## Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://www.etsi.org/legal/home.htm).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in ETSI SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

#### **Foreword**

This European Standard (Telecommunications series) has been produced by ETSI Technical Committee Environmental Engineering (EE).

The present document is part 2, sub-part 6 of a multi-part deliverable covering environmental conditions and environmental tests for telecommunications equipment, as identified below:

Part 1: "Classification of environmental conditions";

#### Part 2: "Specification of environmental tests";

```
Sub-part 0:
              "Introduction";
Sub-part 1:
              "Storage";
              "Transportation";
Sub-part 2:
Sub-part 3:
              "Stationary use at weatherprotected locations";
              "Stationary use at non-weatherprotected locations";
Sub-part 4:
              "Ground vehicle installations";
Sub-part 5:
Sub-part 6: "Ship environments";
Sub-part 7:
              "Portable and non-stationary use";
              "Stationary use at underground locations".
Sub-part 8:
```

Part 1 specifies different standardized environmental classes covering climatic and biological conditions, chemically and mechanically active substances and mechanical conditions during storage, transportation and in use.

Part 2 specifies the recommended test severities and test methods for the different environmental classes.

Part 2-0 forms a general overview of part 2. The present document deals with ship environments.

National transposition dates	
Date of adoption of this EN:	14 September 2001
Date of latest announcement of this EN (doa):	31 December 2001
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	30 June 2002
Date of withdrawal of any conflicting National Standard (dow):	30 June 2002

### 1 Scope

The present document specifies test severities and methods for the verification of the required resistibility of equipment according to the relevant environmental class.

The tests defined in the present document apply to the use of telecommunication equipment installed permanently or temporarily in ships and cover the environments and the vessels stated in ETS 300 019-1-6 [1].

#### 2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication and/or edition number or version number) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.

## 3 Environmental test specifications

The detailed descriptions of the environmental conditions are given in clauses 4 and 5 of ETS 300 019-1-6 [1].

ETS 300 019-2-0 [3] forms a general overview of part 2 of the present multipart standard.

The equipment under test is assumed to be in its operational state throughout the test conditions described in this part unless otherwise stated. The required performance before, during and after the test needs to be specified in the product specification. Input and load conditions of the equipment shall be chosen to obtain full utilization of the equipment under test. The heat dissipation shall be maximized, except for the steady state, low temperature test, where it shall be minimized.

## 3.1 Specification T 6.1: Totally weatherprotected locations

This specification applies to a totally weatherprotected use in ships excluding Warm Damp and Warm Damp Equable climates, see tables 1 and 4.

Table 1: Test specification T 6.1: Totally weatherprotected locations - climatic tests

	Environmental	parameter	Environmental Class 6.1			est specification T6.1 therprotected location

#### 4 Notes to tables

#### 4.1 General Note

The present document applies the use of stationary equipment in ship environment covering the environmental conditions stated in ETS 300 019-1-6 [1]. The notes have been added to explain the main reasons for recommended tests or to explain why no test has been recommended even if there is a characteristic severity given.

The equipment should be in its operational state throughout the test conditions described in the present document unless otherwise stated.

#### 4.2 Notes to tables 1 to 5

NOTE 1: (Air temperature, low).

The characteristic severity can be used as a cold start-up temperature, but it may be modified by the product specification. The equipment under test shall remain operational throughout this test, except for the cold start-up test which shall commence once low temperature stability is achieved.

NOTE 2: (Air temperature, high).

If two temperatures are given, the higher test temperature includes heat trap effect of direct solar radiation on equipment. The equipment under test shall remain operational throughout this test, except for the start-up at high temperature, which shall commence once high temperature stability is achieved.

NOTE 3: (Air temperature, change, gradual).

IEC 60068-2-14 [2] Test Nb has been chosen with characteristic severity. The equipment function shall be monitored throughout the test.

NOTE 4: (Air temperature, change, air/water).

This condition is included in the test IEC 60068-2-14 [2] Test Nb.

NOTE 5: (Air temperature, surface, high).

There is no suitable IEC 60068-2 [2] test method for this parameter. This phenomenon should be taken into account when selecting materials.

NOTE 6: There is no suitable test method for this parameter in IEC 60068-2 [2].

