Intellectual Property Rights

IPRs essential or potentially essential to the present document may have been declared to ETSI. The information pertaining to these essential IPRs, if any, is publicly available for **ETSI members and non-members**, and can be found in ETSI SR 000 314: "*Intellectual Property Rights (IPRs); Essential, or potentially Essential, IPRs notified to ETSI in respect of ETSI standards*", which is available from the ETSI Secretariat. Latest updates are available on the ETSI Web server (<https://ipr.etsi.org>).

Pursuant to the ETSI IPR Policy, no investigation, including IPR searches, has been carried out by ETSI. No guarantee can be given as to the existence of other IPRs not referenced in SR 000 314 (or the updates on the ETSI Web server) which are, or may be, or may become, essential to the present document.

Foreword

This draft Harmonised European Standard (EN) has been produced by ETSI Technical Committee Satellite Earth Stations and Systems (SES), and is now submitted for the combined Public Enquiry and Vote phase of the ETSI standards EN Approval Procedure.

The present document has been prepared under the Commission's standardisation request C(2015) 5376 final [i.2] to provide one voluntary means of conforming to the essential requirements of Directive 2014/53/EU on the harmonisation of the laws of the Member States relating to the making available on the market of radio equipment and repealing Directive 1999/5/EC [6].

Once the present document is cited in the Official Journal of the European Union under that Directive, compliance with the normative clauses of the present document given in table A.1 confers, within the limits of the scope of the present document, a presumption of conformity with the corresponding essential requirements of that Directive, and associated EFTA regulations.

Proposed national transposition dates	
Date of latest announcement of this EN (doa):	3 months after ETSI publication
Date of latest publication of new National Standard or endorsement of this EN (dop/e):	6 months after doa
Date of withdrawal of any conflicting National Standard (dow):	18 months after doa

Modal verbs terminology

In the present document "**shall**", "**shall not**", "**should**", "**should not**", "**may**", "**need not**", "**will**", "**will not**", "**can**" and "**cannot**" are to be interpreted as described in clause 3.2 of the [ETSI Drafting Rules](#) (Verbal forms for the expression of provisions).

"**must**" and "**must not**" are **NOT** allowed in ETSI deliverables except when used in direct citation.

Introduction

The present document is part of a set of standards developed by ETSI and is designed to fit in a modular structure to cover all radio equipment within the scope of the Directive 2014/53/EU [6]. The modular structure is shown in ETSI EG 201 399 [i.1].

The present document is based on ETSI TBR 030 [5].

The determination of the parameters of the user earth stations using a given geo-stationary satellite for the protection of the spectrum allocated to that satellite, is considered to be under the responsibility of the satellite operator or the satellite network operators. For this reason the requirement on the cross polarization discrimination which was in ETSI TBR 30 [5] has not been copied in the present document and intermodulation limits inside the transmit frequency band(s) are to be determined by system design and are subject to satellite operator specifications.

The requirements have been selected to ensure an adequate level of compatibility with other radio services. The levels, however, do not cover extreme cases which may occur in any location but with a low probability of occurrence.

The present document may not cover those cases where a potential source of interference which is producing individually repeated transient phenomena or a continuous phenomenon is present, e.g. a radar or broadcast site in the near vicinity. In such a case it may be necessary to use special protection applied to either the source of interference, or the interfered part or both.

The present document does not contain any requirement, recommendation or information about the installation of the SNG TESSs.

1 Scope

The present document applies to Satellite News Gathering (SNG) Transportable Earth Stations (TESs) which have the following characteristics:

- the SNG TESs are designed for Satellite News Gathering (SNG) which can be either an unforeseen or pre-planned activity;
- SNG TES is capable of transmitting television signals and associated audio or programme audio only towards a satellite positioned on the geostationary orbit. The modulation method may be either analogue or digital. Such transmissions are point-to-point or point-to-multipoint but not for general broadcast reception;
- the SNG TESs are designed for relocation at any time to a different fixed operating location but are not intended to operate during the relocation period. The SNG TESs can be either vehicle mounted or packed for transportation. The SNG TESs considered in the present document are those designed to operate whilst stationary;
- the SNG TESs are operating in the following bands allocated to the Fixed Satellite Services (FSS):
 - 10,70 GHz to 11,70 GHz (space-to-earth, shared);
 - 12,50 GHz to 12,75 GHz (space-to-earth, exclusive);
 - 12,75 GHz to 13,25 GHz (earth-to-space, shared);
 - 13,75 GHz to 14,25 GHz (earth-to-space, exclusive);
 - 14,25 GHz to 14,50 GHz (earth-to-space, shared).
- frequencies could be selected from through the entire frequency range or be restricted to a range completely enclosed within those bands. These bands are partly shared between FSS and Fixed Service (FS);
- at present the ITU Radio Regulations [3] restrict the use of the 13,75 GHz to 14,00 GHz band to earth stations having an antenna diameter of 4,5 m or greater and having a transmitting EIRP between 68 dBW and 85 dBW;
- the SNG TESs use linear polarization;
- the SNG TESs operate through a geostationary satellite at least 3° away from any other geostationary satellite operating in the same frequency band and covering the same area;
- the SNG TES antenna diameter does not exceed 5 m, or equivalent corresponding aperture;
- the SNG TESs are designed for attended operation.

The present document applies to the SNG TES with its ancillary equipment and its various terrestrial ports, and when operated within the boundary limits of the operational environmental profile declared by the applicant.

The present document is intended to cover the provisions of Directive 2014/53/EU [6] (RE Directive) Article 3.2, which states that "... *radio equipment shall be so constructed that it both effectively uses and supports the efficient use of radio spectrum in order to avoid harmful interference.*"

In addition to the present document, other ENs that specify technical requirements in respect of essential requirements under other parts of Article 3 of the Directive 2014/53/EU [6]) may apply to equipment within the scope of the present document.

NOTE: A list of such ENs is included on the ETSI web site.

2 References

2.1 Normative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

Referenced documents which are not found to be publicly available in the expected location might be found at <http://docbox.etsi.org/Reference>.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are necessary for the application of the present document.

- [1] Void.
- [2] CISPR 16-1 (all parts) (2015): "Specification for radio disturbance and immunity measuring apparatus and methods - Part 1: Radio disturbance and immunity measuring apparatus" (annex G: Validation of the open area test site for the frequency range of 30 MHz to 1 000 MHz).
- [3] ITU Radio Regulations (2012).
- [4] Void.
- [5] ETSI TBR 030 (Edition 1) (12-1997): "Satellite Earth Stations and Systems (SES); Satellite News Gathering (SNG) Transportable Earth Stations (TES) operating in the 11-12/13-14 GHz frequency bands".
- [6] Directive 2014/53/EU of the European Parliament and of the Council of 16 April 2014 on the harmonisation of the laws of the Member States relating to the making available on the market of radio equipment and repealing Directive 1999/5/EC (RE Directive).

2.2 Informative references

References are either specific (identified by date of publication and/or edition number or version number) or non-specific. For specific references, only the cited version applies. For non-specific references, the latest version of the referenced document (including any amendments) applies.

NOTE: While any hyperlinks included in this clause were valid at the time of publication, ETSI cannot guarantee their long term validity.

The following referenced documents are not necessary for the application of the present document but they assist the user with regard to a particular subject area.

- [i.1] ETSI EG 201 399: "Electromagnetic compatibility and Radio spectrum Matters (ERM); A guide to the production of Harmonized Standards for application under the Radio & Telecommunication Terminal Equipment Directive 1999/5/EC (R&TTE) and a first guide on the impact of the Radio Equipment Directive 2014/53/EU (RED) on Harmonized Standards".
- [i.2] Commission Implementing Decision C(2015) 5376 final of 4.8.2015 on a standardisation request to the European Committee for Electrotechnical Standardisation and to the European Telecommunications Standards Institute as regards radio equipment in support of Directive 2014/53/EU of the European Parliament and of the Council.

