel in the Mid ARFCN range.

Specific PICS statements:

-

PIXIT statements:

-

Procedure

1. Start GPS scenario #1 as specified in TS 51.010-7 sub clause 5.2.1.2 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in TS 51.010-7 sub clause 5.2.1.2.4. The initial carrier phase difference between taps of the multi-path model shall be randomly selected between 0 and 2π radians by selecting the next random number from a standard uniform random number generator, in the range 0 to 2π , representing radians with a resolution of 0.1, representing 0.1 radians.
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in TS 51.010-7 sub clauses 5.2.2 and 5.2.6 for MS based testing; or sub clauses 5.2.4 and 5.2.6 for MS assisted testing with the value of GPS TOW offset by a random value as specified in TS 51.010-7 sub clause 5.2.6.2; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.11.8.4 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.11.8.4 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in sub clause 70.11.4.2.3. Compare the 2D position error against the value in table 70.11.8.4 and record one Good Result or Bad Result as appropriate; or

For MS assisted testing convert the GPS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in sub clause 70.11.4.3 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in sub clause 70.11.4.2.3. Compare the 2D position error against the value in table 70.11.8.4 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GPS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Select the first two satellite PRNs defined in the table in sub clause 5.2.1.2.5 in TS 51.010-7 for the two satellites with the higher levels. Use new random values for the MS location and altitude, and the initial carrier phase difference between taps of the multi-path model in step 1 and for the GPS TOW offset in step 2.

6. Repeat steps 1 to 5 until the statistical requirements of sub clause 70.11.8.5 are met. Each time scenario #1 or #2 is used, the start time of the GPS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again. Each time scenario #1 or #2 is used, increment the set of two satellite PRNs by one from the ones used previously, defined in the table in sub clause 5.2.1.2.5 in TS 51.010-7, for the two satellites with the higher level (i.e. if the set of satellites is a, b, c, d, e and the first set used was a, b the second set shall be b, c and so on).

7. Terminate the call

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

Specific Message Contents

MEASURE POSITION REQUEST (3GPP TS 44.031 sub clause A.2) to the MS

Information Element	Value/remark
Positioning Instructions	
Accuracy	51.2m
Required Response Time	20s

70.11.8.5 Test Requirements

For the parameters specified in table 70.11.8.3 the MS shall meet the requirements and the success rate specified in table 70.11.8.4 with a confidence level of 95% according to annex A7.2.

Table 70.11.8.3: Test parameters for Multi-Path scenario

Parameters	Unit	Value
Number of generated satellites (see note)	-	5
GPS Coarse Time assistance error range	seconds	± 1.8
HDOP Range	-	1.8 to 2.5
GPS signal for Satellite 1, 2 (see note)	dBm	-130
GPS signal for Satellite 3, 4, 5 (see note)	dBm	LOS signal of -130 dBm, multi-path signal of -136.2 dBm
NOTE: Satellites 1, 2 no multi-path. Satellites 3, 4, 5 multi-path defined in sub clause 70.11.2.4.		

Table 70.11.8.4: Test requirements for Multi-Path scenario

Success rate	2-D position error	Max response time
95 %	101.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in sub clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in sub clause A5.5.4.

70.12 Assisted GNSS General Procedures

70.12.1 Positioning Capability Transfer procedure

70.12.1.1 Conformance requirement:

When the MS receives a complete POSITIONING CAPABILITY REQUEST message, it shall send the POSITIONING CAPABILITY RESPONSE message. The message shall include the positioning capabilities of the MS and the types of supported assistance data. The message may include the types of assistance needed by the MS to obtain a location estimate or positioning measurements.

Test References

3GPP TS 43.059 sub clause 9.4.3a

3GPP TS 44.031 sub clauses 2.3a, 4.6, 4.7, A.7 and A.8

70.12.1.2 Test Purpose

To verify that the MS sends the correct positioning capabilities and the types of supported assistance data in the POSITIONING CAPABILITY RESPONSE message. Note: no positioning procedure is performed.

70.12.1.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending the CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION message containing an RRLP POSITIONING CAPABILITY REQUEST message.

The MS sends a POSITIONING CAPABILITY RESPONSE message. The message includes the positioning capabilities of the MS and the types of supported assistance data.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability, Positioning Method Support and Additional Positioning Capabilities.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	CHANNEL RELEASE	The main signalling link is released

70.13 Assisted GNSS Network Induced Location Request (NI-LR)

70.13.1 NI-LR / Emergency Call on TCH Radio Channel for Mobiles Supporting MS-Based GNSS

70.13.1.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM900 and 1800 MS), or 911 (for PCS 1900 MS in the USA), or 08 (for PCS 1900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
2. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct KSN and TMSI. A mobile station which implements the "LCS" option shall also implement the

“Controlled Early Classmark Sending” option. A mobile station which implements the “Controlled Early Classmark Sending” option shall indicate it in the classmark (ES IND bit).

3. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The “Mobile Station Classmark 3” information element shall correctly specify the positioning methods supported by the MS and shall indicate support for additional positioning capabilities which can be retrieved using RRLP.
7. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
8. After receipt of a CONNECT ACKNOWLEDGE message during correct establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
9. On receiving the POSITIONING CAPABILITY REQUEST message the MS responds with a POSITIONING CAPABILITY RESPONSE message indicating the positioning methods supported by the MS.
10. On receiving an ASSISTANCE DATA message the MS responds with an ASSISTANCE DATA ACKNOWLEDGEMENT message. The message contains the reference number of the ASSISTANCE DATA message received.
11. On receiving the MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements, and calculates its own position. It sends the results in the RRLP MEASURE POSITION RESPONSE message.

Test Procedure

This test case includes sub test cases dependent on the GNSS supported by the MS. Each sub test case is identified by a Sub Test Case Number as defined below:

Sub Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

An Emergency Call is initiated with the MS. SIM card is included in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends RR APPLICATION INFORMATION messages containing a RRLP Positioning Capability Request message.

The MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS sends one or more RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages dependent on the GNSS positioning methods supported by the MS. The reception of each RRLP Assistance Data message is acknowledged by the MS by sending a RR APPLICATION INFORMATION message containing an RRLP Assistance Data Acknowledgement component.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on FACCH including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing or ganssAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The call is cleared by the SS.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		The appropriate "emergency call number" is entered.
2	MS -> SS	CHANNEL REQUEST	Establishment cause is emergency call establishment.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM. The CM service type IE indicates "emergency call establishment". "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The Additional Positioning Capabilities (1 bit field) is set to 1 (the mobile station supports additional positioning capabilities which can be retrieved using RRLP).
6	SS -> MS	CM SERVICE ACCEPT	
7	MS -> SS	EMERGENCY SETUP	
8	SS -> MS	CALL PROCEEDING	
9	SS -> MS	ALERTING	
10	SS -> MS	ASSIGNMENT COMMAND	
11	MS -> SS	ASSIGNMENT COMPLETE	
12	SS -> MS	CONNECT	
13	MS -> SS	CONNECT ACKNOWLEDGE	The MS indicates that the TCH is through connected in both directions.
14	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
15	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
16	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data The SS provides assistance data in one or more RRLP assistance data delivery messages as defined in TS 51.010-7 sub clauses 6.1.3 and 6.1.4. Each message shall contain a maximum of 242 octets.
17	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck Each RRLP Assistance Data message is acknowledged by the MS.
18	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request May contain further assistance data as defined in TS 51.010-7 sub clauses 6.1.3 and 6.1.4.
19	MS -> SS	RR APPLICATION INFORMATION	Option 1: RRLP Measure Position Response: ganssLocationInfo Option 2: locationError with gpsAssDataMissing (Sub Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub Tests 3 and 4) and/or ganssAssistanceData

19a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Assistance Data. If the MS requested additional assistance data in step 19 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
19b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only: RRLP assistanceDataAck. If the SS sent additional assistance data in step 19a, the MS acknowledges the received assistance data.
19c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Measure Position Request. If the MS requested additional assistance data in step 19 that is available in the SS, this message may include further assistance data.
19d	MS-> SS	RR APPLICATION INFORMATION	Option 2 only: RRLP Measure Position Response. If the MS requested additional assistance data in step 19, this message contains ganssLocationInfo.
20	SS -> MS	DISCONNECT	
21	MS -> SS	RELEASE	
22	SS -> MS	RELEASE COMPLETE	
23	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.13.2 NI-LR / Emergency Call on TCH Radio Channel for Mobiles Supporting MS-Assisted GNSS

70.13.2.1 Conformance requirements

1. With the MS in the "idle, updated" state, the user shall initiate an emergency after the number 112 (for GSM900 and 1800 MS), or 911 (for PCS 1900 MS in the USA), or 08 (for PCS 1900 MS in Mexico) has been entered by the user. The MS shall send a CHANNEL REQUEST message with correct establishment cause ("emergency call").
7. When a user requests an emergency call establishment the mobile station will send a CM SERVICE REQUEST message to the network with a CM service type information element indicating emergency call establishment and the correct CKSN and TMSI. A mobile station which implements the "LCS" option shall also implement the "Controlled Early Classmark Sending" option. A mobile station which implements the "Controlled Early Classmark Sending" option shall indicate it in the classmark (ES IND bit).
8. After sending the CM SERVICE REQUEST message the MS shall send a CLASSMARK CHANGE message. The "Mobile Station Classmark 3" information element shall correctly specify the positioning methods supported by the MS and shall indicate support for additional positioning capabilities which can be retrieved using RRLP.
9. After the CM SERVICE ACCEPT message is received from the network, the MS shall send an EMERGENCY SETUP message.
10. After receipt of a CONNECT ACKNOWLEDGE message during establishment of the emergency call the MS shall indicate that the TCH is through connected in both directions.
11. On receiving the POSITIONING CAPABILITY REQUEST message the MS responds with a POSITIONING CAPABILITY RESPONSE message indicating the positioning methods supported by the MS.
12. On receiving the RRLP MEASURE POSITION REQUEST the MS tries to perform the requested location measurements. It sends the results in the RRLP MEASURE POSITION RESPONSE message.

Test Procedure

This test case includes sub test cases dependent on the GNSS supported by the MS. Each sub test case is identified by a Sub Test Case Number as defined below:

Sub Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

An Emergency Call is initiated with the MS. SIM card is included in the MS.

The emergency call is established with a late assignment.

After receiving the CONNECT ACKNOWLEDGE message from the MS, the SS sends RR APPLICATION INFORMATION messages containing a RRLP Positioning Capability Request message.

The MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request on FACCH including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing or ganssAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The call is cleared by the SS.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		The appropriate "emergency call number" is entered.
2	MS -> SS	CHANNEL REQUEST	Establishment cause is emergency call establishment.
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM. The CM service type IE indicates "emergency call establishment". "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The Additional Positioning Capabilities (1 bit field) is set to 1 (the mobile station supports additional positioning capabilities which can be retrieved using RRLP).
6	SS -> MS	CM SERVICE ACCEPT	
7	MS -> SS	EMERGENCY SETUP	
8	SS -> MS	CALL PROCEEDING	
9	SS -> MS	ALERTING	
10	SS -> MS	ASSIGNMENT COMMAND	
11	MS -> SS	ASSIGNMENT COMPLETE	
12	SS -> MS	CONNECT	
13	MS -> SS	CONNECT ACKNOWLEDGE	The MS indicates that the TCH is through connected in both directions.
14	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
15	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
16	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request Contains assistance data as defined in TS 51.010-7 sub clauses 6.1.3 and 6.1.4.
17	MS -> SS	RR APPLICATION INFORMATION	Option 1: RRLP Measure Position Response: ganssMeasureInfo and gps-MeasureInfo (Sub Tests 3 and 4) Option 2: locationError with gpsAssDataMissing (Sub Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub Tests 3 and 4) and/or ganssAssistanceData
17a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Assistance Data. If the MS requested additional assistance data in step 17 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
17b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only: RRLP assistanceDataAck. If the SS sent additional assistance data in step 17a, the MS acknowledges the received assistance data.

17c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Measure Position Request. If the MS requested additional assistance data in step 17 that is available in the SS, this message may include further assistance data.
17d	MS -> SS	RR APPLICATION INFORMATION	Option 2 only: RRLP Measure Position Response. If the MS requested additional assistance data in step 17, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub Tests 3 and 4).
18	SS -> MS	DISCONNECT	
19	MS -> SS	RELEASE	
20	SS -> MS	RELEASE COMPLETE	
21	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

gps-AssistData	SEQUENCE	Dependent on MS capabilities and defined in TS 51.010-7 sub clauses 6.1.3 and 6.1.4.
extended-reference	SEQUENCE	
ganssPositionMethod	BIT STRING	Sub Test 1: bit 5 set to value 1 Sub Test 2: bit 1 set to value 1 Sub Test 3: bits 0 and 3 set to value 1 Sub Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	Dependent on MS capabilities and defined in TS 51.010-7 sub clauses 6.1.3 and 6.1.4.

RRLP Measure Position Response (Step 17 (Option 1) or Step 17d (Option 2)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	1 or 2 (Option 2, Step 17d)
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub Tests 3 and 4); otherwise locationError will be returned)
gps-MeasureInfo	SEQUENCE	Any value of the parameters is acceptable.
locationError	SEQUENCE	Any error value is acceptable
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

RRLP Measure Position Response (Step 17 (Option 2)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	1
component	CHOICE	msrPositionRsp
locationError	SEQUENCE	
locErrorReason	ENUMERATED	gpsAssDataMissing or ganssAssDataMissing
additionalAssistanceData	SEQUENCE	
gpsAssistanceData	OCTET STRING	Indicates missing GPS assistance data elements. This field may only be present for Sub Tests 3 and 4.
ganssAssistanceData	OCTET STRING	Indicates missing GANSS assistance data elements
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

RRLP Assistance Data (Step 17a):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	This field may only be present for Sub Tests 3 and 4. If the MS requested further GPS assistance data in Step 17 (Option 2) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4. Each message shall contain a maximum of 242 octets.
moreAssDataToBeSent	ENUMERATED	If SS sends more than one RRLP assistance data delivery message the moreAssDataToBeSent field shall be set accordingly: 1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	If the MS requested further GANSS assistance data in Step 17 (Option 2) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4. Each message shall contain a maximum of 242 octets.

RRLP Assistance Data Ack (Step 17b):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	assistanceDataAck

RRLP Measure Position Request (Step 17c):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	msrPositionReq
methodType	CHOICE	msAssisted
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4 as requested by the MS in step 17 (Option 2).
extended-reference	SEQUENCE	
ganssPositionMethod	BIT STRING	Sub Test 1: bit 5 set to value 1 Sub Test 2: bit 1 set to value 1 Sub Test 3: bits 0 and 3 set to value 1 Sub Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4 as requested by the MS in step 17 (Option 2).

70.14 Assisted GNSS Mobile Originated Location Request (MO-LR)

70.14.1 MO-LR / Idle mode for Mobiles Supporting MS-Assisted GNSS

70.14.1.1 Conformance requirements

- 1) The MS sends CM SERVICE REQUEST to network for call independent supplementary service.
- 2) The MS invokes self-location request by sending REGISTER message containing Facility IE LCS MO-LR with MOLR-TYPE set to locationEstimate.
- 3) The MS needs to interact with the network for each separate location request.
- 4) On receiving an RRLP MEASURE POSITION REQUEST message the MS tries to perform the requested location measurements. It sends the results in an RRLP MEASURE POSITION RESPONSE message.
- 5) The network returns an LCS result to the MS carrying location estimate requested by the MS in FACILITY message.
- 6) The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

References

3GPP TS 24.080, sub clauses 2.4, 2.5, 3.4 and 4.

3GPP TS 44.031

70.14.1.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing the Facility IE LCS MO-LR. When the MS receives a FACILITY message containing a Facility IE MO-LR LCS result carrying the requested location estimate, it clears the transaction by sending a RELEASE COMPLETE message.

70.14.1.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellite signals: default conditions.

Mobile Station (MS):

The MS is in MM-state “idle, updated” with valid TMSI and CSKN.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS invokes call independent supplementary service through a CM SERVICE REQUEST.

The SS initiates authentication and ciphering. Then the MS invokes an MO-LR request.

The SS sends an RR APPLICATION INFORMATION messages containing a RRLP Positioning Capability Request message.

The MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing or ganssAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result. When MS receives FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate LCS MOLR Procedure (location estimation)
2	MS -> SS	CHANNEL REQUEST	establishment cause "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	The CM service type IE indicates "Supplementary service activation". "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The Additional Positioning Capabilities (1 bit field) is set to 1 (the mobile station supports additional positioning capabilities which can be retrieved using RRLP).
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering
11	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request with MOLR-Type set to locationEstimate
12	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
13	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
14	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. Contains assistance data as defined in sub clause 70.1.3.
15	MS -> SS	RR APPLICATION INFORMATION	Option 1: RRLP Measure Position Response: ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4) Option 2: locationError with gpsAssDataMissing (Sub-Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData
15a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 15 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
15b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 15a, the MS acknowledges the received assistance data.
15c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 15 that is available in the SS, this message may include further assistance data.

15d	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 15, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
16	SS -> MS	FACILITY	LCS MO-LR result message containing location estimate
17	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
18	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.14.2 MO-LR / Idle mode for Mobiles Supporting MS-Based GNSS / Assistance Data Request

70.14.2.1 Conformance requirements

The following requirements apply for this test:

1. The MS sends CM SERVICE REQUEST to network for call independent supplementary service.

2. The MS invokes self-location request by sending REGISTER message containing Facility IE LCS MO-LR with MOLR-TYPE set to assistance data.
3. The MS sends RRLP ASSISTANCE DATA ACK for each RRLP ASSISTANCE DATA component
4. The network shall returns an LCS result of the location procedure to the MS by sending a FACILITY message to the MS containing a LCS-MOLR return result component.
5. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

References

3GPP TS 24.080, sub clauses 2.4, 2.5, 3.4 and 4.

3GPP TS 44.031

70.14.2.2 Test Purpose

To verify that a MS invokes a self-location request by sending the network a REGISTER message containing an LCS-MOLR REQ of type "Assistance data". On receipt of each RRLP ASSISTANCE DATA from SS with the requested assistance data, MS shall send RRLP ASSISTANCE ACK for each component to SS. When the MS receives a FACILITY message containing a LCS-MOLR return result for the acknowledgement of completing assistance data delivery, it clears the transaction by sending a RELEASE COMPLETE message.

70.14.2.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellite signals: default conditions.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valid TMSI and CSKN.

Specific PICS statements

-

PIXIT statements

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS invokes call independent supplementary service through a CM SERVICE REQUEST.

The SS initiates authentication and ciphering. Then the MS invokes an MO-LR request, with MOLR- TYPE set to assistance data.

The SS sends a number of RRLP Assistance Data components and MS sends RRLP Assistance Data Ack for each component.

SS sends LCS-MOLR Return Result for acknowledgement of completion of assistance data delivery.

The MS terminates the dialogue by sending RELEASE COMPLETE message.

Maximum duration of the test

10 minutes.

Expected Sequence

Normal Case:

Step	Direction	Message	Comments
1	MS		Initiate LCS MOLR Procedure (assistance data request)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Establishment cause indicates "Supplementary service activation". "mobile station classmark 2" includes settings for ES_IND.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The Additional Positioning Capabilities (1 bit field) is set to 1 (the mobile station supports additional positioning capabilities which can be retrieved using RRLP).
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to assistanceData.
11n	SS -> MS	RR APPLICATION INFORMATION	RRLP ASSISTANCE DATA The number of instances of this message depends on the amount of assistance data requested in step 10
12n	MS -> SS	RR APPLICATION INFORMATION	RRLP ASSISTANCE DATA ACK Each instance of RRLP ASSISTANCE DATA message in step 11 is acknowledged
13	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT
14	MS -> SS	RELEASE COMPLETE	Terminates the session
15	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Message Type	RELEASE COMPLETE (0011 1010)

70.14.3 MO-LR / Idle mode for Mobiles Supporting MS-Based GNSS / Location Estimate Request

70.14.3.1 Conformance requirements

The following requirements apply for this test:

1. The MS sends CM SERVICE REQUEST to network for call independent supplementary service.
2. The MS invokes self-location request by sending REGISTER message containing Facility IE LCS MO-LR with MOLR-TYPE set to locationEstimate.
3. On receiving the POSITIONING CAPABILITY REQUEST message the MS responds with a POSITIONING CAPABILITY RESPONSE message indicating the positioning methods supported by the MS.
4. On receiving an RRLP MEASURE POSITION REQUEST message, the MS tries to perform the requested location measurements, and possibly calculates its own position. When the MS has location measurements, location estimate, or an error indication (measurements/location estimation not possible), it sends the results in the Measure Position Response component to the SMLC.
5. The network shall return an LCS result of the location procedure to the MS by sending a FACILITY message to the MS containing a LCS-MOLR return result component.
6. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

3GPP TS 44.031

70.14.3.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing an MO-LR Request of type "locationEstimate". When the MS receives a FACILITY message containing a MO-LR return result carrying the requested location estimate, it clears the transaction by sending a RELEASE COMPLETE message.

70.14.3.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellite signals: default conditions.

Mobile Station (MS):

The MS is in MM-state "idle, updated" with valid TMSI and CSKN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS invokes call independent supplementary service through a CM SERVICE REQUEST.

The SS initiates authentication and ciphering. Then the MS invokes an MO-LR request, with MOLR-TYPE set to locationEstimate.

The SS sends an RR APPLICATION INFORMATION messages containing a RRLP Positioning Capability Request message.

The MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing or ganssAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result. When the MS receives the FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test

10 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimation)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUES	The CM Service Type IE indicates "Supplementary service activation".
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The Additional Positioning Capabilities (1 bit field) is set to 1 (the mobile station supports additional positioning capabilities which can be retrieved using RRLP).
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering
11	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request and MO-LR Type set to "locationEstimate".
12	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
13	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
14	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data The SS provides assistance data in one or more RRLP assistance data delivery messages as defined in sub clause 70.1.3. Each message shall contain a maximum of 242 octets.
15	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck Each RRLP Assistance Data message is acknowledged by the MS.
16	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request May contain further assistance data as defined in sub clause 70.1.3.
17	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: ganssLocationInfo (Option 1) or locationError with gpsAssDataMissing (Sub-Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData
17a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Assistance Data. If the MS requested additional assistance data in step 17 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
17b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only: RRLP assistanceDataAck. If the SS sent additional assistance data in step 17a, the MS acknowledges the received assistance data.
17c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only: RRLP Measure Position Request. If the MS requested additional assistance data in step 17 that is available in the SS, this message may include further assistance data.

17d	MS-> SS	RR APPLICATION INFORMATION	Option 2 only: RRLP Measure Position Response. If the MS requested additional assistance data in step 17, this message contains ganssLocationInfo.
20	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT message containing location estimate
21	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
22	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Specific Message Contents

REGISTER (Step 11):

Information element	Value/remark

Transaction Identifier	
Message Type	REGISTER (xx11 1011)
Facility	Invoke = LCS-MOLR LCS-MOLRArg MOLR-Type->locationEstimate
SS version indicator	Value 1 or above

RRLP Positioning Capability Request (Step 12):

Information element	Type	Value/remark
ASN.1 encoded		
extended-reference	SEQUENCE	

RRLP Positioning Capability Response (Step 13):

Information element	Type	Value/remark
ASN.1 encoded		
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the Positioning Capability Request (Step 14).
posCapabilities	SEQUENCE	
nonGANSspositionMethods	BIT STRING	May only be included for Sub-Tests 3 and 4.
gANSsPositionMethods	SEQUENCE	Included for each MS supported GANSS
ganssID	INTEGER	Sub-Test 1: value 3 Sub-Test 2: absent Sub-Test 3: value 1 Sub-Test 4: value 3
gANSsPositioningMethodTypes	BIT STRING	Bit 1 (msBased) set to value 1
gANSsSignals	BIT STRING	Dependent on MS capabilities

RR_APPLICATION_INFORMATION

Information element	Value/remark
Protocol Discriminator	RR Management Protocol (0110)
Skip Indicator	
Message Type	Application Information Message type
APDU ID	APDU ID -> RRLP => 0000
APDU Flags	Bit1=0 -> Last or only segment Bit2=0 -> First or only segment Bit3=0 -> Command or Final Response Bit4=spare
APDU Data	2-N Byte → ASN.1 Coded Step 12: RRLP Positioning Capability Request Step 13: RRLP Positioning Capability Response Steps 18 and 19c: RRLP Measure Position Request Steps 19 and 19d: RRLP Measure Position Response Steps 14, 16, 19a: RRLP Assistance Data Steps 15, 17, 19b: RRLP Assistance Data Ack.

RRLP Assistance Data (Step 14):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	1
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	Dependent on MS capabilities and defined in sub clause 70.1.3.
moreAssDataToBeSent	ENUMERATED	If SS sends more than one RRLP assistance data delivery message at step 14 the moreAssDataToBeSent field shall be set accordingly: 1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	Dependent on MS capabilities and defined in sub clause 70.1.3.

RRLP Assistance Data Ack (Steps 15, 17b):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	1 or 2 (Option 2, Step 17b)
component	CHOICE	assistanceDataAck

RRLP Measure Position Request (Step 16):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	1
component	CHOICE	msrPositionReq
methodType	CHOICE	msBased
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
accuracy	Integer (0-127)	127
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	Dependent on MS capabilities and defined in sub clause 70.1.3.
extended-reference	SEQUENCE	
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	Dependent on MS capabilities and defined in sub clause 70.1.3.

RRLP Measure Position Response (Step 17 (Option 1) or 17d (Option 2)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	1 or 2 (Option 2, Step 17d)
component	CHOICE	msrPositionRsp (A valid response will contain ganssLocationInfo otherwise locationError will be returned)
locationError	SEQUENCE	Any error value is acceptable.
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssLocationInfo	SEQUENCE	Any value is acceptable

RRLP Measure Position Response (Step 17 (Option 2)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	1
component	CHOICE	msrPositionRsp
locationError	SEQUENCE	
locErrorReason	ENUMERATED	gpsAssDataMissing or ganssAssDataMissing
additionalAssistanceData	SEQUENCE	
gpsAssistanceData	OCTET STRING	Indicates missing GPS assistance data elements. This field may only be present for Sub-Tests 3 and 4.
ganssAssistanceData	OCTET STRING	Indicates missing GANSS assistance data elements
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

RRLP Assistance Data (Step 17a):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	2
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	This field may only be present for Sub-Tests 3 and 4. If the MS requested further GPS assistance data in Step 17 (Option 2) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4. Each message shall contain a maximum of 242 octets.
moreAssDataToBeSent	ENUMERATED	If SS sends more than one RRLP assistance data delivery message the moreAssDataToBeSent field shall be set accordingly: 1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	If the MS requested further GANSS assistance data in Step 17 (Option 2) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4. Each message shall contain a maximum of 242 octets.

RRLP Measure Position Request (Step 17c):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	msrPositionReq
methodType	CHOICE	msBased
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
accuracy	Integer (0-127)	127
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4 as requested by the MS in step 17 (Option 2).
extended-reference	SEQUENCE	
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4 as requested by the MS in step 17 (Option 2).

FACILITY (Step 20):

Information element	Value/remark
Protocol Discriminator	Call Independent SS (1011)
Transaction Identifier	
Message Type	FACILITY (0011 1010)
Facility	Return Result = LCS-MOLR LCS-MOLRRes -> locationEstimate

RELEASE COMPLETE (Step 22):

Information element	Value/remark
Protocol Discriminator	Call Independent SS (1011)
Transaction Identifier	
Message Type	RELEASE COMPLETE (xx10 1010)

70.14.4 MO-LR / Dedicated Mode for Mobiles Supporting MS-Assisted GNSS

70.14.4.1 Conformance Requirement:

The MS sends a DTAP LCS MO-LR invoke to the VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component with MO_LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

References

3GPP TS 03.71, sub clause 7.6.6.

3GPP TS 04.30, sub clause 5.1.1.

3GPP TS 24.080, sub clauses 2.4, 2.5, 3.4 and 4.

70.14.4.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing the Facility IE LCS MO-LR on an already established speech call related main DCCH (FACCH). When the MS receives a FACILITY message containing a Facility IE MO-LR LCS result carrying the requested location estimate, it clears the transaction by sending a RELEASE COMPLETE message.

70.14.4.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Satellite signals: default conditions.

Mobile Station (MS):

The MS has valid TMSI and CSKN.

The MS is brought into the state U10 by using table 26.8.1.2/3.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS invokes call independent supplementary service on an existing FACCH channel. After receiving a CM SERVICE ACCEPT message, the MS invokes a self-location request by sending a REGISTER message containing the Facility IE LCS MO-LR.

The SS sends an RR APPLICATION INFORMATION messages containing a RRLP Positioning Capability Request message.

The MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing or ganssAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero,

one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result. When the MS receives a FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate LCS MOLR Procedure (location estimation) on existing FACCH channel
2	MS -> SS	CM SERVICE REQUEST	The CM Service Type IE indicates "Supplementary service activation". "mobile station classmark 2" includes settings for ES_IND.
3	SS -> MS	CM SERVICE ACCEPT	
4	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request with MOLR-Type set to locationEstimate
5	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
6	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
7	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request Contains assistance data as defined in sub clause 70.1.3.
8	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: Option 1: ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4) Option 2: locationError with gpsAssDataMissing (Sub-Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData
8a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 8 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
8b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 8a, the MS acknowledges the received assistance data.
8c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 8 that is available in the SS, this message may include further assistance data.
8d	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 8, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
9	SS -> MS	FACILITY	LCS MO-LR result message containing location estimate
10	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
11	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.14.5 MO-LR / Dedicated Mode for Mobiles Supporting MS-Based GNSS / Assistance Data Request

70.14.5.1 Conformance Requirement:

The following requirements apply for this test:

1. The MS sends CM SERVICE REQUEST to network for call independent supplementary service.

2. The MS invokes self-location request by sending a REGISTER message containing a LCS-MOLR invoke component with MO_LR TYPE set to ASSISTANCE DATA, LOCATION_METHOD TYPE set ASSISTEDGPS, and GPS_ASSISTANCE_DATA TYPE set to the type of ASSISTANCE_DATA requested.
3. The MS sends RRLP ASSISTANCE DATA ACK. for each RRLP ASSISTANCE DATA component.
4. The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 03.71 sub clause 7.6.6

3Gpp TS 24.30 sub clause 5

3GPP TS 24.80 sub clause 4

70.14.5.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing the FACILITY IE LCS-MOLR REQ on an already established speech call related main DCCH (FACCH). On receipt of a RRLP ASSISTANCE DATA from SS with the requested assistance data, MS shall send back RRLP ASSISTANCE ACK for each component to SS. When the MS receives a FACILITY message containing a FACILITY IE LCS-MOLR return result for the acknowledgment of completing assistance data delivery, it clears the transaction by sending a RELEASE COMPLETE message.

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

A MOLR procedure as call independent supplementary services is initiated from the MS on the existing FACCH channel.

After received CM SERVICE ACCEPT message, MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke for Assistance Data.

The SS sends a number of RRLP ASSISTANCE DATA components and MS sends acknowledgement of RRLP ASSISTANCE DATA ACK for each component.

SS sends DTAP LCS-MOLR Return Result for acknowledgement of completion of assistance data delivery procedure.

The MS terminates the dialogue by sending RELEASE COMPLETE message.

Maximum duration of the test:

5 minutes.

Expected Sequence:

Step	Direction	Message	Comments
1	MS		Initiate LCS MOLR Procedure (assistance data request) on existing FACCH channel
2	MS -> SS	CM SERVICE REQUEST	"Mobile identity" IE contains the TMSI. Establishment cause indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
3	SS -> MS	CM SERVICE ACCEPT	
4	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to assistanceData.
5	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
6	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
7n	SS->MS	RR APPLICATION INFORMATION	RRLP ASSISTANCE DATA The number of instances of this message depends on the amount of assistance data requested in step 4
8n	MS -> SS	RR APPLICATION INFORMATION	RRLP ASSISTANCE DATA ACK Each instance of RRLP ASSISTANCE DATA message in step 7 is acknowledged
9	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT
10	MS->SS	RELEASE COMPLETE	Terminates the session
11	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.14.6 MO-LR / Dedicated Mode for Mobiles Supporting MS-Based GNSS / Location Estimate request

70.14.6.1 Conformance requirements:

The following requirements apply for this test:

1. The MS sends CM SERVICE REQUEST to network for call independent supplementary service.
2. The MS invokes a MO-LR by sending a REGISTER message to the network containing a LCS-MOLR invoke component.
3. On receiving the POSITIONING CAPABILITY REQUEST message the MS responds with a POSITIONING CAPABILITY RESPONSE message indicating the positioning methods supported by the MS.
4. On receiving an RRLP MEASURE POSITION REQUEST message, the MS tries to perform the requested location measurements, and possibly calculates its own position. When the MS has location measurements, location estimate, or an error indication (measurements/location estimation not possible), it sends the results in the Measure Position Response component to the SMLC.
5. The network shall pass the result of the location procedure to the MS by sending a FACILITY message to the MS containing a LCS-MOLR return result component.
6. After the last location request operation the MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References

3GPP TS 44.031

70.14.6.2 Test Purpose

To verify that the MS invokes a self-location request by sending the network a REGISTER message containing an MO-LR Request of type "locationEstimate" on an already established speech call related SACCH. When the MS receives a FACILITY message containing a MO-LR return result carrying the requested location estimate, it clears the transaction by sending a RELEASE COMPLETE message.

Specific PICS statements

-

PIXIT statements

-

70.14.6.3 Method of Test

Initial Conditions

System Simulator:

Serving cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS has valid TMSI and CKSN.

The MS is brought into state U10 by using table 26.8.1.2/3.

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS invokes call independent supplementary service on an existing SACCH channel. After receiving a CM SERVICE ACCEPT message, the MS invokes a self location request by sending a REGISTER message containing an MO-LR request of type "locationEstimate".

The SS sends an RR APPLICATION INFORMATION messages containing a RRLP Positioning Capability Request message.

The MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS orders positioning measurement by sending RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages followed by an RRLP Measure Position Request including further assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing or ganssAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS responds with a FACILITY message containing an MO-LR result. When the MS receives the FACILITY message, it clears the transaction by sending a RELEASE COMPLETE message.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MO-LR procedure (location estimation) on existing SACCH channel
2	MS -> SS	CM SERVICE REQUEST	The CM Service Type IE indicates "Supplementary service activation".
3	SS -> MS	CM SERVICE ACCEPT	
4	MS -> SS	REGISTER	Call Independent SS containing Facility IE with LCS-MOLR request and MO-LR Type set to "locationEstimate".
5	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
6	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response

7	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
8	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
9	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
10	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
11	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response: ganssLocationInfo (Option 1) or locationError with gpsAssDataMissing (Sub-Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData (Option 2)
12a	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. If the MS requested additional assistance data in step 12 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
12b	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 12a, the MS acknowledges the received assistance data.
12c	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request. If the MS requested additional assistance data in step 12 that is available in the SS, this message may include further assistance data.
12d	MS-> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response. If the MS requested additional assistance data in step 12, this message contains ganssLocationInfo.
13	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT message containing location estimate
14	MS -> SS	RELEASE COMPLETE	MS terminates the dialogue
15	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.14.7

70.14.8 MO-LR / Location Error

70.14.8.1 MO-LR / Location Error / Requested Method not supported

70.14.8.1.1 Conformance requirement:

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS sends a RRLP MEASURE POSITION RESPONSE to network containing a Location Error component with an error indication if the measurement is not possible.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9 and 10.5.1.6, 10.5.1.7.

3GPP TS 44.031.

70.14.8.1.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall send back RRLP MEASURE POSITION RESPONSE message with Location Error component if the MS does not support the requested method. On receipt of second RRLP MEASURE POSITION REQUEST from SS to start the measurement, the MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.14.8.1.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST with a method type not supported by the mobile. (Type not supported to be GPS for sub-tests 1 and 2, Galileo for sub-tests 3 and 4). The MS sends RRLP MEASURE POSITION RESPONSE to SS containing a Location Error component (Request Method not Supported) as the requested method is not supported.

The SS then sends a RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, and the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS repeats RRLP MEASURE POSITION REQUEST with correct message contents including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS returns location estimate to MS through LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH"
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR request with MOLR-Type set to locationEstimate
11	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1 (Request method not supported)
12	MS->SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE 1 (location_error)
13	SS -> MS	RR APPLICATION INFORMATION	RRLP POSITIONING CAPABILITY REQUEST
14	MS->SS	RR APPLICATION INFORMATION	RRLP POSITIONING CAPABILITY RESPONSE
15	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2
16	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response 2: ganssMeasureInfo and gps-MeasureInfo, (Sub-Tests 3 and 4) (Option 1) or locationError with gpsAssDataMissing (Sub-Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData (Option 2)
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Response. If the MS requested additional assistance data in step 16, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
17	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
18	MS -> SS	RELEASE COMPLETE	Terminates the session
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

RRLP Measure Position Response 2 (Step 16 (Option 2)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	msrPositionRsp
locationError	SEQUENCE	
locErrorReason	ENUMERATED	gpsAssDataMissing
additionalAssistanceData	SEQUENCE	
gpsAssistanceData	OCTET STRING	Indicates missing assistance data elements
ganssAssistanceData	OCTET STRING	Indicates missing GANSS assistance data elements
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

RRLP Assistance Data (Step 16a):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	This field may only be present for Sub-Tests 3 and 4. If the MS requested further GPS assistance data in Step 16 (Option 2) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.
moreAssDataToBeSent	ENUMERATED	If SS sends more than one RRLP assistance data delivery message the moreAssDataToBeSent field shall be set accordingly: 1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	If the MS requested further GANSS assistance data in Step 16 (Option 2) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.

RRLP Assistance Data Ack (Step 16b):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	assistanceDataAck

RRLP Measure Position Request (Step 16c):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	3
component	CHOICE	msrPositionReq
methodType	CHOICE	msAssisted
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 16 (Option 2).
extended-reference	SEQUENCE	Rel 5 and later
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clauses 6.1.3 and 6.1.4 as requested by the MS in step 16 (Option 2).

FACILITY (Step 17):

Information element	Value/remark
Protocol Discriminator	Call Independent SS message (1011)
Transaction Identifier Message Type Facility	FACILITY (0011 1010) Return Result = LCS-MOLR LCS-MOLRRes ->locationEstimate (Note)
Note:	Any value for locationEstimate may be used. The SS shall not be required to calculate the value from the returned gps-MeasureInfo values.

RELEASE COMPLETE (Step 18):

Information element	Value/remark
Protocol Discriminator	Call Independent SS (1011)
Transaction Identifier	
Message Type	RELEASE COMPLETE (xx10 1010)

70.14.8.2 MO-LR / Location Error / GNSS Assistance Data Missing

70.14.8.2.1 Conformance requirement:

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS sends a RRLP MEASURE POSITION RESPONSE to network containing a Location Error component with an error indication if the measurement is not possible.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9 and 10.5.1.6, 10.5.1.7.

3GPP TS 44.031.

70.14.8.2.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall send back RRLP MEASURE POSITION RESPONSE message with Location Error component if GNSS assistance data is missing. On receipt of second RRLP MEASURE POSITION REQUEST (with GNSS assistance data included) from SS to start the measurement, the MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.14.8.2.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The A-GNSS assistance data stored in the MS is reset.

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

On receiving the RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST without GNSS assistance data (GPS or GANSS according to the receiver capabilities).

The MS requests additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to gpsAssDataMissing or ganssAssDataMissing for sub-test cases 3 and 4 and set to ganssAssDataMissing for sub-test cases 1 and 2. The SS provides the requested assistance data that is available in the SS in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data.

The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

The SS returns location estimate to MS through LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Reset all stored A-GNSS assistance data
2	MS		Initiate MOLR Procedure (location estimate)
3	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
4	SS -> MS	IMMEDIATE ASSIGNMENT	
5	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
6	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
7	SS -> MS	AUTHENTICATION REQUEST	
8	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
9	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
10	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
11	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR request with MOLR-Type set to locationEstimate
12	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
13	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
14	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1 (without GNSS assistance data)
15	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response 1: locationError with ganssAssDataMissingor gpsAssDataMissing (Sub-Tests 3 and 4)
16	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. The SS provides the requested data from step 15 that is available in the SS in zero, one or more RRLP Assistance Data delivery messages.
17	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 16, the MS acknowledges the received assistance data.
18	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2. This message may include further assistance data.
19	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE 2 (ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4))
20	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
21	MS -> SS	RELEASE COMPLETE	Terminates the session
22	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.14.9 MO-LR / Multiple RRLP Requests with Same Reference Number and Extended Reference Number

70.14.9.1 Conformance requirement:

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS ignores the later component if the old and new RRLP MEASURE POSITION REQUEST components have the same Reference Number.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9 and 10.5.1.6, 10.5.1.7.

3GPP TS 44.031.

70.14.9.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall ignore the second RRLP MEASURE POSITION REQUEST if the second RRLP MEASURE POSITION REQUEST has the same REFERENCE NUMBER and the same Extended Reference IE as in the previous one. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the current measurement.

70.14.9.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

On receiving the RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the first one (this delay shall be cancelled in the event of option 2). The MS shall ignore the second RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to `gnssAssDataMissing`, and `gpsAssDataMissing` for sub-test cases 3 and 4. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the second one. The MS shall ignore the third RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1
14	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 15. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3 and 4) within 8 seconds, then the SS continues to step 14a.
14a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request 2. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS (Option 2)		Option 2 only : MS is performing the measurement
15	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 with same reference number and same extended reference IE as in Request 1 (Option 1) or RRLP MEASURE POSITION REQUEST 3 with same reference number and same extended reference IE as in Request 2 (Option2) Note: The satellite signals should be made available to MS after sending this message
16	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE (ganssMeasureInfo and gps-measureInfo for Sub-Tests 3 and 4)
17	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
18	MS -> SS	RELEASE COMPLETE	Terminates the session
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Transaction Identifier	
Message Type	RELEASE COMPLETE (xx10 1010)

70.14.10 MO-LR / Multiple RRLP Requests with Different Reference Number

70.14.10.1 Conformance requirement:

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS aborts activity for the former RRLP MEASURE POSITION REQUEST component and starts to act according to the later RRLP MEASURE POSITION REQUEST component if the old and new RRLP MEASURE POSITION REQUEST components have different Reference Number.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9 and 10.5.1.6, 10.5.1.7.

3GPP TS 44.031.

70.14.10.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with a different REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the first one. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.14.10.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

On receiving the RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the first one (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing, and gpsAssDataMissing for sub-test cases 3 and 4. If the MS requests additional assistance data that is available in the SS, then the SS provides the

requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER and the same EXTENDED REFERENCE IE as the second one. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST, including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1
14	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 15. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3 and 4 within 8 seconds, then the SS continues to step 14a.
14a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request 2. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS (Option 2)		Option 2 only : MS is performing the measurement
15	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 with different reference number and same extended reference IE as in Request 1 (Option 1) or RRLP MEASURE POSITION REQUEST 3 with different reference number and same extended reference IE as in Request 2 (Option2) Note: The satellite signals should be made available to MS after sending this message
16	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3 and 4 (Option 1 or 2a). Check reference number is 2 or locationError with gpsAssDataMissing (Sub-Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData (Option 2b) Check reference number is 2

16a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Request. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 16, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
17	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
18	MS -> SS	RELEASE COMPLETE	Terminates the session
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.14.11 MO-LR / Multiple RRLP Requests with Different Extended Reference Number

70.14.11.1 Conformance requirements

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS aborts activity for the former RRLP MEASURE POSITION REQUEST component and starts to act according to the later RRLP MEASURE POSITION REQUEST component if the old and new RRLP MEASURE POSITION REQUEST components have different Extended Reference Number.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9 and 10.5.1.6, 10.5.1.7.

3GPP TS 44.031.

70.14.11.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with the same REFERENCE NUMBER as the first one and a different EXTENDED REFERENCE IE. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.14.11.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

On receiving the RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the first one and a different EXTENDED REFERENCE IE (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-tests 3 and 4). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the second one and a different EXTENDED REFERENCE IE. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST, including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1
14	MS (Option 1) or MS -> SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 15. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3 and 4 within 8 seconds, then the SS continues to step 14a.
14a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request 2. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS (Option 2)		Option 2 only : MS is performing the measurement

15	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 with same reference number as in Request 1 and different extended reference IE (Option 1) or RRLP MEASURE POSITION REQUEST 3 with same reference number as in Request 2 and different extended reference IE (Option2) Note: The satellite signals should be made available to MS after sending this message
16	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3 and 4 (Option 1 or 2a). Check extended reference IE is the equal to the one contained in the request of step 15 or locationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3 and 4) and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData (Option 2b) Check extended reference IE is the equal to the one contained in the request of step 15
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Request. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 16, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
17	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
18	MS -> SS	RELEASE COMPLETE	Terminates the session
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

RELEASE COMPLETE (Step 18):

Information element	Value/remark
Protocol Discriminator	Call Independent SS (1011)
Transaction Identifier	
Message Type	RELEASE COMPLETE (xx10 1010)

70.14.12 MO-LR / RR Management Commands

70.14.12.1 Conformance requirement

The MS sends a DTAP LCS MOLR invoke to VMSC. If the MS is requesting its own location or that its own location be sent to another LCS client, this message carries LCS QoS information (e.g. accuracy, response time).

The MS invokes a MO-LR by sending a REGISTER message to network containing a LCS-MOLR invoke component with MO-LR TYPE set to LocationEstimate, LCS QoS value and other optional field if it is needed.

The MS aborts the measurement procedure and starts on the RR MANAGEMENT procedure if a RR MANAGEMENT command is received during the measurement procedure. The MS sends RR MANAGEMENT RESPONSE message upon completion.

The MS shall terminate the dialogue by sending a RELEASE COMPLETE message.

Test References:

3GPP TS 44.018 sub clauses 3.3.1.1 and 9.1.11.

3GPP TS 24.008 sub clauses 4.5.1.5, 5.2.1, 9.2.9 and 10.5.1.6, 10.5.1.7.

3GPP TS 44.031.

70.14.12.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if a RR MANAGEMENT command is received during the measurement procedure. The MS shall send a RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST and send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.14.12.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

A MOLR procedure as call independent supplementary services is initiated from the MS. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS sends a REGISTER message with Facility IE containing a component set to a DTAP LCS-MOLR Invoke.

On receiving the RR APPLICATION INFORMATION message containing a RRLP Positioning Capability Request message, the MS responds with an RR APPLICATION INFORMATION message containing an RRLP Positioning Capability Response message indicating the GNSS(s) supported by the MS.

The SS then instigates the particular message sequence by sending RRLP MEASURE POSITION REQUEST including assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends an RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends an RR MANAGEMENT RESPONSE message to SS when the RR

MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to `ganssAssDataMissing` or `gpsAssDataMissing`. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and, the SS sends a RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends a RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS either sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST or requests more assistance data and then sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2)

The SS returns location estimate to MS through DTAP LCS-MOLR Return Result. The MS terminates the dialogue by sending RELEASE COMPLETE message after receiving location estimate.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	MS		Initiate MOLR Procedure (location estimate)
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "Other procedures which can be completed with an SDCCH".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS -> SS	CM SERVICE REQUEST	Message is contained in SABM "Mobile identity" IE contains the TMSI. The CM Service Type IE indicates "Supplementary service activation" "mobile station classmark 2" including settings for ES IND and CM3 supported.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.
8	SS -> MS	CIPHERING MODE COMMAND	SS starts deciphering after sending the message.
9	MS -> SS	CIPHERING MODE COMPLETE	Shall be sent enciphered. All following messages shall be sent enciphered.
10	MS -> SS	REGISTER	Call Independent SS containing Facility IE With the component of Invoke message set to LCS-MOLR with MOLR-Type set to locationEstimate.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Positioning Capability Request
12	MS -> SS	RR APPLICATION INFORMATION	RRLP Positioning Capability Response
13	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1
14	MS (Option 1) or MS -> SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 15. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3 and 4 within 8 seconds, then the SS continues to step 14a.
14a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 14 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
14b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 14a, the MS acknowledges the received assistance data.
14c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request 2. If the MS requested additional assistance data in step 14 that is available in the SS, this message may include further assistance data.
14d	MS (Option 2)		Option 2 only : MS is performing the measurement
15	SS -> MS	RR MANAGEMENT COMMAND	
16	MS -> SS	RR MANAGEMENT COMPLETE	MS terminates the measurement procedure and act on the RR management command

17	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 (Option 1) or RRLP MEASURE POSITION REQUEST 3 (Option2) Note: The satellite signals should be made available to MS after sending this message
18	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3 and 4 (Option 1 or 2a). or locationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3 and 4) and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData (Option 2b)
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Request. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 16, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
17	SS -> MS	FACILITY	LCS MO-LR RETURN RESULT (locationEstimate)
18	MS -> SS	RELEASE COMPLETE	Terminates the session
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

3GPP TS 24.080 sub clauses 2.4, 2.5, and 3.4.

70.15.1.2 Test Purpose

To verify that when the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to NotifyLocationAllowed, the MS notifies the MS user of the location request and sends a RELEASE COMPLETE message containing a LocationNotification return result.

70.15.1.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters

Mobile Station (MS):

The MS is in MM-state “idle, updated” with valued TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message containing a Facility IE containing a DTAP LCS Location Notification Invoke message set to notifyLocationAllowed. The MS notifies the MS user of the location request. The MS then responds with a RELEASE COMPLETE message containing a LocationNotification return result to terminate the dialogue.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support and Additional Positioning Capabilities
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESPONSE	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	REGISTER	Call Independent SS containing Facility IE Location Notification Invoke message set to notifyLocationAllowed
12	MS		MS notifies the MS user of the location request
13	MS -> SS	RELEASE COMPLETE	
14	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Specific Message Contents

PAGING RESPONSE

70.15.2.2 Test Purpose

To verify that the MS receives a REGISTER message, containing a LCS Location Notification Invoke component set to notifyAndVerify-LocationAllowedIfNoResponse, the MS notifies the MS user of the location request, indicates that the default response is location allowed if no response is sent, gives the user the option to accept or reject the request and sends a RELEASE COMPLETE message containing a LocationNotification return result with the verificationResponse set to permissionDenied or permissionGranted as appropriate.

70.15.2.3 Method of Test

Initial Conditions

System Simulator (SS):

Serving Cell: default parameters.

Mobile Station (MS):

The MS is in MM-state “idle, updated” with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

- MS LCS Notification timeout timer

Test Procedure

The MS is paged with a PAGING REQUEST TYPE 1 message. After sending the CIPHERING MODE COMPLETE message the MS receives an SS REGISTER message with a Facility IE containing a LCS Location Notification Invoke set to notifyAndVerify-LocationAllowedIfNoResponse. The MS notifies the MS user of the location request, indicates that the default response is location allowed if no response is sent and gives the user the option to accept or reject the request.

Option 1:

The user then accepts the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionGranted.

Option 2:

The user then denies the location request. The MS responds with a RELEASE COMPLETE message containing a LocationNotification return result with verificationResponse set to permissionDenied.

Option 3:

The user ignores the location request by taking no action, allowing the verification process timer to time-out. The SS responds with RELEASE COMPLETE.

Maximum duration of the test

5 minutes.

Expected Sequence

The test sequence is repeated for $k = 1 \dots 3$.

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.

70.15.4 Void

70.15.5 MT-LR / Location Error

70.15.5.1 MT-LR / Location Error / Requested Method not Supported

70.15.5.1.1 Conformance requirements

The MS sends an RRLP MEASURE POSITION RESPONSE message to the network containing a Location Error component with an error indication if the measurement is not possible.

Test References

3GPP TS04.31 sub clause 2.2, A.3.2.6

70.15.5.1.2 Test Purpose

To verify that the MS sends the correct positioning capability via controlled early classmark sending. The MS shall send a RRLP MEASURE POSITION RESPONSE message with Location Error component if the MS does not support the requested method. On receipt of second RRLP MEASURE POSITION REQUEST from SS to start the measurement, the MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.5.1.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

The SS sends an RRLP MEASURE POSITION REQUEST message with a method type not supported by the mobile (Type not supported to be GPS for sub-tests 1 and 2, Galileo for sub-tests 3 and 4).

The MS sends RRLP MEASURE POSITION RESPONSE to SS containing a Location Error component (Requested Method not Supported) as the requested method is not supported.

The MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages followed by a new RRLP MEASURE POSITION REQUEST with correct message contents including assistance data.

Option 1: The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Option 2: The MS may request additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-tests 3 and 4). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS repeats the RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE 1	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES_IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	

8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1 (Request method not supported)

ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 18 (Option 2).

70.15.5.2 Location Error: GNSS Assistance Data Missing

70.15.5.2.1 Conformance requirement

The MS sends an RRLP MEASURE POSITION RESPONSE message to the network containing a Location Error component with an error indication if the measurement is not possible.

Test References

3GPP TS 44.031

70.15.5.2.2 Test Purpose

To verify that the MS sends the correct positioning capability via controlled early classmark sending and that the MS sends a RRLP MEASURE POSITION RESPONSE message with Location Error component because the GNSS assistance data is missing. On receipt of second RRLP MEASURE POSITION REQUEST (with all necessary GNSS assistance data to obtain a location estimate included) from SS to start the measurement, the MS sends back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.5.2.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: default conditions.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The A-GNSS assistance data stored in the MS is reset.

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability. After sending the CIPHERING MODE COMPLETE message the MS receives an RRLP MEASURE POSITION REQUEST message with Reference Time GPS assistance data.

The MS requests additional assistance data by sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-test cases 3 and 4). The SS provides the requested assistance data that is available in the SS in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data.

The SS provides the requested assistance data that is available in the SS in zero, one or more RRLP Assistance Data delivery messages followed by an RRLP Measure Position Request message which may include further assistance data.

The MS then performs positioning measurements, and responds with an RR APPLICATION INFORMATION message containing an RRLP Measure Position Response.

