Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in SR 000 314: "Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (http://www.etsi.org/ipr).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This European Standard (Telecommunications series) has been produced by ETSI Technical Committee Signalling Protocols and Switching (SPS).

The present document is part 3 of a multi-part EN covering the Digital Subscriber Signalling System No. one (DSS1) protocol specification for the Integrated Services Digital Network (ISDN) telephony 7 kHz, videotelephony, audiographic conference and videoconference teleservices, as described below:

Part 1: "Protocol specification";

Part 2: "Protocol Implementation Conformance Statement (PICS) proforma specification";

Part 3: "Test Suite Structure and Test Purposes (TSS&TP) specification for the user";

Part 4: "Abstract Test Suite (ATS) and partial Protocol Implementation eXtra Information for Testing (PIXIT) proforma specification for the user";

Part 5: "Test Suite Structure and Test Purposes (TSS&TP) specification for the network";

Part 6: "Abstract Test Suite (ATS) and partial Protocol Implementation eXtra Information for Testing (PIXIT)

proforma specification for the network".

National transposition dates		
Date of adoption of this EN:	27 August 1999	
Date of latest announcement of this EN (doa):	30 November 1999	
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	31 May 2000	
Date of withdrawal of any conflicting National Standard (dow):	31 May 2000	

Introduction

The present document is divided into seven clauses. Clauses 1 to 3 form the scope, references and abbreviations. Clause 4 contains the test suite structure. Clause 5 contains the complete list of test purposes. Clause 6 contains the list of combined test purposes, i.e. test purposes which can be tested together in one test case. Clause 7 contains the requirements for a generic or abstract test suite to comply with the present document.

It is been assumed that the Implementation Under Test (IUT) already complies with the conformance requirements associated with the ISDN basic call as defined in EN 300 403-1 [2]. This is specified as a requirement in EN 300 267-2 [6], clause 5. EN 300 267-1 [5], subclause 5.1, states that the additional generic requirements of clause 5 are defined to be compatible with the existing requirements of EN 300 403-1 [2].

The following approach is adopted with regard to specifying test purposes:

- resultant states of the IUT are not checked following receipt of messages which comply with EN 300 403-1 [2]. Resultant states of the IUT are checked following receipt of messages which do not comply with EN 300 403-1 [2], e.g. a CONNECT message which contains a Bearer capability information element.

In cases where EN 300 267-1 [5] specifies that requirements in EN 300 403-1 [2] shall apply, it is assumed that, because the IUT already complies with EN 300 403-1 [2], it also complies with these requirements. However, when specifying the abstract test cases, including test case selection, the requirements in EN 300 403-1 [2] need to be taken into account.

1 Scope

The present document is applicable to the stage three of the telephony 7 kHz, videotelephony, audiographic conference and videoconference teleservices for the pan-European Integrated Services Digital Network (ISDN) as provided by European public telecommunications operators at the T reference point or coincident S and T reference point (as specified in ITU-T Recommendation I.411 [11] by means of the Digital Subscriber Signalling System No. one (DSS1) protocol. EN 300 267-1 [5] provides the protocol specification and EN 300 267-2 [6] the Protocol Implementation Conformance Statement (PICS) proforma specification. Stage three identifies the protocol procedures and switching functions needed to support a telecommunications service (see ITU-T Recommendation I.130 [10]).

The present document provides the Test Suite Structure and Test Purposes (TSS&TP) for the user side. It covers the protocol requirements as defined in EN 300 267-1 [5] and provides test purposes for the additional generic requirements for basic telecommunication services not defined in EN 300 403-1 [2] (EN 300 267-1 [5], clause 5), for the telephony 7 kHz teleservice (EN 300 267-1 [5], clause 6), for the videotelephony teleservice (EN 300 267-1 [5], clause 7), for the audiographic conference teleservice (EN 300 267-1 [5], clause 8) and for the videoconference teleservice (EN 300 267-1 [5], clause 9).

Two types of implementations are covered:

- an implementation which supports user requirements at the coincident S and T reference point;
- an implementation which supports user requirements for interworking with private ISDNs at the T reference point.

2 References

The following documents contain provisions which, through reference in this text, constitute provisions of the present document.

- References are either specific (identified by date of publication, edition number, version number, etc.) or non-specific.
- For a specific reference, subsequent revisions do not apply.
- For a non-specific reference, the latest version applies.
- A non-specific reference to an ETS shall also be taken to refer to later versions published as an EN with the same number.