3 Definitions, symbols and abbreviations

3.1 Definitions

For the purpose of the present document, the terms and definitions given in the Directive 2014/53/EU [6] and the following apply.

applicant: manufacturer or its authorized representative within the European Community or the person responsible for placing the apparatus on the market

carrier-off state: that state where the SNG TES is electrically powered and is not transmitting a signal

NOTE: A SNG TES is considered to be in the carrier-off state when one of the following conditions is satisfied:

- the High Power Amplifier (HPA) is in standby mode;
- the transmit subsystem is not switched to the antenna.

carrier-on state: that state where the SNG TES is transmitting a signal

environmental profile: range of environmental conditions under which equipment within the scope of the present document is required to comply with the provisions of the present document

exclusion band: exclusion band is centred on the transmit frequency and is equal to 5 times the occupied bandwidth

occupied Bandwidth (B_o): for a digital modulation scheme the width of the signal spectrum 10 dB below the maximum inband density

NOTE: For an analogue modulation scheme the occupied bandwidth (B_o) is defined as follows:

$$B_o = \Delta F_{pp} + 2f_m$$

where:

ΔF_{pp} = peak-to-peak frequency deviation of the TV-carrier for a 1 V peak-to-peak test tone at the pre-emphasis network cross-over frequency in Hz; and

f_m = top video baseband frequency (e.g. 5 MHz).

nominal antenna diameter: antenna diameter declared by the manufacturer that is a parameter in performance characteristics and that allows reference to a certain performance

NOTE: An antenna with circular aperture of diameter equal to the nominal diameter does typically have the performance specified.

Network operators might request antennas of a certain diameter. Then an antenna that is compliant with the requirement for nominal antenna diameter equal to the requested antenna diameter can be used. Manufacturers can mark their equipment with antenna diameters used in the requirements during compliance test.

Satellite News Gathering Transportable Earth Station (SNG TES): equipment capable of transmitting television signals and associated audio or programme audio only towards a satellite positioned on the geostationary orbit.

NOTE: The modulation method may be either analogue or digital. Such transmissions are point-to-point or point-to-multipoint but not for general broadcast reception.

The SNG TES usually comprises the main parts, as defined below, and all power, interconnecting and other cables required for proper operation of the equipment as follows:

- a) the antenna subsystem, which converts the incident electromagnetic wave into a guided wave and vice versa and which includes any mounting that may be required;
- b) the transmit subsystem, which is composed of the frequency translation equipment and the high power amplifier;

- c) the receive subsystem, which consists of the low noise amplifier and the frequency translation equipment;
- d) the ground communications subsystem, which consists of modulation and demodulation equipment, either analogue or digital, and associated baseband equipment;
- e) the monitoring and control subsystem which consists of test equipment together with a transmitter identification system if implemented;
- f) the communications subsystem which consists of and a facility for two way communication if implemented;
- g) the power subsystem, which consists of any power generation equipment that may be required;
- h) the transportation subsystem, which consists of either a vehicle for vehicle mounted SNG TES or flight cases for "flyaway" SNG TES.

spurious radiation: any radiation outside the exclusion band

transmit frequency band: One of the following frequency bands, or a part of them, within which the SNG TES is able to transmit its carrier:

- 12,75 GHz to 13,25 GHz;
- 13,75 GHz to 14,50 GHz.

The transmit frequency bands of the SNG TES are declared by the applicant.

NOTE: An SNG TES may be designed for several transmit frequency bands.

3.2 Symbols

For the purpose of the present document, the following symbols apply:

dBsd Ratio expressed in decibels relative to the spectral density

3.3 Abbreviations

For the purpose of the present document, the following abbreviations apply:

BW	Wanted signal occupied bandwidth
EIRP	Equivalent Isotropically Radiated Power
EUT	Equipment Under Test
FS	Fixed Service
FSS	Fixed Satellite Services
HPA	High Power Amplifier
IME	Internally Mounted Equipment
LNA	Low Noise Amplifier
LNB	Low Noise Block
modem	MODulator/DEModulator
R&TTE	Radio and Telecommunications Terminal Equipment
RE	Radio Equipment
RED	Radio Equipment Directive
RF	Radio Frequency
SNG TES	Satellite News Gathering Transportable Earth Station

4 Technical requirement specifications

4.1 Environmental profile

The technical requirements of the present document apply under the environmental profile for operation of the equipment, which shall be declared by the supplier. The equipment shall comply with all the technical requirements of the present document at all times when operating within the boundary limits of the declared operational environmental profile.

4.2 Conformance requirements

4.2.1 Off-axis EIRP emission density within the band(s)

4.2.1.0 General

Off-axis EIRP emission density (co-polar and crosspolar) within the transmit frequency band(s).

4.2.1.1 Justification

Protection of other satellite (uplink) systems.

4.2.1.2 Specification

The maximum EIRP in any 40 kHz band of the co-polarized component in any direction ϕ degrees from the antenna main beam axis shall not exceed the following limits:

$33 - 25 \log \phi$	dBW	where	$2,5^\circ \leq \phi \leq 7,0^\circ$
+12	dBW	where	$7,0^\circ < \phi \leq 9,2^\circ$
$36 - 25 \log \phi$	dBW	where	$9,2^\circ < \phi \leq 48^\circ$
-6	dBW	where	$48,0^\circ < \phi \leq 180^\circ$

Where ϕ is the angle, in degrees, between the main beam axis and the direction considered.

For $\phi > 70^\circ$ the values given above may be increased to 0 dBi over the range of angles for which the particular feed system may give rise to relatively high levels of spillover.

In addition the maximum EIRP in any 40 kHz band of the crosspolarized component in any direction ϕ degrees from the antenna main beam axis shall not exceed the following limits:

$23 - 25 \log \phi$	dBW	where	$2,5^\circ \leq \phi \leq 7,0^\circ$
+2	dBW	where	$7,0^\circ < \phi \leq 9,2^\circ$

Where ϕ is the angle, in degrees, between the main beam axis and the direction considered.

4.2.1.3 Conformance tests

Conformance tests shall be carried out as per clause 6.2.1 with the results being computed in accordance with clause 6.2.2.

4.2.2 Off-axis spurious radiation

4.2.2.1 Justification

To limit the level of interference to terrestrial and satellite radio services.

4.2.2.2 Specification

- 1) The SNG TES shall not exceed the limits for radiated field strength over the frequency range from 30 MHz to 1 000 MHz specified in table 1.

Table 1: Limits of radiated field strength at a test distance of 10 m in a 120 kHz bandwidth

Frequency range (MHz)	Quasi-peak limits (dB μ V/m)
30 to 230	30
230 to 1 000	37

The lower limits shall apply at the transition frequency.

- 2) This specification applies outside the exclusion band.

For the carrier-off state, the off-axis spurious EIRP from the SNG TES, in any 100 kHz band, shall not exceed the limits given in table 2, for all off-axis angles greater than 7°.

Table 2: Limits of spurious EIRP with carrier-off

Frequency range (GHz)	EIRP (dBpW)
1,0 to 10,7	48
10,7 to 21,2	54
21,2 to 40,0	60

The lower limits shall apply at the transition frequencies.

- 3) This specification applies outside the exclusion band.

For the carrier-on state, the off-axis spurious EIRP in any 100 kHz band from the SNG TES, shall not exceed the limits given in table 3, for all off-axis angles greater than 7°.

Table 3: Limits of spurious EIRP with carrier-on

Frequency range (GHz)	EIRP (dBpW)
1,0 - 3,4	49
3,4 - 10,7	55
10,7 - 11,7	61
11,7 - 21,2	78 (see note)
21,2 - 40,0	67
NOTE: This limit may be exceeded in a frequency band which shall not exceed 80 MHz centred on the carrier frequency.	

The lower limits shall apply at the transition frequency.

In the frequency bands from 25,5 GHz to 26,5 GHz and from 27,5 GHz to 29,0 GHz, for any 20 MHz band within which one or more spurious signals exceeding the above limit of 67 dBpW are present, then the power of each of those spurious signals exceeding the limit shall be added in watts and the total shall not exceed 78 dBpW.

For SNG TESs designed to transmit simultaneously several different carriers (multicarrier operation), the above limits apply to each individual carrier when transmitted alone.