Maximum duration of the test

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
0	MS		Reset all stored A-GNSS assistance data
1	SS->MS	PAGING REQUEST TYPE 1	
3	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
4	SS -> MS	IMMEDIATE ASSIGNMENT	
5	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
6	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES_IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
7	SS -> MS	AUTHENTICATION REQUEST	
8	MS -> SS	AUTHENTICATION RESP	

9	SS -> MS	CIPHERING MODE COMMAND	
10	MS -> SS	CIPHERING MODE COMPLETE	
11	SS		SS starts ciphering.
12	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 1 (without GNSS assistance data)
13	MS -> SS	RR APPLICATION INFORMATION	RRLP Measure Position Response 1: LocationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3 and 4)
14	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data. The SS provides the requested data from step 13 that is available in the SS in zero, one or more RRLP Assistance Data delivery messages.
15	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck. If the SS sent additional assistance data in step 14, the MS acknowledges the received assistance data.
16	SS-> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 2. This message may include further assistance data.
17	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE 2 (ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4))
18	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.15.6 MT-LR / Multiple RRLP Requests with Same Reference Number and Extended Reference Number

70.15.6.1 Conformance requirement:

When after reception of a Measure Position Request component, but before responding with a Measure Position Response or Protocol Error Component, the MS receives a new RRLP message with the Measure Position Request component, the MS ignores the latter component if the old and new RRLP Measure Position Request components have the same Reference Number.

The SMLC may use the same Reference Number or different Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS04.31 sub clause 2.5.5

3GPP TS04.31 sub clause 3.2

70.15.6.2 Test Purpose:

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall ignore the second RRLP MEASURE POSITION REQUEST if the second RRLP MEASURE POSITION REQUEST has the same REFERENCE NUMBER as in the previous one. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the current measurement.

70.15.6.3 Method of Test

Initial Conditions

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay to of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the first one (this delay shall be cancelled in the event of option 2). The MS shall ignore the second RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-tests 3 and 4). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with the same REFERENCE NUMBER as the second one. The MS

shall ignore the third RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2).

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES_IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	SRES specifies correct value.

8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 1
16	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 17. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3 and 4) within 8 seconds, then the SS continues to step 16a.
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request 2. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS (Option 2)		Option 2 only : MS is performing the measurement
17	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 with same reference number and same extended reference IE as in Request 1 (Option 1) or RRLP MEASURE POSITION REQUEST 3 with same reference number and same extended reference IE as in Request 2 (Option2) Note: The satellite signals should be made available to MS after sending this message
18	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE (ganssMeasureInfo and gps-measureInfo for Sub-Tests 3 and 4)
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

gps-MeasureInfo	SEQUENCE	Any value of the parameters is acceptable.
locationError	SEQUENCE	Any error value is acceptable
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

70.15.7 MT-LR / Multiple RRLP Requests with Different Reference Number

70.15.7.1 Conformance requirement:

When after reception of a Measure Position Request component, but before responding with a Measure Position Response or Protocol Error Component, the MS receives a new RRLP message with the Measure Position Request component, the MS aborts activity for the former component, and starts to act according to the latter component, if the old and new RRLP Measure Position Request components have different Reference Numbers.

The SMLC may use the same Reference Number or different Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS04.31 sub clause 2.5.5

3GPP TS04.31 sub clause 3.2

70.15.7.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if the second RRLP MEASURE POSITION REQUEST is received with a different REFERENCE NUMBER. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS shall send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.7.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER from the first one (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to `ganssAssDataMissing` or `gpsAssDataMissing` (sub-tests 3 and 4). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with a different REFERENCE NUMBER from the second one. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST, including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2).

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	

8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 1
16	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 17. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3 and 4) within 8 seconds, then the SS continues to step 16a.
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request 2. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS (Option 2)		Option 2 only : MS is performing the measurement
17	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 with different reference number and same extended reference IE as in Request 1 (Option 1) or RRLP MEASURE POSITION REQUEST 3 with different reference number and same extended reference IE as in Request 2 (Option2) Note: The satellite signals should be made available to MS after sending this message
18	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3 and 4 (Option 1 or 2a). Check reference number is 2 or locationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3 and 4) and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData (Option 2b) Check reference number is 2

18a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data. If the MS requested additional assistance data in step 18 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
18b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 18a, the MS acknowledges the received assistance data.
18c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Request. If the MS requested additional assistance data in step 18 that is available in the SS, this message may include further assistance data.
18d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 18, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

Test Procedure

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds, the SS sends the second RRLP MEASURE POSITION REQUEST with a different EXTENDED REFERENCE IE and the same REFERENCE NUMBER as the first one (this delay shall be cancelled in the event of option 2). The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST. The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set to ganssAssDataMissing or gpsAssDataMissing (sub-tests 3 and 4). If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends the third RRLP MEASURE POSITION REQUEST with a different EXTENDED REFERENCE IE and the same REFERENCE NUMBER as the second one. The MS shall terminate the current location measurement and perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST, including the possibility of repeating the request for more assistance data (Option 2b). The MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data after finishing the measurement.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2).

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS->SS	CLASSMARK CHANGE	"mobile station classmark 2" includes settings for ES_IND. "mobile station classmark 3" includes settings for Positioning. The setting for positioning specifies Positioning Method capability and Positioning Method Support. In the position method support (5 bit field), Bit 2 is set to 1 (MS-Based GPS)
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	

8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 1
16	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 17. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3 and 4 within 8 seconds, then the SS continues to step 16a.
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request 2. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS (Option 2)		Option 2 only : MS is performing the measurement
17	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 with same reference number and different extended reference IE as in Request 1 (Option 1) or RRLP MEASURE POSITION REQUEST 3 with same reference number and different extended reference IE as in Request 2 (Option2) Note: The satellite signals should be made available to MS after sending this message
18	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3 and 4 (Option 1 or 2a). Check extended reference IE is the equal to the one contained in the request of step 17 or locationError with ganssAssDataMissing or gpsAssDataMissing (Sub-Tests 3 and 4) and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData (Option 2b) Check extended reference IE is the equal to the one contained in the request of step 17

18a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data. If the MS requested additional assistance data in step 18 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
18b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 18a, the MS acknowledges the received assistance data.
18c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Request. If the MS requested additional assistance data in step 18 that is available in the SS, this message may include further assistance data.
18d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 18, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
19	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	Dependent on MS capabilities and defined in sub clause 70.1.3.
ganssID	Integer	See TS 51.010-7 sub clause 6.1.4
ganssReferenceTime	SEQUENCE	See TS 51.010-7 sub clause 6.1.4

RRLP Measure Position Response (Step 16 (Option 2)):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	1
component	CHOICE	msrPositionRsp
locationError	SEQUENCE	
locErrorReason	ENUMERATED	Sub-Tests 1 and 2: ganssAssDataMissing Sub-Tests 3 and 4: ganssAssDataMissing or gpsAssDataMissing
additionalAssistanceData	SEQUENCE	
gpsAssistanceData	OCTET STRING	Indicates missing assistance data elements. This field shall only be present for Sub-Tests 3 and 4.
ganssAssistanceData	OCTET STRING	Indicates missing GANSS assistance data elements
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

RRLP Assistance Data (Step 16a):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	1
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	If the MS requested further assistance data in Step 16 (Option 2) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.
moreAssDataToBeSent	ENUMERATED	1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	If the MS requested further assistance data in Step 16 (Option 2) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.

RRLP Assistance Data Ack (Step 16b):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer,0 to 7	1
component	CHOICE	assistanceDataAck

RRLP Measure Position Request 2 (Step 16c):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	1
component	CHOICE	msrPositionReq
methodType	CHOICE	msBased
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 16 (Option 2).
extended-reference	SEQUENCE	
smlc-code	Integer, 0 to 63	63
transaction-ID	Integer, 0 to 262143	262143
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 16.

RRLP Measure Position Request 2 (Option 1) or Request 3 (Option 2) (Step 17):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	1
component	CHOICE	msrPositionReq
methodType	CHOICE	msBased
positionMethod	Enumerated	gps
measureResponseTime	Integer 0 to 7	5
accuracy	Integer (0-127)	127
useMultipleSets	Enumerated	oneSet
extended-reference	SEQUENCE	
smlc-code	Integer, 0 to 63	63
transaction-ID	Integer, 0 to 262143	262142
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1

RRLP Measure Position Response (Step 18 (Option 1 or 2a) or Step 18d (Option 2b)):

Information element	Type	Value/remark
ASN.1 encoded referenceNumber	Integer, 0 to 7	1
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4); otherwise locationError will be returned)
gps-MeasureInfo	SEQUENCE	Any value of the parameters is acceptable.
locationError	SEQUENCE	Any error value is acceptable except gpsAssDataMissing or ganssAssDataMissing
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request
ganssMeasureInfo	SEQUENCE	Any value is acceptable

RRLP Measure Position Response (Step 18 (Option 2b)):

Information element	Type	Value/remark
ASN.1 encoded referenceNumber	Integer, 0 to 7	2
component	CHOICE	msrPositionRsp (A valid response will contain ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4); otherwise locationError will be returned)
locationError	SEQUENCE	
locErrorReason	ENUMERATED	Sub-Tests 1 and 2: ganssAssDataMissing Sub-Tests 3 and 4: ganssAssDataMissing or gpsAssDataMissing
additionalAssistanceData	SEQUENCE	
gpsAssistanceData	OCTET STRING	Indicates missing assistance data elements. This field shall only be present for Sub-Tests 3 and 4.
ganssAssistanceData	OCTET STRING	Indicates missing GANSS assistance data elements
extended-reference	SEQUENCE	The value returned by the MS shall equal the value received from the SS in the earlier Measure Position Request

RRLP Assistance Data (Step 18a):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	2
component	CHOICE	assistanceData
gps-AssistData	SEQUENCE	If the MS requested further assistance data in Step 18 (Option 2b) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.
moreAssDataToBeSent	ENUMERATED	1, except in the case of the final Assistance Data message when the following Measure Position Request contains no additional Assistance Data (in which case: 0)
extended-reference	SEQUENCE	
ganss-AssistData	SEQUENCE	If the MS requested further assistance data in Step 18 (Option 2b) that is available in the SS, SS shall send zero, one or more RRLP Assistance Data messages containing the requested assistance data from TS 51.010-7 sub clause 6.1.4. Each message shall contain a maximum of 242 octets.

RRLP Measure Position Request (Step 18c):

Information element	Type	Value/remark
ASN.1 encoded		
referenceNumber	Integer, 0 to 7	1
component	CHOICE	msrPositionReq
methodType	CHOICE	msBased
positionMethod	ENUMERATED	gps
measureResponseTime	Integer 0 to 7	5
useMultipleSets	ENUMERATED	oneSet
gps-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 18 (Option 2b).
extended-reference	SEQUENCE	
smlc-code	Integer, 0 to 63	63
transaction-ID	Integer, 0 to 262143	262142
ganssPositionMethod	BIT STRING	Sub-Test 1: bit 5 set to value 1 Sub-Test 2: bit 1 set to value 1 Sub-Test 3: bits 0 and 3 set to value 1 Sub-Test 4: bits 0 and 5 set to value 1
ganss-AssistData	SEQUENCE	May contain further assistance data from TS 51.010-7 sub clause 6.1.4 as requested by the MS in step 18 (Option 2b).

70.15.9 MT-LR / RR Management Commands

70.15.9.1 Conformance requirement

A target MS shall terminate any positioning procedure or the transfer of RRLP positioning assistance data without sending any response to the SMLC if any RR message is received from the BSC that starts some other RR management procedure, including a new positioning procedure. The new RR procedure shall then be executed by the MS.

Upon receiving the HO or other RR management command, the MS will stop the location procedure and start on handover or other RR management procedure, since this has higher priority than location. The MS will then send the HO complete or other RR management response message to BSC.

The SMLC may use the same Reference Number or different Reference Numbers for different RRLP components within the same pseudo-segmentation sequence.

Test References

3GPP TS 03.71 sub clause 7.11.5,

3GPP TS 03.71 sub clause 10.6

3GPP TS04.31 sub clause 3.2

70.15.9.2 Test Purpose

Verifies that a MS sends a correct positioning capability via control classmark sending. MS shall terminate the current location measurement if an RR MANAGEMENT command is received during the measurement procedure. The MS shall send an RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The MS shall perform the measurement according to the newly received RRLP MEASURE POSITION REQUEST and send back RRLP MEASURE POSITION RESPONSE to SS after finishing the measurement.

70.15.9.3 Method of Test

Initial Conditions:

System Simulator:

Serving Cell: default parameters.

Satellite signals: No GPS signal available.

Mobile Station:

The MS is MM-state "idle, updated" with valid TMSI and CKSN.

Specific PICS statements

-

PIXIT statements

-

Test Procedure:

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined below:

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

The MS is paged with a PAGING REQUEST TYPE 1 message. The MS performs control early classmark sending to provide LCS positioning method capability.

After sending CIPHERING MODE COMPLETE message the MS receives RR APPLICATION INFORMATION messages containing RRLP Assistance Data messages.

The SS then sends an RR APPLICATION INFORMATION message containing an RRLP Measure Position Request including further assistance data to start the measurement.

Option 1: The MS then performs positioning measurements. After a delay of 8 seconds the SS sends an RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends an RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST (possibly by requesting additional assistance data first).

Option 2: The MS may request additional assistance data by immediately sending an RRLP Measure Position Response message containing a location error with IE LocErrorReason set ganssAssDataMissing or gpsAssDataMissing. If the MS requests additional assistance data that is available in the SS, then the SS provides the requested assistance data in zero, one or more RRLP Assistance Data delivery messages followed by a second RRLP Measure Position Request message which may include further assistance data. If the MS requests additional assistance data and the entire requested assistance data is not available in the SS, then the SS sends the second RRLP Measure Position Request message without assistance data. The MS then performs positioning measurements and the SS sends a RR MANAGEMENT command. The MS shall terminate the current location measurement and perform the RR MANAGEMENT command. The MS sends a RR MANAGEMENT RESPONSE message to SS when the RR MANAGEMENT procedure is complete. The SS sends a new RRLP MEASURE POSITION REQUEST including assistance data and the MS either sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data finishing the measurement according to the newly received RRLP MEASUREMENT POSITION REQUEST or requests more assistance data and then sends RRLP MEASURE POSITION RESPONSE to SS with the measurement data.

The satellite signals should be made available after sending the second Measure Position request (in case of option 1) and third Measure Position request (in case of option 2).

Maximum duration of the test:

5 minutes.

Expected Sequence

Step	Direction	Message	Comments
1	SS->MS	PAGING REQUEST TYPE I	
2	MS -> SS	CHANNEL REQUEST	Establishment cause indicates "answer to paging".
3	SS -> MS	IMMEDIATE ASSIGNMENT	
4	MS->SS	PAGING RESPONSE	Message is contained in SABM. "mobile station classmark 2" includes settings for ES_IND.
5	MS -> SS	CLASSMARK CHANGE	"mobile station classmark 2" including settings for ES_IND and CM3 supported. "mobile station classmark 3" includes settings for Positioning according to 3GPP TS 24.008, table 10.5.1.7.
6	SS -> MS	AUTHENTICATION REQUEST	
7	MS -> SS	AUTHENTICATION RESP	
8	SS -> MS	CIPHERING MODE COMMAND	
9	MS -> SS	CIPHERING MODE COMPLETE	
10	SS		SS starts ciphering.
11	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
12	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
13	SS -> MS	RR APPLICATION INFORMATION	RRLP Assistance Data
14	MS -> SS	RR APPLICATION INFORMATION	RRLP assistanceDataAck
15	SS -> MS	RR APPLICATION INFORMATION	RRLP Measure Position Request 1
16	MS (Option 1) or MS ->SS (Option 2)	- or RR APPLICATION INFORMATION	If no message is received from the MS within 8 seconds, then the SS shall assume that the MS is performing the measurement (Option 1). The SS continues to step 17. If the MS sends RRLP Measure Position Response: locationError (Option 2) with ganssAssDataMissing or gpsAssDataMissing for Sub-Tests 3 and 4 within 8 seconds, then the SS continues to step 16a.
16a	SS -> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Assistance Data. If the MS requested additional assistance data in step 16 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
16b	MS -> SS	RR APPLICATION INFORMATION	Option 2 only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 16a, the MS acknowledges the received assistance data.
16c	SS-> MS	RR APPLICATION INFORMATION	Option 2 only : RRLP Measure Position Request 2. If the MS requested additional assistance data in step 16 that is available in the SS, this message may include further assistance data.
16d	MS (Option 2)		Option 2 only : MS is performing the measurement
17	SS -> MS	RR MANAGEMENT COMMAND	
18	MS -> SS	RR MANAGEMENT COMPLETE	MS terminates the measurement procedure and act on the RR management command

19	SS -> MS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION REQUEST 2 (Option 1) or RRLP MEASURE POSITION REQUEST 3 (Option2) Note: The satellite signals should be made available to MS after sending this message
20	MS -> SS	RR APPLICATION INFORMATION	RRLP MEASURE POSITION RESPONSE ganssMeasureInfo and gps-measureInfo for Sub-Tests 3 and 4 (Option 1 or 2a). or locationError with gpsAssDataMissing (Sub-Tests 3 and 4) or ganssAssDataMissing and additionalAssistanceData including gpsAssistanceData (Sub-Tests 3 and 4) and/or ganssAssistanceData (Option 2b)
20a	SS -> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Assistance Data. If the MS requested additional assistance data in step 20 that is available in the SS, then SS provides the requested data in zero, one or more RRLP Assistance Data delivery messages.
20b	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP assistanceDataAck. If the SS sent additional assistance data in step 20a, the MS acknowledges the received assistance data.
20c	SS-> MS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Request. If the MS requested additional assistance data in step 20 that is available in the SS, this message may include further assistance data.
20d	MS -> SS	RR APPLICATION INFORMATION	Option 2b only : RRLP Measure Position Response. If the MS requested additional assistance data in step 20, this message contains ganssMeasureInfo and gps-MeasureInfo (Sub-Tests 3 and 4).
21	SS -> MS	CHANNEL RELEASE	The main signalling link is released.

70.16 A-GNSS Minimum Performance tests

This sub clause specifies the measurement procedures for the conformance test of the minimum performance requirements for GSM user equipment (MS) that supports Assisted Global Navigation Satellite Systems (A-GNSS). It

excludes performance requirements for MSs where the only A-GNSS supported is A-GPS L1C/A which are specified in sub clause 70.11

70.16.1 Abbreviations

A-GNSS	Assisted - Global Navigation Satellite Systems
A-GPS	Assisted - Global Positioning System
C/A	Coarse/Acquisition
ECI	Earth-Centered-Inertial
ECEF	Earth Centred, Earth Fixed
EGNOS	European Geostationary Navigation Overlay Service
FEC	Forward Error Correction
GAGAN	GPS Aided Geo Augmented Navigation
GANSS	Galileo and Additional Navigation Satellite Systems
GLONASS	GLObal'naya NAVigatsionnaya Sputnikovaya Sistema (Engl.: Global Navigation Satellite System)
GNSS	Global Navigation Satellite System
GPS	Global Positioning System
GSS	GNSS System Simulator
HDOP	Horizontal Dilution Of Precision

70.16.2 GNSS test conditions

70.16.2.1 GNSS signals

The GNSS signal is defined at the A-GNSS antenna connector of the MS. For MS with integral antenna only, a reference antenna with a gain of 0 dBi is assumed.

70.16.2.2 GNSS frequency

The GNSS signals shall be transmitted with a frequency accuracy of ± 0.025 PPM.

70.16.2.3 GNSS static propagation conditions

The propagation for the static performance measurement is an Additive White Gaussian Noise (AWGN) environment. No fading and multi-paths exist for this propagation model.

70.16.2.4 GNSS multi-path conditions

Doppler frequency difference between direct and reflected signal paths is applied to the carrier and code frequencies. The Carrier and Code Doppler frequencies of LOS and multi-path for GNSS signals are defined in table 70.16.2.1.

Table 70.16.2.1: Multi-path Conditions for GNSS Signals

Initial relative Delay [GNSS chip]	Carrier Doppler frequency of tap [Hz]	Code Doppler frequency of tap [Hz]	Relative mean Power [dB]
0	F_d	F_d / N	0
X	$F_d - 0.1$	$(F_d - 0.1) / N$	Y
NOTE: Discrete Doppler frequency is used for each tap.			

Where the X and Y depends on the GNSS signal type and is shown in Table 70.16.2.2, and N is the ratio between the transmitted carrier frequency of the signals and the transmitted chip rate as shown in Table 70.16.2.3 (where k in Table 70.16.2.3 is the GLONASS frequency channel number).

Table 70.16.2.2

System	Signals	X [m]	Y [dB]
Galileo	E1	125	-4.5
	E5a	15	-6
	E5b	15	-6
GPS/Modernized GPS	L1 C/A	150	-6
	L1C	125	-4.5
	L2C	150	-6
	L5	15	-6
GLONASS	G1	275	-12.5
	G2	275	-12.5

Table 70.16.2.3

System	Signals	N
Galileo	E1	1540
	E5a	115
	E5b	118
GPS/Modernized GPS	L1 C/A	1540
	L1C	1540
	L2C	1200
	L5	115
GLONASS	G1	$3135.03 + k \cdot 1.10$
	G2	$2438.36 + k \cdot 0.86$

The initial carrier phase difference between taps shall be randomly selected between 0 and 2π radians. The initial value shall have uniform random distribution.

70.16.2.5 Mobile stations supporting multiple GNSS signals

For mobile stations supporting multiple GNSS signals, different minimum performance requirements may be associated with different signals. The satellite simulator shall generate all signals supported by the MS. Signals not supported by the MS do not need to be simulated. The relative power levels of each signal type for each GNSS are defined in Table 70.16.2.4. The individual test scenarios define the reference signal power level for each satellite. The power level of each simulated satellite signal type shall be set to the reference signal power level defined in each test scenario plus the relative power level defined in Table 70.16.2.4.

Table 70.16.2.4: Relative signal power levels for each signal type for each GNSS

	Galileo		GPS/Modernized GPS		GLONASS		QZSS		SBAS	
Signal power levels relative to reference power levels	E1	0 dB	L1 C/A	0 dB	G1	0 dB	L1 C/A	0 dB	L1	0 dB
	E6	+2 dB	L1C	+1.5 dB	G2	-6 dB	L1C	+1.5 dB		
	E5	+2 dB	L2C	-1.5 dB			L2C	-1.5 dB		
			L5	+3.6 dB			L5	+3.6 dB		

NOTE 1: For test cases which involve “Modernized GPS”, the satellite simulator shall also generate the GPS L1 C/A signal if the MS supports “GPS” in addition to “Modernized GPS”.

NOTE 2: The signal power levels in the Test Parameter Tables represent the total signal power of the satellite per channel not e.g. pilot and data channels separately.

70.16.2.6 GNSS multi System Time Offsets

If more than one GNSS is used in a test, the accuracy of the GNSS-GNSS Time Offsets used at the system simulator shall be better than 3 ns.

70.16.3 GSM and other test conditions

70.16.3.1 GSM frequency band and frequency range

The tests in this sub clause are performed on one of the mid range ARFCNs of the GSM operating frequency band of the MS. The ARFCNs to be used for mid range are defined in Table 3.3.

If the MS supports multiple frequency bands then the Sensitivity tests in clause 70.16.5 shall be repeated in each supported frequency band.

70.16.3.2 Sensors

The minimum performances shall be met without the use of any data coming from sensors that can aid the positioning. A dedicated test message 'RESET MS POSITIONING STORED INFORMATION' has been defined in TS 44.014 for the purpose of disabling any such sensors.

70.16.4 A-GNSS test conditions

70.16.4.1 General

This sub clause defines the minimum performance requirements for both MS based and MS assisted A-GNSS terminals. If a terminal supports both modes then it shall be tested in both modes.

70.16.4.2 Measurement parameters

70.16.4.2.1 MS based A-GNSS measurement parameters

In case of MS-based A-GNSS, the measurement parameters are contained in the RRLP GANSS LOCATION INFORMATION IE. The measurement parameter is the horizontal position estimate reported by the MS and expressed in latitude/longitude.

70.16.4.2.2 MS assisted A-GNSS measurement parameters

In case of MS-assisted A-GNSS, the measurement parameters are contained in the RRLP GANSS MEASUREMENT INFORMATION IE, and in the RRLP GPS MEASUREMENT INFORMATION IE if GPS L1C/A is supported. The measurement parameters are the MS GANSS Code Phase measurements and the MS GPS Code Phase measurements (if supported). The MS GANSS Code Phase measurements and MS GPS Code Phase measurements are converted into a horizontal position estimate using the procedure detailed in clause 70.16.4.3.

70.16.4.2.3 2D position error

The 2D position error is defined by the horizontal difference in meters between the ellipsoid point reported or calculated from the MS Measurement Report and the actual simulated position of the MS in the test case considered.

70.16.4.2.4 Response time

Max Response Time is defined as the time starting from the moment that the MS has received the final RRLP MEASURE POSITION REQUEST sent before the MS sends the MEASURE POSITION RESPONSE containing the Location Information or the GPS and GANSS Measurement Information, and ending when the MS starts sending the MEASURE POSITION RESPONSE containing the Location Information or the GPS and GANSS Measurement Information on the Air interface. The response times specified for all test cases are Time-to-First-Fix (TTFF), i.e. the MS shall not re-use any information on GNSS time, location or other aiding data that was previously acquired or calculated and stored internally in the MS. A dedicated test message 'RESET MS POSITIONING STORED INFORMATION' has been defined in TS 44.014 for the purpose of deleting this information.

70.16.4.3 Converting MS-assisted measurement reports into position estimates

To convert the MS measurement reports in case of MS-assisted mode of A-GNSS into position errors, a transformation between the "measurement domain" (code-phases, etc.) into the "state" domain (position estimate) is necessary. Such a transformation procedure is outlined in the following clauses. The details can be found in [ICD-GPS 200], [IS-GPS-705], [IS-GPS-800], [SBAS], [IS-QZSS], [GLONASS -ICD], [Galileo-ICD], [P. Axelrad, R.G. Brown] and [S.K. Gupta]

70.16.4.3.1 MS measurement reports

In case of MS-assisted A-GANSS, the measurement parameters are contained in the RRLP GANSS MEASUREMENT INFORMATION ELEMENT (sub clause A.3.2.10 in 3GPP TS 44.031). In case the MS provides also measurements on the GPS L1 C/A signal, the measurement parameters are contained in the RRLP GPS MEASUREMENT INFORMATION ELEMENT (sub clause A.3.2.5 in 3GPP TS 44.031). The measurement parameters required for calculating the MS position are:

1) Reference Time: The MS has two choices for the Reference Time:

- a) "Reference Frame";
- b) "GANSS TOD" and/or "GPS TOW" if GPS L1 C/A signal measurements are also provided.

NOTE: It is not expected that an MS will ever report both a GANSS TOD and a GPS TOW. However if two time stamps are provided and they derive from different user times, be aware that no compensation is made for this difference and this could affect the location accuracy.

2) Measurement Parameters for each GANSS and GANSS Signal: 1 to <maxSat>:

- a) "SV ID"; mapping according to Table A.10.14 in 3GPP TS 44.031;
- b) "Code Phase";
- c) "Integer Code Phase";
- d) "Code Phase RMS Error";

3) Additional Measurement Parameters in case of GPS L1 C/A signal measurements are also provided: 1 to <maxSat>:

- a) "Satellite ID (SV PRN)";
- b) "Whole GPS chips";
- c) "Fractional GPS Chips";
- d) "Pseudorange RMS Error".

Additional information required at the system simulator:

1) "Reference Location" (sub clause A.4.2.4 or A.4.2.6.1 in 3GPP TS 44.031):

Used for initial approximate receiver coordinates.

2) "GANSS Navigation Model" (sub clause A.4.2.6.2 in 3GPP TS 44.031):

Contains the ephemeris and clock correction parameters as specified in the relevant ICD of each supported GANSS; used for calculating the satellite positions and clock corrections.

3) "GANSS Ionospheric Model" (sub clause A.4.2.6.1 in 3GPP TS 44.031):

Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [Galileo-ICD] for computation of the ionospheric delay.

4) "GANSS Additional Ionospheric Model" (sub clause A.4.2.6.1 in 3GPP TS 44.031):

Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [QZSS-ICD] for computation of the ionospheric delay.

5) "GANSS Time Model" (sub clause A.4.2.6.2 in 3GPP TS 44.031):

Contains the GNSS-GNSS Time Offset for each supported GANSS. Note, that "GANSS Time Model" IE contains only the sub-ms part of the offset. Any potential integer seconds offset may be obtained from "UTC Model" (sub clause A.4.2.4 in 3GPP TS 44.031), "GANSS UTC Model" (sub clause A.4.2.6.2 in 3GPP TS 44.031), or "GANSS Additional UTC Model" (sub clause A.4.2.6.2 in 3GPP TS 44.031).

6) "Navigation Model" (sub clause A.4.2.4 in 3GPP TS 44.031):

Contains the GPS ephemeris and clock correction parameters as specified in [IS-GPS-200]; used for calculating the GPS satellite positions and clock corrections in case of GPS L1 C/A signal measurements are the only GPS measurements provided in addition to GANSS measurements.

7) "Ionospheric Model" (sub clause A.4.2.4 in 3GPP TS 44.031):

Contains the ionospheric parameters which allow the single frequency user to utilize the ionospheric model as specified in [IS-GPS 200] for computation of the ionospheric delay.

70.16.4.3.2 WLS position solution

The WLS position solution problem is concerned with the task of solving for four unknowns; x_u, y_u, z_u the receiver coordinates in a suitable frame of reference (usually ECEF) and b_u the receiver clock bias relative to the selected GNSS specific system time. It typically requires the following steps:

Step 1: Formation of pseudo-ranges

The observation of code phase reported by the MS for each satellite SV_i is related to the pseudo-range/c modulo the "GNSS Code Phase Ambiguity", or modulo 1 ms (the length of the C/A code period) in case of GPS L1 C/A signal measurements. For the formation of pseudo-ranges, the integer number of milliseconds to be added to each code-phase measurement has to be determined first. Since 1 ms corresponds to a travelled distance of 300 km, the number of integer ms can be found with the help of reference location and satellite ephemeris. The distance between the reference location and each satellite SV_i at the time of measurement is calculated, and the integer number of milliseconds to be added to the MS code phase measurements is obtained.

Step 2: Correction of pseudo-ranges for the GNSS-GNSS time offsets

In case the MS reports measurements for more than a single GNSS, the pseudo-ranges are corrected for the time offsets between the GNSSs relative to the selected reference time using the GNSS-GNSS time offsets available at the system simulator:

$$\rho_{GNSS_m,i} \equiv \rho_{GNSS_m,i} - c \cdot (t_{GNSS_k} - t_{GNSS_m}),$$

where $\rho_{GNSS_m,i}$ is the measured pseudo-range of satellite i of $GNSS_m$. The system time t_{GNSS_k} of $GNSS_k$ is the reference time frame, and $(t_{GNSS_k} - t_{GNSS_m})$ is the available GNSS-GNSS time offset, and c is the speed of light.

Step 3: Formation of weighting matrix

The MS reported "Code Phase RMS Error" and/or "Pseudorange RMS Error" values are used to calculate the weighting matrix for the WLS algorithm described in [P. Axelrad, R.G. Brown]. According to 3GPP TS 44.031, the encoding for these fields is a 6 bit value that consists of a 3 bit mantissa, X_i and a 3 bit exponent, Y_i for each SV_i of $GNSS_j$:

$$w_{GNSS_j,i} = RMSError = 0.5 \times \left(1 + \frac{X_i}{8} \right) \times 2^{Y_i}$$

The weighting Matrix $\mathbf{W}$ is defined as a diagonal matrix containing the estimated variances calculated from the "Code Phase RMS Error" and/or "Pseudorange RMS Error" values:

$$\mathbf{W} = \text{diag} \left\{ 1/w_{GNSS_1,1}^2, 1/w_{GNSS_1,2}^2, \dots, 1/w_{GNSS_1,n}^2, \dots, 1/w_{GNSS_m,1}^2, 1/w_{GNSS_m,2}^2, \dots, 1/w_{GNSS_m,l}^2 \right\}$$

Step 4: WLS position solution

The WLS position solution is described in e.g., [P. Axelrad, R.G. Brown] and usually requires the following steps:

- 1) Computation of satellite locations at time of transmission using the ephemeris parameters and user algorithms defined in the relevant ICD of the particular GNSS. The satellite locations are transformed into WGS-84 reference frame, if needed.
- 2) Computation of clock correction parameters using the parameters and algorithms as defined in the relevant ICD of the particular GNSS.
- 3) Computation of atmospheric delay corrections using the parameters and algorithms defined in the relevant ICD of the particular GNSS for the ionospheric delay, and using the Gupta model defined in [S.K. Gupta] p. 121 equation (2) for the tropospheric delay. For GNSSs which do not natively provide ionospheric correction models (e.g., GLONASS), the ionospheric delay is determined using the available ionospheric model adapted to the particular GNSS frequency.

- 4) The WLS position solution starts with an initial estimate of the user state (position and clock offset). The Reference Location is used as initial position estimate. The following steps are required:
- Calculate geometric range (corrected for Earth rotation) between initial location estimate and each satellite included in the MS measurement report.
 - Predict pseudo-ranges for each measurement including clock and atmospheric biases as calculated in 1) to 3) above and defined in the relevant ICD of the particular GNSS and [P. Axelrad, R.G. Brown].
 - Calculate difference between predicted and measured pseudo-ranges Δp .
 - Calculate the "Geometry Matrix" $\mathbf{G}$ as defined in [P. Axelrad, R.G. Brown]:

$$\mathbf{G} \equiv \begin{bmatrix} -\hat{\mathbf{1}}_{GNSS_1,1}^T & 1 \\ -\hat{\mathbf{1}}_{GNSS_1,2}^T & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}_{GNSS_1,n}^T & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}_{GNSS_m,1}^T & 1 \\ -\hat{\mathbf{1}}_{GNSS_m,2}^T & 1 \\ \vdots & \vdots \\ -\hat{\mathbf{1}}_{GNSS_m,l}^T & 1 \end{bmatrix} \quad \text{with } \hat{\mathbf{1}}_{GNSS_m,i} \equiv \frac{\mathbf{r}_{s_{GNSS_m,i}} - \hat{\mathbf{r}}_u}{\|\mathbf{r}_{s_{GNSS_m,i}} - \hat{\mathbf{r}}_u\|} \quad \text{where } \mathbf{r}_{s_{GNSS_m,i}} \text{ is the satellite position vector for SV}_i \text{ of GNSS}_m$$

(calculated in 1) above), and $\hat{\mathbf{r}}_u$ is the estimate of the user location.

- Calculate the WLS solution according to [P. Axelrad, R.G. Brown]:

$$\Delta \hat{\mathbf{x}} = \left(\mathbf{G}^T \mathbf{W} \mathbf{G} \right)^{-1} \mathbf{G}^T \mathbf{W} \Delta p$$

- Adding the $\Delta \hat{\mathbf{x}}$ to the initial state estimate gives an improved estimate of the state vector:

$$\hat{\mathbf{x}} \rightarrow \hat{\mathbf{x}} + \Delta \hat{\mathbf{x}}.$$

- 5) This new state vector $\hat{\mathbf{x}}$ can be used as new initial estimate and the procedure is repeated until the change in $\hat{\mathbf{x}}$ is sufficiently small.

Step 4: Transformation from Cartesian coordinate system to Geodetic coordinate system

The state vector $\hat{\mathbf{x}}$ calculated in Step 3 contains the MS position in ECEF Cartesian coordinates together with the MS receiver clock bias relative to the selected GNSS system time. Only the user position is of further interest. It is usually desirable to convert from ECEF coordinates x_u, y_u, z_u to geodetic latitude φ , longitude λ and altitude h on the WGS84 reference ellipsoid.

Step 5: Calculation of "2-D Position Errors"

The latitude φ / longitude λ obtained after Step 4 is used to calculate the 2-D position error.

70.16.5 Sensitivity

70.16.5.1 Sensitivity Coarse Time Assistance

70.16.5.1.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.5.1.1.

Table 70.16.5.1.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

70.16.5.1.1 Definition

Sensitivity with coarse time assistance is the minimum level of GNSS satellite signals required for the MS to make an A-GNSS position estimate to a specific accuracy and within a specific response time when the network only provides coarse time assistance.

70.16.5.1.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.5.1.4 for the parameters specified in table 70.16.5.1.2.

Table 70.16.5.1.2: Test parameters for Sensitivity Coarse Time Assistance

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.5.1.3
	Total number of generated satellites	-	6
	HDOP range		1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
Galileo	Reference high signal power level	dBm	-142
	Reference low signal power level	dBm	-147
GPS ⁽¹⁾	Reference high signal power level	dBm	-142
	Reference low signal power level	dBm	-147
GLONASS	Reference high signal power level	dBm	-142
	Reference low signal power level	dBm	-147
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.5.1.3: Power level and satellite allocation

		Satellite allocation for each constellation		
		GNSS-1 ⁽¹⁾	GNSS-2	GNSS-3
Single constellation	High signal level	1	-	-
	Low signal level	5	-	-
Dual constellation	High signal level	1	-	-
	Low signal level	2	3	-
Triple constellation	High signal level	1	-	-
	Low signal level	1	2	2
Note 1: For GPS capable receivers, GNSS-1, i.e. the system having the satellite with high signal level, shall be GPS.				

Table 70.16.5.1.4: Conformance requirement for Sensitivity Coarse Time Assistance

System	Success rate	2-D position error	Max response time
All	95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.1.1.

70.16.5.1.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that represent weak signal conditions and with only Coarse Time Assistance provided by the SS.

70.16.5.1.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.5.1.5 for GNSS scenario #1. For GNSS-1, select the first satellite SV ID defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the one satellite with the higher level.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GNSS scenario #1 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the value of GNSS TOW offset by a random value as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.5.1.7 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.5.1.7 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.5.1.7 and record one Good Result or Bad Result as appropriate; or

For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.5 and then compare the result against the simulated position of the MS, used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.5.1.7 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. For GNSS-1, select the first satellite SV ID defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the one satellite with the higher level. Use new random values for the MS location and altitude in step 1 and for the GNSS TOW offset in step 2.
6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.5.1.5 are met. Each time scenario #1 or #2 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again.

Each time scenario #1 or #2 is used, for GNSS-1 select the next satellite SV ID from the one used previously, defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7, for the one satellite with the higher level.

7. Release the signalling connection.

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

Specific Message Contents

MEASURE POSITION REQUEST (3GPP TS 44.031 sub clause A.2) to the MS

Information Element	Value/remark
Positioning Instructions	
Accuracy	51.2m
Required Response Time	20s

70.16.5.1.5 Test Requirements

For the parameters specified in table 70.16.5.1.5 the MS shall meet the requirements and the success rate specified in table 70.16.5.1.7 with a confidence level of 95% according to annex A7.2.

Table 70.16.5.1.5: Test parameters for Sensitivity Coarse Time Assistance

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.5.1.6
	Total number of generated satellites	-	6
	HDOP range		1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	± 1.8
Galileo	Reference high signal power level	dBm	-141
	Reference low signal power level	dBm	-146
GPS ⁽¹⁾	Reference high signal power level	dBm	-141
	Reference low signal power level	dBm	-146
GLONASS	Reference high signal power level	dBm	-141
	Reference low signal power level	dBm	-146
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.5.1.6: Power level and satellite allocation

		Satellite allocation for each constellation		
		GNSS-1 ⁽¹⁾	GNSS-2	GNSS-3
Single constellation	High signal level	1	-	-
	Low signal level	5	-	-
Dual constellation	High signal level	1	-	-
	Low signal level	2	3	-
Triple constellation	High signal level	1	-	-
	Low signal level	1	2	2
Note 1: For GPS capable receivers, GNSS-1, i.e. the system having the satellite with high signal level, shall be GPS.				

Table 70.16.5.1.7: Test requirements for Sensitivity Coarse Time Assistance

System	Success rate	2-D position error	Max response time
All	95 %	101.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

70.16.5.2 Sensitivity Fine Time Assistance

70.16.5.2.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.5.2.1.

Table 70.16.5.2.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

70.16.5.2.1 Definition

Sensitivity with fine time assistance is the minimum level of GNSS satellite signals required for the MS to make an A-GNSS position estimate to a specific accuracy and within a specific response time when the network provides fine time assistance in addition to coarse time assistance.

70.16.5.2.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.5.2.4 for the parameters specified in table 70.16.5.2.2.

Table 70.16.5.2.2: Test parameters for Sensitivity Fine Time Assistance

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.5.2.3
	Total number of generated satellites	-	6
	HDOP range		1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
	GNSS fine time assistance error range	µs	±10
Galileo	Reference signal power level	dBm	-147
GPS ⁽¹⁾	Reference signal power level	dBm	-147
GLONASS	Reference signal power level	dBm	-147
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.5.2.3: Satellite allocation

	Satellite allocation for each constellation		
	GNSS-1	GNSS-2	GNSS-3
Single constellation	6	-	-
Dual constellation	3	3	-
Triple constellation	2	2	2

Table 70.16.5.2.4: Conformance requirement for Sensitivity Fine Time Assistance

System	Success rate	2-D position error	Max response time
All	95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.1.2.

70.16.5.2.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that represent weak signal conditions and with Fine Time Assistance provided by the SS.

70.16.5.2.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.5.2.5 for GNSS scenario #1.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GNSS scenario #1 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the values of GNSS TOW and BN offset by random values as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.5.2.7 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.5.2.7 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.5.2.7 and record one Good Result or Bad Result as appropriate; or

For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.3 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.5.2.7 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Use new random values for the MS location and altitude in step 1 and for the GNSS TOW and BN offsets in step 2.
6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.5.2.5 are met. Each time scenario #1 or #2 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again.

7. Release the signalling connection.

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

Specific Message Contents

MEASURE POSITION REQUEST (3GPP TS 44.031 sub clause A.2) to the MS

Information Element	Value/remark
Positioning Instructions	
Accuracy	51.2m
Required Response Time	20s

70.16.5.2.5 Test Requirements

For the parameters specified in table 70.16.5.2.5 the MS shall meet the requirements and the success rate specified in table 70.16.5.2.7 with a confidence level of 95% according to annex A7.2.

Table 70.16.5.2.5: Test parameters for Sensitivity Fine Time Assistance

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.5.2.6
	Total number of generated satellites	-	6
	HDOP range		1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±1.8
	GNSS fine time assistance error range	µs	±9
Galileo	Reference signal power level	dBm	-146
GPS ⁽¹⁾	Reference signal power level	dBm	-146
GLONASS	Reference signal power level	dBm	-146
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.5.2.6: Satellite allocation

	Satellite allocation for each constellation		
	GNSS-1	GNSS-2	GNSS-3
Single constellation	6	-	-
Dual constellation	3	3	-
Triple constellation	2	2	2

Table 70.16.5.2.7: Test requirements for Sensitivity Fine Time Assistance

System	Success rate	2-D position error	Max response time
All	95 %	101.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

70.16.6 Nominal Accuracy

70.16.6.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.6.1.

Table 70.16.6.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

70.16.6.1 Definition

Nominal accuracy is the accuracy of the MS's A-GNSS position estimate under ideal GNSS signal conditions.

70.16.6.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.6.4 for the parameters specified in table 70.16.6.2.

Table 70.16.6.2: Test parameters for Nominal Accuracy

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.6.3
	Total number of generated satellites	-	6 or 7 ⁽²⁾
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
GPS ⁽¹⁾	Reference signal power level for all satellites	dBm	-128.5
Galileo	Reference signal power level for all satellites	dBm	-127
GLONASS	Reference signal power level for all satellites	dBm	-131
QZSS	Reference signal power level for all satellites	dBm	-128.5
SBAS	Reference signal power level for all satellites	dBm	-131
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			
NOTE 2: 7 satellites apply only for SBAS case.			

If QZSS is supported, one of the GPS satellites will be replaced by a QZSS satellite with respective signal support.

If SBAS is supported, the SBAS satellite with the highest elevation will be added to the scenario.

Table 70.16.6.3: Satellite allocation

	Satellite allocation for each constellation			
	GNSS 1 ⁽¹⁾	GNSS 2 ⁽¹⁾	GNSS 3 ⁽¹⁾	SBAS
Single constellation	6	--	--	1
Dual constellation	3	3	--	1
Triple constellation	2	2	2	1
NOTE1: GNSS refers to global systems i.e., GPS, Galileo, GLONASS				

Table 70.16.6.4: Conformance requirement for Nominal Accuracy

System	Success rate	2-D position error	Max response time
All	95 %	15 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.2.

70.16.6.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that represent ideal conditions.

70.16.6.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.6.5 for GNSS scenario #3.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GNSS scenario #3 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the value of GNSS TOW offset by a random value as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.6.7 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.6.7 or reports a MS positioning error in the Measure Position Response message then record one Good Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.6.7 and record one Good Result or Bad Result as appropriate; or

For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.5 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.6.7 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #4 instead of #3 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Use new random values for the MS location and altitude in step 1 and for the GNSS TOW offset in step 2.
6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.6.5 are met. Each time scenario #3 or #4 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again.
7. Release the signalling connection.

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

MEASURE POSITION REQUEST (3GPP TS 44.031 sub clause A.2) to the MS

Information Element	Value/remark
Positioning Instructions	
Accuracy	7.7m
Required Response Time	20s

70.16.6.5 Test Requirements

For the parameters specified in table 70.16.6.5 the MS shall meet the requirements and the success rate specified in table 70.16.6.7 with a confidence level of 95% according to annex A7.2.

Table 70.16.6.5: Test parameters for Nominal Accuracy

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.6.3
	Total number of generated satellites	-	6 or 7 ⁽²⁾
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±1.8
GPS ⁽¹⁾	Reference signal power level for all satellites	dBm	-128.5
Galileo	Reference signal power level for all satellites	dBm	-127
GLONASS	Reference signal power level for all satellites	dBm	-131
QZSS	Reference signal power level for all satellites	dBm	-128.5
SBAS	Reference signal power level for all satellites	dBm	-131
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			
NOTE 2: 7 satellites apply only for SBAS case.			

If QZSS is supported, one of the GPS satellites will be replaced by a QZSS satellite with respective signal support.

If SBAS is supported, the SBAS satellite with the highest elevation will be added to the scenario.

Table 70.16.6.3: Satellite allocation

	Satellite allocation for each constellation			
	GNSS 1 ⁽¹⁾	GNSS 2 ⁽¹⁾	GNSS 3 ⁽¹⁾	SBAS
Single constellation	6	--	--	1
Dual constellation	3	3	--	1
Triple constellation	2	2	2	1
NOTE1: GNSS refers to global systems i.e., GPS, Galileo, GLONASS				

Table 70.16.6.7: Test requirements for Nominal Accuracy

System	Success rate	2-D position error	Max response time
All	95 %	16.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

70.16.7 Dynamic Range

70.16.7.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.7.1.

Table 70.16.7.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

70.16.7.1 Definition

Dynamic Range is the maximum difference in level of the GNSS signals from a number of satellites that allows the MS to make an A-GNSS position estimate with a specific accuracy and a specific response time.

70.16.7.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.7.4 for the parameters specified in table 70.16.7.2.

Table 70.16.7.2: Test parameters for Dynamic Range

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.7.3
	Total number of generated satellites	-	6
	HDOP Range	-	1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
Galileo	Reference high signal power level	dBm	-127,5
	Reference low signal power level	dBm	-147
GPS ⁽¹⁾	Reference high signal power level	dBm	-129
	Reference low signal power level	dBm	-147
GLONASS	Reference high signal power level	dBm	-131.5
	Reference low signal power level	dBm	-147
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.7.3: Power level and satellite allocation

		Satellite allocation for each constellation		
		GNSS 1 ⁽¹⁾	GNSS 2 ⁽¹⁾	GNSS 3 ⁽¹⁾
Single constellation	High signal level	2	--	--
	Low signal level	4	--	--
Dual constellation	High signal level	1	1	--
	Low signal level	2	2	--
Triple constellation	High signal level	1	1	1
	Low signal level	1	1	1
NOTE1: GNSS refers to global systems i.e., GPS, Galileo, GLONASS				

Table 70.16.7.4: Conformance requirement for Dynamic Range

System	Success rate	2-D position error	Max response time
All	95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.3.

70.16.7.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that have a wide dynamic range. Strong satellites are likely to degrade the acquisition of weaker satellites due to their cross-correlation products.

70.16.7.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.7.5 for GNSS scenario #1. Randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the satellites with the higher levels.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements

-

PIXIT statements

-

Procedure

1. Start GNSS scenario #1 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the value of GNSS TOW offset by a random value as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.7.7 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.7.7 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.7.7 and record one Good Result or Bad Result as appropriate; or

For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.5 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.7.7 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the satellites with the higher levels. Use new random values for the MS location and altitude in step 1 and for the GNSS TOW offset in step 2.
6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.7.5 are met. Each time scenario #1 or #2 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again. Each time scenario #1 or #2 is used, randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7, for the satellites with the higher levels.
7. Release the signalling connection.

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

System	Success rate	2-D position error	Max response time
All	95 %	101.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

70.16.8 Multi-Path scenario

70.16.8.1a Sub-tests

This test case includes sub-test cases dependent on the GNSS supported by the MS. Each sub-test case is identified by a Sub-Test Case Number as defined in Table 70.16.8.1.

Table 70.16.8.1: Sub-Test Case Number Definition

Sub-Test Case Number	Supported GNSS
1	MS supporting A-GLONASS only
2	MS supporting A-Galileo only
3	MS supporting A-GPS and Modernized GPS only
4	MS supporting A-GPS and A-GLONASS only

70.16.8.1 Definition

Multi-path performance measures the accuracy and response time of the MS's A-GNSS position estimate in a specific GNSS signal multi-path environment.

70.16.8.2 Conformance requirement

The first fix position estimates shall meet the accuracy and response time requirements in table 70.16.8.4 for the parameters specified in table 70.16.8.2.

Table 70.16.8.2: Test parameters for Multi-Path scenario

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.8.3
	Total number of generated satellites	-	6
	HDOP range		1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±2
Galileo	Reference signal power level	dBm	-127
GPS ⁽¹⁾	Reference signal power level	dBm	-128.5
GLONASS	Reference signal power level	dBm	-131
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.8.3: Channel model allocation

		Channel model allocation for each constellation		
		GNSS-1	GNSS-2	GNSS-3

	Two-tap channel (see note)	4	--	--
Dual constellation	One-tap channel (see note)	1	1	--
	Two-tap channel (see note)	2	2	--
Triple constellation	One-tap channel (see note)	1	1	1
	Two-tap channel (see note)	1	1	1
NOTE: One-tap channel: no multi-path. Two-tap channel: multi-path defined in clause 70.16.2.4				

Table 70.16.8.4: Conformance requirement for Multi-Path scenario

System	Success rate	2-D position error	Max response time
All	95 %	100 m	20 s

The reference for this requirement is 3GPP TS 45.005, clause O.2.4.

70.16.8.3 Test purpose

To verify the MS's first position estimate meets the Conformance requirement under GNSS satellite signal conditions that represent simple multi-path conditions.

70.16.8.4 Method of test

Initial conditions

Test environment: normal; see clause A1.2.2.

1. Connect SS and GSS to the MS antenna connector or antenna connectors.
2. Set the GNSS test parameters as specified in table 70.16.8.5 for GNSS scenario #1. Randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the satellites with one-tap channels.
3. Switch on the MS.
4. Establish a signalling connection according to the generic procedure in clause 10.1a on a channel in the Mid ARFCN range.

Specific PICS statements:

-

PIXIT statements:

-

Procedure

1. Start GNSS scenario #1 as specified in clause 6.2.1.2 of TS 51.010-7 with the MS location randomly selected to be within 3 km of the Reference Location and the altitude of the MS randomly selected between 0 m to 500 m above WGS-84 reference ellipsoid using the method described in clause 6.2.1.2.5 of TS 51.010-7. The initial carrier phase difference between taps of the multi-path model shall be randomly selected between 0 and 2π radians by selecting the next random number from a standard uniform random number generator, in the range 0 to 2π , representing radians with a resolution of 0.1, representing 0.1 radians.
2. Send a RESET MS POSITIONING STORED INFORMATION message followed by RRLP Assistance Data and RRLP Measure Position Request messages containing appropriate assistance data; as specified in clauses 6.2.2 and 6.2.6 of TS 51.010-7 for MS based testing; or clauses 6.2.4 and 6.2.6 of TS 51.010-7 for MS assisted testing with the value of GNSS TOW offset by a random value as specified in clause 6.2.6.2 of TS 51.010-7; as required to obtain a fix.
3. If the MS returns a valid result in the Measure Position Response message within the Max response time specified in table 70.16.8.8 then record the result and process it as specified in step 4. If the MS does not return a valid result within the Max response time specified in table 70.16.8.8 or reports a MS positioning error in the Measure Position Response message then record one Bad Result.
4. For MS based testing compare the reported Location Information in the Measure Position Response message against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.8.8 and record one Good Result or Bad Result as appropriate; or

For MS assisted testing convert the GNSS Measurement Information reported in the Measure Position Response message to a 2D position using the method described in clause 70.16.4.3 and then compare the result against the simulated position of the MS used in step 1, and calculate the 2D position error as specified in clause 70.16.4.3.2. Compare the 2D position error against the value in table 70.16.8.8 and record one Good Result or Bad Result as appropriate.

5. Repeat steps 1 to 4 using GNSS scenario #2 instead of #1 so that the reference location changes sufficiently such that the MS shall have to use the new assistance data. Randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7 for the satellites with the one-tap channels. Use new random values for the MS location and altitude, and the initial carrier phase difference between taps of the multi-path model in step 1 and for the GNSS TOW offset in step 2.

6. Repeat steps 1 to 5 until the statistical requirements of clause 70.16.8.5 are met. Each time scenario #1 or #2 is used, the start time of the GNSS scenario shall be advanced by 2 minutes from the time used previously for that scenario. Once a scenario reaches the end of its viable running time, restart it from its nominal start time again. Each time scenario #1 or #2 is used, randomly select from the satellite SV IDs defined in the relevant table of Satellites to be simulated in clause 6.2.1.2 in TS 51.010-7, for the satellites with the one-tap channels.

7. Release the signalling connection

Minimum / Maximum duration of the test

Minimum duration approximately 1 hour, maximum duration approximately 20 hours

Specific Message Contents

MEASURE POSITION REQUEST (3GPP TS 44.031 sub clause A.2) to the MS

Information Element	Value/remark
Positioning Instructions	
Accuracy	51.2m
Required Response Time	20s

70.16.8.5 Test Requirements

For the parameters specified in table 70.16.8.5 the MS shall meet the requirements and the success rate specified in table 70.16.8.8 with a confidence level of 95% according to annex A7.2.