3 Definitions and abbreviations

3.1 Definitions

For the purposes of the present document, the following terms and definitions apply, in addition to those given in EN 300 267-1 [5].

BC = **speech:** Bearer Capability information element with its information transfer capability field set to "speech" and its user information layer one protocol field set to "ITU-T Recommendation G.711 [9] A-law".

BC = **UDI/TA**: Bearer Capability information element with its information transfer capability field set to "UDI/TA" and its user information layer one protocol field set to "ITU-T Recommendations H.221 [15] and H.242 [16]".

BC = **UDI**: Bearer Capability information element with its information transfer capability field set to "UDI" and its user information layer one protocol field set to "ITU-T Recommendations H.221 [15] and H.242 [16]".

bit-rate allocation signal: bit position within the frame structure to transmit commands, control and indication signals, capabilities.

HLC = **telephony:** High Layer Compatibility information element with its high layer characteristics identification field set to "telephony".

HLC = videotelephony_ic: High Layer Compatibility information element with its high layer characteristics identification field set to "110 0000 - videotelephony (ITU-T Recommendations F.720 [17] and F.721 [18])" and its extended audiovisual characteristics identification field set to "000 0001 - capability set of initial channel of ITU-T Recommendation H.221 [15]".

- **HLC** = **videotelephony_nex**: High Layer Compatibility information element with its high layer characteristics identification field set to "110 0000 videotelephony (ITU-T Recommendations F.720 [17] and F.721 [18])" but not containing an extended audiovisual characteristics identification field.
- **HLC = videotelephony_sc:** High Layer Compatibility information element with its high layer characteristics identification field set to "110 0000 videotelephony (ITU-T Recommendations F.720 [17] and F.721 [18])" and its extended audiovisual characteristics identification field set to "000 0010 capability set of subsequent channel of ITU-T Recommendation H.221 [15]".
- **HLC** = audiographic_ic: High Layer Compatibility information element with its high layer characteristics identification field set to "110 0010 audiographic conferencing (ITU-T Recommendations F.720 [17] and F.721 [18])" and its extended audiovisual characteristics identification field set to "000 0001 capability set of initial channel of Recommendation H.221 [15]".
- **HLC** = audiographic_nex: High Layer Compatibility information element with its high layer characteristics identification field set to "110 0010 audiographic conferencing (ITU-T Recommendations F.720 [17] and F.721 [18])" but not containing an extended audiovisual characteristics identification field.
- **HLC** = audiographic_sc: High Layer Compatibility information element with its high layer characteristics identification field set to "110 0010 audiographic conferencing (ITU-TRecommendations F.720 [17] and F.721 [18])" and its extended audiovisual characteristics identification field set to "000 0010 capability set of subsequent channel of ITU-T Recommendation H.221 [15]".
- **HLC** = **videoconf_ic:** High Layer Compatibility information element with its high layer characteristics identification field set to "110 0001 videoconferencing (ITU-T Recommendations F.720 [17] and F.721 [18])" and its extended audiovisual characteristics identification field set to "000 0001 capability set of initial channel of ITU-T Recommendation H.221 [15]".
- **HLC** = **videoconf_nex:** High Layer Compatibility information element with its high layer characteristics identification field set to "110 0001 videoconferencing (ITU-T Recommendations F.720 [17] and F.721 [18])" but not containing an extended audiovisual characteristics identification field.
- **HLC** = videoconf_sc: High Layer Compatibility information element with its high layer characteristics identification field set to "110 0001 videoconferencing (ITU-T Recommendations F.720 [17] and F.721 [18])" and its extended audiovisual characteristics identification field set to "000 0010 capability set of subsequent channel of ITU-T Recommendation H.221 [15]".
- **Implementation Under Test (IUT):** component of the system under test (user terminal or private ISDN) providing the protocol specified in EN 300 267-1 [5] at the S/T or T reference point.
- in-band signalling: signalling via the bit-rate allocation signal of the frame structure, as defined in ETS 300 144 [3].
- **mode 0F:** transmission mode in which the initial channel contains framing, and 7-bit ITU-T Recommendation G.711 [9] audio signal is being transmitted.
- **mode 0U:** transmission mode in which the initial channel does not contain framing, and 8-bit ITU-T Recommendation G.711 [9] audio signal is being transmitted.
- **PI** = #1: Progress Indicator information element, with its progress description field set to #1 "Call is not end-to-end ISDN".
- **PI** = #2: Progress Indicator information element, with its progress description field set to #2 "Destination address is non-ISDN".
- **PI** = #4: Progress Indicator information element, with its progress description field set to #4 "Call has returned to the ISDN".
- **PI** = #5: Progress Indicator information element, with its progress description field set to #5 "interworking has occurred and has resulted in a telecommunications service change".
- **PI** = #8: Progress Indicator information element, with its progress description field set to #8 "In-band information or appropriate pattern now available".