4.2.2.3 Conformance tests

Conformance tests shall be carried out in accordance with clause 6.3.

4.2.3 On-axis spurious radiation

4.2.3.1 Justification

To limit the level of interference to satellite radio services.

4.2.3.2 Specification

In the transmit frequency band outside the exclusion band the EIRP spectral density of the spurious radiation shall not exceed 4 dBW in any 4 kHz band.

For SNG TESs designed to transmit simultaneously several different carriers (multicarrier operation), the above limits apply to each individual carrier when transmitted alone.

NOTE 1: The on-axis spurious radiations, outside the transmit frequency band(s), are indirectly limited by clause 4.2.2.2. Consequently no specification is needed.

NOTE 2: Intermodulation limits inside the transmit frequency band(s) are to be determined by system design and are subject to satellite operator specifications.

4.2.3.3 Conformance tests

Conformance tests shall be carried out in accordance with clause 6.4.

4.2.4 Mechanical (antenna pointing)

4.2.4.1 Justification

Protection of signals to and from both the same and adjacent satellites.

4.2.4.2 Specification

a) Pointing stability:

The SNG TES shall not show any sign of distortion and the pointing shall not need adjustment whilst being used in a wind speed which is less than that specified by the applicant at which the antenna shall be stowed.

b) Pointing accuracy capability:

The antenna mount shall allow the position of the antenna transmit main beam axis to be maintained with an accuracy better than the off-axis angle measured when the main beam gain has decreased by 1 dB at any frequency in the equipment operating band, over the full range of azimuth and elevation movement available to the antenna.

c) Polarization angle alignment capability:

The polarization angle shall be continuously adjustable in a range of at least 180°; it shall be possible to fix the transmit antenna polarization angle with an accuracy better than 1°.

d) Polarization alignment stability:

The SNG TES shall not show any sign of distortion and the polarization shall not need realignment whilst being used in a wind speed which is under that specified by the applicant at which the antenna shall be stowed nor from any accidental mechanical action.

4.2.4.3 Conformance tests

Conformance tests shall be carried out in accordance with clause 6.5.

4.2.5 Receive antenna off-axis gain pattern

4.2.5.1 Justification

To protect the wanted signals from interference from terrestrial services and from other satellite services.

4.2.5.2 Specification

The maximum antenna gain of each of the co-polarized components in any direction φ degrees from the antenna main beam axis shall not exceed the following limits:

$$\begin{aligned} G &= 32 - 25 \log \varphi & \text{dBi} & \quad \text{for } \varphi_{min} \leq \varphi < 48^\circ \\ G &= -10 & \text{dBi} & \quad \text{for } 48^\circ \leq \varphi \leq 85^\circ \\ G &= 0 & \text{dBi} & \quad \text{for } 85^\circ \leq \varphi \leq 180^\circ \end{aligned}$$

where:

$$\varphi_{min} = 1^\circ \text{ or } 100 \lambda/D \text{ degrees, whichever is the greater, for } D/\lambda \geq 50.$$

$$\varphi_{min} = 2^\circ \text{ or } 114 (D/\lambda)^{-1.09} \text{ degrees, whichever is the greater, for } D/\lambda < 50.$$

D is the nominal diameter of the antenna.

In addition the maximum antenna gain of each of the cross-polarized components in any direction φ degrees from the antenna main beam axis shall not exceed the following limits:

$$G_x(\varphi) = 23 - 20 \log \varphi \quad \text{dBi} \quad \text{for } \varphi_r \leq \varphi \leq 7^\circ$$

where φ_r is equal to 1° or $100 \lambda/D$, whichever is greater.

4.2.5.3 Conformance tests

Conformance tests shall be carried out in accordance with clause 6.6.

4.2.6 Blocking performance

4.2.6.1 Justification

To prevent high power signals outside the receive frequency band from blocking the reception of signals inside the receive frequency band.

4.2.6.2 Specification

Receiver blocking is characterized here through gain compression for a signal inside the receive frequency band that is caused by another signal outside the receive frequency band at high power. The level of the other signal is compared to the level of a signal inside the receive frequency band that would cause the same gain compression.

Receiver blocking rejection at a particular frequency is defined as the level of a second signal at this frequency that causes a certain gain compression to a first signal inside the receive frequency band, minus the level of a second signal at a frequency inside the receive frequency band that causes the same gain compression.

The first signal shall be at the centre frequency of the receive frequency band and have a level in the operational range. The second signal shall cause a gain compression for the first signal of 1 dB.

The rejection shall comply with table 4.

Table 4: Receiver blocking rejection

Frequency	Minimum rejection
below 9 GHz	20 dB
9 to 10 GHz	10 dB
14 to 16 GHz	10 dB
Above 16 GHz	20 dB
NOTE: In the frequency ranges 10 to 10,7 GHz and 12,75 to 14 GHz, the rejection needs further studies.	

4.2.6.3 Conformance tests

Conformance tests shall be carried out in accordance with clause 6.7.

4.2.7 Adjacent Signal Selectivity

4.2.7.1 Justification

To enable reception of a wanted signal in presence of other signals on adjacent frequencies which are transmitted with high EIRP density from target satellite orbital position.

NOTE: The power level of signals transmitted from the same orbital position are under control of the satellite operator. Signals transmitted from an adjacent orbital position that is not near-by are suppressed by the antenna gain pattern.

4.2.7.2 Specification

Adjacent Signal Selectivity is a measure of a receiver's ability to receive a signal at its assigned channel frequency in the presence of an adjacent signal at a given frequency offset from the centre frequency of the assigned channel. The adjacent signal shall occupy the same bandwidth as the wanted signal. Frequency offset and relative power level of the adjacent signal compared to the wanted signal shall take the value given in table 5. BW is the wanted signal occupied bandwidth.

Table 5: Adjacent signal frequency and Power level

Signal	Centre frequency offset from wanted signal	Power level relative to wanted signal
Adjacent Carrier	BW	7 dBsd

The decrease in the required signal to noise ratio in the presence of an adjacent signal shall be no more than 0,5 dB.

4.2.7.3 Conformance tests

Conformance tests shall be carried out in accordance with clause 6.8.

5 Testing for compliance with technical requirements

5.1 Environmental conditions for testing

Tests defined in the present document shall be carried out at representative points within the boundary limits of the declared operational environmental profile.

5.2 Essential radio test suites

The essential radio test suites for a SNG is given in clause 6.

6 Test methods

6.1 General

The values of measurement uncertainty associated with each measurement parameter apply to all of the test cases described in the present document. The measurement uncertainties shall not exceed the values shown in tables 6 and 7.

Table 6: Measurement uncertainty

Measurement parameter	Uncertainty
Radio frequency	±10 kHz
RF power	±0,75 dB
Conducted spurious	±4 dB
Radiated spurious	±6 dB
Antenna gain	±0,5 dB

Table 7: Measurement uncertainties for antenna gain pattern

Gain relative to the antenna on-axis gain	Uncertainty
> -3 dB	±0,3 dB
-3 dB to -20 dB	±1,0 dB
-20 dB to -30 dB	±2,0 dB
-30 dB to -40 dB	±3,0 dB

For vehicle mounted equipment the EUT, as defined for each test, does not include the transportation subsystem unless agreed between the applicant and test house.

The EUT does not include the control and monitoring and power subsystems unless agreed between the applicant and test house.

The antenna shall never be rotated around its main beam axis.

All tests with carrier-on shall be conducted with maximum transmit power as declared by the applicant.

The modulation shall be by an energy dispersal signal only, as specified by the applicant, in the case of an analogue modulation scheme or by a pseudo random bit sequence in the case of a digital modulation scheme.

All technical characteristics and operational conditions declared by the applicant shall be entered in the test report.

6.2 Off-axis EIRP density within the band

6.2.0 General

Off-axis EIRP emission density (co-polar and crosspolar) within the transmit frequency band(s).

6.2.1 Test method

6.2.1.1 General

Conformance shall be determined from:

- a) measurement of maximum RF power density entering the antenna feed for the different modulation schemes declared by the applicant;
- b) measurement of transmit antenna gain pattern.