Table 70.16.8.5: Test parameters for Multi-Path scenario

System	Parameters	Unit	Value
	Number of generated satellites per system	-	See Table 70.16.8.6
	Total number of generated satellites	-	6
	HDOP range		1.4 to 2.1
	Propagation conditions	-	AWGN
	GNSS coarse time assistance error range	seconds	±1.8
Galileo	Reference signal power level	dBm	-127
GPS ⁽¹⁾	Reference signal power level	dBm	-128.5
GLONASS	Reference signal power level	dBm	-131
NOTE 1: "GPS" here means GPS L1 C/A, Modernized GPS, or both, dependent on MS capabilities.			

Table 70.16.8.6: Channel model allocation

		Channel model allocation for each constellation		
		GNSS-1	GNSS-2	GNSS-3
Single constellation	One-tap channel(see note)	2	--	--
	Two-tap channel(see note)	4	--	--
Dual constellation	One-tap channel(see note)	1	1	--
	Two-tap channel(see note)	2	2	--
Triple constellation	One-tap channel(see note)	1	1	1
	Two-tap channel(see note)	1	1	1
NOTE: One-tap channel: no multi-path. Two-tap channel: multi-path defined in clause 70.16.2.4 with Relative mean Power (Y) defined in Table 70.16.8.7.				

Table 70.16.8.7: Relative mean Power (Y)for use in Table 70.16.2.1

System	Signals	Y [dB]
Galileo	E1	-4.7
	E5a	-6.2
	E5b	-6.2
GPS/Modernized GPS	L1 C/A	-6.2
	L1C	-4.7
	L2C	-6.2
	L5	-6.2
GLONASS	G1	-12.7
	G2	-12.7

Table 70.16.8.8: Test requirements for Multi-Path scenario

System	Success rate	2-D position error	Max response time
All	95 %	101.3 m	20.3 s

NOTE: If the above Test Requirement differs from the Conformance requirement then the Test Parameter Relaxation applied for this test is non-zero. The Test Parameter Relaxation for this test is defined in clause A5.5.2 and the explanation of how the Conformance requirement has been relaxed by the Test Parameter Relaxation is given in clause A5.5.4.

80 Generic Access default conditions, message contents and macros

80.1 Default test conditions

The following default test conditions shall apply if not stated otherwise within an individual test description.

80.1.1 Unlicensed Radio Access

80.1.1.1 IEEE 802.11

First access point.

	Setting
Channel	7
SSID	GAN_1
SSID-Broadcast	On
Ciphering	Off
Mode	Infrastructure

Second access point.

	Setting
Channel	3
SSID	GAN_2
SSID-Broadcast	On
Ciphering	Off
Mode	Infrastructure

80.1.1.2 Bluetooth

	Setting
Profile	PAN

80.1.2 Protocol Settings

80.1.2.1 Dynamic Host Configuration Protocol - DHCP

	Setting
Server IP-Address	192.168.11.1
Port	67
Client (Transport) IP Range Pool	192.168.11.10 - 15
Address Mask	255.255.255.0
Default Gateway	192.168.11.1

80.1.2.2 Domain Name System – DNS

80.1.2.2.1 Public DNS Server

	Setting
Server IP-Address	192.168.11.16
Port	53

The following entries should be used:

	FQDN	IP
Provisioning SEGW	psvgw.gan.mnc001.mcc001.3gppnetwork.org	192.168.11.32
Default SEGW	dsgw.default.gan	192.168.11.33
Serving SEGW	ssgw.serving.gan	192.168.11.34

80.1.2.2.2 DNS associated with GANC

	Setting
Server IP-Address	172.16.0.144
Port	53

The following entries should be used:

	FQDN	IP
Provisioning GANC	gan.mnc001.mcc001.3gppnetwork.org	172.16.0.192
Default GANC	gan.default.gan	172.16.0.193
Serving GANC	gan.serving.gan	172.16.0.194

80.1.2.3 Secure Gateway (SEGW)

	FQDN	IP
Provisioning SEGW	psvgw.gan.mnc001.mcc001.3gppnetwork.org	192.168.11.32
Default SEGW	dsgw.default.gan	192.168.11.33
Serving SEGW	ssgw.serving.gan	192.168.11.34

80.1.2.4 Generic Access Network Controller (GANC)

	FQDN	IP
Provisioning GANC	gan.mnc001.mcc001.3gppnetwork.org	172.16.0.192
Default GANC	gan.default.gan	172.16.0.193
Serving GANC	gan.serving.gan	172.16.0.194

The TCP port used for Discovery and Registration is port number 14001 (see 44.318: 12.2.1)

80.1.2.5 Secure Internet Protocol - IPsec

All cryptographic suites must be supported on SS side.

The certificates specified in annex A9 shall be used for authentication of the SS by the MS.

	Setting
Client (Local) IP Range Pool	172.16.0.202 -217

80.2 Default message contents

80.3 Macros

80.3.1 Overview

The present document presents macros for Generic Access test cases. It is intended to be a working document forming part of the Generic Access Test Specifications.

80.3.1.1 Definition

A macro is a name or sentence, possibly followed by an argument list, that is equated to a text to which it is to be expanded, possibly with the substitution of actual arguments.

Macros may be used to simplify the writing and reading of the test cases or to avoid the repetition of common sentences, message contents or message sequences. The macros defined in this subclause can be used throughout the test cases.

The definition of the macros is done in alphabetical order.

80.3.1.2 Syntax

80.3.1.2.1 Message contents

Any macro referencing message contents shall use the following table:

Macro reference (arguments)		
(P)SI	Information Element	Value/Remarks

The table must contain:

Macro reference: word or sentence that gives the name to the macro. It may include a list of arguments with actual values for some IE's.

(P)SI: the System Information and Packet System Information messages whose content is referenced. Several (P)SIs can be referenced in this column. The defined IE value(s) refers to the (P)SI(s) in the same row.

Information Element: IE which value is specified.

Value/Remarks: value and any other comment specific to the IE's. In particular, the mapping between an argument value and its coding shall be specified in this column (see note).

NOTE: If possible, only the meaning of the value will be shown and not the value itself; this avoids updating when the core specifications are modified.

80.3.1.2.2 Message sequence

Any macro referencing message contents shall use the following table:

Step	Direction	Message	Comments
		{ Macro reference }	Macro (arguments)

The table must contain:

Macro reference: word or sentence that assigns the name to the macro. It may include a list of arguments with actual values for some parameters used within the macro.

Step: Number of the message. Letters may be used for general values: the same rules as in 3GPP TS 11.10 apply.

Direction: it must be either:

- "MS → SS": for an uplink message or a macro containing only uplink message(s);
- "SS → MS": for a downlink message or a macro containing only downlink message(s);
- "SS ↔ MS": for a macro containing both uplink and downlink message(s);

- "MS": for an action performed on the mobile side; or
- "SS": for an action performed on the system simulator side.

Message: Message name or macro reference.

Comments: any other comment specific to the message. In particular, value of certain bits/fields of the corresponding message.

The symbol ':' can be used to indicate that the previous and following message or sequence of messages (both previous and following must appear) is repeated an unknown number of times, probably referenced with a letter on the 'step' column.

80.3.2 Default message contents

80.3.3 Macro message sequences

80.3.3.1 Location Update Procedure

80.3.3.1.1 GAN A/Gb Mode Location Update Procedure

Step	Direction	Message	Comments
		{ GAN A/Gb Mode Location Update Procedure }	
1	MS → SS	GA-CSR REQUEST	Containing L3 (MM) Location Update Request Containing L3 (MM) Authentication Request Containing L3 (MM) Authentication Response Containing L3 (MM) Location Update Accept Containing L3 (MM) TMSI Reallocation Complete This step is executed only when assigned mobile identity is of type TMSI NOTE: Only in case the MS performed GPRS suspension procedure prior to the CS session, then the GPRS RESUMPTION IE shall be present with ACK field set to 1.
2	SS → MS	GA-CSR REQUEST ACCEPT	
3	MS → SS	GA-CSR UPLINK DIRECT TRANSFER	
4	SS → MS	GA-CSR DOWNLINK DIRECT TRANSFER	
5	MS → SS	GA-CSR UPLINK DIRECT TRANSFER	
6	SS → MS	GA-CSR DOWNLINK DIRECT TRANSFER	
A6 (Optional)	MS → SS	GA-CSR UPLINK DIRECT TRANSFER	
7	SS → MS	GA-CSR RELEASE	
8	MS → SS	GA-CSR RELEASE COMPLETE	

80.3.3.1.2 GAN Iu Mode Location Update Procedure

Step	Direction	Message	Comments
		{ GAN Iu Mode Location Update Procedure }	
1	MS → SS	GA-RRC REQUEST	Containing L3 (MM) Location Update Request Containing L3 (MM) Authentication Request Containing L3 (MM) Authentication Response
2	SS → MS	GA-RRC REQUEST ACCEPT	
3	MS → SS	GA-RRC UPLINK DIRECT TRANSFER	
4	SS → MS	GA-RRC DOWNLINK DIRECT TRANSFER	
5	MS → SS	GA-RRC UPLINK DIRECT TRANSFER	

6	SS → MS	GA-RRC DOWNLINK DIRECT TRANSFER	Containing L3 (MM) Location Update Accept
A6 (Optional)	MS → SS	GA-RRC UPLINK DIRECT TRANSFER	Containing L3 (MM) TMSI Reallocation Complete This step is executed only when assigned mobile identity is of type TMSI
7	SS → MS	GA-RRC RELEASE	
8	MS → SS	GA-RRC RELEASE COMPLETE	

80.4 Test PDP contexts

PDP context 1: same as PDP context 1 in section 40.5.

81 GAN Discovery and Registration Procedures

81.1 Discovery Procedure

81.1.1 Discovery Procedure, Accepted

81.1.1.1 Discovery Procedure, MS holds the IP address of the provisioning SEGW and FQDN of provisioning GANC, provisioning GANC and default GANC belong to the same SEGW

81.1.1.1.1 Conformance requirement

The MS shall:

- If the MS holds an IP address of the Provisioning SEGW, the MS establishes the secure connection towards the Provisioning SEGW according to sub-clause 4.2
- Following successful establishment of secure connection to the Provisioning SEGW:
- If the MS holds a FQDN of the Provisioning GANC, the MS shall perform a DNS query "inside the secure connection" to retrieve the IP-address of the Provisioning GANC. The MS shall establish a TCP connection to the Provisioning GANC using this IP address and a TCP port defined for Discovery (see sub-clause 12.2.1). The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching).

When the MS receives GA-RC DISCOVERY ACCEPT message, it shall:

- stop the timer TU3901.
- set the timer value for TU3903 to the default value,
- store the information about Default GANC in persistent storage:
- The Default GANC information consists of the Default GANC, SEGW associated with the Default GANC and optionally a TCP port to be used with that Default GANC. If a specific TCP Port is not received in the message, the defined port for Registration is used (see sub-clause 12.2.1)
 - release the TCP connection towards the Provisioning GANC
 - the secure connection to the Provisioning SEGW can be reused as follows;
- If the MS is provisioned with an IP address of the Provisioning GANC-SEGW and it matches the received Default GANC-SEGW IP address IE, the MS shall reuse the existing secure connection.
- If the MS is provisioned with a FQDN of the Provisioning GANC-SEGW or derived a FQDN for the Provisioning GANC-SEGW and it matches the received Default GANC-SEGW FQDN IE, the MS shall reuse the existing secure connection.

- otherwise the MS shall release the existing secure connection towards the SEGW of the Provisioning GANC as defined in sub-clause 4.5
- initiate the registration procedure towards the Default GANC as defined in sub-clause 6.2.

Reference(s)

3GPP TS 44.318 sub-clause 5.3 and 5.5.1

81.1.1.1.2 Test purpose

To verify that the MS is able to initiate the Discovery Procedure with an IP address to the SEGW associated with the provisioning GANC and the FQDN to the GANC.

To verify that the MS keeps the secure connection when registering to the default GANC if the provisioning GANC and default GANC have the same SEGW.

81.1.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Provisioning GANC and default GANC belonging to the same SEGW
- Public DNS without knowledge of SEGW FQDN associated with Provisioning GANC

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the IP address for the SEGW associated with the provisioning GANC, but not the FQDN
- The MS has the FQDN for the provisioning GANC, but not the IP address
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will stay in state GA-RC DEREGISTERED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is supposed to answer the Discovery Request message with a valid FQDN or IP address of Default GANC and IP address of the SEGW associated with Default GANC matching the IP address of SEGW associated with Provisioning GANC before timer TU3901 expires.

The MS shall attempt to register towards the Default GANC reusing the same security connection used during Discovery procedure.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			Set up Ipsec tunnel to SEGW
3	→			DNS Standard Query for GANC to the DNS server associated with the GANC
4	←			Standard Query Response with IP address to GANC
5	MS			Establish TCP connection to provisioning GANC
6	→		GA-RC DISCOVERY REQUEST	To provisioning GANC
7	←		GA-RC DISCOVERY ACCEPT	Default GANC and SEGW provided. Note: Default GANC belongs to the same SEGW as the Provisioning GANC The message is sent before expiry of TU3901.
8	MS			Establish TCP connection to default GANC using either IP address or FQDN
9	→		GA-RC REGISTER REQUEST	To default GANC

81.1.1.2 Discovery procedure, the MS holds the FQDN of the provisioning SEGW and IP address of the provisioning GANC, provisioning GANC and default GANC belong to different SEGWs

81.1.1.2.1 Conformance requirement

- If the MS holds a FQDN of the Provisioning SEGW, the MS performs a public DNS query to retrieve the IP-address of the Provisioning SEGW and establish the secure connection towards the Provisioning SEGW according to sub-clause 4.2. The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching).
- Following successful establishment of secure connection to the Provisioning SEGW
- If the MS holds an IP address of the Provisioning GANC, the MS shall establish a TCP connection to the Provisioning GANC using the well-known TCP port for Discovery as defined in sub-clause 12.2.1

When the MS receives GA-RC DISCOVERY ACCEPT message, it shall:

- stop the timer TU3901.
- set the timer value for TU3903 to the default value,
- store the information about Default GANC in persistent storage:
- The Default GANC information consists of the Default GANC, SEGW associated with the Default GANC and optionally a TCP port to be used with that Default GANC. If a specific TCP Port is not received in the message, the defined port for Registration is used (see sub-clause 12.2.1)
 - release the TCP connection towards the Provisioning GANC
 - the secure connection to the Provisioning SEGW can be reused as follows;
- If the MS is provisioned with an IP address of the Provisioning GANC-SEGW and it matches the received Default GANC-SEGW IP address IE, the MS shall reuse the existing secure connection.
- If the MS is provisioned with a FQDN of the Provisioning GANC-SEGW or derived a FQDN for the Provisioning GANC-SEGW and it matches the received Default GANC-SEGW FQDN IE, the MS shall reuse the existing secure connection.

- otherwise the MS shall release the existing secure connection towards the SEGW of the Provisioning GANC as defined in sub-clause 4.5
- initiate the registration procedure towards the Default GANC as defined in sub-clause 6.2.

Reference(s)

3GPP TS 44.318 sub-clause 5.3 and 5.5.1

81.1.1.2.2 Test purpose

To verify that the MS can initiate the Discovery Procedure with the FQDN to the SEGW associated with the provisioning GANC and IP address to the GANC.

To verify that the MS releases the secure connection when registering to the default GANC if the provisioning GANC and default GANC don't have the same SEGW.

81.1.1.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS that holds the IP address to the SEGW associated with the provisioning GANC, but without knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the FQDN for the SEGW associated with the provisioning GANC, but not the IP address
- The MS has the IP address to the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will stay in state GA-RC DEREGISTRED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is supposed to answer the Discovery Request message before timer TU3901 expires.

The MS shall release the Security Association towards the SEGW associated with Provisioning GANC.

The MS shall establish a secure tunnel towards the SEGW provided in Discovery Accept message and establish TCP to the Default GANC.

The MS shall send Register Request message towards the Default GANC.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	→			DNS Standard Query for the SEGW to the public DNS server
3	←			Standard Query Response with IP address to the SEGW
4	MS			MS sets up a secure connection to the SEGW and establishes TCP connection to the provisioning GANC
5	MS			MS establish a TCP connection using the stored IP address
6	→		GA-RC DISCOVERY REQUEST	To provisioning GANC
7	←		GA-RC DISCOVERY ACCEPT	Default GANC and SEGW provided. The message is sent before expiry of TU3901.
8				MS releases the secure connection to the SEGW
9				MS sets up a secure connection to the new SEGW using either IP address or FQDN
10				MS establish a TCP connection to the default GANC using either IP address or FQDN
11	→		GA-RC REGISTER REQUEST	To default GANC

81.1.1.3 Discovery procedure, the MS is not provisioned with information about the provisioning GANC or its SEGW

81.1.1.3.1 Conformance requirement

- In case the MS is not provisioned with information about the Provisioning SEGW, derive a FQDN of the Provisioning SEGW from the IMSI (as described in [3]);

The MS performs a public DNS Query to retrieve the IP-address of the Provisioning SEGW and establish the secure connection towards the Provisioning SEGW according to sub-clause 4.2. The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching);

- Following successful establishment of secure connection to the Provisioning SEGW:

- In cases where the MS is not provisioned with information about the Provisioning GANC, the MS derives a FQDN of the Provisioning GANC from the IMSI (as described in [3]).

A DNS query is performed "inside the secure connection" to retrieve the IP-address of the Provisioning GANC. The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching). A TCP connection is then established inside the IPsec tunnel, to the Provisioning GANC using the TCP port defined for Discovery procedure (see sub-clause 12.2.1).

- In all cases the MS shall establish only a single TCP connection to the GANC over the IPsec tunnel.

Reference(s)

3GPP TS 44.318 sub-clause 5.3.

81.1.1.3.2 Test purpose

To verify that the MS can derive the FQDN from its IMSI and go to the correct DNS to ask for the IP address to the SEGW and provisioning GANC.

81.1.1.3.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS does not have any knowledge about the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will stay in state GA-RC DEREGISTRED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The MS will derive SEGW associated with provisioning GANC and provisioning GANC from the IMSI.

The SS is supposed to answer the Discovery Request message before timer TU3901 expires.

Use a default GANC associated with the same SEGW as the provisioning GANC in order to simplify the test sequence.

The MS will attempt to register towards the default GANC reusing the same security association.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			Derive FQDN to SEGW from the IMSI
3	→			DNS Standard Query for the SEGW to the public DNS server
4	←			Standard Query Response with IP address to the SEGW
5	MS			MS sets up a secure connection to the SEGW
6	MS			Derive FQDN to GANC from the IMSI
7	→			DNS Standard Query for GANC to the DNS server associated with the GANC
8	←			Standard Query Response with address to GANC
9	MS			Establish TCP connection to provisioning GANC over the secure connection
10	→		GA-RC DISCOVERY REQUEST	To provisioning GANC

11	←	GA-RC DISCOVERY ACCEPT	Default GANC provided and SEGW matching the SEGW associated with provisioning GANC. The message is sent before expiry of TU3901.
12	MS		Establish TCP connection to default GANC using either IP address or FQDN
13	→	GA-RC REGISTER REQUEST	To default GANC

81.1.2 Discovery Procedure, Rejected

81.1.2.1 Discovery Procedure, Discovery Reject, Network Congestion

81.1.2.1.1 Conformance requirement

When the MS receives GA-RC DISCOVERY REJECT message it shall:

- stop the timer TU3901,
- set the timer value for TU3903 to the default value,
- If the value of the Reject Cause IE indicates 'Network Congestion', the MS shall
- Maintain the secure connection to the GANC-SEGW and the TCP connection to the GANC
- Create a random value between zero and the received value in TU3902 Timer IE and
- Add this value to the received value in TU3902 Timer IE, this becomes the new value for TU3902
- Start timer TU3902 according to the new calculated value

Reference(s)

3GPP TS 44.318 sub-clause 5.5.2

81.1.2.1.2 Test purpose

To verify that the MS wait the correct time after receiving Discovery Reject due to network congestion before it tries to go through the discovery procedure again.

81.1.2.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the IP address or the FQDN for the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will stay in state GA-RC DEREGISTRED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is supposed to answer the Discovery Request message with Discovery rejected with cause 'Network congestion' before timer TU3901 expires. The TU3902 timer is set to 60 (1 minutes).

The MS will set TU3902 between 1 and 2 minutes and send a Discovery Request message towards the provisioning GANC after expiration of the timer.

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
3	→		GA-RC DISCOVERY REQUEST	To provisioning GANC
4	←		GA-RC DISCOVERY REJECTED	With cause set to Network congestion TU3902 Timer IEs set to 60
5	MS			Wait for 1 – 2 minutes . The MS sets TU3902 randomly between 60 and 120, i.e. 1 to 2 minutes.
6	→		GA-RC DISCOVERY REQUEST	New attempt on the same secure connection to the provisioning GANC

81.1.2.2 Discovery Procedure, Discovery Reject, IMSI not allowed

81.1.2.2.1 Conformance requirement

When the MS receives GA-RC DISCOVERY REJECT message it shall:

- If the value of the Reject Cause IE indicates 'IMSI not allowed' or "Unspecified", then the MS shall:
- Release the TCP connection established to the Provisioning GANC, if still established.
- Release the secure connection towards the SEGW associated with the Provisioning GANC as defined in sub-clause 4.5.
- Not initiate a new Discovery procedure until the next power-on.

Reference(s)

3GPP TS 44.318 sub-clause 5.5.2.

81.1.2.2.2 Test purpose

To verify that the MS does not try to kick off the Discovery procedure again after receiving Discovery Reject due to IMSI not allowed.

81.1.2.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the provisioning GANC's FQDN

- DNS inside of the SEGW associated with the provisioning GANC with knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the IP address or the FQDN for the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC

Foreseen final state of the MS

The MS will start the discovery procedure and receive Discovery rejected with cause value 'IMSI not allowed'. The MS will not try to kick off the Discovery procedure until it is powered off and back on again. When the second attempt to register has started the signalling is interrupted and the MS will stay in state GA-RC DEREGISTRED.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is supposed to answer the Discovery Request message with Discovery rejected with cause 'IMSI not allowed' before timer TU3901 expires. The TU3902 timer is set to 60 (1 minutes).

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
3	→		GA-RC DISCOVERY REQUEST	To provisioning GANC
4	←		GA-RC DISCOVERY REJECTED	Cause: IMSI not allowed
5				MS releases the TCP connection and the secure connection
6	MS			Wait for 2 minutes. Make sure that the MS does not try to access the GAN network.
7	MS			Switch off the MS and then back on again.
8	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
9	→		GA-RC DISCOVERY REQUEST	New attempt

81.1.2.3 Void

81.1.3 Discovery Procedure, Abnormal Cases

81.1.3.1 Discovery Procedure, TU3901/TU3903 Expires

81.1.3.1.1 Conformance requirement

If timer TU3901 has expired in the MS, the MS shall:

- release the TCP connection towards the Provisioning GANC,
- release the secure connection towards SEGW of the Provisioning GANC as defined in sub-clause 4.5,
- double the current value for timer TU3903 but not exceeding the maximum value defined for this timer as defined in sub-clause 12.1.1 and
- start timer TU3903

Reference(s)

3GPP TS 44.318 sub-clause 5.6.1.

81.1.3.1.2 Test purpose

To verify that the MS attempts to kick off the Discovery procedure again after the correct time has elapsed when the TU3901/TU3903 timer expires.

81.1.3.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the provisioning GANC's FQDN
- DNS inside of the SEGW associated with the provisioning GANC with knowledge of the provisioning GANC's FQDN

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the IP address or the FQDN for the provisioning GANC
- The MS does not have any knowledge about the default GANC
- The MS does not have any knowledge about the serving GANC
- Timer TU3901 set to the default value 30 seconds
- Timer TU3903 set to 1 minute

Foreseen final state of the MS

The MS will start the discovery procedure and when TU3901 expires it will set TU3903 to 2 minutes. When TU3903 expires it will kick off the Discovery procedure again. The same sequence is repeated and for each time TU3903 is doubled until it reaches its maximum value of 32 minutes.

Test procedure

Make the MS join the AP so that the Discovery procedure is kicked off.

The SS is not supposed to answer the Discovery Request message at any occasion.

Specific Test Parameters

-

Maximum duration of test

100 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
3	→		GA-RC DISCOVERY REQUEST	To provisioning GANC, MS starts TU3901
4	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 2 min. when TU3901 expires.
5				MS releases the TCP connection and the secure connection
6	MS			Wait for 2 minutes so that TU3903 expires
7	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
8	→		GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
9	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 4 min. when TU3901 expires the 2 nd time.
10				MS releases the TCP connection and the secure connection
11	MS			Wait for 4 minutes so that TU3903 expires.
12	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
13	→		GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
14	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 8 min. when TU3901 expires the 3 rd time.
15				MS releases the TCP connection and the secure connection
16	MS			Wait for 8 minutes so that TU3903 expires.
17	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
18	→		GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
19	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 16 min. when TU3901 expires the 4 th time.
20				MS releases the TCP connection and the secure connection
21	MS			Wait for 16 minutes so that TU3903 expires.
22	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
23	→		GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
24	MS			Wait for 30 s so TU3901 expires. TU3903 is set to 32 min. when TU3901 expires the 5 th time.
25				MS releases the TCP connection and the secure connection

26	MS		Wait for 32 minutes so that TU3903 expires.
27	MS		MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
28	→	GA-RC DISCOVERY REQUEST	New attempt, MS starts TU3901
29	MS		Wait for 30 s so TU3901 expires. TU3903 is set to 32 min. again when TU3901 expires the 6 th time.
30			MS releases the TCP connection and the secure connection
31	MS		Wait for 32 minutes so that TU3903 expires.
32	MS		MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
33	→	GA-RC DISCOVERY REQUEST	New attempt

81.1.3.2 Void

81.1.3.3 Void

81.1.3.4 Void

81.1.3.5 Void

81.1.3.6 Void

81.1.3.7 SEGW certificate checking, the MS holds the "invalid" FQDN of the provisioning SEGW

81.1.3.7.1 Conformance requirement

As the MS and GANC-SEGW use EAP-SIM or EAP-AKA for mutual authentication, IKEv2 mandates that this is used in conjunction with a public key signature based authentication of the GANC-SEGW to the MS.

The MS requirements for certificate authentication and handling are listed in 3GPP TS 33.234 [10].

In addition to the requirements listed in 3GPP TS 33.234 [10], the MS shall take the following actions for received GANC-SEGW certificates:

- match the SubjectAltName in the end entity certificate with the IDr payload, and with GANC-SEGW identity obtained from derivation of the Provisioning GANC-SEGW FQDN, provisioning, discovery or register redirect.
- If the MS was provisioned with an IP address of the GANC-SEGW, (or received it in the GA-RC DISCOVERY ACCEPT or GA-RC REGISTER REDIRECT message), then the certificate shall contain an IPAddress SubjectAltName that matches that address.
- If the MS was provisioned with an FQDN of the GANC-SEGW, or received it in the GA-RC DISCOVERY ACCEPT or GA-RC REGISTER REDIRECT message, then the certificate shall contain a DNSname SubjectAltName that matches that FQDN.
- If the MS derived the FQDN of the Provisioning GANC-SEGW, then the certificate shall contain a DNSname SubjectAltName that matches that FQDN.

If the MS and GANC-SEGW are not able to set up the SA for any other reason than EAP-SIM or EAP-AKA authentication failure, and the current GANC-SEGW is the SEGW associated to the Provisioning GANC, the MS shall act as if a "Lower layer failure in the MS" has occurred and act as defined in sub-clause 5.6.2.

Reference(s)

3GPP TS 44.318 sub-clauses 4.2.5 and 4.2.6

81.1.3.7.2 Test purpose

To verify that the MS does correct SEGW certificate checking during secure tunnel establishment.

81.1.3.7.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS that holds the IP address to the SEGW associated with the provisioning GANC, but that DNS entry is not in provisioning SEGW certificate.

Mobile Station:

- MS in state GA-RC DEREGISTERED
- The MS has the "invalid" FQDN for the SEGW

The MS holds an "invalid" FQDN of the Provisioning SEGW. MS is made to perform a public DNS query to retrieve the IP-address of the Provisioning SEGW and to initialise establishment of the secure connection towards the Provisioning SEGW. Secure tunnel establishment will fail, because provisioning SEGW certificate does not contain DNS subjectAltName "invalid.provisioning.gan". The MS shall act as if "a Lower layer failure in the MS" has occurred and act as defined in sub-clause 5.6.2.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	→			DNS Standard Query for the SEGW to the public DNS server
3	←			Standard Query Response with IP address to the SEGW
4	→		IKE_SA_INIT	MS sends IKE_SA_INIT message to initialize secure connection setup to the SEGW
5	←		IKE_SA_INIT	SEGW replies with IKE_SA_INIT
6	→		IKE_AUTH	MS informs trusted CA certificates in CERT_REQ payload. Authentication phase is started
7	←		IKE_AUTH	SEGW replies with certificate that does not contain "invalid" FQDN in its SubjectAltName field
8 (optional)	→		IKE_AUTH	MS may optionally send one more IKE_AUTH message
9	MS			MS stops attempting to set up a security connection and starts TU3903
10	MS			Wait for 10 seconds
11	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC using either IP address or FQDN

81.2 Registration Procedure

81.2.1 Registration Procedure, Accepted

81.2.1.1 Registration Procedure, MS in GSM Coverage, Serving GANC for CGI Known

81.2.1.1.1 Conformance requirement

If the MS is in GERAN or UTRAN coverage, it shall check if it has stored Serving GANC information for the current GSM CGI in case of GERAN coverage, or UTRAN cell Identity, in case of UTRAN Coverage, or if the MS is not in GERAN/UTRAN coverage, it shall check if it has stored Serving GANC information for the current AP-ID

- if found, the MS shall initiate Registration procedure towards the stored Serving GANC

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- Start Keep alive mechanism as defined in sub-clause 6.5 using the received TU3906 Timer IE

Reference(s)

3GPP TS 44.318 sub-clause 6.2.1 and 6.2.3.1

81.2.1.1.2 Test purpose

To verify that the MS can store the address to a serving GANC associated with a certain GSM cell and access that GANC at the Registration procedure.

81.2.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds GANC Control Channel Description IE shall indicate that GPRS services are not available and IMSI Attach/Detach procedure shall not apply.
5	MS			Wait for 1 minutes so that TU3906 expires
A5 (Optional)			{GAN A/Gb Mode Location Update Procedure}	This step is performed only if the MS initiates a Location Area Update while TU3906 is still running
6	→		GA-RC KEEP ALIVE	

81.2.1.2 Registration Procedure, MS in GSM Coverage, Serving GANC for CGI Not Known; MS not in GSM Coverage, Serving GANC for AP Known

81.2.1.2.1 Conformance requirement

If the MS is in GERAN or UTRAN coverage, it shall check if it has stored Serving GANC information for the current GSM CGI in case of GERAN coverage, or UTRAN cell Identity, in case of UTRAN Coverage, or if the MS is not in GERAN/UTRAN coverage, it shall check if it has stored Serving GANC information for the current AP-ID

- if found, the MS shall initiate the GAN Registration procedure towards the stored Serving GANC

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- Start Keep alive mechanism as defined in sub-clause 6.5 using the received TU3906 Timer IE

The GANC may at any time initiate the deregistration of a MS by sending the GA-RC DEREGISTER message to the MS. When the GA-RC layer in the network has submitted the GA-RC DEREGISTER message to the TCP layer, it may initiate release of its half of the bidirectional TCP connection

Reference(s)

3GPP TS 44.318 sub-clause 6.2.1, 6.2.3.1, and 6.4.3

81.2.1.2.2 Test purpose

To verify that the MS can register to the default GANC if it doesn't have any data stored about serving GANC in the current GSM cell.

To verify that the MS can store the address to a serving GANC associated with a certain AP and access that GANC at the Registration procedure.

81.2.1.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, default parameter

- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored a serving GANC associated with the AP-ID
- MS has not stored a serving GANC associated with the GSM cell (CGI)
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

The SS requests the MS to deregister. The GSM cell is then removed. The MS should now attempt to register using the stored AP-ID.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To default GANC, verify correct GSM CGI is used.
4	←		GA-RC REGISTER ACCEPT.	GANC Control Channel Description IE shall indicate that GPRS services are not available and IMSI Attach/Detach procedure shall not apply.
A4 (Optional)			{GAN A/Gb Mode Location Update Procedure}	This step is performed only if the MS initiates a Location Area Update
5	←		GA-RC DEREGISTER	Reject Cause = Unspecified
6	SS			Remove GSM Coverage
7	MS			Remove the TCP connection and the secure connection to SEGW
8	MS			MS is joining the AP
9	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
10	→		GA-RC REGISTER REQUEST	To serving GANC, verify correct AP-ID is used.

11	←	GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds
12	MS		Wait for 1 minutes so that TU3906 expires
13	→	GA-RC KEEP ALIVE	

81.2.1.3 Void

81.2.1.4 Registration Procedure, MS Holds The IP Address to The serving SEGW And The FQDN to The Serving GANC

81.2.1.4.1 Conformance requirement

To initiate the registration procedure the MS shall:

- If the MS has stored an IP address of the GANC-SEGW, and the MS does not already have an established secure connection to this GANC-SEGW, the MS establishes a secure connection towards the GANC-SEGW according to sub-clause 4.2,

Following successful establishment of secure tunnel:

- If the MS holds a FQDN of the GANC, the MS performs a DNS query "inside the secure tunnel" to retrieve the IP-address of the GANC. The MS establishes a TCP connection to the GANC at the stored TCP port to be used for Registration with this GANC. If no TCP port has been stored for this GANC, the default TCP port (see sub-clause 12.2.1) shall be used. The MS shall not store the retrieved IP address for subsequent procedures (apart from DNS resolver caching);
- The MS shall only establish a single TCP connection to the GANC over the IPsec tunnel.

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- Start Keep alive mechanism as defined in sub-clause 6.5 using the received TU3906 Timer IE

Reference(s)

3GPP TS 44.318 sub-clause 6.2.1 and 6.2.3.1

81.2.1.4.2 Test purpose

To verify that the MS can register to the GANC by using IP addresses to SEGW and GANC.

81.2.1.4.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored the IP address to the SEGW associated with the serving GANC associated with the AP-ID but not the FQDN
- MS has stored the FQDN to the serving GANC associated with the AP-ID but not the IP address
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			Set up Ipsec tunnel to serving SEGW
3	→			DNS Standard Query for GANC to the DNS server associated with the GANC
4	←			Standard Query Response with IP address to GANC
5	MS			Establish TCP connection to serving GANC
6	→		GA-RC REGISTER REQUEST	To serving GANC
7	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds. GANC Control Channel Description IE shall indicate that GPRS services are not available and IMSI Attach/Detach procedure shall not apply.

81.2.1.5 Registration Procedure, MS Holds The FQDN to The serving SEGW And The IP Address to The Serving GANC

81.2.1.5.1 Conformance requirement

To initiate the GAN registration procedure the MS shall:

- If the MS has stored a FQDN of the GANC-SEGW, the MS performs a public DNS query to retrieve the IP-address of the GANC-SEGW, if the MS does not already have an established secure connection to this GANC-SEGW, the MS establishes the secure connection towards the GANC-SEGW according to sub-clause 4.2. The MS shall not store the IP address retrieved from DNS for subsequent procedures (apart from DNS resolver caching).

Following successful establishment of secure tunnel:

- If the MS holds an IP address of the GANC, the MS establishes a TCP connection to the GANC at the stored TCP port to be used for Registration with this GANC. If no TCP port has been stored for this GANC, the default TCP port (see sub-clause 12.2.1) shall be used.
- The MS shall only establish a single TCP connection to the GANC over the IPsec tunnel.

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- Start Keep alive mechanism as defined in sub-clause 6.5 using the received TU3906 Timer IE

Reference(s)

3GPP TS 44.318 sub-clause 6.2.1 and 6.2.3.1

81.2.1.5.2 Test purpose

To verify that the MS can register to the GANC by using FQDN to SEGW.

81.2.1.5.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN

Mobile Station:

- MS has stored the FQDN to the SEGW associated with the serving GANC associated with the AP-ID, but not the IP address
- MS has stored the IP address to the serving GANC associated with the AP-ID, but not the FQDN
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

81.2.1.6 Registration Procedure, MS is capable of GAN A/Gb mode and GAN Iu mode, directed to operate in GAN A/Gb mode

81.2.1.6.1 Conformance requirement

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- stop the timer TU3904,
- reset the Redirection Counter,
- retrieve the GAN Mode Indicator IE (if included) and:
 - if no GAN Mode Indicator IE is included or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, and the MS supports GAN A/Gb mode, then the MS shall operate in GAN A/Gb mode while registered with the GANC.
 - if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN Iu mode, and the MS supports GAN Iu mode, then the MS shall operate in GAN Iu mode while registered with the GANC.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.1

81.2.1.6.2 Test purpose

To verify that the MS that is capable of both GAN A/Gb mode and GAN Iu mode operation can be directed to operate in GAN A/Gb mode as a result of the Registration procedure.

81.2.1.6.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, with different LAI than GAN cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP

2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC GAN Mode Support Indicator in GAN Classmark IE indicates that MS supports GAN A/Gb mode and GAN lu mode
4	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds GAN Mode Indicator IE indicates that MS shall use GAN lu mode
5			{GAN lu Mode Location Update Procedure}	

81.2.1.8 Registration Procedure, MS is capable of GAN A/Gb mode and GAN lu mode, no GAN Mode Indicator IE in GA-RC REGISTER ACCEPT

81.2.1.8.1 Conformance requirement

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- stop the timer TU3904,
- reset the Redirection Counter,
- retrieve the GAN Mode Indicator IE (if included) and:

- if no GAN Mode Indicator IE is included or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, and the MS supports GAN A/Gb mode, then the MS shall operate in GAN A/Gb mode while registered with the GANC.
- if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN Iu mode, and the MS supports GAN Iu mode, then the MS shall operate in GAN Iu mode while registered with the GANC.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.1

81.2.1.8.2 Test purpose

To verify that the MS that is capable of both GAN A/Gb mode and GAN Iu mode operation will use GAN A/Gb mode if no GAN Mode Indicator IE is included in the GA-RC REGISTER ACCEPT message.

81.2.1.8.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, with different LAI than GAN cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN

3	→	GA-RC REGISTER REQUEST	To serving GANC GAN Mode Support Indicator in GAN Classmark IE indicates that MS supports GAN A/Gb mode and GAN Iu mode
4	←	GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds No GAN Mode Indicator IE included
5		{GAN A/GB Mode Location Update Procedure}	

81.2.1.9 Registration Procedure, MS is capable of GAN Iu mode only, no GAN Mode Indicator IE in GA-RC REGISTER ACCEPT

81.2.1.9.1 Conformance requirement

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- stop the timer TU3904,
- reset the Redirection Counter,
- retrieve the GAN Mode Indicator IE (if included) and:
 - if no GAN Mode Indicator IE is included or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, and the MS supports GAN A/Gb mode, then the MS shall operate in GAN A/Gb mode while registered with the GANC.
 - if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN Iu mode, and the MS supports GAN Iu mode, then the MS shall operate in GAN Iu mode while registered with the GANC.

If no GAN Mode Indicator IE is included in the GA-RC REGISTER ACCEPT message or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, but the MS does not support GAN A/Gb mode, then the MS shall immediately initiate GAN deregistration per sub-clause 6.4.1 and then proceed according to the registration reject procedures defined for the case of 'Invalid GANC' in sub-clause 6.2.3.3.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.1 and 6.2.4.6

81.2.1.9.2 Test purpose

To verify that the MS that is capable of GAN Iu mode operation (only) initiates GAN deregistration if the GA-RC REGISTER ACCEPT message does not include the GAN Mode Indicator.

81.2.1.9.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, with different LAI than GAN cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC GAN Mode Support Indicator in GAN Classmark IE indicates that MS supports GAN Iu mode (only)
4	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds No GAN Mode Indicator IE included
5	→		GA-RC DEREGISTER	Register Reject Cause = Unspecified

81.2.1.10 Registration Procedure, MS is capable of GAN Iu mode only, GAN Mode Indicator IE in GA-RC REGISTER ACCEPT indicates that MS shall use GAN A/Gb mode

81.2.1.10.1 Conformance requirement

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- stop the timer TU3904,
- reset the Redirection Counter,
- retrieve the GAN Mode Indicator IE (if included) and:
 - if no GAN Mode Indicator IE is included or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, and the MS supports GAN A/Gb mode, then the MS shall operate in GAN A/Gb mode while registered with the GANC.
 - if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN Iu mode, and the MS supports GAN Iu mode, then the MS shall operate in GAN Iu mode while registered with the GANC.

If no GAN Mode Indicator IE is included in the GA-RC REGISTER ACCEPT message or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, but the MS does not support GAN A/Gb mode, then the MS shall immediately initiate GAN deregistration per sub-clause 6.4.1 and then proceed according to the registration reject procedures defined for the case of 'Invalid GANC' in sub-clause 6.2.3.3.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.1 and 6.2.4.6

81.2.1.10.2 Test purpose

To verify that the MS that is capable of GAN Iu mode operation (only) initiates GAN deregistration if the GA-RC REGISTER ACCEPT message includes the GAN Mode Indicator with value 'The MS shall operate in GAN A/Gb mode'.

81.2.1.10.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, with different LAI than GAN cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP

3	→		GA-RC REGISTER REQUEST	To serving GANC GAN Mode Support Indicator in GAN Classmark IE indicates that MS supports GAN Iu mode (only)
4	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds GAN Mode Indicator IE indicates that MS shall use GAN A/Gb mode
5	→		GA-RC DEREGISTER	Register Reject Cause = Unspecified

81.2.1.11 Registration Procedure, MS is capable of GAN Iu mode (only) is directed to operate in GAN Iu mode

81.2.1.11.1 Conformance requirement

When the MS receives GA-RC REGISTER ACCEPT message, it shall:

- stop the timer TU3904,
- reset the Redirection Counter,
- retrieve the GAN Mode Indicator IE (if included) and:
 - if no GAN Mode Indicator IE is included or if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN A/Gb mode, and the MS supports GAN A/Gb mode, then the MS shall operate in GAN A/Gb mode while registered with the GANC.
 - if the GAN Mode Indicator IE is included and indicates that the MS shall operate in GAN Iu mode, and the MS supports GAN Iu mode, then the MS shall operate in GAN Iu mode while registered with the GANC.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.1

81.2.1.11.2 Test purpose

To verify that the MS that is capable of GAN Iu mode operation (only) can be directed to operate in GAN Iu mode as a result of the Registration procedure.

81.2.1.11.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, with different LAI than GAN cell
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored a serving GANC associated with the GSM cell (CGI)
- MS has not stored a serving GANC associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Accept before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC GAN Mode Support Indicator in GAN Classmark IE indicates that MS supports GAN lu mode (only)
4	←		GA-RC REGISTER ACCEPT	TU3906 set to 60 seconds GAN Mode Indicator IE indicates that MS shall use GAN lu mode
5			{GAN lu Mode Location Update Procedure}	

81.2.2 Registration Procedure, Redirected

81.2.2.1 Registration Procedure, Redirected, Not Possible to Reuse Secure Connection

81.2.2.1.1 Conformance requirement

When the MS receives GA-RC REGISTER REDIRECT message, it shall:

- stop the timer TU3904,
- Increment the Redirection counter,
- release the TCP connection towards the GANC,
- otherwise release the secure connection towards SEGW of the previous GANC as defined in sub-clause 4.5
- initiate the registration procedure towards the returned GANC as defined in sub-clause 6.2.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.2

81.2.2.1.2 Test purpose

To verify that the MS can register to another GANC when it receives Registration Redirect as a response on the Registration Request message.

81.2.2.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID

- The serving GANC does not belong to the same SEGW as the default GANC
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Redirect before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
				MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
2	→		GA-RC REGISTER REQUEST	To serving GANC
3	←		GA-RC REGISTER REDIRECT	Redirect default GANC, with associated default SEGW IP or FQDN
4	MS			Remove the TCP connection and the secure connection to SEGW
5	MS			MS sets up secure connection to the new SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.2.2 Registration Procedure, Redirected, Current And Received GANC Belongs to The Same SEGW, IP Address Matches

81.2.2.2.1 Conformance requirement

When the MS receives GA-RC REGISTER REDIRECT message, it shall:

- stop the timer TU3904,
- Increment the Redirection counter,
- release the TCP connection towards the GANC,
- if the returned SEGW is the same as the one used for the connection towards the previous GANC,
- if the MS held a Serving GANC-SEGW IP address for the current Serving GANC (either in the Serving GANC store or received in a previous GA-RC REGISTER REDIRECT) and the received GA-RC REGISTER REDIRECT contains the Serving GANC-SEGW IP address IE, and these two IP addresses match, the MS shall reuse the secure connection, or

- initiate the registration procedure towards the returned GANC as defined in sub-clause 6.2.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.2

81.2.2.2.2 Test purpose

To verify that the MS can register to another GANC when it receives Registration Redirect as a response on the Registration Request message.

To verify that the same Ipsec tunnel can be reused if the current GANC belongs to the same SEGW as the received GANC using FQDN as identifier.

81.2.2.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC and default GANC.

Mobile Station:

- MS has stored the IP address or FQDN to the serving GANC and its SEGW associated with the AP-ID
- The serving GANC belongs to the same SEGW as the default GANC
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Redirect before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
				MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
2	→		GA-RC REGISTER REQUEST	To serving GANC
3	←		GA-RC REGISTER REDIRECT	Redirect default GANC, IP address for the SEGW sent

4	MS		Remove the TCP connection
5	MS		Establish a TCP connection to the default GANC over the same secure connection
6	→	GA-RC REGISTER REQUEST	To default GANC

81.2.2.3 Registration Procedure, Redirected, Current And Received GANC Belongs to The Same SEGW, FQDN Matches

81.2.2.3.1 Conformance requirement

When the MS receives GA-RC REGISTER REDIRECT message, it shall:

- stop the timer TU3904,
- Increment the Redirection counter,
- release the TCP connection towards the GANC,
- if the returned SEGW is the same as the one used for the connection towards the previous GANC,
- if the MS held a Serving GANC-SEGW FQDN identifier (either in the Serving GANC store or received in a previous GA-RC REGISTER REDIRECT) and the received GA-RC REGISTER REDIRECT contains the Serving GANC-SEGW FQDN IE, and these identifiers match, the MS shall reuse the secure connection
 - initiate the registration procedure towards the returned GANC as defined in sub-clause 6.2

.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.2

81.2.2.3.2 Test purpose

To verify that the MS can register to another GANC when it receives Registration. Redirect as a response on the Registration Request message.

To verify that the same Ipsec tunnel can be reused if the current GANC belongs to the same SEGW as the received GANC using FQDN as identifier.

81.2.2.3.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC and default GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and the IP address or FQDN of its SEGW associated with the AP-ID
- The serving GANC belongs to the same SEGW as the default GANC
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC REGISTERED.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Redirect before timer TU3904 expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
				MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using FQDN
2	→		GA-RC REGISTER REQUEST	To serving GANC
3	←		GA-RC REGISTER REDIRECT	Redirect default GANC, FQDN for the SEGW sent
4	MS			Remove the TCP connection
5	MS			Establish a TCP connection to the default GANC over the same secure connection
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.3 Registration Procedure, Rejected

81.2.3.1 Registration Procedure, Registration rejected, Network congestion

81.2.3.1.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;
- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'Network Congestion'
 - create a random value between zero and the received value in IE 'TU3907 Timer' and
 - add this value to the received value in IE 'TU3907 Timer', and use this as the new value for TU3907
 - start timer TU3907 according to the new calculated value and wait for it to expire.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.1.2 Test purpose

To verify that the MS retries to register again after the correct time, according to the received timer TU3907, after receiving Register reject.

81.2.3.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN or IP address of the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to network congestion before timer TU3904 expires. TU3907 Timer IE is set to 60 (1 minutes).

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT	Cause: network congested. TU3907 Timer IE is set to 60 seconds
5	MS			The MS sets TU3907 randomly between 60 and 120, i.e. 1 – 2 minutes. Wait until the TU3907 expires
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.2.3.2 Registration Procedure, Registration rejected, AP not allowed

81.2.3.2.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;
- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.
 - else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'AP not allowed'
- release the TCP connection established to the GANC, if still established,
- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
- store the AP-ID in the AP Black List and not initiate a new Register Request from this AP, until the AP-ID is removed from the AP Black List i.e. as a result of power-cycle.

The MS shall also:

- Update the stored Serving GANC table as follows if the received Reject cause was not 'Network Congestion' or 'Geo Location not known':
- If the MS is not in GERAN/UTRAN coverage it shall remove information related to the AP-ID, if exists in the table.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.2.2 Test purpose

To verify that the MS does not try to register again, after receiving Register reject due to Location not allowed until the MS is joining another AP.

81.2.3.2.3 Method of test

Initial conditions

System Simulator:

- 2 GAN cells, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN or IP address to the serving GANC and its SEGW associated with the AP-ID
- MS has stored the FQDN or IP address to the default GANC and its SEGW
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to AP not allowed before timer TU3904 expires.

The MS are not allowed to try to register again from the same AP. Therefore wait for 2 minutes and let the MS join the second AP, where the mobile will try to register again.

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT	Cause: AP not allowed
5	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
6	MS			Wait for 2 minutes. Make sure that the MS doesn't try to register again.
7	MS			MS is joining the second AP
8	MS			MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
9	→		GA-RC REGISTER REQUEST	To default GANC

81.2.3.3 Registration Procedure, Registration rejected, Location not allowed

81.2.3.3.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;
- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'Location not allowed'
 - release the TCP connection established to the GANC, if still established,
 - release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
 - update the Location Black List according to the received information elements Location Black List indicator and Location Area Identification (i.e. the same as that included in the GA-RC REGISTER REQUEST message) and not initiate a new Register Request from the locations indicated by the updated Location Black List, until they are removed from the Location Black List i.e. as a result of power-cycle.

The MS shall also:

- Update the stored Serving GANC table as follows if the received Reject cause was not 'Network Congestion' or 'Geo Location not known':

- If the MS is in GERAN/UTRAN coverage it shall remove information related to the current GSM-CGI or UTRAN Cell Identity, if it exists in the table.
- If the MS is not in GERAN/UTRAN coverage it shall remove information related to the AP-ID, if exists in the table.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.3.2 Test purpose

To verify that the MS does not try to register again, after receiving Register reject due to Location not allowed until it is powercycled.

81.2.3.3.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- 1 GSM cell, default parameters
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN or IP address to the serving GANC and its SEGW associated with the GSM cell (CGI)
- MS has stored the FQDN or IP address to the default GANC and its SEGW
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to Location not allowed before timer TU3904 expires.

The MS are not allowed to try to register again from the same Location Area. Therefore wait for 5 minutes and then powercycle the MS so that the LAI disappears from the Location black list and the MS can register again from that Location area.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP

2	MS		MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→	GA-RC REGISTER REQUEST	To serving GANC
4	←	GA-RC REGISTER REJECT	Cause: Location not allowed
5	MS		Release the TCP connection to the GANC and the secure connection to the SEGW
6	MS		Wait for 5 minutes. Make sure that the MS doesn't try to register again.
7	MS		Powercycle the MS
8	MS		MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
9	→	GA-RC REGISTER REQUEST	To default GANC

81.2.3.4 Registration Procedure, Registration rejected, IMSI not allowed

81.2.3.4.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;
- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'IMSI not allowed'
 - release the TCP connection established to the GANC, if still established.
 - release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
 - not initiate a new GAN Registration procedure until the next power-on.

The MS shall also:

- Update the stored Serving GANC table as follows if the received Reject cause was not 'Network Congestion' or 'Geo Location not known':
- If the MS is not in GERAN/UTRAN coverage it shall remove information related to the AP-ID, if exists in the table.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.4.2 Test purpose

To verify that the MS does not try to register again after receiving Registration reject due to IMSI not allowed until the MS is power cycled.

81.2.3.4.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN or the IP address to the serving GANC and its SEGW associated with the AP-ID
- MS has stored the FQDN or the IP address to the default GANC and its SEGW
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to IMSI not allowed before timer TU3904 expires.

Wait for 2 minutes to confirm that the MS does not try to register again.

Switch off the MS and switch it back on again. The MS is supposed to try to register with the default GANC.

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT	Cause: IMSI not allowed
5	MS			Release the TCP connection to the serving GANC and the secure connection to the serving SEGW
6	MS			Wait for 2 minutes. Make sure that the MS doesn't try to register again.
7	MS			Power cycle the MS
8	MS			MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
9	→		GA-RC REGISTER REQUEST	To default GANC

81.2.3.5 Void

81.2.3.6 Registration Procedure, Registration rejected, invalid GANC

81.2.3.6.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;
- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.
 - else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'Invalid GANC' or 'Unspecified'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
- act as defined in sub-clause 6.2.4.5

The MS shall also:

- Update the stored Serving GANC table as follows if the received Reject cause was not 'Network Congestion' or 'Geo Location not known':
- If the MS is not in GERAN/UTRAN coverage it shall remove information related to the AP-ID, if exists in the table.

The MS shall;

- If the GANC selection is ongoing;
- act on upper layer indications as follows;
- If no more PLMNs/GANCs are available for GANC selection or the GANC selection is finished unsuccessfully;
- stop all ongoing registration procedures;
- release the TCP connection towards the current GANC, if established,
- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5
- initiate registration towards the Default GANC as defined in sub-clause 6.2.1;
- else if the GANC selection process indicates new PLMN/GANC selection:
- initiate registration procedure towards the GANC associated with the selected PLMN as defined in sub-clause 6.2.
 - else if the MS attempted the registration towards the Default GANC
- delete the stored information about the Default GANC,
- delete the contents of the stored Serving GANC table
- Increment Redirection Counter
- initiate Discovery Procedure as defined in sub-clause 5.3
 - else if the MS attempted the registration towards current GANC is a Serving GANC
- Update the stored Serving GANC table as defined in the end of sub-clause 6.2.3.3 (i.e. delete information about this Serving GANC in the table) and
- Increment Redirection Counter

- initiate Registration Procedure towards the Default GANC as defined in sub-clause 6.2.1

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3 and 6.2.4.5

81.2.3.6.2 Test purpose

To verify for serving and default GANC that the MS does not try to register again to the same GANC after receiving Registration reject due to invalid GANC.