telephony 7 **kHz fallback allowed SETUP message:** SETUP message containing two BCs, with the first BC = speech and the second BC = UDI/TA, a HLC = telephony, and not containing a LLC.

telephony 7 kHz fallback not allowed SETUP message: SETUP message containing a single BC = UDI/TA and a single HLC = telephony, and not containing a LLC.

videotelephony fallback allowed SETUP message: SETUP message containing two BCs, with the first BC = speech and the second BC = UDI/TA, and two HLCs, with the first HLC = telephony and the second HLC = videotelephony_ic, and not containing a LLC.

videotelephony fallback not allowed SETUP message: SETUP message containing a single BC = UDI/TA and a single HLC = videotelephony ic, and not containing a LLC.

videotelephony SETUP message for CR2: SETUP message containing a single BC = UDI and a single HLC = videotelephony_sc. The SETUP message is used to establish the second connection in a videotelephony call requiring two connections.

audiographic conference fallback allowed SETUP message: SETUP message containing two BCs, with the first BC = speech and the second BC = UDI/TA, and two HLCs, with the first HLC = telephony and the second HLC = audiographic ic, and not containing a LLC.

audiographic conference fallback not allowed SETUP message: SETUP message containing a single BC = UDI/TA and a single HLC = audiographic ic, and not containing a LLC.

audiographic conference SETUP message for CR2: SETUP message containing a single BC = UDI and a single HLC = audiographic_sc. The SETUP message is used to establish the second connection in an audiographic conference call requiring two connections.

videoconference fallback allowed SETUP message: SETUP message containing two BCs, with the first BC = speech and the second BC = UDI/TA, and two HLCs, with the first HLC = telephony and the second HLC = videoconf_ic, and not containing a LLC.

videoconference fallback not allowed SETUP message: SETUP message containing a single BC = UDI/TA and a single HLC = videoconf_ic, and not containing a LLC.

videoconference SETUP message for CR2: SETUP message containing a single BC = UDI and a single HLC = videoconf_sc. The SETUP message is used to establish the second connection in a videoconference call requiring two connections.

3.2 Abbreviations

For the purposes of the present document, the following abbreviations apply:

ATS	Abstract Test Suite
BC	Bearer Capability information element
CR1	Call Reference for the first call
CR2	Call Reference for the second call
DSS1	Digital Subscriber Signalling System No. one
HLC	High Layer Compatibility information element
ISDN	Integrated Services Digital Network
IUT	Implementation Under Test
LLC	Low Layer Compatibility information element
PI	Progress Indicator information element
PICS	Protocol Implementation Conformance Statement
PIXIT	Protocol Implementation eXtra Information for Testing
TP	Test Purpose
TSS	Test Suite Structure
UDI	Unrestricted Digital Information
UDI/TA	Unrestricted Digital Information with Tones/Announcements

For TSS specific abbreviations, see clause 4.

4 Test Suite Structure (TSS)

The test suite is structured as a tree. Six test group levels are defined. The TSS is depicted in figure 1.

4.1 First test group level

The first test group level contains the name of the test suite:

- UT7VAC User side telephony 7 kHz, videotelephony teleservices, audiographic conference, videoconference and generic protocol.

4.2 Second test group level

The second test group level indicates whether the test purpose covers a requirement applicable to the generic protocol, the telephony 7 kHz protocol, the videotelephony protocol, the audiographic conference protocol or the videoconference protocol:

- GEN Generic requirements. The test purpose covers a requirement applicable for the generic part of EN 300 267-1 [5] (clause 5);
- TL7 Telephony 7 kHz teleservice. The test purpose covers a requirement applicable for the telephony 7 kHz part of EN 300 267-1 [5] (clause 6);
- VTL Videotelephony teleservice. The test purpose covers a requirement applicable for the videotelephony part of EN 300 267-1 [5] (clause 7);
- AGC Audiographic conference teleservice. The test purpose covers a requirement applicable for the audiographic conference part of EN 300 267-1 [5] (clause 8);
- VCF Videoconference teleservice. The test purpose covers a requirement applicable for the audiographic conference part of EN 300 267-1 [5] (clause 9).