To ascertain the off-axis EIRP it is necessary to know the transmit power density and antenna transmit radiation pattern. To ascertain the radiation pattern it is necessary to know the antenna transmit gain.

The following three measurement procedures shall, therefore, be performed:

- a) transmitter output power density (dBW/40 kHz);
- b) antenna transmit gain (dBi);
- c) antenna transmit radiation patterns (dBi).

6.2.1.2 Transmit output power density

6.2.1.2.1 General

For the purpose of the present document, transmitter output power is defined as the maximum power delivered continuously by the transmitting equipment to the antenna flange.

For the purpose of this test the EUT is defined as the SNG TES excluding the antenna from the antenna flange.

6.2.1.2.2 Test site

There are no requirements for the test site to be used for this test.

6.2.1.2.3 Method of measurement

Figure 1: Test arrangement - transmit output power density measurement

- a) The test arrangement shall be as shown in figure 1.
- b) With the carrier being modulated the maximum power supplied to the antenna flange shall be measured in dBW/40 kHz. The coupling factor of the test coupler at the test frequency and the attenuation of any necessary waveguide adapter and any other test equipment (e.g. cable) shall be taken into account. The resolution bandwidth of the spectrum analyser shall be set as close as possible to the specified measuring bandwidth. If the resolution bandwidth is different from the specified bandwidth then bandwidth correction shall be performed.
- c) The measurement shall be performed for each modulation scheme as applicable and for each transmit frequency band at a frequency in the centre of the band, and at a transmit frequency as close to the upper limit of the transmit frequency band as possible regarding the bandwidth of the signal and at a transmit frequency as close to the lower limit of the transmit frequency band as possible regarding the bandwidth of the signal.

6.2.1.3 Antenna transmit gain

6.2.1.3.1 General

For the purpose of the present document, the antenna transmit gain is defined as the ratio, expressed in decibels (dB), of the power that would have to be supplied to the reference antenna, i.e. an isotropic radiator isolated in space, to the power supplied to the antenna being considered, so that they produce the same field strength at the same distance in the same direction. Unless otherwise specified the gain is for the direction of maximum radiation.

For the purpose of this test the EUT is defined as that part of the SNG TES which comprises the antenna and its flange. The antenna includes the reflector(s), feed, support struts and an enclosure of equal weight/distribution to any electrical equipment normally housed with the feed at the antenna focal point.

6.2.1.3.2 Test site

This test shall be performed on either an outdoor far-field test site or compact test range. However, if the near-field scanner technology to convert near-field measurements to far-field results is proven and sufficiently accurate by reference to tests taken in both regions then antenna measurements may be taken in the near field.

Fully automated systems can be used for these tests providing that the results can be proven to be as accurate as if they were done according to the specified method.

6.2.1.3.3 Method of measurement

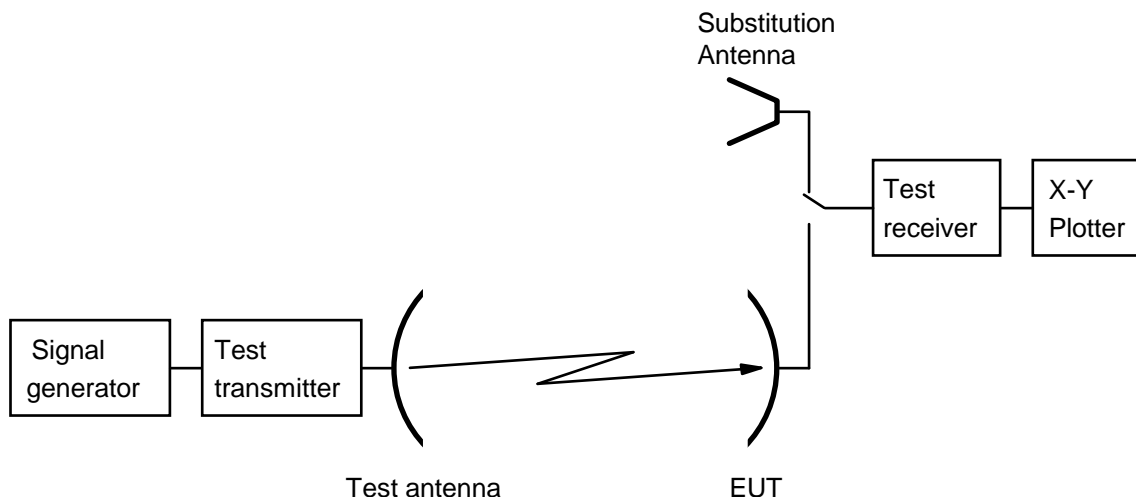

Figure 2: Test arrangement - antenna transmit gain measurement

The following test procedure shall be performed for each transmit frequency band.

- a) The test arrangement shall be as shown in figure 2 with the EUT connected to the test receiver. A signal proportional to the angular position from the servo mechanism shall be applied to the X-axis and the signal level from the test receiver shall be applied to the Y-axis of the plotter.
- b) A test signal at a frequency in the centre of the transmit frequency band shall be transmitted by the test transmitter through the test antenna. The E-plane shall be vertical. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter. The polarizer of the EUT antenna shall be rotated and adjusted such that the E-plane coincides with the E-plane of the test transmitter.
- c) The EUT shall be aligned to maximize the received signal and the X-Y plotter adjusted to give the maximum reading on the chart.
- d) The EUT shall be driven in azimuth in one direction through 10°.
- e) The pattern measurement is then obtained by driving the EUT in azimuth back through boresight to 10° the other side with the plotter recording the results.
- f) The EUT shall be replaced by the substitution antenna and the received signal level maximized.
- g) This level shall be recorded on the X-Y plotter.
- h) The substitution antenna shall be driven in azimuth as in d) and e).
- i) The gain of the EUT shall be calculated from:

$$G_{EUT} = L_1 - L_2 + C$$

where:

- G_{EUT} is the gain of the EUT (dBi);
 - L_1 is the level obtained with the EUT (dB);
 - L_2 is the level obtained with the substitution antenna (dB);
 - C is the calibrated gain of the substituted antenna at the test frequency (dBi).
- j) The tests in c) to i) shall be repeated with the frequency changed to 5 MHz above the bottom of the transmit frequency band.
 - k) The tests in c) to i) shall be repeated with the frequency changed to 5 MHz below the top of the transmit frequency band.

- l) The tests in b) to k) may be performed simultaneously.

6.2.1.4 Antenna transmit radiation patterns

6.2.1.4.1 General

For the purpose of the present document, the antenna transmit radiation patterns are diagrams relating field strength to the angle of the direction pointed by the antenna at a constant large distance from the antenna.

For the purpose of this test, the EUT is defined as that part of the SNG TES which comprises the antenna and its flange. The antenna includes the reflector(s), feed, support struts and an enclosure of equal weight/distribution to any electrical equipment normally housed with the feed at the antenna focal point.

6.2.1.4.2 Test site

This test shall be performed on either an outdoor far-field test site or compact test range. However if the near-field scanner technology to convert near-field measurements to far-field results is proven and sufficiently accurate by reference to tests taken in both regions then antenna measurements may be taken in the near field.

Fully automated systems can be used for these tests providing that the results can be proven to be as accurate as if they were done according to the specified method.

6.2.1.4.3 Method of measurement

Figure 3: Test arrangement - antenna transmit radiation pattern measurement

6.2.1.4.4 Co-polar radiation pattern - azimuth

The following test procedure shall be performed for each transmit frequency band.