81.2.3.6.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of any GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC
- DNS inside of the default SEGW associated with the default GANC
- DNS inside of the provisioning SEGW associated with the provisioning GANC

Mobile Station:

- MS has stored the FQDN or IP address to the serving GANC associated with the AP-ID
- MS has stored the FQDN or IP address to the default GANC
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due invalid GANC before timer TU3904 expires.

Check that the MS kicks off the Registration procedure towards the Default GANC. Check the Register Reject Cause IE and Redirection Counter IE in the Discovery Request message.

The SS is supposed to answer the Registration Request message with Registration Rejected due invalid GANC before timer TU3904 expires.

Check that the MS kicks off the Discovery procedure towards the Provisioning GANC. Check the Register Reject Cause IE and Redirection Counter IE in the Discovery Request message.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT.	Cause: Invalid GANC
5				Release the TCP connection to the serving GANC and the secure connection to the serving SEGW
6				MS sets up secure connection to the default SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
7	→		GA-RC REGISTER REQUEST	To default GANC
8	←		GA-RC REGISTER REJECT.	Cause: Invalid GANC
9				Release the TCP connection to the default GANC and the secure connection to the default SEGW
10				MS sets up secure connection to the provisioning SEGW and establishes a TCP connection to the provisioning GANC using either IP address or FQDN
11	→		GA-RC DISCOVERY REQUEST	To provisioning GANC

81.2.3.7 Registration Procedure, Registration rejected, Geo location not known

81.2.3.7.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;
- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'Geo Location not known'
 - release the TCP connection established to the GANC, if still established.
 - release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5
 - not retry registration from this AP until the location is provided or until the next power-on.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3

81.2.3.7.2 Test purpose

To verify that the MS does not try to register again after receiving Registration Reject due to 'Geo location not known' until the MS is power cycled.

81.2.3.7.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the serving SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN or the IP address to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to Geo location not known before timer TU3904 expires.

Wait for 2 minutes to confirm that the MS does not try to register again.

Switch off the MS and switch it back on again. The MS is supposed to try to register again.

Specific Test Parameters

-

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP
2	MS			MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	To serving GANC
4	←		GA-RC REGISTER REJECT	Cause: Geo location not known
5				Release the TCP connection to the GANC and the secure connection to the SEGW
6	MS			Wait for 2 minutes. Make sure that the MS doesn't try to register again.
7	MS			Power cycle the MS

8	MS		MS sets up secure connection to the serving SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
9	→	GA-RC REGISTER REQUEST	To serving GANC

81.2.4 Registration Procedure, Abnormal Cases

81.2.4.1 Registration Procedure, TU3904/TU3905 expiry, Serving GANC

81.2.4.1.1 Conformance requirement

If timer TU3904 expires in the MS, the MS shall:

- release the TCP connection towards the GANC,
- release the secure connection towards SEGW of the GANC as defined in sub-clause 4.5,
- If GAN registration is unsuccessful after a number of attempts defined by the MS parameter "Up Register Max Retries" (defined in sub-clause 12.2.3), the MS shall act as defined in sub-clause 6.2.4.5.
- Otherwise, if GAN Registration can be re-attempted according to the MS parameter "Up Register Max Retries", start timer TU3905 and wait for it to expire.

If timer TU3905 has expired in the MS, the MS shall restart the Registration procedure as defined in sub-clause 6.2.1.

Reference(s)

3GPP TS 44.318 sub-clause 6.2.4.1 and 6.2.4.3

81.2.4.1.2 Test purpose

To verify that the MS retries to register correct number of times before it tries to register at another GANC when it does not get any reply on the Registration Request message.

81.2.4.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is not supposed to answer the Registration Request message at all.

The MS will wait for TU3904 and TU3905 to expire and retry to register again the number of times that is set in the MS parameter 'Up Register Max Retries'. After that it will try to register at the default GANC

Specific Test Parameters

‘Up Register Max Retries’ (3 times)

Maximum duration of test

3 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the first AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	1 st time to serving GANC, MS starts TU3904
4	MS			Wait for 30 seconds so that TU3904 expires. TU3905 is set
5	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
6	MS			Wait for 10 seconds so that TU3905 expires
7	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
8	→		GA-RC REGISTER REQUEST	2 nd time to serving GANC, MS starts TU3904. 1 st reattempt
9	MS			Wait for 30 seconds so that TU3904 expires. TU3905 is set
10	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
11	MS			Wait for 10 seconds so that TU3905 expires
12	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
13	→		GA-RC REGISTER REQUEST	3 rd time to serving GANC, MS starts TU3904. 2 nd reattempt
14	MS			Wait for 30 seconds so that TU3904 expires.
15	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
16	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
17	→		GA-RC REGISTER REQUEST	To default GANC

81.2.4.2 Registration Procedure, Registration Rejected, Network Congestion, Persistent Fault

81.2.4.2.1 Conformance requirement

When the MS receives GA-RC REGISTER REJECT message it shall:

- stop the timer TU3904,
- if the MS is in the process of GANC selection;

- ignore the received Register Reject Cause Information Element; and;
- proceed as defined in sub-clause 6.2.4.5.
 - else extract the Register Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'Network Congestion'
- create a random value between zero and the received value in IE 'TU3907 Timer' and
- add this value to the received value in IE 'TU3907 Timer', and use this as the new value for TU3907
- start timer TU3907 according to the new calculated value and wait for it to expire.

If timer TU3907 expires in the MS, the MS shall:

- If GAN registration is unsuccessful after a number of attempts defined by the MS parameter "Up Register Max Retries" (defined in sub-clause 12.2.3), the MS shall act as if a "Lower layer failure in the MS" has occurred as defined in sub-clause 6.2.4.2
- else, if the TCP connection to the GANC is still established,
- send a GA-RC REGISTER REQUEST that includes information elements as described in sub-clause 6.2.1 and
- start timer TU3904
 - else, restart the GAN Registration procedure towards the GANC as defined in sub-clause 6.2.1

Reference(s)

3GPP TS 44.318 sub-clause 6.2.3.3 and 6.2.4.4

81.2.4.2.2 Test purpose

To verify that the MS retries to register to the same GANC the correct number of times when it gets rejected due to network congestion several times.

81.2.4.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC DEREGISTERED

Foreseen final state of the MS

The MS will stay in state to GA-RC DEREGISTERED as the registration fails.

Test procedure

Make the MS join the AP so that the Registration procedure is kicked off.

The SS is supposed to answer the Registration Request message with Registration Rejected due to network congestion before timer TU3904 expires. TU3907 Timer IE is set to 60 (1 minutes).

The MS will wait for TU3904 and TU3907 to expire and retry to register again the number of times that is set in the MS parameter 'Up Register Max Retries'.

At the first reject the SS releases the TCP connection and the Ipsec tunnel, so that the MS has to establish the connection again. The rest of the rejects can keep the connection as that is the most likely scenario.

Specific Test Parameters

Up Register Max Retries' is set to 3 times

Maximum duration of test

7 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is joining the AP
2	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
3	→		GA-RC REGISTER REQUEST	1 st time to serving GANC, MS starts TU3904
4	←		GA-RC REGISTER REJECT	Cause: network congested. TU3907 Timer IE is set to 60 seconds
5	MS			The MS sets TU3907 randomly between 60 and 120, i.e. 1 – 2 minutes. Wait until TU3907 expires
6	→		GA-RC REGISTER REQUEST	2 nd time to serving GANC, MS starts TU3904. 1 st reattempt
7	←		GA-RC REGISTER REJECT	Cause: network congested. TU3907 Timer IE is set to 60 seconds
8	MS			The MS sets TU3907 randomly between 60 and 120, i.e. 1 – 2 minutes. Wait until TU3907 expires
9	→		GA-RC REGISTER REQUEST	3 rd time to serving GANC, MS starts TU3904. 2 nd reattempt
10	←		GA-RC REGISTER REJECT	Cause: network congested. TU3907 Timer IE is set to 60 seconds
11 (optional)	MS			The MS sets TU3907 randomly between 60 and 120, i.e. 1 – 2 minutes. Wait until TU3907 expires
12	MS			Release the TCP connection to the GANC and the secure connection to the SEGW

81.2.4.3 Void

81.2.4.4 Void

81.2.4.5 Void

81.2.4.6 Void

81.2.4.7 Void

81.2.5 Registration Procedure, Register Update

81.2.5.1 Registration Procedure, Register Update, Rejected

81.2.5.1.1 Conformance requirement

If the network rejects the Registration Update, it shall send the GA-RC DEREGISTER message to the MS. This message shall contain the Register Reject Cause information element.

When the MS receives the GA-RC DEREGISTER message, it shall behave as defined in sub-clause 6.4.4 "Reception of GA-RC DEREGISTER by MS".

When the MS receives the GA-RC DEREGISTER message, it shall:

- 'AP not allowed'
- release the TCP connection established to the GANC, if still established,
- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5,
- store the AP-ID in the AP Black List of and not initiate a new Register Request from this AP, until the AP-ID is removed from the AP black list i.e. as a result of power-cycle.

Reference(s)

3GPP TS 44.318 sub-clause 6.3.2.2, 6.3.3.1 and 6.4.4

81.2.5.1.2 Test purpose

To verify that the MS acts according to the Register Update Reject Cause contained in the GA-RC DEREGISTER from the network.

81.2.5.1.3 Method of test

Initial conditions

System Simulator:

- 2 GAN cells, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED

Test procedure

Make the MS join a second AP so that the Registration Update procedure is kicked off.

The SS is supposed to reply with GA-RC DEREGISTER.

The MS will then check the Register Reject Cause IE contained in GA-RC DEREGISTER message and act as specified in GANC 44.318 section 6.4.4.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is changing APs
2	→		GA-RC REGISTER UPDATE UPLINK	To serving GANC

3	←	GA-RC DEREGISTER	To MS Cause: AP not allowed
4	MS		Release the TCP connection to the GANC and the secure connection to the SEGW
5	MS		Wait for 5 minutes. Make sure that the MS doesn't try to register again.

81.2.5.2 Registration Procedure, Register Update, Redirection

81.2.5.2.1 Conformance requirement

If the network decides to redirect the MS to another GANC, it shall send the GA-RC REGISTER REDIRECT message to the MS. This message shall contain valid information about another GANC, so that the MS is able to initiate the Registration procedure towards that GANC.

Reference(s)

3GPP TS 44.318 sub-clause 6.3.2.3

81.2.5.2.2 Test purpose

To verify that the MS can register to another GANC if it gets redirected as a result of the Registration Update procedure.

81.2.5.2.3 Method of test

Initial conditions

System Simulator:

- 1GAN cell, default parameter
- 1 GSM cell, initially switched off

Mobile Station:

- MS in state GA-RC REGISTERED under no GSM coverage

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED as the Registration procedure to the new GANC is interrupted.

Test procedure

GSM cell is activated, MS is changing location area by going into GSM coverage area and Registration Update procedure is kicked off.

The SS is supposed to reply with .GA-RC REGISTER REDIRECT

The MS will then send GA-RC REGISTER REQUEST to the suggested GANC.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	SS			The GSM cell is activated.

2	→	GA-RC REGISTER UPDATE UPLINK	To serving GANC
3	←	GA-RC REGISTER REDIRECT	Suggest a different GANC
4	→	GA-RC REGISTER REQUEST	To the suggested GANC.

81.2.6 Registration Procedure, Deregister

81.2.6.1 Registration Procedure, Deregister, Network Congestion, MS in State GA-CSR DEDICATED

81.2.6.1.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'Network Congestion'
 - release all local GAN resources (e.g. MS is in active call over GAN)
 - release the TCP connection towards the current GANC and
 - release the secure connection towards the GANC-SEGW, as defined in sub-clause 4.5
 - create a random value between zero and the received value in IE 'TU3907 Timer' and
 - add this value to the received value in IE 'TU3907 Timer', and use this as the new value for TU3907
 - start timer TU3907 according to the new calculated value

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.1.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and starts to try to register again after receiving GA-RC DEREGISTER with cause 'Network Congestion'.

81.2.6.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-CSR DEDICATED with an active call

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Network Congestion'.

The MS is supposed to start the Registration procedure when TU3907 has expired.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: network congested. TU3907 is set to 10 sec.
2	MS			Release the active call
3	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
4	MS			The SS checks that the following step is initiated by the MS within min 10 and 20 sec
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.2.6.2 Registration Procedure, Deregister, AP Not Allowed, MS in State GA-RC REGISTERED

81.2.6.2.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'AP not allowed'
 - release the TCP connection established to the GANC, if still established,
 - release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5,
 - store the AP-ID in the AP Black List of and not initiate a new Register Request from this AP, until the AP-ID is removed from the AP black list i.e. as a result of power-cycle.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.2.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again after receiving GA-RC DEREGISTER with cause 'AP not allowed' until it is powercycled.

81.2.6.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'AP not allowed'.

The MS are not allowed to try to register again from the same AP. Therefore, wait for 5 minutes and then powercycle the MS so that the AP disappears from the AP black list and the MS can register again from that AP.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: AP not allowed.
2	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS			Wait for 5 minutes
4	MS			Powercycle the MS
5				MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.3 Registration Procedure, Deregister, Location Not Allowed, MS in State GA-CSR IDLE

81.2.6.3.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
 - else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'Location not allowed'
- release the TCP connection established to the GANC, if still established,
- release the secure connection towards the SEGW associated with the GANC, as defined in sub-clause 4.5,
- update the Location Black List according to the received information elements Location Black List indicator and Location Area Identification and not initiate a new Register Request from that Location, until the Location is removed from the Location Black List i.e. as a result of power-cycle.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.3.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again after receiving GA-RC DEREGISTER with cause 'Location not allowed' until it is powercycled.

81.2.6.3.3 Method of test

Initial conditions

System Simulator:

- 1 GSM cell, default parameters
- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the GSM cell (CGI)
- MS in state GA-CSR IDLE

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Location not allowed'.

The MS are not allowed to try to register again from the same Location area. Therefore, wait for 5 minutes and then powercycle the MS so that the LAI disappears from the Location black list and the MS can register again from that Location area.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: Location not allowed.
2	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS			Wait for 5 minutes
4	MS			Powercycle the MS
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.4 Registration Procedure, Deregister, IMSI Not Allowed

81.2.6.4.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
 - else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'IMSI not allowed'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,
- not initiate a new Registration procedure until the next power-on.

The MS shall also,

- Update the stored Serving GANC table as following if the received Reject cause was not 'Network Congestion' or 'Geo Location not known'
- If the MS is not in GERAN/UTRAN coverage
- Remove information related to the AP-ID, if exists in the table.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.4.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again after receiving GA-RC DEREGISTER with cause 'IMSI not allowed' until it is powercycled.

81.2.6.4.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

- Public DNS without knowledge of the default GANC's FQDN
- DNS inside of the SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN to the default GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'IMSI not allowed'.

The MS are not allowed to try to register again. Therefore, wait for 5 minutes and then powercycle the MS so that the MS can register again.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: IMSI not allowed.
2				Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS			Wait for 5 minutes
4	MS			Powercycle the MS
5				MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using FQDN
6	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.5 Registration Procedure, Deregister, Unspecified

81.2.6.5.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'Unspecified'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,

- act as if a "Lower layer failure in the MS" has occurred as defined in sub-clause 6.2.4.2

The MS shall also,

- Update the stored Serving GANC table as following if the received Reject cause was not 'Network Congestion' or 'Geo Location not known'
- If the MS is not in GERAN/UTRAN coverage
- Remove information related to the AP-ID, if exists in the table.

Lower layer failure in the MS can be for example related to DNS, IPsec or TCP. If any lower layer failure happens in the MS, the MS shall:

- release the TCP connection towards the current GANC, if established,
- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5 and
-
-

If registration is still unsuccessful after a number of attempts defined by the MS parameter "Up Connect Attempt Count" (defined in sub-clause 12.2.3), the MS shall act as defined in sub-clause 6.2.4.5.

- Otherwise, start timer TU3905 and wait for it to expire.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4 and 6.2.4.2

81.2.6.5.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and act as if it has discovered a lower layer fault when it receives the GA-RC DEREGISTER message with message code 'Unspecified' and the number of failed attempts doesn't exceed the Up Connection Attempt Count.

81.2.6.5.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the default GANC's FQDN
- DNS inside of the SEGW associated with the default GANC

Mobile Station:

- MS has stored the FQDN to the default GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Unspecified'.

The MS will try to register again to the default GANC.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, with reject cause: Unspecified.
2	MS			Release the TCP connection to the GANC and the secure connection to the SEGW and TU3905 is started
3	MS			TU3905 expires
4	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using FQDN
5	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.6 Registration Procedure, Deregister, Unspecified, Persistent Fault, Default GANC

81.2.6.6.1 Conformance requirement

3GPP TS 44.318, section 6.4.4:

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'Unspecified'
 - release the TCP connection established to the GANC, if still established.
 - release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,
 - act as if a "Lower layer failure in the MS" has occurred as defined in sub-clause 6.2.4.2

The MS shall also,

- Update the stored Serving GANC table as following if the received Reject cause was not 'Network Congestion' or 'Geo Location not known'
- If the MS is not in GERAN/UTRAN coverage
- Remove information related to the AP-ID, if exists in the table.

3GPP TS 44.318, section 6.2.4.2:

Lower layer failure in the MS can be for example related to DNS, IPsec or TCP. If any lower layer failure happens in the MS, the MS shall:

- release the TCP connection towards the current GANC, if established,
- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5 and
- If registration is still unsuccessful after a number of attempts defined by the MS parameter "Up Connect Attempt Count" (defined in sub-clause 12.2.3), the MS shall act as defined in sub-clause 6.2.4.5.
- Otherwise, start timer TU3905 and wait for it to expire.

3GPP TS 44.318, section 6.2.4.5:

else if the MS attempted the registration towards the Default GANC

- delete the stored information about the Default GANC,
- delete the contents of the stored Serving GANC table
- Increment Redirection Counter
- initiate Discovery Procedure as defined in sub-clause 5.3

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4 and 6.2.4.2, 6.2.4.5

81.2.6.6.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and will act as after a Registration Failure when it receives the GA-RC DEREGISTER message with message code 'Unspecified' and the number of failed attempts exceeds the Up Connection Attempt Count..

81.2.6.6.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS has stored the FQDN to the default GANC and its SEGW
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Unspecified'. The MS treat this as a lower layer fault and starts to try to set up the connection to the GANC again. The SS simulates a persistent lower layer fault and after three attempts the number of failed attempts has reached the 'Up Connect Attempt Count' parameter and the fault will be treated as a registration fault. The MS will perform a Discovery procedure towards the Provisioning GANC.

Specific Test Parameters

-

Maximum duration of test

2 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, with reject cause : Unspecified.
2	MS			Release the TCP connection to the serving GANC and the secure connection to the SEGW and TU3905 is started
3	MS			TU 3905 expires after 10 seconds
4	MS			MS tries to set up a secure connection to the default SEGW but fails. MS removes the secure connection. Number of Up Connect Attempts is increased to 1 and TU3905 is started
5	MS			TU 3905 expires after 10 seconds
6	MS			MS sets up a secure connection to the default SEGW and tries to set up a TCP connection to the default GANC but fails with the TCP connection. MS removes the TCP connection and the secure connection. Number of Up Connect Attempts is increased to 2 and TU3905 is started
7	MS			TU 3905 expires after 10 seconds
8	MS			MS sets up a secure connection to the default SEGW and tries to set up a TCP connection to the default GANC but fails with the TCP connection. MS removes the TCP connection and the secure connection. Number of Up Connect Attempts is increased to 3.
9	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the provisioning GANC
10	→		GA-RC DISCOVERY REQUEST	To provisioning GANC

81.2.6.7 Registration Procedure, Deregister, Invalid GANC, Serving GANC

81.2.6.7.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
- 'Invalid GANC'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,
- act as defined in sub-clause 6.2.4.5 "Registration Failure"

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.7.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again to the same GANC after receiving GA-RC DEREGISTER with cause 'Invalid GANC'.

81.2.6.7.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Invalid GANC'.

The MS will try to register to default GANC.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, invalid GANC.
2	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the default GANC using either IP address or FQDN
4	→		GA-RC REGISTER REQUEST	To default GANC

81.2.6.8 Registration Procedure, Deregister, Geo Location Not Known

81.2.6.8.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
 - else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'Geo Location not known'
- release the TCP connection established to the GANC, if still established.
- release the secure connection towards the SEGW associated with the GANC as defined in sub-clause 4.5,
- not retry registration from this AP until the location is provided or until the next power-on.

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.8.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and does not start to try to register again after receiving GA-RC DEREGISTER with cause 'Geo location not known' until it is powercycled.

81.2.6.8.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Geo location not known'.

The MS are not allowed to try to register again. Therefore, wait for 5 minutes and then powercycle the MS so that the MS can register again.

Specific Test Parameters

-

Maximum duration of test

6 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		

1	←	GA-RC DEREGISTER	From serving GANC, cause: Geo location not known'.
2			Release the TCP connection to the GANC and the secure connection to the SEGW
3	MS		Wait for 5 minutes
4	MS		Powercycle the MS
5			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→	GA-RC REGISTER REQUEST	To serving GANC

81.2.6.9 Registration Procedure, Deregister, MS Initiated

81.2.6.9.1 Conformance requirement

When the MS is leaving or about to leave the GAN coverage and the MS has successfully registered with a GANC, it should:

- send the GA-RC DEREGISTER -message using the currently established TCP-connection,
- release the TCP connection towards the GANC,
- release the secure connection towards the SEGW, as defined in sub-clause 4.5 and
- release all resources related to GAN

Reference(s)

3GPP TS 44.318 sub-clause 6.4.1

81.2.6.9.2 Test purpose

To verify that the MS sends GA-RC DEREGISTER when it is about to leave the AP e.g. when it is powered off.

81.2.6.9.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter
- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RC REGISTERED

Foreseen final state of the MS

The MS will be switched off.

Test procedure

The MS sends the GA-RC DEREGISTER message as it is switched off.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			Switch off the MS
2	→		GA-RC DEREGISTER	To serving GANC
3	MS			Release the TCP connection to the GANC and the secure connection to the SEGW

81.2.6.10 Registration Procedure, Deregister, Network Congestion, MS in State GA-RRC CONNECTED

81.2.6.10.1 Conformance requirement

When the MS receives the GA-RC DEREGISTER message, it shall:

- if the MS is in the process of PLMN selection;
- ignore the received Register Reject Cause Information Element, and
- proceed as defined in sub-clause 6.2.4.5.
- else extract the Reject Cause information element and act as following depending on the value of the Reject Cause IE:
 - 'Network Congestion'
 - release all local GAN resources (e.g. MS is in active call over GAN)
 - release the TCP connection towards the current GANC and
 - release the secure connection towards the GANC-SEGW, as defined in sub-clause 4.5
 - create a random value between zero and the received value in IE 'TU3907 Timer' and
 - add this value to the received value in IE 'TU3907 Timer', and use this as the new value for TU3907
 - start timer TU3907 according to the new calculated value

Reference(s)

3GPP TS 44.318 sub-clause 6.4.4

81.2.6.10.2 Test purpose

To verify that the MS changes state to GA-RC DEREGISTERED and starts to try to register again after receiving GA-RC DEREGISTER with cause 'Network Congestion'.

81.2.6.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

- Public DNS without knowledge of the serving GANC's FQDN
- DNS inside of the SEGW associated with the serving GANC

Mobile Station:

- MS has stored the FQDN to the serving GANC and its SEGW associated with the AP-ID
- MS in state GA-RRC CONNECTED (CS sublayer entity or CS sublayer entity or both CS and PS CS sublayer entities)

Foreseen final state of the MS

The MS will change state to GA-RC DEREGISTERED.

Test procedure

The SS initiates the deregistration by sending GA-RC DEREGISTER with cause 'Network Congestion'.

The MS is supposed to start the Registration procedure when TU3907 has expired.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	←		GA-RC DEREGISTER	From serving GANC, cause: network congested. TU3907 is set to 10 sec.
2	MS			Release the active call
3	MS			Release the TCP connection to the GANC and the secure connection to the SEGW
4	MS			The SS checks that the following step is initiated by the MS within min 10 and 20 sec
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.3 Lower Layer Faults

81.3.1 TCP Reset

81.3.1.1 TCP Reset, Successful Re-establishment, MS in State GA-CSR DEDICATED

81.3.1.1.1 Conformance requirement

When MS receives TCP RST after TCP connection failure, it shall attempt to re-establish TCP connection once. After successfully re-establishing TCP connection, the MS shall send GA-RC SYNCHRONIZATION INFORMATION to the GANC to synchronize the state information. If unsuccessful, the MS shall release the related local GA-CSR or GA-PSR resources, and continue as per section 9.5.

Reference(s)

3GPP TS 44.318 sub-clause 6.6.1.

81.3.1.1.2 Test purpose

To verify that the MS can re-establish the TCP connection after receiving a TCP Reset.

81.3.1.1.3 Method of test**Initial conditions****System Simulator:**

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR DEDICATED
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will stay in GA-CSR DEDICATED.

Test procedure

The MS starts in GA-CSR DEDICATED.

The SS sends a TCP RST and the MS re-establishes the TCP connection and sends the GA-RC SYNCHRONISATION INFORMATION message.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-CSR DEDICATED
2	SS			The SS sends TCP RST
3	MS			The MS re-establishes the TCP connection
4	→		GA-RC SYNCHRONIZATION INFORMATION	To serving GANC

81.3.1.2 TCP Reset, Unsuccessful Re-establishment, MS in State GA-CSR IDLE**81.3.1.2.1 Conformance requirement**

When MS receives TCP RST after TCP connection failure, it shall attempt to re-establish TCP connection once. After successfully re-establishing TCP connection, the MS shall send GA-RC SYNCHRONIZATION INFORMATION to the GANC to synchronize the state information. If unsuccessful, the MS shall release the related local GA-RC or GA-PSR resources, and continue as per section 9.5.

Reference(s)

3GPP TS 44.318 sub-clause 6.6.1.

81.3.1.2.2 Test purpose

To verify that the MS can re-establish the TCP connection after receiving a TCP Reset.

81.3.1.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR IDLE
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will change to GA-RC DEREGISTERED.

Test procedure

The MS starts in GA-CSR IDLE.

The SS sends a TCP RST and the MS tries to re-establish the TCP connection. When that fails it start timer TU3905 and tries to register again when the timer expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-CSR IDLE
2	SS			The SS sends TCP RST
3	MS			The MS tries to re-establish the TCP connection, the SS doesn't reply. MS starts timer TU3905
4	MS			Wait for 10 seconds
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.3.1.3 TCP Reset, Successful Re-establishment, MS in State GA-RRC-CONNECTED (CS domain)

81.3.1.3.1 Conformance requirement

When MS receives TCP RST after TCP connection failure, it shall attempt to re-establish TCP connection once. After successfully re-establishing TCP connection, the MS shall send GA-RC SYNCHRONIZATION INFORMATION to the GANC to synchronize the state information. If unsuccessful, the MS shall release the related local GA-RRC resources, and continue as per section 9.5.

Reference(s)

3GPP TS 44.318 sub-clause 6.6.1.

81.3.1.3.2 Test purpose

To verify that the MS can re-establish the TCP connection after receiving a TCP Reset.

81.3.1.3.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-RRC-CONNECTED (CS domain)
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will stay in GA-RRC-CONNECTED (CS domain).

Test procedure

The MS starts in GA-RRC-CONNECTED (CS domain).

The SS sends a TCP RST and the MS re-establish the TCP connection and send the GA-RC SYNCHRONISATION INFORMATION message.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-RRC-CONNECTED (CS domain)
2	SS			The SS sends TCP RST

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-RRC-IDLE (CS and PS domains)
2	SS			The SS sends TCP RST
3	MS			The MS tries to re-establish the TCP connection, the SS doesn't reply. MS starts timer TU3905
4	MS			Wait for 10 seconds
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.3.2 Lower Layer Faults, MS is Registered

81.3.2.1 IPsec Tunnel Failure, MS in State GA-CSR IDLE

81.3.2.1.1 Conformance requirement

The handling of lower layer failures in the MS while in the GA-RC-DEREGISTERED state is described in sub-clauses 5.6.2 and 6.2.4.2.

The handling of lower layer failures in the MS while not in the GA-RC-DEREGISTERED state is described below:

For all lower layer failures in the MS (for example related to DNS, IPsec or TCP failures other than RST) except the TCP connection failure specified in section 6.6, the MS shall:

- release the TCP connection towards the current GANC, if established,
- stop timer TU3906,
- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5,
- start timer TU3905, and
- enter GA-RC-DEREGISTERED state.

Reference(s)

3GPP TS 44.318 sub-clause 9.5.

81.3.2.1.2 Test purpose

To verify that the MS tries to register again after a lower layer fault when in state GA-CSR IDLE.

81.3.2.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR IDLE
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will change to GA-RC DEREGISTERED.

Test procedure

The MS starts in GA-CSR IDLE.

The SS removes the Ipsec tunnel. When that happens the MS starts timer TU3905 and tries to register again when the timer expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-CSR IDLE
2	SS			The SS removes the Ipsec tunnel
3	MS			MS starts timer TU3905
4	MS			Wait for 10 seconds

5	MS		MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→	GA-RC REGISTER REQUEST	To serving GANC

81.3.2.2 TCP Failure, MS in State GA-CSR DEDICATED

81.3.2.2.1 Conformance requirement

The handling of lower layer failures in the MS while in the GA-RC-DEREGISTERED state is described in sub-clauses 5.6.2 and 6.2.4.2.

The handling of lower layer failures in the MS while not in the GA-RC-DEREGISTERED state is described below:

For all lower layer failures in the MS (for example related to DNS, IPsec or TCP failures other than RST) except the TCP connection failure specified in section 6.6, the MS shall:

- release the TCP connection towards the current GANC, if established,
- stop timer TU3906,
- release the secure connection towards SEGW of the current GANC, if established, as defined in sub-clause 4.5,
- start timer TU3905, and
- enter GA-RC-DEREGISTERED state.

Reference(s)

3GPP TS 44.318 sub-clause 9.5

81.3.2.2.2 Test purpose

To verify that the MS tries to register again after a lower layer fault when in state GA-CSR DEDICATED.

81.3.2.2.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR DEDICATED
- The MS has the IP address or the FQDN for the serving GANC

Foreseen final state of the MS

The MS will change to GA-RC DEREGISTERED.

Test procedure

The MS starts in GA-CSR DEDICATED.

The SS removes the Ipsec tunnel. When that happens the MS starts timer TU3905 and tries to register again when the timer expires.

Specific Test Parameters

-

Maximum duration of test

1 min.

Expected sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS starts in GA-CSR DEDICATED
2	SS			The SS removes the Ipsec tunnel
3	MS			MS starts timer TU3905
4	MS			Wait for 10 seconds
5	MS			MS sets up secure connection to the SEGW and establishes a TCP connection to the serving GANC using either IP address or FQDN
6	→		GA-RC REGISTER REQUEST	To serving GANC

81.3.2.3 IPsec Tunnel Failure, MS in State GA-RRC-IDLE (CS and PS domains)

81.3.2.3.1 Conformance requirement

The handling of lower layer failures in the MS while in the GA-RC-DEREGISTERED state is described in sub-clauses 5.6.2 and 6.2.4.2.

The handling of lower layer failures in the MS while not in the GA-RC-DEREGISTERED state is described below:

For all lower layer failures in the MS (for example related to DNS, IPsec or TCP failures other than RST) except the TCP connection failure specified in section 6.6, the MS shall:

82 GAN CS Domain Procedures

82.1 GA-CSR connection establishment

82.1.1 GA-CSR connection establishment / successful case

82.1.1.1 GA-CSR connection establishment, Upper Layer Message Transmission and GA-CRS connection release by GANC

82.1.1.1.1 Conformance requirement

The GA-CSR connection is a logical connection between the MS and the GANC. It is established when the upper layers in the MS request GA-CSR to enter dedicated mode. The MS initiates GA-CSR connection establishment by sending the GA-CSR REQUEST message to the network. When a successful response is received from the network, GA-CSR replies to the upper layer that it has entered dedicated mode. The upper layers have then the possibility to request transmission of messages to the network. These messages are sent to the network using GA-CSR UPLINK DIRECT TRANSFER messages as defined in sub-clause 7.2.1.

The GA-CSR UPLINK DIRECT TRANSFER message is used for the transfer of upper layer messages from the MS to the GANC while the GA-CSR DOWNLINK DIRECT TRANSFER message is used for the transfer of upper layer messages from the GANC to the MS. The first GA-CSR UPLINK DIRECT TRANSFER message received by the GANC triggers the establishment of the signalling connection to the CN for that MS.

The GANC initiates this procedure to command the MS to release the GA-CSR and any traffic channel resources and instruct the MS to leave GA-CSR-DEDICATED state.

The GA-CSR RELEASE message will include an RR cause indication as follows:

- #0: normal release, e.g. at the end of a call.
- #1: unspecified abnormal release.
- #65: if e.g. a handover procedure is stopped because the call has been cleared.

When the MS receives the GA-CSR RELEASE message, it shall:

- transmit a GA-CSR RELEASE COMPLETE message to the GANC and release all GA-CSR and any traffic channel resources,
- Enter GA-CSR-IDLE state.

Reference(s)

3GPP TS 44.318 subclause 7.1 / 7.2 / 7.5.3 / 7.5.4

82.1.1.1.2 Test purpose

To verify that MS is able to initiate GA-CSR connection establishment between the MS and GANC and to verify that MS is able to communicate with the CN by encapsulating upper layer messages (CC/MM/SS/SMS messages) to GA-CSR UPLINK DIRECT TRANSFER container message and able to receive upper layer messages within GA-CSR DOWNLINK DIRECT TRANSFER container message.

To verify that MS is able to release the GA-CSR connection, able to move into GA-CSR-IDLE state and release all GA-CSR and any traffic channel resources, when the MS receives the GA-CSR RELEASE message from SS.

82.1.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-IDLE state in service of GAN cell

Foreseen Final State of the MS

MS in GA-CSR-IDLE state.

Test Procedure

The MS is made to initiate a GA-CSR connection establishment. The MS moves into GA-CSR-DEDICATED state when the MS receives the GA-CSR REQUEST ACCEPT message from the SS within timer TU3908 (5 sec.) from sending GA-CSR REQUEST message. SS verifies that MS sends GA-CSR UPLINK DIRECT TRANSFER message within 10s from GA-CSR REQUEST ACCEPT message. The SS answers by sending upper layer message within GA-CSR DOWNLINK DIRECT TRANSFER container message.

The SS sends GA-CSR RELEASE message. The MS enters GA-CSR-IDLE state and transmits a GA-CSR RELEASE COMPLETE to the SS and releases all GA-CSR and any traffic channel resources.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is made to initiate GA-CSR connection
2	MS			MS checks for access permission based on Access Control Class bits
3	→		GA-CSR REQUEST	
4	←		GA-CSR REQUEST ACCEPT	
5	MS			MS in GA-CSR-DEDICATED state
6	→		GA-CSR UPLINK DIRECT TRANSFER	Within 10s from GA-CSR REQUEST ACCEPT message Containing (UL) CC/MM/SS/SMS message
7	←		GA-CSR DOWNLINK DIRECT TRANSFER	Containing (DL) CC/MM/SS/SMS message
8	←		GA-CSR RELEASE	IE 'RR cause' indicates #0
9	→		GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.1.2 GA-CSR connection establishment / negative cases

82.1.2.1 GA-CSR REQUEST rejected

82.1.2.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.1.2.2:

If the GANC rejects the GA-CSR connection establishment request, it shall send the GA-CSR REQUEST REJECT message to the MS.

3GPP TS 44.318 subclause 7.1.3.2:

When the MS receives the GA-CSR REQUEST REJECT message, it shall:

- if timer TU3908 is active:

- stop timer TU3908,
- remain in GA-CSR-IDLE state and
- indicate to upper layers that GA-CSR was not able to enter dedicated state

3GPP TS 44.318 subclause 7.3.2:

If the mobile identity in the GA-CSR PAGING REQUEST message matches any of the valid identities of the MS and the MS is in GA-CSR-IDLE state, the MS shall:

- if timer TU3908 is not active and access to the network is allowed;
- send a GA-CSR PAGING RESPONSE message to the GANC and
- enter GA-CSR-DEDICATED state.

Reference(s)

3GPP TS 44.318 subclauses 7.1.2.2 / 7.1.3.2 / 7.3.2

82.1.2.1.2 Test purpose

To verify that MS will remain in GA-CSR-IDLE state when MS receives the GA-CSR REQUEST REJECT message.

82.1.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-IDLE state in service of GAN cell

Foreseen Final State of the MS

MS in GA-CSR- IDLE state.

Test Procedure

The MS is made to initiate a GA-CSR connection establishment. SS sends the GA-CSR REQUEST REJECT message to the MS. MS is not able to enter GA-CSR-DEDICATED state. The SS sends GA-CSR PAGING REQUEST to verify that MS in GA-CSR-IDLE state. MS answers by sending GA-CSR PAGING RESPONSE.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is made to initiate GA-CSR connection
2	MS			MS checks for access permission based on Access Control Class bits
3	→		GA-CSR REQUEST	TU3908 is started
4	←		GA-CSR REQUEST REJECT	The SS sends GA-CSR REQUEST REJECT before the expiry of TU3908.

5	MS		MS in GA-CSR-IDLE state
6	←	GA-CSR PAGING REQUEST	Valid identity of the MS ('TMSI'/'IMSI')
7	→	GA-CSR PAGING RESPONSE	MS enters GA-CSR-DEDICATED state
8	←	GA-CSR RELEASE	IE 'RR cause' indicates #0
9	→	GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state

82.1.2.2 MS receives GA-CSR REQUEST ACCEPT message after TU3908 expiry

82.1.2.2.1 Conformance requirement

If the GANC accepts the GA-CSR connection establishment request, it shall send the GA-CSR REQUEST ACCEPT message to the MS.

When the MS receives the GA-CSR REQUEST ACCEPT message, it shall:

- if timer TU3908 is active:
- stop timer TU3908,
- move into GA-CSR-DEDICATED state,
- indicate to upper layers that GA-CSR has entered dedicated state and
- send the initial GA-CSR UPLINK DIRECT TRANSFER message to the network
 - if timer TU3908 is not active:
- ignore the GA-CSR REQUEST ACCEPT message and
- continue with any ongoing procedure as if the GA-CSR REQUEST ACCEPT message was not received
 - If timer TU3908 expires in the MS, the MS shall remain in GA-CSR-IDLE state and indicate to upper layers that GA-CSR was not able to enter dedicated state

If the mobile identity in the GA-CSR PAGING REQUEST message matches any of the valid identities of the MS and the MS is in GA-CSR-IDLE state, the MS shall:

- if timer TU3908 is not active and access to the network is allowed;
- send a GA-CSR PAGING RESPONSE message to the GANC and
- enter GA-CSR-DEDICATED state.
 - if timer TU3908 is active;
 - discard the received GA-CSR PAGING REQUEST message.

2	←		GA-CSR PAGING REQUEST	Valid identity of the MS ('TMSI'/'IMSI')
3	MS			MS ignores the GA-CSR PAGING REQUEST and continues with ongoing procedure
4	SS			SS waits 10s for response
5	←		GA-CSR RELEASE	IE 'RR cause'

6	→	GA-CSR RELEASE COMPLETE	MS enters GA-CSR-IDLE state
---	---	-------------------------	-----------------------------

82.3.2.4 MS receives GA-CSR PAGING REQUEST when in GA-RC REGISTERED state

82.3.2.4.1 Conformance requirement

If the MS receives a GA-CSR PAGING REQUEST message and MS is in GA-CSR-DEDICATED state or GA-RC-REGISTERED state, the MS shall:

- ignore the GA-CSR PAGING REQUEST message
- continue with any ongoing procedure as if the GA-CSR PAGING REQUEST was not received.

Reference(s)

3GPP TS 44.318 subclause 7.3.4

82.3.2.4.2 Test purpose

To verify that MS ignores the GA-CSR PAGING REQUEST and continues with any ongoing procedure as if the GA-CSR PAGING REQUEST was not received, if MS receives GA-CSR PAGING REQUEST when MS is in GA-RC-REGISTERED state.

82.3.2.4.3 Method of test

Initial Conditions

System Simulator:

- 2 cells: GERAN cell & GAN cell
- 1 GERAN cell, default parameters
- 1 GAN cell, default parameters

Mobile Station:

- MS in GERAN mode camped on a GERAN cell, voice call activated and in GA-RC-REGISTERED state

Foreseen Final State of the MS

MS in GA-CSR- IDLE state.

Test Procedure

MS is camped on a GERAN cell, voice call activated and in GA-RC-REGISTERED state. The SS initiates paging procedure by sending GA-CSR PAGING REQUEST message to the MS. The MS ignores the GA-CSR PAGING REQUEST and continues with any ongoing procedure as if the GA-CSR PAGING REQUEST was not received. After 10s, the voice call is deactivated to switch the serving RR entity to GA-CSR. The SS waits 30 seconds to ensure that the MS enters the GA-CSR-IDLE state and sends GA-CSR PAGING REQUEST to verify that MS in GA-CSR-IDLE state. MS answers by sending GA-CSR PAGING RESPONSE.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

82.4 Traffic Channel assignment

82.4.1 Traffic Channel assignment / successful cases

82.4.1.1 Traffic Channel assignment

82.4.1.1 Traffic Channel assignment and Release

82.4.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.4.2:

The MS shall act on the received GA-CSR ACTIVATE CHANNEL message when in GA-CSR-DEDICATED state as follows:

- Code and decode the CS payload samples according to the IE "Channel Mode";
- Use the value indicated by the IE "Sample Size" as the minimum sampling size for the coding and decoding of the CS payload samples, if the MS is not able to use the indicated value. If AMR is used with FEC by sending redundant frames, the sample size is defined as the size of the new speech sample in each RTP packet, not including any redundant speech sample.
- Configure the uplink CS payload stream to be transmitted to the UDP port identified by the IE "UDP Port";
- Configure the uplink CS payload stream to be transmitted to the IP address identified by the IE "IP address";
- If received, use the configuration included in the IE 'Multi-rate Configuration' for the CS payload stream;
- If received, use the configuration included in the IE "RTP Redundancy Configuration" for the CS payload stream. The redundancy policy is defined for each of the AMR modes to use. The level of redundancy can span from no redundancy to double redundancy. In the same active codec set, a lower codec mode shall not be associated with a lower redundancy level than a higher codec mode. For example, the highest mode in the set is used with no redundancy, the next lower with single redundancy and rest of the modes with double redundancy;
- If received, use the Payload Type included in the IE 'Payload Type' for the PT field in the RTP header for the CS downlink and uplink payload streams;
- On successful activation of the channel, the MS shall:
 - Transmit a GA-CSR ACTIVATE CHANNEL ACK message and include the UDP port number in the IE 'UDP Port' for the downlink CS payload stream to be used by the GANC.
 - Include the selected RTP sample size, to be used uplink and downlink, in the IE Sample Size.

- if the IE 'RTCP UDP Port' was received in the GA-CSR ACTIVATE CHANNEL message and the MS is capable of supporting RTCP, activate the uplink RTCP stream and include the IE 'RTCP UDP Port' for the downlink RTCP stream to be used by the GANC.

3GPP TS 44.318 subclause 7.4.4:

The RTP channel is available for use by upper layers. To enable uplink quality measurements in the GANC, the MS shall send at least one RTP frame each 480 ms. The AMR payload Table of Contents shall indicate NO_DATA if there is no speech or SID frames to send.

3GPP TS 44.318 subclause 7.5.1:

If the MS needs to release the GA-CSR connection and signalling connection to the core network, it shall send the GA-CSR CLEAR REQUEST message to the GANC. The MS shall include the 'RR Cause' IE.

Reference(s)

3GPP TS 44.318 subclauses 7.4.2 / 7.4.4/ 7.5.1

82.4.1.1.2 Test purpose

To verify that MS is able to establish a GAN traffic channel.

The MS initiates the release the GA-CSR connection by sending GA-CSR CLEAR REQUEST to the SS. The MS enters GA-CSR-IDLE state and releases all GA-CSR and any traffic channel resources.

82.4.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-DEDICATED state in service of GAN cell and a voice call is ongoing.

Foreseen Final State of the MS

MS in GA-CSR-IDLE state in service of GAN cell.

Test Procedure

A voice call is ongoing. The SS configures a traffic channel by transmitting GA-CSR ACTIVATE CHANNEL to the MS. MS responds by transmitting a GA-CSR ACTIVATE CHANNEL ACK with the IE 'UDP Port'. Then the SS configures itself for transmission of RTP packets to the MS to the indicated UDP port and transmits a GA-CSR ACTIVATE CHANNEL COMPLETE message to the MS. MS and SS sends at least one RTP frame each 480 ms. The SS releases the call by sending GA-CSR DL DIRECT TRANSFER message (Release) and receiving GA-CSR UL DIRECT TRANSFER (Release Complete) message. Therefore, the MS will send GA-CSR CLEAR REQUEST to release CSR connection.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-CSR-DEDICATED state, voice call is ongoing.

2	←	GA-CSR ACTIVATE CHANNEL	IE 'Channel Mode', IE 'Sample Size', IE 'UDP Port', IE 'IP address', optional IE 'Multi-rate Configuration', optional IE 'RTP Redundancy Configuration', optional IE 'Payload Type'.
3	→	GA-CSR ACTIVATE CHANNEL ACK	IE 'UDP Port', optional IE 'RTCP UDP Port'
4	←	GA-CSR ACTIVATE CHANNEL COMPLETE	
5	→		Verify that the MS sends at least one RTP frame
6	←	GA-CSR DL DIRECT TRANSFER (Release)	
7	→	GA-CSR UL DIRECT TRANSFER (Release Complete)	Eventual CC L3 messages are ignored.
8	→	GA-CSR CLEAR REQUEST	

82.4.2 Traffic Channel assignment / negative cases

82.4.2.1 MS fails to establish the traffic channel

82.4.2.1.1 Conformance requirement

If the MS fails to establish the channel indicated in the GA-CSR ACTIVATE CHANNEL the MS shall:

- transmit a GA-CSR ACTIVATE CHANNEL FAILURE message
- act as if the GA-CSR ACTIVATE CHANNEL message was not received.

Reference(s)

3GPP TS 44.318 subclause 7.4.5

82.4.2.1.2 Test purpose

To verify that if MS fails to establish the traffic channel, it transmits a GA-CSR ACTIVATE CHANNEL FAILURE and act as if the GA-CSR ACTIVATE CHANNEL was not received.

82.4.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-CSR-DEDICATED state in service of GAN cell and a voice call is ongoing.

Foreseen Final State of the MS

MS in GA-CSR- IDLE state in service of GAN cell.

Test Procedure

A voice call is ongoing. The SS configures a traffic channel by transmitting corrupted GA-CSR ACTIVATE CHANNEL to the MS. In the corrupted GA-CSR ACTIVATE CHANNEL message "Sample Size" octet 3 is set to "1" (1ms), which is a undefined value.

MS fails to establish the traffic channel and transmits a GA-CSR ACTIVATE CHANNEL FAILURE and acts as if the GA-CSR ACTIVATE CHANNEL was not received.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-CSR-DEDICATED state, voice call is ongoing
2	←		GA-CSR ACTIVATE CHANNEL	This message has non-supportive configuration, with a "Sample Size" octet 3 set to "1"

82.5.1.2 Void

82.6 Classmark Indication

82.6.1 Classmark Indication Procedure

82.6.1.1 Classmark Indication, Initiation of Classmark Interrogation by MS

82.6.1.1.1 Conformance requirement

On receipt of the GA-CSR CLASSMARK ENQUIRY message or in case of "early classmark sending" procedure based on the system information indication received in GA-RC REGISTER ACCEPT message, the mobile station sends a GA-CSR CLASSMARK CHANGE message to the GANC.

The MS shall include the IE "Mobile Classmark 2" in the GA-CSR CLASSMARK CHANGE. It may also contain a IE "Mobile Classmark 3" depending on the MS capabilities.

In addition a MS supporting UTRAN sends a GA-CSR UTRAN CLASSMARK CHANGE message.

The Classmark Enquiry Mask information element in the GA-CSR CLASSMARK ENQUIRY message indicates the type of request. If the Classmark Enquiry Mask information element is not included in the GA-CSR CLASSMARK ENQUIRY message, this indicates a request for GA-CSR CLASSMARK CHANGE message.

Reference(s)

3GPP TS 44.318 sub-clause 7.6.2

82.6.1.1.2 Test purpose

To verify that the MS replies the GA-CSR CLASSMARK ENQUIRY correctly.

82.6.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR-DEDICATED

Foreseen final state of the MS

MS in GA-CSR- IDLE state.

Test procedure

The SS sends the GA-CSR CLASSMARK ENQUIRY message. The MS replies with the GA-CSR CLASMARK CHANGE message.

Specific Test Parameters

-

Maximum duration of test

1 min.

82.7 Handover to GAN

82.7.1 Handover to GAN / successful cases

82.7.1.1 Handover from GERAN to GAN

82.7.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.7.1:

The procedure is initiated when the source radio access technology (e.g. GERAN) orders the MS to make handover to GAN.

The procedure is applicable in GA-RC REGISTERED state provided the conditions described in Annex C: "(Source-RAT) Measurement Report for Handover and Cell Change Order to GAN" are met.

The handover order in the source radio access technology mode is sent via the (RR) HANDOVER COMMAND message. If the ARFCN and BSIC parameters included in the Cell Description IE in the (RR) HANDOVER COMMAND message (specified in [12]) match those of the GAN cell, the MS shall:

- send a GA-CSR HANDOVER ACCESS message to the network including the complete (RR) HANDOVER COMMAND message in the Handover To GAN Command IE and enter GA-CSR-DEDICATED state;

NOTE: sending the complete (RR) HANDOVER COMMAND message in the Handover To GAN Command IE instead of the Handover Reference IE allows for more than 256 concurrent handover requests

- if non-signalling mode is indicated in Channel Mode IE, the MS shall:
- start timer TU3920;

3GPP TS 44.318 subclause 7.7.3:

- If the traffic channel assignment was successfully completed within timer TU3920, the MS shall:
- stop timer TU3920;
- send a GA-CSR HANDOVER COMPLETE message to the network;
- switch to GAN mode i.e. attach the GA-RR entity to the RR-SAP;

In addition the MS shall send upper layer messages for which LAPDm has not yet received acknowledgement from the network to the network using the GA-RR entity.

Reference(s)

3GPP TS 44.318 subclause 7.7.1 / 7.7.3

82.7.1.1.2 Test purpose

To verify that MS completes the handover procedure from GERAN to GAN successfully.

82.7.1.1.3 Method of test

Initial Conditions

System Simulator:

- 2 cells: GERAN cell & GAN cell
- 1 GERAN cell, default parameters
- 1 GAN cell, default parameters

Mobile Station:

- MS in GERAN mode in service of GERAN cell, voice call activated and in GA-RC-REGISTERED state

Foreseen Final State of the MS

MS in GA-CSR-IDLE state. Test Procedure

The MS is in GERAN mode in service of GERAN cell, voice call activated. MS sends MEASUREMENT REPORT with GAN-ARFCN within cell info list to GERAN cell and MS has not detected GSM neighbour cell matching the {GAN-ARFCN, GAN-BSIC} couple. SS sends (RR) HANDOVER COMMAND with ARFCN and BSIC in 'Cell Description' IE matched of the GAN cell. MS sends a GA-CSR HANDOVER ACCESS message to the GAN network with the complete (RR) HANDOVER COMMAND message in the 'Handover To GAN Command' IE and enters GA-CSR-DEDICATED state. MS establishes GAN traffic channel with SS and MS sends GA-CSR HANDOVER COMPLETE message to the SS.

8	MS		MS terminates handover procedure and resumes connection on GERAN cell
9	→	HANDOVER FAILURE	Sent on GERAN cell

82.8 Handover from GAN

82.8.1 Handover from GAN / successful cases

82.8.1.1 Handover from GAN to GERAN

82.8.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 7.8.1:

The purpose of this procedure is to transfer, upon request from the MS (and under the control of the GAN), a connection between MS and GAN to another radio access technology (e.g. GERAN).

The procedure is applicable in GA-CSR-DEDICATED state.

The procedure may be initiated by the MS based on:

- local measurements of GAN coverage signal quality;
- reception of a GA-CSR UPLINK QUALITY INDICATION message indicating poor uplink quality in the *UL Quality Indication* IE; If the UL Quality Indication IE indicates "Network problem" a handover out to GERAN or UTRAN should be attempted. In case the UL Quality Indication information element shows "Radio problem" or "Undetermined problem" a search for a new access point should be done before the handover out is initiated;
- reception of RTCP packets indicating poor uplink quality;
- excessive loss or delay in the received RTP packets.

When the MS decides to trigger the handover from GAN, it shall:

- send a GA-CSR HANDOVER INFORMATION message to the network including a list of candidate/ target cell identifiers ranked in order of preference which is the most recent list available from the other radio access technology (e.g. GSM RR) and including the received signal strength for each identified GERAN or UTRAN cell. The MS may include GERAN cells, UTRAN cells or both.

3GPP TS 44.318 subclause 7.8.3:

The MS shall:

- suspend all NAS layer signalling transmissions;
- start the connection establishment to the target radio access technology (e.g. GERAN) by using the contents of the Handover From GAN Command IE. This message carries information about the candidate/ target cell identifier and radio parameters relevant for the target radio access technology;

A MS that is simultaneously operating in GPRS and CS modes over GAN shall follow the procedure as outlined in 3GPP TS 43.055 when it switches to target cell.

NOTE: The requirements concerning the establishment of the radio connection towards the target radio access technology (e.g. GERAN) and the signalling procedure are outside of the scope of this specification.

3GPP TS 44.318 subclause 7.8.4:

Upon successfully completing the handover, the GANC should:

- release all radio resources associated with the GAN connection.

Upon successfully completing the handover, the MS shall:

- switch to target radio access technology (e.g. GERAN) mode i.e. detach the GA-RR entity from the RR-SAP;
- enter GA- RC -REGISTERED state.

NOTE: The release of the GAN radio resources is initiated from the target RAT. The MS may deregister from the GANC (as defined in sub-clause 6.4) after successfully completing the handover. If the MS chooses to deregister from the GANC, it may do so either immediately after successfully completing the handover or after sending the GA-CSR RELEASE COMPLETE message to the GANC in response to the GA-CSR RELEASE message from the GANC.