The group for generic requirements does not appear in the TSS of the combined test purposes. None of the generic test purposes can be considered as testable.

4.3 Third test group level

The third test group level indicates whether the IUT is the calling or the called terminal:

- ORIG Calling User Interface;
- DEST Called User Interface.

4.4 Fourth test group level

The fourth test group level indicates whether the test purpose covers a requirement applicable to valid behaviour, to invalid behaviour or to inopportune behaviour:

- BV Valid behaviour test purpose;
- BO inOpportune Behaviour test purpose.

4.5 Fifth test group level

The fifth test group level indicates which kind of functionality is tested and, more precisely, whether the test purposes cover requirements applicable to fallback allowed, fallback not allowed or connection management. Three groups are defined:

- FBA FallBack Allowed: this group covers all tests where a fallback allowed SETUP message is sent to the IUT;
- FBN FallBack Not allowed: this group covers all tests where a fallback not allowed SETUP message is sent to the IUT;
- CMN Connection MaNagement: this group includes all other cases which do not test the response to or the sending of a fallback allowed or a fallback not allowed SETUP message. As a consequence, the clearing of a call and the establishment of a second connection for videotelephony is tested here.

4.6 Sixth test group level

The sixth test group level indicates the type of implementation to which the test purpose applies:

- ST An implementation which supports user requirements at the coincident S and T reference point;
- PT An implementation which supports user requirements for interworking with private ISDNs at the T reference point;
- ST_T An implementation which supports user requirements at the coincident S and T reference point or user requirements for interworking with private ISDNs at the T reference point.

This level group does not appear when only ST T is included as a subgroup.

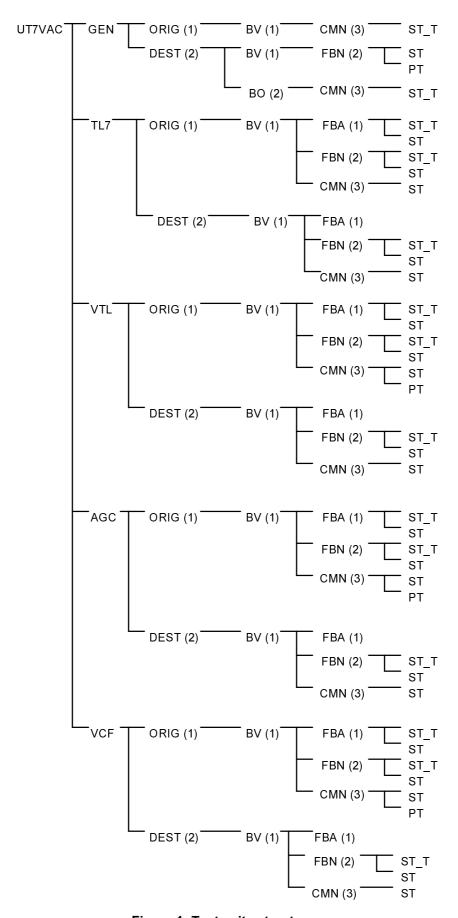

Figure 1: Test suite structure

5 Test purposes

5.1 Test purpose format

The structure of a test purpose identifier is defined in table 1.

Table 1: TP identifier naming convention

<requirement><nnn>_<nn></nn></nnn></requirement>			
<requirement></requirement>	GTP TTP VTP ATP CTP	generic protocol requirement telephony 7 kHz requirement videotelephony requirement audiographic conference requirement videoconference requirement	
<nnn></nnn>	1 st digit 2 nd digit 3 rd digit	1 Originating Interface; 2 Destination Interface1 Valid; 2 Inopportune1 Fallback Allowed; 2 Fallback Not Allowed; 3Connection Management	
<nn></nn>	2 digits	sequential test case number	

The test purposes are formatted as tables to increase readability. The table format is shown in table 2. Text in **bold** shows the text which is always present, normal text provides an explanation for each field.

Table 2: Structure of a single TP

Test purpose identifier	Reference to EN 300 267-1 [5]:	Other relevant reference:	
TSS reference	TSS reference The full test suite structure reference.		
Selection criteria	Selection criteria The criteria necessary in order to select the test. Unless otherwise specified, reference		
	are to EN 300 267-2 [6].		
Test purpose	Description of the test purpose.		
Cross reference	GTP/TTP/VTP/ATP/CTP cross reference data.		
Comments	Any relevant comments.		