- The test arrangement shall be as shown in figure 3 with the EUT connected to the test receiver. A signal proportional to the angular position from the servo mechanism shall be applied to the X-axis and the signal level from the test receiver shall be applied to the Y-axis of the plotter.
- The frequency of the test signal shall be set to a frequency in the centre of the transmit frequency band.
- The initial E-plane of the test signal radiated by the test transmitter through its antenna shall be vertical. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter. The polarizer of the EUT shall be rotated and adjusted such that its E-plane coincides with the E-plane of the test transmitter. Precise co-polar peaking of the polarization plane shall be done by observing the crosspolar minimum (fine adjustment).
- The EUT shall be aligned to maximize the received signal and the X-Y plotter adjusted to give the maximum reading on the chart.
- The EUT shall be driven in azimuth to -180° .
- The transmit pattern measurement is then obtained by driving the EUT in azimuth from -180° to $+180^\circ$ with the plotter recording the results.
- The tests in d) to f) shall be repeated with the frequency changed 5 MHz above the bottom of the transmit frequency band.
- The tests in d) to f) shall be repeated with the frequency changed to 5 MHz below the top of the transmit frequency band.

- i) The tests in b) to h) may be performed simultaneously.
- j) The tests in d) to i) shall be repeated with the E-plane of the test signal being horizontal. The frequency of the test signal shall be set to a frequency in the centre of the transmit frequency band. The polarizer of the EUT antenna shall be rotated and adjusted such that its E-plane coincides with the E-plane of the test transmitter. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter precise co-polar peaking of the polarization plane shall be done by observing the crosspolar minimum (fine adjustment).

6.2.1.4.5 Co-polar radiation pattern - elevation

The following test procedure shall be performed for each transmit frequency band.

- a) The test arrangement shall be as shown in figure 3 with the EUT connected to the test receiver. A signal proportional to the angular position from the servo mechanism shall be applied to the X-axis and the signal level from the test receiver shall be applied to the Y-axis of the plotter.
- b) The frequency of the test signal shall be set to a frequency in the centre of the transmit frequency band.
- c) The initial E-plane of the test signal radiated by the test transmitter through its antenna shall be vertical. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter. The polarizer of the EUT shall be rotated and adjusted such that its E-plane coincides with the E-plane of the test transmitter. Precise co-polar peaking of the polarization plane shall be done by observing the crosspolar minimum (fine adjustment).
- d) The EUT shall be aligned to maximize the received signal and the X-Y plotter adjusted to give the maximum reading on the chart.
- e) The EUT shall be driven in elevation to -1° .
- f) The transmit pattern measurement is then obtained by driving the EUT in elevation from -1° to $+70^\circ$ with the plotter recording the results.
- g) The tests in d) to f) shall be repeated with the frequency changed 5 MHz above the bottom of the transmit frequency band.
- h) The tests in d) to f) shall be repeated with the frequency changed to 5 MHz below the top of the transmit frequency band.
- i) The tests in b) to h) may be performed simultaneously.
- j) The tests in d) to i) shall be repeated with the E-plane of the test signal being horizontal. The frequency of the test signal shall be set to a frequency in the centre of the transmit frequency band. The polarizer of the EUT antenna shall be rotated and adjusted such that its E-plane coincides with the E-plane of the test transmitter. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter precise co-polar peaking of the polarization plane shall be done by observing the crosspolar minimum (fine adjustment).

6.2.1.4.6 Crosspolar radiation pattern - azimuth

The following test procedure shall be performed for each transmit frequency band.

- a) The test arrangement shall be as shown in figure 3 with the EUT connected to the test receiver. A signal proportional to the angular position from the servo mechanism shall be applied to the X-axis and the signal level from the test receiver shall be applied to the Y-axis of the plotter.
- b) The frequency of the test signal shall be set to a frequency in the centre of the transmit frequency band.
- c) The initial E-plane of the test signal radiated by the test transmitter through its antenna shall be vertical. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter. The polarizer of the EUT shall be rotated and adjusted such that its E-plane is orthogonal to the E-plane of the test transmitter. Precise fine adjustment of the polarization plane shall be done by observing the crosspolar minimum.
- d) In order to adjust the X-Y plotter giving the maximum reading on the chart the boresight co-polar receive signal shall be used.

- e) The EUT shall be driven in azimuth to -10° .
- f) The transmit pattern measurement is then obtained by driving the EUT in azimuth from -10° to $+10^\circ$ with the plotter recording the results.
- g) The tests in d) to f) shall be repeated with the frequency changed 5 MHz above the bottom of the transmit frequency band.
- h) The tests in d) to f) shall be repeated with the frequency changed to 5 MHz below the top of the transmit frequency band.
- i) The tests in b) to h) may be performed simultaneously.
- j) The tests in d) to i) shall be repeated with the E-plane of the test signal being horizontal. The frequency of the test signal shall be set to a frequency in the centre of the transmit frequency band. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter. The polarizer of the EUT antenna shall be rotated and adjusted such that its E-plane is orthogonal with the E-plane of the test transmitter. Precise adjustment of the polarization plane shall be done by observing the crosspolar minimum.

6.2.1.4.7 Crosspolar radiation pattern - elevation

The following test procedure shall be performed for each transmit frequency band.

- a) The test arrangement shall be as shown in figure 3 with the EUT connected to the test receiver. A signal proportional to the angular position from the servo mechanism shall be applied to the X-axis and the signal level from the test receiver shall be applied to the Y-axis of the plotter.
- b) The frequency of the test signal shall be set to a frequency in the centre of the transmit frequency band.
- c) The initial E-plane of the test signal radiated by the test transmitter through its antenna shall be vertical. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter. The polarizer of the EUT shall be rotated and adjusted such that its E-plane is orthogonal to the E-plane of the test transmitter. Precise fine adjustment of the polarization plane shall be done by observing the crosspolar minimum.
- d) In order to adjust the X-Y plotter giving the maximum reading on the chart the boresight co-polar receive signal shall be used.
- e) The EUT shall be driven in elevation to -1° .
- f) The transmit pattern measurement is then obtained by driving the EUT in elevation from -1° to $+10^\circ$ with the plotter recording the results.
- g) The tests in d) to f) shall be repeated with the frequency changed 5 MHz above the bottom of the transmit frequency band.
- h) The tests in d) to f) shall be repeated with the frequency changed to 5 MHz below the top of the transmit frequency band.
- i) The tests in b) to h) may be performed simultaneously.
- j) The tests in d) to i) shall be repeated with the E-plane of the test signal being horizontal. The frequency of the test signal shall be set to a frequency in the centre of the transmit frequency band. The EUT antenna main beam axis shall be aligned with the main beam axis of the test transmitter. The polarizer of the EUT antenna shall be rotated and adjusted such that its E-plane coincides with the E-plane of the test transmitter. Precise fine adjustment of the polarization plane shall be done by observing the crosspolar minimum.

6.2.2 Computation of results

The results shall be computed by producing a "mask" to the specified limits with the reference level being equal to the sum of the transmitter output power density and the gain of the antenna at the closest frequency to the frequency at which the power density is measured. This reference shall then be placed on the maximum point of the plot obtained from the transmit radiation pattern measurements at the closest frequency to the frequency at which the power density is measured, so as to ascertain that the off-axis EIRP density is within the mask, and thus conforming to the specification.

6.3 Off-axis spurious radiation

6.3.1 Test method

6.3.1.0 General

The tests shall be performed with the EUT comprising the SNG TES up to the antenna flange. The antenna shall be replaced by a dummy load. The interconnections cables between the various units shall be the same types as supplied by the applicant. The type of cable used shall be entered in the test report.

The EUT shall be terminated with matched impedance at the terrestrial ports if there is no associated equipment connected to such ports if recommended by the applicant in the user documentation.

For frequencies up to 80 MHz the measuring antenna shall have a length equal to the 80 MHz resonant length and shall be matched to the feeder by a suitable transforming device. Measurements with broadband antennas is also possible provided that the test site has been calibrated according to the requirements of CISPR 16-1 [2].

For frequencies between 80 MHz and 1 GHz the measuring antenna shall be a balanced dipole which shall be resonant in length. Measurements with broadband antennas is also possible provided that the test site has been calibrated according to the requirements of CISPR 16-1 [2].

For frequencies above 1 GHz the tests shall be performed according to the procedures a) to c) of clause 6.3.1.2. The measuring antenna shall be a horn radiator of known gain/frequency characteristics. When used for reception the antenna and any associated amplification system shall have an amplitude/frequency response within ± 2 dB of the combined calibration curves across the measurement frequency range considered for the antenna. The antenna is mounted on a support capable of allowing the antenna to be used in either horizontal or vertical polarization and at the specified height.