82.8.1.2 Handover from GAN to UTRAN

82.8.1.2.1 Conformance requirement

3GPP TS 44.318 subclause 7.8.1:

The purpose of this procedure is to transfer, upon request from the MS (and under the control of the GAN), a connection between MS and GAN to another radio access technology (e.g. GERAN).

The procedure is applicable in GA-CSR-DEDICATED state.

The procedure may be initiated by the MS based on:

- local measurements of GAN coverage signal quality;
- reception of a GA-CSR UPLINK QUALITY INDICATION message indicating poor uplink quality in the *UL Quality Indication* IE; If the UL Quality Indication IE indicates "Network problem" a handover out to GERAN or UTRAN should be attempted. In case the UL Quality Indication information element shows "Radio problem" or "Undetermined problem" a search for a new access point should be done before the handover out is initiated;
- reception of RTCP packets indicating poor uplink quality;
- excessive loss or delay in the received RTP packets.

When the MS decides to trigger the handover from GAN, it shall:

- send a GA-CSR HANDOVER INFORMATION message to the network including a list of candidate/ target cell identifiers ranked in order of preference which is the most recent list available from the other radio access technology (e.g. GSM RR) and including the received signal strength for each identified GERAN or UTRAN cell. The MS may include GERAN cells, UTRAN cells or both.

3GPP TS 44.318 subclause 7.8.3:

The MS shall:

- suspend all NAS layer signalling transmissions;

- start the connection establishment to the target radio access technology (e.g. GERAN) by using the contents of the *Handover From GAN Command* IE. This message carries information about the candidate/ target cell identifier and radio parameters relevant for the target radio access technology;

A MS that is simultaneously operating in GPRS and CS modes over GAN shall follow the procedure as outlined in 3GPP TS 43.055 when it switches to target cell.

NOTE: The requirements concerning the establishment of the radio connection towards the target radio access technology (e.g. GERAN) and the signalling procedure are outside of the scope of this specification.

3GPP TS 44.318 subclause 7.8.4:

Upon successfully completing the handover, the GANC should:

- release all radio resources associated with the GAN connection.

Upon successfully completing the handover, the MS shall:

- switch to target radio access technology (e.g. GERAN) mode i.e. detach the GA-RR entity from the RR-SAP;
- enter GA- RC -REGISTERED state.

NOTE: The release of the GAN radio resources is initiated from the target RAT. The MS may deregister from the GANC (as defined in sub-clause 6.4) after successfully completing the handover. If the MS chooses to deregister from the GANC, it may do so either immediately after successfully completing the handover or after sending the GA-CSR RELEASE COMPLETE message to the GANC in response to the GA-CSR RELEASE message from the GANC.

82.9 Ciphering Configuration Procedure

82.9.1 Ciphering Configuration Procedure, Normal cases

82.9.1.1 Ciphering Configuration Procedure

82.9.1.1.1 Conformance requirement

The network initiates the ciphering mode setting procedure by sending a GA-CSR CIPHERING MODE COMMAND message to the mobile station, indicating whether ciphering shall be used or not, and if yes which algorithm to use.

Additionally, the network may, by the use of the cipher response information element, request the mobile station to include its IMEISV in the GA-CSR CIPHERING MODE COMPLETE message.

Whenever the mobile station receives a valid GA-CSR CIPHERING MODE COMMAND message, it shall, if a SIM is present and considered valid and the ciphering key sequence number stored on the SIM indicates that a ciphering key is available, save information about the ciphering key to use if the MS is later performing Handover from GAN. A valid GA-CSR CIPHERING MODE COMMAND message is defined to be one of the following:

- one that indicates "start ciphering" and is received by the mobile station in the "not ciphered" mode;
- one that indicates "no ciphering" and is received by the MS in the "not ciphered" mode; or
- one that indicates "no ciphering" and is received by the mobile station in the "ciphered" mode.

Other GA-CSR CIPHERING MODE COMMAND messages shall be regarded as erroneous, and a GA-CSR STATUS message with cause "Protocol error unspecified" shall be returned, and no further action taken.

The MS shall also calculate a MAC (Message Authentication Code). The MAC shall be calculated over the following data:

RAND | IMSI

using "HMAC-SHA1-96" algorithm, as specified in [24] with Kc as authentication key.

In the formulas above, the "|" character denotes concatenation. RAND is the 16-octet random number received from the GANC in the GA-CSR CIPHERING MODE COMMAND message. IMSI is the MS IMSI, in the same format as defined for the Mobile Identity IE as defined in [8 / 3GPP TS 44.318 v.6.0.0] i.e. as a variable-length sequence of digits in BCD format (e.g. the IMSI "123456789098765" is encoded as the following octets (in hexadecimal): "21 43 65 87 09 89 67 F5"). Network byte order is used.

The Kc key is the Kc that has been derived during the last authentication. The length of the MAC is 12 octets.

When the appropriate action on the GA-CSR CIPHERING MODE COMMAND message has been taken, the mobile station sends back a GA-CSR CIPHERING MODE COMPLETE message. If the "cipher response" field of the cipher response information element in the GA-CSR CIPHERING MODE COMMAND message specified "IMEISV must be included" the mobile station shall include its IMEISV in the GA-CSR CIPHERING MODE COMPLETE message.

Reference(s)

3GPP TS 44.318 sub-clause 7.9.1 and 7.9.2

82.9.1.1.2 Test purpose

To verify that the MS can reply a GA-CSR CIPHERING MODE COMMAND message and return the correct Message Authentication Code (MAC).

82.9.1.1.3 Method of test

Initial conditions

System Simulator:

- 1 GAN cell, default parameter

Mobile Station:

- MS in state GA-CSR-DEDICATED
- MS in not ciphered mode

Foreseen final state of the MS

MS in GA-CSR IDLE state. Test procedure

The SS sends the GA-CSR CIPHERING MODE message. The Cipher Response IE should indicate that IMEISV should not be included. The MS replies with the GA-CSR CIPHERING MODE COMPLETE message. SS checks that the IMEISV is not included and that the MAC is correct. The SS sends another GA-CSR CIPHERING MODE COMMAND message with SC in Cipher Mode Setting IE set to "No ciphering". The MS replies with the GA-CSR CIPHERING MODE COMPLETE message. The SS sends new GA-CSR CIPHERING MODE message. The Cipher Response IE should indicate that IMEISV should be included. The MS replies with the GA-CSR CIPHERING MODE COMPLETE message. SS checks that the IMEISV is included and that the MAC is correct.

82.10 Channel mode modify procedure

82.10.1 Channel mode modify procedure / successful cases

82.10.1.1 Channel mode modify / successful case

82.10.1.1.1 Conformance requirement

In dedicated mode, the GANC can request a modification of the channel mode, multi-rate configuration, RTP redundancy configuration, sample size, GANC IP address, GANC RTP UDP port and GANC RTCP UDP port used for an active traffic channel.

The channel mode modify procedure allows the network to request the mobile station to modify configuration used for an active channel. The channel mode covers the coding, decoding and transcoding mode as well as the redundancy policy used on the active channel.

This procedure is always initiated by the network.

The network initiates the procedure by sending a GA-CSR CHANNEL MODE MODIFY message to the mobile station.

When the MS has received the GA-CSR CHANNEL MODE MODIFY message, the mobile station modifies the configuration, sets the mode and/or the RTP redundancy configuration for the active channel and then replies by a GA-CSR CHANNEL MODE MODIFY ACKNOWLEDGE message indicating the ordered channel mode.

Reference(s)

3GPP TS 44.318 subclauses 7.10 / 7.10.1.1 / 7.10.1.2

82.10.1.1.2 Test purpose

83.1.2 GA-PSR Transport Channel Activation & Deactivation Procedures, Abnormal Cases.

83.1.2.1 GA-PSR TC Activation Collision

83.1.2.1.1 Conformance requirements

If the GANC receives a GA-PSR-ACTIVATE-UTC-REQ message from the MS while the network initiated GA-PSR TC activation procedure is in progress, the GANC aborts the network initiated activation procedure and responds to the MS with the GA-PSR-ACTIVATE-UTC-ACK message including the cause indicating successful activation. The message includes GANC IP address and GANC UDP port to be used for the uplink GPRS user data transport.

If the MS receives a GA-PSR-ACTIVATE-UTC-REQ message from the GANC while the MS initiated GA-PSR TC activation procedure is in progress, the MS shall silently discard the request and wait for the acknowledgment related to the MS initiated activation already in progress.

Upon receiving the uplink user data transfer request from the LLC for LLC SAPI 3, 5, 9 or 11 and while the MS GA-PSR is in the GA-PSR-STANDBY state, the MS shall,

- send a GA-PSR-ACTIVATE-UTC-REQ message,
- start timer TU4002,
- set the uplink packet sequence number to 0,
- set the expected downlink packet sequence number to 0 and

Upon receiving the GA-PSR-ACTIVATE-UTC-ACK message while the MS initiated GA-PSR TC activation is in progress, the MS shall stop timer TU4002, create and store the corresponding GA-PSR TC information and the MS GA-PSR shall transition into GA-PSR-ACTIVE state. The MS GA-PSR shall start TU4001 timer and forward any outstanding uplink user data packets. The TU4001 timer is restarted whenever any user data packet is sent to or received from the GANC.

References

3GPP TS 44.318, subclauses 8.2.1; 8.2.3 & 8.2.4.1

83.1.2.1.2 Test purpose

To verify that on receiving a GA-PSR-ACTIVATE-UTC-REQ message from the GANC while the MS initiated GA-PSR TC activation procedure is in progress, the MS shall silently discard the request and wait for the acknowledgment related to the MS initiated activation already in progress.

83.1.2.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

MS is made to initiate MS GA-PSR TC activation procedure and hence the MS receives a GA-PSR-ACTIVATE-UTC-REQ message from the GANC.

MS waits for the GA-PSR-ACTIVATE-UTC-ACK, while ignoring the GA-PSR-ACTIVATE-UTC-REQ from the GANC. Upon receiving the GA-PSR-ACTIVATE-UTC-ACK from the GANC, the MS enters the GA-PSR-ACTIVE

state, transmitting the GA-PSR-UNITDATA to the SS. SS confirms that MS in the GA-PSR-ACTIVE state by receiving the GA-PSR-UNITDATA message.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1	MS			MS is made to initiate GA-PSR TC
2	→		GA-PSR-ACTIVATE-UTC-REQ	MS initiated GA-PSR-ACTIVE state
3	←		GA-PSR-ACTIVATE-UTC-REQ	SS initiated GA-PSR-ACTIVE state
4	←		GA-PSR-ACTIVATE-UTC-ACK	MS is waiting for this message
5	→		GA-PSR-UNITDATA	MS is transmitting the uplink user data packets
6		←	GA-PSR-DEACTIVATE-UTC-REQ	SS initiates the deactivation
7		→	GA-PSR-DEACTIVATE-UTC-ACK	MS response on deactivation

Specific Message Contents

83.1.2.2 GANC Rejects GA-PSR TC Activation

83.1.2.2.1 Conformance requirements

Upon receiving the uplink user data transfer request from the LLC for LLC SAPI 3, 5, 9 or 11 and while the MS GA-PSR is in the GA-PSR-STANDBY state, the MS shall,

- send a GA-PSR-ACTIVATE-UTC-REQ message,
- start timer TU4002,
- set the uplink packet sequence number to 0,
- set the expected downlink packet sequence number to 0 and

If the GANC decides to reject GA-PSR TC activation, it shall send a GA-PSR-ACTIVATE-UTC-ACK message to the MS with the failure cause code and shall not include GANC IP address and UDP port number. The following rejection cause values are supported:

- "No available resources" indicates that the GANC failed to allocate required resources.
- "GANC failure" indicates internal GANC failure
- "Not authorized for data service" indicates that the MS is not authorized to use data services via GAN

Upon receiving the GA-PSR-ACTIVATE-UTC-ACK message indicating failure, the MS shall declare the procedure as failed to the upper layers.

References

3GPP TS 44.318, subclauses 8.2.1; 8.2.4.1; 8.2.4.4

83.1.2.2.2 Test purpose

To verify that by receiving the GA-PSR-ACTIVATE-UTC-ACK message with the failure cause code, described below, the MS would declare the procedure as failed to the upper layers.

83.1.2.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The MS initiates the GA-PSR-ACTIVE state transmitting GA-PSR-ACTIVATE-UTC-REQ to the SS. The SS responds with GA-PSR-ACTIVATE-UTC-ACK with failure code "No available resources". The MS remains in the GA-PSR-STANDBY state. To confirm that the MS is in the GA-PSR-STANDBY state, the SS sends GA-PSR-ACTIVATE-UTC-REQ and waits for the GA-PSR-ACTIVATE-UTC-ACK from the MS. Upon receiving the GA-PSR-ACTIVATE-UTC-ACK, the SS concludes that the MS was in GA-PSR-STANDBY state in step 4.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1				MS is made to initiate GA-PSR TC
2	→		GA-PSR-ACTIVATE-UTC-REQ	MS initiated GA-PSR-ACTIVE state
3	←		GA-PSR-ACTIVATE-UTC-ACK	Failure code is "No available resources" without valid IP address and port
4	MS			MS is declaring the procedure as failed to the upper layers and remains to be in the GA-PSR-STANDBY state.
5	←		GA-PSR-ACTIVATE-UTC-REQ	
6	→		GA-PSR-ACTIVATE-UTC-ACK	SS confirms that the MS was in the GA-PSR-STANDBY state.
7	←		GA-PSR-DEACTIVATE-UTC-REQ	
8	→		GA-PSR-DEACTIVATE-UTC-ACK

83.1.3 Network Initiated GA-PSR Transport Channel Activation, Normal Case

83.1.3.1 Processing of the GA-PSR TC Activation Request by the MS

83.1.3.1.1 Conformance requirements

Upon receiving the downlink user data transfer request associated with LLC SAPI 3, 5, 9 or 11 and if there is no GA-PSR TC associated with the specific MS, the GANC allocates the IP address and the UDP port number to be used by the MS for GPRS user data transport and sends a GA-PSR-ACTIVATE-UTC-REQ message to the MS. The GANC also:

- sets downlink packet sequence number to 0 and
- sets the expected uplink packet sequence number to 0

Upon receiving the GA-PSR-ACTIVATE-UTC-REQ message from the GANC, the MS shall verify the following:

- the GA-PSR is in GA-PSR-STANDBY state
- the GA-PSR TC does not exist
- the GPRS service is not suspended

Assuming successful verification, the MS shall allocate UDP port number for the MS GPRS user data transport and store the associated information. In parallel, the MS GA-PSR shall transition to GA-PSR-ACTIVE state and start TU4001 timer. Subsequently, the MS shall send the GA-PSR-ACTIVATE-UTC-ACK message to the GANC with the cause indicating successful activation. The message includes the MS UDP port to be used for the downlink GPRS user data transport.

After the MS has sent the GA-PSR-ACTIVATE-UTC-ACK message, it shall:

- set the uplink packet sequence number to 0 and
- set the expected downlink packet sequence number to 0

When the TU4001 timer expires and if there are no outstanding uplink GPRS user data messages to be transferred, the MS GA-PSR shall send the GA-PSR-DEACTIVATE-UTC-REQ message to the GANC to request the deactivation of the transport channel. In parallel, the MS shall start TU4002 timer to wait for the confirmation.

References

3GPP TS 44.318, subclauses 8.3.1; 8.3.2 & 8.4.1

83.1.3.1.2 Test purpose

To verify that on receiving the GA-PSR-ACTIVATE-UTC-REQ message from the GANC, MS will:

- 1) Allocate UDP port number for the MS GPRS user data transport and store the associated information.
- 2) Transition to GA-PSR-ACTIVE state and start TU4001 timer.
- 3) Send the GA-PSR-ACTIVATE-UTC-ACK message to the GANC with the cause indicating successful activation.
- 4) Includes the MS UDP port to be used for the downlink GPRS user data transport in the GA-PSR-ACTIVATE-UTC-ACK message.
- 5) Set uplink packet sequence number to 0 and
- 6) Set the expected downlink packet sequence number to 0

83.1.3.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The SS initiates the GA-PSR-ACTIVE state transmitting GA-PSR-ACTIVATE-UTC-REQ to the MS. MS responds with GA-PSR-ACTIVATE-UTC-ACK and starts TU4001. SS does not transmit any data for the time exceeding TU4001. The MS transmits GA-PSR-DEACTIVATE-UTC-REQ, confirming that the MS was in GA-PSR-ACTIVE state and TU4001 has been started in step 2.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1	←		GA-PSR-ACTIVATE-UTC-REQ	
2	→		GA-PSR-ACTIVATE-UTC-ACK	SS verifying the IE UDP Port for GPRS user data transport (port number for DL)
3		SS		Waiting for time exceeding TU4001
4	→		GA-PSR-DEACTIVATE-UTC-REQ	SS confirms that the MS was in GA-PSR-ACTIVE state in step 3.
5		←	GA-PSR-DEACTIVATE-UTC-ACK

83.1.4 Network Initiated GA-PSR Transport Channel Activation, Abnormal Cases

83.1.4.1 Void

83.1.4.2 MS Rejects GA-PSR TC Activation when the GPRS Service is suspended

83.1.4.2.1 Conformance requirements

If the MS determines that the GPRS service is suspended when the GA-PSR-ACTIVATE-UTC-REQ is received, it shall send a GA-PSR-ACTIVATE-UTC-ACK message to the GANC with the failure cause code set to "GPRS Suspended".

Upon receiving the GA-PSR-ACTIVATE-UTC-ACK message indicating that the GPRS service is suspended, the GANC aborts the activation procedure.

References

3GPP TS 44.318, subclause 8.3.4.2

83.1.4.2.2 Test purpose

To verify that on receiving a GA-PSR-ACTIVATE-UTC-REQ by the MS when the GPRS service for the MS is suspended, the MS sends a GA-PSR-ACTIVATE-UTC-ACK message to the GANC with the failure cause code set to "GPRS Suspended".

83.1.4.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The SS initiates the GA-PSR-ACTIVE state transmitting GA-PSR-ACTIVATE-UTC-REQ to the MS. The SS responds with GA-PSR-ACTIVATE-UTC-ACK and MS enters the GA-PSR-ACTIVE state. The MS starts to transmit data using GA-PSR-UNITDATA. The MS is made to initiate a voice call, which will make MS initiate the GPRS suspend procedure. The SS initiates the GA-PSR-ACTIVE procedure, sending the GA-PSR-ACTIVATE-UTC-REQ.

The MS responds with GA-PSR-ACTIVATE-UTC-ACK, with failure cause code set to "GPRS Suspended"

The SS checks that GA-PSR-ACTIVATE-UTC-ACK, contains failure cause code "GPRS Suspended"

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1				Trigger MS to initiate data transfer

83.1.4.3 MS Receives GA-PSR TC Activation Request while GA-PSR TC active

83.1.4.3.1 Conformance requirements

If the MS receives a GA-PSR TC activation message from the GANC while the GA-PSR TC is active, it shall send the GA-PSR-ACTIVATE-UTC-ACK message to the GANC. The message shall include MS UDP port allocated to the existing GA-PSR TC. In parallel, if the GANC provided new IP Address and UDP port number, the MS shall update the GA-PSR TC attributes accordingly.

After sending the GA-PSR-ACTIVATE-UTC-ACK message, the MS shall:

- set uplink packet sequence number to 0 and
- set the expected downlink packet sequence number to 0

References

3GPP TS 44.318, subclauses 8.2.1; 8.2.3 & 8.3.4.3

83.1.4.3.2 Test purpose

To verify that if the MS receives a GA-PSR TC activation message from the GANC while the GA-PSR TC is active, the MS sends the GA-PSR-ACTIVATE-UTC-ACK message to the GANC.

83.1.4.3.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state establishment and SS responds with GA-PSR-ACTIVATE-UTC-ACK. MS enters the GA-PSR-ACTIVE state and sends GA-PSR-UNITDATA. While the MS is transmitting data the SS sends GA-PSR-ACTIVATE-UTC-REQ with a different IP address and port number.

The MS responds with GA-PSR-ACTIVATE-UTC-ACK, containing the MS UDP port allocated to the existing GA-PSR TC. MS is triggered to initiate another data transfer. The MS transmits GA-PSR-UNITDATA, using new IP address and port number.

SS checks that the MS transmits the GA-PSR-UNITDATA, using new IP address and port number, and that the MS sets uplink packet sequence number to 0.

Maximum Duration of Test

1 min.

83.1.5 MS Initiated Deactivation of GA-PSR Transport Channel, Normal Case

83.1.5.1 GA-PSR TC Deactivation Initiation by the MS

83.1.5.1.1 Conformance requirements

When the TU4001 timer expires and if there are no outstanding uplink GPRS user data messages to be transferred, the MS GA-PSR shall send GA-PSR-DEACTIVATE-UTC-REQ message to the GANC to request the deactivation of the transport channel. In parallel, the MS shall start TU4002 timer to wait for the confirmation.

Upon receipt of a GA-PSR-DEACTIVATE-UTC-REQ message from the MS, the GANC releases the GA-PSR TC and sends the GA-PSR-DEACTIVATE-UTC-ACK message to the MS indicating successful deactivation; i.e. the cause IE is set to "success".

Upon receipt of a GA-PSR-DEACTIVATE-UTC-ACK message from the GANC, the MS GA-PSR shall stop TU4002 timer, and release the GA-PSR TC. In parallel, the MS GA-PSR shall transition to GA-PSR-STANDBY state.

Packets received out-of-sequence should be dropped.

References

3GPP TS 44.318, subclauses 8.4.1; 8.4.2; 8.4.3 and 8.7.5.3

83.1.5.1.2 Test purpose

To verify that, when the TU4001 timer expires and if there are no outstanding uplink GPRS user data messages to be transferred, the MS GA-PSR sends GA-PSR-DEACTIVATE-UTC-REQ message to the GANC to request the deactivation of the transport channel and in parallel, the MS starts TU4002 timer to wait for the confirmation.

To verify that upon receiving a GA-PSR-DEACTIVATE-UTC-ACK message from the GANC, the MS GA-PSR stops TU4002 timer, and releases the GA-PSR TC and that the MS GA-PSR transitions to GA-PSR-STANDBY state.

83.1.5.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state and SS responds with GA-PSR-ACTIVATE-UTC-ACK. MS enters the GA-PSR-ACTIVE state and sends GA-PSR-UNITDATA. Once all expected data has been transmitted and the sequential TU has expired, the MS sends GA-PSR-DEACTIVATE-UTC-REQ, and starts TU4002, requesting SS to deactivate GA-PSR state. In response, the SS sends GA-PSR-DEACTIVATE-UTC-ACK. Upon receiving the GA-PSR-DEACTIVATE-UTC-ACK the MS stops the TU4002 and enters the GA-PSR-STANDBY state.

To verify that the MS deactivated timer TU4002, SS sends a GA-PSR-ACTIVATE-UTC-REQ again. If the MS deactivated TU4002, the MS will respond with a GA-PSR-ACTIVATE-UTC-ACK.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments

83.1.6.3 Unexpected GA-PSR-DEACTIVATE-UTC-ACK response

83.1.6.3.1 Conformance requirements

If the MS receives an unexpected GA-PSR-DEACTIVATE-UTC-ACK message response while the GA-PSR is in GA-PSR-ACTIVE state, the MS GA-PSR shall stop TU4001 timer, and release the GA-PSR TC. In parallel, the MS GA-PSR shall transition to GA-PSR-STANDBY state.

If the MS receives an unexpected GA-PSR-DEACTIVATE-UTC-ACK message response while the GA-PSR is in GA-PSR-STANDBY state, the message is silently discarded.

References

3GPP TS 44.318, subclauses 8.4.4.5

83.1.6.3.2 Test purpose

To verify that if the MS receives an unexpected GA-PSR-DEACTIVATE-UTC-ACK response while the GA-PSR is in GA-PSR-ACTIVE state, the MS GA-PSR stops TU4001 timer, releases the GA-PSR TC and, the MS GA-PSR transitions to GA-PSR-STANDBY state.

83.1.6.3.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell.

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state establishment and SS responds with GA-PSR-ACTIVATE-UTC-ACK. While the MS transmits data, the SS sends GA-PSR-DEACTIVATE-UTC-ACK. The MS enters the GA-PSR-STANDBY state. To confirm that the MS is in the GA-PSR-STANDBY state, the SS sends the GA-PSR-UNITDATA message and expects to receive the GA-PSR-ACTIVATE-UTC-REQ.

Check for 10 sec that MS does not send any more messages.

To verify that the MS is in GA-PSR-STANDBY state a new connection is initiated with GA-PSR-ACTIVATE-UTC-REQ. If the MS responds with GA-PSR-ACTIVATE-UTC-ACK, the MS was in GA-PSR-STANDBY state.

Maximum Duration of Test

1 min.

83.1.6.4 Unexpected GA-PSR-ACTIVATE-UTC-REQ

83.1.6.4.1 Conformance requirements

If the MS receives any downlink user data packets while waiting for the GA-PSR-DEACTIVATE-UTC-ACK message response, it shall abort the deactivation procedure (i.e. stop timer TU4002) and restart TU4001 timer.

If the MS receives an unexpected GA-PSR-ACTIVATE-UTC-REQ message while waiting for GA-PSR-DEACTIVATE-UTC-ACK message response, the MS ignores the request and continues waiting for deactivation response.

References

3GPP TS 44.318, subclauses 8.4.4.4 and 8.4.4.6

83.1.6.4.2 Test purpose

To verify that if the MS receives an unexpected GA-PSR-ACTIVATE-UTC-REQ while waiting for GA-PSR-DEACTIVATE-UTC-ACK response, the MS ignores the request and continues waiting for deactivation response.

83.1.6.4.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell.

Test Procedure

MS is made to initiate GA-PSR-ACTIVE state establishment and SS responds with GA-PSR-ACTIVATE-UTC-ACK. MS transmits data and sequentially initiates the deactivation procedure sending GA-PSR-DEACTIVATE-UTC-REQ. The MS receives an unexpected GA-PSR-ACTIVATE-UTC-REQ while waiting for GA-PSR-DEACTIVATE-UTC-

ACK response. MS ignores this message and continues to wait for the GA-PSR-DEACTIVATE-UTC-ACK response. SS waits for one second to make sure MS receives GA-PSR-ACTIVATE-UTC-REQ before GA-PSR-UNIT-DATA. SS sends the GA-PSR-UNITDATA, and MS responds by aborting the deactivation procedure. To finish the test SS sends GA-PSR-DEACTIVATE-UTC-REQ and MS responds with GA-PSR-DEACTIVATE-UTC-ACK.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1				Trigger MS to initiate data transfer
2	→		GA-PSR-ACTIVATE-UTC-REQ	MS initiated GA-PSR-ACTIVE state
3	←		GA-PSR-ACTIVATE-UTC-ACK

83.1.7 GANC Initiated Deactivation of GA-PSR Transport Channel, Normal Case

83.1.7.1 GA-PSR TC Deactivation Initiation by the GANC

83.1.5.7.1 Conformance requirements

When the GANC decides to deactivate GA-PSR TC channel, it shall send GA-PSR-DEACTIVATE-UTC-REQ message to the MS to request the deactivation.

If the MS receives an unexpected GA-PSR-DEACTIVATE-UTC-ACK message response while the GA-PSR is in GA-PSR-ACTIVE state, the MS GA-PSR shall stop TU4001 timer, and release the GA-PSR TC. In parallel, the MS GA-PSR shall transition to GA-PSR-STANDBY state.

References

3GPP TS 44.318, subclauses 8.5.1 & 8.4.4.5

83.1.7.1.2 Test purpose

To verify that upon receiving a GA-PSR-DEACTIVATE-UTC-REQ message from the GANC, the MS releases the GA-PSR TC, sends the GA-PSR-DEACTIVATE-UTC-ACK message to the GANC indicating successful deactivation and MS GA-PSR enters the GA-PSR-STANDBY state.

83.1.7.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The SS initiates active state. The MS responds with GA-PSR-ACTIVATE-UTC-ACK. The SS initiates deactivation of the TC and sends GA-PSR-DEACTIVATE-UTC-ACK. The MS responds with GA-PSR-DEACTIVATE-UTC-ACK and enters the GA-PSR-STANDBY state. To confirm that the MS is in the GA-PSR-STANDBY state, the MS is triggered to send user data. Therefore, GA-PSR-ACTIVATE-UTC-REQ is expected to be sent from the MS. The SS sends GA-PSR-ACTIVATE-UTC-ACK message and waits for GA-PSR-UNITDATA.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1	←		GA-PSR-ACTIVATE-UTC-REQ	SS initiated GA-PSR-ACTIVE state
2	→		GA-PSR-ACTIVATE-UTC-ACK

83.1.8 Void

83.2 GA-PSR GPRS User Data Transport

83.2.1 GA-PSR GPRS User Data Transport , Normal Cases

83.2.1.1 MS Initiates Uplink GPRS User Data Transfer

83.2.1.1.1 Conformance requirements

The GPRS user data packets are tunnelled using UDP transport as specified for GA-PSR Transport Channel. Each packet is assigned a sequence number in the range of 0 to 65535 sequentially. The sequence number is set to 0 after reaching the maximum – 65535.

Assuming that the GA-PSR TC has been already activated as specified in sub-clauses 8.2 or 8.3, the MS GA-PSR is able to immediately forward any uplink GPRS user data packets to the GANC. Upon the request from the LLC to transfer an uplink LLC PDU with GPRS user data identified with LLC SAPI 3, 5, 9 or 11, the MS GA-PSR shall restart TU4001 timer and encapsulate the complete LLC PDU within a GA-PSR UNITDATA message.

Subsequently, the MS shall send the GA-PSR UNITDATA message to the GANC using the existing GA-PSR TC; i.e. using the corresponding GANC IP address and UDP port number.

The MS shall increment the uplink packet sequence number for each GA-PSR-UNITDATA message sent to the GANC.

References

3GPP TS 44.318, subclauses 8.7 & 8.7.1.

83.2.1.1.2 Test purpose

To verify that MS:

- 1) Uses corresponding GANC IP address and UDP port number,
- 2) Transmits at least 65537 packets, and that each packet is assigned a sequence number in the range of 0 to 65535 sequentially.
- 3) Assigns sequence number to 0 after reaching the maximum – 65535

83.2.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell.

Test Procedure

The MS activates the GA-PSR TC with the corresponding GANC IP address and UDP port number and immediately forwards uplink GPRS user data, which consist of 65537 of packets, being requested from the MS LLC, to the GANC. The MS tunnels the GPRS data packets using UDP transport, assigning number to the packets in range from 0 to 65535 sequentially. The MS increments the uplink packet sequence number for each GA-PSR-UNITDATA message, being sent to the GANC, and assigns the number 0 after reaching the 65535.

SS verifies that MS:

- 1) Uses corresponding GANC IP address and UDP port number,

- 2) Transmits at least 65537 packets, and that each packet is assigned a sequence number in the range of 0 to 65535 sequentially.
- 3) Assigns sequence number to 0 after reaching the maximum – 65535

Maximum Duration of Test

30 min.

Expected Sequence

83.2.2 GA-PSR GPRS User Data Transport , Abnormal Cases

83.2.2.1 Void

83.2.2.2 Void

83.2.2.3 MS Receives a Downlink Message to Initiate Uplink GPRS User Data Transfer while the GA-PSR TC activation Procedure is in progress

83.2.2.3.1 Conformance requirements

Upon receiving a downlink message while the GA-PSR TC activation procedure is in progress (TU4002 timer is still running), the MS GA-PSR shall process the request as if the transport channel was active. The MS shall not initiate uplink GPRS user data transfer until the GA-PSR TC activation procedure is successfully completed (as specified in the subclause 8.2). The MS shall use the IP address and UDP port number received in the GA-PSR ACTIVATE UTC ACK message for sending uplink GPRS user data packets to the GANC on that transport channel.

References

3GPP TS 44.318, subclause 8.7.5.4

83.2.2.3.2 Test purpose

To verify that MS GA-PSR shall only use IP address and UDP port number received in the GA-PSR ACTIVATE UTC ACK message to send uplink GPRS user data packets to the SS

83.2.2.3.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated

Foreseen Final State of the MS

MS in GA-PSR-ACTIVE state in service of GAN cell.

Test Procedure

The MS receives a downlink message GA-PSR UNITDATA while Transport Channel activation is in progress. The MS activates the GA-PSR TC with the GANC IP address and UDP port number given in the GA-PSR ACTIVATE UTC ACK message and sends uplink GPRS user data.

SS verifies that MS:

- 1) GA-PSR shall only use IP address and UDP port number received in the GA-PSR ACTIVATE UTC ACK message to send uplink GPRS user data packets to the SS

Maximum Duration of Test

5 min.

Expected Sequence

Step	Direction		Message	Comments
	MS	SS		
1	MS			MS in GA-PSR-STANDBY state
2	→		GA-PSR-ACTIVATE-UTC-REQ	MS initiates GA-PSR TC activation
3	←		GA-PSR-UNITDATA	SS initiates a GPRS user data transfer by sending GA_PSR UNIT DATA message with IP address and UDP port address
4	SS			Waiting for 2 sec to check MS does not send any data
5	←		GA-PSR-ACTIVATE-UTC-ACK	SS sends a different IP address and UDP port number than source IP address and UDP port number in step 3
6	MS			MS in GA-PSR-ACTIVE state
7	→		GA-PSR-UNITDATA	MS completes data transfer using new IP address and UDP port given in GA-PSR-ACTIVATE-UTC-ACK

83.3 Packet paging for packet service

83.3.1 PS Paging Request Processed by the MS, Normal Case

83.3.1.1 PS Paging Request Processed by the MS

83.3.1.1.1 Conformance requirements

Upon receiving a GA-PSR-PS-PAGE message from the GANC, the MS GA-PSR shall forward the indication to the GMM layer using the GMMRR SAP as per standard GPRS. Subsequently, the MS shall send an uplink LLC PDU as a page response per standard GPRS. The MS may either send GA-PSR-DATA or GA-PSR-UNITDATA message as described in sub-clauses 8.7 and 8.8.

References

3GPP TS 44.318, subclauses 8.9.2

83.3.1.1.2 Test purpose

To verify that the MS responds with GA-PSR-DATA message upon receiving a GA-PSR-PS-PAGE message from the GANC.

83.3.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Forseen Final State of the MS

MS in Idle state

Test Procedure

The SS sends the GA-PSR-PS-PAGE, paging the MS. The MS responds with GA-PSR-DATA. The SS checks the received data is the paging response.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction	Message	Comments
1	x		MS is in GA-PSR-STANDBY state
2	←	GA-PSR-PS-PAGE	MS is made to initiate GA-PSR TC
3	→	GA-PSR-DATA	SS verifies that the MS sends the GA-PSR-DATA Check that the received data is the paging response (Empty LLC PDU)

83.4 GPRS Suspend Procedure

83.4.1 GPRS Suspension Initiation by the MS, normal Case

83.4.1.1 GPRS Suspension Initiation by the MS

83.4.1.1.1 Conformance requirements

While transitioning to dedicated mode and if unable to support simultaneous CS and PS services, the MS shall request the suspension of the downlink GPRS data transfer by sending a GA-CSR GPRS SUSPENSION REQUEST message to the GANC

Upon receiving a GA-CSR GPRS SUSPENSION REQUEST message from the MS, the GANC completes the GPRS suspend procedure via the Gb interface as defined in [3GPP 48.018].

References

3GPP TS 44.318, subclauses 8.10.1 & 8.10.2

83.4.1.1.2 Test purpose

To verify that the MS requests the suspension of the downlink GPRS data transfer by sending a GA-CSR GPRS SUSPENSION REQUEST message to the GANC, while the MS is transitioning to dedicated mode and if the MS unable to support simultaneous CS and PS services.

83.4.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Foreseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

The SS initiates GA-PSR TC, sending the GA-PSR-ACTIVATE-UTC-REQ. The MS responds with GA-PSR-ACTIVATE-UTC-ACK. The SS sends data, sending GA-PSR-UNITDATA. The SS sends GA-CSR PAGING REQUEST, requesting transitioning of the MS to dedicated mode. MS sends GA-CSR GPRS SUSPENSION REQUEST. The SS verifies that the MS requests GPRS suspension.

Maximum Duration of Test

1 min.

83.5 Downlink Flow Control

83.5.1 Initiation of the Downlink Flow Control and Processing of the TU4003 Timer Expiry by the MS, Normal Case

83.5.1.1 Initiation of the Downlink Flow Control and Processing of the TU4003 Timer Expiry by the MS

83.5.1.1.1 Conformance requirements

Upon detecting the downlink flow control condition, the MS shall initiate a downlink flow control procedure by sending a GA-PSR-DFC-REQ message to the GANC via the existing GA-PSR TC. The message includes new estimated data rate that can be supported. At the same time the MS shall start timer TU4003 to continue monitoring the flow control condition. The timer TU4003 is specified in sub-clause 12.

When the TU4003 timer expires, the MS shall re-evaluate the flow control condition and perform the following based on the outcome of the evaluation:

- If the flow control condition still exists (e.g. downlink buffer utilization is still above the low watermark level), the MS shall calculate a new data rate that can be supported and forward the corresponding GA-PSR-DFC-REQ to the GANC via the existing GA-PSR TC. Simultaneously, the MS shall start timer TU4003 to continue monitoring the downlink data transfer.
- If the flow condition has been resolved (e.g. buffer utilization is below the low mark level), the MS shall not restart the TU4003 timer and shall stop sending flow control requests to the GANC.

References

3GPP TS 44.318, subclauses 8.11.1 & 8.11.3

83.5.1.1.2 Test purpose

To verify that:

- 1) If the flow control condition exists the MS calculates a new data rate that can be supported and forwards the corresponding GA-PSR-DFC-REQ to the GANC via the existing GA-PSR TC.
- 2) If the timer expires, the MS checks the downlink flow control condition, and if it continues to exist, the MS restarts the timer TU4003, and optionally sends another GA-PSR-DFC-REQ message to the GANC.
- 3) If the flow condition has been resolved (e.g. buffer utilization is below the low mark level), the MS not restarts the TU4003 timer and stops sending flow control requests to the GANC.

83.5.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Forseen Final State of the MS

MS in GA-PSR-STANDBY state in service of GAN cell

Test Procedure

SS initiates the activation procedure and starts to transmit data. The MS detects flow control condition, sends the GA-PSR-DFC-REQ message and starts the TU4003 timer. SS reduces the data rate and continues to send the data. The SS verifies that the MS does not send GA-PSR-DFC-REQ message.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is in GA-PSR-STANDBY state
2	←		GA-PSR-ACTIVATE-UTC-REQ	SS initiates GA-PSR TC
3	→		GA-PSR-ACTIVATE-UTC-ACK	
4	←		GA-PSR-UNITDATA	SS sends data, with very high data rate to overflow the MS
5	→		GA-PSR-DFC-REQ	MS request DL Flow Control and starts TU4003
6	←		GA-PSR-UNITDATA	SS sends data, with normal data rate
7	SS			SS verifies that MS does not sends GA-PSR-DFC-REQ for the time exceeding TU4003
8	←		GA-PSR-DEACTIVATE-UTC-REQ	SS deactivates
9	→		GS-PSR DEACTIVATE-UTC-ACK

83.6 Uplink Flow Control

83.6.1 Processing of the Uplink Flow Control Request by the MS, Normal Case

83.6.1.1 Processing of the Uplink Flow Control Request by the MS

83.6.1.1.1 Conformance requirements

Upon detecting the uplink flow control condition, the GANC initiates an uplink flow control procedure by sending a GA-PSR-UFC-REQUEST message to the MS via the existing GA-PSR TC. The request is PFC based if the packet flow management procedures are supported.

Upon receiving the GA-PSR-UFC-REQUEST message from the GANC, the MS adjusts the uplink data rate accordingly.

References

3GPP TS 44.318, subclauses 8.12.1 & 8.12.2

83.6.1.1.2 Test purpose

To verify that the MS adjusts the uplink data rate accordingly with GA-PSR-UFC-REQUEST message received from the GANC.

83.6.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS GA-PSR is in the GA-PSR-STANDBY state. PDP context 1 is activated.

Forseen Final State of the MS

MS in Idle state

Test Procedure

The MS activates GA-PSR TC and starts to send lowest data rate to the SS. SS requests UL Flow Control sending the GA-PSR-UFC-REQ. The MS sends the data with rate adjusted according to GA-PSR-UFC-REQ.

The SS verifies whether the MS sends the data with adjusted data rate.

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS is in GA-PSR-STANDBY state
2	→		GA-PSR-ACTIVATE-UTC-REQ	SS is made to activate GA-PSR TC
3	←		GA-PSR-ACTIVATE-UTC-ACK	
4	→		GA-PSR-UNITDATA	MS sends data
5	←		GA-PSR-UFC-REQ	SS request UL Flow Control of 100 bits/s.
6	→		GA-PSR-UNITDATA	MS sends data with the adjusted data rate (100 bits/s), according with GA-PSR-UFC-REQ
7	SS			SS verifies whether the MS have adjusted data rate
8		←	GA-PSR-DEACTIVATE-UTC-REQ	SS initiates the deactivation
9		→	GA-PSR-DEACTIVATE-UTC-ACK	MS response on deactivation

84 GAN Iu Mode Procedures

84.1 Macros for GAN Iu mode

84.2 GA-RRC connection establishment

84.2.1 GA-RRC connection establishment / successful case

84.2.1.1 GA-RRC connection establishment, Upper Layer Message Transmission and GA-RRC connection release by GANC (CS domain)

84.2.1.1.1 Conformance requirement

The GAN Iu mode GA-RRC CS and PS connections are logical connections between the MS and the GANC. As described in 3GPP TS 43.318, the GA-RRC sub-layer in the MS contains two entities, the CS domain GA-RRC sublayer entity and the PS domain GA-RRC sublayer entity. These entities operate independently and in parallel; e.g., two GA-RRC connections are established in the case of simultaneous CS and PS services, one GA-RRC connection for each domain. Each GA-RRC sub-layer entity in the MS can be in one of two states, GA-RRC-IDLE or GA-RRC-CONNECTED.

A GA-RRC connection is established when the upper layers in the MS request the establishment of a signalling connection for either CS or PS domain and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for that domain; i.e., no GA-RRC connection exists. When a successful response is received from the network, GA-RRC replies to the upper layer that the GA-RRC sub-layer entity in the MS has entered the RRC connected mode (i.e., the GA-RRC-CONNECTED state). The upper layers then have the possibility to request transmission of NAS messages to the network.

The GA-RRC INITIAL DIRECT TRANSFER message is used to transfer the "initial" upper layer message for the domain (i.e., the first NAS message after GA-RRC connection establishment for the domain) from the MS to the GANC. Receipt of the GA-RRC INITIAL DIRECT TRANSFER message by the GANC triggers the establishment of the signalling connection to the indicated CN domain for the MS. The GA-RRC UPLINK DIRECT TRANSFER message is used to transfer all subsequent upper layer messages for the signalling connection from the MS to the GANC.

The GA-RRC DOWNLINK DIRECT TRANSFER message is used to transfer upper layer messages from the GANC to the MS.

The GANC initiates the GA-RRC connection release procedure to command the MS to release the GA-RRC connection and any user plane resources for a particular domain and instruct the GA-RRC sub-layer entity of the MS to leave the GA-RRC-CONNECTED state and return to the GA-RRC-IDLE state for the domain. The GANC normally initiates this procedure when it receives the Iu Release Command from the CN; however, the GANC may also initiate this procedure under certain failure conditions.

The GA-RRC RELEASE message includes the IE "GA-RRC Cause". The GA-RRC Cause value should be one of the following:

- #83: normal release; e.g., at the end of a call
- #115: unspecified failure

Other values, if received, should be treated as "unspecified failure".

When the GA-RRC sublayer entity in the MS receives the GA-RRC RELEASE message, it shall:

- send a GA-RRC RELEASE COMPLETE message to the GANC,
- release the GA-RRC connection and any user plane resources for the indicated domain,
- stop timer TU5002 for the domain (if running),
- stop timer TU5909 for the domain (if running), and
- enter the GA-RRC-IDLE state for the domain.

Reference(s)

3GPP TS 44.318 subclause 8a.1 / 8a.2 / 8a.5.3 / 8a.5.4

84.2.1.1.2 Test purpose

To verify all of the following for the CS domain.

To verify that MS is able to initiate GA-RRC connection establishment between the MS and GANC and to verify that MS is able to communicate with the CN by encapsulating NAS messages in the GA-RRC INITIAL DIRECT TRANSFER message (first NAS message after GA-RRC connection establishment) and GA-RRC UPLINK DIRECT TRANSFER message and able to receive upper layer messages within GA-RRC DOWNLINK DIRECT TRANSFER message.

To verify that MS is able to release the GA-RRC connection, able to move into GA-RRC-IDLE state and release all GA-RRC and any traffic channel resources, when the MS receives the GA-RRC RELEASE message from SS.

84.2.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-IDLE state for CS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC-IDLE state for CS domain.

Test Procedure

The MS is made to initiate a GA-RRC connection establishment for CS domain. The MS moves into GA-RRC-CONNECTED state when the MS receives the GA-RRC REQUEST ACCEPT message from the SS within timer TU5908 (5 sec.) from sending GA-RRC REQUEST message. SS verifies that MS sends GA-RRC INITIAL DIRECT TRANSFER message within 10s from GA-RRC REQUEST ACCEPT message. The SS answers by sending upper layer message within GA-RRC DOWNLINK DIRECT TRANSFER container message.

The SS sends GA-RRC RELEASE message. The MS enters GA-RRC-IDLE state and transmits a GA-RRC RELEASE COMPLETE to the SS and releases all GA-RRC and any traffic channel resources.

Specific test parameters

7	←	GA-RRC DOWNLINK DIRECT TRANSFER	Containing NAS message IE 'CN Domain Identity' indicates CS domain
8	←	GA-RRC RELEASE	IE 'GA-RRC Cause' indicates #83 IE 'CN Domain Identity' indicates CS domain
9	→	GA-RRC RELEASE COMPLETE	MS enters GA-RRC-IDLE state IE 'CN Domain Identity' indicates CS domain

84.2.1.2 GA-RRC connection establishment, Upper Layer Message Transmission and GA-RRC connection release by GANC (PS domain)

84.2.1.2.1 Conformance requirement

The GAN Iu mode GA-RRC CS and PS connections are logical connections between the MS and the GANC. As described in 3GPP TS 43.318, the GA-RRC sub-layer in the MS contains two entities, the CS domain GA-RRC sublayer entity and the PS domain GA-RRC sublayer entity. These entities operate independently and in parallel; e.g., two GA-RRC connections are established in the case of simultaneous CS and PS services, one GA-RRC connection for each domain. Each GA-RRC sub-layer entity in the MS can be in one of two states, GA-RRC-IDLE or GA-RRC-CONNECTED.

A GA-RRC connection is established when the upper layers in the MS request the establishment of a signalling connection for either CS or PS domain and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for that domain; i.e., no GA-RRC connection exists. When a successful response is received from the network, GA-RRC replies to the upper layer that the GA-RRC sub-layer entity in the MS has entered the RRC connected mode (i.e., the GA-RRC-CONNECTED state). The upper layers then have the possibility to request transmission of NAS messages to the network.

The GA-RRC INITIAL DIRECT TRANSFER message is used to transfer the "initial" upper layer message for the domain (i.e., the first NAS message after GA-RRC connection establishment for the domain) from the MS to the GANC. Receipt of the GA-RRC INITIAL DIRECT TRANSFER message by the GANC triggers the establishment of the signalling connection to the indicated CN domain for the MS. The GA-RRC UPLINK DIRECT TRANSFER message is used to transfer all subsequent upper layer messages for the signalling connection from the MS to the GANC.

The GA-RRC DOWNLINK DIRECT TRANSFER message is used to transfer upper layer messages from the GANC to the MS.

The GANC initiates the GA-RRC connection release procedure to command the MS to release the GA-RRC connection and any user plane resources for a particular domain and instruct the GA-RRC sub-layer entity of the MS to leave the GA-RRC-CONNECTED state and return to the GA-RRC-IDLE state for the domain. The GANC normally initiates this procedure when it receives the Iu Release Command from the CN; however, the GANC may also initiate this procedure under certain failure conditions.

The GA-RRC RELEASE message includes the IE "GA-RRC Cause". The GA-RRC Cause value should be one of the following:

- #83: normal release; e.g., at the end of a call
- #115: unspecified failure

Other values, if received, should be treated as "unspecified failure".

When the GA-RRC sublayer entity in the MS receives the GA-RRC RELEASE message, it shall:

- send a GA-RRC RELEASE COMPLETE message to the GANC,
- release the GA-RRC connection and any user plane resources for the indicated domain,

- stop timer TU5002 for the domain (if running),
- stop timer TU5909 for the domain (if running), and
- enter the GA-RRC-IDLE state for the domain.

Reference(s)

84.2.1.2.2 Test purpose

To verify all of the following for the PS domain.

To verify that MS is able to initiate GA-RRC connection establishment between the MS and GANC and to verify that MS is able to communicate with the CN by encapsulating NAS messages in the GA-RRC INITIAL DIRECT TRANSFER message (first NAS message after GA-RRC connection establishment) and GA-RRC UPLINK DIRECT TRANSFER message and able to receive upper layer messages within GA-RRC DOWNLINK DIRECT TRANSFER message.

To verify that MS is able to release the GA-RRC connection, able to move into GA-RRC-IDLE state and release all GA-RRC and any traffic channel resources, when the MS receives the GA-RRC RELEASE message from SS.

84.2.1.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-IDLE state for PS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC-IDLE state for PS domain.

Test Procedure

The MS is made to initiate a GA-RRC connection establishment for PS domain. The MS moves into GA-RRC-CONNECTED state when the MS receives the GA-RRC REQUEST ACCEPT message from the SS within timer TU5908 (5 sec.) from sending GA-RRC REQUEST message. SS verifies that MS sends GA-RRC INITIAL DIRECT TRANSFER message within 10s from GA-RRC REQUEST ACCEPT message. The SS answers by sending upper layer message within GA-RRC DOWNLINK DIRECT TRANSFER container message.

The SS sends GA-RRC RELEASE message. The MS enters GA-RRC-IDLE state and transmits a GA-RRC RELEASE COMPLETE to the SS and releases all GA-RRC and any traffic channel resources.

Specific test parameters

84.2.2 GA-RRC connection establishment / negative cases

84.2.2.1 GA-RRC REQUEST rejected (CS domain)

84.2.2.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.1.2.2:

If the GANC rejects the GA-RRC connection establishment request, it shall send the GA-RRC REQUEST REJECT message to the MS including the IE "CN Domain Identity".

3GPP TS 44.318 subclause 8a.1.3.2:

When the MS receives the GA-RRC REQUEST REJECT message, it shall:

- if timer TU5908 is active for the domain indicated by the IE "CN Domain Identity":
- stop timer TU5908 for that domain,
- remain in the GA-RRC-IDLE state for that domain, and
- indicate to upper layers that GA-RRC was not able to enter the connected state for that domain;
- if timer TU5908 is not active for the domain indicated by the IE "CN Domain Identity":
- ignore the GA-RRC REQUEST REJECT message, and
- continue with the procedure as if the GA-RRC REQUEST REJECT message was not received.

3GPP TS 44.318 subclause 8a.3.2:

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:
- indicate reception of paging to upper layers, and
- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;
- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.
- if timer TU5908 is active for the domain:

- ignore the GA-RRC PAGING REQUEST message, and
- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

84.3.2.2 MS receives GA-RRC DOWNLINK DIRECT TRANSFER message when not in GA-RRC-CONNECTED state (PS domain)

84.3.2.2.1 Conformance requirement

If the MS receives a GA-RRC DOWNLINK DIRECT TRANSFER message and GA-RRC sub-layer entity in the MS is not in GA-RRC-CONNECTED state for the indicated domain, the MS shall:

- ignore the contents of the GA-RRC DOWNLINK DIRECT TRANSFER message;
- transmit a GA-RRC STATUS message to the GANC as follows:
- set the IE "GA-RRC Cause" to "Message type not compatible with protocol state"
- include the received message contents in the IE "PDU in Error"
- continue with any ongoing procedure and act as if the GA-RRC DOWNLINK DIRECT TRANSFER message was not received.

Reference(s)

3GPP TS 44.318 subclause 8a.2.6.1

84.3.2.2.2 Test purpose

To verify that MS ignores the contents of the GA-RRC DOWNLINK DIRECT TRANSFER message (PS domain) if MS is not in GA-RRC-CONNECTED state (PS domain) and to be able to send GA-RRC STATUS message to the SS.

84.3.2.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-IDLE state for PS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC-IDLE state for PS domain in service of GAN cell

Test Procedure

MS is in GA-RRC-IDLE state for PS domain in service of GAN cell. SS sends GA-RRC DOWNLINK DIRECT TRANSFER message containing upper layer message. MS ignores the contents of the message and sends GA-RRC STATUS message to the SS with IE 'GA-RRC Cause': 'Message type not compatible with protocol state'. MS includes the received message contents in the IE 'PDU in error'.

Specific test parameters

-

Maximum Duration of Test

1 min.

Expected Sequence

Step	Direction		Message	Comment
	MS	SS		
1	MS			MS in GA-RRC-IDLE state for PS domain
2	←		GA-RRC DOWNLINK DIRECT TRANSFER	Containing (DL) CC/MM/SS/SMS message IE 'CN Domain Identity' indicates PS domain
3	→		GA-RRC STATUS	IE 'CN Domain Identity' indicates PS domain IE 'GA-RRC Cause' indicates #99 IE PDU in Error: '<received (DL) message>'

84.4 Paging

84.4.1 Paging for CS domain / successful cases

84.4.1.1 Paging for CS domain

84.4.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.3.1:

The GANC sends the GA-RRC PAGING REQUEST message to the MS when the GANC receives a PAGING message over the Iu interface from a CN domain. The IMSI of the MS to be paged is identified by the IE "Permanent NAS UE Identity" received in the request from the CN. If the request also includes the (P-)TMSI then the GANC shall include the (P-)TMSI in the IE "Mobile Identity"; else the GANC shall include the IMSI in the IE "Mobile Identity". The GANC also includes the IE "CN Domain Identity" and the IE "GA-RRC Paging Cause", if a cause is received from the CN.