The "Other relevant reference" field, where applicable, contains a reference to a specification document containing the whole, or part, of the requirement to be tested by the test purpose.

The "Selection criteria" field consists of a Boolean expression incorporating items from EN 300 267-2 [6] (in which case items are not prefixed by a reference number) and from EN 300 403-3 [8].

Some of the telephony 7 kHz, videotelephony, audiographic conference or videoconference test purposes are directly related, but not identical, to generic ones. Where such a relationship exists, the reference to the related generic test purpose is specified in the "Cross reference" field of the telephony 7 kHz, videotelephony, audiographic conference or videoconference test purpose. Generic test purposes test generic protocol requirements which define procedures that are additional to basic call requirements and also requirements which correspond to no particular IUT, but when parameterized with real values for bearer capability etc. give a test for a specific service.

5.2 Generic requirements

5.2.1 Calling user interface

5.2.1.1 Valid behaviour

5.2.1.1.1 Connection management

5.2.1.1.1.1 User requirements at the coincident S and T reference point or for interworking with private ISDNs

6 Combined test purposes

Combined test purposes are used to enable the number of abstract test cases to be reduced by bringing together test purposes which are similar in their objective and which use the same preambles and PDUs. Even though some test purposes in the combined test purposes clause consist of only one test purpose, these still have a combined test purpose name associated with them to allow a one-to-one mapping between the test purposes and the corresponding test cases in the abstract test suite. Therefore, this clause contains the complete set of test purposes excluding the Generic ones.

6.1 Combined test purpose format

The structure of a combined test purpose identifier is defined in table 3. The digits correspond to the digits of the first TP included in the combined test purpose.

Table 3: Combined TP identifier naming convention scheme

CT <digit><digit>_<digit><digit></digit></digit></digit></digit>	combined TP covering a telephony 7 kHz requirement.
CV <digit><digit><digit><digit></digit></digit></digit></digit>	combined TP covering a videotelephony requirement.
CA <digit><digit><digit><digit></digit></digit></digit></digit>	combined TP covering an audiographic conference requirement.
CC <digit><digit><digit>_<digit><digit></digit></digit></digit></digit></digit>	combined TP covering an videoconference requirement.

The combined test purposes are formatted as tables to increase readability. The table format is shown in table 4. Text in **bold** shows the text which is always present, normal text provides an explanation for each field.

7 Compliance

A generic or abstract test suite complying with this TSS&TP specification shall:

- consist of a set of test cases corresponding to the set or to a subset of the TPs specified in clauses 5 and 6;
- use a TSS which is an appropriate subset of the whole of the TSS specified in clause 4;
- use the same naming conventions for the test groups and test cases;
- maintain the relationship, specified in clauses 5 and 6, between the TPs and the entries in the PICS proforma, specified in EN 300 267-2 [6], to be used for test case selection;
- comply with ISO/IEC 9646-2 [12] and ISO/IEC 9646-3 [13].

Annex A (informative):

Cross reference: Generic, telephony 7 kHz, video telephony, audiographic conference and videoconference teleservices test purposes

A.1 Generic test purposes to telephony 7 kHz, videotelephony, audiographic conference and videoconference teleservices test purposes

Table A.1 lists all the generic test purposes. Each row shows the telephony 7 kHz, videotelephony, audiographic conference and videoconference teleservices test purpose(s) to which the indicated generic test purpose is related.

Table A.1

Generic TP	Telephony 7 kHz TP	Videotelephony TP	Audiographic conference TP	Videoconference TP
GTP113_01				
GTP113_02		VTP113_01	ATP113_01, ATP113_06	CTP113_01, CTP113_06
GTP212_01				
GTP212_02				
GTP233_01	_	-	_	
NOTE: The initial states specified for these test purposes are different to those in the related generic ones.				

A.2 Telephony 7 kHz to videotelephony, audiographic conference and videoconference teleservices test purposes

Table A.2 lists all the telephony 7 kHz, videotelephony, audiographic conference and videoconference teleservices test purposes. Equivalent test purposes are listed on the same row: in some cases a telephony 7 kHz test purpose is equivalent to more than one videotelephony test purpose. The telephony 7 kHz group is a subset of the videotelephony group, with each telephony 7 kHz test purpose being a modified version of the equivalent videotelephony one(s) (e.g. compare TTP111_02 with VTP111_02).