6.3.1.1 Up to 1,0 GHz

6.3.1.1.1 Test site

The test shall be performed either in an open area test site, a semi-anechoic chamber or an anechoic chamber. Ambient noise levels shall be at least 6 dB below the applicable unwanted emissions limit.

The open area test site shall be flat, free of overhead wires and nearby reflecting structures, sufficiently large to permit aerial placement at the specified measuring distance and provide adequate separation between aerial, test unit and reflecting structures, according to the specification of CISPR 16-1 [2].

For both the open area test site and the semi-anechoic chamber a metal ground plane shall be inserted on the natural ground plane and it shall extend at least 1 m beyond the perimeter of the EUT at one end and at least 1 m beyond the measurement antenna at the other end.

The distance between the EUT and measuring antenna shall be 10 m. An inverse proportionality factor of 20 dB per decade shall be used to normalize the measured data to the specified distance for determining compliance. Care should be taken in measurement of large test units at 3 m at frequencies near 30 MHz due to near field effects.

6.3.1.1.2 Measuring receivers

Measuring receivers shall conform to the following characteristics:

- the response to a constant amplitude sine wave signal shall remain within ± 1 dB across the frequency range of interest;
- quasi-peak detection shall be used in a -6 dB bandwidth of 120 kHz;
- the receiver shall be operated at more than 1 dB below the compression point during tests/measurements.

6.3.1.1.3 Procedure

- a) The EUT shall be in the carrier-on state transmitting on a frequency in the centre of each transmit frequency band and for each modulation scheme.

- b) The EUT shall be rotated through 360° and, except in an anechoic chamber, the measuring antenna height simultaneously varied from 1 m to 4 m above the ground plane.
- c) All spurious radiation shall be measured and noted in frequency and level.

6.3.1.2 Above 1,0 GHz

6.3.1.2.1 General

The spectrum analyser resolution bandwidth shall be set to the specified measuring bandwidth or as close as possible. If the resolution bandwidth is different from the specified measuring bandwidth, bandwidth correction shall be performed for the noise-like wideband spurious radiation.

The test shall be performed in three stages for both the carrier-off and carrier-on states:

- Procedure a): Identification of the significant frequencies of spurious radiation;
- Procedure b): Measurement of radiated power levels of identified spurious radiation;
- Procedure c): Measurement of conducted spurious radiation radiated through the antenna flange.

6.3.1.2.2 Identification of the significant frequencies of spurious radiation

6.3.1.2.2.1 Test site

The identification of frequencies emitting from the EUT shall be performed in an anechoic chamber, an open area test site or a semi-anechoic chamber with the test antenna close to the EUT and at the same height as the volume centre of the EUT.

6.3.1.2.2.2 Procedure

The following test procedure shall be performed for all transmit frequency bands.

- a) The EUT shall be in the carrier-off state.
- b) The receivers shall scan the frequency band whilst the EUT revolves.
- c) The EUT shall be rotated through 360° and the frequency of any spurious signals noted for further investigation.
- d) The tests in b) to c) shall be repeated with the test antenna being in the opposite polarization.
- e) The tests in b) to d) shall be repeated in the carrier-on state whilst transmitting one modulated carrier at maximum power for each modulation scheme at a frequency at the centre of the transmit frequency band.

6.3.1.2.3 Measurement of radiated power levels of identified spurious radiation

6.3.1.2.3.1 Test site

The measurement of each spurious radiation noted during the test procedure in clause 6.3.1.2.2.2 shall be performed on a test site that is free from reflecting objects, i.e. either an open-area test site, a semi-anechoic chamber or an anechoic chamber.

6.3.1.2.3.2 Procedure

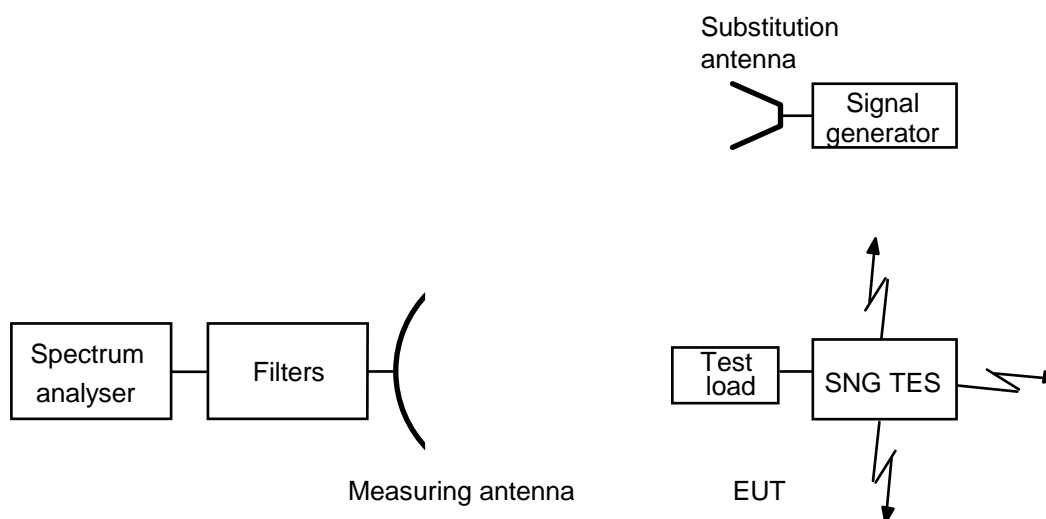

Figure 4: Test arrangement - Spurious radiation measurement above 1,0 GHz

The following test procedure shall be performed for each transmit frequency band.

- a) The test arrangement shall be as shown in figure 4.
- b) The EUT shall be installed such that the various units are placed in their normal operating positions relative to each other. If the test is performed in an open area test site or a semi-anechoic chamber any interconnection cables shall be maintained by non-metallic means at a height between 0,5 m and 1,0 m.
- c) The measuring antenna shall be positioned at a distance from the EUT relevant to the applied test site (e.g. 3, 5, 10 m). The measuring antenna shall be adjusted in height and the EUT rotated, whilst the EUT is in the appropriate carrier condition (transmit power and frequency and modulation scheme), for a maximum response on the associated spectrum analyser at each spurious frequency previously identified, this response level shall be noted. The adjustment in height of the measuring antenna does not apply when an anechoic chamber is being used.
- d) The investigation shall be repeated with the measuring antenna in the opposite polarization and the response level similarly noted.
- e) The EUT shall be replaced by the substitution antenna to which is connected a signal generator. The main beam axes of the measuring and substitution antennas shall be aligned. The distance between these antennas shall be the distance determined under step c).
- f) The substitution and measuring antennas shall be aligned in the polarization which produced the larger response between the EUT and the test antenna in steps c) and d).
- g) The output of the generator shall be adjusted so that the received level is identical to that of the previously noted largest spurious radiation.
- h) The output level of the signal generator shall be noted. The EIRP of the spurious radiation is the sum, in dB, of the signal generator output plus the substitution antenna isotropic gain minus the interconnection cable loss.

6.3.1.2.4 Measurement of conducted spurious radiation at the antenna flange

6.3.1.2.4.1 Test site

There are no requirements for the test site to be used for this test.

6.3.1.2.4.2

Procedure

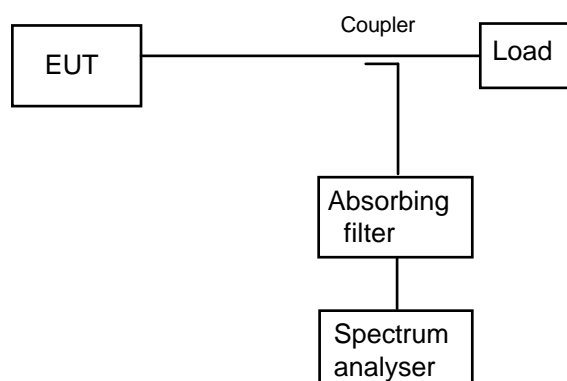

Figure 5: Test arrangement - conducted spurious radiation above the cut-off frequency

The following test procedure shall be performed for each modulation scheme as applicable in the frequency range of interest.