3GPP TS 44.318 subclause 8a.3.2:

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:
- indicate reception of paging to upper layers, and
- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;
- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.
- if timer TU5908 is active for the domain:
- ignore the GA-RRC PAGING REQUEST message, and
- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

3GPP TS 44.318 subclause 8a.3.3:

If the MS receives a GA-RRC PAGING REQUEST and the mobile identity included in the message does not match any of the valid identities assigned to the MS, the MS shall:

- ignore the GA-RRC PAGING REQUEST message, and
- continue with any ongoing procedure as if the GA-RRC PAGING REQUEST message was not received.

Reference(s)

3GPP TS 44.318 subclauses 8a.3.1 / 8a.3.2 / 8a.3.3

84.4.1.1.2 Test purpose

To verify all of the following for the CS domain.

To verify that MS ignores the GA-RRC PAGING REQUEST and continues with any ongoing procedure, if received GA-RRC PAGING REQUEST doesn't contain valid identity.

To verify that MS is able send a GA-RRC INITIAL DIRECT TRANSFER containing a page response to the SS and enter GA-RRC-CONNECTED state when MS receives GA-RRC PAGING REQUEST with valid identities of the MS.

84.4.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-IDLE state for CS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC-IDLE state for CS domain in service of GAN cell

Test Procedure

The SS initiates paging procedure by sending GA-RRC PAGING REQUEST message with not matching identity to the MS. MS ignores the GA-RRC PAGING REQUEST and continues with any ongoing procedure as if the GA-RRC PAGING REQUEST was not received. After 10s the SS sends GA-RRC PAGING REQUEST to verify that MS in GA-RRC-IDLE state. MS answers by sending GA-RRC INITIAL DIRECT TRANSFER message containing page response.

	MS	SS		
1	←		GA-RRC PAGING REQUEST	With not matching identity IE 'CN Domain Identity' indicates CS domain
2	MS			MS ignores GA-RRC PAGING REQUEST message
3	SS			SS waits 10s for response
4	←		GA-RRC PAGING REQUEST	Valid identity of the MS ('TMSI'/'IMSI') IE 'CN Domain Identity' indicates CS domain
5	→		GA-RRC INITIAL DIRECT TRANSFER	IE 'L3 Message' contains Paging Response IE 'CN Domain Identity' indicates CS domain MS enters GA-RRC-CONNECTED state for CS domain
6	←		GA-RRC RELEASE	IE 'GA-RRC Cause' = #83 IE 'CN Domain Identity' indicates CS domain
7	→		GA-RRC RELEASE COMPLETE	IE 'CN Domain Identity' indicates CS domain MS enters GA-RRC-IDLE state for CS domain

84.4.2 Paging for CS domain / negative cases

84.4.2.1 Void

84.4.2.2 Paging for CS domain / negative cases / MS receives GA-RRC PAGING REQUEST when TU5908 is active

84.4.2.2.1 Conformance requirement

If the mobile identity in the GA-RRC PAGING REQUEST message matches any of the valid identities of the MS and the GA-RRC sub-layer entity in the MS is in the GA-RRC-IDLE state for the indicated domain, the MS shall:

- if timer TU5908 is not active for the domain and access to the network is allowed:
- indicate reception of paging to upper layers, and
- forward the IE "CN Domain Identity", the IE "Mobile Identity" and the IE "Paging Cause" (if received) to the upper layers;

- Note: The upper layers will request the establishment of a signalling connection and the transmission of the paging response in the initial NAS message. This results in the implicit establishment of the GA-RRC connection (i.e., the GA-RRC sub-layer entity in the MS enters the GA-RRC CONNECTED state) and the transmission of the paging response from the MS to the GANC in the GA-RRC INITIAL DIRECT TRANSFER message, as shown in Figure 8a.3.1.

- if timer TU5908 is active for the domain:
- ignore the GA-RRC PAGING REQUEST message, and
- continue with the ongoing procedure as if the GA-RRC PAGING REQUEST was not received.

Reference(s)

3GPP TS 44.318 subclause 8a.3.2

84.4.2.2.2 Test purpose

To verify that MS discards the received GA-RRC PAGING REQUEST message (indicating CS domain page) if timer TU5908 is active for the CS domain.

84.4.2.2.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-IDLE state for CS domain in service of GAN cell

Foreseen Final State of the MS

MS in GA-RRC- IDLE state for CS domain.

Test Procedure

MS is made to initiate GA-RRC connection for CS domain. MS sends GA-RRC REQUEST message and activates timer TU5908. The SS initiates paging procedure by sending GA-RRC PAGING REQUEST message to the MS when TU5908 is active in MS. MS discards the received GA-RRC PAGING REQUEST message. After TU5908 expiry the SS sends GA-RRC PAGING REQUEST to verify that MS in GA-RRC-IDLE state. MS may answer by sending GA-RRC INITIAL DIRECT TRANSFER or re-establish the GA-RRC connection by re-sending GA-RRC REQUEST message.

84.5 Traffic Channel assignment

84.5.1 CS Traffic Channel assignment / successful cases

84.5.1.1 CS Traffic Channel assignment and Release

84.5.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.4.1.2:

The MS shall act on the received GA-RRC ACTIVATE CHANNEL message indicating the CS domain as follows:

- for each CTC specified in the IE "CTC Activation List":
 - store the RAB ID;
 - if the IE "RAB Configuration" indicates that the CTC is for AMR or AMR-WB speech, use the format specified in Annex A.1 and Annex D to code and decode the RTP packets;
 - if the IE "RAB Configuration" indicates that the CTC is for circuit switched data, use the format specified in Annex A.2 to code and decode the RTP packets;
 - use the value indicated by the IE "Sample Size" as the minimum sample size for the coding and decoding of the RTP packets, if the MS is not able to use the indicated value. If the circuit transport channel is for AMR or AMR-WB speech with RTP redundancy, the sample size is defined as the size of the new speech sample in each RTP packet, not including any redundant speech samples;
 - configure the uplink RTP packets to be transmitted to the UDP port and IP address identified by the IE "RTP UDP Port" and the IE "GANC IP address", respectively;
 - use the Payload Type included in the IE "Payload Type" for the PT field in the RTP header for the RTP packets;
 - if received, use the configuration included in the IE "Multi-rate Configuration 2" for the circuit transport channel that is for AMR or AMR-WB speech;
 - if received, use the configuration included in the IE "RTP Redundancy Configuration" for the circuit transport channel that is for AMR or AMR-WB speech. The redundancy policy is defined for each of the AMR modes specified in the IE "Multi-rate Configuration 2". The level of redundancy can span from no redundancy to double redundancy. In the same active codec set, a lower codec mode shall not be associated with a lower redundancy level than a higher codec mode. For example, the highest mode in the set is used with no redundancy, the next lower with single redundancy and rest of the modes with double redundancy.
 - if received, pass the contents of the NAS Synchronisation Indicator to upper layers.

On completing the above procedure, the MS shall:

- start timer TU5911 for the CS domain;
- transmit a GA-RRC ACTIVATE CHANNEL ACK message including the IE "CN Domain Identity" and the IE "CTC Activation Ack List". For each CTC specified in the IE "CTC Activation Ack List":
 - include the IE "RAB ID" for the CTC with the same value as received in the GA-RRC ACTIVATE CHANNEL message in the IE "RAB ID";
 - include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
 - for each CTC that is successfully configured (i.e., GA-RRC Cause value is '0'):
 - include the allocated UDP port number in the IE "RTP UDP Port" for the downlink RTP packets to be sent from the GANC to the MS;
 - include the selected RTP sample size, to be used for uplink and downlink RTP packets, in the IE "Sample Size";
 - include the Payload Type in the IE "Payload Type";

- if the IE "RTCP UDP Port" was received in the GA-RRC ACTIVATE CHANNEL message and the MS is capable of supporting RTCP, activate the uplink RTCP stream and include the IE "RTCP UDP Port" for the downlink RTCP packets to be sent from the GANC to the MS.

3GPP TS 44.318 subclause 8a.4.1.4:

On reception of the GA-RRC ACTIVATE CHANNEL COMPLETE message indicating the CS domain, the MS shall stop timer TU5911 for the CS domain and consider the successfully activated CTC(s) to be available for use by upper layers. To enable uplink quality measurements in the GANC, the MS shall send at least one RTP frame each 480 ms for each active CTC. During periods of discontinuous transmission (DTX), each RTP frame transmitted by the MS shall bear a format in the AMR/AMR-WB payload Table of Contents that either (a) omits all NO_DATA indications and contains only the next AMR speech or SID frame that is available, or (b) includes a single NO_DATA frame should no AMR speech or SID frame become available for 480 ms. The RTP timestamp shall indicate the time of that speech or SID or NO_DATA frame. See Section A.1.2 of Annex A for examples.

3GPP TS 44.318 subclause 8a.5.1:

If the MS needs to release the GA-RRC connection and signalling connection to a particular CN domain, it shall send the GA-RRC RELEASE REQUEST message to the GANC and start timer TU5909 for the domain. The MS shall include the IE "CN Domain Identity" and the IE "GA-RRC Cause". The GA-RRC Cause value shall be one of the following:

- #40: UE generated signalling connection release
- #115: unspecified failure

84.5.1.1.2 Test purpose

To verify that MS is able to establish a CS domain traffic channel.

The MS initiates the release the GA-RRC connection (CS domain) by sending GA-RRC CLEAR REQUEST to the SS. The MS enters GA-RRC-IDLE state and releases all GA-RRC and any traffic channel resources (CS domain).

84.5.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-CONNECTED state (CS domain) in service of GAN cell and a voice call is ongoing.

Foreseen Final State of the MS

MS in GA-RRC-IDLE state (CS domain) in service of GAN cell.

Test Procedure

A voice call is ongoing. The SS configures a CS traffic channel by transmitting GA-RRC ACTIVATE CHANNEL (CS domain) to the MS. MS responds by transmitting a GA-RRC ACTIVATE CHANNEL ACK including the IE 'UDP Port'. Then the SS configures itself for transmission of RTP packets to the MS to the indicated UDP port and transmits a GA-RRC ACTIVATE CHANNEL COMPLETE message to the MS. MS and SS sends at least one RTP frame each 480 ms. The SS releases the call by sending GA-RRC DL DIRECT TRANSFER message (Release) and receiving GA-RRC UL DIRECT TRANSFER (Release Complete) message. Therefore, the MS will send GA-RRC RELEASE REQUEST to release the CS domain connection.

Specific test parameters

FFS

84.7 Void

84.8 Void

84.9 Security Mode Control Procedure

84.9.1 Security Mode Control Procedure / successful cases

84.9.1.1 Security Mode Control Procedure (CS domain)

84.9.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.6.1:

The GANC initiates the security mode control procedure by sending a GA-RRC SECURITY MODE COMMAND message to the MS. This message includes the IE "Selected Integrity Protection Algorithm", the IE "Selected Encryption Algorithm" (optional), and the IE "Random Number". The GANC selects the algorithms based on the permitted algorithms received from the CN and the MS security capabilities indicated in the IE "3G Security Capability" received from the MS in the GA-RC REGISTER REQUEST message.

3GPP TS 44.318 subclause 8a.6.2:

Whenever the MS receives a valid GA-RRC SECURITY MODE COMMAND message, it shall, if a (U)SIM is present and considered valid and the key set identifier (KSI) stored on the (U)SIM indicates that an integrity key and cipher key are available for the domain indicated in the IE "CN Domain Identity", store the selected integrity protection algorithm and (if received) the selected encryption algorithm for possible future use after a handover from GAN Iu mode to UTRAN during the same upper layer transaction. If handover from GAN Iu mode to UTRAN occurs, encryption is enabled if the IE "Selected Encryption Algorithm" is present in the message and disabled otherwise.

The MS shall also calculate a MAC (Message Authentication Code). The MAC shall be calculated over the following data:

RAND | IMSI

using "HMAC-SHA1-96" algorithm, as specified in [24] with the integrity key (IK) for the domain indicated in the IE "CN Domain Identity" used as the authentication key.

In the formulas above, the "|" character denotes concatenation. RAND is the 16-octet random number received from the GANC in the GA-RRC SECURITY MODE COMMAND message. IMSI is the MS IMSI, in the same format as defined for the Mobile Identity IE as defined in [8]; i.e. as a variable-length sequence of digits in BCD format (e.g. the IMSI "123456789098765" is encoded as the following octets (in hexadecimal): "21 43 65 87 09 89 67 F5"). Network byte order is used.

The IK key is the IK that has been derived during the last authentication for the domain indicated in the IE "CN Domain Identity". The length of the MAC is 12 octets.

When the appropriate action on the GA-RRC SECURITY MODE COMMAND message has been taken, the MS sends a GA-RRC SECURITY MODE COMPLETE message to the GANC. The MS includes the calculated MAC value in the IE "Ciphering Command MAC".

Reference(s)

3GPP TS 44.318 sub-clause 8a.6.1 and 8a.6.2.

84.9.1.1.2 Test purpose

To verify that the MS can reply to a GA-RRC SECURITY MODE COMMAND message and return the correct Message Authentication Code (MAC).

84.9.1.1.3 Method of test

Initial conditions

System Simulator:

84.10 Channel modify procedure

84.10.1 CS channel modify procedure / successful cases

84.10.1.1 CS channel modify / successful case

84.10.1.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.7.1.1:

The GANC initiates the circuit transport channel (CTC) modification procedure when it determines that one or more active CTCs require modification; e.g., based on information received from the MSC in the RAB Assignment Request message or based on local GANC logic.

The following CTC parameters may be modified:

- RAB Configuration
- Sample Size
- GANC RTP UDP Port
- GANC IP Address
- Multi-rate Configuration 2
- RTP Redundancy Configuration
- GANC RTCP UDP Port

- NAS Synchronisation Indicator

The GANC only includes the IEs which specify modifications to the existing CTC parameters.

One or more CTCs may be modified using a single instance of the channel modification procedure; however, it is not possible to modify both circuit and packet transport channels using a single instance of the channel modification procedure.

The GANC begins the modification of the CTC(s) by transmitting the GA-RRC MODIFY CHANNEL message to the MS. The message contains the IE "CN Domain Identity" (indicating CS domain) and IE "CTC Modification List" which includes the parameters necessary to describe the modifications to each circuit transport channel.

3GPP TS 44.318 subclause 8a.7.1.2:

On receipt of the GA-RRC MODIFY CHANNEL message indicating the CS domain, the MS shall process the specified CTC modifications.

On completion of the modification of the CTC(s), the MS shall:

- transmit a GA-RRC MODIFY CHANNEL ACK message including the IE "CN Domain Identity" and the IE "CTC Modification Ack List". For each CTC specified in the IE "CTC Modification Ack List":
 - include the IE "RAB ID" for the CTC with the same value as received in the GA-RRC MODIFY CHANNEL message in the IE "RAB ID";
 - include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
 - for each CTC that is successfully modified (i.e., GA-RRC Cause value is '0'):
 - include the modified parameter values currently used by the MS.

When the MS has sent the GA-RRC MODIFY CHANNEL ACK message, it shall start transmitting RTP packets based on the successful parameter modifications. The MS shall be able to receive RTP packets with the old parameters until the MS determines that the first RTP packet using the new parameters has been received.

Reference(s)

3GPP TS 44.318 subclauses 8a.7.1.1, 8a.7.1.2

84.10.1.1.2 Test purpose

To verify that MS is able to change active CTC parameters if requested.

84.10.1.1.3 Method of test

Initial Conditions

System Simulator:

- 1 GAN cell, default parameters

Mobile Station:

- MS in GA-RRC-CONNECTED state (CS domain) in service of GAN cell, voice call activated

Foreseen Final State of the MS

MS in GA-RRC-IDLE state (CS domain)

Test Procedure

The MS is in GA-RRC-CONNECTED state (CS domain) in service of GAN cell, voice call activated. SS sends GA-RRC MODIFY CHANNEL message to change the active sample size for the CTC. The MS sets the sample size for the active CTC and then replies by a GA-RRC MODIFY CHANNEL ACK message indicating the modified parameter.

Specific test parameters

84.10.2 CS channel modify procedure / negative cases

84.10.2.1 CS channel modify requests illegal change to parameter

84.10.2.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.7.1.1:

The GANC initiates the circuit transport channel (CTC) modification procedure when it determines that one or more active CTCs require modification; e.g., based on information received from the MSC in the RAB Assignment Request message or based on local GANC logic.

The following CTC parameters may be modified:

- RAB Configuration
- Sample Size
- GANC RTP UDP Port
- GANC IP Address
- Multi-rate Configuration 2
- RTP Redundancy Configuration
- GANC RTCP UDP Port
- NAS Synchronisation Indicator

The GANC only includes the IEs which specify modifications to the existing CTC parameters.

One or more CTCs may be modified using a single instance of the channel modification procedure; however, it is not possible to modify both circuit and packet transport channels using a single instance of the channel modification procedure.

The GANC begins the modification of the CTC(s) by transmitting the GA-RRC MODIFY CHANNEL message to the MS. The message contains the IE "CN Domain Identity" (indicating CS domain) and IE "CTC Modification List" which includes the parameters necessary to describe the modifications to each circuit transport channel.

3GPP TS 44.318 subclause 8a.7.1.2:

On receipt of the GA-RRC MODIFY CHANNEL message indicating the CS domain, the MS shall process the specified CTC modifications.

On completion of the modification of the CTC(s), the MS shall:

- transmit a GA-RRC MODIFY CHANNEL ACK message including the IE "CN Domain Identity" and the IE "CTC Modification Ack List". For each CTC specified in the IE "CTC Modification Ack List":
 - include the IE "RAB ID" for the CTC with the same value as received in the GA-RRC MODIFY CHANNEL message in the IE "RAB ID";
 - include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
 - for each CTC that is successfully modified (i.e., GA-RRC Cause value is '0'):
 - include the modified parameter values currently used by the MS.

When the MS has sent the GA-RRC MODIFY CHANNEL ACK message, it shall start transmitting RTP packets based on the successful parameter modifications. The MS shall be able to receive RTP packets with the old parameters until the MS determines that the first RTP packet using the new parameters has been received.

84.10.3 PS channel modify procedure / successful cases

84.10.3.1 PS channel modify / successful case

84.10.3.1.1 Conformance requirement

3GPP TS 44.318 subclause 8a.7.2.1:

The GANC initiates the packet transport channel (PTC) modification procedure when it determines that one or more active PTCs require modification; e.g., based on information received from the SGSN in the RAB Assignment Request message or based on local GANC logic.

The following PTC parameters may be modified:

- RAB Configuration
- GANC UDP Port
- GANC IP Address

The GANC only includes the IEs which specify modifications to the existing PTC parameters.

One or more PTCs may be modified using a single instance of the channel modification procedure; however, it is not possible to modify both circuit and packet transport channels using a single instance of the channel modification procedure.

The GANC begins the modification of the PTC(s) by transmitting the GA-RRC MODIFY CHANNEL message to the MS. The message contains the IE "CN Domain Identity" (indicating PS domain) and IE "PTC Modification List" which includes the parameters necessary to describe the modifications to each packet transport channel.

3GPP TS 44.318 subclause 8a.7.2.2:

On receipt of the GA-RRC MODIFY CHANNEL message indicating the PS domain, the MS shall process the specified PTC modifications.

On completion of the modification of the PTC(s), the MS shall:

- transmit a GA-RRC MODIFY CHANNEL ACK message including the IE "CN Domain Identity" and the IE "PTC Modification Ack List". For each PTC specified in the IE "PTC Modification Ack List":
 - include the IE "RAB ID" for the PTC with the same value as received in the GA-RRC MODIFY CHANNEL message in the IE "RAB ID";
 - include the IE "GA-RRC Cause" indicating either success (i.e., value '0') or a failure cause value;
 - for each PTC that is successfully modified (i.e., GA-RRC Cause value is '0'):
 - include the modified parameter values currently used by the MS.

When the MS has sent the GA-RRC MODIFY CHANNEL ACK message, it shall start transmitting GA-RRC PDU messages based on the successful parameter modifications. The MS shall be able to receive GA-RRC PDU messages with the old parameters until the MS determines that the first GA-RRC PDU message using the new parameters has been received.

3GPP TS 44.318 subclause 8a.8.3:

The GANC normally initiates this procedure when it receives the RAB Assignment message from the CN indicating RAB release; however, the GANC may also initiate this procedure under certain failure conditions.

One or more circuit or packet transport channels may be deactivated using a single instance of the channel deactivation procedure; however, it is not possible to deactivate both circuit and packet transport channels using a single instance of the channel deactivation procedure.

The GA-RRC DEACTIVATE CHANNEL message includes the IE "GA-RRC Cause" with value as follows:

#0: normal event, e.g. deactivate due to RAB release request from CN

#115: unspecified failure

#10: relocation cancelled (e.g., the handover procedure is stopped because the call has been cleared)

3GPP TS 44.318 subclause 8a.8.4:

When the MS receives the GA-RRC DEACTIVATE CHANNEL message, it shall:

- deactivate the CTC(s) or PTC(s) identified in the IE "RAB ID List";
- send a GA-RRC DEACTIVATE CHANNEL COMPLETE message to the GANC.

3GPP TS 44.318 subclause 8a.8.5:

If timer TU5002 expires in the MS, the MS shall release the associated transport channel(s).

90 Text Telephony (TTY) Services

This subclause contains test cases for Text Telephony (TTY) services.

90.1 Transmission of CTM Bearer Code

90.1.1 Mobile Originated TTY Call

90.1.1.1 Conformance requirement

- 1) When establishing a mobile originated call with TTY mode enabled in the MS, bit 6 of Octet 3a in the Bearer Capability Information Element shall be '1'.
- 2) When establishing a mobile originated call with TTY mode disabled in the TTY-compatible MS, bit 6 of Octet 3a in the Bearer Capability Information Element shall be '0'.

Reference(s):

For conformance requirement 1 and 2:

3GPP TS 04.08 / TS 24.008, subclause 10.5.4.5

90.1.1.2 Test purpose

- 1) To verify that a TTY compatible MS, with TTY mode enabled, correctly sets bit 6 of Octet 3a in the Bearer Capability Information Element to 1 when made to originate a call.
- 2) To verify that a TTY compatible MS, with TTY mode disabled, correctly sets bit 6 of Octet 3a in the Bearer Capability Information Element to 0 when made to originate a call.

90.1.1.3 Method of test

90.1.1.3.1 void

90.1.1.3.2 Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

90.1.1.3.3 Final foreseen state of the MS

U0, null.

90.1.1.3.4 Test Procedure

- a) The MS is set to TTY mode using the normal MMI. A mobile originated call is established following the generic call set-up procedure for mobile originating speech calls.

- b) After receipt of the SETUP message from the MS, the SS shall disconnect the call.
- c) TTY mode is disabled in the MS using the normal MMI. A mobile originated call is established following the generic call set-up procedure for mobile originating speech calls.
- d) After receipt of the SETUP message from the MS, the SS shall disconnect the call.

90.1.1.4 Test requirement

- 1) In step a), the MS shall send a SETUP message where bit 6 of Octet 3a of the Bearer Capability Information Element is set to 1.
- 2) In step c), the MS shall send a SETUP message where bit 6 of Octet 3a of the Bearer Capability Information Element is set to 0.

90.1.2 Mobile Terminated TTY Call

90.1.2.1 Conformance requirement

- 1) When establishing a mobile terminated call with TTY mode enabled in the MS, bit 6 of Octet 3a in the Bearer Capability Information Element shall be '1'.
- 2) When establishing a mobile terminated call with TTY mode disabled in the TTY-compatible MS, bit 6 of Octet 3a in the Bearer Capability Information Element shall be '0'.

Reference(s):

For conformance requirement 1 and 2:

3GPP TS 04.08 / TS 24.008, subclause 10.5.4.5

90.1.2.2 Test purpose

- 3) verify that a TTY compatible MS, with TTY mode enabled, correctly sets bit 6 of Octet 3a in the Bearer Capability Information Element to 1 when receiving a mobile terminated call.
- 4) To verify that a TTY compatible MS, with TTY mode disabled, correctly sets bit 6 of Octet 3a in the Bearer Capability Information Element to 0 when receiving a mobile terminated call.

90.1.2.3 Method of test

90.1.2.3.1 void

90.1.2.3.2 Initial conditions

System Simulator:

- 1 cell, default parameters.

Mobile Station:

- The MS is in MM-state "idle, updated" with valid TMSI and CKSN.

90.1.2.3.3 Final foreseen state of the MS

U0, null.

90.1.2.3.4 Test Procedure

- a) The MS is set to TTY mode using the normal MMI. A mobile terminated call is established following the generic call set-up procedure for mobile terminating speech calls.
- b) After receipt of the CALL CONFIRMED message from the MS, the SS shall disconnect the call.
- c) TTY mode is disabled in the MS using the normal MMI. A mobile terminated call is established following the generic call set-up procedure for mobile terminating speech calls.
- d) After receipt of the CALL CONFIRMED message from the MS, the SS shall disconnect the call.

90.1.2.4 Test requirement

- 1) In step a), the MS shall send a CALL CONFIRMED message where bit 6 of Octet 3a of the Bearer Capability Information Element is set to 1.
- 2) In step c), the MS shall send a CALL CONFIRMED message where bit 6 of Octet 3a of the Bearer Capability Information Element is set to 0.

Annex 1 (normative): Reference test methods

A1.1 General Conditions (GC)

A1.1.1 Outdoor test site and general arrangements for measurements involving the use of radiated fields (GC4)

The outdoor test site shall be on a reasonably level surface or ground. At one point on the site a ground plane of at least 5 m diameter shall be provided. In the middle of this ground plane a non-conducting support capable of rotation through 360 degrees in the horizontal plane shall be used to support the test sample at 1,5 m above the ground plane.

The test site shall be large enough to allow the erection of a measuring or transmitting antenna at a distance of half a wavelength or at least 3 m whichever is the greater. Sufficient precautions shall be taken to ensure that reflections from extraneous objects adjacent to the site and ground reflections do not degrade the measurement results.

The test antenna is used to detect the radiation from both the test sample and the substitution antenna, when the site is used for radiation measurements. Where necessary the substitution antenna is used as a transmitting antenna, when the site is used for the measurement of receiver characteristics. This antenna is mounted on a support such as to allow the antenna to be used in either the horizontal or vertical polarization and for the height of its centre above ground to be varied over the range 1 m to 4 m. Preferably test antennas with pronounced directivity should be used. The size of the test antenna along the measurement axis shall not exceed 20 % of the measuring distance.

For radiation measurements the test antenna is connected to a test receiver capable of being tuned to any frequency under investigation and of measuring accurately the relative levels of signals at its input. When necessary (for receiver measurements) the test receiver is replaced by a signal source.

The substitution antenna shall be a half wave dipole, resonant at the frequency under consideration, or a shortened dipole, or (in the range 1 GHz to 4 GHz) a horn radiator. Antennas other than a half wave dipole shall have been calibrated to the half wave dipole. The centre of this antenna shall coincide with the reference point of the test sample it has replaced. This reference point shall be the volume centre of the sample when its antenna is mounted inside the cabinet, or the point where an external antenna is connected to the cabinet. The distance between the lower extremity of the dipole and the ground shall be at least 30 cm.

The substitution antenna shall be connected to a calibrated signal generator when the site is used for radiation measurements and to a calibrated measuring receiver when the site is used for measurements of receiver characteristics. The signal generator and the receiver shall be operating at the frequencies under investigation and shall be connected to the antenna through suitable matching and balancing network.

A1.1.2 Anechoic shielded chamber (GC5)

As an alternative to the above mentioned outdoor test site an indoor test site, being a well shielded anechoic chamber simulating free space environment may be used. If such a chamber is used, this shall be recorded in the test report.

NOTE: The anechoic shielded chamber is the preferred test site for testing to the present document.

The measurement site may be an electrically shielded anechoic chamber being 10 m long, 5 m broad and 5 m high. Walls and ceiling should be coated with RF absorbers of 1 m height. The ground should be covered with absorbing material 1 m thick able to carry test equipment and operators. A measuring distance of 3 m to 5 m in the long middle axis of the chamber can be used for measurements up to at least 10 GHz.

The test antenna, test receiver, substitution antenna and calibrated signal generator are used in a way similar to that of the outdoor test site method with the exception that, because the floor absorbers reject floor reflections, the antenna height need not be changed and shall be at the same height as the test sample. In the range between 30 MHz and 100 MHz some additional calibration may be necessary.

A1.1.3 Temporary antenna connector (GC7)

If the MS to be tested does not normally have a permanent external 50 Ω connector then for test purposes only it may be modified to fit a temporary 50 Ω antenna connector.

The permanent integral antenna shall be used for measurement of:

- Transmitter effective radiated power (subclause 13.3).
- Radiated spurious emissions (clause 12).

For tests in the relevant MS Receive band:

- The temporary antenna coupling factor is determined using the procedure defined in annex 1, subclause 1.1.5. When using the temporary antenna connector, the temporary antenna coupling factor needs to be taken into consideration when determining a stimulus or measured level in the receive band.

For tests in the relevant MS Transmit band:

- The temporary antenna coupling factor is determined using the procedure defined in subclause 13.3.4.2. When using the temporary antenna connector, the temporary antenna coupling factor needs to be taken into consideration when determining a stimulus or measured level in the transmit band.

For frequencies outside the above mentioned relevant bands the temporary antenna coupling factor is assumed to be 0 dB.

NOTE 1: The uncertainty in the determined value of the temporary antenna coupling factor is directly related to the uncertainty of the field strength value measured in subclause 13.3.4.2 step n) and annex 1, subclause 1.1.5.2 (approximately ± 3 dB). By mutual agreement, between the MS manufacturer and the testing authority, a value of 0 dB for the temporary antenna coupling factor could be used.

NOTE 2: The accommodation of the uncertainty in the temporary antenna coupling factor in the relevant MS receive band for the tests in clause 14 is for further study.

NOTE 3: The uncertainty in the temporary antenna coupling factor in the relevant MS transmit band can be accommodated with appropriate adjustment of the measured levels by the uncertainty.

Testing must be performed in the following order to ensure that all the free field measurements are performed before the MS is modified.

- Subclause 12.1.2.
- Annex 1, subclauses 1.1.5.1 and 1.1.5.2.
- Subclause 13.3.4.2 (during this step the MS is modified).
- Annex 1, subclause 1.1.5.3.
- All remaining tests of clauses 12, 13, 14, 15, 16, 17, 18, 19, 20, 21 and 22.

A1.1.4 Temporary antenna connector characteristics

The method of connection of the temporary connector shall allow secure and repeatable connections to be made to the device under test.

The antenna connector shall present a nominal 50 Ω impedance over the GSM receive and transmit frequency ranges. The maximum loss within the frequency range 100 kHz to 12,75 GHz shall be less than 1 dB.

The connection circuitry shall be maximally broadband and shall contain no non-linear or active devices.

The characteristics of the connector shall not be significantly affected by temperatures in the range -25° to +60° Celsius.

A1.1.5 Calibration of the temporary antenna connector

For equipments fitted with an integral antenna and not provided with a permanent means for connection to an external antenna a calibration procedure is required to allow subsequent measurements to be performed on the temporary antenna connector.

Once calibrated this temporary antenna connector enables all receiver test procedures to be identical for equipments with an integral antenna and for equipments with an antenna connector.

The calibration procedure shall be carried out at three frequencies, namely an ARFCN in the low mid and high ARFCN ranges. The procedure consists of three distinct stages as follows:

- 1) Establish the MS antenna radiation pattern for the three selected frequencies.
- 2) Calibrate the test range (or anechoic shielded chamber) for the conditions needed in 1).
- 3) Determine the temporary antenna connector coupling factor.

A1.1.5.1 Antenna radiation pattern

- a) The MS shall be in the anechoic shielded chamber, or on an outdoor test site, on an isolated support in a vertical position at an orientation specified by the manufacturer. This position is the 0° position.

A test antenna, connected to the SS shall be in the anechoic shielded chamber, or on the outdoor test site, at a distance of at least 3 m from the MS.
- b) A call shall be originated by the SS to the MS on a frequency in the low ARFCN range. The MS shall be made to answer the call. The SS shall command the MS to maximum transmit power.
- c) The SS shall, using estimated parameters for the outdoor test site or anechoic shielded chamber, set its output level "E" [see figure A1-1 to give an MS receiver input level of approximately 32 dBμV_{emf}. This corresponds to a field strength of 55,5 dBμV/m at the MS position. The signal shall be the Standard Test Signal C1.

NOTE 1: The absolute value of the received signal level is not critical. The value suggested however will ensure that the MS receiver is operating essentially error free, yet is low enough to avoid any non linear effects in the receiver.

- d) The SS shall use the RXLEV message from the MS to determine a measure of the received field strength. The procedure detailed in the flow chart of figure A1-1 shall now be followed.

Figure A1-1

The signal level from the SS that just results in the transition from $RXLEV_a$ to $RXLEV_b$ shall be recorded as E_i .

NOTE 2: The actual values of $RXLEV_a$ and $RXLEV_b$ will need to be recorded, because this transition will be used as the reference point for all further stages of the calibration procedure.

- e) Step d) shall be repeated after the MS has been rotated by $n \times 45^\circ$ in the horizontal plane. Ensuring that the same RXLEV transition is used, the signal levels from the SS shall be recorded as E_{in} .

- f) Calculate the effective mean signal level from the RMS value of the eight signal levels obtained in d) and e) above by using the following formula:

$$E_1 = \left[\frac{8}{\sum_{n=0}^{n=7} \frac{1}{E_{in}}} \right]^{\frac{1}{2}}$$

- g) Repeat steps b) to f), except in step b) use an ARFCN in the mid ARFCN range to obtain a mean signal level E_2 . Ensure the same RXLEV transition is used.
- h) Repeat steps b) to f), except in step b) use an ARFCN in the high ARFCN range to obtain a mean signal level E_3 .

Ensure the same RXLEV transition is used.

A1.1.5.2 Test range calibration

The objective of this step is to determine the actual field strength at the MS corresponding to the three signal levels E_1 , E_2 and E_3 established in annex 1, subclause 1.1.5.1. The following procedure shall be used:

- a) Replace the MS by a calibrated reception antenna connected to a measuring receiver.
- b) For each frequency used in annex 1, subclause 1.1.5.1 measure the field strength E_{fr} corresponding to the respective signal levels E_r determined in steps f), g) and h) of annex 1, subclause 1.1.5.1 record these values as E_{f1} , E_{f2} , E_{f3} .

A1.1.5.3 Temporary antenna connector coupling factor

The coupling factor of the temporary antenna connector is the relationship expressed in dB, between the output signal of the SS and the effective receiver input signal for the MS.

The test sample MS is modified to fit a temporary antenna connector in accordance with annex 1, subclause 1.1.3. Or alternatively a second MS shall be provided, fitted with such a temporary antenna connector.

NOTE: If only one MS is supplied for testing, the tests of radiated spurious emissions (transmit and receive) and receiver sensitivity shall be performed before the MS is modified to accept a temporary antenna connector.

The calibration procedure shall be as follows:

- a) The MS temporary connector is connected to the output of the SS.
- b) A call shall be originated by the SS to the MS using a frequency in the low ARFCN range. The MS shall be made to answer the call. The SS shall command the MS to maximum transmit power, non hopping encrypted mode.
- c) The SS shall, using the procedures of annex 1, subclause 1.1.5.1, adjust its output signal level to determine the $RXLEV_a$ to $RXLEV_b$ transition. This signal level shall be recorded as E_{c1} .
- d) Repeat steps b) and c) for frequencies in the mid ARFCN range and the high ARFCN range. Record the RXLEV transitions as E_{c2} and E_{c3} respectively.
- e) The temporary antenna connector coupling factor F is then calculated from:

$$F_n = 20 \log_{10} \left[\frac{E_{cn}}{E_{fn} * K_n} \right]$$

where K_n = conversion factor of an isotropic antenna expressed as μV at the frequency $\mu V/m$ corresponding to the ARFCN used.

- f) The mean antenna coupling factor F_m to be used for measurements requiring hopping shall be calculated from the RMS value of all parameters in e) as follows:

$$E_{cm} = \left[\frac{3}{1/E_{c1} + 1/E_{c2} + 1/E_{c3}} \right]^{1/2}$$

$$E_{fm} = \left[\frac{3}{1/E_{f1} + 1/E_{f2} + 1/E_{f3}} \right]^{1/2}$$

$$k_m = \left[\frac{k_1 + k_2 + k_3}{3} \right]^{1/2}$$

$$F_m = 20 \log_{10} \left[\frac{E_{cm}}{E_{fm} + k_m} \right]$$

g) In all tests in which a MS with integral antenna is the unit under test, the signal level at the temporary antenna connector is determined from:

$$- E_{in} = E_{req} + F;$$

where:

- E_{in} = signal level at coupling device (dBμVemf);
- E_{req} = signal level required by the test (dBμVemf);
- F = coupling factor at the respective ARFCN (dB).

This is indicated in the test procedures as E_{req} , dBμVemf(), where the empty parenthesis is to be read as E_{in} .

For frequencies not in the receive band or the transmit band, 0dBi antenna gain shall be assumed.]

A1.1.6 Connection of devices with multiple antennae

Devices with multiple antennae must be connected in well defined manner in order for test requirements to be considered valid. This applies equally to those tests which are specifically testing these requirements associated with a device with multiple antennae, as those which are not.

A1.1.6.1 DARP phase 2 MS

For those tests which are specifically designed for DARP phase 2 MS, the SS must present signals to, and connect to the MS in a manner specified in TS 45.005 Annex N.2. Additionally, the SS must be able to accommodate the MS transmission being on either one or both of these antennae, or indeed an alternative antenna.

A1.2 Normal and extreme Test Conditions (TC)

A1.2.1 Power sources and ambient temperatures (TC2)

During type approval tests the power source of the equipment shall be replaced by a test power source, capable of producing normal and extreme test voltages as specified in subclauses 1.2.2 and 1.2.3. The internal impedance of the test power source shall be low enough for its effect on the test results to be negligible. For the purpose of tests, the voltage of the power source shall be measured at the input terminals of the equipment. If the equipment is provided with a permanently connected power cable, the test voltage shall be that measured at the point of connection of the power cable to the equipment. In equipment with incorporated batteries the test power source shall be applied as close to the battery terminals as practicable.

During tests the power source voltages shall be maintained within a tolerance of ± 3 % relative to the voltage at the beginning of each test.

A1.2.2 Normal test conditions (TC2.1)

The normal temperature and humidity conditions for tests shall be any convenient combination of temperature and humidity within the following ranges:

- Temperature: +15°C to +35°C (degrees Celsius).
- Relative humidity: up to 75 %.

NOTE: When it is impracticable to carry out the tests under the conditions stated above, the actual temperature and relative humidity during the tests shall be recorded in the test report.

The normal test voltage for equipment to be connected to the mains shall be the nominal mains voltage. For the purpose of these specifications, the nominal voltage shall be the declared voltage or any of the declared voltages for which the equipment was designed. The frequency of the test power source corresponding to the mains shall be within 1 Hz of the nominal mains frequency.

When the radio equipment is intended for operation from the usual types of regulated lead-acid battery power source of vehicles, the normal test voltage shall be 1,1 times the nominal voltage of the battery (6 volts, 12 volts etc.).

For operation from other power sources or types of battery (primary or secondary) the normal test voltage shall be that declared by the equipment manufacturer.

A1.2.3 Extreme test conditions (TC2.2)

For tests under extreme test conditions the 4 combinations of extreme voltages and extreme temperatures in table A1.1 shall be applied.

Table A1.1

	1	2	3	4
Temperature	High	High	Low	Low
Voltage	High	Low	High	Low

For tests at extreme ambient temperatures measurements shall be made at the temperatures given in table A1.2 (see 3GPP TS 45.005, D.2.1 for further details), following the testing procedures given in IEC publications 68-2-1 and 68-2-2 for the low and high temperature tests.

For tests at the high temperature, after thermal balance has been achieved, the MS is switched on in the transmit condition (non DTX) for a period of one minute followed by 4 minutes in the idle mode (non DRX) after which the MS shall meet the specified requirements.

For tests at the low temperature, after thermal balance has been achieved, the MS is switched to the idle mode (non DRX) for a period of one minute after which the MS shall meet the specified requirements.

Table A1.2

	Temperature (degrees Celsius)	
	Low	High
For small MS units	-10	+55
For other units	-20	+55
Note 1: Mobile phones, Tabs, Data cards, Embedded modules etc. are considered belonging to the small MS category		

For tests at extreme voltages measurements shall be made at the lower and higher extreme voltages as declared by the MS manufacturer. For MS that can be operated from one or more of the power sources listed below, the lower extreme voltage shall not be higher, and the higher extreme voltage shall not be lower than that specified in table A1.3.

Table A1.3

	Voltage (relative to nominal)		
	Lower extreme	Higher extreme	Normal cond.
Power source:			
AC mains	0,9	1,1	1,0
Regulated lead acid battery	0,9	1,3	1,1
Non regulated batteries:			
Leclanché	0,85	1,0	1,0
lithium	0,95	1,10	1,10
mercury/ nickel cadmium	0,9	1,0	1,0

A1.2.4 Vibration requirements (TC4)

When the MS is to be tested under vibration, then random vibration is used, where the acceleration spectral densities (ASD) and the frequency ranges of 3GPP TS 05.05 [subclause D.2.3] apply. These are given in table A1.4.

Table A1.4

frequency in Hz	ASD in m^2/s^3
5- 20	0,96
20 - 500	0,96 at 20 Hz, thereafter -3 dB / octave

The test shall be performed as described in IEC publication 68-2-36.

Annex 2:

Void

Annex 3:

Protocol implementation information

General

The list of PICS and PIXIT gives all the information needed to perform the tests described in 3GPP TS 11.10.

A3.1 Protocol Implementation Conformance Statement (PICS)

For the points listed the manufacturer has the choice between different solutions in implementation. The manufacturer has to describe his choice if there is any consequence for the tests.

A3.1.1 LAPDm protocol (3GPP TS 04.05 and 04.06)

A3.1.1.1 Simplified protocol - 3GPP TS 04.06 clause 6

Statement about the choice made by the manufacturer.

A3.1.1.2 Management of SAPI = 3 - 3GPP TS 04.11 subclause 2.3

Statement about the handling of SAPI = 3 on the data link layer chosen by the manufacturer.

A3.1.2 Mobility management

A3.1.2.1 IMSI detach initiation by the MS - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.4.1

During a location updating, if an IMSI detach has to be performed (SIM or power off), the IMSI detach can be delayed until the location updating is finished, or can be omitted.

A3.1.2.2 IMSI detach completion by the MS - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.3.4.3

The MS should delay the local release of the channel to allow a normal release from the network after a detach by power off command, if possible.

If not possible the RR sub-layer on the MS side should be aborted without waiting for something from the network.

A3.1.2.3 MM specific procedures - 3GPP TS 04.08 / 3GPP TS 24.008 subclauses 4.4 and 4.5.1.1

During the lifetime of an MM specific procedure, if an MM connection establishment is required by a CM-entity, this request will either be rejected or delayed until the running MM specific procedure is terminated and, provided that the network has not sent a "follow-on proceed" indication, the RR connection is released.

If the LOCATION UPDATING REQUEST message has not been sent, the mobile station may include a "follow-on request" indicator in the message. The mobile station shall then delay the request until the MM specific procedure is completed, when it may be given the opportunity by the network to use the RR connection.

A3.1.2.4 Receiving an MM STATUS message - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 4.6

If the MM-entity of the Mobile Station receives a MM-STATUS message no state transition and no specific action shall be taken as seen from the radio interface, i.e. local actions are possible.

A3.1.3 Call control

A3.1.3.1 Status enquiry procedures - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.5.3.1

The MS may send a STATUS ENQUIRY and take the appropriate actions based on the answer (STATUS) of the network.

A3.1.3.2 Receiving a STATUS message by a CC entity - 3GPP TS 04.08 / 3GPP TS 24.008 subclause 5.5.3.2

The determination of which CC states are incompatible between the MS and the network is left as an implementation decision except in some particular cases.

A3.1.3.3 Called side compatibility checking - 3GPP TS 04.08 / 3GPP TS 24.008 clause B.3

Compatibility checking can be performed in various ways from the viewpoint of execution order and information to be checked, e.g. first DDI number, sub-address and then compatibility or vice versa.

A3.1.3.4 Disconnect on incoming call

The mobile equipment may or may not offer the possibility to disconnect an incoming call:

- a) after having confirmed an incoming call, but before alerting;
- b) after alerting, but before connecting.

3GPP TS 02.30 (subclause 5.2.3) allows the combination of SEND and END function in one key.

A3.1.4 Layer 1

A3.1.4.1 Optional storage of BCCH carrier information - 3GPP TS 05.08 subclause 6.3

The MS may include optional storage of BCCH carrier information. For instance, the MS may store the BCCH carriers in use by the PLMN accessed when it was last active in the GSM network, or it may store BCCH carriers for more than one PLMN.

A3.1.5 Autocalling - (ref.: 3GPP TS 02.07, annex 1)

Cause number 27 implemented in:

- category 2 (preferred);
- category 3.

A3.1.6 Transient states

The following call control states may be transient in the mobile station:

State U6

State U6 may be transient if the mobile station is not configured to support explicit refusal of an incoming call by the (human or non-human) user (e.g. via a terminal interface) before call confirmation.

If U6 is transient, there is an internal transition:

U6 -----CALL CONFIRMED-----> U9

or an internal transition:

RELEASE COMPLETE

U6 ----- > U0.

State U7:

State U7 is transient if the implementation allows for automatic connect after an implementation specific time T.

If U7 is transient, there is an internal transition:

after T, CONNECT

U7 ----- > U8.

State U9:

State U9 is not transient if:

- the implementation does not support immediate connect;
- an appropriate TCH is not yet assigned;
- the signalling element has not been present in the SETUP.

If the implementation supports immediate connect, there is an internal transition:

CONNECT

U9 ----- > U8.

If the appropriate TCH is available or the signalling element was present in SETUP, there is an internal transition:

ALERTING

U9 ----- > U7.

State U12:

U12 is a stable state, if an appropriate speech traffic channel is connected and progress indicator #8 was present in the DISCONNECT message. Otherwise U12 is transient, and there is an internal transition:

A3.2 Protocol Implementation Extra Information for Testing (PIXIT)

A3.2.0 Introduction

Some of the features listed below are mandatory, others are not ; but in any case for each feature implemented the manufacturer must provide information to enable regulatory testing to be conducted.

A3.2.1 Basic characteristics

A3.2.1.1 Type of antenna

- Integrated without a connector.
- Position for normal use (if integrated without a connector).
- With a connector allowing the connection of an external antenna.
- If with a connector, declare in band impedance.

A3.2.1.2 Power supply

- Type of battery (if any).
- Type of power supply.
- Nominal voltage(s).
- End-point voltage(s) of battery(s) (if any).
- Details of MS shut-down voltage.

A3.2.1.3 Power class of the MS

- Different class declared.
- Class mark change: description of the means to change the RF power capabilities.

A3.2.1.4 Channel modes supported

- Speech full rate.
- Speech half rate.
- Data 14.5 kbit/s T/NT.
- Data 12 kbit/s full rate T/NT.
- Data 6 kbit/s full rate T/NT.
- Data 6 kbit/s half rate T/NT.
- Data 3,6 kbit/s full rate T.
- Data 3,6 kbit/s half rate T.

A3.2.1.5 Teleservices supported

- 11) Telephony.
- 12) Emergency calls.
- 21) Short message MT/PP.
- 22) Short message MO/PP.
- 23) Short message transmission cell broadcast.
- 61) Alternate speech and facsimile group 3 T/NT.
- 62) Automatic facsimile group 3 T/NT.

A3.2.1.6 Supplementary services supported

- Call forwarding.
- Call restriction.
- Handling of undefined GSM Supplementary Services.

A3.2.1.7 Bearer services supported

- | | | |
|-----|-------------------------------------|---------------------------------|
| 20) | Asynchronous General Bearer Service | see 3GPP TS 02.02 subclause 3.1 |
| 21) | Data circuit Duplex asynchronous | 300 bit/s T/NT |
| 22) | Data circuit Duplex asynchronous | 1 200 bit/s T/NT |

23)	Data circuit Duplex asynchronous	1 200/75 bit/s	T/NT
24)	Data circuit Duplex asynchronous	2 400 bit/s	T/NT
25)	Data circuit Duplex asynchronous	4 800 bit/s	T/NT
26)	Data circuit Duplex asynchronous	9 600 bit/s	T/NT
30)	Synchronous General Bearer Service	see 3GPP TS 02.02 subclause 3.1	
31)	Data circuit Duplex synchronous	1 200 bit/s	T
32)	Data circuit Duplex synchronous	2 400 bit/s	T/NT
33)	Data circuit Duplex synchronous	4 800 bit/s	T/NT
34)	Data circuit Duplex synchronous	9 600 bit/s	T/NT
40)	General PAD Access Bearer Service	see 3GPP TS 02.02 subclause 3.1	
41)	PAD Access circuit asynchronous	300 bit/s	T/NT
42)	PAD Access circuit asynchronous	1 200 bit/s	T/NT
43)	PAD Access circuit asynchronous	1 200/75 bit/s	T/NT
44)	PAD Access circuit asynchronous	2 400 bit/s	T/NT
45)	PAD Access circuit asynchronous	4 800 bit/s	T/NT
46)	PAD Access circuit asynchronous	9 600 bit/s	T/NT
50)	General Packet Access Bearer Service	see 3GPP TS 02.02 subclause 3.1	
51)	Data Packet Duplex synchronous	2 400 bit/s	NT
52)	Data Packet Duplex synchronous	4 800 bit/s	NT
53)	Data Packet Duplex synchronous	9 600 bit/s	NT
61)	Alternate Speech/Data (here Data offers the same service as bearer services 21-34 with "3,1kHz" information transfer capability)		
81)	Speech followed by Data (here Data offers the same service as bearer services 21-34 with "3,1kHz" information transfer capability).		

A3.2.1.8 SIM removal

- Removal of the SIM is possible without disconnection of the power supply (Y/N).

A3.2.1.9 Classmark

The coding of Mobile station classmark 1, 2, and 3 and the fact whether and under which conditions the classmark 3 information element is included in a CLASSMARK CHANGE message, has to be declared by the manufacturer. The declaration has to fulfil the following requirements:

- Mobile station classmark 1: Bits 4, 5 and 8 of the first (and only) octet of the value part of the information element shall be coded as "0". The "Revision level" and "RF power capability" field shall specify the value that is correct for the MS.
- Mobile station classmark 2: Bits 4, 5 and 8 of the first octet, bits 2, 3 and 8 of the second octet, bits 3 to 7 of the third octet of the value part of the information element shall be coded as "0". The "Revision level" field, "RF power capability" field, "PS capability" field, "SS Screening indicator" field, "SM capability" field, "Frequency capability" field, "Classmark 3" field, "A5/2 algorithm supported" field, and "A5/3 algorithm supported" field shall specify the value that is correct for the MS.
- Mobile station classmark 3: Bits 5 to 8 of the first octet of the value part of the information element shall be coded as "0". If the value part contains more octets, they shall be coded as "0000 0000". The "A5/4 algorithm supported" field, "A5/5 algorithm supported" field, "A5/6 algorithm supported" field, and "A5/7 algorithm supported" field shall specify the value that is correct for the MS (that is, they shall be set to "0").

NOTE: The requirements to the classmark may be subject to changes. That is why test cases are expected to verify the manufacturer's declaration, whereas the correctness of the manufacturer's declaration is to be verified "off line".

A3.2.1.10 Type of SIM/ME interface (ref. 3GPP TS 11.11 and 3GPP TS 11.12)

- 5V SIM/ME interface (5V only ME).
- 3V SIM/ME interface (3V only ME).
- 5V/3V SIM/ME interface (3V technology ME).

A3.2.1.11 Multislot class

- Multislot class as defined in clause B.1 of 3GPP TS 05.02.

A3.2.2 Man machine interface

A3.2.2.1 Mobile station features

- Description of manual entry and display of a called number.
- Description of the basic way to send a call manually.
- Description of the basic way to take a call manually.
- Description of the basic way to end a call manually.
- Description of the basic way to send an emergency call manually.
- Description of the basic way to send DTMF manually.
- Description of the manual PLMN selector.
- Description of the automatic PLMN selector.
- Description of the indication of the country.
- Description of the indication of the available PLMN.
- Description of the indication of the automatic registration to a PLMN.
- Description of the service indicator.
- Description of the management of the SIM by the user:
 - keying PIN and changing PIN;
 - indication of acceptance or rejection of keyed PIN;
 - indication of blocked SIM;
 - indication of successful unblocking of the SIM;
 - storing an abbreviated number;
 - displaying an abbreviated number.
- Description of the selection of the hands free.
- Description of the volume control.
- Description of local barring of outgoing calls.
- Description of prevention of unauthorized calls.
- Description of the auto calling management:
 - selection of the auto calling;

- indication that the call failed and a re-try is attempted;
- indication that the call finally failed;
- number of B-party numbers that can be stored in the list of blacklisted numbers.
- Description of the way in which the MS generates an MS originated NOTIFY, if possible. This feature may or may not be supported by the MS.
- Description of the way the MS indicates the identity of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).
- Description of the way the MS indicates the change of the current LSA to the human user (only applicable if the SoLSA MS has an interface to the human user).

NOTE: All the above description could be extracted from the user's manual.

A3.2.2.2 Short message service

- Description of the basic procedures to send a mobile originated short message.
- Description of the basic procedures to display a mobile terminated short message.
- Description of the basic procedures to display a cell broadcasted short message.
- Whether SMS messages are stored in the SIM and/or the ME.
- Maximum length (characters) of a mobile originated short message.

A3.2.2.3 Supplementary services

A3.2.2.3.1 Call forwarding

- Description of the user's commands and of the display of the answers from the network for:
 - registration;
 - erasure;
 - activation;
 - deactivation;
 - interrogation;
 - specific data request.
- Description of the display of:
 - notification of an incoming call to the "served" mobile or the "forwarded to" mobile;
 - notification during out-going call;
 - information to the calling mobile.

A3.2.2.3.2 Call restriction

- Description of the user's commands and the display of the answers from the network for:
 - registration;
 - change of the password;
 - activation;
 - deactivation;

- interrogation.
- Description of the display of the indication of call barring.

A3.2.2.3.3 Handling of (undefined) GSM supplementary services

- Description of the user's commands and the display of the answer from the network.
- Identification of the short strings defining MS manufacturer defined procedure in idle mode (1 or 2 characters defined in the 3GPP TS 03.38 default alphabet followed by "SEND").