NOTE 7: (Humidity, relative, high, slow temperature change).

These severities are the nearest preferred values in IEC 60068-2-56 [2] Test Cb. The minor differences both in temperature and in humidity conditions are considered to be insignificant.

NOTE 8: (Humidity, relative, high, rapid temperature change).

Rapid temperature change is a relevant parameter and therefore equipment should be designed with this requirement in mind. The wetting effect is included in IEC 60068-2-30 [2] Test Db.

NOTE 9: (Humidity, absolute, rapid temperature change).

For rapid change of temperature IEC 60068-2-30 [2] Test Db, Variant 2 is recommended.

NOTE 10: (Water, temperature, low).

The cooling effect of the low temperature of the rain is included in IEC 60068-2-14 [2] Test Nb.

NOTE 11:(Water, rain).

IEC 60068-2-18 [2] Test Rb method 1.2 has been chosen even though it does not imitate normal rain. It is a simple hand held shower test, which is easy to perform and can demonstrate that the specimen design is adequately toleranced to survive this condition.

NOTE 12:(Water, other sources).

The effect of water is covered by IEC 60068-2-18 [2] Test Rb. This test does not demonstrate the mechanical shock caused by water waves. In IEC 60068-2 [2] series there is no a suitable test for this, but the effect has to be considered in the design of equipment. The corrosion effect of sea water should be considered when choosing materials and components. In particular, IEC 60068-2-52 [2] Test: Kb severity 1 is recommended.

NOTE 13:(Water, wetness).

If the equipment is in contact with wet surfaces the corrosion and degeneration effect has to be considered.

NOTE 14:(Radiation, solar, heat).

The effect of direct sun radiation is included in the higher test value in IEC 60068-2-2 [2] Test Bb/Bd as described in note 2. Photochemical tests can be made separately for components and materials.

NOTE 15:(Chemically active substances).

The characteristic severities are maximum values. For chemically active substances the characteristics severities should be considered when choosing components and materials. No test is recommended in the present document.

NOTE 16: (Mechanically active substances).

The characteristic seventies are much lower than lowest severity in IEC 60068-2-68 [2] Test Lb and therefore no test is recommended. This condition should be considered when designing the equipment and when choosing components and materials.

NOTE 17:(Flora, fauna).

The characteristic severities should be considered when choosing components and materials.

NOTE 18:(Vibration, sinusoidal).

Test severity covers all types of vessels in any conditions.

The severities are given as peak values. Test severity values not specified in IEC 60068-2 [2]. The test severity is the same as the characteristic severity. In class 6M4 the maximum test frequency has been reduced because between 150 Hz and 200 Hz the contribution is insignificant. Equipment under test shall be mounted in the "in-use" position. The equipment function shall be monitored throughout the test.

A 30 minutes endurance test shall be carried out at any significant resonant frequencies.

NOTE 19:(Vibration, sinusoidal).

Test severity covers larger types of ship which do not navigate in ice.

The severities are given as peak values. Test severity values not specified in IEC 60068-2 [2]. The test severity is lower than the characteristic severity, which is considered to be too severe for this class. The maximum test frequency has been reduced because between 80 Hz and 200 Hz the contribution is insignificant. Equipment under test shall be mounted in the "in-use" position. The equipment function shall be monitored throughout the test.

A 30 minutes endurance test shall be carried out at any significant resonant frequencies.

NOTE 20: (Vibration, random).

ASD (Acceleration Spectral Density) random vibration testing method may be used instead of the sinusoidal vibration test. The test severity values are not specified in IEC 60068-2 [2]. The maximum test frequency has been reduced because between 150 Hz and 200 Hz the contribution is insignificant.

	IEC class 6M4
Acceleration RMS	36,4 m/s <sup>2</sup>
(for information only)	·

Equipment under test shall be mounted in the "in-use" position. The equipment function shall be monitored throughout the test.

#### NOTE 21:(Shocks).

Shock to a hull is most likely to be perceived by the equipment as bump. A shock test is specified for equipment  $\geq 100$  kg as this is the most practical test.

The severities are given as peak values. Equipment under test shall be mounted in the "in-use" position. The equipment function shall be monitored throughout the test.

If the normal attitude is specified then the number of directions is reduced to 3.