The following test procedure shall be performed for each transmit frequency band.

- a) The test arrangement shall be as shown in figure 5. If in order to protect the spectrum analyser while ensuring the necessary measurement accuracy, particularly close to the carrier, an absorbing filter is used it shall be tuned to the transmit carrier frequency.
- b) The frequency range from the cut-off frequency of the waveguide of the EUT to 40 GHz shall be investigated for spurious radiation whilst in the carrier-on state with one carrier being modulated and at maximum power at a frequency in the centre of the transmit frequency band. For spurious radiations depending on the transmit carrier frequency an investigation may be necessary with the carrier frequency changed to the lower or upper end of the transmit frequency band.
- c) To obtain the off-axis spurious EIRP the maximum measured antenna transmit gain, measured at the frequency of the identified unwanted emission, for off-axis angles greater than 7° , shall be added to the measured power density and any correction and calibration factors summated with the result. If agreed by the applicant, it shall be acceptable that the worst case value assumed (i.e. 8 dBi for off-axis angles greater than 7°) is used in place of the maximum off-axis antenna gain at the frequency of the identified unwanted emission.
- d) The test shall be repeated in the carrier-off state.

6.4 On-axis spurious radiation

6.4.1 Test method

6.4.1.1 General

The test shall be performed at the antenna flange.

6.4.1.2 Method of measurement

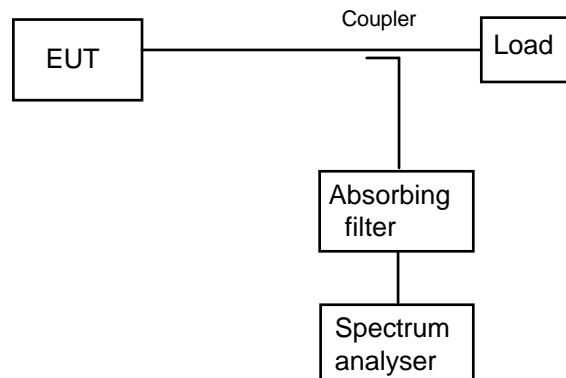

Figure 6: Test arrangement - on-axis spurious radiation measurements

The following test procedure shall be performed for each modulation scheme as appropriate in each transmit frequency band.

- a) The EUT shall be as shown in figure 6. If in order to protect the spectrum analyser while ensuring the necessary measurement accuracy, particularly close to the carrier, an absorbing filter is used it shall be tuned to the transmit carrier frequency.
- b) The EUT shall continuously transmit one modulated carrier centred on a frequency as close to the lower limit of the operating frequency band of the EUT as possible. The transmit frequency band shall be investigated.
- c) The spectrum analyser resolution bandwidth shall be set to the specified measuring bandwidth or as close as possible. If the resolution bandwidth is different from the specified measuring bandwidth, bandwidth correction shall be performed for noise-like wideband spurious radiation.
- d) To obtain the on-axis spurious EIRP, the antenna transmit gain shall be added to any figure obtained in the above measurement and any correction or calibration factor summated with the result. The antenna gain shall be as measured in clause 6.2.1.3 at the closest frequency to the spurious frequency.
- e) The tests in a) to d) shall be repeated with a transmit frequency in the centre of the transmit frequency band.
- f) The tests in a) to d) shall be repeated with a transmit frequency as close to the upper limit of the transmit frequency band as possible.

6.5 Mechanical (antenna pointing)

6.5.1 Test method

- a) Pointing stability:

As it is considered impracticable to perform the test on pointing stability no test is given. The test methodology described in annex C (informative) may be used to show compliance with the specification for pointing stability.

- b) Pointing accuracy capability:

- 1) The EUT shall be inspected (e.g. with the aid of an inclinometer or laser equipment to ascertain whether fine adjustment facilities are available for the azimuth axis (coarse adjustment is usually provided by the positioning of the means of attachment).
- 2) The adjustment facilities shall be examined to determine both the angular movement possible and the means of arresting that movement.
- 3) The arresting facility shall be examined to determine its permanency.
- 4) The test shall be repeated for the elevation axis.

- c) Polarization angle alignment capability:
 - 1) The adjustment facilities shall be examined to determine both the angular movement possible and the means of arresting that movement.
 - 2) The arresting facility shall be examined to determine its permanency.
- d) Polarization alignment stability:

As it is considered impracticable to perform the test on pointing stability no test is given. The test methodology described in annex C (informative) may be used to show compliance with the specification for pointing stability.

6.6 Receive antenna off-axis gain pattern

6.6.1 Test Method

6.6.1.1 Test site

This test shall be performed on either an outdoor far field test site or compact test range. However if the near field scanner technology to convert near field measurements to far field results is proven and sufficiently accurate by reference to tests taken in both regions then antenna measurements may be taken in the near field. Fully automated systems can be used for these tests providing that the results can be proven to be as accurate as if they were done according to the specified method.

6.6.1.2 Method of measurement

Figure 7: Test arrangement - antenna receive pattern measurement

- a) The test arrangement shall be as shown in Figure 7 with the EUT connected to the test receiver.
- b) A signal proportional to the angular position from the servo mechanism shall be applied to the X-axis and the signal level from the test receiver shall be applied to the Y-axis of the plotter.
- c) The test frequencies shall be the centre frequency of each applicable frequency range. The E plane shall be vertical.
- d) The EUT shall be aligned to maximize the received signal level and the X-Y plotter shall be adjusted to give the maximum reading on the chart.
- e) The EUT shall be driven in azimuth through 180°.
- f) The pattern measurement is then obtained by driving the EUT in azimuth through 360° with the plotter recording the results.
- g) The tests in b) to e) shall be repeated with the frequency changed to the lower limit of the applicable band as declared by the manufacturer.
- h) The tests in b) to e) shall be repeated with the frequency changed to the upper limit of the applicable band as declared by the manufacturer.
- i) The tests in b) to h) shall be repeated with the frequencies changed to the others specified if the design of the equipment is such that operation is possible, but not necessarily simultaneously, in all bands.
- j) The tests in b) to h) shall be repeated with the test signal being transmitted in the H-plane instead of the E-plane.

- k) The tests in b) to h) shall be repeated with the test signal being transmitted in a plane at 45° to the H-plane.
- l) The tests in b) to h) shall be repeated with the test signal being transmitted in a plane at 90° to that in k).
- m) The tests in b) to l) shall be repeated between the angles of φ , and 7° with the EUT rotated through 90°, or the test antenna or the polarization subsystem of the EUT rotated by 90°, to give the cross-polar measurement.

6.7 Blocking performance

6.7.1 Test method

- a) The output signals of two signal generators shall be combined with equal weight. The combined signal shall be coupled to the LNB input in a reasonable and appropriate way.
- b) A spectrum analyser shall be connected to the LNB output in a way that allows to supply the LNB with power.
- c) f_c is the centre frequency of the receive frequency band.
- d) The first signal generator frequency shall be set to f_c .
- e) The first signal generator level shall be set to a level in the LNB operational input level range.
- f) The spectrum analyser shall be set for measuring the level of the converted first signal at the LNB output.
- g) The second signal generator frequency shall be set to $f_c - 20$ MHz.
- h) The second signal generator level shall be adjusted so that the measured level is 1 dB less than in absence of the second signal.
- i) The second signal generator level shall be noted down as reference level.
- j) The second signal generator frequency shall be set to the frequency of interest.
- k) The second signal generator level shall be adjusted so that the measured level is 1 dB less than in absence of the second signal.
- l) The rejection at the frequency of interest is equal to the second signal generator level minus the reference level determined in step i).
- m) Steps j) to l) shall be repeated for frequencies in the ranges of table 4.

NOTE: The worst case rejection in a particular frequency range can be determined after step i) by sweeping the second signal generator frequency over the frequency range and observe the gain compression, then perform steps j) to l) with the frequency where gain compression is highest.