A3.2.3 Electrical Man Machine Interface (EMMI)

A3.2.3.1 Methods supported for activation/deactivation of EMMI

- All possibilities specified in 3GPP TS 11.10, subclause 36.2.2.
- All possibilities specified in 3GPP TS 11.10, subclause 36.2.2, except activation by inserting a test SIM (when the ME is already switched on).
- Activation/deactivation only via layer 3 messages on the radio interface according to 3GPP TS 11.10, subclause 36.2.2.

A3.2.3.2 Transmission rate supported by the ME on the EMMI

A3.2.3.3 Layer 3 messages supported on the EMMI

- Layer 3 messages as specified in 3GPP TS 11.10, subclause 36.3.5.3.2, except: (followed by the list of messages not supported).
- others than defined in 3GPP TS 11.10 subclause 36.3.5.3.1 table 9.

A3.2.3.4 Keystroke sequence messages

Non standard keystroke sequences to be used on the EMMI (in line with 3GPP TS 11.10, subclause 36.3.5.3.2):

- related to tests of the mobile station features (3GPP TS 11.10, clause 33);
- related to testing of the ME/SIM interface (3GPP TS 11.10, clause 27);
- related to tests of autocalling restrictions (3GPP TS 11.10, clause 28);
- related to tests of supplementary services (3GPP TS 11.10, clause 31);
- related to tests of data services (3GPP TS 11.10, clause 29);
- related to tests of short message service (3GPP TS 11.10, clause 34);
- related to other tests.

A3.2.3.5 Internal malfunction detected messages

List of the error indicators provided.

A3.2.4 Digital Audio Interface (DAI)

Description of the speech data routing:

- via the control lines; or
- via the test interface message.

A3.2.5 Characteristics related to bearer services or teleservices

A3.2.5.1 Access interface

Description of the access interface to connect the DTE (e.g. V series (V.24, V.28), X series, two wire analogue interface for use with fax group 3, I.420 (S-reference point).

In case of a proprietary interface to a DTE (non standard), description of this interface (hardware and software).

In case of a non standard connector provide a mechanical adapter.

A3.2.5.2 Configuration of the MT

Description of the configuration information to be selected in the MT to connect a terminal equipment to the mobile termination.

Description of the (different) configuration(s) of the MT for each bearer service and each teleservice supported, with the range or value for the parameters and the configuration procedure.

For the purpose of test of MOC, the manufacturer shall describe precisely how it is possible to put the MT in the different configurations to generate the capability information of the Mobile according to subclause 3.2.5.3, and described as supported by the MS.

For the purpose of test of MTC, the manufacturer shall describe how to verify the correct selection by the MT of the required function with regard to the capability information as described below, especially using the messages at the Um interface if there is no R or S interface available (case MTO). The description shall be made for every combination of the parameter value valid for the MT.

A3.2.5.3 Capability information

Description of the capability information, related to supported bearer services:

- bearer capabilities;
- higher layer capabilities;
- lower layer capabilities.

The manufacturer shall describe for every capability the associated terminal functions and their characteristics.

A3.2.5.4 Subaddress or DDI number

Subaddress or a DDI number of the MT.

Procedure to allocate or change DDI number or subaddress, if possible.

A3.2.5.5 User to user signalling

Description of the function and the user's access to it.

A3.2.5.6 Data call set-up and data call clearing

For each implemented transparent and non-transparent data service:

- Description of the data call establishment mechanism:
 - Terminal initiated (CT108) (if possible);
 - MT (MMI/EMMI) initiated;
 - Description of DCE provided information (MT to TE), if any;
 - Declaration of optimal function and procedure, services supported by the MT.
- Description of the data call clearing mechanism:

- Terminal initiated (CT109) (if possible);
- MT (MMI/EMMI) initiated;
- Description of DCE provided information (MT to TE) related to a mobile or network initiated call clearing, if any.

A3.2.5.7 Characteristics of non-transparent data services

Description of Radio Link Protocol (RLP) features supported.

Description of supported RLP parameters and how to modify these values (if possible):

- <iws> IWF to MS window size
- <mws> MS to IWF window size
- <T1> acknowledgement timer T1
- <N2> retransmission attempts N2

Ability to configure the MS to use non-default RLP parameters.

Description of flow control mechanism:

- INBAND (XON/XOFF);
- OUTBAND COPnoFICt (CT105 and CT106).

A3.2.5.8 Possible ways of setting-up a call from either an external interface or internally

Describe in detail all possible ways a call can be initiated from the MS or a connected terminal.

A3.2.5.9 Application layer causing automatic call termination

State whether the call termination facility can be disabled and if so, describe in detail how.

A3.2.5.10 Call re-establishment for MS not supporting speech

Applicability of call re-establishment.

A3.2.6 International mobile station equipment identity

IMEI of the MS.

A3.2.7 Receiver intermediate frequencies

F_{lo} - Local Oscillator frequency applied to first receiver mixer.

$IF_1 \dots IF_n$ - intermediate frequencies.

A3.2.8 Artificial ear

The manufacturer shall declare which type of artificial ear (type 1 or type 3.2 or type 3.4) is used for teleservices speech testing.

The following illustrate the results of both artificial ears when specified for acoustic receiving measurement.

Type 3.2 results are currently referred to ERP (as specified), but measured at DRP. When introducing DRP to ERP correction, a special frequency response is used which is obtained with the artificial ear in a free sound field. The overall result actually differs substantially from the transfer function under the IEC 318 test conditions. Referring the results to DRP instead avoids misleading interpretations.

This slide as well as the following two shows results of three measurement and evaluation methods per each mobile sample. The blue curve is as measured sealed to IEC 318 closed coupler. The green curve is as measured with type 3.2 low leak coupler at DRP. The red curve shows the same measurement data corrected to ERP using the correction function provided by the manufacturer.

Below 1 KHz both type 3.2 curves are similar. The level decreases from IEC 318 to the type 3.2 results is due to the leak. At high frequencies the measured type 3.2 curve without DRP to ERP correction (green) clearly illustrates better compatibility towards IEC 318 results than the curve referred to ERP (red).

The three curves show the DRP to ERP transfer function for different source conditions. The blue line is obtained mounted in a baffle. The other two functions are measured with a probe microphone at ERP on two mobiles with different acoustic source impedance.

Contrary to the first three slides, the type 3.2 low leak response at ERP here is not calculated, but measured with a probe microphone. The relationship between the three curves is the same as in each of the first three slides.

The difference between the results of type 3.2 low leak artificial ear referred to DRP and ERP respectively is due to the acoustic input impedance of the artificial ear. The high acoustic impedance at DRP is transferred to a relatively low impedance at ERP for high frequencies according to the quarter wavelength distance between both points. This means that acoustic energy at ERP is more in terms of sound velocity, which is not measured with the used pressure microphone. The human ear is known to have its highest sensitivity around 5 KHz. Type 3.2 low leak measurement referred to ERP has particularly low sensitivity at this frequency. In order to account for compatibility between IEC 318 results and type 3.2 low leak results as well as for the sensitivity of the human ear, it is up to the choice of the terminal manufacturer, whether acoustic test results from the type 3.2 low leak artificial ear should be referred to ERP or to DRP.

Annex 4: Test SIM Parameters

A4.1 Introduction

This clause defines default parameters for programming the elementary files of the test SIM. The requirements of this annex do not apply to the SIM/ME tests of clause 27.

A4.1.1 Definitions

"Test SIM card":

A SIM card supporting the test algorithm for authentication, programmed with the parameters defined in this subclause. The electrical, mechanical and environmental requirements of the test SIM card are specified in 3GPP TS 11.11 / 3GPP TS 51.011.

"Test SIM":

Either a test SIM card or the SIM simulator programmed with the parameters defined in this subclause.

A4.1.2 Definition of the test algorithm for authentication

The following procedure employs bit wise modulo 2 addition ("XOR").

The following convention applies:

In all data transfer the most significant byte is the first byte to be sent; data is represented so that the left most bit is the most significant bit of the most significant byte.

Step 1:

XOR to the challenge RAND, a predefined number Ki, having the same bit length (128 bits) as RAND. The result RES1 of this is

$$\text{RES1} = \text{RAND XOR Ki}$$

Step 2:

The most significant 32 bits of RES1 form SRES. The next 64 bits of RES1 form Kc. The remaining 32 bits are not used.

A4.2 Default Parameters for the test SIM

Ki:

The authentication key "Ki" will be chosen by the test house and will be non zero. The "Ki" value used by the SS will align with this value.

PIN Disabling

The PIN enabled / disabled flag will be set to "PIN Disabled". This ensures that when the Test SIM is inserted into a MS the user will not be prompted for PIN entry. This requires a specific card capability defined by the SIM service table (see subclause 2.9).

A4.3 Default settings for the Elementary Files (EFs)

The format and coding of elementary files of the SIM are defined in 3GPP TS 11.11 / 3GPP TS 51.011. The following subclauses define the default parameters to be programmed into each elementary file. Some files may be updated by the MS based on information received from the SS. These are identified in the following subclauses.

A4.3.1 EF_{ICCID} (ICC Identification)

The programming of this EF is a test house option.

A4.3.2 EF_{LP} (Language preference)

The programming of this EF is a test house option.

A4.3.3 EF_{IMSI} (IMSI)

The IMSI value will be chosen by the test house. The IMSI used by the SS will align this value.

File size: 9 bytes

Default values: Byte 1 (DEC): 8

Bytes 2-9 (DEC): 09 10 10 ** ** **

**	**
----	----

 for GSM 400, GSM 900 and DCS 1 800

Bytes 2-9 (DEC): 09 10 10 *1 ** **

**	**
----	----

 for GSM 700, GSM 850 and GSM 1 900

"*" indicates any number between 0 and 9 subject to the restriction that IMSI mod 1000 (i.e. the three boxed "**" digits number 13, 15 and 16) lies in one of the following ranges:

- 063-125, 189-251, 315-377, 441-503, 567-629, 693-755, 819-881 or 945-999.

NOTE: This ensures that the MS can listen to the second CCCH when more than one basic physical channel is configured for the CCCH. This is necessary for the test of "paging re-organization".

A4.3.4 EF_{Kc} (Ciphering key Kc)

File size: 9 Bytes

Default values (HEX): Bytes 1-8: Align with Kc used by SS
Byte 9: 07

Byte 9 is set to 07 to indicate that there is no key available at the start of a test.

The bytes within this elementary file may be updated by the MS as a result of a successful authentication attempt.

A4.3.5 EF_{PLMNsel} (PLMN selector)

GSM 400, GSM 900 and DCS 1 800 begin

File size: 102 bytes

Default values (HEX): Bytes 1-3: 32 F4 10 (MCC, MNC) - Translates to 234, 01

Bytes 4-6: 32 F4 20 (MCC, MNC)

Bytes 7-9: 32 F4 30 (MCC, MNC)

....

....

....

Bytes 94-96: 32 F4 23 (MCC, MNC)

Bytes 97-99: 32 F4 33 (MCC, MNC)

Bytes 100-102: 32 F4 43 (MCC, MNC)

GSM 400, GSM 900 and DCS 1 800 end

GSM 700, GSM 850 and PCS 1900 begin

File size: 102 bytes

Default values (HEX): Bytes 1-3: 32 24 10 (MCC, MNC) - Translates to 234, 012

Bytes 4-6: 32 34 20 (MCC, MNC)

Bytes 7-9: 32 44 30 (MCC, MNC)

....

....

....

Bytes 94-96: 32 34 23 (MCC, MNC)

Bytes 97-99: 32 44 33 (MCC, MNC)
 Bytes 100-102: 32 54 43 (MCC, MNC)

GSM 700, GSM 850 and PCS 1900 end

34 PLMNs are shown coded above since this is the largest number required for a test - see subclause 27.9.4.1. It is necessary to take this into account since the SIM cards must be dimensioned to cope with this number of records.

A4.3.6 EF_{HPLMN} (HPLMN search period)

File size: 1 byte

Default value (HEX): 00 (no HPLMN search attempts)

A4.3.7 EF_{ACMmax} (ACM maximum value)

File size: 3 bytes

Default: Byte 1: 00
 Byte 2: 00
 Byte 3: 00

The above translates to: "Not valid".

A4.3.8 EF_{SST} (SIM service table)

Services will be allocated and activated as follows:

Service	Allocated	Activated
No. 1: CHV1 disable function	Yes	Yes
No. 2: Abbreviated Dialling numbers (ADN)	Yes	Yes
No. 3: Fixed dialling numbers (FDN)	Yes	Optional
No. 4: Short Message Storage (SMS)	Yes	Yes
No. 5: Advice of Charge (AoC)	Yes	Yes
No. 6: Capability Configuration Parameters (CCP)	Yes	Yes
No. 7: PLMN Selector	Yes	Yes
No. 8: Reserved for future use	No	No
No. 9: MSISDN	Optional	Optional
No. 10: Extension 1	Yes	Optional
No. 11: Extension 2	Yes	Optional
No. 12: SMS Parameters	Yes	Yes
No. 13: Last Dialed Number (LND)	Yes	Yes
No. 14: Cell Broadcast Message Identifier	Yes	Yes
No. 15: Group identifier Level 1	Yes	Optional
No. 16: Group identifier Level 2	Yes	Optional
No. 17: Service Provider Name	Optional	Optional
No. 18: Service Dialling Numbers (SDN)	Optional	Optional
No. 19: Extension3	Optional	Optional
No. 20: RFU	Optional	Optional
No. 21: VGCS Group Identifier List (EF _{VGCS} , EF _{VGCS})	Yes	Yes
No. 22: VBS Group Identifier List (EF _{VBS} , EF _{VBS})	Yes	Yes
No. 23: eMLPP service	Yes	Yes
No. 24: Automatic answer for eMLPP	Yes	Yes
No. 25: Data download via SMS-CB	Optional	Optional
No. 26: Data download via SMS-PP	Optional	Optional
No. 27: Menu selection	Optional	Optional
No. 28: Call control	Optional	Optional
No. 29: Proactive SIM	Optional	Optional
No. 30: Cell Broadcast Message Identifier Ranges	Optional	Optional
No. 31: Barred Dialling Numbers (BDN)	Optional	Optional
No. 32: Extension4	Optional	Optional
No. 33: De-personalization Control Keys	Optional	Optional
No. 34: Co-operative Network List	Optional	Optional
No. 35: Short Message Status Reports	Optional	Optional
No. 36: Network's indication of alerting in the MS	Optional	Optional

Service	Allocated	Activated
No. 37: Mobile Originated Short Message control by SIM	Optional	Optional
No. 38: GPRS	Optional	NOTE 1
No. 39: Image (IMG)	Optional	Optional
No. 40: SoLSA (Support of Local Service Area)	Optional	Optional
No. 41: USSD string data object supported in Call Control	Optional	Optional
No. 42: RUN AT COMMAND command	Optional	Optional
No. 43: User controlled PLMN Selector with Access Technology	Optional	Optional
No. 44: Operator controlled PLMN Selector with Access Technology	Optional	NOTE 2
No. 45: HPLMN Selector with Access Technology	Optional	NOTE 2
No. 46: CPBCCCH Information	Optional	Optional
No. 47: Investigation Scan	Optional	Optional
No. 48: Extended Capability Configuration Parameters	Optional	Optional
No. 49: MExE	Optional	Optional
No. 50: Reserved and shall be ignored	No	No
No. 51: PLMN Network Name	Optional	Optional
No. 52: Operator PLMN List	Optional	Optional
No. 53: Mailbox Dialling Numbers	Optional	Optional
No. 54: Message Waiting Indication Status	Optional	Optional
No. 55: Call Forwarding Indication Status	Optional	Optional
No. 56: Service Provider Display Information	Optional	Optional
No. 57: Multimedia Messaging Service (MMS)	Optional	Optional
No. 58: Extension 8	Optional	Optional
No. 59: MMS User Connectivity Parameters	Optional	Optional
NOTE 1: For GPRS tests the GPRS service shall be activated.		
NOTE 2: If allocated EF _{PLMNwACT} , EF _{OPLMNwACT} are present on the SIM they shall have same settings as EF _{PLMNsel} .		

A4.3.9 EF_{ACM} (Accumulated call meter)

File size: 3 bytes
Default: Byte 1: 00
Byte 2: 00
Byte 3: 00

The above translates to: "Not yet implemented".

A4.3.10 EF_{PUCT} (Price per unit and currency table)

File size: 5 bytes
Default: Byte 1-3: FF
Byte 4-5: 00

A4.3.11 EF_{CBMI} (Cell broadcast Message Identifier Selection)

The programming of this EF is a test house option.

The file size is 2n bytes, where n is the number of Cell broadcast message identifier records - each record defining a type of Cell Broadcast message which may be accessed by the MS. Care should be taken when dimensioning the SIM to take into account the number of Cell Broadcast message identifier records required.

A4.3.12 EF_{BCCH} (Broadcast control channels)

File size: 16 Bytes
Default values (BIN): Bytes 1-2: 11111111 11111111
Bytes 3-4: 11111111 11111111
Bytes 5-6: 11111111 11111111
Bytes 7-8: 11111111 11111111
Bytes 9-10: 11111111 11111111
Bytes 11-12: 11111111 11111111

Bytes 13-14: 11111111 11111111
 Bytes 15-16: 11111111 11111111

This field may be updated dependent on the MS implementation.

A4.3.13 EF_{ACC} (Access control class)

File size: 2 Bytes
 Default values (BIN): Byte 1: 00000000
 Byte 2: *****

The test house may set any single bit of byte 2 to "1". All remaining bits of byte 2 will be set to "0". This determines the access control class of the SIM.

A4.3.14 EF_{FPLMN} (Forbidden PLMNs)

Length: 12 Bytes
 Format (HEX): Bytes 1-3: FF FF FF
 Bytes 4-6: FF FF FF
 Bytes 7-9: FF FF FF
 Bytes 10-12: FF FF FF

This coding corresponds to an empty "forbidden PLMN list". The bytes within this file may be updated if a LOCATION UPDATE REJECT message is received by the MS with cause, "PLMN not allowed".

A4.3.15 EF_{LOCI} (Location information)

GSM 400, GSM 900 and DCS 1 800 begin

File size: 11 Bytes
 Default values: Bytes 1-4 (HEX): FF FF FF FF (TMSI)
 Bytes 5-9 (HEX): 42 F6 18 FF FE (LAI)
 Byte 10 (HEX): FF (Periodic LU Time = "the timer is not running")
 Byte 11 (BIN): 00000001 (Location Update Status = "not updated")

Bytes 5-9: LAI-MCC = 246 (bytes 5-6) and LAI-MNC = 81 (byte 7) are frequently used in clause 27. The LAC (bytes 8-9) is set to "FF FE" since this, in conjunction with byte 11 setting of "01", is used to ensure that the MS performs a location update at the beginning of a test.

Bytes in this file (e.g. TMSI in bytes 1-4) may be updated as a result of a location update attempt by the MS.

GSM 400, GSM 900 and DCS 1 800 end

GSM 700, GSM 850 and PCS 1900 begin

File size: 11 Bytes
 Default values: Bytes 1-4 (HEX): FF FF FF FF (TMSI)
 Bytes 5-9 (HEX): 42 36 18 FF FE (LAI)
 Byte 10 (HEX): FF (Periodic LU Time = "the timer is not running")
 Byte 11 (BIN): 00000001 (Location Update Status = "not updated")

Bytes 5-9: LAI-MCC = 246 (bytes 5-6) and LAI-MNC = 813 (bytes 6-7) are frequently used in clause 27. The LAC (bytes 8-9) is set to "FF FE" since this, in conjunction with byte 11 setting of "01", is used to ensure that the MS performs a location update at the beginning of a test.

Bytes in this file (e.g. TMSI in bytes 1-4) may be updated as a result of a location update attempt by the MS.

GSM 700, GSM 850 and PCS 1900 end

A4.3.16 EF_{AD} (Administrative data)

File size: 3 bytes
 Default values Byte 1: 10000000 - (type approval operations)
 Byte 2: 11111111
 Byte 3: 11111111

A4.3.17 EF_{Phase} (Phase identification)

File size: 1 byte
 Default value (HEX): 02 Phase 2

A4.3.18 EF_{ADN} (Abbreviated dialling numbers)

The programming of this EF is a test house option. It should be noted that sufficient space should be provided on the SIM card for 101 records - see subclause 27.15.4.1.

A4.3.19 EF_{FDN} (Fixed dialling numbers)

Optional.

A4.3.20 EF_{SMS} (Short messages)

Default:	Records 1-5	Byte 1:	00
		Byte 2:	FF
		Bytes 3-14:	FF FF FF FF FF FF FF FF FF FF FF FF
		Bytes 15-26:	FF FF FF FF FF FF FF FF FF FF FF FF
		Byte 27:	FF
		Byte 28:	FF
		Bytes 29-35:	FF FF FF FF FF FF FF
		Byte 36:	FF
		Bytes 37-176:	All Bytes set to FF

A4.3.21 EF_{CCP} (Capability configuration parameters)

File size: 14 bytes
 Default values Byte 1: 04
 Byte 2: 01
 Byte 3: A0
 Bytes 4-14: FF

The above translates to: "Full rate, GSM Standardized coding, circuit mode and speech".

A4.3.22 EF_{MSISDN} (MSISDN)

Optional.

A4.3.23 EF_{SMSP} (Short message service parameters)

The programming of this EF is a test house option.

Each record size is 28+Y bytes, where Y is the number of bytes in the Alpha Identifier. Care should be taken when dimensioning the SIM to take into account the number of Short message service parameter records required.

A4.3.24 EF_{SMSS} (SMS status)

File size: 2 bytes
 Byte 1: 00
 Byte 2 (BIN): 11111111

The above translates to:

- (a) Last Mobile Originated Short Message had a TP Message Reference parameter of "00".
- (b) SMS Memory Capacity Exceeded, Notification Flag unset: memory capacity available.

A4.3.25 EF_{EXT1} (Extension 1)

Optional.

A4.3.26 EF_{EXT2} (Extension 2)

Optional.

A4.3.27 EF_{VGCS} (Voice Group Call Service)

This EF contains a list of the default VGCS group identifiers.

File size: Bytes 200

Default values:

Bytes	Group ID	Value	BCD encoding in the SIM card
1-4	1	12	21 FF FF FF
5-8	2	123	21 F3 FF FF
9-12	3	1234	21 43 FF FF
13-16	4	12348	21 43 F8 FF
17-20	5	123491	21 43 19 FF
21-24	6	1235029	21 53 20 F9
25-28	7	12351	21 53 F1 FF
29-32	8	12352	21 53 F2 FF
33-36	9	12353	21 53 F3 FF
37-40	10	12354	21 53 F4 FF
41-44	11	12355	21 53 F5 FF
45-48	12	12356	21 53 F6 FF
49-52	13	12357	21 53 F7 FF
53-56	14	12358	21 53 F8 FF
57-60	15	12359	21 53 F9 FF
61-64	16	20000	02 00 F0 FF
65-68	17	20001	02 00 F1 FF
69-72	18	20002	02 00 F2 FF
73-76	19	20003	02 00 F3 FF
77-80	20	20004	02 00 F4 FF
81-84	21	20005	02 00 F5 FF
85-88	22	20006	02 00 F6 FF
89-92	23	20007	02 00 F7 FF
93-96	24	20008	02 00 F8 FF
97-100	25	20009	02 00 F9 FF
101-104	26	20010	02 10 F0 FF
105-108	27	66660	66 66 F0 FF
109-112	28	66661	66 66 F1 FF
113-116	29	66662	66 66 F2 FF
117-120	30	666638	66 66 83 FF
121-124	31	66664	66 66 F4 FF
125-128	32	66665	66 66 F5 FF
129-132	33	66666	66 66 F6 FF
133-136	34	66667	66 66 F7 FF
137-140	35	66668	66 66 F8 FF
141-144	36	66669	66 66 F9 FF
145-148	37	66670	66 76 F0 FF
149-152	38	80120	08 21 F0 FF
153-156	39	80121	08 21 F1 FF
157-160	40	80122	08 21 F2 FF
161-164	41	80123	08 21 F3 FF

Bytes	Group ID	Value	BCD encoding in the SIM card
165-168	42	80124	08 21 F4 FF
169-172	43	80125	08 21 F5 FF
173-176	44	80126	08 21 F6 FF
177-180	45	80127	08 21 F7 FF
181-184	46	80128	08 21 F8 FF
185-188	47	80129	08 21 F9 FF
189-192	48	80130	08 31 F0 FF
193-196	49	99999	99 99 F9 FF
197-200	50	1111119	11 11 11 F9

A4.3.28 EF_{VGCS} (Voice Group Call Service Status)

This EF contains the default activation of the VGCS group identifiers. The following list of group ID are activated: 1, 4, 20, 30, and 50.

File size: Bytes 7
 Default values (HEX): Bytes 1-7: '09 00 08 20 00 00 FE'

A4.3.29 EF_{VBS} (Voice Broadcast Service)

This EF contains a list of the default VBS group identifiers.

File size: Bytes 200

Default values:

Bytes	Group ID	Value	BCD encoding in the SIM card
1-4	1	12	21 FF FF FF
5-8	2	123	21 F3 FF FF
9-12	3	1234	21 43 FF FF
13-16	4	12348	21 43 F8 FF
17-20	5	123491	21 43 19 FF
21-24	6	1235029	21 53 20 F9
25-28	7	12351	21 53 F1 FF
29-32	8	12352	21 53 F2 FF
33-36	9	12353	21 53 F3 FF
37-40	10	12354	21 53 F4 FF
41-44	11	12355	21 53 F5 FF
45-48	12	12356	21 53 F6 FF
49-52	13	12357	21 53 F7 FF
53-56	14	12358	21 53 F8 FF
57-60	15	12359	21 53 F9 FF
61-64	16	20000	02 00 F0 FF
65-68	17	20001	02 00 F1 FF
69-72	18	20002	02 00 F2 FF
73-76	19	20003	02 00 F3 FF
77-80	20	20004	02 00 F4 FF
81-84	21	20005	02 00 F5 FF
85-88	22	20006	02 00 F6 FF
89-92	23	20007	02 00 F7 FF
93-96	24	20008	02 00 F8 FF
97-100	25	20009	02 00 F9 FF
101-104	26	20010	02 10 F0 FF
105-108	27	66660	66 66 F0 FF
109-112	28	66661	66 66 F1 FF
113-116	29	66662	66 66 F2 FF
117-120	30	666638	66 66 83 FF
121-124	31	66664	66 66 F4 FF
125-128	32	66665	66 66 F5 FF
129-132	33	66666	66 66 F6 FF
133-136	34	66667	66 66 F7 FF
137-140	35	66668	66 66 F8 FF

Bytes	Group ID	Value	BCD encoding in the SIM card
141-144	36	66669	66 66 F9 FF
145-148	37	66670	66 76 F0 FF
149-152	38	80120	08 21 F0 FF
153-156	39	80121	08 21 F1 FF
157-160	40	80122	08 21 F2 FF
161-164	41	80123	08 21 F3 FF
165-168	42	80124	08 21 F4 FF
169-172	43	80125	08 21 F5 FF
173-176	44	80126	08 21 F6 FF
177-180	45	80127	08 21 F7 FF
181-184	46	80128	08 21 F8 FF
185-188	47	80129	08 21 F9 FF
189-192	48	80130	08 31 F0 FF
193-196	49	99999	99 99 F9 FF
197-200	50	1111119	11 11 11 F9

A4.3.30EF_{VBSS} (Voice Broadcast Service Status)

This EF contains the default activation of the VBS group identifiers. The following list of group ID are activated: 1, 4, 20, 30, and 50.

File size: Bytes 7
 Default values (HEX): Bytes 1-7: '09 00 08 20 00 00 FE'

A4.3.31EF_{eMLPP} (enhanced Multi Level Pre-emption and Priority)

This EF contains default information about priority levels and fast call set-up conditions for the enhanced Multi Level Pre-emption and Priority service.

Length: 2 Bytes
 Format (HEX): Byte 1 (Priority levels): '74'
 Byte 2 (Fast call set-up conditions): '04'

The coding corresponds to available priority levels 2, 3, 4 and 0. For fast call setup, the coding corresponds to available priority level 0.

A4.3.32EF_{AAeM} (Automatic Answer for eMLPP Service)

This EF contains the default priority levels (of the Multi Level Pre-emption and Priority service) for which the mobile station shall answer automatically to incoming calls.

Length: 1 Byte
 Format (HEX): Byte 1: '0F'

The coding corresponds to the default capability of the MS to answer automatically to incoming calls that have a priority level higher than 2.

A4.3.33EF_{KcGPRS} (GPRS Ciphering key KcGPRS)

Mandatory if GPRS shall be tested else optional.

File size: 9 bytes
 Default values (HEX): Bytes 1-8: Align with KcGPRS used by SS
 Byte 9: 07

Byte 9 is set to 07 to indicate that there is no key available at the start of a test unless other conditions follow from the definition of the initial conditions of the mobile.

The bytes within this elementary file may be updated by the MS as a result of a successful authentication attempt.

A4.3.34 EF_{LOCIGPRS} (GPRS location information)

Mandatory if GPRS shall be tested else optional.

File size: 14 bytes
Default values: Bytes 1-4 (HEX): FF FF FF FF (P-TMSI)
Bytes 5-7 (HEX): FF FF FF (P-TMSI signature value)
Bytes 8-13 (HEX): FF FF FF FF FF FF (RAI)
Byte 14 (BIN): 00000001 (Routing Area Update Status = "not updated")

Bytes in this file (e.g. P-TMSI in bytes 1-4) may be updated as a result of a routing area update attempt by the MS.

Annex 4A:

Test USIM Parameters

Test USIM is required for test cases of some GERAN features or Inter-RAT.

For test cases indicating Test USIM to be used, the default Test USIM parameters are specified in 3GPP TS 34.108 clause 8 “Test USIM Parameters” if not otherwise specified within the test case.

For UMTS Authentication Challenge (i.e. UMTS AKA using an USIM as defined in TS 33.102), the SS shall be able to handle vectors of AUTN, RAND, CK, IK, AUTS and XRES in the way as the MSC/BSS entities. The SS and Test USIM shall incorporate a test algorithm for generating RES and CK, IK from RAND, AUTN and IK which operates as described in TS 34.108 clause 8.1.2.

Annex 5: Test equipment

A5.1 Introduction

A5.1.1 General

The test equipment is either an equipment or assembly of equipments which enables the tests described in the present document to be conducted.

This annex describes requirements for the test equipment which cannot be derived from and which are assumed in, the conformance test descriptions described in the present document.

Specifically stimulus setting and measurement uncertainties are defined.

A5.1.2 Test equipment terms

The term "System Simulator" (SS) is used to describe the complete suite of test equipment required to perform the tests in the present document when interacting with the following MS interfaces:

- Antenna (Connector or radiated);
- Acoustic;
- Data Port(s);
- Power supply;
- DAI.

NOTE: To perform a sub-set of tests, the SS may be simplified accordingly.

The term "SIM simulator" is used to describe the test equipment required to interact with the SIM/ME interface.

A "test SIM" has the physical characteristics of a standard SIM card, (see 3GPP TS 11.11) with specific parameters defined in annex 3.

A5.1.3 Confidence level

All uncertainty values stated in this annex are quoted for a Confidence Level of 95 %.

A5.2 Standard test signals

The Cx signals represent the wanted signals and the Ix signals represent the unwanted signals.

Signal C0	Unmodulated continuous carrier.
Signal C1	A standard signal with GMSK AQPSK, 8-PSK, 16-QAM or 32-QAM modulation as appropriate. The channel coder will depend on the test and the cipher mode shall be selectable by the test method. When using this signal in the non hopping mode, the unused seven time slots shall also contain dummy bursts, with power levels variable with respect to the used timeslot, see also DYNAMIC LEVEL SETTING in subclause A5.3.4.7.
Signal I0	Unmodulated continuous carrier.
Signal I1	A GMSK modulated carrier following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or pseudo random data stream.
Signal I2	A standard GMSK modulated signal with valid midamble, different from C1. The data bits (including bits 58 and 59) shall be derived from a random or pseudo random data stream.
Signal I3	An Additive White Gaussian Noise (AWGN) signal having a minimum bandwidth of 1,5 times the symbol rate i.e. minimum 402,6kHz for a GSM channel. The AWGN power shall be measured over a noise bandwidth of 270,833 kHz. In the complex baseband, the AWGN signals shall be independent in the real and in the imaginary part, zero-mean and with equal power.
Signal I4	A GMSK modulated signal with valid training sequence code (TSC) randomly selected on a burst-by-burst basis from {TSC1,...,TSC7}. The interferer shall be a single slot wide, and shall apply power ramping according to the requirements in 3GPP TS 45.005. The interferer shall be delayed with respect to the wanted signal by an integer number of symbols in the range -1 to +4. Unless specified in a given test case, The delay shall be randomly chosen and shall remain fixed for the duration of the test.
Signal I5	A GMSK modulated signal following the structure of the GSM signals, but with all modulating bits (including the midamble period) derived directly from a random or pseudo random data stream. The interferer shall be a single slot wide, and shall apply power ramping according to the requirements in 3GPP TS 45.005. The interferer shall be delayed with respect to the wanted signal by 74 symbols.

NOTE: For multi-slot configuration the same number of active slots for test signal I4 and I5 shall be used.

A5.3 SS functional requirements

A5.3.1 Level setting range

It is assumed that the SS is capable of setting stimulus levels, at the MS interface, to those required in the test specification extended by the measurement uncertainty defined in this annex.

NOTE: This ensures that the SS is able adequately to stimulate the MS performance at and just beyond the limit requirement under all conditions.

A5.3.2 Level Measurement / operation range

It is assumed that the SS is capable of performing measurements, within the uncertainty defined in this annex, over a level range, at the MS interface, as required in the test specification extended by the SS measurement uncertainty defined in this annex and extended by a further 3dB on the MS conformity requirement.

NOTE: This ensures that the SS is able adequately to measure the MS performance at and just beyond the limit requirement under all conditions.

A5.3.3 MS power supply interface

Test DC power supply for MS:

Voltage setting uncertainty < 1 %.

Ripple < 10 mV RMS, 50 mV peak to peak.

Test AC power supply for MS:

Voltage setting uncertainty: < 1 %.

A5.3.4 MS antenna interface

The SS is assumed to offer a nominal 50 ohm impedance to the MS.

	GSM/DCS/PCS bands	< 4 GHz	< 10 GHz	< 12,75 GHz
VSWR	≤ 1,3	≤ 2,0	≤ 3,0	≤ 3,5

A5.3.4.1 Uplink receiver error

The SS receiver should be capable of performing the tests as specified in 3GPP TS 11.10 without the addition of bit errors in excess of 1 in 10E7 due to the receiver performance when operated with a MS which meets the transmitter requirements of 3GPP TS 05.05. This requirement shall apply for GMSK and 8PSK modulation.

NOTE: This requirement is based on a minimum BER measurement of 1 in 10E5.

A5.3.4.2 Power and Power versus time measurements

Measurement uncertainty of transmitter output power for GMSK and 8PSK signals: ±1 dB.

In the case of 8PSK, provision is made for power measurement by averaging over multiple bursts or by using an estimation method, see 3GPP TS 05.05, clause 4. The estimation method may be based on measurements of one or more bursts, or part of a burst.

If 8PSK power is measured by averaging over multiple bursts, allowance must be made for variations in burst power as a function of the data. This allowance must be included within the ±1 dB measurement limit. The allowance is related to the number of bursts taken in the average and shall be defined as follows:

Allowance for burst power variation = $2\sigma/\text{SQRT}(N)$

Where: σ = the standard deviation of burst power variation for random data (0,2 dB).

(two standard deviations yield a 95 % confidence interval).

N = number of averages.

EXAMPLE: An average is calculated from 4 bursts. The allowance for burst power variation is 0,2 dB. The accuracy for the power meter should then be better than ±0,8 dB.

If 8PSK power is measured using an estimation method, it shall be demonstrated, using the method described below, that the accuracy of the estimation technique is also ±1 dB.

A test signal is established consisting of properly formatted bursts with midambles and random data in the payload. The long-term average power of this signal is determined by measuring the power over 200 bursts and taking the average (P_{avg}). The measurement uncertainty of the equipment used to determine the long-term average shall be noted (ΔP).

The same test signal is then measured using the estimation technique. The difference between the estimated value of long-term average power and the measured long-term average power is noted (P_{est}). The following inequality shall hold:

$$|\Delta P| + |(P_{\text{avg}} - P_{\text{est}})| \leq 1 \text{ dB}$$

For GMSK, measurement uncertainty of power level (relative to peak transmitter carrier power):

Power level	Measurement uncertainty
+6 dB to -7 dB	$\pm 0,25$ dB
-7 dB to -20 dB	$\pm 1,0$ dB
-20 dB to -32 dB	$\pm 2,0$ dB
-32 dB to -45 dB	$\pm 5,0$ dB
-45 dB to -71 dB	$\pm 1,0$ dB
< -71 dB	$\pm 2,0$ dB

For 8PSK, measurement uncertainty of power level (relative to output power):

Power level	Measurement uncertainty
+6 dB to -7 dB	$\pm 0,25$ dB
-7 dB to -16 dB	$\pm 1,0$ dB
-16 dB to -32 dB	$\pm 2,0$ dB
-32 dB to -45 dB	$\pm 5,0$ dB
-45 dB to -71 dB	$\pm 1,0$ dB
< -71 dB	$\pm 2,0$ dB

NOTE: Due to the method of measurement (downconversion to I/Q baseband / filtering / A/D conversion / postprocessing) several uncertainties occur. The sources are:

- a) absolute level uncertainty;
- b) filter ripple,
I/Q gain imbalance,
I/Q imperfect quadrature;
- c) A/D conversion (resolution),
I/Q offset.

Items under b) and c) affect the individual samples and can be observed as a "ripple" in the horizontal part of the power time mask.

Items under b) are uncertainties which are proportional to the signal measured.

Items under c) are constant amounts of uncertainty, independent of the signal measured.

The item a) moves the entire power time template up or down.

The uncertainties b) and c) are added to the measured signal as an uncorrelated interferer.

The above mentioned absolute measurement uncertainty refers to a). The table covers uncertainties b) and c).

Uncertainty of time measurement

The relative timing uncertainty of the transition point:

- symbol 13 to 14 in the midamble (normal burst);
- end of the sync sequence (access burst);

is $\pm 1/8$ symbol.

Timing uncertainty of the measurement samples in the vertical part of the power time mask are displayed as marked fields in the figure A5.3-1.

Figure A5.3-1: Time Measurement Uncertainty for the Power Time Mask

NOTE: With a real method of measurement one has to reckon on systematic measurement uncertainties in the vertical part of the power time template (figures 13-2 & 13-3). The reason for this is that the measurement is conducted through a filter which has to fulfil different requirements simultaneously, requirements in the frequency domain and in the time domain as well. The time behaviour of the filter causes the above mentioned measurement uncertainty. It occurs clearly when measuring the falling edge of the power burst. The measurement uncertainty, which in principle delays the actual performance, depends on the filter characteristics and on the signal shape. At favourable signal shapes the uncertainty is negligible, however, at unfavourable signal shapes it consumes the marked area in figure A5.3-1 (falling edge).

The underlying filter is:

- type inverse Chebycheff.
- passband $\leq \pm 200$ kHz.
- stopband (40 dB stop att.) $\geq \pm 541,67$ kHz.

To avoid aliasing with this filter the RF output spectrum must meet the requirements of subclause 13.4.

If the lowest limit line in the power time template is replaced by a -54 dBm line, measuring lower carrier powers, the area of measurement uncertainty is reduced equivalently.

The marked area in figure A5.3-1 describes the systematic measurement uncertainty of the test equipment and does not widen the design requirements.

Uncertainties associated with 13.3.5 requirement b) (power control levels, adjacent steps):

Repeatability	$\pm 0,3 \text{ dB}$
Linearity	$\pm 0,03 \text{ dB/dB}$
Combined uncertainty is:	$\pm (0,3 + 0,03 \text{ dB/dB}) \text{ dB}$

E.g. where the indicated value of the step size is 2,0 dB, the uncertainty is:

$$\pm (0,3 + 0,06) \text{ dB} = \pm 0,36 \text{ dB}.$$

A5.3.4.3 Wideband selective power measurement

Power is to be measured selectively for spurious emissions without frequency hopping (ref.: clause 12).

Uncertainty conducted	100 kHz to 1GHz	±1,5 dB
	1 GHz to 12,75 GHz	±3,0 dB
Uncertainty radiated	30 MHz to 4 GHz	±6 dB

NOTE: The uncertainties include the effect of a worst case reflection from the MS of 0,7 for out of band signals.

It is acceptable to use a band stop filter in spurious emission measurements of the transceiver in order to fulfil the above requirements.

A5.3.4.4 Inband selective power measurements

Power is to be measured selectively for output RF spectrum.

The measurement is performed on a single frequency while the MS is frequency hopping (ref.: subclause 13.3).

Uncertainty $< \pm 1,6$ dB

NOTE: The video signal of the spectrum analyser is "gated" such that the spectrum generated by at least 40 of the bits 87 to 132 of the burst is the only spectrum measured. This gating may be analogue or numerical, dependent upon the design of the spectrum analyser.

A5.3.4.5 Modulation accuracy and frequency error measurements

GMSK modulation

Ref.: Subclauses 13.1 and 13.2 for definitions and methods of measurement.

Phase measurement uncertainty:

± 1 degree RMS;

± 4 degrees for individual phase measurement samples.

The phase measurement uncertainties above apply during the useful bits.

Frequency measurement uncertainty: ± 5 Hz.

8PSK modulation

Ref.: Subclause 13.17.1 for definitions and methods of measurement.

EVM measurement uncertainty:

$+(0,75 - 0,025\text{RMS_EVM}), -(0,75 + 0,025\text{RMS_EVM})$ % RMS;

4% for individual EVM measurement samples.

NOTE 1: The value of the RMS EVM specification is a function of the value of RMS_EVM being measured. The asymmetric specification results from the RMS EVM minimisation method used for parameter estimation (see 3GPP TS 05.05, annex G). This method of measurement for RMS EVM always produces a result that is lower than the actual value of RMS EVM.

NOTE 2: The value for individual EVM samples assumes a Rayleigh distribution of measurement errors. It represents the maximum 95th percentile value test equipment should return when measuring a signal without error.

NOTE 3: If the test equipment demodulates the transmitted signal to derive the reference signal for the EVM measurement, the symbol error rate of the demodulation process must be less than 4.4×10^{-4} for 95% confidence that no detection errors occur in a burst.

Origin Offset uncertainty (for a single burst) $< \pm 1,5$ dB for origin offset ≥ -35 dBc.

Frequency measurement uncertainty $< \pm 20$ Hz.

A5.3.4.6 RF delay measurements relative to nominal times

Range -140 to +140 symbol periods.

Resolution 1/4 symbol period.

Uncertainty $\pm 1/8$ symbol period.

A5.3.4.7 The wanted signal or traffic channel of serving cell

The Wanted signal is used in most of the specified RF measurements. The traffic channel of the serving cell is used in most of the signalling tests.

FREQUENCY:

GMSK

Uncertainty: $< \pm 5 \times 10^{-9}$.

8PSK

Uncertainty: $< \pm 20 \times 10^{-9}$.

MODULATION (see 3GPP TS 05.04):

GMSK

Phase uncertainty: $< \pm 1$ degree RMS; and
 $< \pm 4$ degrees peak(as defined in 3GPP TS 05.05).

8PSK

EVM uncertainty < 4 % RMS.
Origin offset suppression < -35 dBc.

LEVEL:

Uncertainty: $< \pm 1$ dB in subclause 13, 14 except;
 $< \pm 3$ dB for test 14.2 radiated;
 $< \pm 1,2$ dB for test 14.6;
 $< \pm 2,5$ dB for all other tests.
Settling time: < 10 us.

DYNAMIC LEVEL SETTING:

The SS shall be able to switch from any power level to any other power level within the range of 30 dB on a timeslot per timeslot basis. This dynamic switching requirement only applicable for a single channel for a limited number of tests.

SPURIOUS:

in channel:

Covered by phase error.

out channel:

Noise Power, 1 Hz bandwidth:

< -100 dBc for > 100 kHz carrier offset;
 < -110 dBc for > 300 kHz carrier offset;
 < -121 dBc for $> 1\,500$ kHz carrier offset.

Non harmonics:

< -55 dBc for > 100 kHz carrier offset;
 < -68 dBc for $> 1\,500$ kHz carrier offset.

FREQUENCY HOPPING:

The signal shall be capable of hopping according to the criteria of 3GPP TS 05.02. The timing of the frequency change shall be such that frequency transitions do not occur during the active timeslot of the MS.

A5.3.4.8 The first interfering signal or traffic channel of the first adjacent cell

The First interfering signal is used in measurements of co-channel rejection, adjacent channel rejection and intermodulation rejection. The Traffic channel of the first adjacent cell is used in handover tests.

FREQUENCY:

Uncertainty:

$< \pm 5 \cdot 10^{-9}$

PHASE:

Uncertainty:

$< \pm 1$ degree RMS; and

$< \pm 4$ degrees peak (as defined in 3GPP TS 05.05).

LEVEL:

Uncertainty:

$< \pm 1$ dB relative to the wanted signal for test 13.2 and 14.5;

$< \pm 0,3$ dB relative to the wanted signal for test 14.4, 14.10, 14.11, 14.12 and 14.16.4;

$< \pm 1$ dB for test 14.6;

$< \pm 2,5$ dB for all other tests.

MODULATION:

GMSK (as specified in 3GPP TS 05.04)

The total relative single sideband power (noise + harmonics) in the frequency range 1,5 MHz to 1,7 MHz offset from the nominal carrier frequency shall be less than -72 dBc.

SPURIOUS:

In channel:

Covered by phase error.

Out channel:

Noise Power, 1 Hz bandwidth:

< -100 dBc for > 100 kHz carrier offset;

< -110 dBc for > 300 kHz carrier offset;

< -127 dBc for $> 1\,500$ kHz carrier offset.

non harmonics:

< -55 dBc for > 100 kHz carrier offset;

< -68 dBc for $> 1\,500$ kHz carrier offset.

FREQUENCY HOPPING:

The signal shall be capable of hopping according to the criteria of 3GPP TS 05.02. The timing of the frequency change shall be such that frequency transitions do not occur during the active timeslot of the MS.

A5.3.4.9 The second interfering signal

The second interfering signal is used in the measurements of intermodulation rejection and blocking.

FREQUENCY:

Uncertainty:

< $\pm 5 \cdot 10^{-9}$.**LEVEL:**

Uncertainty:

< ± 1 dB for test 14.6;< $\pm 1,5$ dB relative to the wanted signal for all other tests.**MODULATION:**

Unmodulated.

SPURIOUS:

In channel:

No requirements.

Out channel:

Noise Power, 1 Hz bandwidth:

< -135 dBc for > 500kHz carrier offset;

< -140 dBc for > 700kHz carrier offset;

< -150 dBc for > 1 500kHz carrier offset.

Non harmonics:

< -79 dBc for > 500 kHz carrier offset;

< -84 dBc for > 700 kHz carrier offset;

< -94 dBc for > 1 500 kHz carrier offset.

Harmonically related spuri:

< -40 dBc.

A5.3.4.10 BCCH carriers of serving and adjacent cells

The BCCH of the serving cell is used for synchronizing the MS and to send network information to the MS under test. The BCCH signals of the adjacent cells are used in the handover tests. The MS measures the RF-levels of the BCCHs of adjacent cells.

FREQUENCY:

Uncertainty:

< $\pm 5 \cdot 10^{-9}$.

PHASE:

Uncertainty:

< ± 1 degree RMS; and

< ± 4 degrees peak(as defined in 3GPP TS 05.05).

LEVEL:

Uncertainty:

< 1 dB for test 13.2 and 20;

< 2,5 dB for all other tests;

< 0,6 dB relative to each other and to TCH for test 21 over the range 65 dBmicroVoltemf to 3 dBmicroVoltemf;

< 1,2 dB relative to each other and to TCH for test 26.3.

MODULATION:

GMSK (as specified in 3GPP TS 05.04).

SPURIOUS:

In channel:

Covered by phase error.

Out channel:

Noise Power, 1Hz bandwidth:

< -100 dBc for > 100 kHz carrier offset;

< -125 dBc for > 1 500 kHz carrier offset.

Non harmonics:

< -55 dBc for > 100 kHz carrier offset;

< -72 dBc for > 1 500 kHz carrier offset.

A5.3.4.11 The wide frequency range signal

The wide frequency range signal is used in the measurements of spurious response.

FREQUENCY

Uncertainty:

< $\pm 5 \cdot 10^{-9}$.

LEVEL

Uncertainty:

< $\pm 1,5$ dB relative to the wanted signal for test 14.7;

< ± 1 dB error of substituted "wanted signal".

MODULATION:

Unmodulated.

SPURIOUS in the MS receiving range:

Non harmonics:

< -94 dBc.

Harmonically related spuri:

< -40 dBc.

Noise:

< -4 dBuVemf equivalent at the MS receiver input when measured in a 200 kHz bandwidth.

A5.3.4.12 The multipath fading function

The multipath fading function simulates the fading effects of a broadband radio channel in mobile radio communication.

The propagation conditions are specified in 3GPP TS 05.05, annex 3.

The multipath fading function shall be performed only within a 5 MHz bandwidth during one test case.

A5.3.5 MS audio interface and DAI

A5.3.5.1 General uncertainties

Unless otherwise specified, the following uncertainties apply to the audio interface:

Signal level measurement uncertainty: $\pm 0,2$ dB;

Sound pressure measurement uncertainty: $\pm 0,6$ dB;

Frequency Measurement uncertainty: $\pm 0,1$ %.

Stimulus frequency setting uncertainty:

Frequency settings are taken from ISO 3, R10 series or R40 series or from table 2 of Rec. ITU-T Recommendation P.79. A departure from the nominal frequencies of ± 5 % below 240 Hz and ± 2 % at 240 Hz and above is accepted.

In the case of 4 kHz the departure is restricted to -2 %.

A5.3.5.2 Analogue single test tone

Total distortion:

< 0,5 %.

A5.3.5.3 Delay measurement between Um and DAI

The delay measurement between the Um interface of the MS and its DAI in both directions is described in subclause 32.5.

Uncertainty:

< $\pm 0,1$ ms.

A5.4 SIM simulator functional requirements

A5.4.1 General

The SIM simulator shall implement the functions of a SIM as described in 3GPP TS 02.17 and 3GPP TS 11.11.

The Test Algorithm for authentication incorporated in the SIM Simulator shall operate as described in annex 3.

A5.4.2 Contacts C1, C2, C6, C7

A5.4.2.1 Default measurement / setting uncertainties

Unless stated otherwise below, the following uncertainties apply:

Voltage measurement uncertainty: $< \pm 50$ mV;

Voltage setting uncertainty: $< \pm 20$ mV;

Time measurement uncertainty: $< \pm 100$ ns.

A5.4.2.2 Contact C1

Continuous Spikes:

Voltage measurement uncertainty:

$< \pm 100$ mV.

Current Load Amplitude:

0 mA - 20 mA

Adjustable Step Size:

1 mA.

Uncertainty

$< \pm 1$ mA.

Additional Current Offset:

0 mA - 5 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

$< \pm 1$ mA.

Pulse Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

$< \pm 25$ ns.

Rise and Fall Time:

≤ 50 ns.

Pause Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

$< \pm 25$ ns.

Random Spikes:

Voltage measurement uncertainty:

$< \pm 100$ mV.

Current Load Amplitude:

50 mA - 200 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

$< \pm 1$ mA.

Additional Current Offset:

0 mA - 5 mA.

Adjustable Step Size:

1 mA.

Uncertainty:

$< \pm 0,1$ mA.

Pulse Width:

100 ns - 500 ns.

Adjustable Step Size:

50 ns.

Uncertainty:

$< \pm 25$ ns.

Rise and Fall Time:

≤ 50 ns.

Pause Width:

0,1 ms - 500 ms, randomly varied.

Adjustable Step Size:

0,1 ms.

Uncertainty:

$< \pm 0,1$ ms.

A5.4.2.3 Contact C7

The Elementary Time Unit (etu) used in the subclauses below refer to the nominal bit duration on the I/O line, as defined in ISO 7816-3.

Rise & fall Time setting uncertainty: $< \pm 100$ ns.

Jitter measurement uncertainty: $< \pm 5 \cdot 10^{-3}$ etu.

Jitter setting uncertainty: $< \pm 5 \cdot 10^{-3}$ etu.

A5.4.3 Contact C3

Frequency measurement uncertainty: $< \pm 0,5$ %.

Voltage Measurement uncertainty: $< \pm 50$ mV.

Rise & fall time measurement uncertainty: $< \pm 5$ ns.

Duty cycle measurement uncertainty: $< \pm 2,5$ %.

A5.4.4 Definition of timing

It shall be possible to define all timings relative to the clock. The SIM simulator shall be able to calculate and to use the absolute values automatically, even if the ME changes the frequency during the communication.

A5.5 A-GPS and A-GNSS Minimum Performance Test System requirements

A5.5.1 Test System Uncertainty for A-GPS and A-GNSS Minimum Performance tests

The maximum acceptable uncertainty of the Test System is specified below for each test, where appropriate.

The Test System shall enable the stimulus signals in the test case to be adjusted to within the specified range, and the equipment under test to be measured with an uncertainty not exceeding the specified values. All ranges and uncertainties are absolute values, and are valid for a confidence level of 95 %, unless otherwise stated.

A confidence level of 95 % is the measurement uncertainty tolerance interval for a specific measurement that contains 95 % of the performance of a population of test equipment.

It should be noted that the uncertainties in this clause apply to the Test System operating into a nominal 50 ohm load and do not include system effects due to mismatch between the DUT and the Test System.

Table A5.5.1: Maximum Test System Uncertainty for A-GPS Minimum Performance tests

Clause	Maximum Test System Uncertainty		Derivation of Test System Uncertainty
70.11.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	±200 ms	
	Absolute GPS signal level	±1 dB	
	Position error	±0.05 m	Position error consists of ±0.05 m system uncertainty. The effect of position reporting resolution of approximately ±1.2 m (see note) is not included in the allowable test system uncertainty but is included in the Test Parameter Relaxations since this resolution limitation limits the reporting capability of the MS. . For simplicity the combined Test Parameter Relaxation is given as ±1.3 m
	Response time	± 300 ms	
70.11.5.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	±200 ms	
	Fine Time Assistance	±1 us	
	Absolute GPS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.11.6 Nominal Accuracy	Coarse Time Assistance	±200 ms	
	Absolute GPS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.11.7 Dynamic Range	Coarse Time Assistance	±200 ms	
	Absolute GPS signal level	±1 dB	
	Relative GPS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.11.8 Multi-Path scenario	Coarse Time Assistance	±200 ms	
	Absolute GPS signal level	±1 dB	
	Relative GPS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	

NOTE: For MS based mode the effect of position reporting resolution is given by:

$$\sqrt{\left(\frac{90 \times 2 \times \pi \times R}{2E23 \times 360}\right)^2 + \left(\frac{360 \times 2 \times \pi \times R \times \cos \phi}{2E24 \times 360}\right)^2} \text{ meters, where } R \text{ is the radius of the earth and } \phi \text{ is the latitude of}$$

the location. For the two GPS scenarios defined in TS 51.010-7 subclause 5.2 this equates to approximately 2.32 m and 2.24 m. For simplicity this is given as ±1.2 m.

For MS assisted mode it is assumed that the output from the WLS position solution calculation in clause 70.11.4.3 is coded using the same position coding method as for MS based mode before being used to calculate position error. Therefore the effect of reporting resolution will be the same as for MS based mode.

Table A5.5.2: Maximum Test System Uncertainty for A-GNSS Minimum Performance tests

Clause	Maximum Test System Uncertainty		Derivation of Test System Uncertainty
70.16.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error consists of ±0.05 m system uncertainty. The effect of position reporting resolution of approximately ±1.2 m (see note) is not included in the allowable test system uncertainty but is included in the Test Parameter Relaxations since this resolution limitation limits the reporting capability of the MS. For simplicity the combined Test Parameter Relaxation is given as ±1.3 m
	Response time	± 300 ms	
70.16.5.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	±200 ms	
	Fine Time Assistance	±1 us	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.16.6 Nominal Accuracy	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.16.7 Dynamic Range	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Relative GNSS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	
70.16.8 Multi-Path scenario	Coarse Time Assistance	±200 ms	
	Absolute GNSS signal level	±1 dB	
	Relative GNSS signal level	±0.2 dB	
	Position error	±0.05 m	Position error as above
	Response time	± 300 ms	

NOTE: For MS based mode the effect of position reporting resolution is given by:

$$\sqrt{\left(\frac{90 \times 2 \times \pi \times R}{2E23 \times 360}\right)^2 + \left(\frac{360 \times 2 \times \pi \times R \times \cos \phi}{2E24 \times 360}\right)^2} \text{ meters, where } R \text{ is the radius of the earth and } \phi \text{ is the latitude of}$$

the location. For the GNSS scenarios defined in TS 51.010-7 subclause 6.2 this equates to approximately [TBD] m. For simplicity this is given as ±1.2 m.

For MS assisted mode it is assumed that the output from the WLS position solution calculation in clause 70.16.4.3 is coded using the same position coding method as for MS based mode before being used to calculate position error. Therefore the effect of reporting resolution will be the same as for MS based mode.

A5.5.2 Test Parameter Relaxations (This clause is informative)

The Test Parameter Relaxations defined in this clause have been used to relax the Conformance requirement to derive the Test Requirements.

The Test Parameter Relaxations are derived from Test System uncertainties, regulatory requirements and criticality to system performance. As a result, the Test Parameter Relaxations may sometimes be set to zero.

The Test Parameter Relaxations should not be modified for any reason e.g. to take account of commonly known test system errors (such as mismatch, cable loss, etc.).

Table A5.5.2.1: Test Parameter Relaxations for A-GPS Minimum Performance tests

Clause	Test Parameter Relaxation	
70.11.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	200 ms
	Absolute GPS signal level	1 dB
	Position error	1.3 m
	Response time	300 ms
70.11.5.2 Sensitivity Fine Time Assistance	Coarse Time Assistance	200 ms
	Fine Time Assistance	1 us
	Absolute GPS signal level	1 dB
	Position error	1.3 m
	Response time	300 ms
70.11.6 Nominal Accuracy	Coarse Time Assistance	200 ms
	Absolute GPS signal level	0 dB
	Position error	1.3 m
	Response time	300 ms
70.11.7 Dynamic Range	Coarse Time Assistance	200 ms
	Absolute GPS signal level	0 dB
	Relative GPS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms
70.11.8 Multi-Path scenario	Coarse Time Assistance	200 ms
	Absolute GPS signal level	0 dB
	Relative GPS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms

Table A5.5.2.2: Test Parameter Relaxations for A-GNSS Minimum Performance tests

Clause	Test Parameter Relaxation	
70.16.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	1 dB
	Position error	1.3 m
	Response time	300 ms

70.16.8 Multi-Path scenario	Coarse Time Assistance	200 ms
	Absolute GNSS signal level	0 dB
	Relative GNSS signal level	0.2 dB
	Position error	1.3 m
	Response time	300 ms

A5.5.3 Interpretation of measurement results

The measurement results returned by the Test System are compared - without any modification - against the Test Requirements as defined by the shared risk principle.

The Shared Risk principle is defined in TR 102 273-1-2, clause 6.5.

The actual measurement uncertainty of the Test System for the measurement of each parameter shall be included in the test report.

The recorded value for the Test System uncertainty shall be, for each measurement, equal to or lower than the appropriate figure in clause A5.5.1.

If the Test System for a test is known to have a measurement uncertainty greater than that specified in clause A5.5.1, it is still permitted to use this apparatus provided that an adjustment is made value as follows:

Any additional uncertainty in the Test System over and above that specified in clause A5.5.1 shall be used to tighten the Test Requirement - making the test harder to pass. (This may require modification of stimulus signals). This procedure will ensure that a Test System not compliant with clause A5.5.1 does not increase the chance of passing a device under test where that device would otherwise have failed the test if a Test System compliant with clause A5.5.1 had been used.

A5.5.4 Derivation of Test Requirements (This clause is informative)

The Test Requirements have been calculated by relaxing the Conformance requirement of the core specification using the Test Parameter Relaxations defined in clause A5.5.2. When the Test Parameter Relaxation is zero, the Test Requirement will be the same as the Conformance requirement. When the Test Parameter Relaxation is non-zero, the Test Requirements will differ from the Conformance requirement, and the formula used for this relaxation is given in table A5.5.4.1 and A5.5.4.2.

Table A5.5.4.1: Derivation of Test Requirements for A-GPS Minimum Performance tests

Test	Conformance requirement in 3GPP TS 45.005		Test Parameter Relaxation (TPR)	Test Requirement
70.11.5.1 Sensitivity Coarse Time Assistance	Coarse Time Assistance	± 2 s	200 ms	Formulas: UL-TPR, LL+TPR: ± 1.8 s
	Absolute GPS signal level	-142, -147 dBm	1 dB	Level + TPR: -141, -146 dBm
	Position error	100 m	1.3 m	Error +TPR: 101.3 m

Annex 6 (informative): E-OTD Accuracy Measurement Test Environment

A6.1 Recommended Timing Accuracy Test Environment (Unassisted)

3GPP TS 05.05, annex I calls for a best-case MS measurement observed timing difference (OTD) accuracy of 100 nanoseconds. This level of measurement accuracy implies that:

1. The time delay and phase shift of all components in the test environment must be taken into account.
2. The laboratory equipment utilized to measure the burst alignment of the two base station simulators must support a time resolution of at least 10 nanoseconds.
3. All base station simulators, active RF channel simulators, and time measurement equipment must be phase-locked to a common reference clock.
4. All base station simulators used for this test must be frame synchronized.

Figure A6-1 represents a recommended configuration for the unassisted measurement of E-OTD accuracy. If this test environment is utilized, the effects of differing cable lengths, channel simulator processing delays, etc., must be compensated for in order to establish the RTD between bursts from the base station simulators.

The "unassisted" test environment should require a relatively short time ($< 3\ 000$ s) for the test environment to obtain N measurements for the purpose of calculating the RMS_{90} timing error of the MS. In many cases, the predominant component leading to uncertainty in RTD between the two base station simulators during the measurement period will be phase jitter, which should follow a Gaussian distribution. The standard deviation of this distribution must be kept within a range that allows the test laboratory to confirm that this uncertainty component does not significantly affect the results of the OTD measurements made and reported by the MS. Test labs and base station simulator manufacturers are expected to quantify and document the test environment's RTD. Test labs and base station simulator manufacturers are also expected to have some means of verifying the standard deviation of the test environment's RTD (including phase jitter introduced by the RF channel simulators), declaring that this uncertainty will be negligible relative to the 100 nanosecond RMS_{90} best-case requirements of 3GPP TS 05.05 (V8.7.1), Release 99, annex I.

Figure A6-1: "Unassisted" E-OTD Test Environment

A6.2 Recommended Timing Accuracy Test Environment (Assisted)

In some laboratory environments, test equipment may not be available to measure and/or maintain the base station simulator burst time alignment to the accuracy required by the "unassisted" test environment described earlier. In such cases, a test configuration of the type shown in figure A6-2 may be employed for E-OTD performance validation. In this configuration, an LMU of known accuracy is used to measure the real timing difference (RTD) between the serving and neighbour base station simulators.

The "assisted" test environment should require a relatively short time ($< 3\,000$ s) for the test environment to obtain N measurements for the purpose of calculating the RMS_{90} timing error of the MS. In many cases, the predominant component leading to uncertainty in RTD between the two base station simulators during the measurement period will be phase jitter, which should follow a Gaussian distribution. The timing offset or RTD between the two base station simulators is reported by the LMU. Even if an RTD measurement from the LMU is made in synchronism with an OTD measurement from the MS, some means of verification must be available to assure that the standard deviation of the RTD is kept within a range that allows the laboratory to confirm that this uncertainty does not significantly affect the results of the OTD reported by the MS. Test labs and LMU manufacturers are expected to have some means of verifying the standard deviation of the RTD reported for the test environment (including phase jitter introduced by the RF channel simulator), and declaring that this uncertainty component will be negligible relative to the 100 nanosecond RMS_{90} best-case requirements of 3GPP TS 05.05 (V8.7.1), Release 99, annex I.

Figure A6-2: "Assisted" E-OTD Test Environment

Delay Line

Almost all active RF channel fading simulators introduce some intrinsic propagation delay, even when set to an RF channel delay of zero. In some cases, this delay may be too great to compensate for using a passive delay as shown in figure A6-1 and figure A6-2. In such cases, the intrinsic delay of the channel simulator shall be included in the

calculation of RTD for the test environment. Any phase jitter contribution from the RF channel fading simulator must be taken into account when evaluating the standard deviation of the test environment's RTD.

Simulated Geometric Time Difference

Once the RTD of the test environment is known, any additional time delay added to the fading simulator RF path will simulate the effect of distance between the MS and its neighbour cell. 3GPP TS 05.05 (V8.7.1), Release 99, annex I does not specify a value for geometric time delay, in part because the MS could be equidistant from the three base stations required for E-OTD calculation in a real network. Also, in an actual network, the geometric delay an MS must contend with can vary from 0 μ sec to over 50 μ sec, however, the 3GPP TS 05.05, annex I specification is only concerned with measurement error. Consequently, the test procedures described in this subclause require that no additional time delay will be added to simulate a geometric time difference.

Neighbour Lists

The serving base station simulator must be configured to include the neighbour base station simulator in its BA list. During interference tests, the interfering signal generator shall not be included in the serving base station simulator's BA list.

Interfering BCCH Signal Generator

The interfering BCCH signal generator shall provide a continuous GMSK signal, modulated with a pseudo-random bit sequence. This signal generator shall not be frame-synchronized with the serving or neighbour base station simulators.

RRLP Measure Position Request

The RRLP Measure Position Request sent from the serving base station simulator shall include the field values listed in table A6-1.

Table A6-1: RRLP Measure Position Request Field Values, Positioning Instructions Data Element

Field Name	Value	Comments
Method Type	0	Value="MS assisted"
Positioning Methods	0	Value="E-OTD"
Response Time	1	Value=2 seconds
Accuracy	NA	This field is optional
Multiple Sets	0	Value=Multiple sets allowed
Environmental Characterisation	NA	This field is optional

The following Measure Position Request components will be used when relevant to the test:

- E-OTD Reference BTS of Assistance Data;
- E-OTD Measurement Assistance Data for System Information List Element;

These two assistance data elements are necessary in the Measure Position Request to facilitate the execution of certain physical-layer E-OTD tests. For example, 3GPP TS 05.05, Annex I requires that in some instances, an E-OTD capable MS must support a specified timing measurement accuracy when the neighbour BCCH is below the device's reference sensitivity. Without assistance data, it may be impossible to execute the necessary physical layer validation tests because the MS upper protocol layers would be incapable of decoding the BSIC of the neighbour BCCH.

MS Mode During Measurement

The MS under test shall make the requested measurements while in the dedicated mode on a TCH.

Automation of E-OTD Measurements

If at all possible, the laboratory environment used to verify E-OTD accuracy should be capable of supporting automated measurements. A minimum of 250 trials shall be utilized.

Terminal Unit RRLP Message Monitoring

The test lab shall have some means of logging the Measure Position Response message transmitted by the MS. This can be accomplished utilizing a suitable U_m interface analyzer monitoring the MS RRLP messages on the uplink, or through a base station simulator capable of reading and logging RRLP messaging. The device used to capture the received

RRLP messages should be capable of logging the MS observed time difference measurement to a flat ASCII file, with each of the reported OTD values in decimal.

E-OTD Measurement With 8PSK Modulated Bursts

3GPP TS 05.05 (V8.7.1) Release 99, annex I requires that an E-OTD-capable MS must support E-OTD measurements when the serving and the neighbour base stations are transmitting 8PSK modulated bursts. This test plan verifies that the timing error of an E-OTD-capable MS is maintained regardless of whether the serving and neighbour base station simulators are transmitting either GMSK or 8PSK in time slots 1 through 7.

Accuracy Calculation

In order to minimize the effects of "outlying" data points, the timing difference measurement accuracy of an E-OTD MS shall be calculated as an RMS value of 90% of the measurement trials with the least error. For example, if N=250 measurement trials, the trial error results x_1 through x_{250} shall be sorted in ascending order of error. A subset M that includes 90 % of the trials in set N (M=225 trials in this example) shall be established. In this example, the subset M will include the 225 trial results with the least error from set N. The RMS error is then calculated from the data points in subset M according to Equation A6-1 below:

(Equation A6-1) RMS_{90} Calculation

$$Error_{RMS} = \sqrt{\left(\left(\sum_{1}^M x^2 \right) + M \right)}$$

Annex 7 (informative): General rules for statistical testing

A7.1 Statistical testing of receiver performance

Testing the receiver performance can be done either in the classical way with a fixed minimum number of samples or using statistical methods that lead to an early pass/fail decision with test time significantly reduced for MS with an error rate not on the limit.

Statistical testing of the receiver performance is based on the evaluation of error rates, such as bit error rates, block error rates or also the rate of missing bad frame indications.

A7.1.1 Basics

A7.1.1.1 Definition of (error) events

1) Bit Error Ratio (BER)

The Bit Error Ratio is defined as the ratio of the bits wrongly received to all data bits sent.

2) Block Error Ratio (BLER)

A Block Error Ratio is defined as the ratio of the number of erroneous blocks received to the total number of blocks sent. An erroneous block is defined as a Transport Block, the cyclic redundancy check (CRC) of which is wrong.

3) Rate of missing Bad Frame Indications (BFI)

The rate of missing Bad Frame Indications is the ratio of frames not marked incorrect to all frames sent, although all frames sent are incorrectly. This mechanism is used to test Bad Frame Indication of the MS.

A7.1.1.2 Test Method

Each test is performed in the following manner:

- a) Set up the required test conditions.
- b) Continuously record the number of samples tested and the number of (error) events (bit error, block error or missing BFI).
- c) While recording samples and errors continuously check, if it is about time to make a decision. The possible outcomes of a decision are: Early pass, early fail, continue with measuring the error rates, pass or fail.

A7.1.1.3 Test Criteria

The test shall fulfil the following requirements:

- a) good pass fail decision with high confidence level
 - 1) to keep reasonably low the probability (risk) of passing a bad unit for each individual test;
 - 2) to have high probability of passing a good unit for each individual test;
- b) good balance between test time and statistical significance
 - 3) to perform measurements with a high degree of statistical significance;
 - 4) to keep the test time as low as possible.

A7.1.1.4 Calculation assumptions

A7.1.1.4.1 Statistical independence

- (a) It is assumed, that error events are rare (error rate close to zero) and independent statistical events.

The assumption of rare events is justified by the error rates that need to be met by the DUT. Statistical independence is given as data bits of completely transmitted bursts are evaluated without further memory of the receiver active. Samples and errors are summed up after every time slot interval. So the assumption of independent error events is justified.

- (b) In error rate tests with fading there is the memory of the multipath fading channel which interferes the statistical independence. A minimum test time is introduced to average fluctuations of the multipath fading channel. So the assumption of independent error events is justified approximately.

A7.1.1.4.2 Applied formulas

The formulas, applied to describe the error rate test, are based on the following experiments:

- (1) After having observed a certain number of (error) events (**ne**) the number of samples are counted to calculate the error rate. Provisions are made such that the complementary experiment is valid as well:
- (2) After a certain number of samples (**ns**) the number of errors, occurred, are counted to calculate the error rate.

Experiment (1) stipulates to use the following Chi Square Distribution with degree of freedom **ne**:

$$2 \times X^2(2 \times \nu, 2 \times \mathbf{ne})$$

Where X^2 is the Chi-square distribution.

Experiment (2) stipulates to use the Poisson Distribution:

$$P_v(\mathbf{ne})$$

Where $P_v(\mathbf{ne})$ is the Poisson distribution for **ne** with mean ν .

with ν as the mean of the distribution.

To determine the early stop conditions, the following inverse cumulative operation is applied:

$$\frac{1}{2} C^{-1}(D, 2 \times \mathbf{ne}). \text{ This is applicable for experiment (1) and (2).}$$

D Wrong decision risk per test step.

NOTE: Where C^{-1} is the inverse cumulative distribution function for the X^2 distribution (the D-quantile function)
Other inverse cumulative operations are available, however only this is suited for experiment (1) and (2).

A7.1.2 Definition of good pass fail decision

A correct pass/fail decision requires the knowledge of the exact (true) error ratio of the DUT. However the true error ratio of the DUT is generally unknown. Measuring the true error ratio of the DUT requires to evaluate an infinite number of samples, which of course is not possible. This means that any error rate measurement within limited time is affected by an uncertainty, leading to two kinds of wrong decisions possible. If the measured error rate is higher than the true error rate a good DUT could possibly be failed and vice versa if the measured error rate is lower a bad DUT could possibly be passed.

Error rate tests within limited time hence require the acceptance of a wrong decision risk. The measure of a good pass fail decision is given by the probability (risk) F of the wrong decision at the end of the test. The probability of a correct decision is $1-F$.

Wrong decision risk F for one single error ratio test:

The probability (risk) to fail a good DUT shall be F_{fail} according to the following definition: A DUT is failed, accepting a probability F_{fail} that the DUT is still better than the test requirement

The probability (risk) to pass a bad DUT shall be F_{pass} according to the following definition: A DUT is passed, accepting a probability F_{pass} that the DUT is still worse than M times the specified error ratio. ($M > 1$ is the bad DUT factor).

The wrong decision risk F explained above applies to one single error ratio test. In most test cases where only one or few error ratio tests are done the wrong decision risk acceptable for an erroneous pass is identical to the acceptable risk for an erroneous fail:

$$F_{\text{pass}} = F_{\text{fail}} = F \quad \text{and e.g.} \quad F = 0.2\%$$

If a test is repeated under different conditions for several times, the total wrong decision risk for the DUT increases. The increasing risk for a bad fail decision is not acceptable for test cases that are composed of many single error rate tests like e.g. the blocking test, which implies approximately 3000 error rate tests (depends on design of MS). A DUT on the limit will fail approximately 6 to 7 times due to statistical reasons (wrong decision probability at the end of the test $F = 0.2\%$). 30 fails (6 in inband range and 24 outside) are allowed in the blocking test but these fails are reserved for spurious responses. This problem shall be solved by the following rules:

- All passes (based on $F_{\text{pass}} = 0.2\%$) are accepted, including the wrong decisions due to statistical reasons.
- An early fail limit based on $F_{\text{fail}} = 0.02\%$ instead of 0.2% is established, that ensures that wrong decisions due to statistical reasons are reduced to less than one.

These asymmetric test conditions ensure that a DUT on the test limit consumes hardly more test time for a blocking test than in the symmetric case and on the other hand discriminates sufficiently between statistical fails and spurious response cases.

Wrong decision probability D per test step:

As one single error ratio test is composed of several test steps the wrong decision probability per test step needs to be sufficiently small to keep the wrong decision risk F (the wrong decision risk at the end of the test) within the requirements. The wrong decision probability D per test step is a numerically evaluated fraction of F . Considerations regarding symmetry between probability of wrong pass and wrong fail decision are identical to those given for F .

For most test cases where only one or few error rate tests are done the wrong decision probability D per test step for a pass decision is identical to the wrong decision probability for a fail decision.

$$D_{\text{pass}} = D_{\text{fail}} = D \quad \text{and e.g.} \quad D = 0.0085\%$$

For test cases where $F_{\text{pass}} \neq F_{\text{fail}}$ (e.g. blocking) this applies also to D : $D_{\text{pass}} \neq D_{\text{fail}}$.

A7.1.3 Implementation

A7.1.3.1 Proceeding

- a) Set up the required test conditions.
- b) Continuously record the number of samples tested and the number of (error) events (bit error, block error or missing BFI). Calculate the preliminary error rates ber_0 and ber_1 from the number of samples and the number of (error) events. Regarding ber_0 and ber_1 refer to “A7.1.3.1 Limit lines”.
- c) Continuously check while recording samples and errors, if it is about time to make a decision. The possible outcomes of a decision are: Early pass, early fail, continue with measuring the error rates, pass or fail.
 - 1st decision after minimum test time due to fading (refer to Table A7.1.4.2 : Minimum test time due to fading) has elapsed. In case the test runs without fading conditions this time is zero and in case this time exceeds the target test time (refer to A7.1.3.1 Limit lines), the test is already finished requiring a pass/fail decision .
 - 2nd and possibly further (early) decisions after a certain cyclic interval or the occurrence of the next error event. As long as no early decision can be made the test is continued.
 - If the target test time has elapsed the test is definitively finished and a pass/fail decision can be made. In case the minimum test time due to fading exceeds the target test time this point is reached already in the 1st step.

A7.1.3.2 Limit lines

Early decisions require that the actual error rate is checked both against a limit line for early pass and a limit line for early fail.

Limit line for early pass decision (for $ne \geq 1$):

The condition for an early pass decision is: $ber_1 < berlim_{pass}$

$$berlim_{pass}(D_{pass}, ne) = \frac{2 \times ne \times M}{C^{-1}(1 - D_{pass}, 2 \times ne)}$$

ber_1 is the normalised bit error rate with counting errors started from one which means that an artificial error is introduced at the beginning to avoid that the early pass condition is met when the test starts. After the first real error event has occurred the artificial error has to be removed to calculate the error rate correctly.

Limit line for early fail decision (for $ne \geq 7$):

The condition for an early fail decision is: $ber_0 > berlim_{fail}$

$$berlim_{fail}(D_{fail}, ne) = \frac{2 \times ne}{C^{-1}(D_{fail}, 2 \times ne)}$$

ber_0 is the normalised bit error rate with counting errors started from zero, meaning that no artificial erroneous sample is introduced at the beginning of the test..

Due to the nature of the test, namely discrete error events, the early fail condition shall not be valid, when fractional errors < 1 are used to calculate the early fail limit: Any early fail decision is postponed until number of errors $ne \geq 7$. In the blocking test any early fail decision is postponed until number of errors $ne \geq 8$.

Parameters for limit lines:

1.	D		wrong decision probability per test step.
2.	M	= 1.5	bad DUT factor
3.	ne		number of (error) events. This parameter is the x-ordinate in figure A7.1.3.1 Limit lines.
4.	ns		number of samples. This parameter is not needed for limit lines, but enumerated here because it is aligned to ne closely. The bit error rate is calculated from ne and ns.
Parameters D and M define the limit lines for early pass and early fail. With the two curves known the intersection point of the two limit lines can be calculated. The x-ordinate of this intersection point is the target number of errors (TNE) and y-ordinate is the (normalised) test limit (TL). This intersection point is reached when the target test time has elapsed. In this case a decision against the test limit (column "derived test limit") can be made.			
5.	TL	= 1.234	For tests with $F = 0.2$ the parameters given above lead to this (normalised) test limit. The BER limit given in the core specs (column "Orig. BER requirement" in the tables defining the test limits) is multiplied with the test limit factor TL to gain the limit for the pass/fail decision (column "derived test limit").
	TL	= 1.251	Normalized test limit for tests with $F = 0.02$ (e.g. blocking test).
6.	TNE		The parameters given above lead to a target number of errors. For tests with $F = 0.2$ the target number of errors is 345. For tests with $F = 0.02$ (e.g. blocking test) the target number of errors results in 403.

Figure A7.1.3.1 Limit lines

A typical error rate test, calculated from the number of samples and errors using experimental method (1) or (2) (see A7.1.1.4 Calculation assumptions) runs along the yellow trajectory. With an errorless sample the trajectory goes down vertically. With an erroneous sample it jumps up right. Making a pass/fail decision means to check if the error rate

("BER trajectory") intersects the limit lines for early pass or early fail. The term 'test limit' used in the figure above denotes the term 'derived test limit' used in this document.

A7.1.4 Good balance between test time and statistical significance

Three independent test parameters are introduced into the test and shown in Table A7.1.4.1. These are the obvious basis of test time and statistical significance. From the first two of them four dependent test parameters are derived. The third independent test parameter is justified separately.

Table A7.1.4.1 Independent and dependent test parameters

Independent test parameters			Dependent test parameters		
Test Parameter	Value	Reference	Test parameter	Value	Reference
Bad DUT factor M	1.5	Section A7.1.3.1	Early pass/fail condition	Curves	Section A7.1.3.1 Figure A7.1.3.1
Final probability of wrong pass/fail decision F	0.2% 0.02% for blocking	Section A7.1.2	Target number of error events	345 403 for blocking	Section A7.1.3.1
			Probability of wrong pass/fail decision per test step D	0.0085% 0.0008% for blocking	Section A7.1.2
			Test limit factor TL	1.234 1.251 for blocking	Section A7.1.3.1
Minimum test time		Table A7.1.4.2			

The minimum test time is derived from the following justification:

- 1) For no propagation conditions and static propagation condition

No early fail calculated from fractional number of errors <1

- 2) For multipath fading condition

No stop of the test until 990 wavelengths are crossed for fading profiles greater than 5km/h, and 250 wavelengths are crossed for fading profiles less than or equal to 5km/h. The minimum test time due to multipath fading conditions depends on the frequency of the DL signal, the vehicle speed and the data rate (full rate or half rate). Refer to table A7.1.6.2 : Minimum test time due to fading

Table A7.1.4.2: Minimum test time due to fading

Frequency	0,4	0,7	0,85	0,9	1,8	1,9	GHz

A7.1.5 Minimum and maximum expected duration of tests

Since there are a number of dependant and independent factors which determine the expected duration of a test using these statistical methods, it is recommended that in individual test cases an expected minimum and an expected maximum duration of test is specified for each configuration (e.g. times may significantly change for differing bands). Where the expected minimum and maximum duration are constrained by the same factor, and are thus the same, for clarity both values should be stated.

Where minimum and/or maximum test durations are specified, they should only be used in an informative manner (e.g. by a test case implementer to determine whether a given implementation is correct). These specified durations should not be used as a failure determination unless this is explicitly stated in an individual clause.

A7.2 Statistical testing of 2 D position error and TTFF for A-GPS and A-GNSS Minimum Performance test cases

A7.2.1 Test Method

Each test is performed in the following manner:

- Setup the required test conditions.

- b) Measure the 2D position and Time to First Fix repeated times. Start each repetition after having applied the message 'RESET MS POSITIONING STORED INFORMATION'. This ensures that each result is independent from the previous one. The results, measured, are simplified to:

good result, if the 2D position and TTFF are $\leq$ limit.

bad result, if the 2D position or TTFF or both are $>$ limit

- c) Record the number of results (ns) and the number of bad results (ne)
- d) Stop the test at a pass or an fail event.
- e) Once the test is stopped, decide according to the pass fail decision rules (A7.2.4.2)

A7.2.2 Error Ratio (ER)

The Error Ratio (ER) is defined as the ratio of bad results (ne) to all results (ns).
(1-ER is the success ratio)

A7.2.3 Test Design

A statistical test is characterised by:

Test-time, Selectivity and Confidence level

A7.2.3.1 Confidence level

The outcome of a statistical test is a decision. This decision may be correct or in-correct. The Confidence Level CL describes the probability that the decision is a correct one. The complement is the wrong decision probability (risk) $D = 1 - CL$

A7.2.3.2 Introduction: Supplier Risk versus Customer Risk

There are two targets of decision:

- a) A measurement on the pass-limit shows, that the DUT has the specified quality or is better with probability CL (CL e.g.95%) This shall lead to a "pass decision"

The pass-limit is on the good side of the specified DUT-quality. A more stringent CL (CL e.g.99%) shifts the pass-limit further into the good direction. Given that the quality of the DUTs is distributed, a greater CL passes less and better DUTs.

A measurement on the bad side of the pass-limit is simply "not pass" (undecided)

- aa) Complementary:

A measurement on the fail-limit shows, that the DUT is worse than the specified quality with probability CL.

The fail-limit is on the bad side of the specified DUT-quality. A more stringent CL shifts the fail-limit further into the bad direction. Given that the quality of the DUTs is distributed, a greater CL fails less and worse DUTs.

A measurement on the good side of the fail-limit is simply "not fail".

- b) A DUT, known to have the specified quality, shall be measured and decided pass with probability CL. This leads to the pass limit.

For CL e.g. 95%, the pass limit is on the bad side of the specified DUT-quality. CL e.g.99% shifts the pass-limit further into the bad direction. Given that the DUT-quality is distributed, a greater CL passes more and worse DUTs.

- bb) A DUT, known to be an $(\varepsilon \rightarrow 0)$ beyond the specified quality, shall be measured and decided fail with probability CL.

For CL e.g.95%, the fail limit is on the good side of the specified DUT-quality.

NOTE: the different sense for CL in (a), (aa) versus (b), (bb).

NOTE: for constant CL in all 4 bullets (a) is equivalent to (bb) and (aa) is equivalent to (b).

A7.2.3.3 Supplier Risk versus Customer Risk

The table below summarizes the different targets of decision.

Table A7.2.3.3 Equivalent statements

	Equivalent statements, using different cause-to-effect-directions, and assuming CL = constant >0.5	
cause-to-effect-directions	Known measurement result → estimation of the DUT's quality	Known DUT's quality → estimation of the measurement's outcome
Supplier Risk	A measurement on the pass-limit shows, that the DUT has the specified quality or is better (a)	A DUT, known to have an ($\epsilon \rightarrow 0$) beyond the specified DUT-quality, shall be measured and decided fail (bb)
Customer Risk	A measurement on the fail-limit shall shows, that the DUT is worse than the specified quality (aa)	A DUT, known to have the specified quality, shall be measured and decided pass (b)

NOTE: The bold text shows the obvious interpretation of Supplier Risk and Customer Risk. The same statements can be based on other DUT-quality-definitions.

A7.2.3.4 Introduction: Standard test versus early decision concept

In standard statistical tests, a certain number of results (ns) is predefined in advance of the test. After ns results the number of bad results (ne) is counted and the error ratio (ER) is calculated as ne/ns .

Applying statistical theory, a decision limit can be designed, against which the calculated ER is compared to derive the decision. Such a limit is one decision point and is characterised by:

- D: the wrong decision probability (a predefined parameter)
- ns: the number of results (a fixed predefined parameter)
- ne: the number of bad results (the limit based on just ns)

In the formula for the limit, D and ns are parameters and ne is the variable. In the standard test ns and D are constant. The property of such a test is: It discriminate between two states only, depending on the test design:

- pass (with CL) / undecided (undecided in the sense: finally undecided)
- fail (with CL) / undecided (undecided in the sense: finally undecided)
- pass(with CL) / fail (with CL) (however against two limits).

In contrast to the standard statistical tests, the early decision concept predefines a set of (ne,ns) co-ordinates, representing the limit-curve for decision. After each result a preliminary ER is calculated and compared against the limit-curve. After each result one may make the decision or not (undecided for later decision) The parameters and variables in the limit-curve for the early decision concept have a similar but not equal meaning:

- D: the wrong decision probability (a predefined parameter)
- ns: the number of results (a variable parameter)
- ne: the number of bad results (the limit. It varies together with ns)

To avoid a "final undecided" in the standard test, a second limit must be introduced and the single decision co-ordinate (ne,ns) needs a high ne, leading to a fixed (high) test time. In the early decision concept, having the same selectivity and

the same confidence level an “undecided” does not need to be avoided, as it can be decided later. A perfect DUT will hit the decision coordinate (ne,ns) with ne=0. This test time is short.

A7.2.3.5 Standard test versus early decision concept

For Supplier Risk:

The wrong decision probability D in the standard test is the probability, to decide a DUT in-correctly in the single decision point. In the early decision concept there is a probability of in-correct decisions d at each point of the limit-curve. The sum of all those wrong decision probabilities accumulate to D . Hence $d < D$

For Customer Risk:

The correct decision probability CL in the standard test is the probability, to decide a DUT correctly in the single decision point. In the early decision concept there is a probability of correct decisions cl at each point of the limit-curve. The sum of all those correct decision probabilities accumulate to CL . Hence $cl < CL$ or $d > D$

A7.2.3.6 Selectivity

There is no statistical test which can discriminate between a limit-DUT-quality and a DUT-quality which is an ($\varepsilon \rightarrow 0$) apart from the limit in finite time and confidence level $CL > 1/2$. Either the test discriminates against one limit with the results pass (with CL)/undecided or fail (with CL)/undecided, or the test ends in a result pass (with CL)/fail (with CL) but this requires a second limit.

For $CL > 0.5$, a (measurement-result = specified-DUT-quality), generates undecided in test “supplier risk against pass limit” (a in clause A7.2.3.2) and also in the equivalent test against the fail limit (aa in clause A7.2.3.2)

For $CL > 0.5$, a DUT, known to be on the limit, will be decided pass for the test “customer risk against pass limit” (b in clause A7.2.3.2) and also in the equivalent test against fail limit (bb in clause A7.2.3.2).

This overlap or undecided area is not a fault or a contradiction, however it can be avoided by introducing a Bad or a Good DUT quality according to:

- Bad DUT quality: specified DUT-quality * M ($M > 1$)
- Good DUT quality: specified DUT-quality * m ($m < 1$)

Using e.g $M > 1$ and $CL = 95\%$ the test for different DUT qualities yield different pass probabilities:

Figure A7.2.3.6: Pass probability versus DUT quality

A7.2.3.7 Design of the test

The test is defined according to the following design principles:

1. The early decision concept is applied.
2. A second limit is introduced: Bad DUT factor $M > 1$
3. To decide the test pass:

Supplier risk is applied based on the Bad DUT quality

To decide the test fail

Customer Risk is applied based on the specified DUT quality

The test is defined using the following parameters:

1. Specified DUT quality: $ER = 0.05$
2. Bad DUT quality: $M = 1.5$ (selectivity)
3. Confidence level $CL = 95\%$ (for specified DUT and Bad DUT-quality)

This has the following consequences:

- a) A measurement on the fail limit is connected with 2 equivalent statements:

A measurement on the fail-limit shows, that the DUT is worse than the specified DUT-quality	A DUT, known to have the specified quality, shall be measured and decided pass
---	--

A measurement on the pass limit is connected with the complementary statements:

A measurement on the pass limit shows, that the DUT is better than the Bad DUT-quality.	A DUT, known to have the Bad DUT quality, shall be measured and decided fail
---	--

The left column is used to decide the measurement.

The right column is used to verify the design of the test by simulation.

The simulation is based on the two fulcrums A and B only in Figure A7.2.3.6. There is freedom to shape the remainder of the function.

- b) Test time

1. The minimum and maximum test time is fixed.
2. The average test time is a function of the DUT's quality.
3. The individual test time is not predictable (except ideal DUT).

- c) The number of decision co-ordinates (n_e, n_s) in the early decision concept is responsible for the selectivity of the test and the maximum test time. Having fixed the number of decision co-ordinates there is still freedom to select the individual decision co-ordinates in many combinations, all leading to the same confidence level.

A7.2.4 Pass fail decision

A7.2.4.1 Numerical definition of the pass fail limits

42	839	560	85	1510	1280	128	2158	2032			

NOTE: The first column is the number of bad results (ne)
The second column is the number of results for the pass limit (n_{sp})
The third column is the number of results for the fail limit (n_{sf})

A7.2.4.2 Pass fail decision rules

Having observed 0 bad results, pass the test at ≥ 77 results, otherwise continue

Having observed 1 bad result, pass the test at ≥ 106 results, otherwise continue

Having observed 2 bad results, pass the test at ≥ 131 results, otherwise continue

etc. until

Having observed 6 bad results, pass the test at ≥ 218 results, fail the test at ≤ 42 results, otherwise continue

Having observed 7 bad results, pass the test at ≥ 238 results, fail the test at ≤ 52 results, otherwise continue

etc. until

Having observed 168 bad results, pass the test at ≥ 2751 results, fail the test at ≤ 2747 results, otherwise continue

Having observed 169 bad results, pass the test at ≥ 2765 results, otherwise fail

NOTE: an ideal DUT passes after 77 results. The maximum test time is 2765 results.

A7.2.4.3 Background information to the pass fail limits

There is freedom to design the decision co-ordinates (ne,ns).

The binomial distribution and its inverse is used to design the pass and fail limits. Note that this method is not unique and that other methods exist.

$$\text{fail}(ne, d_f) := \frac{ne}{(ne + \text{qnbinom}(d_f, ne, ER))}$$

$$\text{pass}(ne, cl_p, M) := \frac{ne}{(ne + \text{qnbinom}(cl_p, ne, ER \cdot M))}$$

Where

fail(..) is the error ratio for the fail limit

pass(..) is the error ratio for the pass limit

ER is the specified error ratio 0.05

ne is the number of bad results. This is the variable in both equations

M is the Bad DUT factor M=1.5

d_f is the wrong decision probability of a single (ne,ns) co-ordinate for the fail limit.
It is found by simulation to be $d_f = 0.004$

cl_p is the confidence level of a single (ne,ns) co-ordinate for the pass limit.
It is found by simulation to be $cl_p = 0.9975$

qnbinom(..): The inverse cumulative function of the negative binomial distribution

The simulation works as follows:

A large population of limit DUTs with true ER = 0.05 is decided against the pass and fail limits.

cl_p and d_f are tuned such that CL (95%) of the population passes and D (5%) of the population fails.

A population of Bad DUTs with true ER = M*0.05 is decided against the same pass and fail limits.

cl_p and d_f are tuned such that CL (95%) of the population fails and D (5%) of the population passes.

This procedure and the relationship to the measurement is justified in clause A7.2.3.7. The number of DUTs decrease during the simulation, as the decided DUTs leave the population. That number decreases with an approximately exponential characteristics. After 169 bad results all DUTs of the population are decided.

NOTE: The exponential decrease of the population is an optimal design goal for the decision co-ordinates (ne,ns), which can be achieved with other formulas or methods as well.

Annex 8:

Void

Annex 9 (normative): GAN certificate

A9.1 Files relating to GAN certificate for testing

All files associated with the certificates to be used for authentication in IPSec are contained in archive GAN_certificate_V1.zip.

Files to be used both by MS and SS are contained in this archive.

The archive file set consists of the following:

-	Ca.key	
-	Ca.crt	
-	Segw.key	
-	Segw.csr	
-	Segw.crt	
-	_Command.txt	The commands performed to generate the above files
-	_Openssl.txt	Input file containing information required to generate above certificates (renamed from openssl.cnf)
-	_Execution.txt	Activity log generated whilst above files are generated (also contains details of information prompted for during command execution)

A9.1.1 Overview and usage of certificate files

In a regular network (non-test) environment, a public certification authority (CA) would be used to generate a SEGW certificate (ca.crt) using the CA's private key and the network operator's information. For testing we are using our own test CA and have made available the test CA self-signed root certificate (self signing ca.crt).

Of the above files, the MS will need to store the test CA root certificate (ca.crt).

The SS will use the private key (segw.key) and certificate (segw.crt) for mutual authentication relating to the provisioning SEGW.

The SS vendor will use the test CA private key (ca.key) and test CA root certificate (ca.crt) to generate further certificates relating to the default and serving SEGWs.

A9.1.2 Privacy of private keys and usage of certificate

Since the private key relating to the root certificate is published here, there is no privacy, and thus no relationship of trust associated with this root certificate (ca.crt). It is of the utmost importance that the MS will only utilise this certificate for test purposes. For further details refer to TS 44.014.

Annex 10 (informative): Repeated SACCH Layer 1 Test Method:

A10.1 Details on Repeated SACCH Testing

Table A10.1.1 shows the PCL values exchanged in the L1 headers between a MS and SS during a typical session with zero block errors on time slot 0. On the DL the SS updates the commanded PCL every second SACCH interval as each SACCH block is repeated. The SS must complete the following actions during the period between the last burst of the UL SACCH and the first burst of the DL SACCH (26 frames):

- Decode the reported PCL in the UL SACCH L1 header.
- Determine the new PCL based on the reported PCL in the UL L1 header and the PCL commanded in the previous SACCH interval on the DL. The procedure used is specified in section 14.2.26 or 14.4.32.
- Format the data for the first burst in the DL SACCH L1 header.

Using the information in Table A10.1.1 as an example, the SS must complete the above steps between the end of FN 42106 and the start of FN 42132. The “Next Commanded PCL by SS” to use in FN 42132 is determined according to table 14.2.26-1 or 14.4.32-1, referring to the following parameters:

- The “Last Commanded PCL” is that used in the DL SACCH block that started at FN 42028,
- The “Corresponding Reported MS PCL” is that reported for the UL SACCH block that started at FN 42028.

The entries in table 14.2.26-1 or 14.4.32-1 are derived such that the “Next commanded PCL by SS” is chosen so that it is not equal to either the “Last commanded PCL by SS” or the “Corresponding Reported MS PCL”. This ensures that the SS can detect all block error events. Only three PCL values are needed to ensure that all block error events are captured. The choice of PCL values 7, 8 and 9 are specified to ensure that all PCL values are within 2 steps of each other. This is to avoid rate limiting between changes in PCL values [see TS 45.008 subclause 4.7.1]. Note that PCL values 7, 8, and 9 were chosen to ensure all MSs, even those that do not support PCL values of 0, would work with these test cases.

Table A10.1.2 illustrates the specific case where an error only occurs in the first SACCH block of a repeated SACCH interval. Although this affects the SACCH block sequence that the SS receives from the MS, it does not alter its decisions as no block error occurs. In the case where only the second SACCH block of a repeated SACCH interval is in error, this is not detectable by the SS, however this is not a block error condition as the first SACCH block of the repeated SACCH interval was received without error.

Table A10.1.3 illustrates the specific case where an error occurs in the both the first and second SACCH blocks of a repeated SACCH interval. In this event, the SS detects the block error and the PCL sequence used by the SS is altered from the normal case in response to the sequence received from the MS.

Table A10.1.4 illustrates the specific case where multiple (in this case 4) sequential errors occur. In this event the SS detects two block errors and the PCL sequence used by the SS is altered from the normal case in response to the sequence received from the MS.

Table A10.1.1: Repeated SACCH Typical PCL Sequence (No Errors)

FN OF FIRST BURST OF SACCH	FN OF LAST BURST OF SACCH	SS DL COMMANDED PCL IN L1 HEADER	MS UL REPORTED PCL IN L1 HEADER	COMMENTS
...	...	...	...

GP-26	GP-052206	3118	1	CR 051.010-1 Section 52.9.2.1.4 Extended Dynamic Allocation / Uplink Transfer / Normal / PACCH operation in downlink	F	6.3.0	6.4.0	GP-052206	EDGE
GP-26	GP-052005	3119	-	CR 51.010-1 47.4.1 PDP Context Activation / Performed on main DCCCH and TBFs	F	6.3.0	6.4.0	GP-052005	GPRS
GP-26	GP-052289	3120	1	CR 51.010-1 Correction to sections 52.6.3 and 52.6.4 (EGPRS Packet Access for signalling / PCCCH case)	F	6.3.0	6.4.0	GP-052289	EDGE
GP-26	GP-052010	3123	-	Section 14.12.1 - Addition Of DCS Band Details and Correction To Sample Rate	F	6.3.0	6.4.0	GP-052010	DARP
GP-26	GP-052188	3124	1	Sections 42.4.5.4 and 42.4.5.9 Need To Allow Multiple Packet SI Status Messages	F	6.3.0	6.4.0	GP-052188	GPRS
GP-26	GP-052012	3125	-	New Test Case for MS-Based A-GPS: Multiple RRLP Requests with same Reference Number	F	6.3.0	6.4.0	GP-052012	TEI
GP-26	GP-052013	3126	-	New Test Case for MS-Based A-GPS: Multiple RRLP Requests with different Reference Number	F	6.3.0	6.4.0	GP-052013	TEI
GP-26	GP-052160	3131	-	42.4.8.3.3: Error in initial conditions	F	6.3.0	6.4.0	GP-052160	GPRS
GP-26	GP-052204	3132	1	Corrections to GPS scenario files	F	6.3.0	6.4.0	GP-052204	TEI
GP-26	GP-052178	3133	-	CR 051.010-1 Section 42.3.3.3 - Peak Throughput Class for MS supporting SMS over GPRS	F	6.3.0	6.4.0	GP-052178	GPRS
GP-26	GP-052179	3134	-	CR 051.010-1 Section 52.3.3.3 - Peak Throughput Class for MS supporting SMS over EGPRS	F	6.3.0	6.4.0	GP-052179	EDGE
GP-26	GP-052200	3135	-	Clarifications in section 40 and 50	F	6.3.0	6.4.0	GP-052200	GPRS
GP-26	GP-052202	3136	-	20.22.5 - Increase the value of NC_REPORTING_PERIOD_T	F	6.3.0	6.4.0	GP-052202	GPRS
-	-	-	-	Duplicated sections 42.9.2.2, 42.9.2.2.1, 42.9.2.2.2, 42.9.2.2.3, 42.9.2.2.4, 42.9.2.2.5 removed	D	6.4.0	6.4.1	-	-
GP-27	GP-052358	3143	-	14.12.1.2 – Correction of power level for DCS 1800 /1900 MS	F	6.4.1	6.5.0	GP-052358	DARP
GP-27	GP-052361	3155	-	14.4.16 – Removal of fixed test limits	F	6.4.1	6.5.0	GP-052361	AMR
GP-27	GP-052362	3156	-	14.4.17 – Tests reduction	F	6.4.1	6.5.0	GP-052362	AMR
GP-27	GP-052363	3157	-	14.4.8 – Correction of test limits	F	6.4.1	6.5.0	GP-052363	AMR
GP-27	GP-052364	3158	-	14.5.1.2 – Corrections to test procedure	F	6.4.1	6.5.0	GP-052364	AMR
GP-27	GP-052368	3160	-	14.2.19, 14.2.20, 14.4.17, 14.4.18 – clarification of Loop I operation	F	6.4.1	6.5.0	GP-052368	AMR
GP-27	GP-052369	3161	-	14 – Remove reference to tests which no longer use fixed test limits.	F	6.4.1	6.5.0	GP-052369	AMR
GP-27	GP-052468	3246	-	14.5.1.2 & 14.5.1.3 correction to purpose	F	6.4.1	6.5.0	GP-052468	GSM
GP-27	GP-052501	3254	-	13.6 removal of vibration condition	F	6.4.1	6.5.0	GP-052501	GSM
GP-27	GP-052518	3260	-	Section 21.4.3 Editorial Correction To Surplus Statement Added In Recent Update	F	6.4.1	6.5.0	GP-052518	DARP
GP-27	GP-052713	3174	-	CR 51.010-1-3174 cl. 13.4 - Change of measurement window to eliminate test system variations	F	6.4.1	6.5.0	GP-052713	GSM
GP-27	GP-052771	3154	1	14.1.3, 14.1.4, 14.4.3 – Tests reduction (tests deleted)	F	6.4.1	6.5.0	GP-052771	AMR
GP-27	GP-052391	3187	-	14.16.1 - Inconsistency in GMSK Power Levels	F	6.4.1	6.5.0	GP-052391	GPRS
GP-27	GP-052408	3144	-	14.16 - GPRS receiver tests – Minimum number of "blocks " for USF tests	F	6.4.1	6.5.0	GP-052408	GPRS
GP-27	GP-052463	3243	-	22.3 corrections to the test procedure	F	6.4.1	6.5.0	GP-052463	GPRS
GP-27	GP-052502	3255	-	13.16.1 removal of vibration condition	F	6.4.1	6.5.0	GP-052502	GPRS
GP-27	GP-052714	3175	-	CR 51.010-1-3175 cl. 13.16.3 - Change of measurement window to eliminate test system variations	F	6.4.1	6.5.0	GP-052714	GPRS
GP-27	GP-052409	3145	-	14.18 - EGPRS receiver tests – Minimum number of "blocks " for USF tests	F	6.4.1	6.5.0	GP-052409	GPRS
GP-27	GP-052410	3146	-	14.18.1 - Inconsistency in GMSK Power Levels	F	6.4.1	6.5.0	GP-052410	EGPRS
GP-27	GP-052464	3244	-	22.8 corrections to the test procedure	F	6.4.1	6.5.0	GP-052464	EDGE

TSG #	TSG Doc	CR	Rev	Subject/Comment	Cat	Old	New	WG Doc	Work item
GP-27	GP-052469	3247	-	14.18.3 corrections to the test procedure	F	6.4.1	6.5.0	GP-052469	EDGE
GP-27	GP-052715	3176	-	CR 51.010-1-3176 cl. 13.17.4 - Change of measurement window to eliminate test system variations	F	6.4.1	6.5.0	GP-052715	EDGE
GP-27	GP-052776	3159	1	14.5.1.4 – Corrections to test procedure	F	6.4.1	6.5.0	GP-052776	8PSK-AH
GP-27	GP-052393	3189	-	40.5 – Addition of R5 QOS Parameters to Test PDP Contexts.	F	6.4.1	6.5.0	GP-052393	GPRS
GP-27	GP-052417	3207	-	CR 51.010-1 Section 40.4.3.9 Conditional parameter check in Two Phase Access macro.	F	6.4.1	6.5.0	GP-052417	GPRS
GP-27	GP-052454	3242	-	CR 51.010-1 Section 40.4.3.22 New macro Bring MS in the active state (U10)	F	6.4.1	6.5.0	GP-052454	GPRS
GP-27	GP-052779	3177	1	51010-1:Changes in the expected sequence of the testcase 41.3.3	F	6.4.1	6.5.0	GP-052779	GPRS
GP-27	GP-052781	3191	1	41.3.6.8 – All Packet System Information for Cell B is replaced by Packet Downlink Dummy Control Block on PBCCH. The data trigger at Step1 is reduced to 1200 octets	F	6.4.1	6.5.0	GP-052781	GPRS
GP-27	GP-052418	3208	-	CR 51.010-1 Section 41.3.6.6 Clarification on the Access Type of Packet Resource Request in step 16.	F	6.4.1	6.5.0	GP-052418	GPRS
GP-27	GP-052783	3212	1	CR 51.010-1 Section 41.3.6.9 missing steps to prevent retransmission of old LLC PDU and to handle inactive period	F	6.4.1	6.5.0	GP-052783	GPRS
GP-27	GP-052785	3214	1	CR 51.010-1 Section – 41.5.1.1.2.1 Ambiguous note in step 4 removed	F	6.4.1	6.5.0	GP-052785	GPRS
GP-27	GP-052426	3216	-	CR 51.010-1 Section – 41.5.1.2.1.1 Clarification of step 1 (ambiguous Note)	F	6.4.1	6.5.0	GP-052426	GPRS
GP-27	GP-052777	3139	1	CR 051.010-1 Section 41.3.1.2 TBF Release / Uplink / Normal / MS initiated / Unacknowledged mode	F	6.4.1	6.5.0	GP-052777	GPRS
GP-27	GP-052342	3137	-	CR 051.010-1 42.9.2.2.3 Extended Dynamic Allocation / Uplink Transfer / configuration change / Reduction in number of uplink slots using PACKET UPLINK ASSIGNMENT.	F	6.4.1	6.5.0	GP-052342	GPRS
GP-27	GP-052786	3152	1	Correction to TC42.3.3.2.1	F	6.4.1	6.5.0	GP-052786	GPRS
GP-27	GP-052787	3147	1	Changes for Extended Dynamic Allocation / Shifted USF test cases 42.9.3.1.1-3	F	6.4.1	6.5.0	GP-052787	GPRS
GP-27	GP-052788	3148	1	42.9.2.1.1.1, 42.9.2.1.2.1 Changes to Conformance Statement.	F	6.4.1	6.5.0	GP-052788	GPRS
GP-27	GP-052852	3150	1	42.4.4.1 – Clarification of Packet Measurement Report handling during initial conditions	F	6.4.1	6.5.0	GP-052852	GPRS
GP-27	GP-052397	3193	-	42.4.1.4 - Step 8 is updated to allow for the DRX period for the first measurement report sent by the MS on moving to Idle mode (for Rel4 and earlier).	F	6.4.1	6.5.0	GP-052397	GPRS
GP-27	GP-052775	3194	1	42.4.5.4 & 42.4.5.9 - Ready timer is deactivated	F	6.4.1	6.5.0	GP-052775	GPRS
GP-27	GP-052399	3195	-	42.4.5.8 – Test sequence modified to handle Packet Measurement Reports appropriately after MS enters NC2 mode.	F	6.4.1	6.5.0	GP-052399	GPRS
GP-27	GP-052400	3196	-	42.4.8.4.1 and 42.4.8.4.3 – BS_PA_MFRMS parameter value is changed.	F	6.4.1	6.5.0	GP-052400	GPRS
GP-27	GP-052822	3218	1	51.010-1 section 42.4.5.3 Step B18 and B35: Incorrect comment deleted	F	6.4.1	6.5.0	GP-052822	GPRS