6.8 Adjacent Signal Selectivity

6.8.1 Test method

- a) Two test signal generators shall be used. Each signal generator shall generate a modulated signal in the IME input frequency range and thermal noise.
- b) The signal generators shall be connected to the IME input through a splitter (combiner).
- c) The test signal generators shall be set to the frequencies and levels according to table 5.
- d) The IME shall be set to receive the signal of the first test signal generator.
- e) The second test signal generator shall be set to signal off.
- f) The noise level (or signal to noise ratio) of the first test signal generator shall be varied in order to determine the threshold reference sensitivity level.
- g) The second signal generator shall be set to signal on.

- h) The noise level (or signal to noise ratio) of the first test signal generator shall be varied in order to determine the threshold reference sensitivity level.
- i) The degradation is equal to the noise level (or signal to noise ratio) determined in step h minus that determined in step f.
- j) The result is the highest degradation found.

7 Test methods for SNG TES subsystems

7.1 General

The modifications of a SNG TES may consist of the replacement of one or several of the following modules:

- a) Antenna subsystem.
- b) High Power Amplifier (HPA).
- c) Up converter.
- d) Low Noise Amplifier (LNA).
- e) Down converter.
- f) MODulator/DEModulator (modem).

The intermediate and final results of the SNG TES tests before modification shall be made available by the applicant.

7.2 Antenna subsystem replacement

This clause is only applicable to passive antennas.

The following measurements made on the SNG TES before modification shall not be repeated:

- 6.2.1.2 Transmitter output power density;
- 6.3.1.1.3 Procedure for off-axis spurious radiation up to 1,0 GHz;
- 6.3.1.2.2 Identification of the significant frequencies of spurious radiation;
- 6.3.1.2.3 Measurement of radiated power levels of identified spurious radiation (EUT without antenna);
- 6.3.1.2.4 Measurement of conducted spurious radiation at the antenna flange;
- 6.4.1.2 Method of measurement at the antenna flange of on-axis spurious radiation.

The results of these measurements shall be used as those of the unmodified SNG TES and entered in the computation of these clauses.

Annex A (normative): Relationship between the present document and the essential requirements of Directive 2014/53/EU

The present document has been prepared under the Commission's standardisation request C(2015) 5376 final [i.2] to provide one voluntary means of conforming to the essential requirements of Directive 2014/53/EU on the harmonisation of the laws of the Member States relating to the making available on the market of radio equipment and repealing Directive 1999/5/EC [6].

The present document is therefore intended to cover the provisions of Directive 2014/53/EU [6] (RE Directive) Article 3.2 which states that "...radio equipment shall be so constructed that it both effectively uses and supports the efficient use of radio spectrum in order to avoid harmful interference".

Recital 10 of Directive 2014/53/EU [6] states that "*in order to ensure that radio equipment uses the radio spectrum effectively and supports the efficient use of radio spectrum, radio equipment should be constructed so that: in the case of a transmitter, when the transmitter is properly installed, maintained and used for its intended purpose it generates radio waves emissions that do not create harmful interference, while unwanted radio waves emissions generated by the transmitter (e.g. in adjacent channels) with a potential negative impact on the goals of radio spectrum policy should be limited to such a level that, according to the state of the art, harmful interference is avoided; and, in the case of a receiver, it has a level of performance that allows it to operate as intended and protects it against the risk of harmful interference, in particular from shared or adjacent channels, and, in so doing, supports improvements in the efficient use of shared or adjacent channels.*"

Recital 11 of Directive 2014/53/EU [6] states that "*although receivers do not themselves cause harmful interference, reception capabilities are an increasingly important factor in ensuring the efficient use of radio spectrum by way of an increased resilience of receivers against harmful interference and unwanted signals on the basis of the relevant essential requirements of Union harmonisation legislation.*"

As a consequence, the present document includes both transmitting and receiving parameters to maximize the efficient use of radio spectrum.

NOTE: The present document may be prepared and already be published before the standardisation request is adopted. In such a case the full reference to the standardisation request would not be available.

Once the present document is cited in the Official Journal of the European Union under that Directive, compliance with the normative clauses of the present document given in table A.1 confers, within the limits of the scope of the present document, a presumption of conformity with the corresponding essential requirements of that Directive, and associated EFTA regulations.

**Table A.1: Relationship between the present document and
the essential requirements of Directive 2014/53/EU**

Harmonised Standard ETSI EN 301 430				
The following requirements are relevant to the presumption of conformity under the article 3.2 of Directive 2014/53/EU [6]				
Requirement			Requirement Conditionality	
No	Description	Reference: Clause No	U/C	Condition
1	Off-axis EIRP emission density within the band(s)	4.2.1	U	
2	Off-axis spurious radiation	4.2.2	U	
3	On-axis spurious radiation	4.2.3	U	
4	Mechanical (antenna pointing)	4.2.4	U	

Harmonised Standard ETSI EN 301 430				
The following requirements are relevant to the presumption of conformity under the article 3.2 of Directive 2014/53/EU [6]				
Requirement			Requirement Conditionality	
No	Description	Reference: Clause No	U/C	Condition
5	Antenna off-axis gain pattern	4.2.5	C	Satellite communications networks may contain a central control unit that keeps received interference low by taking into account the actual antenna gain pattern of earth stations. The requirement is not relevant for earth stations that are always operated as part of such a network. The requirement is relevant in all other cases. If the receive antenna performance does not meet the requirement of clause 4.2.5, then the earth station shall accept an additional co-frequency interference caused by its off-axis gain which is not compliant to the mask.
6	Blocking performance	4.2.6	U	
7	Adjacent Signal Selectivity	4.2.7	U	

Key to columns:**Requirement:**

No A unique identifier for one row of the table which may be used to identify a requirement.

Description A textual reference to the requirement.

Clause Number Identification of clause(s) defining the requirement in the present document unless another document is referenced explicitly.

Requirement Conditionality:

U/C Indicates whether the requirement shall be unconditionally applicable (U) or is conditional upon the manufacturers claimed functionality of the equipment (C).

Condition Explains the conditions when the requirement shall or shall not be applicable for a requirement which is classified "conditional".

Presumption of conformity stays valid only as long as a reference to the present document is maintained in the list published in the Official Journal of the European Union. Users of the present document should consult frequently the latest list published in the Official Journal of the European Union.

Other Union legislation may be applicable to the product(s) falling within the scope of the present document.

Annex B (informative): Pointing stability methodology

This test should be performed by numerical analysis and performed in two stages:

- a) In the first stage the effects of maximum wind speed should be computed on the outdoor unit using a numerical analysis method (finite elements method by computer) taking into account the intrinsic properties of the materials.
- b) In the second stage the computed loads should be applied to the structure.

The purpose of the numerical analysis is twofold:

- a) to show that the fields of force and torque applied to the outdoor unit structure under nominated conditions do not reach the breakpoint limit of any element of the structure;
- b) to compute equivalent static loads (force and torque) applied to the critical attachment points of the structures, e.g.:
 - reflector - mounting legs fixing point;
 - reflector - struts;
 - LNB - struts.

Numerical analysis and load applications procedure:

- a) The air related parameters, namely the cinematic viscosity used to calculate drags at the rims of the structure should be calculated with the standard atmospheric environmental conditions (temperature = 293 K, air pressure = $1,013 \times 10^5$ Pascal).
- b) The computations needed to derive the field of force and torque and the equivalent static stresses should be carried out for each of the following variables:
 - elevation angle: maximum and minimum;
 - wind direction: in steps of 45° around the outdoor unit;
 - wind speed: 180 km/h.
- c) It should be verified with the simulated results that break point limits are not exceeded for any self-contained element.
- d) The calculated equivalent static loads should be applied at any identified critical fixing point of the assembly.
- e) Whilst the loads are applied the outdoor unit should be observed and any distortion noted.
- f) The test report should contain the following information:
 - the computation method used;
 - description of the test equipment;
 - description of the tests performed;
 - results of the safety margin test;
 - any signs of distortion observed;
 - results of the measurements of the deviation of the antenna position;
 - component deviation with respect to each other.
